 2. Position the AJB aside.

7. Remove the nuts, bolt and position the FEM aside.

8. Remove the FEM.
 1. Disconnect the six electrical connectors.
 2. Remove the FEM.

9. To install, reverse the removal procedure.
-

Electronic Compass

Compass Display

Item	Part Number	Description
1	—	Compass display
2	—	COMP/MIRROR switch

NOTE: The compass display and module are integral to the inside rear view mirror and not installed separately. For additional information, refer to [Section 501-09](#).

The compass:

- has a two-character display in the upper RH side of the mirror, which indicates the direction in which the vehicle is pointed (N, NE, E, SE, S, SW, W, NW).
- uses an electronic compass sensor that is attached to the mirror to windshield bracket.
- has compass adjustment (calibration and zone variation) controlled by a COMP switch on the mirror.

Electronic Compass

Refer to Wiring Diagrams Section [501-09](#) for schematic and connector information.

Special Tool(s)

 <p>ST1137-A</p>	<p>73III Automotive Meter 105-R0057 or equivalent</p>
---	---

Inspection and Verification

NOTE: Press the COMP button to turn on the display.

1. Verify the customer concern by operating the vehicle along roads of known direction to duplicate the customer concern with the compass.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
<ul style="list-style-type: none"> ● Mirror assembly 	<ul style="list-style-type: none"> ● Central junction box (CJB) fuse 216 (5A) ● Circuitry ● Loose or corroded connectors ● Compass sensor (part of the inside rear view mirror)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the fault is not visually evident, determine the symptom and proceed to the Symptom Chart.

Symptom Chart

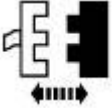

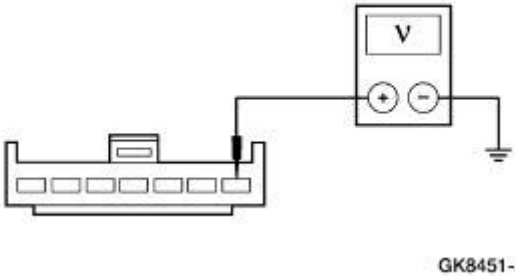

Symptom Chart

Condition	Possible Sources	Action
<ul style="list-style-type: none"> ● The compass is inoperative 	<ul style="list-style-type: none"> ● Central junction box (CJB) fuse 216 (5A). ● Circuitry. ● Inside rear view mirror. 	<ul style="list-style-type: none"> ● GO to Pinpoint Test A.

Pinpoint Tests

PINPOINT TEST A: THE COMPASS IS INOPERATIVE

CONDITIONS	DETAILS/RESULTS/ACTIONS
A1 CHECK POWER SUPPLY TO COMPASS — CIRCUIT 20-AD15 (PK)	
<p>1 </p> <p>2  Inside Rear View Mirror C911</p> <p>3 </p> <p>4  GK8451-A</p>	<p>4 Measure the voltage between the inside rear view mirror C911 pin 1, circuit 20-AD15 (PK), harness side and ground.</p> <ul style="list-style-type: none"> ● Is the voltage greater than 10 volts? <p>→ Yes GO to <u>A2</u>.</p> <p>→ No REPAIR the circuit. TEST the system for normal operation.</p>
A2 CHECK CIRCUIT 31-AD15 (BK) FOR OPEN	
<p>1 </p>	

2

2

Measure the resistance between the inside rear view mirror C911 pin 2, circuit 31-AD15 (BK), harness side and ground.

● Is the resistance less than 5 ohms?

→ **Yes**
 INSTALL a new inside rear view mirror. REFER to [Section 501-09](#). TEST the system for normal operation.

→ **No**
 REPAIR the circuit. TEST the system for normal operation.

PINPOINT TEST B: THE COMPASS IS INACCURATE

CONDITIONS	DETAILS/RESULTS/ACTIONS
B1 CHECK COMPASS ZONE SETTING	
	<p>1 Carry out the compass zone adjustment procedure. Refer to Compass Zone Adjustment in this section.</p> <p>● Is the compass zone set correctly?</p> <p>→ Yes GO to B2.</p> <p>→ No INSTALL a new inside rear view mirror. REFER to Section 501-09. TEST the system for normal operation.</p>
B2 CALIBRATE THE COMPASS	
	<p>1 Carry out the compass calibration adjustment procedure. Refer to Calibration Adjustment in this section.</p> <p>● Does the compass calibrate correctly?</p> <p>→ Yes GO to B4.</p> <p>→ No GO to B3.</p>
B3 DEMAGNETIZE THE VEHICLE	
	<p>1 Demagnetize the vehicle. Refer to Vehicle Demagnetizing in this section.</p>

● **Does the compass calibrate correctly?**

→ **Yes**
GO to B4.

→ **No**
INSTALL a new inside rear view mirror. REFER to Section 501-09. TEST the system for normal operation.

B4 CHECK COMPASS ACCURACY

1 Position the vehicle and observe the compass display as follows:

Direction	Compass Display
North	N
Northeast	NE
East	E
Southeast	SE
South	S
Southwest	SW
West	W
Northwest	NW

● **Does the compass display as indicated?**

→ **Yes**
The compass is OK.

→ **No**
INSTALL a new inside rear view mirror. REFER to Section 501-09. TEST the system for normal operation.

Compass Zone Adjustment

1. Refer to the compass calibration zone map to select the correct compass zone setting for your geographical location.

2. With the compass display turned on, press and hold the COMP button (for three seconds) until the display shows the current zone of operation.

3. Momentarily press the COMP button to cycle the zone number display. Set the zone display number to match the vehicle location on the compass calibration zone map.
4. Releasing the switch for 10 seconds will exit the zone setting mode.

Calibration Adjustment

1. **NOTE:** For optimum calibration, drive to an open, level location away from large metallic objects or structures. Switch off all non-essential electrical accessories (rear window defrost, heater, A/C, map lamps and wipers) and make sure all doors are shut.

Press and hold the COMP button until C appears (six seconds). Release the COMP button.

2. Drive the vehicle at less than 8 km/h (5 mph) in a continuous circle until the compass heading is shown.
 3. If the C message does not turn off within five circles, demagnetize the vehicle. Refer to [Vehicle Demagnetizing](#) in this section.
-

Vehicle Demagnetizing

CAUTION: During demagnetizing, the demagnetizer coil will be pulled toward the vehicle. Place a cloth over the vehicle roof to protect the vehicle surface if contact occurs. Make sure the cloth covers the front third and the entire width of the roof.

NOTE: The demagnetizing process requires the use of a demagnetizing coil commonly used by television repair technicians to demagnetize television tubes.

NOTE: To demagnetize, use a constant circular motion over the vehicle roof. Do not turn off the demagnetizer while sweeping the vehicle roof to prevent remagnetizing ferrous materials contained in the vehicle.

NOTE: During the demagnetizing process, make sure the phenolic surface of the tool (the side opposite the handle) is closest to the vehicle surface.

NOTE: Turn the ignition switch to the OFF position.

1. Demagnetize the front third of the vehicle roof.
 1. Turn on the demagnetizer at least 1 meter (3 ft) away from the vehicle.
 2. Holding the demagnetizer no more than 2.5 cm (1 in) from the roof and starting on the passenger side, demagnetize the front third of the roof closest to the windshield using a constant circular motion. Keep the circle's radius within 30 cm (12 in) while sweeping across the entire surface of the roof closest to the windshield. Continue the circular motion four times.
 3. After the fourth pass and without stopping, move the demagnetizer at least 1 meter (3 ft) away from the vehicle.
 4. Turn the demagnetizer off.
2. **NOTE:** The demagnetizer must be located over the outside of the windshield no greater than 2.5 cm (1 in).

Demagnetize the inside rear view mirror mounting pad.

1. Turn on the demagnetizer at least 1 meter (3 ft) away from the vehicle.
 2. Using a circular motion, pass the demagnetizer over the outside of the windshield near the inside rear view mirror mounting pad. Without stopping, move the demagnetizer at least 1 meter (3 ft) away from the vehicle.
 3. Turn the demagnetizer off.
 3. Carry out the compass zone adjustment procedure; refer to [Compass Zone Adjustment](#) in this section.
 4. Carry out the calibration adjustment procedure; refer to [Calibration Adjustment](#) in this section.
-

Silicone Gasket and Sealant F7AZ-19554-EA	WSE-M4G323-A4

Body

Body and Sheet Metal

The body:

- is a uni-body open cowl structure.
 - is constructed of a monocoque, lightweight, all-steel material with removable bolted hood (16612), front fenders (16005), doors, and luggage compartment lid.
-

Insulation

Insulation is comprised of urethane, PVC, and recycled felt. Insulation is installed:

- under the roof panel.
 - above and below the instrument panel.
 - on the cowl sides.
 - over the front and rear floor areas.
 - in the B-pillar and C-pillar sections.
-

Body Sealer Types and Applications

Liquid Butyl Sealer

Liquid Butyl Sealer F8AZ-19554-CA or equivalent meeting Ford Specification ESB-M4G162-A:

- does not run.
- is fast drying.
- remains semi-elastic.
- can be used for seam sealing on the floor pan, wheelhouse, door openings, and drip rails.

Caulking Cord

3M Strip Caulk-Black 051135-08578 or equivalent meeting Ford specification WSB-M4G32-C:

- is a heavy-bodied, plastic base with a filler.
- is commonly known as perma-gum.
- is used on spot-welds holes and between surfaces not sealed with a gasket.

Weatherstrip Adhesive

Weatherstrip Adhesive E8AZ-19552-A or equivalent meeting Ford specification ESB-M2G14-A:

- is a quick drying, strong adhesive designed to hold weatherstripping onto all body panels and surrounding metal.

Silicone Lubricant

Silicone Lubricant F7AZ-19G208-BA meeting Ford specification ESR-M13P4-A:

- is used to keep the door and the window weatherstrip pliable and soft.
 - should be applied to the weatherstrip at every lubrication period.
 - makes the door easier to close.
 - retards weatherstrip squeaks.
 - retards weatherstrip wear.
 - helps retain door window alignment by reducing friction between the glass frame and the rubber weatherstrip.
 - should not be used prior to painting.
-

Body System

Inspection and Verification

Leaks

NOTE: Trim will reveal the location of most leaks.

1. Remove any trim or carpet in the general area of the leak.
2. Road test or water test the vehicle.
3. Inspect for a dust pattern around the area in question. Inspect for water paths near and above the area in question.
4. Some leaks can be located by placing bright light under the vehicle, removing any necessary trim or carpet, and inspecting the interior of the body at joints and weld lines.

Noise

Wind noise, rattles and their sources are detected by driving the vehicle at highway speeds. The vehicle should be driven in four different directions with all of the windows closed, the radio off, the blower motor off, and all of the ventilation ducts open.

Most wind noise leaks will occur at the door and window seals or at the sheet metal joints in the door or the door opening.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
<ul style="list-style-type: none">● Dust and water leaks	<ul style="list-style-type: none">● Body sealer missing.● Opening in weldings or body joints.● Components not fully installed.● Components missing.● Components damaged.	<ul style="list-style-type: none">● REMOVE trim. Front End Body Panels

The grille opening reinforcement:

- is bolted to the fenders and bumper beam.
- retains the headlamp assemblies and bumper cover.

The cowl vent screen is a two-piece component. The right side of the cowl vent screen may be removed without the removal of the windshield wiper pivot arm.

Cowl Vent Screen

Removal

NOTE: To remove the left side cowl vent screen, the right cowl vent screen must be removed first. Follow the entire cowl vent screen procedure.

Right Side Only

1. **NOTE:** The fasteners are reusable.

Remove the right side of the cowl vent screen.

1. Remove the two-part pin-type retainers and separate the Velcro® attachment of the rubber hinge cover to the rear outboard corner of the cowl vent screen.
2. Pull up on the cowl vent screen to release the lower clips.

Entire Cowl Vent Screen

2. Remove the two wiper pivot arms.
 1. Remove the two pivot arm nut covers.
 2. Remove the two nuts.
 3. Remove the two wiper pivot arms.

3. **NOTE:** Remove the right side first when removing the entire cowl vent screen.

Remove the cowl vent screen.

1. Remove the two-part pin-type retainers and separate the Velcro® attachment of the rubber hinge cover to the rear outboard corner of the cowl vent screen.
2. Lift up on the cowl vent screen to release the clips.

Installation

NOTE: When installing the entire cowl vent screen, install the left side first. Follow the entire cowl vent screen procedure.

Right Side Only

1. Install the right side of the cowl vent screen.
 1. Position the cowl vent screen and the Velcro® attachment of the rubber hinge cover.
 2. Install the two-part pin-type retainers.

Entire Cowl Vent Screen

2. **NOTE:** Use the lower rearward clips as locators prior to installation, working from the center of the vehicle outward.

Install the cowl vent screen.

1. Position the windshield moulding flap over the left side cowl vent screen and attach the rubber hinge cover to the cowl screen.
2. Install the cowl vent screens and install the two-part pin-type retainers.

3. Cycle the windshield wiper motor to park the windshield wiper pivot arm shafts.

4. Install the windshield wiper and pivot arms onto the pivot shaft and align the blade to the heated wiper park/windshield wire lines on the windshield glass within the specification.

5. Tighten the windshield wiper pivot arm nuts.
 - Install the two pivot arm nut covers.

Fender

Removal and Installation

LH or RH Side

1. Remove the front bumper cover. For additional information, refer to [Section 501-19](#).
2. Remove the wheel and tire assembly. For additional information, refer to [Section 204-04](#).
3. Remove the front and rear inner splash shield.

LH Side Only

4. Position the speed control module aside.
 - Loosen the top bolt.
 - Remove the bottom bolt.

LH or RH Side

5. Remove the fender stuffer.
6. Remove the inner front fender bolts.

7. Remove the two front two-part pin-type retainers and position the front rocker moulding aside.

8. Remove the lower front fender bolts.

9. Remove the radiator upper sight shield.
 1. Remove the retainers.
 2. Remove the radiator upper sight shield.

10. Remove the headlamp assembly.
 1. Remove the three bolts.
 2. Remove the headlamp assembly.
 - Disconnect the electrical connector.

11. Remove the radiator grille opening panel to front fender bolts.

LH Side Only

12. Position the splash shield aside.

LH or RH Side

13. Disengage the wiring harness locator.

14. **NOTE:** Support the hood using a prop rod.

Disengage the lower hood assist strut.

15. Remove the front fender bolts and the hood assist strut ball stud.

16. Remove the front fender.
 17. To install, reverse the removal procedure.
-

Radiator Grille Opening Panel

Removal and Installation

1. Remove the front bumper cover. For additional information, refer to [Section 501-19](#).
2. Remove the radiator upper sight shield.
 1. Remove the retainers.
 2. Remove the radiator upper sight shield.

3. **NOTE:** LH side shown, RH side similar.

Remove the two headlamp assemblies.

1. Remove the six bolts.
 2. Remove the headlamp assemblies.
- Disconnect the electrical connector.

4. Release the wiring harness fasteners and position the wiring harnesses rearward.

5. Remove the radiator grille opening panel bolts and the brackets.

6. Remove the radiator grille opening panel.
 7. To install, reverse the removal procedure.
-

Torsion Bar Loading

 **WARNING:** Safety glasses must be worn when carrying out this operation. Failure to follow these instructions may result in physical injury.

1. **NOTE:** The luggage compartment lid tension should be decreased if the luggage compartment lid (40110) opens with more force than desired. The luggage compartment lid tension should be increased if the luggage compartment lid opens with less force than desired.

Open and support the luggage compartment lid in the full-open position.

2.  **WARNING:** Use care when adjusting the luggage compartment lid torsion bar. It is under tension and could spring out of control if it is not handled correctly. Failure to follow these instructions could result in personal injury.

Move the luggage compartment lid end of the luggage compartment lid torsion bar to another position.

3. Check the adjustment.
4. If required, move the luggage compartment lid end of the luggage compartment lid torsion bar to another position.

Door

Removal

All Doors

1. Remove the door trim panel. For additional information, refer to [Section 501-05](#).
2. Remove the screws and the speaker.

Front Door

3. **NOTE:** Driver door shown, passenger door similar.

Disconnect the electrical connectors.

4. Remove the two nuts, the bolt and the inner front door support bracket.

5. Release the wiring harness locators.

Rear Door

6. Disconnect the electrical connector.

7. Release the wiring harness locators.

All Doors

8. Remove the grommet and wiring harness.

9.  **CAUTION: Do not close the door after the door check screws have been removed.**

Remove the door check strap screws.

10. Mark the hinge location on the door.
11. **NOTE:** An assistant is required to support the door during its removal.
Remove the hinge to door bolts and the door.

Installation

All Doors

1. Position the door and install the hinge to door bolts.

2. Install the door check strap screws.

3. Install the grommet and the wiring harness.

Rear Door

4. Connect the electrical connector.

Front Door

5. Install the front door support bracket, the two nuts and the bolt.

6. Connect the electrical connectors.

All Doors

7. Install the screws and the speaker.
 8. Install the door trim panel. For additional information, refer to [Section 501-05](#).
 9. Check the door for a flush fit to the body.
-

Door —Check Strap

Removal and Installation

All Doors

1. Remove the door trim panel. For additional information, refer to [Section 501-05](#).
2. Remove the screws and the speaker.

3.  **CAUTION:** Do not close the door after removal of the check strap screws

Remove the door check strap screws.

Rear Door

4. Remove the cover.

All Doors

5. Remove the nuts and the door check strap.

6. To install, reverse the removal procedure.
-

Interior Trim

The interior trim consists of:

- door trim panels
 - headliner (coupe)
 - package tray trim panel (coupe)
 - rear quarter trim panels
 - sun visors
 - tether anchor covers (coupe)
 - upper quarter trim panel (coupe)
 - scuff plates
 - lower A-pillar trim panels
 - windshield side garnish mouldings
-

Trim Panel —Front Door

Removal

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Lift the cover and remove the screws.

3. Remove the interior door handle trim panel.

4. Remove the five screws and remove the trim panel.
 - Disconnect the electrical connectors.

Installation

1. To install, reverse the removal procedure.

Trim Panel —Rear Door

Removal

1. Lift the cover and remove the screws.

2. Remove the door trim panel.
 1. Remove the three screws.
 2. Remove the ashtray assembly.
 - Disconnect the electrical connectors.

Installation

1. To install, reverse the removal procedure.
-

Trim Panel —A-Pillar Lower

Removal

1. Remove the front scuff plate.

2. Pull back the weatherstrip.

3. Remove the A-pillar lower trim panel.

Installation

1. To install, reverse the removal procedure.

Trim Panel —Package Tray

Removal

1. Remove the rear seat bolsters. For additional information, refer to [Section 501-10](#).
2. Position the two quarter trim panels aside.

3. Remove the rear high mounted stoplamp (HMSL) cover.

4. Remove the rear center safety belt cover.

5. Remove the pin-type retainers and pull down the rear seat latch covers.

6. Remove the package tray trim panel.

Installation

1. To install, reverse the removal procedure.
-

Trim Panel —Upper B-Pillar

Removal

1. Pull back the weatherstrip surrounding the upper B-pillar trim.
2. Remove the front seat safety belt cover.

3. Remove the front seat safety belt nut.

4. Remove the upper B-pillar trim.

Installation

1. **NOTE:** Position the shoulder safety belt height adjuster at its highest setting before installing the B-pillar trim.

To install, reverse the removal procedure.

- Check the restraint system for correct operation.
-

Trim Panel —Quarter

Special Tool(s)

Removal

1. Remove the rear seat bolster. For additional information, refer to [Section 501-10](#).
2. Using the special tool, remove the rear safety belt anchor bolt.

3. Remove the quarter trim panel.

Installation

1. **NOTE:** Position the weatherstrip over the quarter trim panel.

To install, reverse the removal procedure.

- Check the restraint system for correct operation.

Trim Panel —Windshield Side Garnish Moulding

1. Position the weatherstrip aside.
2. Remove the windshield side garnish moulding.

Installation

1. To install, reverse the removal procedure.
-

Headliner

Removal

1. Move the front passenger seat fully rearward and fully recline.
2. Move the driver seat fully forward and the seat backrest fully upright.
3. Remove the screws and the sun visors.
 - Disconnect the electrical connectors.

4. Remove the screws and the sun visor clips.

5. Remove the four assist handles.
 1. Position the end caps aside.
 2. Remove the screws.

6. Remove the windshield side garnish mouldings.

7. Position the upper B-pillar trim aside.

8. Position the upper portion of the door weatherstrip seals aside.
9. Remove the quarter trim panels. For additional information, refer to [Trim Panel—Quarter](#).
10. **NOTE:** Vehicles without moon roofs—Use a plastic scraper to detach the headliner from the roof.

Release the map lamp clips and lower the headliner.

11. Disconnect the electrical connector.

12. Remove the headliner from the left rear door opening.

Installation

Installing New Headliner

1.  **CAUTION: Folding the headliner will result in damage to the headliner.**

Carefully position the headliner in the vehicle.

2. **NOTE:** Adhesive required for vehicles without moon roofs.

Apply Headliner Adhesive F1VY-19562-A or equivalent meeting Ford specification WSS-M2G355-B in a triangular pattern to the center of the headliner.

3. Connect the electrical connector.

4. Press the headliner against the roof to make sure adhesive contacts both surfaces.

Installing Existing Headliner

5.  **CAUTION: Folding the headliner will result in damage to the headliner.**

Carefully position the roof headliner in the vehicle.

6. Bend the tabs of the rear locator back into their original position.

7. Apply Headliner Adhesive F1VY-19562-A or equivalent meeting Ford specification WSS-M2G355-B in a triangular pattern to the center of the headliner.

8. Connect the electrical connector.

9. Press the headliner against the roof to make sure the adhesive contacts both surfaces.

New or Existing Headliner

10. Install the quarter trim panels. For additional information, refer to [Trim Panel—Quarter](#) .

11. Install the upper B-pillar trim.

12. Install the windshield garnish mouldings on each side.

13. Position the sun visor clips and install the screws.

14. Connect the electrical connectors, position the sun visors, and install the screws.

15. Install the four assist handles.
1. Position the assist handles.

2. Install the screws.
3. Install the end caps.

16. Install the door weatherstrips.
 17. Place the seats in upright positions.
-

Radiator Grille

Removal and Installation

1. Open the hood.
2. Remove the radiator grille.
 1. Remove the nuts.
 2. Release the clips.

3. To install, reverse the removal procedure.
-

License Plate Housing

Removal and Installation

1. Remove the pin-type retainers and the luggage compartment lid trim panel.

2. Disconnect the two reversing lamp electrical connectors.

3. Disconnect the two license plate lamp electrical connectors.

4. Remove the license plate housing.
 1. Remove the nuts.
 2. Release the retaining clips.

5. To install, reverse the removal procedure.
 - Transfer components as necessary.
-

Torque Specifications

Description	Nm	lb-ft	lb-in
Exterior rear view mirror nuts	5	—	44
Mirror motor screws	2	—	18

Rear View Mirrors

Rear View Mirrors

The exterior rear view mirror is:

- electrically operated.
- controlled by the exterior mirror control switch for both vertical and horizontal movement.

The interior rear view mirror features automatic dimming which:

- automatically reduces glare caused by headlamps reflecting in the interior rear view mirror.
- houses two sensors to determine dimmer actuator.
- activates whenever the ignition is in the RUN or ACC position.
- defaults to the NORMAL setting when the transmission is shifted to REVERSE to allow a bright view for backing up.
- is disabled by pushing the mirror-mounted switch to the OFF position.
- can be manually activated or deactivated.

Memory

The memory mirror:

- automatically provides preferred positioning of the exterior rear view mirrors.
- may be recalled through the door-mounted switches, the remote-entry transmitter or keyless entry keypad.
- provides recall when the ignition switch is in the OFF or RUN position and the transmission is in the PARK or NEUTRAL position.
- position is stored in the driver door module (DDM).

Heated Mirrors

The heated mirror function:

- provides electric heating to both the driver and passenger side exterior rear view mirrors.
- raises the temperature of the glass to clear frost and condensation.
- is activated by activating the rear defrost button.
- automatically shuts off after ten minutes.

Electrochromic Interior Rear View Mirror

The optional electrochromic interior rear view mirror:

- is equipped with an automatic dimming feature that controls the interior rear view mirror reflecting surface to reduce glare caused by headlamps reflecting in the mirror.
 - has two integral sensors to control dimming functions.
 - defaults to normal setting when the transmission is shifted to REVERSE to allow a bright view for backing up.
 - can be switched off by pressing the MODE switch to the OFF position.
-

Rear View Mirrors

Refer to Wiring Diagrams Section [501-09](#), Rear View Mirrors for schematic and connector information.

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool
 ST1137-A	73 III Automotive Meter 105-R0057 or equivalent

Principles of Operation

Exterior Mirrors

The exterior mirrors are controlled by the exterior rear view mirror control. The exterior rear view mirror control is hardwired to the driver door module (DDM). When the driver exterior rear view mirror is selected, adjustment is carried out by moving the control to the desired position. The DDM receives the adjustment input command from the exterior rear view mirror control and supplies power and ground to the appropriate exterior rear view mirror motor to adjust the exterior rear view mirror. The passenger exterior rear view mirror is controlled by the front electronics module (FEM). When the DDM receives an adjustment command for the passenger exterior rear view mirror, the DDM interprets the command and sends the adjustment command over the SCP communication network to the FEM. The FEM interprets the command and supplies power and ground to the appropriate exterior rear view mirror motor to adjust the exterior rear view mirror.

Memory Operation

The DDM and FEM constantly track mirror position. Each exterior mirror motor is equipped with a potentiometer, which the modules monitor to track the mirror position. This position remains in memory as long as the module retains power. When a position is stored in memory by the operator, the module will retain this position in memory for future recall. When a memory position is recalled by the operator, the DDM and FEM will power the exterior mirror motors simultaneously and monitor the potentiometer circuits. When the stored memory position is reached, the DDM and FEM will remove power from the motors. If the exterior rear view mirror control is operated during a memory recall, the modules will stop the memory recall and respond to the exterior rear view mirror control command.

Heated Exterior Mirrors

The heated exterior mirrors will only function when the rear window defrost is operating. There is no separate control for heated exterior mirrors, they will function anytime the rear window defrost is ON. For additional information on the rear window defrost, refer to [Section 501-11](#).

The heated mirror power is supplied by the rear window defrost relay through a separate battery junction box (BJB) fuse that isolates the heated mirrors from the rear window defrost in the event of a concern.

Electrochromic Interior Rear View Mirror

The electrochromic interior rear view mirror will lighten or darken depending on the input of the sensors that are internal to the mirror.

The electrochromic interior rear view mirror reverse input is supplied by a hardwired circuit to the rear electronic module (REM). When REVERSE is selected, the REM will receive the PRNDL message over the SCP communication network from the PCM stating reverse has been selected. The REM will then supply a power signal to the electrochromic interior rear view mirror causing the electrochromic interior rear view mirror to cancel any dimming function currently operating and return to a full bright status. When the gear selector is moved out of REVERSE, the electrochromic interior rear view mirror returns normal operation and resumes any interrupted dimming functions.

If the REM does not receive the PRNDL information from the PCM, a communication DTC will be logged. As a default, the REM will supply power to the dimming circuit preventing the automatic dimming function from operating until the message and communication is restored.

The reverse message supplied to the REM has a time delay before the message is sent by the PCM. This delay allows for the gear selector to be moved through REVERSE without canceling dimming operations.

When installing a new electrochromatic interior rear view mirror, it is necessary to set the compass zone and calibrate the compass, refer to [Section 419-11](#).

Switched System Power (SSP)

The SSP is invoked by both the FEM and REM. This function removes power from relays that provide power to the exterior lamps, interior lamps, and power door locks. This is only accomplished when both the FEM and the REM are in sleep mode. The sleep function of the FEM and REM places the modules in sleep mode when the ignition switch is in the OFF position, and no wake up (inputs) signals occur for 30 minutes. The module will not sleep if the parking lamps or the hazard lamps are active. The following relays are controlled by the SSP function: SSP1, SSP2, SSP3, and SSP4. When either the FEM or REM are not in sleep mode, all SSP relays will be energized. Each relay, when energized, will supply power to multiple features/functions. For additional information, refer to the SSP Relay Index for diagnosis and testing of SSP-related issues.

Inspection and Verification

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
<ul style="list-style-type: none"> ● Damaged exterior rear view mirrors ● Damaged interior rear view mirror 	<ul style="list-style-type: none"> ● Battery junction box (BJB) Fuses 406 (10A), 409 (5A), 422 (20A), 423 (30A), 424 (30A), 425 (40A), 427 (30A), and 432 (30A). ● Central junction box (CJB) Fuse 207 (5A), 216 (5A), 222 (10A), and 235 (5A). ● Switched system power (SSP) relays 1 and 2. ● Exterior rear view mirror control. ● Exterior rear view mirror motor. ● Exterior rear view mirror glass. ● Electrochromic interior rear view mirror. ● Wiring harness.

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the diagnostic tool tester does not power up, refer to the diagnostic tool manual.
5. Carry out the DATA LINK DIAGNOSTICS. If the diagnostic tool responds with:
 - CKT 914, CKT 915 or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to [Section 418-00](#).
 - NO RESP/NOT EQUIP for FEM, go to Pinpoint Test A.
 - NO RESP/NOT EQUIP for REM, go to Pinpoint Test B.
 - NO RESP/NOT EQUIP for DDM, go to Pinpoint Test C.
 - SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the FEM, REM and DDM.
6. If the DTCs retrieved are related to the concern, go to the FEM Diagnostic Trouble Code (DTC) Index, REM Diagnostic Trouble Code (DTC) Index, or DDM Diagnostic Trouble Code (DTC) Index.
7. If no DTCs related to the concern are retrieved, proceed to the Symptom Chart to continue the diagnostics.

FEM Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1319	Driver Door Ajar Circuit Failure	FEM	REFER to Section 417-02 .
B1327	Passenger Door Ajar Circuit Failure	FEM	REFER to Section 417-02 .
B1342	ECU Is Defective	FEM	CLEAR the DTC. REPEAT the FEM self-test. If DTC B1342 is retrieved, INSTALL a new FEM. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test.

Pinpoint Tests

CAUTION: Electronic modules are sensitive to electrical charges. If exposed to these charges, damage may result.

PINPOINT TEST A: NO COMMUNICATION WITH THE FRONT

ELECTRONIC MODULE (FEM)

CONDITIONS	DETAILS/RESULTS/ACTIONS
A1 CHECK CIRCUITS 29-DK20 (OG/GN) AND 29S-DK22 (OG/YE) FOR VOLTAGE	
NOTE: Cycle ignition switch from OFF to RUN to enable the switched system power feature.	
<ol style="list-style-type: none"> 1  2  FEM C201c 3  FEM C201f 4  5  A0006297 	<ol style="list-style-type: none"> 5 Measure the voltage between FEM C201c pin 6, circuit 29-DK20 (OG/GN), harness side and ground; and between FEM C201f pin 1, circuit 29S-DK22 (OG/YE) harness side and ground. <ul style="list-style-type: none"> • Are the voltages greater than 10 volts? <p>→ Yes GO to <u>A2</u>.</p> <p>→ No REPAIR the circuit(s) in question. TEST the system for normal operation.</p>
A2 CHECK CIRCUITS 31-DK20 (BK/RD), 31-DK20A (BK/RD), 31-DK20B (BK/RD), 31-DK20C (BK/RD) AND 31-DK20D (BK/RD) FOR OPENS	
<ol style="list-style-type: none"> 1  	

2

FEM C201a

3

3

Using the following table, measure the resistance between FEM connectors, harness side and ground:

FEM	Pin	Circuit
C201c	12	31-DK20 (BK/RD)
C201a	11	31-DK20A (BK/RD)
C201a	13	31-DK20B (BK/RD)
C201a	14	31-DK20C (BK/RD)
C201a	15	31-DK20D (BK/RD)

• Are the resistances less than 5 ohms?

→ Yes

REFER to [Section 418-00](#).

→ No

REPAIR the circuit(s) in question. TEST the system for normal operation.

PINPOINT TEST B: NO COMMUNICATION WITH THE REAR ELECTRONIC MODULE (REM)

CONDITIONS	DETAILS/RESULTS/ACTIONS
B1 CHECK CIRCUIT 29-DK31 (OG/BK) FOR VOLTAGE	
NOTE: Cycle ignition switch from OFF to RUN to enable the switched system power feature.	
<p>1</p>	
<p>2</p> <p>REM C420d</p>	
<p>3</p> <p>REM C420c</p>	
<p>4</p>	

5

A0006299

5

Measure the voltage between REM C420d pin 3, circuit 29-DK31 (OG/BK), harness side and ground.

• Is the voltage greater than 10 volts?

→ **Yes**
GO to B2.

→ **No**
REPAIR the circuit. TEST the system for normal operation.

B2 CHECK CIRCUITS 29S-DK31 (OG/BK), 31-DK30D (BK), 31-DK30E (BK), 31-DK30F (BK), 31-DK30G (BK) AND 31-DK30H (BK/OG), FOR OPENS

1

2

REM C420b

3

A0006300

3

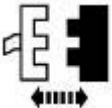

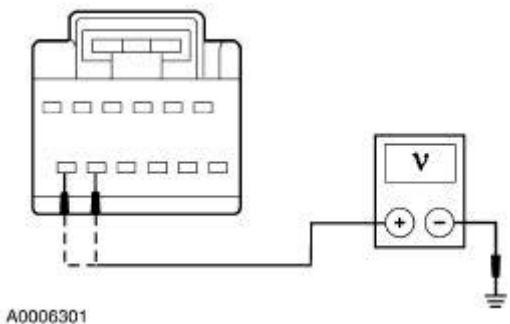

Using the following table, measure the resistance between REM connectors, harness side and ground:

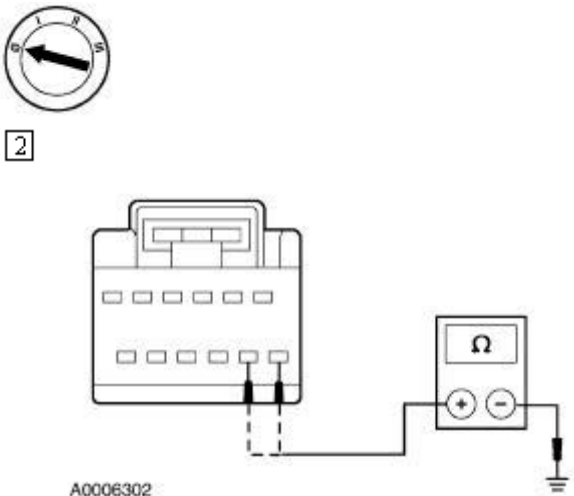

REM	Pin	Circuit
C420c	13	29S-DK31 (OG/BK)
C420c	12	31-DK30E (BK)
C420c	11	31-DK30D (BK)
C420c	26	31-DK30G (BK)
C420c	25	31-DK30F (BK)
C420b	12	31-DK30H (BK/OG)

• Are the resistances less than 5 ohms?

- **Yes**
REFER to Section 418-00.
- **No**
REPAIR the circuit(s) in question. TEST the system for normal operation.

PINPOINT TEST C: NO COMMUNICATION WITH THE DRIVER DOOR MODULE (DDM)

CONDITIONS	DETAILS/RESULTS/ACTIONS
C1 CHECK CIRCUITS 29-AJ80 (OG) AND 29S-AJ86 (OG/BU) FOR VOLTAGE	
NOTE: Cycle ignition switch from OFF to RUN to enable the switched system power feature.	
<p>1 </p> <p>2  DDM C501a</p> <p>3 </p> <p>4 </p>	<p>4 Measure the voltage between DDM C501a pin 11, circuit 29-AJ80 (OG), harness side and ground; and between DDM C501a pin 12, circuit 29S-AJ86 (OG/BU), harness side and ground.</p> <ul style="list-style-type: none"> • Are the voltages greater than 10 volts? <p>→ Yes GO to <u>C2</u>.</p> <p>→ No REPAIR the circuit(s) in question. TEST the system for normal operation.</p>
C2 CHECK CIRCUITS 31-AJ80B (BK/OG) AND 91-AJ80 (BN/BU) FOR OPENS	
1	

A0006302

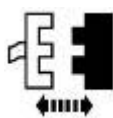

2 Measure the resistance between DDM C501a pin 7, circuit 91-AJ80 (BN/BU), harness side and ground; and between DDM C501a pin 8, circuit 31-AJ80B (BK/OG), harness side and ground.

- Are the resistances less than 5 ohms?

→ **Yes**
REFER to [Section 418-00](#).

→ **No**
REPAIR the circuit(s) in question. TEST the system for normal operation.

PINPOINT TEST D: THE MIRRORS ARE INOPERATIVE

CONDITIONS	DETAILS/RESULTS/ACTIONS
D1 CHECK DDM AND FEM DTCS	
	<p>1 Use the recorded results from the FEM and DDM self-tests.</p> <ul style="list-style-type: none"> ● Are any DTCs retrieved? <p>→ Yes For DTC B2336 or B2320, GO to D9.</p> <p>→ No GO to D2.</p>
D2 CHECK CIRCUIT 33-AD12 (YE) FOR VOLTAGE	
<p>1</p>  <p>2</p>  <p style="text-align: center;">Exterior Rear View Mirror Control C204</p>	

3

4

A0002454

4

Measure the voltage between exterior rear view mirror control C204 pin 7, circuit 33-AD12 (YE), harness side and ground.

• Is the voltage greater than 5 volts?

→ Yes
GO to D4.

→ No
GO to D3.

D3 CHECK CIRCUIT 33-AD12 (YE) FOR AN OPEN

1

2

DDM C501d

3

4

A0002455

4

Measure the resistance between the exterior rear view mirror control C204 pin 7, circuit 33-AD12 (YE), harness side and DDM C501d pin 12, circuit 7-AD1 (YE), harness side.

• Is the resistance less than 5 ohms?

→ **Yes**
INSTALL a new DDM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

D4 CHECK CIRCUIT 31-AD12 (BK/YE) FOR AN OPEN

1

1 Measure the resistance between exterior rear view mirror control C204 pin 3, circuit 31-AD12 (BK/YE), harness side and ground.

● Is the resistance less than 5 ohms?

→ **Yes**
GO to [D5](#).

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

D5 CHECK CIRCUIT 33-AD12 (YE) FOR A SHORT TO GROUND

1

1 Measure the resistance between exterior rear view mirror control C204 pin 4, circuit 33-AD12 (YE), harness side and ground.

● Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to [D7](#).

→ **No**
GO to [D6](#).

D6 CHECK DDM FOR AN INTERNAL SHORT TO GROUND

1

2

DDM C501d

3

4

A0002458

4 Measure the resistance between exterior rear view mirror control C204 pin 4, circuit 33-AD12 (YE), harness side and ground.

• Is the resistance greater than 10,000 ohms?

→ **Yes**
INSTALL a new DDM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

D7 CHECK CIRCUIT 33-AD12 (YE) FOR AN OPEN

1

2

DDM C501d

3

4

4 Measure the resistance between exterior

rear view mirror control C204 pin 4, circuit 33-AD12 (YE), harness side and DDM C501d pin 18, circuit 33-AD12 (YE), harness side.

- Is the resistance less than 5 ohms?

→ **Yes**
GO to D8.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

D8 CHECK THE EXTERIOR REAR VIEW MIRROR CONTROL

1 Carry out the exterior rear view mirror control component test. Refer to Wiring Diagrams Section 700-09-00, Component Testing.

- Is the exterior rear view mirror control OK?

→ **Yes**
INSTALL a new DDM. REFER to Section 419-10. CLEAR the DTCs. REPEAT the self-test.

→ **No**
INSTALL a new exterior rear view mirror control. For additional information, REFER to Switch—Exterior Rear View Mirror Control in this section. CLEAR the DTCs. REPEAT the self test.

D9 CHECK THE EXTERIOR REAR VIEW MIRROR CONTROL

1

2

Exterior Rear View Mirror Control C204

3 Carry out the exterior rear view mirror control component test. Refer to Wiring Diagrams Section 700-09-00, Component Testing.

- Is the exterior rear view mirror control OK?

→ **Yes**
GO to D10.

→ **No**
INSTALL a new exterior rear view mirror control. For additional information, REFER to Switch—Exterior Rear View Mirror Control in this section. CLEAR the DTCs. REPEAT the self test.

D10 CHECK EXTERIOR REAR VIEW MIRROR CONTROL CIRCUITS FOR VOLTAGE

1

2

A0005550

2 Using the following table, measure the voltage between the exterior rear view mirror control C204 pins, harness side and ground:

Pin	Circuit
1	32-AD30 (WH/BK)
2	32-AD32 (WH/RD)
4	33-AD12 (YE)
8	34-AD31 (BU/WH)
9	34-AD29 (BU/OG)

- Is the voltage greater than 10 volts for any measurement?

→ **Yes**
GO to D12.

→ **No**
GO to D11.

D11 CHECK EXTERIOR REAR VIEW MIRROR CONTROL CIRCUITS FOR SHORT TO GROUND

1

2

DDM C501d

3

3 Using the following table, measure the

A0005551

resistance between the exterior rear view mirror control C204 pins, harness side and ground:

Pin	Circuit
1	32-AD30 (WH/BK)
2	32-AD32 (WH/RD)
4	33-AD12 (YE)
8	34-AD31 (BU/WH)
9	34-AD29 (BU/OG)

- Is the resistance less than 5 ohms for any measurement?

→ **Yes**
 INSTALL a new DDM. REFER to Section 419-10. CLEAR the DTCs. REPEAT the self-test.

→ **No**
 REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

D12 CHECK EXTERIOR REAR VIEW MIRROR CONTROL CIRCUITS FOR SHORT TO VOLTAGE

1

2

DDM C501d

3

4

A0005550

4 Using the following table, measure the voltage between the exterior rear view mirror control C204 pins, harness side and ground:

Pin	Circuit
1	32-AD30 (WH/BK)
2	32-AD32 (WH/RD)
4	33-AD12 (YE)
8	34-AD31 (BU/WH)
9	34-AD29 (BU/OG)

	<ul style="list-style-type: none"> ● Is voltage present for any measurement? <p>→ Yes REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.</p> <p>→ No INSTALL a new DDM. REFER to Section 419-10. CLEAR the DTCs. REPEAT the self-test.</p>
--	---

PINPOINT TEST E: A SINGLE MIRROR IS INOPERATIVE

CONDITIONS	DETAILS/RESULTS/ACTIONS
E1 CHECK THE DDM DTCS	
	<p>1 Use the recorded results from the DDM self-test.</p> <ul style="list-style-type: none"> ● Are any DTCs retrieved? <p>→ Yes For DTC B2336, GO to E30. For DTC B2320 or B2324, GO to E20. For all other DDM DTCs, REFER to the DDM Diagnostic Trouble Code (DTC) Index.</p> <p>→ No GO to E2.</p>
E2 CHECK THE FEM DTCS	
	<p>1 Use the recorded results from the FEM self-test.</p> <ul style="list-style-type: none"> ● Are any DTCs recorded? <p>→ Yes For DTC B2312 or B2316, GO to E5. For all other FEM DTCs, REFER to the FEM Diagnostic Trouble Code (DTC) Index.</p> <p>→ No GO to E3.</p>
E3 CHECK THE EXTERIOR REAR VIEW MIRROR CONTROL PIDS	
NOTE: Cycle the ignition switch from OFF to RUN to enable the switched system power feature.	
<p>1</p>  <p>2</p>	

3

3 Monitor the DDM PIDs MIRH_SW, MIRV_SW and MIR_SEL, while operating the exterior rear view mirror control in each direction

- **Did the DDM PID values agree with the exterior rear view mirror control positions?**

→ **Yes**
GO to E4.

→ **No**
GO to E18.

E4 IDENTIFY THE INOPERATIVE MIRROR

1 Operate the driver and passenger exterior rear view mirrors.

- **Is the passenger mirror inoperative?**

→ **Yes**
GO to E5.

→ **No**
GO to E20.

E5 CHECK BJB FUSE 406 (10A) FOR VOLTAGE

2

1 Remove BJB Fuse 406 (10A).

2 Measure the voltage between BJB Fuse 406 (10A) input side, circuit 30S-DB15 (RD/OG), harness side and ground.

A0002460

● Is the voltage greater than 10 volts?

→ **Yes**
GO to E6.

→ **No**
REPAIR the power source to the fuse.
CLEAR the DTCs. REPEAT the self-test.

E6 CHECK CIRCUIT 29S-DK21 (OG/WH) AND 29S-LG1 (OG/YE) FOR AN OPEN

2

3

FEM C201a

4

5

1 Reinstall Fuse 406 (10A).

5 Measure the voltage between FEM C201a pin 1, circuit 29S-DK21 (OG/WH), harness side and ground.

A0002461

● Is the voltage greater than 10 volts?

→ **Yes**
GO to E7.

→ **No**
REPAIR the circuit. CLEAR the DTCs.
REPEAT the self-test.

E7 CHECK THE PASSENGER MIRROR ACTIVE COMMAND

1 Select the FEM active command menu
POWER MIRROR CONTROL.

2 Trigger the FEM active commands PR
UP, PR DOWN, PR LEFT and PR
RIGHT ON and OFF.

● Did the passenger exterior rear
view mirror function correctly?

→ **Yes**
GO to E14.

→ **No**
GO to E8.

E8 CHECK FOR VOLTAGE AT THE PASSENGER MIRROR MOTOR

Passenger Exterior Rear View Mirror C601

4

A0002462

4 Using the following table, measure the voltage between the passenger exterior rear view mirror C601 pins, harness side and ground:

Pin	Circuit
4	33-AD10 (YE/BK)
2	32-AD10 (WH/BK)
6	35-AD11 (VT/WH)
8	34-AD11 (BU/OG)

● Is the voltage greater than 10 volts for any measurement?

→ **Yes**
GO to E12.

→ **No**
GO to E9.

E9 CHECK FOR RESISTANCE AT THE PASSENGER EXTERIOR REAR VIEW MIRROR

1

A0002463

1 Using the following table, measure the resistance between passenger exterior rear view mirror C601 pins, harness side and ground:

Pin	Circuit
4	33-AD10 (YE/BK)
2	32-AD10 (WH/BK)
6	35-AD11 (VT/WH)
8	34-AD11 (BU/OG)

● Are the resistances less than 5 ohms?

→ **Yes**
GO to E13.

→ **No**
GO to E10.

E10 CHECK FOR AN OPEN AT THE PASSENGER MIRROR ASSEMBLY

1

1 Using the following table, measure the voltage between passenger exterior rear view mirror C601 pins, harness side and ground, while moving the exterior rear view mirror control to the listed positions:

Pin	Circuit	Mirror Position
4	33-AD10 (YE/BK)	RIGHT

A0002462

2	32-AD10 (WH/BK)	LEFT
6	35-AD11 (VT/WH)	DOWN
8	34-AD11 (BU/OG)	UP

- Are the voltages greater than 10 volts for all measurements?

→ **Yes**
 INSTALL a new passenger rear view mirror motor. For additional information, REFER to Mirror—Motor in this section. CLEAR the DTCs. REPEAT the self-test.

→ **No**
 GO to E11.

E11 CHECK CIRCUITS 33-AD10 (YE/BK), 32-AD10 (WH/BK), 35-AD11 (VT/WH) AND 34-AD11 (BU/OG) FOR AN OPEN

1

2

FEM C201e

3

4

A0002464

- 4 Using the following table, measure the resistance between FEM C201e pins, harness side and passenger exterior rear view mirror C601 pins, harness side:

Passenger Exterior Rear View Mirror Pin	Circuit	FEM C201e Pin
4	33-AD10 (YE/BK)	24
2	32-AD10 (WH/BK)	23
6	35-AD11	21

	(VT/WH)	
8	34-AD11 (BU/OG)	20

- Are the resistances less than 5 ohms?

→ **Yes**
INSTALL a new FEM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

E12 CHECK CIRCUITS 33-AD10 (YE/BK), 32-AD10 (WH/BK), 35-AD11 (VT/WH) AND 34-AD11 (BU/OG) FOR A SHORT TO VOLTAGE

1

2

FEM C201e

3

4

A0002462

4 Using the following table, measure the voltage between the passenger exterior rear view mirror C601 pins, harness side and ground:

Pin	Circuit
4	33-AD10 (YE/BK)
2	32-AD10 (WH/BK)
6	35-AD11 (VT/WH)
8	34-AD11 (BU/OG)

- Is voltage present for any measurement?

→ **Yes**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

→ **No**
INSTALL a new FEM. REFER to [Section](#)

419-10. CLEAR the DTCs. REPEAT the self-test.

E13 CHECK CIRCUITS 33-AD10 (YE/BK), 32-AD10 (WH/BK), 35-AD11 (VT/WH) AND 34-AD11 (BU/OG) FOR A SHORT TO GROUND

1

2

FEM C201e

3

4

4 Using the following table, measure the resistance between FEM C201e pins, harness side and passenger exterior rear view mirror C601 pins, harness side:

Passenger Exterior Rear View Mirror Pin	Circuit	FEM C201e Pin
4	33-AD10 (YE/BK)	24
2	32-AD10 (WH/BK)	23
6	35-AD11 (VT/WH)	21
8	34-AD11 (BU/OG)	20

● Are the resistances less than 5 ohms?

→ **Yes**
INSTALL a new FEM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

E14 CHECK THE FEM FOR THE CORRECT OUTPUTS

1

2

3

2

Select FEM active command POWER MIRROR CONTROL.

3

Trigger the FEM active commands PR UP, PR DOWN, PR LEFT and PR RIGHT ON and OFF, while monitoring the FEM PIDs MIRH_SW and MIRV_SW.

- Do the FEM PID values agree with the passenger exterior rear view mirror commanded positions?

→ Yes

INSTALL a new FEM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ No

GO to [E15](#).

E15 CHECK CIRCUITS 8-AD19 (WH/RD), 7-AD19 (YE/RD), 9-AD19 (BN/RD) AND 10-AD19 (GY/RD) FOR A SHORT TO VOLTAGE

1

2

Passenger Exterior Rear View Mirror C601

3

FEM C201e

4

5

5

Using the following table, measure the voltage between the passenger exterior rear view mirror C601 pins, harness side and ground:

Pin	Circuit

A0002465

1	8-AD19 (WH/RD)
7	7-AD19 (YE/RD)
3	9-AD19 (BN/RD)
5	10-AD19 (GY/RD)

● **Is voltage present for any measurement?**

- **Yes**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
- **No**
GO to E16.

E16 CHECK CIRCUITS 8-AD19 (WH/RD), 7-AD19 (YE/RD), 9-AD19 (BN/RD) AND 10-AD19 (GY/RD) FOR A SHORT TO GROUND

1

2

A0002466

- 2 Using the following table, measure the resistance between passenger exterior rear view mirror C601 pins, harness side and ground:

Pin	Circuit
1	8-AD19 (WH/RD)
7	7-AD19 (YE/RD)
3	9-AD19 (BN/RD)
5	10-AD19 (GY/RD)

● **Are the resistances greater than 10,000 ohms?**

- **Yes**
GO to E17.
- **No**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

E17 CHECK CIRCUITS 8-AD19 (WH/RD), 7-AD19 (YE/RD), 9-AD19 (BN/RD) AND 10-AD19 (GY/RD) FOR AN OPEN

1

- 1 Using the following table, measure the resistance between FEM C201e pins, harness side and passenger exterior rear view mirror C601 pins, harness

side:

Passenger Exterior Rear View Mirror Pin	Circuit	FEM C201e Pin
1	8-AD19 (WH/RD)	7
7	7-AD19 (YE/RD)	8
3	9-AD19 (BN/RD)	22
5	10-AD19 (GY/RD)	11

- Are the resistances less than 5 ohms?

→ **Yes**
 INSTALL a new passenger exterior rear view mirror. CLEAR the DTCs. REPEAT the self-test.

→ **No**
 REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

E18 CHECK THE EXTERIOR REAR VIEW MIRROR CONTROL

1 Carry out the exterior rear view mirror control component test. Refer to Wiring Diagrams Section 700-09-00, Component Testing.

- Did the exterior rear view mirror control pass?

→ **Yes**
 GO to E19.

→ **No**
 INSTALL a new exterior rear view mirror control. For additional information, REFER to Switch—Exterior Rear View Mirror Control in this section. CLEAR the DTCs. REPEAT the self-test.

E19 CHECK THE EXTERIOR REAR VIEW MIRROR CONTROL CIRCUITS FOR AN OPEN

1

2

Exterior Rear View Mirror Control C204

3

DDM C501d

4

5

5 Using the following table, measure the resistance between the following exterior rear view mirror control C204 pins, harness side and DDM C501d pins, harness side:

Exterior Rear View Mirror Control Pins	Circuit	DDM Pins
1	32-AD30 (WH/BK)	15
2	32-AD32 (WH/RD)	17
9	34-AD29 (BU/OG)	14
8	34-AD31 (BU/WH)	16

• Are the resistances less than 5 ohms?

→ **Yes**
INSTALL a new DDM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

E20 CHECK CJB FUSE 222 (10A) FOR VOLTAGE

1 Remove CJB Fuse 222 (10A).

2 Measure the voltage between CJB Fuse 222 (10A) input side and ground.

• Is the voltage greater than 10 volts?

→ **Yes**
GO to [E21](#).

→ **No**
REPAIR the power source to Fuse 222 (10A). CLEAR the DTCs. REPEAT the self-test.

E21 CHECK CIRCUIT 29S-AJ86 FOR AN OPEN

2

3

DDM C501a

4

5

A0002471

1 Reinstall Fuse 222 (10A).

5 Measure the voltage between DDM C501a pin 12, circuit 29S-AJ86 (OG/BU), harness side and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
GO to E22.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

E22 CHECK THE DRIVER EXTERIOR REAR VIEW MIRROR ACTIVE COMMANDS

1

2

1 Select DDM active command menu POWER MIRROR CONTROL.

2 Trigger the DDM active command DR UP, DR DOWN, DR LEFT and DR RIGHT.

- Did the driver exterior rear view mirror operate correctly?

→ **Yes**
GO to E27.

→ **No**
GO to E23.

E23 CHECK FOR VOLTAGE AT THE DRIVER MIRROR MOTOR

1

2

Driver Exterior Rear View Mirror C520

3

4

A0002462

4 Using the following table, measure the voltage between driver exterior rear view mirror C520 pins, harness side and ground:

Pin	Circuit
4	33-AD7 (YE/RD)
2	32-AD7 (WH/RD)
6	35-AD8 (VT)
8	34-AD8 (BU/WH)

- Is any voltage greater than 10 volts?

→ **Yes**
GO to E31.

→ **No**
GO to E24.

E24 CHECK FOR OPENS AT THE DRIVER MIRROR ASSEMBLY

1

1 Using the following table, measure the voltage between driver exterior rear view mirror C520 pins, harness side and ground, while moving the exterior rear view mirror control through the listed positions.

		Mirror

A0002462

Pin	Circuit	Position
4	33-AD7 (YE/RD)	RIGHT
2	32-AD7 (WH/RD)	LEFT
6	35-AD8 (VT)	DOWN
8	34-AD8 (BU/WH)	UP

- Are the voltages greater than 10 volts?

→ **Yes**

INSTALL a new driver rear view mirror motor. For additional information, REFER to Mirror—Motor. CLEAR the DTCs. REPEAT the self-test.

→ **No**

GO to E25.

E25 CHECK FOR RESISTANCE AT THE DRIVER EXTERIOR REAR VIEW MIRROR

1

2

DDM C501c

3

4

A0002472

4

Using the following table, measure the resistance between DDM C501c pins, harness side and driver exterior rear view mirror C520 pins, harness side.

Driver Exterior Rear View Mirror Pin	Circuit	DDM Pin
2	32-AD7 (WH/RD)	1
4	33-AD7 (YE/RD)	2
6	35-AD8 (VT)	4
8	34-AD8	3

(BU/WH)

- Are the resistances less than 5 ohms?

→ **Yes**
GO to E26 .

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

E26 CHECK CIRCUITS 32-AD7 (WH/RD), 33-AD7 (YE/RD), 34-AD8 (BU/WH) AND 35-AD8 (VT) FOR A SHORT TO GROUND

1

1 Using the following table, measure the resistance between driver exterior rear view mirror C520 pins, harness side and ground.

Pin	Circuit
2	32-AD7 (WH/RD)
4	33-AD7 (YE/RD)
6	35-AD8 (VT)
8	34-AD8 (BU/WH)

- Are the resistances greater than 10,000 ohms?

→ **Yes**
INSTALL a new DDM. REFER to Section 419-10. CLEAR the DTCs. REPEAT the self-test.

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

E27 CHECK THE DDM FOR THE CORRECT OUTPUTS

1

2

3

2 Select DDM active command menu POWER MIRROR CONTROL.

3 Trigger the DDM active command DR UP, DR DOWN, DR LEFT and DR RIGHT ON and OFF while monitoring the DDM PIDs MIRH_SW and MIRV_SW.

- Do the PID values agree with the

**driver exterior rear view mirror
commanded positions?**

- **Yes**
INSTALL a new DDM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.
- **No**
GO to [E28](#).

E28 CHECK CIRCUITS 8-AD18 (WH/BK), 7-AD18 (YE/BK), 9-AD18 (BN/YE) AND 10-AD18 (GY/BK) FOR A SHORT TO VOLTAGE

1

2

Driver Exterior Rear View Mirror C520

3

DDM C501c

4

5

- 5 Using the following table, measure the voltage between driver exterior rear view mirror C520 pins, harness side and ground.

Pin	Circuit
1	8-AD18 (WH/BK)
7	7-AD18 (YE/BK)
3	9-AD18 (BN/YE)
5	10-AD18 (GY/BK)

• Is voltage present for any measurement?

- **Yes**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
- **No**
GO to [E29](#).

E29 CHECK CIRCUITS 8-AD18 (WH/BK), 7-AD18 (YE/BK), 9-AD18 (BN/YE) AND 10-AD18 (GY/BK) FOR A SHORT TO GROUND

1

1

Using the following table, measure the resistance between driver exterior rear view mirror C520 pins, harness side and ground.

Pin	Circuit
1	8-AD18 (WH/BK)
7	7-AD18 (YE/BK)
3	9-AD18 (BN/YE)
5	10-AD18 (GY/BK)

• Are the resistances greater than 10,000 ohms?

→ **Yes**
GO to E30.

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

E30 CHECK CIRCUITS 8-AD18 (WH/BK), 7-AD18 (YE/BK), 9-AD18 (BN/YE) AND 10-AD18 (GY/BK) FOR AN OPEN

1

2

Driver Exterior Rear View Mirror C520

3

DDM C501c

4

4

Using the following table, measure the resistance between DDM C501c pins, harness side and driver exterior rear view mirror C520 pins, harness side.

Driver Exterior Rear View Mirror Pin	Circuit	DDM Pin
1	8-AD18 (WH/BK)	14
7	7-AD18 (YE/BK)	5

3	9-AD18 (BN/YE)	19
5	10-AD18 (GY/BK)	15

- Are the resistances less than 5 ohms?

→ **Yes**
 INSTALL a new driver exterior rear view mirror. For additional information, REFER to Mirror—Exterior Rear View. CLEAR the DTCs. REPEAT the self-test.

→ **No**
 REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

E31 CHECK FOR VOLTAGE AT THE DRIVER EXTERIOR REAR VIEW MIRROR ASSEMBLY

1

2

Driver Exterior Rear View Mirror C520

3

DDM C501c

4

5

A0002462

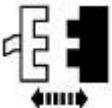

5 Using the following table, measure the voltage between driver exterior rear view mirror C520 pins, harness side and ground.

Pin	Circuit
2	32-AD7 (WH/RD)
4	33-AD7 (YE/RD)
8	34-AD8 (BU/WH)
6	35-AD8 (VT)

- Are any of the voltages greater than 10 volts?

	<p>→ Yes REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.</p> <p>→ No INSTALL a new DDM. REFER to Section 419-10. CLEAR the DTCs. REPEAT the self-test.</p>
--	--

PINPOINT TEST F: THE AUTO DIMMING MIRROR DOES NOT OPERATE CORRECTLY

CONDITIONS	DETAILS/RESULTS/ACTIONS
F1 CHECK FOR REM RETRIEVED DIAGNOSTIC TROUBLE CODES	
	<p>1 Use the recorded results from the REM self-test.</p> <ul style="list-style-type: none"> • Are any DTCs retrieved? <p>→ Yes REFER to the REM Diagnostic Trouble Code (DTC) Index.</p> <p>→ No GO to F2.</p>
F2 CHECK POWER TO CJB FUSE 216 (5A)	
<p>1</p>  <p>CJB Fuse 216 (5A)</p> <p>2</p> 	<p>3 Measure the voltage between CJB Fuse 216 (5A) input terminal and ground.</p> <ul style="list-style-type: none"> • Is the voltage greater than 10 volts? <p>→ Yes GO to F3.</p> <p>→ No REPAIR the power supply to the fuse. CLEAR the DTCs. REPEAT the self-test.</p>
F3 CHECK CIRCUIT 640 (RD/YE) FOR AN OPEN	
1

CJB Fuse 216 (5A)

3

Electrochromic Interior Rear View Mirror C911

4

5

AN2024-A

5 Measure the voltage between electrochromic interior rear view mirror C911, pin 1 circuit 20-AD15 (PK), harness side and ground.

• Is the voltage greater than 10 volts?

→ Yes
GO to F4.

→ No
REPAIR the circuit. CLEAR the DTCs.
REPEAT the self-test.

F4 CHECK CIRCUIT 31-AD15 (BK) FOR AN OPEN

1

AN2025-A

1 Measure the resistance between electrochromic interior rear view mirror C911, pin 2 circuit 31-AD15 (BK), harness side and ground.

• Is the resistance less than 5 ohms?

- **Yes**
GO to F5.
- **No**
REPAIR the circuit. CLEAR the DTCs.
REPEAT the self-test.

F5 CHECK THE REM OUTPUT

1

2  **CAUTION: Make sure the engine is not running. The ignition switch should be in the RUN position with the engine OFF.**

Engage the parking brake and shift the transmission to the REVERSE position.

3

AN2026-A

3 Measure the voltage between electrochromic interior rear view mirror C911, pin 3 circuit 8-AD15 (WH/BU), harness side and ground.

• Is the voltage greater than 10 volts?

→ **Yes**
GO to F8.

→ **No**
GO to F6.

F6 CHECK CIRCUIT 8-AD15 (WH/BU) FOR AN OPEN

1

2

3

REM C420b

4

4

Measure the resistance between electrochromic interior rear view mirror C911, pin 3 circuit 8-AD15 (WH/BU), harness side and REM C420b pin 4, circuit 8-AD15 (WH/BU), harness side.

• Is the resistance less than 5 ohms?

→ **Yes**
GO to F7.

→ **No**
REPAIR the circuit. CLEAR the DTCs.
REPEAT the self-test.

F7 CHECK CIRCUIT 8-AD15 (WH/BU) FOR A SHORT TO GROUND

1

1

Measure the resistance between REM C420b pin 4, circuit 8-AD15 (WH/BU), harness side and ground.

• Is the resistance greater than 10,000 ohms?

→ **Yes**
INSTALL a new REM. REFER to Section 419-10. CLEAR the DTCs. REPEAT the self-test.

→ **No**
REPAIR the circuit. CLEAR the DTCs.
REPEAT the self-test.

F8 CHECK FOR THE CORRECT OUTPUT TO THE MIRROR

1

PRND
↑

2

AN2026-A

2

Measure the voltage between electrochromic interior rear view mirror C911, pin 3 circuit 8-AD15 (WH/BU), harness side and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
GO to F9.

→ **No**
INSTALL a new electrochromic interior rear view mirror. For additional information, REFER to Mirror—Interior Rear View, Electrochromic. CLEAR the DTCs. REPEAT the self-test. If the auto dimming feature continues to function incorrectly, INSTALL a new REM. REFER to Section 419-10. CLEAR the DTCs. REPEAT the self-test.

F9 CHECK CIRCUIT 8-AD15 (WH/BU) FOR A SHORT TO VOLTAGE

1

2

REM C420b

3

4

4

Measure the voltage between REM C420b pin 4, circuit 8-AD15 (WH/BU), harness side and ground.

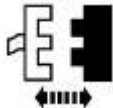

A0002479

● **Is voltage present?**

→ **Yes**
REPAIR the circuit. CLEAR the DTCs.
REPEAT the self-test.

→ **No**
INSTALL a new REM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST G: THE MEMORY MIRROR IS INOPERATIVE

CONDITIONS	DETAILS/RESULTS/ACTIONS						
G1 CHECK FOR DDM DTCS							
	<p>1 Use the recorded results from the DDM self-test.</p> <p>● Was DTC B1534, B1538 or B1530 retrieved?</p> <p>→ Yes GO to G2.</p> <p>→ No GO to G4.</p>						
G2 CHECK THE MEMORY SET SWITCH FOR A SHORT TO GROUND							
<p>1</p>  <p>Memory Set Switch C503</p> <p>2</p>	<p>2 Using the following table, measure the resistance between memory set switch C503 pins, harness side and ground.</p> <table border="1" data-bbox="887 1892 1171 2043"> <thead> <tr> <th>Pin</th> <th>Circuit</th> </tr> </thead> <tbody> <tr> <td>2</td> <td>8-AH27 (WH)</td> </tr> <tr> <td>6</td> <td>8-AH31 (WH/RD)</td> </tr> </tbody> </table>	Pin	Circuit	2	8-AH27 (WH)	6	8-AH31 (WH/RD)

1 | 8-AH32 (WH/BU)

- Are the resistances greater than 10,000 ohms?

→ **Yes**
 INSTALL a new memory set switch.
 CLEAR the DTCs. REPEAT the self-test.

→ **No**
 GO to G3.

G3 CHECK CIRCUIT 8-AH27 (WH), 8-AH31 (WH/RD) AND 8-AH32 (WH/BU) FOR A SHORT TO GROUND

1

DDM C501c

2

A0002480

2 Using the following table, measure the resistance between memory set switch C503 pins, harness side and ground.

Pin	Circuit
2	8-AH27 (WH)
6	8-AH31 (WH/RD)
1	8-AH32 (WH/BU)

- Are the resistances greater than 10,000 ohms?

→ **Yes**
 INSTALL a new DDM. REFER to Section 419-10. CLEAR the DTCs. REPEAT the self-test.

→ **No**
 REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

G4 CHECK THE MEMORY SET SWITCH USING DDM PIDS

1

1 Monitor the DDM PIDs MEMS_SW, MEM1_SW and MEM2_SW, while

actuating the memory set switch buttons.

- Did the DDM PID values agree with the memory set switch positions?

→ **Yes**
 INSTALL a new DDM. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test.

→ **No**
 GO to G5 .

G5 CHECK CIRCUIT 31-AH27 (BK) FOR AN OPEN

1

Memory Set Switch C503

2

2 Measure the resistance between memory set switch C503 pin 4, circuit 31-AH27 (BK), harness side and ground.

- Is the resistance less than 5 ohms?

→ **Yes**
 GO to G6 .

→ **No**
 REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

G6 CHECK FOR AN OPEN CIRCUIT BETWEEN THE DDM AND MEMORY SET SWITCH

1

DDM C501c

2

2 Using the following table, measure the resistance between DDM C501d pins, harness side and memory set switch C503 pins, harness side.

DDM	Memory Set
-----	------------

A0002482

Pin	Circuit	Switch Pin
25	8-AH27 (WH)	2
10	8-AH31 (WH/RD)	6
11	8-AH32 (WH/BU)	1

- Are the resistances less than 5 ohms?

→ **Yes**
GO to G7.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

G7 CHECK THE MEMORY SET SWITCH FOR AN OPEN

1

Memory Set Switch C503

2

A0002442

- 2 Using the following table, measure the resistance between DDM C501d pins, harness side and ground, while activating the indicated memory set switch button.

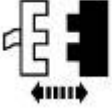

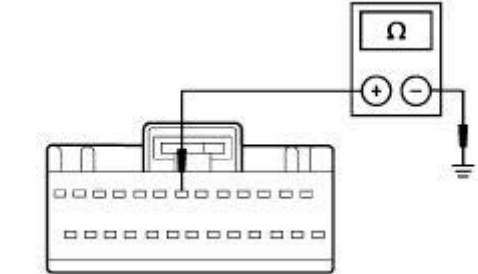

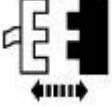

DDM Pin	Circuit	Memory Set Switch Button
25	8-AH27 (WH)	SET
10	8-AH31 (WH/RD)	MEMORY 1
11	8-AH32 (WH/BU)	MEMORY 2

- Is the resistance less than 5 ohms when each button is pressed?

→ **Yes**
INSTALL a new DDM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
INSTALL a new memory set switch. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST H: THE MEMORY MIRROR IS INOPERATIVE — MEMORY SET SWITCH LED

CONDITIONS	DETAILS/RESULTS/ACTIONS
H1 CHECK THE MEMORY SWITCH LED	
	<p>1 Operate the memory set switch.</p> <ul style="list-style-type: none"> ● Is the memory set switch LED always ON? <p>→ Yes GO to H6.</p> <p>→ No GO to H2.</p>
H2 CHECK CIRCUIT 7S-AH27 (YE) FOR RESISTANCE	
<p>1</p>  <p>DDM C501c</p> <p>2</p>  <p>A0002483</p>	<p>2 Measure the resistance between DDM C501d pin 7, circuit 7S-AH27 (YE), harness side and ground.</p> <ul style="list-style-type: none"> ● Is the resistance greater than 10,000 ohms? <p>→ Yes GO to H4.</p> <p>→ No GO to H3.</p>
H3 CHECK CIRCUIT 7S-AH27 (YE) FOR A SHORT TO GROUND	
<p>1</p>  <p>Memory Set Switch C503</p> <p>2</p>	<p>2 Measure the resistance between DDM C501d pin 7, circuit 7S-AH27 (YE), harness side and ground.</p>

A0002483

- Is the resistance greater than 10,000 ohms?

- **Yes**
 INSTALL a new memory set switch.
 CLEAR the DTCs. REPEAT the self-test.
- **No**
 REPAIR the circuit. CLEAR the DTCs.
 REPEAT the self-test.

H4 CHECK THE DDM

- 1 Connect a 5A fused jumper wire between DDM C501c pin 7, circuit 7S-AH27 (YE), harness side and battery voltage.

- Did the memory set switch LED illuminate?

- **Yes**
 INSTALL a new DDM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.
- **No**
 GO to [H5](#).

H5 CHECK CIRCUIT 7S-AH27 (YE) FOR AN OPEN

1

Memory Set Switch C503

2

- 2 Measure the resistance between memory set switch C503 pin 5, circuit 7S-AH27 (YE), harness side and DDM C501d pin 7, circuit 7S-AH27 (YE), harness side.

● Is the resistance less than 5 ohms?

- **Yes**
 INSTALL a new memory set switch.
 CLEAR the DTCs. REPEAT the self-test.
- **No**
 REPAIR the circuit. CLEAR the DTCs.
 REPEAT the self-test.

H6 CHECK THE DDM FOR AN INTERNAL SHORT TO VOLTAGE

1

DDM C501c

● Did the memory set switch LED turn OFF?

- **Yes**
 INSTALL a new DDM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.
- **No**
 GO to [H7](#).

H7 CHECK CIRCUIT 7S-AH27 (YE) FOR A SHORT TO VOLTAGE

1

Memory Set Switch C503

2

- 2 Measure the voltage between memory set switch C503 pin 5, circuit 7S-AH27 (YE), harness side and ground.

A0002485

● **Is voltage present?**

→ **Yes**
REPAIR the circuit. CLEAR the DTCs.
REPEAT the self-test.

→ **No**
INSTALL a new memory set switch.
CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST I: THE HEATED EXTERIOR MIRROR DOES NOT DEFROST

CONDITIONS	DETAILS/RESULTS/ACTIONS
I1 CHECK THE REAR WINDOW DEFROST OPERATION	
<p>1</p>  <p>2</p> 	<p>3</p> <p>Depress the rear window defrost switch to ON.</p> <p>● Does the rear window defrost or warm up?</p> <p>→ Yes GO to I2.</p> <p>→ No REFER to Section 501-11 to diagnose the rear window defrost system.</p>
I2 CHECK THE HEATED FUNCTION OF THE EXTERIOR REAR VIEW MIRRORS	
	<p>1</p> <p>Check the heated function of the exterior rear view mirrors.</p>

- Is the heated function of both exterior rear view mirrors inoperative?

→ **Yes**
GO to 13.

→ **No**
For the driver side exterior rear view mirror, GO to 14.

For the passenger side exterior rear view mirror, GO to 16.

13 CHECK CIRCUIT 15S-DC1 (GN/YE) FOR VOLTAGE

1

2

BJB Fuse 409 (5A)

3

5

4 Depress the rear window defrost switch to ON.

5 Measure the voltage between BJB Fuse 409 (5A) input pin, circuit 15S-DC1 (GN/YE), and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
REPAIR circuit 29S-HB1 (OG/YE). TEST the system for normal operation.

→ **No**
REPAIR circuit 15S-DC1 (GN/YE). TEST the system for normal operation.

I4 CHECK CIRCUIT 29S-HB1 (OG/YE) FOR OPEN

1

2

Driver Exterior Rear View Mirror C520

3

A0002488

3 Measure the resistance between BJB Fuse 409 (5A) output terminal, circuit 29S-HB1 (OG/YE) and driver exterior rear view mirror C520 pin 9, circuit 29-HB35 (OG/BK), harness side.

● Is the resistance less than 5 ohms?

→ **Yes**
GO to I5.

→ **No**
REPAIR circuit 29-HB35 (OG/BK). TEST the system for normal operation.

I5 CHECK CIRCUIT 31-HB35 (BK) FOR OPEN

1

A0002489

- 1 Measure the resistance between driver exterior rear view mirror C520 pin 10, circuit 31-HB35 (BK), harness side and ground.

● Is the resistance less than 5 ohms?

→ **Yes**
 INSTALL a new driver exterior rear view mirror. For additional information, REFER to [Mirror—Exterior Rear View](#) in this section. TEST the system for normal operation.

→ **No**
 REPAIR circuit 31-HB35 (BK). TEST the system for normal operation.

I6 CHECK CIRCUIT 29-HB36 (OG/GN) FOR OPEN

1

2

Passenger Exterior Rear View Mirror C601

3

- 3 Measure the resistance between BJB Fuse 409 (5A) output terminal, circuit 29S-HB1 (OG/YE) and passenger exterior rear view mirror C601 pin 9, circuit 29-HB36 (OG/GN), harness side.

A0002488

● Is the resistance less than 5 ohms?

→ **Yes**
GO to I7.

→ **No**
REPAIR circuit 29-HB36 (OG/GN). TEST the system for normal operation.

I7 CHECK CIRCUIT 31-HB36 (BK) FOR OPEN

1

A0002489

1

Measure the resistance between passenger exterior rear view mirror C601 pin 10, circuit 31-HB36 (BK), harness side and ground.

● Is the resistance less than 5 ohms?

→ **Yes**
INSTALL a new passenger exterior rear view mirror. For additional information, REFER to Mirror—Exterior Rear View in this section. TEST the system for normal operation.

→ **No**

REPAIR circuit 31-HB36 (BK). TEST the system for normal operation.

Mirror —Exterior Rear View

Removal and Installation

1. Remove the front door trim panel. For additional information, refer to [Section 501-05](#).
2. Remove the interior garnish moulding.

3. Disconnect the electrical connector.

4. Remove the exterior rear view mirror nuts.

5. Remove the exterior rear view mirror.

6. To install, reverse the removal procedure.

Mirror —Glass

Removal and Installation

1. Push in the upper edge of the mirror glass to the maximum travel.

2. Grasp the bottom of the mirror glass and pull outward.
3. Disconnect the electrical connectors and remove the mirror glass.

4. **NOTE:** When installing the mirror glass, make sure it snaps into the mirror motor.

To install, reverse the removal procedure.

Mirror —Motor

Removal and Installation

1. Remove the exterior rear view mirror glass. For additional information, refer to [Mirror—Glass](#).
2. Remove the mirror motor screws.

3. Disconnect the electrical connector and remove the mirror motor.

4. To install, reverse the removal procedure.
-

Mirror —Interior Rear View, Electrochromic

Removal

 **CAUTION:** The interior rear view mirror is a breakaway design. Excessive force in any direction will cause damage to the interior rear view mirror.

Equipped With Rain-Sensitive Wipers

1. **NOTE:** To avoid damage to the rain sensor module cover, push up on the cover while rotating the top of the cover toward the rear of the vehicle.

Remove the rain sensor module cover.

2. Remove the rain sensor module.
 1. Pull the latch on the connector away from the harness and disconnect the electrical connector.
 2. **NOTE:** When removing the rain sensor module, it is necessary to apply inward pressure on the module prior to releasing the rain sensor module retaining slides.

Release the rain sensor module retaining slides.

3. Remove the rain sensor module.

3. Disconnect the mirror connector.

4. Support the mirror with one hand against the windshield and pull towards the passenger side with the other hand.

Installation

1. Push the mirror down on the clip until an audible click is heard and the mirror snaps into place.

2. Connect the mirror connector.

Equipped With Rain-Sensitive Wipers

3. **NOTE:** Prior to installing the rain sensor module, the windshield glass area between the rain sensor module brackets must be cleaned.

NOTE: When installing the rain sensor module, it is necessary to apply inward pressure on the module prior to locking the rain sensor module retaining slides in place.

Install the rain sensor module.

- Connect the electrical connector.

4. Install the rain sensor module cover.

5. Carry out the compass zone adjustment procedure. For additional information, refer to [Section 419-11](#).
 6. Carry out the compass calibration adjustment procedure. For additional information, refer to [Section 419-11](#).
-

Switch —Exterior Rear View Mirror Control

Removal and Installation

1. Remove the instrument panel steering column cover.
 1. Remove the screws.
 2. Remove the instrument panel steering column cover.
 - Disconnect the electrical connectors.

2. Remove the upper finish panel.

3. Disconnect the interior rear view mirror control switch electrical connector.

4. Remove the interior rear view mirror control switch.

5. To install, reverse the removal procedure.

Seats

Seats — Front

The front seats have the following features:

- memory set (optional)
- power lumbar (optional)
- manual lumbar
- horizontal, vertical and front and rear tilt adjustments
- power recline
- heat (optional)

Adjustment of the seat may be accomplished with the seat regulator control switch located on the side of the seat.

Seats — Rear

The rear seat has the following features:

- fold down seat backrest
- removable cushion retained by two latches located at the front of the cushion
- two rear bolsters on each side of the rear seat backrest

Fold down the rear seat backrest by releasing the two levers in the luggage compartment.

Seats — Power Recliner

The power recliner tilts the seat backrest rearward or forward and is controlled by the seat regulator control switch.

The power recliner cannot be repaired separately. If the power recliner needs to be repaired, an entirely new front seat backrest latch must be installed.

Seats — Power Lumbar Support

The seat has electro-mechanical front seat backrest pad adjuster. The lumbar switch adjustment is on the side of the seat.

Seats — Manual Lumbar Support

The manual front seat backrest lumbar is adjusted by a knob (57620) mounted on the front of the seat cushion.

Seats — Memory Set

This system allows automatic positioning of the driver seat, outside rearview mirrors, and power adjusted tilt/telescope steering column to two programmable positions.

The memory seat control is located on the driver door.

Seats — Heated

Each heated front seat is controlled by a switch on the instrument panel.

The heated seat system will only operate with the ignition switch in the RUN position.

Side Air Bag

Driver and passenger side air bags (611A08) are attached to the seat backrest frame. For diagnostic information or if the side air bag has been deployed, refer to [Section 501-20B](#).

The front seat backrest trim covers cannot be repaired. If the front seat backrest covers need to be repaired, an entirely new cover must be installed. Cleaning the front seat backrest cover is permissible.

If a side air bag deployment took place, a new seat back pad, trim cover and side air bag module must be installed. Install a new seat backrest frame if necessary.

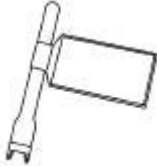

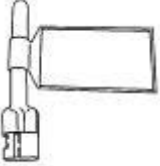

Seats — Driver Seat Module

The driver seat module is attached to the driver seat track. For additional information, refer to [Section 419-10](#) for removal and installation procedures.

Seats

Refer to Wiring Diagrams Section [501-10](#) for schematic and connector information.

 ST2506-A	Diagnostic Tool, Restraint System (2 Required) 418-F088
 ST2507-A	Diagnostic Tool, Restraint System (2 Required) 418-133

Restraint System Diagnostic Tool Warning

 **WARNING:** The Restraint System Diagnostic Tools are for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

Principles of Operation

Driver Power Seat

The driver power seat is controlled by the driver seat module (DSM). The DSM does not need to be configured, however the driver seat does need to be calibrated when the DSM is installed. The driver seat regulator control switch provides voltage to the DSM when activated. The neutral position of each driver seat regulator control switch position is a ground state through the seat regulator control switch contacts. A voltage input causes the DSM to power the appropriate motor until the input is removed. Ground is the normal state of the motor circuits through the DSM and is not switched to control the motors. The DSM internally switches the appropriate line from ground to power to adjust the motors.

As the seat is adjusted, the DSM constantly monitors the motor position sensors to record the current seat position. The DSM will remove power from the motor upon termination of the seat regulator control switch input or if the DSM does not see movement from the motor by monitoring the position sensor. The DSM must be calibrated to the seat track it is controlling. For additional information, refer to Seat Calibration. Once the DSM is calibrated to the seat track, it will only allow movement within the calibrated range.

Seat Calibration

The DSM is calibrated using a scan tool. The calibration procedure automatically powers the driver power seat through its full range of motion and records the full stop positions by monitoring the motor position sensors. Once the full stop positions or range of the seat have been recorded, the DSM will only operate within the calibrated range. Any input attempting to drive the seat beyond the calibrated range will be ignored. This calibration is used for all seat control functions including manual switch control and memory recall positioning. During the seat calibration, the DSM may identify a function that is inoperative, such as a position sensor not changing. If the DSM identifies a concern that has a related diagnostic trouble code (DTC), the DSM will set the related DTC at the end of the validation procedure.

The calibration procedure powers the seat track adjustments to the end of their travel, which is determined by the DSM seeing a change of state in the motor position sensors. If there is a concern with the seat track or motor position sensor that limits the travel, the DSM will interpret the stopping point as the end of travel and store the position. The DSM is not able to determine if the seat has moved to its full travel position. It is only capable of monitoring and storing the amount of travel seen by the position sensor changing states.

For additional information on carrying out the power seat calibration procedure, refer to the scan tool operating manual.

Memory Seat

Memory seat positioning can be recalled with the memory switches on the driver door panel or a programmed remote keyless entry transmitter. In either case, the DSM receives a memory recall 1 or 2 command from the driver door module (DDM) over the SCP communication network. The memory recall switches are a hardwired input to the DDM. The DDM also receives the remote keyless entry transmitter signals. Once a valid memory recall command is received from the DDM, the DSM moves the driver's seat to the position stored in memory by powering the appropriate motors and monitoring the motor position sensors until the position is reached.

Easy Exit/Easy Entry

The easy exit function moves the seat backwards about two inches when the ignition key is removed from the ignition switch. The DSM receives a key out command over the SCP communication network and powers the driver seat rearward. This function will not operate if the seat is less than the travel distance to the end of the track, or the function has been deactivated at the message center driver personality settings. The DSM will also cancel this operation if a valid input command is received, such as the seat regulator control switch or memory recall request.

The DSM will record the current seat position before powering the seat for a easy exit function. This

recorded position will be used to return the seat to this position on the easy entry operation. During easy entry operation, the seat is returned to the position previous to the easy exit operation. Easy entry operation will be cancelled if a valid input command is received by the DSM.

Passenger Power Seat

The passenger power seat motors are hardwired to the passenger seat regulator control switch. The circuits are normally at ground through the seat regulator control switch. The individual circuit is switched to power when the specific adjustment position is selected.

Heated Seats

The driver and passenger heated seats share a common battery and ignition feed. A separate shared ignition source supplies the heated seat switches. When the heated seat switch is pressed with the ignition switch in RUN, a momentary voltage signal is sent to the heated seat module. The heated seat module then supplies power to the heating element circuit. The cushion element and seat backrest element are wired in series and powered by the same output. The heated seat module also will ground the separate indicator circuit at the heated seat switch to indicate an ON state. The heated seat module will remain on until the heated seat switch is pressed and a momentary voltage signal is received, or until 10 minutes expire. If the ignition source is removed from the module, the heated seat module will enter an off state and will not return to ON until the switch is once again pressed with the ignition switch in RUN. The heated seat module is designed to heat the seat to 37.5°C (99.5°F) and maintain the temperature until time-out or switched off. This temperature is maintained by the heated seat module monitoring the temperature sensor located in the seat cushion element, and adjusting the current flow to the heating elements.

Inspection and Verification

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
<ul style="list-style-type: none"> ● Front seat track motors. ● Front seat track binding or obstructed. ● Front seat backrest power recline. ● Lumbar motor. 	<ul style="list-style-type: none"> ● BJB Fuses 411 (15A), 421 (20A), 425 (40A), 428 (20A) ● CJB Fuses 205 (5A), 216 (5A), 207 (5A) ● Seat regulator control switch. ● Memory set switch. ● Lumbar seat control switch.

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern remains after the inspection, connect the scan tool to the data link connector (DLC) located beneath the instrument panel. Then select the vehicle to be tested from the scan tool menu. If the scan tool does not communicate with the vehicle:
 - Check that the program card is correctly installed.
 - Check the connections to the vehicle.
 - Check the ignition switch position.
5. If the scan tool still does not communicate with the vehicle, refer to the scan tool manual.
6. Carry out the DATA LINK DIAGNOSTICS test. If the scan tool responds with:

- CKT 914, CKT 915 or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to [Section 418-00](#).
- NO RESP/NOT EQUIP for DSM, [Go To Pinpoint Test A](#) .
- NO RESP/NOT EQUIP for DDM, [Go To Pinpoint Test B](#) .
- System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self test diagnostics for the DSM and the DDM.

7. If the DSM DTCs retrieved are related to the concern, go to the DSM Diagnostic Trouble Code (DTC) Index.
8. If the DDM DTCs retrieved are related to the concern, go to the DDM Diagnostic Trouble Code (DTC) Index.
9. If no DTCs related to the concern are retrieved, proceed to the Symptom Chart to continue the diagnostics.

DSM Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1342	ECU Is Defective	DSM	REPEAT the DSM self-test. If DTC B1342 is retrieved again, INSTALL a new DSM. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self test.

Pinpoint Tests

PINPOINT TEST A: NO COMMUNICATION WITH THE DRIVER SEAT MODULE (DSM)

CONDITIONS	DETAILS/RESULTS/ACTIONS
A1 CHECK NGS TESTER COMMUNICATION TO THE DDM	
<p>NOTE: If a seat equipped with a side mounted side airbag and/or a safety belt pretensioner (if equipped) system is being serviced the airbag system must be deactivated per the deactivation procedure contained in Section 501-20B.</p> <p>NOTE: Restraint system diagnostic tools MUST be installed under the seats in the side airbag and safety belt pretensioner (if equipped) to floor connectors.</p> <p>NOTE: Diagnostics or repairs are not to be performed on a side airbag system and/or a safety</p>	

belt pretensioner (if equipped) system with the seats in the vehicle. Prior to attempting to diagnose/repair the side airbag system and/or a safety belt pretensioner (if equipped) system the seats must be removed from the vehicle and the restraint system diagnostic tools must be installed in the side airbag and the safety belt pretensioner (if equipped) connectors at the floor connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: Diagnostics may be performed on seat systems other than the side airbag or the safety belt pretensioner (if equipped) system (lumbar, climate controlled, heated, power seat track) with the seat installed in the vehicle as long as the restraint system diagnostic tools are installed under the seats in the side airbag and safety belt pretensioner to floor connectors.

NOTE: After diagnosing/repairing a seat system, **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

1 Using the results from the DATA LINK DIAGNOSTICS test, check for communication to the DDM.

● **Does the NGS Tester communicate with the DDM?**

→ **Yes**
GO to A2 .

→ **No**
Go To Pinpoint Test B .

A2 CHECK CIRCUITS 29-AH80 (OG/WH) AND 30-AH80 (RD) FOR VOLTAGE

1

2

DSM C341b

4

DSM C341c

5

3 Deactivate the supplemental restraint system (SRS). Refer to Section 501-20B .

5 Measure the voltage between DSM C341c pin 10, circuit 29-AH80 (OG/WH), harness side and ground; and between DSM C341b pin 4, circuit 30-AH80 (RD), harness side and ground

A0005666

- Are the voltages greater than 10 volts?

→ **Yes**
GO to A3.

→ **No**
REPAIR the circuit in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

A3 CHECK CIRCUIT 31-AH80 (BK) AND 91-AH80 (BK) FOR AN OPEN

1

A0003054

1

Measure the resistance between the DSM C341b pin 3, circuit 31-AH80 (BK), harness side and ground; and between DSM C341c pin 2, circuit 91-AH80 (BK), harness side and ground.

- Are the resistances less than 5 ohms?

→ **Yes**
REFER to Section 418-00.

→ **No**
REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

PINPOINT TEST B: NO COMMUNICATION WITH THE DRIVER DOOR MODULE (DDM)

CONDITIONS**DETAILS/RESULTS/ACTIONS****B1 CHECK CIRCUITS 29-AJ80 (OG) AND 29S-AJ86 (OG/BU) FOR VOLTAGE**

NOTE: If a seat equipped with a side mounted side airbag and/or a safety belt pretensioner (if equipped) system is being serviced **the airbag system must be deactivated** per the deactivation procedure contained in [Section 501-20B](#).

NOTE: Airbag simulators (Restraint system diagnostic tools) **MUST** be installed under the seats in the side airbag and safety belt pretensioner (if equipped) to floor connectors.

NOTE: Diagnostics or repairs are not to be performed on a side airbag system and/or a safety belt pretensioner (if equipped) system with the seats in the vehicle. Prior to attempting to diagnose/repair the side airbag system and/or a safety belt pretensioner (if equipped) system the seats must be removed from the vehicle and the restraint system diagnostic tools must be installed in the side airbag and the safety belt pretensioner (if equipped) connectors at the floor connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: Diagnostics may be performed on seat systems other than the side airbag or the safety belt pretensioner (if equipped) system (lumbar, climate controlled, heated, power seat track) with the seat installed in the vehicle as long as the restraint system diagnostic tools are installed under the seats in the side airbag and safety belt pretensioner to floor connectors.

NOTE: After diagnosing/repairing a seat system, **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: Cycle the ignition from OFF to RUN to enable the switched system power feature.

1

3

DDM C501a

4

5

A0006301

2

Deactivate the supplemental restraint system (SRS). Refer to [Section 501-20B](#).

5

Measure the voltage between DDM C501a pin 11, circuit 29-AJ80 (OG), harness side and ground; and between DDM C501a pin 12, circuit 29S-AJ86 (OG/BU), harness side and ground.

- Is the voltage greater than 10 volts?

- **Yes**
GO to B2.
- **No**
REPAIR the circuit in question Test the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

B2 CHECK CIRCUITS 31-AJ80 (BK/OG) AND 91-AJ80 (BN/BU) FOR OPENS

1

2

2 Measure the resistance between DDM C501a pin 7, circuit 91-AJ80 (BN/BU), harness side and ground; and between DDM C501a pin 8, circuit 31-AJ80B (BK/OG), harness side and ground.

- Is the resistance less than 5 ohms?

- **Yes**
REFER to Section 418-00.
- **No**
REPAIR the circuit(s) in question. Test the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

PINPOINT TEST C: THE POWER SEAT IS INOPERATIVE — DRIVER

CONDITIONS	DETAILS/RESULTS/ACTIONS
C1 CHECK CIRCUIT 30-AH35 (RD) FOR VOLTAGE	
<p>NOTE: If a seat equipped with a side mounted side airbag and/or a safety belt pretensioner (if equipped) system is being serviced the airbag system must be deactivated per the deactivation procedure contained in <u>Section 501-20B</u>.</p>	
<p>NOTE: Airbag simulators (Restraint system diagnostic tools) MUST be installed under the seats in the side airbag and safety belt pretensioner (if equipped) to floor connectors.</p>	
<p>NOTE: Diagnostics or repairs are not to be performed on a side airbag system and/or a safety belt pretensioner (if equipped) system with the seats in the vehicle. Prior to attempting to</p>	

diagnose/repair the side airbag system and/or a safety belt pretensioner (if equipped) system the seats must be removed from the vehicle and the restraint system diagnostic tools must be installed in the side airbag and the safety belt pretensioner (if equipped) connectors at the floor connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: Diagnostics may be performed on seat systems other than the side airbag or the safety belt pretensioner (if equipped) system (lumbar, climate controlled, heated, power seat track) with the seat installed in the vehicle as long as the restraint system diagnostic tools are installed under the seats in the side airbag and safety belt pretensioner to floor connectors.

NOTE: After diagnosing/repairing a seat system, **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

1

3

Driver Seat Regulator Control Switch C360

4

2 Deactivate the supplemental restraint system (SRS). Refer to [Section 501-20B](#).

4 Measure the voltage between driver seat regulator control switch C360 pin 6, circuit 30-AH35 (RD), harness side and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
GO to [C2](#).

→ **No**
REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

C2 CHECK CIRCUIT 31-AH35 (BK) FOR AN OPEN

1

1 Measure the resistance between driver seat regulator control switch C360 pin 1, circuit 31-AH35 (BK), harness side and ground.

- Is the resistance less than 5 ohms?

→ **Yes**

INSTALL a new driver seat regulator control switch. REFER to Seat Control Switch. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

→ **No**

REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

PINPOINT TEST D: THE POWER SEAT IS INOPERATIVE—PASSENGER

CONDITIONS	DETAILS/RESULTS/ACTIONS
	D1 CHECK FOR POWER TO THE PASSENGER SEAT REGULATOR CONTROL SWITCH
	<p>NOTE: If a seat equipped with a side mounted side airbag and/or a safety belt pretensioner (if equipped) system is being serviced the airbag system must be deactivated per the deactivation procedure contained in <u>Section 501-20B</u>.</p> <p>NOTE: Airbag simulators (Restraint system diagnostic tools) MUST be installed under the seats in the side airbag and safety belt pretensioner (if equipped) to floor connectors.</p> <p>NOTE: Diagnostics or repairs are not to be performed on a side airbag system and/or a safety belt pretensioner (if equipped) system with the seats in the vehicle. Prior to attempting to diagnose/repair the side airbag system and/or a safety belt pretensioner (if equipped) system the seats must be removed from the vehicle and the restraint system diagnostic tools must be installed in the side airbag and the safety belt pretensioner (if equipped) connectors at the floor connectors. The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.</p> <p>NOTE: Diagnostics may be performed on seat systems other than the side airbag or the safety belt pretensioner (if equipped) system (lumbar, climate controlled, heated, power seat track) with the seat installed in the vehicle as long as the restraint system diagnostic tools are installed under the seats in the side airbag and safety belt pretensioner to floor connectors.</p> <p>NOTE: After diagnosing/repairing a seat system, The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.</p>

2

3

3

Using the following table, measure the voltage between DSM C341c pins, harness side and ground.

DSM C341c Pin	Circuit
3	10-AH83 (GY/OG)
4	10-AH82 (GY/RD)
5	8-AH84 (WH/BK)
6	10-AH85 (WH/GN)
11	8-AH83 (WH/GN)
12	8-AH82 (WH/RD)
13	10-AH84 (GY/BK)
14	8-AH85 (WH/VT)

• Are any of the voltages greater than 10 volts?

→ **Yes**

GO to E3.

→ **No**

CLEAR the DSM DTCs. REPEAT the DSM self-test. If DTC B1703, B1707, B1711, B1715, B1719, B1723, B1727 or B1731 is retrieved, INSTALL a new DSM. REFER to Section 419-10. CALIBRATE the driver seat, REFER to Seat

Calibration in Principles of Operation.

If any other DTCs are retrieved refer the DSM Diagnostic Trouble Code (DTC) Index. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

E3 CHECK THE DRIVER SEAT REGULATOR CONTROL SWITCH FOR A SHORT TO BATTERY

1

2

Driver Seat Regulator Control Switch C360

3

4

4 Using the following table, measure the voltage between DSM C341c pins, harness side and ground.

DSM C341c Pin	Circuit
3	10-AH83 (GY/OG)
4	10-AH82 (GY/RD)
5	8-AH84 (WH/BK)
6	10-AH85 (WH/GN)
11	8-AH83 (WH/GN)
12	8-AH82 (WH/RD)
13	10-AH84 (GY/BK)
14	8-AH85 (WH/VT)

● Are any of the voltages greater than 10 volts?

→ **Yes**

REPAIR the circuit in question. REPEAT the DSM self-test. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

→ **No**

INSTALL a new driver seat regulator

control switch. REFER to Seat Control Switch. REPEAT the DSM self-test. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

E4 CHECK FOR MULTIPLE DSM DTCS

1 Use the results recorded from the DSM continuous and on-demand self-tests.

- Are the DSM DTCS B1757, B1761 and B1765 all retrieved?

→ Yes
GO to E5.

→ No
GO to E10.

E5 CHECK THE HORIZONTAL POSITION SENSOR COMMON RETURN

1

2

Horizontal Position Sensor C372

3

A0003063

3 Measure the resistance between horizontal position sensor C372 pin 3, circuit 7-AH26 (YE/RD), harness side and ground.

- Is the resistance less than 180 ohms?

→ Yes
GO to E7.

→ No
GO to E6.

E6 CHECK CIRCUIT 9-AH26 (BN/RD) FOR AN OPEN

1

DSM C341a

2

2

Measure the resistance between horizontal position sensor C372 pin 1, circuit 9-AH26 (BN/RD), harness side and DSM C341a pin 11, circuit 9-AH80 (BN/WH), harness side.

● Is the resistance less than 5 ohms?

→ **Yes**

INSTALL a new DSM. REFER to [Section 419-10](#). CALIBRATE the driver seat, REFER to Seat Calibration in Principles of Operation. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

→ **No**

REPAIR the circuit. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

E7 CHECK THE POSITION SENSOR COMMON FEED

1

2

3

3

Measure the voltage between horizontal position sensor C372 pin 3, circuit 7-AH26 (YE/RD), harness side and ground.

A0003065

● Is the voltage greater than 10 volts?

→ **Yes**
GO to E10.

→ **No**
GO to E8.

E8 CHECK CIRCUIT 7-AH26 (YE/RD) FOR A SHORT TO GROUND

1

2

DSM C341a

3

A0003066

3 Measure the resistance between horizontal position sensor C372 pin 3, circuit 7-AH26 (YE/RD), harness side and ground.

● Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to E9.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

E9 CHECK CIRCUIT 7-AH26 (YE/RD) OR 7-AH80 (YE/VT) FOR AN OPEN

1

1

Measure the resistance between horizontal position sensor C372 pin 3, circuit 7-AH26 (YE/RD), harness side and DSM C341a pin 15, circuit 7-AH80 (YE/VT), harness side.

● **Is the resistance less than 5 ohms?**

→ **Yes**

INSTALL a new DSM. REFER to [Section 419-10](#). CALIBRATE the driver seat, REFER to Seat Calibration in Principles of Operation. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

→ **No**

REPAIR the circuit. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

E10 CHECK FOR SINGLE DTCS

1

Using the recorded results from the DSM self-test.

● **Was DTC B1757, B1761, B1765 or B1769 retrieved?**

→ **Yes**

For DTC B1757 GO to [E11](#).

For DTC B1761 GO to [E19](#).

For DTC B1765 GO to [E27](#).

For DTC B1769 GO to [E35](#).

→ **No**

GO to [E43](#).

E11 CHECK VOLTAGE TO THE DRIVER SEAT REAR HEIGHT MOTOR

1

Driver Seat Rear Height Motor C382

2

A0003068

2

Measure the voltage between driver seat rear height motor C382, circuit 33-AH41 (YE/VT), harness side and driver seat rear height motor C382, circuit 32-AH41 (WH/VT), harness side.

3

Operate the driver seat regulator control switch to the rear up and rear down position.

- **Is the voltage greater than 10 volts in both directions?**

→ **Yes**
GO to E15.

→ **No**
GO to E12.

E12 CHECK THE DSM DRIVER SIDE REAR HEIGHT MOTOR CONTROL

1

A0003069

1

Measure the voltage between driver seat rear height motor C382, circuit 33-AH41 (YE/VT), harness side and ground while operating the driver seat regulator control switch to the rear down position; and between driver seat rear height motor C382, circuit 32-AH41 (WH/VT), harness side and ground while operating the driver seat regulator control switch to the rear up position.

- **Is the voltage greater than 10 volts in both directions?**

→ **Yes**
INSTALL a new DSM. REFER to Section 419-10. CALIBRATE the driver seat, REFER to Seat Calibration in Principles of Operation. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

→ **No**
GO to E13.

E13 CHECK CIRCUIT 33-AH41 (YE/VT) AND 32-AH41 (WH/VT) FOR A SHORT TO GROUND

1

2

DSM C341a

3

A0003070

3 Measure the resistance between driver seat rear height motor C382, circuit 33-AH41 (YE/VT), harness side and ground; and between driver seat rear height motor C382, circuit 32-AH41 (WH/VT), harness side and ground.

- Are the resistances greater than 10,000 ohms?

→ **Yes**
GO to E14.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

E14 CHECK CIRCUIT 33-AH41 (YE/VT) AND 32-AH41 (WH/VT) FOR AN OPEN

1

A0003071

1 Measure the resistance between driver seat rear height motor C382, circuit 33-AH41 (YE/VT), harness side and DSM C341a pin 8, circuit 33-AH41 (YE/VT), harness side; and between driver seat rear height motor C382, circuit 32-AH41 (WH/VT), harness side and DSM C341a pin 16, circuit 32-AH41 (WH/VT), harness side.

- Are the resistances less than 5 ohms?

→ **Yes**
INSTALL a new DSM. REFER to [Section 419-10](#). CALIBRATE the driver seat, REFER to Seat Calibration in Principles of Operation. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

→ **No**
REPAIR the circuit. REPEAT the DSM self-test. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

E15 CHECK CIRCUIT 9-AH25 (BN/GN) FOR AN OPEN

1

2

Rear Height Motor Position Sensor C383

3

A0003063

3 Measure the resistance between rear height motor position sensor C383 pin 3, circuit 9-AH25 (BN/GN), harness side and ground.

● Is the resistance less than 5 ohms?

→ **Yes**
GO to [E16](#).

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

E16 CHECK CIRCUIT 7-AH25 (YE/GN) FOR AN OPEN

1

2

A0003065

2 Measure the voltage between rear height motor position sensor C383 pin 1, circuit 7-AH25 (YE/GN), harness side and ground.

• Is the voltage approximately 5 volts?

→ **Yes**
GO to E17.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

E17 CHECK CIRCUIT 8-AH25 (WH/GN) FOR A SHORT TO GROUND

1

2

DSM C341a

3

A0003072

3 Measure the resistance between rear height motor position sensor C383 pin 2, circuit 8-AH25 (WH/GN), harness side and ground.

• Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to E18.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

E18 CHECK CIRCUIT 8-AH25 (WH/GN) FOR AN OPEN

1

1 Measure the resistance between rear height motor position sensor C383 pin 2, circuit 8-AH25 (WH/GN), harness side and DSM C341a pin 14, circuit 8-AH25 (WH/GN), harness side.

● **Is the resistance less than 5 ohms?**

→ **Yes**
INSTALL a new seat track. REFER to Seat Track in this section. CALIBRATE the driver seat. REFER to Principles of Operation. REPEAT the DSM self-test. If DTC B1757 is retrieved, INSTALL a new DSM. REFER to Section 419-10. CALIBRATE the driver seat. REFER to Principles of Operation. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

E19 CHECK THE DRIVER SEAT FRONT HEIGHT MOTOR SUPPLY

1

Driver Seat Front Height Motor C363

2

2 Measure the voltage between driver seat front height motor C363, circuit 33-AH38 (YE/BK), harness side and driver seat

A0003068

front height motor C363, circuit 32-AH38 (WH/BK), harness side.

3 Operate the driver seat regulator control switch to the front up and front down position.

• Is the voltage greater than 10 volts in both directions?

→ Yes
GO to E23.

→ No
GO to E20.

E20 CHECK THE DSM DRIVER SEAT FRONT HEIGHT MOTOR CONTROL

1

A0003069

1 Measure the voltage between driver seat front height motor C363, circuit 33-AH38 (YE/BK), harness side and ground while operating the driver seat regulator control switch to the front down position; and between driver seat front height motor C363, circuit 32-AH38 (WH/BK), harness side and ground, while operating the driver seat regulator control switch to the front up position.

• Is the voltage greater than 10 volts in both directions?

→ Yes
INSTALL a new DSM. REFER to [Section 419-10](#). CALIBRATE the driver seat, REFER to Seat Calibration in Principles of Operation. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

→ No
GO to E21.

E21 CHECK CIRCUIT 33-AH38 (YE/BK) AND 32-AH38 (WH/BK) FOR A SHORT TO GROUND

1

DSM C341a

2

A0003070

2

Measure the resistance between driver seat front height motor C363, circuit 33-AH38 (YE/BK), harness side and ground; and between driver seat front height motor C363, circuit 32-AH38 (WH/BK), harness side and ground.

- Are the resistances greater than 10,000 ohms?

→ **Yes**
GO to [E22](#).

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

E22 CHECK CIRCUIT 33-AH38 (YE/BK) AND 32-AH38 (WH/BK) FOR AN OPEN

1

A0003074

1

Measure the resistance between driver seat front height motor C363, circuit 33-AH38 (YE/BK), harness side and DSM C341a pin 7, circuit 33-AH38 (YE/BK), harness side; and between driver seat front height motor C363, circuit 32-AH38 (WH/BK), harness side and DSM C341a pin 17, circuit 32-AH38 (WH/BK), harness side.

- Are the resistances less than 5 ohms?

→ **Yes**
INSTALL a new DSM. REFER to [Section 419-10](#). CALIBRATE the driver seat, REFER to Seat Calibration in Principles of Operation. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

E23 CHECK CIRCUIT 9-AH24 (BN/YE) FOR AN OPEN

1

Front Height Motor Position Sensor C373

2

A0003066

2 Measure the resistance between front height motor position sensor C373 pin 3, circuit 9-AH24 (BN/YE), harness side and ground.

● Is the resistance less than 5 ohms?

→ **Yes**
GO to [E24](#).

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

E24 CHECK CIRCUIT 7-AH24 (YE/BK) FOR AN OPEN

1

A0003075

1 Measure the voltage between front height motor position sensor C373 pin 3, circuit 7-AH24 (YE/BK), harness side and ground.

● Is the voltage approximately 5 volts?

→ **Yes**
GO to E25.

→ **No**
REPAIR the circuit. CLEAR the DTCs.
REPEAT the self test. REACTIVATE the supplemental restraint system (SRS).
PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

E25 CHECK CIRCUIT 8-AH24 (WH/BK) FOR A SHORT TO GROUND

1

DSM C341a

2

A0003072

2

Measure the resistance between front height motor position sensor C373 pin 2, circuit 8-AH24 (WH/BK), harness side and ground.

● **Is the resistance greater than 10,000 ohms?**

→ **Yes**
GO to E26.

→ **No**
REPAIR the circuit. CLEAR the DTCs.
REPEAT the self test. REACTIVATE the supplemental restraint system (SRS).
PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

E26 CHECK CIRCUIT 8-AH24 (WH/BK) FOR AN OPEN

1

A0003076

1

Measure the resistance between front height motor position sensor C373 pin 2, circuit 8-AH24 (WH/BK), harness side and DSM C341a pin 5, circuit 8-AH24 (WH/BK), harness side.

- Is the resistance less than 5 ohms?

→ **Yes**

INSTALL a new seat track. REFER to Seat Track. CALIBRATE the driver seat. REFER to Principles of Operation. REPEAT the DSM self-test. If DTC B1761 is retrieved, INSTALL a new DSM. REFER to Section 419-10. CALIBRATE the driver seat. REFER to Principles of Operation. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

→ **No**

REPAIR the circuit. REPEAT the DSM self-test. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

E27 CHECK THE VOLTAGE TO THE DRIVER SEAT FORWARD/REARWARD MOTOR

1

Driver Seat Forward/Rearward Motor C362

2

A0003068

2

Measure the voltage between driver side forward/rearward motor C362, circuit 33-AH37 (WH/GN), harness side and driver side forward/rearward motor C362, circuit 32-AH37 (YE/GN), harness side.

3

Operate the driver seat regulator control switch to the forward and rearward position.

- Is the voltage greater than 10 volts in both directions?

→ **Yes**

GO to E31.

→ **No**

GO to E28.

E28 CHECK THE DSM FORWARD/REARWARD MOTOR CONTROL

1

1

Measure the voltage between driver side

A0003069

forward/rearward motor C362, circuit 33-AH37 (WH/GN), harness side and ground while operating the driver seat regulator control switch to the rearward position; and between driver side forward/rearward motor C362, circuit 32-AH37 (YE/GN), harness side and ground while operating the driver seat regulator control switch to the forward position.

- Is the voltage greater than 10 volts in both directions?

→ **Yes**

INSTALL a new DSM. REFER to [Section 419-10](#). CALIBRATE the driver seat, REFER to Seat Calibration in Principles of Operation. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

→ **No**

GO to [E29](#).

E29 CHECK CIRCUIT 33-AH37 (WH/GN) AND 32-AH37 (YE/GN) FOR A SHORT TO GROUND

1

2

DSM C341

3

A0003070

- 3 Measure the resistance between driver side forward/rearward motor C362, circuit 33-AH37 (WH/GN), harness side and ground; and between driver side forward/rearward motor C362, circuit 32-AH37 (YE/GN), harness side and ground.

- Are the resistances greater than 10,000 ohms?

→ **Yes**
GO to E30.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

E30 CHECK CIRCUIT 33-AH37 (WH/GN) AND 32-AH37 (YE/GN) FOR AN OPEN

1

1

Measure the resistance between driver side forward/rearward motor C362, circuit 33-AH37 (WH/GN), harness side and DSM C341a pin 1, circuit 33-AH37 (YE/GN), harness side; and between driver side forward/rearward motor C362, circuit 32-AH37 (YE/GN), harness side and DSM C341a pin 10, circuit 32-AH9 (YE/GN), harness side.

● **Are the resistances less than 5 ohms?**

→ **Yes**
INSTALL a new DSM. REFER to Section 419-10. CALIBRATE the driver seat, REFER to Seat Calibration in Principles of Operation. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

E31 CHECK CIRCUIT 9-AH26 (BN/RD) FOR AN OPEN

1

Forward/Rearward Motor Position Sensor C372

2

2

Measure the resistance between forward/rearward motor position sensor C372 pin 1, circuit 9-AH26 (BN/RD), harness side and ground.

A0003063

● Is the resistance less than 5 ohms?

→ **Yes**
GO to E32.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

E32 CHECK CIRCUIT 7-AH26 (YE/RD) FOR AN OPEN

1

A0003065

1 Measure the voltage between forward/rearward motor position sensor C372 pin 3, circuit 7-AH26 (YE/RD), harness side and ground.

● Is the voltage approximately 5 volts?

→ **Yes**
GO to E33.

→ **No**
REPAIR the circuit. REPEAT the DSM self-test. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

E33 CHECK CIRCUIT 8-AH26 (WH/RD) FOR A SHORT TO GROUND

1

DSM C341a

2

A0003072

2

Measure the resistance between forward/rearward motor position sensor C372 pin 2, circuit 8-AH26 (WH/RD), harness side and ground.

● Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to E34.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

E34 CHECK CIRCUIT 8-AH26 (WH/RD) FOR AN OPEN

1

A0003078

1

Measure the resistance between forward/rearward motor position sensor C372 pin 2, circuit 8-AH26 (WH/RD), harness side and DSM C341a pin 4, circuit 8-AH26 (WH/RD), harness side.

● Is the resistance less than 5 ohms?

→ **Yes**
INSTALL a new seat track. REFER to Seat Track. CALIBRATE the driver seat. REFER to Principles of Operation. REPEAT the DSM self-test. If DTC B1765 is retrieved, INSTALL a new DSM. REFER to Section 419-10. CALIBRATE the driver seat. REFER to Principles of Operation. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

→ **No**
REPAIR the circuit. CLEAR the DTCs.
REPEAT the self test. REACTIVATE the
supplemental restraint system (SRS).
PROVE OUT the supplemental restraint
system (SRS). REFER to [Section 501-
20B](#).

E35 CHECK THE DRIVER SEAT BACKREST MOTOR SUPPLY

1

Driver Seat Backrest Motor C368

2

A0003079

2 Measure the voltage between driver seat
backrest motor C368, circuit 33-AH36
(YE/RD), harness side and driver seat
backrest motor C368, circuit 32-AH36
(WH/RD), harness side, while operating
the driver seat regulator control switch to
the recline forward and recline rearward
position.

- Is the voltage greater than 10 volts
in both directions?

→ **Yes**
GO to [E39](#).

→ **No**
GO to [E36](#).

E36 CHECK THE DSM BACKREST MOTOR CONTROL

1

A0003080

1 Measure the voltage between driver seat
backrest motor C368, circuit 33-AH36
(YE/RD), harness side and ground while
operating the driver seat regulator
control switch to the backrest forward
position; and between driver seat
backrest motor C368, circuit 32-AH36
(WH/RD), harness side and ground
while operating the driver seat regulator
control switch to the backrest rearward
position.

- Is the voltage greater than 10 volts
in both directions?

→ **Yes**
INSTALL a new DSM. REFER to [Section
419-10](#). CALIBRATE the driver seat,
REFER to Seat Calibration in Principles

of Operation. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

→ **No**
GO to [E37](#).

E37 CHECK CIRCUIT 33-AH36 (YE/RD) AND 32-AH36 (WH/RD) FOR A SHORT TO GROUND

1

DSM C341a

2

A0003081

2 Measure the resistance between driver seat backrest motor C368, circuit 33-AH36 (YE/RD), harness side and ground; and between driver seat backrest motor C368, circuit 32-AH36 (WH/RD), harness side and ground.

- Are the resistances greater than 10,000 ohms?

→ **Yes**
GO to [E38](#).

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

E38 CHECK CIRCUIT 33-AH36 (YE/RD), 33-AH36 (YE/RD), 32-AH36 (WH/RD) AND 32-AH36 (WH/RD) FOR AN OPEN

1

A0003082

1 Measure the resistance between driver seat backrest motor C368, circuit 33-AH36 (YE/RD), harness side and DSM C341a pin 9, circuit 33-AH36 (YE/RD), harness side; and between driver seat backrest motor C368, circuit 32-AH36 (WH/RD), harness side and DSM C341a pin 2, circuit 32-AH36 (WH/RD), harness side.

- Are the resistances less than 5 ohms?

→ **Yes**

INSTALL a new DSM. REFER to [Section 419-10](#) . CALIBRATE the driver seat, REFER to Seat Calibration in Principles of Operation. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#) .

→ **No**

REPAIR the circuit. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#) .

E39 CHECK CIRCUIT 9-AH30 (BN/BU) FOR AN OPEN

1

Backrest Motor Position Sensor C376

2

A0003066

2

Measure the resistance between backrest motor position sensor C376 pin 3, circuit 9-AH30 (BN/BU), harness side and ground.

- Is the resistance less than 5 ohms?

→ **Yes**

GO to [E40](#) .

→ **No**

REPAIR the circuit. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#) .

E40 CHECK CIRCUIT 7-AH30 (YE/BU) FOR AN OPEN

1

1

Measure the voltage between backrest motor position sensor C376 pin 1, circuit

A0003075

7-AH30 (YE/BU), harness side and ground.

- Is the voltage approximately 5 volts?

→ **Yes**
GO to E41.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

E41 CHECK CIRCUIT 8-AH30 (WH/BU) FOR A SHORT TO GROUND

1

DSM C341a

2

A0003072

2 Measure the resistance between backrest motor position sensor C376 pin 2, circuit 8-AH30 (WH/BU), harness side and ground.

- Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to E42.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-

E42 CHECK CIRCUIT 8-AH30 (WH/BU) FOR AN OPEN

1

1

Measure the resistance between backrest motor position sensor C376 pin 2, circuit 8-AH30 (WH/BU), harness side and DSM C341a pin 13, circuit 8-AH30 (WH/BU), harness side.

● Is the resistance less than 5 ohms?

→ Yes

INSTALL a new seat track. REFER to [Seat Track](#). CALIBRATE the driver seat. REFER to Principles of Operation. REPEAT the DSM self-test. If DTC B1769 is retrieved, INSTALL a new DSM. REFER to [Section 419-10](#). CALIBRATE the driver seat. REFER to Principles of Operation. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

→ No

REPAIR the circuit. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

E43 CHECK FOR HESITATION OR JOGGING

1

2

3

2

Clear all DSM DTCs.

3

Operate the driver seat regulator control switch through all positions while monitoring DSM PIDs SFNT_MT, SREARMT, SFWD_MT and SRCL_MT, while watching seat movement.

● Did the driver seat stop or hesitate,

or did any of the DSM PIDs read inconsistently?

→ **Yes**

INSTALL a new seat track. REFER to Seat Track. CALIBRATE the driver seat. REFER to Principles of Operation. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

→ **No**

GO to E44.

E44 CHECK FOR AN INTERMITTENT CONCERN

1

3

DSM Self-Test

1

Clear all DSM DTCs.

2

Operate the driver power seat. Wiggle the harness and connectors. Inspect for any visual concerns.

● **Were any DTCs retrieved?**

→ **Yes**

If DTC B2146, B2149, B2152 or B2155 is retrieved, INSTALL a new seat track. REFER to Seat Track. CALIBRATE the driver seat. REFER to Principles of Operation. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

→ **No**

CALIBRATE the driver seat. REFER to Principles of Operation. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

E45 CHECK THE DRIVER SEAT REGULATOR CONTROL SWITCH PIDS

1

1

Operate the driver seat regulator control seat switch through all positions while monitoring the DSM PIDs SFNT_SW,

SFWD_SW, SREARSW and SRCL_SW.

- Do the DSM PIDs accurately represent the seat regulator control switch positions?

→ **Yes**

INSTALL a new DSM. REFER to Section 419-10 . CALIBRATE the driver seat, REFER to Seat Calibration in Principles of Operation. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B .

→ **No**

GO to E46 .

E46 CHECK THE DRIVER SEAT REGULATOR CONTROL SWITCH CIRCUITS FOR AN OPEN

1

DSM C341c

2

2

Using the following table, measure the resistance between DSM C341c pins, harness side and ground.

DSM C341c Pin	Circuit
3	10-AH83 (GY/OG)
4	10-AH82 (GY/RD)
5	8-AH84 (WH/BK)
6	10-AH85 (WH/GN)
11	8-AH83 (WH/GN)
12	8-AH82 (WH/RD)
13	10-AH84 (GY/BK)
14	8-AH85 (WH/VT)

- Are the resistances less than 5 ohms?

→ **Yes**

GO to E47 .

→ **No**

REPAIR the circuit. CLEAR the DTCs. REPEAT the self test. REACTIVATE the

supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

E47 CHECK THE DRIVER SEAT REGULATOR CONTROL SWITCH CIRCUITS FOR A SHORT TO GROUND

1

Driver Seat Regulator Control Switch C360

2

2

Using the following table, measure the resistance between DSM C341c pins, harness side and ground.

DSM C341c Pin	Circuit
3	10-AH83 (GY/OG)
4	10-AH82 (GY/RD)
5	8-AH84 (WH/BK)
6	10-AH85 (WH/GN)
11	8-AH83 (WH/GN)
12	8-AH82 (WH/RD)
13	10-AH84 (GY/BK)
14	8-AH85 (WH/VT)

- Are the resistances greater than 10,000 ohms?

→ **Yes**

INSTALL a new driver seat regulator control switch. REFER to [Seat Track](#). CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

→ **No**

REPAIR the circuit. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

PINPOINT TEST F: THE POWER SEAT DOES NOT MOVE HORIZONTALLY/VERTICALLY —PASSENGER

CONDITIONS	DETAILS/RESULTS/ACTIONS
F1 CHECK THE PASSENGER SEAT MOTOR OPERATION	

NOTE: If a seat equipped with a side mounted side airbag and/or a safety belt pretensioner (if equipped) system is being serviced **the airbag system must be deactivated** per the deactivation procedure contained in [Section 501-20B](#).

NOTE: Airbag simulators (Restraint system diagnostic tools) **MUST** be installed under the seats in the side airbag and safety belt pretensioner (if equipped) to floor connectors.

NOTE: Diagnostics or repairs are not to be performed on a side airbag system and/or a safety belt pretensioner (if equipped) system with the seats in the vehicle. Prior to attempting to diagnose/repair the side airbag system and/or a safety belt pretensioner (if equipped) system the seats must be removed from the vehicle and the restraint system diagnostic tools must be installed in the side airbag and the safety belt pretensioner (if equipped) connectors at the floor connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: Diagnostics may be performed on seat systems other than the side airbag or the safety belt pretensioner (if equipped) system (lumbar, climate controlled, heated, power seat track) with the seat installed in the vehicle as long as the restraint system diagnostic tools are installed under the seats in the side airbag and safety belt pretensioner to floor connectors.

NOTE: After diagnosing/repairing a seat system, **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

1

3

4

5

2

Deactivate the supplemental restraint system (SRS). Refer to [Section 501-20B](#).

3

Disconnect the passenger seat motor connector in question: (forward/rearward motor C332, seat height motor C333, or seat backrest motor C338).

5

Using the following table, measure the voltage between the inoperative passenger seat motor connector, harness side and ground, while moving the seat regulator control switch in the indicated direction:

Motor Connector	Pin	Circuit	Direction of Control Switch
Forward/Reverse Motor C332	1	32-AH44 (WH/GN)	Forward
Forward/Reverse Motor C332	2	33-AH44 (YE/GN)	Reverse
Height Motor	1	32-AH34 (WH/BK)	Up

C333			
Height Motor C333	2	33-AH34 (YE/BK)	Down
Backrest Motor C338	1	32-AH15 (WH/RD)	Tilt Up
Backrest Motor C338	2	33-AH15 (YE/RD)	Tilt Down

● Are the voltages greater than 10 volts in the inoperative directions?

→ **Yes**

INSTALL a new passenger seat track or the backrest assembly. REFER to [Seat Track](#) or [Front Seat Backrest](#). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

→ **No**

GO to [F2](#).

F2 CHECK THE PASSENGER SEAT MOTOR CIRCUITS FOR A SHORT TO GROUND

1

2

Passenger Seat Regulator Control Switch C330

3

3

Using the following table, measure the resistance between passenger seat regulator control switch C330 pins, harness side and ground:

Pin	Circuit	Inoperative Motor
12	32-AH43 (WH/RD)	Backrest
7	33-AH43 (YE/RD)	Backrest
4	32-AH34 (WH/BK)	Height
5	33-AH34 (YE/BK)	Height
3	32-AH44	Forward/

	(WH/GN)	Rearward
11	33-AH44 (YE/GN)	Forward/ Rearward

- Are the resistances greater than 10,000 ohms?

→ **Yes**
GO to F3.

→ **No**
REPAIR the circuit in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

F3 CHECK FOR AN OPEN CIRCUIT

1

2

2

Measure the resistance between the passenger seat regulator control switch C330 pins, harness side and the inoperative motor connector, harness side:

C330 Pin	Circuit	Motor Connector
Height Motor		
4	32-AH34 (WH/BK)	C333 pin 1
5	33-AH34 (YE/BK)	C333 pin 2
Forward/Reverse Motor		
3	32-AH44 (WH/GN)	C332 pin 1
11	33-AH44 (YE/GN)	C332 pin 2
Backrest Motor		
12	32-AH43, 32- AH15 (WH/RD)	C338 pin 1
7	33-AH43, 33- AH15 (YE/RD)	C338 pin 2

- Are all resistance readings less than 5 ohms?

→ **Yes**

INSTALL a new passenger seat regulator control switch. REFER to [Seat Control Switch](#). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

→ **No**
REPAIR the circuit in question. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

PINPOINT TEST G: THE MEMORY SEAT IS INOPERATIVE

CONDITIONS	DETAILS/RESULTS/ACTIONS
G1 CHECK THE MEMORY MIRROR OPERATION	
	<p>NOTE: If a seat equipped with a side mounted side airbag and/or a safety belt pretensioner (if equipped) system is being serviced the airbag system must be deactivated per the deactivation procedure contained in Section 501-20B.</p> <p>NOTE: Airbag simulators (Restraint system diagnostic tools) MUST be installed under the seats in the side airbag and safety belt pretensioner (if equipped) to floor connectors.</p> <p>NOTE: Diagnostics or repairs are not to be performed on a side airbag system and/or a safety belt pretensioner (if equipped) system with the seats in the vehicle. Prior to attempting to diagnose/repair the side airbag system and/or a safety belt pretensioner (if equipped) system the seats must be removed from the vehicle and the restraint system diagnostic tools must be installed in the side airbag and the safety belt pretensioner (if equipped) connectors at the floor connectors. The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.</p> <p>NOTE: Diagnostics may be performed on seat systems other than the side airbag or the safety belt pretensioner (if equipped) system (lumbar, climate controlled, heated, power seat track) with the seat installed in the vehicle as long as the restraint system diagnostic tools are installed under the seats in the side airbag and safety belt pretensioner to floor connectors.</p> <p>NOTE: After diagnosing/repairing a seat system, The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.</p>
	<p>1 Carry out a memory recall for the exterior rear view mirrors.</p> <ul style="list-style-type: none"> ● Did the memory mirrors operate correctly? <p>→ Yes GO to G2.</p> <p>→ No REFER to Section 501-09.</p>
G2 CHECK THE DTCS FROM THE DSM	
	<p>1 Using the recorded results from DSM self-test.</p> <ul style="list-style-type: none"> ● Was DSM DTC B1342 retrieved? <p>→ Yes</p>

CLEAR the DSM DTCs. REPEAT the DSM self-test. If DTC B1342 is retrieved, INSTALL a new DSM. REFER to [Section 419-10](#). CALIBRATE the driver seat, REFER to Seat Calibration in Principles of Operation. CLEAR the DTCs. REPEAT the self test. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

→ **No**
GO to [G3](#).

G3 CHECK THE POWER SEAT CALIBRATION

1

CLEAR DSM
DTCs

2 Calibrate the driver seat. Refer to Seat Calibration in Principles of Operation.

● **Were any DSM DTCs retrieved from calibration?**

→ **Yes**
REFER to the DSM Diagnostic Trouble Code (DTC) Index.

→ **No**
GO to [G4](#).

G4 CHECK THE MEMORY RECALL OPERATION

1 Set a new memory seat position for driver 1 and driver 2.

2 Activate the memory recall for driver position 1 and driver position 2 from the memory set switch.

● **Do the memory recall functions operate correctly?**

→ **Yes**
The driver power seat is operating correctly. REVERIFY symptom.

→ **No**
INSTALL a new DSM. REFER to [Section 419-10](#). CALIBRATE the driver seat, REFER to Seat Calibration in Principles of Operation. GO to [G5](#).

G5 CHECK THE MEMORY RECALL OPERATION

1 Set a new memory seat position for driver 1 and driver 2.

2 Activate the memory recall for driver position 1 and driver position 2 from the memory set switch.

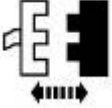

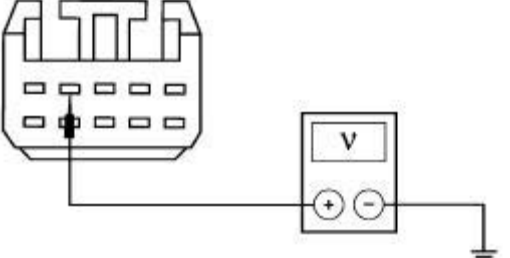

● **Do the memory recall functions operate correctly?**

→ **Yes**
The driver power seat is operating correctly. REVERIFY symptom.

→ **No**
CHECK the DDM for any memory function related DTCs. REPAIR as necessary. REFER to the DDM Diagnostic Trouble Code (DTC) Index.

CHECK for any DSM DTCs. REPAIR as necessary. REFER to the DSM Diagnostic Trouble Code (DTC) Index. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

PINPOINT TEST H: THE HEATED SEAT IS INOPERATIVE — DRIVER

CONDITIONS	DETAILS/RESULTS/ACTIONS
H1 CHECK FOR VOLTAGE TO THE HEATED SEAT MODULE — CIRCUIT 30-HC21 (RD)	
<p>NOTE: If a seat equipped with a seat mounted side airbag and/or a safety belt pretensioner (if equipped) system is being serviced, the airbag system must be deactivated. Refer to Section 501-20B.</p> <p>NOTE: Restraint system diagnostic tools MUST be installed under the seats in the side airbag and safety belt pretensioner (if equipped) to floor connectors.</p> <p>NOTE: Diagnostics or repairs are not to be performed on a side airbag system and/or a safety belt pretensioner (if equipped) system with the seats in the vehicle. Prior to attempting to diagnose/repair the side airbag system and/or a safety belt pretensioner (if equipped) system the seats must be removed from the vehicle and the restraint system diagnostic tools must be installed in the side airbag and the safety belt pretensioner (if equipped) connectors at the floor connectors. The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.</p> <p>NOTE: Diagnostics may be performed on seat systems other than the side airbag or the safety belt pretensioner (if equipped) system (lumbar, climate controlled, heated, power seat track) with the seat installed in the vehicle as long as the restraint system diagnostic tools are installed under the seats in the side airbag and safety belt pretensioner to floor connectors.</p> <p>NOTE: After diagnosing/repairing a seat system the restraint system diagnostic tools must be removed before operating the vehicle over the road.</p>	
<p>1</p>  <p>3</p>  <p>Driver Heated Seat Module C359</p> <p>4</p>  <p>GR3561-A</p>	<p>2 Deactivate the system. Refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.</p> <p>4 Measure the voltage between driver heated seat module C359 pin 4, circuit 30-HC21 (RD), harness side and ground.</p>

● Is the voltage greater than 10 volts?

→ **Yes**
GO to H2.

→ **No**
REPAIR circuit 30-HC21 (RD). TEST the system for normal operation.
REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

H2 CHECK FOR VOLTAGE TO THE HEATED SEAT SWITCH — CIRCUIT 20-HC17 (PK/YE)

 **WARNING:** The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

1

2

Driver Heated Seat Switch C344

3

4

A0005661

4 Measure the voltage between driver heated seat switch C344 pin 3, circuit 20-HC17 (PK/YE), harness side and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
GO to H3.

→ **No**
REPAIR circuit 20-HC17 (PK/YE). TEST the system for normal operation.

REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

H3 CHECK FOR VOLTAGE TO THE HEATED SEAT MODULE — CIRCUIT 15-HC21 (GN/BK)

 **WARNING:** The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

1

2

Driver Heated Seat Module C359

3

4

A0003088

4 Measure the voltage between heated seat module C359 pin 6, circuit 15-HC21 (GN/BK), harness side and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
GO to [H4](#).

→ **No**
REPAIR circuit 15-HC21 (GN/BK). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

H4 CHECK DRIVER HEATED SEAT MODULE GROUND — CIRCUIT 31-HC21 (BK)

 **WARNING:** The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

1

1 Measure the resistance between driver

heated seat module C359 pin 8, circuit 31-HC21 (BK), harness side and ground.

- Is the resistance less than 5 ohms?

→ **Yes**
GO to H5.

→ **No**
REPAIR circuit 31-HC21 (BK). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

H5 CHECK FOR VOLTAGE TO THE HEATED SEAT MODULE

1

2

Driver Heated Seat Module C359

3

4

- 4 Measure the voltage between driver heated seat module C359 pin 2, circuit 20S-HC21 (PK/BK), harness side and ground while pressing and holding the heated seat switch.

- Is the voltage greater than 10 volts?

→ **Yes**
GO to H7.

→ **No**
GO to H6.

H6 CHECK CIRCUIT 20S-HC21 (PK/BK) FOR OPEN

 **WARNING:** The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

1

2

2 Measure the resistance between driver heated seat module C359 pin 2, circuit 20S-HC21 (PK/BK), and driver heated seat switch C344 pin 4, circuit 20S-HC21 (PK/BK), harness side.

● **Is the resistance less than 5 ohms?**

→ **Yes**
INSTALL a new heated seat switch.
TEST the system for normal operation.
REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

→ **No**
REPAIR circuit 20S-HC21 (PK/BK).
TEST the system for normal operation.
REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

H7 CHECK THE HEATED SEAT CIRCUITRY FOR OPEN AND SHORT TO GROUND

 **WARNING:** The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

1

2

Driver Heated Seat Module 359

3

3

Measure the resistance between heated seat module C359 pin 3, circuit 20S-HC17 (PK), and heated seat module C359 pin 5, circuit 31S-HC16 (BK/BU); and between heated seat module C359, circuit 20S-HC17 (PK), harness side and ground.

- Is the resistance less than 5 ohms between the two connectors and greater than 10,000 ohms between the heated seat module connector and ground?

→ Yes

INSTALL a new heated seat module. REFER to [Heated Seat Module](#) in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

→ No

GO to [H8](#).

H8 CHECK CIRCUIT 20S-HC17 (PK) FOR OPEN AND SHORT TO GROUND

WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

1

Driver Heated Seat Cushion C364

2

2

Measure the resistance between heated seat module C359 pin 3, circuit 20S-HC17 (PK), and seat cushion heater C364 pin 1, circuit 20S-HC17 (PK); and between heated seat module C359 pin 3, circuit 20S-HC17 (PK), harness side and ground.

- Is the resistance less than 5 ohms between the two connectors and greater than 10,000 ohms between the seat module connector and ground?

→ **Yes**
GO to H9.

→ **No**
REPAIR circuit 20S-HC17 (PK). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

H9 CHECK CIRCUIT 31S-HC16 (BK/BU) FOR OPEN

⚠ WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

2 Measure the resistance between heated seat module C359 pin 5, circuit 31S-HC16 (BK/BU), and seat back heater C365 pin 2, circuit 31S-HC16 (BK/BU), harness side.

- Is the resistance less than 5 ohms?

→ **Yes**
GO to H10.

→ **No**
REPAIR circuit 31S-HC16 (BK/BU).
TEST the system for normal operation.
REACTIVATE the supplemental restraint system (SRS). REFER to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

H10 CHECK CIRCUIT 20S-HC16 (PK/BU) FOR OPEN

 **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

1

1 Measure the resistance between seat back heater C365 pin 1, circuit 20S-HC16 (PK/BU), and seat cushion heater C364 pin 4, circuit 20S-HC16 (PK/BU), harness side.

● Is the resistance less than 5 ohms?

→ **Yes**
GO to [H11](#).

→ **No**
REPAIR circuit 20S-HC16 (PK/BU).
TEST the system for normal operation.
REACTIVATE the supplemental restraint system (SRS). REFER to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

H11 CHECK THE HEATED SEAT TEMPERATURE SENSOR CIRCUITRY FOR CONTINUITY

 **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

1

2

2 Measure the resistance between heated seat module C359 pin 7, circuit 8-HC23 (WH/BK), and heated seat module C359 pin 1, circuit 9-HC23 (BN/YE), harness side.

- Is the resistance less than 300,000 ohms and greater than 50 ohms?

→ Yes

INSTALL a new heated seat module. REFER to Heated Seat Module in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

→ No

GO to H12.

H12 CHECK CIRCUIT 8-HC23 (WH/BK) FOR OPEN AND SHORT TO GROUND

⚠ WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

1

Driver Heated Seat Cushion C364

2

2

Measure the resistance between heated seat module C359 pin 7, circuit 8-HC23 (WH/BK), and seat cushion heater C364 pin 2, circuit 8-HC23 (WH/BK); and between heated seat module C359 pin 7, circuit 8-HC23 (WH/BK), harness side and ground.

- Is the resistance less than 5 ohms between the two connectors and greater than 10,000 ohms between the heated seat module connector and ground?

→ Yes

GO to [H13](#).

→ **No**
REPAIR circuit 8-HC23 (WH/BK). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

H13 CHECK CIRCUIT 9-HC23 (BN/YE) FOR OPEN AND SHORT TO GROUND

⚠ WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

1

1

Measure the resistance between heated seat module C359 pin 1, circuit 9-HC23 (BN/YE), and seat cushion heater C364 pin 3, circuit 9-HC23 (BN/YE); and between heated seat module C359 pin 1, circuit 9-HC23 (BN/YE), harness side and ground.

- Is the resistance less than 5 ohms between the two connectors and greater than 10,000 ohms between the heated seat module connector and ground?

→ **Yes**
INSTALL a new seat cushion. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

→ **No**
REPAIR circuit 9-HC23 (BN/YE). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

PINPOINT TEST I: THE HEATED SEAT IS INOPERATIVE — PASSENGER

CONDITIONS	DETAILS/RESULTS/ACTIONS
I1 CHECK FOR VOLTAGE TO THE HEATED SEAT MODULE — CIRCUIT 30-HC22 (RD)	
NOTE: If a seat equipped with a seat mounted side airbag and/or a safety belt pretensioner (if	

equipped) system is being serviced, **the airbag system must be deactivated.** Refer to [Section 501-20B](#).

NOTE: Restraint system diagnostic tools **MUST** be installed under the seats in the side airbag and safety belt pretensioner (if equipped) to floor connectors.

NOTE: Diagnostics or repairs are not to be performed on a side airbag system and/or a safety belt pretensioner (if equipped) system with the seats in the vehicle. Prior to attempting to diagnose/repair the side airbag system and/or a safety belt pretensioner (if equipped) system the seats must be removed from the vehicle and the restraint system diagnostic tools must be installed in the side airbag and the safety belt pretensioner (if equipped) connectors at the floor connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: Diagnostics may be performed on seat systems other than the side airbag or the safety belt pretensioner (if equipped) system (lumbar, climate controlled, heated, power seat track) with the seat installed in the vehicle as long as the restraint system diagnostic tools are installed under the seats in the side airbag and safety belt pretensioner to floor connectors.

NOTE: After diagnosing/repairing a seat system **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

1

3

Passenger Heated Seat Module C329

4

2

Deactivate the system. Refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

4

Measure the voltage between passenger heated seat module C329 pin 4, circuit 30-HC22 (RD), harness side and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
GO to [12](#).

→ **No**
REPAIR circuit 30-HC22 (RD). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to [Supplemental Restraint System \(SRS\) Deactivation](#)

and Reactivation in this section.

12 CHECK FOR VOLTAGE TO THE HEATED SEAT SWITCH — CIRCUIT 20-HC9 (PK/BK)

 **WARNING:** The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

1

2

Passenger Heated Seat Switch C342

3

4

A0005661

4 Measure the voltage between the passenger heated seat switch C342 pin 3, circuit 20-HC9 (PK/BK), harness side and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
GO to 13.

→ **No**
REPAIR circuit 20-HC9 (PK/BK). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation.

13 CHECK FOR VOLTAGE TO THE HEATED SEAT MODULE — CIRCUIT 15-HC22 (GN/YE)

 **WARNING:** The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

1

2

Passenger Heated Seat Module C329

3

4

A0003088

4 Measure the voltage between heated seat module C329 pin 6, circuit 15-HC22 (GN/YE), harness side and ground.

• Is the voltage greater than 10 volts?

→ Yes
GO to 4.

→ No
REPAIR circuit 15-HC22 (GN/YE). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

I4 CHECK PASSENGER HEATED SEAT MODULE GROUND — CIRCUIT 31-HC22 (BK)

WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

1

GR3644-A

1 Measure the resistance between heated seat module C329 pin 8, circuit 31-HC22 (BK), harness side and ground.

- Is the resistance less than 5 ohms?

→ **Yes**
GO to 15.

→ **No**
REPAIR circuit 31-HC22 (BK). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

15 CHECK FOR VOLTAGE TO THE HEATED SEAT MODULE

1

2

Passenger Heated Seat Module C329

3

3 Measure the voltage between heated seat module C329 pin 2, circuit 20S-HC22 (PK/YE), harness side and ground while pressing and holding the heated seat switch.

- Is the voltage greater than 10 volts?

→ **Yes**
GO to 17.

→ **No**
GO to 16.

16 CHECK CIRCUIT 20S-HC22 (PK/YE) FOR OPEN

WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

1

2

2

Measure the resistance between passenger heated seat module C329 pin 2, circuit 20S-HC22 (PK/YE), and passenger heated seat switch C342 pin 4, circuit 20S-HC22 (PK/YE), harness side.

- Is the resistance less than 5 ohms?

→ **Yes**
INSTALL a new heated seat switch.
TEST the system for normal operation.
REACTIVATE the supplemental restraint system (SRS). REFER to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

→ **No**
REPAIR circuit 20S-HC22 (PK/YE).
TEST the system for normal operation.
REACTIVATE the supplemental restraint system (SRS). REFER to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

17 CHECK THE HEATED SEAT CIRCUITRY FOR OPEN AND SHORT TO GROUND

WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

1

2

Passenger Heated Seat Module C329

3

3

Measure the resistance between heated seat module C329 pin 3, circuit 20S-HC20 (PK/WH), and heated seat module C329 pin 5, circuit 31S-HC19 (BK/RD); and between heated seat module C329 pin 5, circuit 20S-HC20 (PK/WH), harness side and ground.

A0041535

- Is the resistance less than 5 ohms between the two connectors and greater than 10,000 ohms between the heated seat module connector and ground?

→ **Yes**

INSTALL a new heated seat module. REFER to [Heated Seat Module](#) in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

→ **No**

GO to [18](#).

18 CHECK CIRCUIT 20S-HC20 (PK/WH) FOR OPEN AND SHORT TO GROUND

⚠ WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

1

Passenger Heated Seat Cushion C334

2

GR3564-A

2

Measure the resistance between heated seat module C329 pin 3, circuit 20S-HC20 (PK/WH), and seat cushion heater C334 pin 1, circuit 20S-HC20 (PK/WH), and between heated seat module C329 pin 3, circuit 20S-HC20 (PK/WH), harness side and ground.

- Is the resistance less than 5 ohms between the two connectors and greater than 10,000 ohms between the seat module connector and

ground?

- **Yes**
GO to 19.
- **No**
REPAIR circuit 20S-HC20 (PK/WH).
TEST the system for normal operation.
REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

19 CHECK CIRCUIT 31S-HC19 (BK/RD) FOR OPEN

⚠ WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

1

Passenger Heated Seat Backrest C335

2

GR3565-A

2

Measure the resistance between heated seat module C329 pin 5, circuit 31S-HC19 (BK/RD), and seat back heater C335 pin 2, circuit 31S-HC19 (BK/RD), harness side.

● **Is the resistance less than 5 ohms?**

- **Yes**
GO to 110.
- **No**
REPAIR circuit 31S-HC19 (BK/RD).
TEST the system for normal operation.
REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

110 CHECK CIRCUIT 20S-HC19 (PK/OG) FOR OPEN

⚠ WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

1

1

Measure the resistance between seat back heater C335 pin 1, circuit 20S-HC19 (PK/OG), and seat cushion

heater C334 pin 4, circuit 20S-HC19 (PK/OG), harness side.

- Is the resistance less than 5 ohms?

→ **Yes**
GO to I11.

→ **No**
REPAIR circuit 20S-HC19 (PK/OG). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

I11 CHECK THE HEATED SEAT TEMPERATURE SENSOR CIRCUITRY FOR CONTINUITY

 **WARNING:** The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

1

2

- 2 Measure the resistance between heated seat module C329 pin 7, circuit 8-HC24 (WH/RD), and heated seat module C329 pin 1, circuit 9-HC24 (BN/RD), harness side.

- Is the resistance less than 300,000 ohms and greater than 50 ohms?

→ **Yes**
INSTALL a new heated seat module. REFER to Heated Seat Module in this section. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint

System (SRS) Deactivation and Reactivation in this section.

→ **No**
GO to I12.

I12 CHECK CIRCUIT 8-HC24 (WH/RD) FOR OPEN AND SHORT TO GROUND

⚠ WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

1

Passenger Heated Seat Cushion C334

2

2

Measure the resistance between heated seat module C329 pin 7, circuit 8-HC24 (WH/RD), and seat cushion heater C334 pin 2, circuit 8-HC24 (WH/RD), and between heated seat module C329 pin 7, circuit 8-HC24 (WH/RD), harness side and ground.

- **Is the resistance less than 5 ohms between the two connectors and greater than 10,000 ohms between the heated seat module connector and ground?**

→ **Yes**
GO to I13.

→ **No**
REPAIR circuit 8-HC24 (WH/RD). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

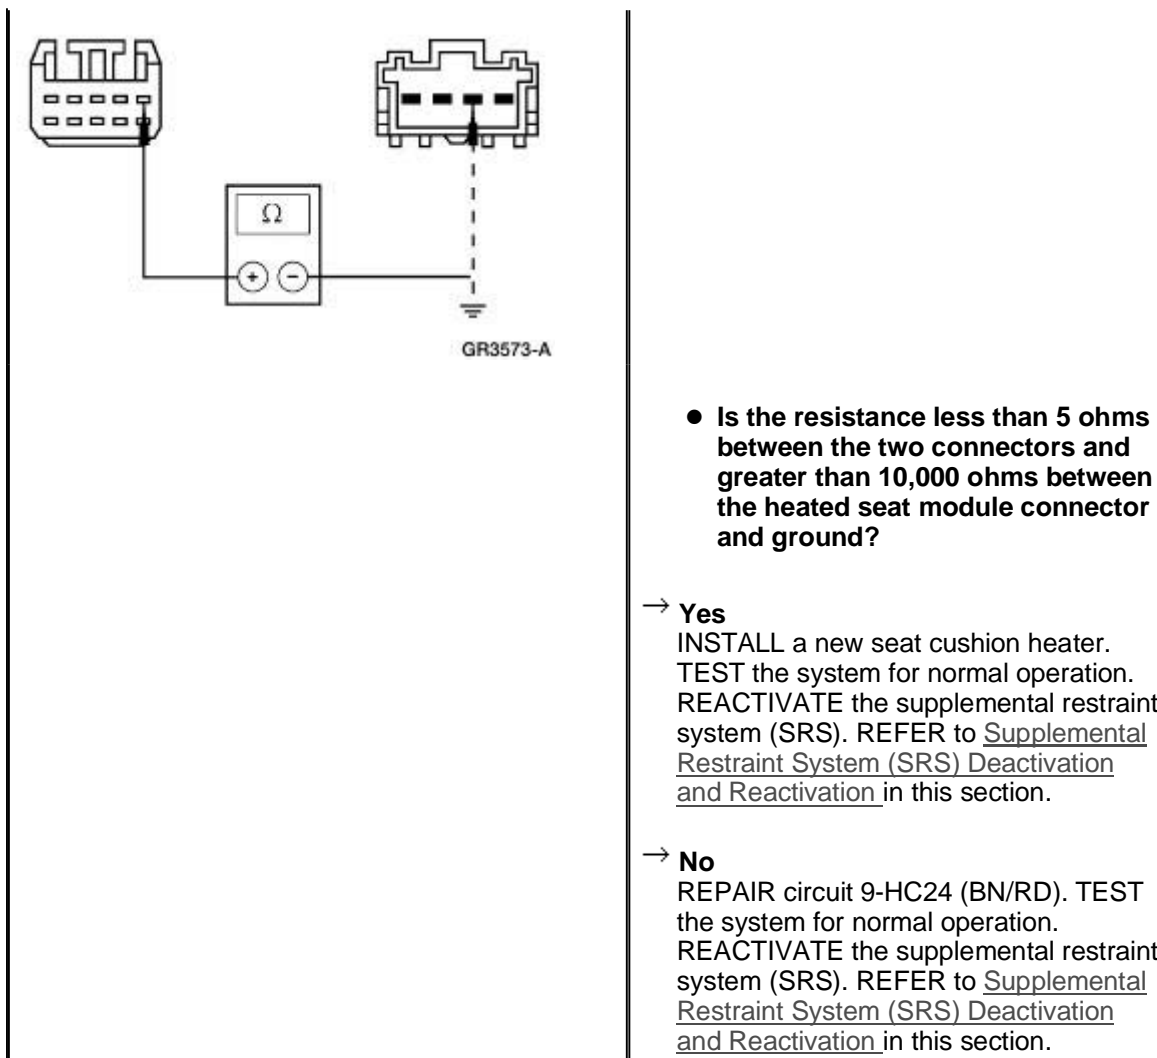

I13 CHECK CIRCUIT 9-HC24 (BN/RD) FOR OPEN AND SHORT TO GROUND

⚠ WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

1

1

Measure the resistance between heated seat module C329 pin 1, circuit 9-HC24 (BN/RD), and seat cushion heater C334 pin 3, circuit 9-HC24 (BN/RD), and between heated seat module C329 pin 1, circuit 9-HC24 (BN/RD), harness side and ground.

PINPOINT TEST J: THE HEATED SEATS ARE INOPERATIVE

CONDITIONS	DETAILS/RESULTS/ACTIONS
J1 CHECK THE IGNITION INPUT TO THE HEATED SEAT SWITCHES	<p>NOTE: If a seat equipped with a side mounted side airbag and/or a safety belt pretensioner (if equipped) system is being serviced the airbag system must be deactivated per the deactivation procedure contained in Section 501-20B .</p> <p>NOTE: Airbag simulators (Restraint system diagnostic tools) MUST be installed under the seats in the side airbag and safety belt pretensioner (if equipped) to floor connectors.</p> <p>NOTE: Diagnostics or repairs are not to be performed on a side airbag system and/or a safety belt pretensioner (if equipped) system with the seats in the vehicle. Prior to attempting to diagnose/repair the side airbag system and/or a safety belt pretensioner (if equipped) system the seats must be removed from the vehicle and the restraint system diagnostic tools must be installed in the side airbag and the safety belt pretensioner (if equipped) connectors at the floor connectors. The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.</p> <p>NOTE: Diagnostics may be performed on seat systems other than the side airbag or the safety belt pretensioner (if equipped) system (lumbar, climate controlled, heated, power seat track) with the seat installed in the vehicle as long as the restraint system diagnostic tools are installed under the seats in the side airbag and safety belt pretensioner to floor connectors.</p> <p>NOTE: After diagnosing/repairing a seat system, The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.</p>

2

3

Driver Heated Seat Switch C344

4

5

A0005661

1 Deactivate the supplemental restraint system (SRS). Refer to [Section 501-20B](#).

5 Measure the voltage between driver heated seat switch C344 pin 3, circuit 20-HC6 (PK/YE), harness side and ground.

• Is the voltage greater than 10 volts?

→ Yes
GO to [J8](#).

→ No
GO to [J2](#).

J2 CHECK CIRCUIT 20-HC6 (PK/YE) FOR AN OPEN

1

A0005662

1 Measure voltage between CJB fuse 216 (5A), output side and ground.

• Is the voltage greater than 10 volts?

→ **Yes**
REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

→ **No**
GO to [J3](#).

J3 CHECK CIRCUIT 20-HC6 (PK/YE) FOR A SHORT TO GROUND

1

2

A0005663

2 Measure the resistance between driver heated seat switch C344 pin 3, circuit 20-HC6 (PK/YE), harness side and ground.

- Is the resistance less than 5 ohms?

→ **Yes**
GO to [J4](#).

→ **No**
REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

J4 CHECK CIRCUIT 20S-HC21 (PK/BK) FOR A SHORT TO GROUND

1

Driver Heated Seat Module C359

2

2 Measure the resistance between driver heated seat switch C344 pin 4, circuit 20S-HC21 (PK/BK), harness side and ground.

A0005664

- Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to J5.

→ **No**
REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

J5 CHECK CIRCUIT 20S-HC22 (PK/YE) FOR A SHORT TO GROUND

1

Passenger Heated Seat Module C329

2

Passenger Heated Seat Switch C342

3

A0005664

- 3 Measure the resistance between passenger heated seat switch C342 pin 4, circuit 20S-HC22 (PK/YE), harness side and ground.

- Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to J6.

→ **Yes**

REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

J6 CHECK THE PASSENGER HEATED SEAT MODULE FOR A SHORT

1

Passenger Heated Seat Switch C342

2

Passenger Heated Seat Module C329

4

3 Install a new CJB fuse 216 (5A).

5 Press the passenger heated seat switch to ON.

• Is CJB fuse 216 (5A) OK?

→ **Yes**
GO to [J7](#).

→ **No**
INSTALL a new passenger heated seat module. REFER to [Heated Seat Module](#). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

J7 CHECK THE DRIVER HEATED SEAT MODULE FOR A SHORT

1

Driver Heated Seat Switch C344

2

Driver Heated Seat Module C359

3

4 Press the driver heated seat switch to ON.

● Is CJB fuse 216 (5A) OK?

→ Yes

CHECK the driver and passenger system for an intermittent short to ground. REVERIFY the symptom. REFER to the Symptom Chart.

→ No

INSTALL a new driver heated seat module. REFER to [Heated Seat Module](#). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

J8 CHECK THE ANTI-THEFT OPERATION

NOTE: The anti-theft system and heated seat system use a common fuse. CJB Fuse 205 (5A) supplies ignition power to both the anti-theft system and heated seat system.

1 Check the anti-theft system operation. Refer to [Section 419-01A](#).

● Does the anti-theft system operate?

→ Yes

GO to [J9](#).

→ No

REFER to [Section 419-01A](#) to repair the anti-theft system operation. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#)

J9 CHECK CIRCUIT 15-HC21 (GN/BK) FOR AN OPEN

1

2

Driver Heated Seat Module C359

3

4

A0003088

4

Measure the voltage between driver heated seat module C359 pin 6, circuit 15-HC21 (GN/BK), harness side and ground.

• **Is the voltage greater than 10 volts?**

→ **Yes**
GO to J10.

→ **No**
REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

J10 CHECK THE COMMON BATTERY SUPPLY

1

A0003089

1

Measure the voltage between driver heated seat module C359 pin 4, circuit 30-HC21 (RD), harness side and ground.

• **Is the voltage greater than 10 volts?**

→ **Yes**
The heated seat system is operating correctly. CHECK each system independently. REVERIFY the symptom. REFER to the Symptom Chart.

→ **No**
GO to J11.

J11 CHECK CIRCUIT 30-HC21 (RD) FOR AN OPEN

1

1 Measure voltage between BJB fuse 411 (15A) and ground.

• Is the voltage greater than 10 volts?

→ **Yes**
REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

→ **No**
GO to [J12](#).

J12 CHECK CIRCUIT 30-HC21 (RD) FOR A SHORT TO GROUND

1

2

Passenger Heated Seat Module C329

3

3 Measure the resistance between driver heated seat module C359 pin 4, circuit 30-HC21 (RD), harness side and ground.

• Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to [J13](#).

→ **No**
REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

J13 CHECK FOR A SHORTED PASSENGER HEATED SEAT SYSTEM

1

Passenger Heated Seat Module C329

3

2 Install a new BJB fuse 411 (15A).

4 Press the passenger heated seat switch to ON.

● Is rear BJB fuse 411 (15A) OK?

→ **Yes**
GO to J15.

→ **No**
GO to J14.

J14 CHECK FOR A SHORTED PASSENGER HEATING ELEMENT CIRCUIT

1

2

Passenger Heated Seat Module C329

3

A0003119

3 Measure the resistance between passenger heated seat module C329 pin 3, circuit 20S-HC20 (PK/WH), harness side and ground.

- Is the resistance greater than 10,000 ohms?

→ **Yes**

INSTALL a new passenger heated seat module. REFER to Heated Seat Module. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

→ **No**

REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

J15 CHECK FOR A SHORTED DRIVER HEATED SEAT SYSTEM

1

Driver Heated Seat Module C359

2

3 Press the driver heated seat switch to ON.

- Is rear BJB fuse 411 (15A) OK?

→ **Yes**

The heated seat system is operating correctly. CHECK each system independently. REVERIFY the symptom. REFER to the Symptom Chart.

→ **No**

GO to J16.

J16 CHECK FOR A SHORTED DRIVER HEATING ELEMENT CIRCUIT

1

2

Driver Heated Seat Module C359

3

3

Measure the resistance between driver heated seat module C359 pin 3, circuit 20S-HC17 (BK), harness side and ground.

- **Is the resistance greater than 10,000 ohms?**

→ **Yes**

INSTALL a new driver heated seat module. REFER to [Heated Seat Module](#). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

→ **No**

REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

PINPOINT TEST K: THE POWER LUMBAR IS INOPERATIVE — DRIVER

CONDITIONS	DETAILS/RESULTS/ACTIONS
K1 CHECK THE DRIVER POWER SEAT OPERATION	
<p>NOTE: If a seat equipped with a side mounted side airbag and/or a safety belt pretensioner (if equipped) system is being serviced the airbag system must be deactivated per the deactivation procedure contained in Section 501-20B.</p>	
<p>NOTE: Airbag simulators (Restraint system diagnostic tools) MUST be installed under the seats in the side airbag and safety belt pretensioner (if equipped) to floor connectors.</p>	
<p>NOTE: Diagnostics or repairs are not to be performed on a side airbag system and/or a safety belt pretensioner (if equipped) system with the seats in the vehicle. Prior to attempting to diagnose/repair the side airbag system and/or a safety belt pretensioner (if equipped) system the seats must be removed from the vehicle and the restraint system diagnostic tools must be installed in the side airbag and the safety belt pretensioner (if equipped) connectors at the floor connectors. The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.</p>	
<p>NOTE: Diagnostics may be performed on seat systems other than the side airbag or the safety belt pretensioner (if equipped) system (lumbar, climate controlled, heated, power seat track) with the seat installed in the vehicle as long as the restraint system diagnostic tools are installed under the seats in the side airbag and safety belt pretensioner to floor connectors.</p>	

NOTE: After diagnosing/repairing a seat system, **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

1 Operate the driver power seat.

● **Does the power seat operate?**

→ **Yes**
GO to K2.

→ **No**
Go To Pinpoint Test C.

K2 CHECK CIRCUIT 30-AH40 (RD) FOR AN OPEN

1 Deactivate the supplemental restraint system (SRS). Refer to Section 501-20B.

2

3

Driver Seat Lumbar Control Switch C361

4

5

A0003120

5 Measure the voltage between the driver seat lumbar control switch C361 pin 5, circuit 30-AH40 (RD), harness side and ground.

● **Is the voltage greater than 10 volts?**

→ **Yes**
GO to K3.

→ **No**
REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-

K3 CHECK CIRCUIT 31-AH40 (BK) FOR AN OPEN

1

2

2

Measure the resistance between driver seat lumbar control switch C361 pin 3, circuit 31-AH40 (BK), harness side and ground.

- Is the resistance less than 5 ohms?

→ **Yes**
GO to K4.

→ **No**
REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

K4 CHECK THE DRIVER SEAT LUMBAR MOTOR

1

Driver Seat Lumbar Control Switch C361

2

Driver Seat Lumbar Motor C366

3

3

Measure the voltage between driver seat lumbar motor C366, circuit 32-AH39 (WH/BU), harness side and driver seat lumbar motor C366, circuit 33-AH39 (YE/BU), harness side.

A0003122

4 Operate the driver seat lumbar control switch in both directions.

● Is the voltage greater than 10 volts?

→ **Yes**
 INSTALL a new driver seat lumbar motor. REFER to Motor—Front Seat Lumbar. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

→ **No**
 GO to K5.

K5 CHECK CIRCUIT 32-AH39 (WH/BU) AND 33-AH39 (YE/BU) FOR A SHORT TO GROUND

1

2

Driver Seat Lumbar Control Switch C361

3

A0003060

3 Measure the resistance between driver seat lumbar control switch C361 pin 1, circuit 32-AH39 (WH/BU), harness side and ground; and between driver seat lumbar control switch C361 pin 4, circuit 33-AH39 (YE/BU), harness side and ground.

● Are the resistances greater than 10,000 ohms?

→ **Yes**
GO to [K6](#).

→ **No**
REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

K6 CHECK CIRCUIT 32-AH39 (WH/BU) FOR AN OPEN

1

1

Measure the resistance between driver seat lumbar control switch C361 pin 1, circuit 32-AH39 (WH/BU), harness side and driver seat lumbar motor C366, circuit 32-AH39 (WH/BU), harness side.

- Is the resistance less than 5 ohms?

→ **Yes**
GO to [K7](#).

→ **No**
REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

K7 CHECK CIRCUIT 33-AH39 (YE/BU) FOR AN OPEN

1

1

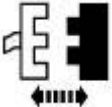

Measure the resistance between driver seat lumbar control switch C361 pin 4, circuit 33-AH39 (YE/BU), harness side and driver seat lumbar motor C366, circuit 33-AH39 (YE/BU), harness side.

- Is the resistance less than 5 ohms?

→ **Yes**
INSTALL a new driver seat lumbar

	<p>control switch. REFER to Lumbar Control Switch . TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B .</p> <p>→ No REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B .</p>
--	--

PINPOINT TEST L: THE POWER LUMBAR IS INOPERATIVE — PASSENGER

CONDITIONS	DETAILS/RESULTS/ACTIONS
L1 CHECK THE PASSENGER POWER SEAT OPERATION	
<p>NOTE: If a seat equipped with a side mounted side airbag and/or a safety belt pretensioner (if equipped) system is being serviced the airbag system must be deactivated per the deactivation procedure contained in Section 501-20B .</p> <p>NOTE: Airbag simulators (Restraint system diagnostic tools) MUST be installed under the seats in the side airbag and safety belt pretensioner (if equipped) to floor connectors.</p> <p>NOTE: Diagnostics or repairs are not to be performed on a side airbag system and/or a safety belt pretensioner (if equipped) system with the seats in the vehicle. Prior to attempting to diagnose/repair the side airbag system and/or a safety belt pretensioner (if equipped) system the seats must be removed from the vehicle and the restraint system diagnostic tools must be installed in the side airbag and the safety belt pretensioner (if equipped) connectors at the floor connectors. The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.</p> <p>NOTE: Diagnostics may be performed on seat systems other than the side airbag or the safety belt pretensioner (if equipped) system (lumbar, climate controlled, heated, power seat track) with the seat installed in the vehicle as long as the restraint system diagnostic tools are installed under the seats in the side airbag and safety belt pretensioner to floor connectors.</p> <p>NOTE: After diagnosing/repairing a seat system, The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.</p>	
	<p>1 Operate the passenger power seat.</p> <p style="padding-left: 40px;">● Does the power seat operate?</p> <p>→ Yes GO to L2 .</p> <p>→ No Go To Pinpoint Test D .</p>
L2 CHECK CIRCUIT 30-AH46 (RD) FOR AN OPEN	
<p>1</p> 	<p>1 Deactivate the supplemental restraint system (SRS). Refer to Section 501-20B .</p>

Passenger Seat Lumbar Control Switch C331

2

A0003120

2 Measure the voltage between the passenger seat lumbar control switch C331 pin 5, circuit 30-AH46 (RD), harness side and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
GO to L3.

→ **No**
REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

L3 CHECK CIRCUIT 31-XL20 (BK) FOR AN OPEN

1

2

A0003121

2 Measure the resistance between passenger seat lumbar control switch C331 pin 3, circuit 31-AH46 (BK), harness side and ground.

● Is the resistance less than 5 ohms?

→ **Yes**
GO to L4.

→ **No**
REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint

system (SRS). REFER to [Section 501-20B](#).

L4 CHECK THE PASSENGER SEAT LUMBAR MOTOR

1

Passenger Seat Lumbar Control Switch C331

2

Passenger Seat Lumbar Motor C336

3

A0003122

3

Measure the voltage between passenger seat lumbar motor C336, circuit 32-AH23 (WH/BU), harness side and passenger seat lumbar motor C336, circuit 33-AH23 (YE/BU), harness side.

4

Operate the passenger seat lumbar control switch in both directions.

- **Is the voltage greater than 10 volts?**

→ **Yes**

INSTALL a new driver seat lumbar motor. REFER to [Motor—Front Seat Lumbar](#). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

→ **No**

GO to [L5](#).

L5 CHECK CIRCUIT 32-AH45 (WH/BU) AND 33-AH45 (YE/BU) FOR A SHORT TO GROUND

1

2

Passenger Seat Lumbar Control Switch C331

3

3

Measure the resistance between passenger seat lumbar control switch C331 pin 1, circuit 32-AH45 (WH/BU), harness side and ground; and between passenger seat lumbar control switch C331 pin 4, circuit 33-AH45 (YE/BU), harness side and ground.

- Are the resistances greater than 10,000 ohms?

→ **Yes**
GO to L6.

→ **No**
REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

L6 CHECK CIRCUIT 32-AH45 (WH/BU) FOR AN OPEN

1

1

Measure the resistance between passenger seat lumbar control switch C331 pin 1, circuit 32-AH45 (WH/BU), harness side and passenger seat lumbar motor C336, circuit 32-AH45 (WH/BU), harness side.

- Is the resistance less than 5 ohms?

→ **Yes**
GO to L7.

→ **No**
REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

L7 CHECK CIRCUIT 33-AH45 (YE/BU) FOR AN OPEN

1

1

Measure the resistance between passenger seat lumbar control switch

A0003124

C331 pin 4, circuit 33-AH45 (YE/BU), harness side and passenger seat lumbar motor C336, circuit 33-AH23 (YE/BU), harness side.

- Is the resistance less than 5 ohms?

→ **Yes**

INSTALL a new passenger seat lumbar control switch. REFER to Lumbar Control Switch . TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B .

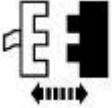

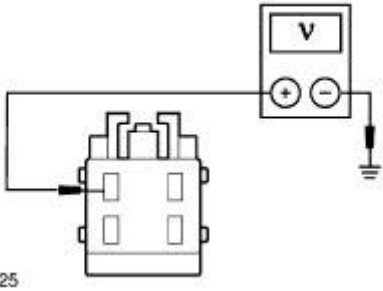

→ **No**

REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B .

PINPOINT TEST M: DTC B1676 BATTERY PACK VOLTAGE OUT OF RANGE

CONDITIONS	DETAILS/RESULTS/ACTIONS
M1 CHECK FOR VOLTAGE AT THE DSM	
<p>NOTE: If a seat equipped with a side mounted side airbag and/or a safety belt pretensioner (if equipped) system is being serviced the airbag system must be deactivated per the deactivation procedure contained in <u>Section 501-20B</u> .</p>	
<p>NOTE: Airbag simulators (Restraint system diagnostic tools) MUST be installed under the seats in the side airbag and safety belt pretensioner (if equipped) to floor connectors.</p>	
<p>NOTE: Diagnostics or repairs are not to be performed on a side airbag system and/or a safety belt pretensioner (if equipped) system with the seats in the vehicle. Prior to attempting to diagnose/repair the side airbag system and/or a safety belt pretensioner (if equipped) system the seats must be removed from the vehicle and the restraint system diagnostic tools must be installed in the side airbag and the safety belt pretensioner (if equipped) connectors at the floor connectors. The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.</p>	
<p>NOTE: Diagnostics may be performed on seat systems other than the side airbag or the safety belt pretensioner (if equipped) system (lumbar, climate controlled, heated, power seat track) with the seat installed in the vehicle as long as the restraint system diagnostic tools are installed under the seats in the side airbag and safety belt pretensioner to floor connectors.</p>	
<p>NOTE: After diagnosing/repairing a seat system, The restraint system diagnostic tools must</p>	

be removed prior to operating the vehicle over the road.

<p>1</p>  <p>3</p>  <p>DSM C341b</p> <p>4</p>  <p>5</p>  <p>A0003125</p>	<p>2</p> <p>Deactivate the supplemental restraint system (SRS). Refer to Section 501-20B.</p> <p>5</p> <p>Measure the voltage between DSM C341b pin 4, circuit 30-AH80 (RD), harness side and ground.</p> <ul style="list-style-type: none"> • Is the voltage between 11.5 and 16 volts? <p>→ Yes CLEAR the DTC. REPEAT the DSM self-test. If DTC B1676 is retrieved, INSTALL a new DSM. REFER to Section 419-10. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.</p> <p>→ No REFER to Section 414-00 for battery and charging system repair.</p>
---	---

PINPOINT TEST N: THE POWER SEAT DOES NOT MOVE HORIZONTALLY/VERTICALLY — DRIVER

CONDITIONS	DETAILS/RESULTS/ACTIONS
N1 CHECK HORIZONTAL DIRECTION MOTOR FOR CORRECT OPERATION	

NOTE: If a seat equipped with a side mounted side airbag and/or a safety belt pretensioner (if equipped) system is being serviced **the airbag system must be deactivated** per the deactivation procedure contained in [Section 501-20B](#).

NOTE: Airbag simulators (Restraint system diagnostic tools) **MUST** be installed under the seats in the side airbag and safety belt pretensioner (if equipped) to floor connectors.

NOTE: Diagnostics or repairs are not to be performed on a side airbag system and/or a safety belt pretensioner (if equipped) system with the seats in the vehicle. Prior to attempting to diagnose/repair the side airbag system and/or a safety belt pretensioner (if equipped) system the seats must be removed from the vehicle and the restraint system diagnostic tools must be installed in the side airbag and the safety belt pretensioner (if equipped) connectors at the floor connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: Diagnostics may be performed on seat systems other than the side airbag or the safety belt pretensioner (if equipped) system (lumbar, climate controlled, heated, power seat track) with the seat installed in the vehicle as long as the restraint system diagnostic tools are installed under the seats in the side airbag and safety belt pretensioner to floor connectors.

NOTE: After diagnosing/repairing a seat system, **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

<p>1</p>  <p>3</p> 	<p>2 Deactivate the supplemental restraint system (SRS). Refer to Section 501-20B.</p> <p>4 Operate the driver power seat forward and rearward.</p> <ul style="list-style-type: none"> ● Will the seat move horizontally? <p>→ Yes GO to N2.</p> <p>→ No GO to N3.</p>
---	--

N2 CHECK BACKREST MOTOR FOR CORRECT OPERATION

	<p>1 Operate the driver power seat backrest up and down.</p> <ul style="list-style-type: none"> ● Will the seat backrest move up and down? <p>→ Yes GO to N6.</p> <p>→ No GO to N13.</p>
--	--

N3 CHECK THE VOLTAGE TO THE DRIVER SEAT FORWARD/REVERSE MOTOR

1

Driver Seat Forward/Reverse Motor C362

2

A0003068

2

Measure the voltage between driver seat forward/reverse motor C362 pin 1, circuit 32-AH37 (YE/GN), harness side and C362 pin 2, circuit 33-AH37 (WH/GN), harness side, while pushing the driver seat regulator control switch forward and rearward.

- Is the voltage greater than 10 volts when the switch is pushed forward, greater than -10 volts when the switch is pushed rearward, and 0 volts when the switch is in a rest position?

→ **Yes**

INSTALL a new driver seat forward/reverse motor. REFER to [Seat Track](#). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

→ **No**

GO to [N4](#).

N4 CHECK CIRCUIT 32-AH37 (WH/GN) FOR AN OPEN AND SHORT TO GROUND

1

2

Driver Seat Forward/Reverse Motor C362

3

3

Measure the resistance between driver seat regulator control switch C360 pin 3, circuit 32-AH37 (WH/GN), harness side and driver seat forward/reverse motor C362 pin 2, circuit 32-AH37 (WH/GN), harness side; and between driver seat regulator control switch C360 pin 3, circuit 32-AH37 (WH/GN),

A0005668

harness side and ground.

- Is the resistance less than 5 ohms between the driver seat forward/reverse motor and the driver seat regulator control switch, and greater than 10,000 ohms between the driver seat regulator control switch and ground?

→ **Yes**
GO to N5.

→ **No**
REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

N5 CHECK CIRCUIT 33-AH37 (YE/GN) FOR AN OPEN AND SHORT TO GROUND

1

A0005669

1

Measure the resistance between driver seat regulator control switch C360 pin 11, circuit 33-AH37 (YE/GN), harness side and driver seat forward/reverse motor C362 pin 2, circuit 33-AH37 (YE/GN), harness side; and between driver seat regulator control switch C360 pin 11, circuit 33-AH37 (YE/GN), harness side and ground.

- Is the resistance less than 5 ohms between the driver seat forward/reverse motor and the driver seat regulator control switch, and greater than 10,000 ohms between the driver seat regulator control switch and ground?

→ **Yes**
INSTALL a new driver seat regulator control switch. REFER to Seat Control Switch. TEST the system for normal

operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

→ **No**
REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

N6 DETERMINE SEAT TILTING FAILURE

1 Determine seat tilting failure.

- **Can the seat be tilted forward or backward?**

→ **Yes**
If only forward tilting operates, GO to [N7](#).

If only rear tilting operates, GO to [N10](#).

→ **No**
INSTALL a new driver seat regulator control switch. REFER to [Seat Control Switch](#). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

N7 CHECK THE VOLTAGE TO THE DRIVER SEAT REAR HEIGHT MOTOR

1

Driver Seat Rear Height Motor C382

2

A0003068

2 Measure the voltage between driver seat rear height motor C382 pin 1, circuit 32-AH41 (WH/VT), harness side and C382 pin 2, circuit 33-AH41 (WH/VT), harness side, while depressing the rear tilt switch up and down.

- **Is the voltage greater than +10 volts when the rear tilt switch is pressed down, greater than -10**

volts when the rear tilt switch is pressed up and 0 volts when the switch is in the rest position?

→ **Yes**

INSTALL a new the driver seat rear height motor. REFER to Seat Track. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

→ **No**

GO to N8.

N8 CHECK CIRCUIT 32-AH41 (WH/VT) FOR OPEN AND SHORT TO GROUND

1

Driver Seat Regulator Control Switch C360

2

A0005701

2

Measure the resistance between driver seat regulator control switch C360 pin 8, circuit 32-AH41 (WH/VT), harness side and driver seat rear height motor C382 pin 1, circuit 32-AH41 (WH/VT), harness side; and between driver seat regulator control switch C360 pin 8, circuit 32-AH41 (WH/VT), and ground.

- **Is the resistance less than 5 ohms between the driver seat rear height motor and the driver seat regulator control switch, and greater than 10,000 ohms between the driver seat regulator control switch and ground?**

→ **Yes**

GO to N9.

→ **No**

REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to Section 501-20B.

N9 CHECK CIRCUIT 33-AH41 (WH/VT) FOR OPEN AND SHORT TO GROUND

1

1

Measure the resistance between driver seat regulator control switch C360 pin 9, circuit 33-AH41 (WH/VT), harness

A0005700

side and driver seat rear height motor C382 pin 2, circuit 33-AH41 (WH/VT), harness side; and between driver seat regulator control switch C360 pin 9, circuit 33-AH41 (WH/VT), harness side and ground.

- Is the resistance less than 5 ohms between the driver seat rear height motor and the driver seat regulator control switch, and greater than 10,000 ohms between the driver seat regulator control switch and ground?

→ **Yes**

INSTALL a new driver seat regulator control switch. REFER to [Seat Control Switch](#). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

→ **No**

REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

N10 CHECK THE VOLTAGE TO DRIVER SEAT FRONT HEIGHT MOTOR

1

Driver Seat Front Height Motor C363

2

A0003068

2

Measure the voltage between driver seat front height motor C363 pin 1, circuit 33-AH38 (YE/BK), harness side and C363 pin 2, circuit 32-AH38 (WH/BK), while pushing the rear tilting switch up and down.

- Is the voltage greater than +10

volts when the front tilt switch is pressed down, greater than -10 volts when the front tilt switch is pressed up and 0 volts when the switch is in the rest position?

→ **Yes**

INSTALL a new driver seat front height motor. REFER to [Seat Track](#). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

→ **No**

GO to [N11](#).

N11 CHECK CIRCUIT 32-AH38 (WH/BK) FOR OPEN AND SHORT TO GROUND

1

Driver Seat Regulator Control Switch C360

2

2

Measure the resistance between driver seat regulator control switch C360 pin 5, circuit 32-AH38 (WH/BK), harness side and driver seat front height motor C363 pin 2, circuit 32-AH38 (WH/BK), harness side; and between driver seat regulator control switch C360 pin 5, circuit 32-AH38 (WH/BK), harness side and ground.

- **Is the resistance less than 5 ohms between the driver seat front height motor and the driver seat regulator control switch, and greater than 10,000 ohms between the driver seat regulator control switch and ground?**

→ **Yes**

GO to [N12](#).

→ **No**

REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). REFER to [Section 501-20B](#). PROVE OUT the supplemental restraint system (SRS).

N12 CHECK CIRCUIT 33-AH38 (YE/BK) FOR OPEN

1

1

Measure the resistance between driver

A0005703

seat regulator control switch C360 pin 4, circuit 33-AH38 (YE/BK) harness side, and driver seat front height motor C363 pin 1, circuit 33-AH38 (YE/BK), harness side; and between driver seat regulator control switch C360 pin 4, circuit 33-AH38 (YE/BK), harness side and ground.

- **Is the resistance less than 5 ohms between the driver seat front height motor and the driver seat regulator control switch, and greater than 10,000 ohms between the driver seat regulator control switch and ground?**

→ **Yes**

INSTALL a new driver seat regulator control switch. REFER to [Seat Control Switch](#). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

→ **No**

REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

N13 CHECK THE VOLTAGE TO DRIVER SEAT BACKREST MOTOR

1

Driver Seat Backrest Motor C368

2

A0005708

2

Measure the voltage between driver seat backrest motor C368 pin 1, circuit 32-AH36 (WH/RD), harness side and C363 pin 2, circuit 33-AH36 (YE/RD), while pushing the backrest switch forward and rearward.

- **Is the voltage greater than 10 volts**

when the switch is pushed forward, greater than -10 volts when the switch is pushed rearward, and 0 volts when the switch is in a rest position?

→ **Yes**

INSTALL a new driver seat backrest motor. REFER to [Front Seat Backrest](#). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

→ **No**

GO to [N14](#).

N14 CHECK CIRCUIT 32-AH36 (WH/RD) FOR OPEN AND SHORT TO GROUND

1

Driver Seat Regulator Control Switch C360

2

2

Measure the resistance between driver seat regulator control switch C360 pin 12, circuit 32-AH36 (WH/RD), harness side and driver seat backrest motor C368 pin 1, circuit 32-AH36 (WH/RD), harness side; and between driver seat regulator control switch C360 pin 12, circuit 32-AH36 (WH/RD), harness side and ground.

- **Is the resistance less than 5 ohms between the driver seat backrest motor and the driver seat regulator control switch, and greater than 10,000 ohms between the driver seat regulator control switch and ground?**

→ **Yes**

GO to [N15](#).

→ **No**

REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

N15 CHECK CIRCUIT 33-AH36 (YE/RD) FOR OPEN

1

1

Measure the resistance between driver

seat regulator control switch C360 pin 7, circuit 33-AH36 (YE/RD) harness side, and driver seat backrest motor C368 pin 2, circuit 33-AH36 (YE/RD), harness side; and between driver seat regulator control switch C360 pin 7, circuit 33-AH36 (YE/RD), harness side and ground.

- **Is the resistance less than 5 ohms between the driver seat backrest motor and the driver seat regulator control switch, and greater than 10,000 ohms between the seat regulator control switch and ground?**

→ **Yes**

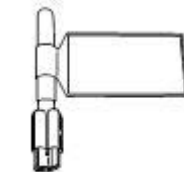

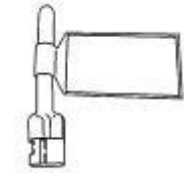

INSTALL a new driver seat regulator control switch. REFER to [Seat Control Switch](#). TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

→ **No**

REPAIR the circuit. TEST the system for normal operation. REACTIVATE the supplemental restraint system (SRS). PROVE OUT the supplemental restraint system (SRS). REFER to [Section 501-20B](#).

Supplemental Restraint System (SRS) Deactivation and Reactivation

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (1 Req'd) 418-F395
 ST2506-A	Diagnostic Tool, Restraint System (3 Req'd) 418-F088 (105-R0012)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)

Deactivation

 **WARNING:** Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Do not set a live air bag module down with the trim cover face down. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

 **WARNING:** Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

 **WARNING:** The safety belt buckle pretensioner and safety belt retractor pretensioner are pyrotechnic devices. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: Vehicle sensor orientation is critical for proper system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. Replace and properly position the sensor or any other damaged supplemental restraint system (SRS) components whether or not the air bag is deployed.

WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

NOTE: If a seat equipped with a seat mounted side air bag and/or a safety belt pretensioner (if equipped) system is being serviced, **the air bag system must be deactivated.**

NOTE: Restraint system diagnostic tools **MUST** be installed under the seats in the seat side air bag (if equipped) and safety belt pretensioner (if equipped) to floor connectors.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle workshop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, Disconnect the battery ground cable and wait at least one minute to allow for the depletion of the restraint system backup power supply. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute to allow for the depletion of the restraint system backup power supply. For additional information, refer to [Section 414-01](#).

- Remove the two screws and pull out on the lower steering column opening finish panel enough to access the electrical connectors.

3. Remove the lower steering column opening finish panel.
 1. Disconnect the electrical connectors.
 2. Remove the lower steering column opening finish panel.

4. Remove the screws. Separate the hood latch release cable and handle assembly from the steering column opening reinforcement.

5. Remove the two pin-type retainers and the RH instrument panel insulator.
 - Disconnect the courtesy lamp.

6. Remove the screw and the heater duct.

7. Loosen the two driver-side instrument panel tunnel brace bolts.
- Position the carpet aside to gain access to the bolts.

8. Remove the screws and the steering column opening reinforcement.

9. Disconnect the clockspring electrical connector at the base of the steering column.

10. Attach the restraint system diagnostic tool to the vehicle harness side of the clockspring

electrical connector.

11. Remove the glove compartment. For additional information, refer to [Section 501-12](#).
12. Disconnect the passenger air bag module electrical connector.
 1. Reaching into the glove box opening toward the center of the instrument panel, under the cross-car beam, slide and disengage the passenger air bag module electrical connector locking clip.
 2. Push in on the two release tabs and disconnect the passenger air bag module electrical connector.

13. Attach the restraint system diagnostic tool to the vehicle harness side of the passenger air bag electrical connector.

14. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).
15. Move and tilt the front seats to their highest and most forward position.
16.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors,

instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle workshop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, Disconnect the battery ground cable and wait at least one minute to allow for the depletion of the restraint system backup power supply. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute to allow for the depletion of the restraint system backup power supply. For additional information, refer to [Section 414-01](#).

17. From under the passenger seat, release the tab on the connector bracket and remove the passenger seat side air bag electrical connector.

18. Disconnect the passenger seat side air bag electrical connector.
 1. Slide and disengage the passenger seat side air bag electrical connector locking clip.
 2. Push in to release the tab and disconnect the passenger seat side air bag electrical connector.

19. Attach the restraint system diagnostic tool to the passenger seat side air bag floor electrical connector.

20. Remove the passenger side B-pillar weatherstripping.
21. Position the safety belt D-ring to its highest point.
22. Remove the passenger side B-pillar upper trim panel.

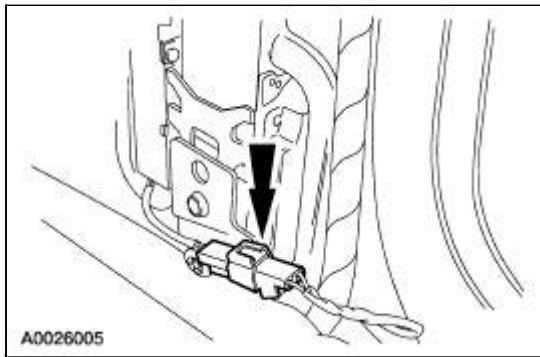

23. Remove the passenger side front and rear door scuff plates.

24. Remove the passenger side B-pillar lower trim panel.

25. Disconnect the passenger side safety belt retractor pretensioner floor electrical connector.

26. Attach the restraint system diagnostic tool to the passenger side safety belt retractor pretensioner floor electrical connector.

27. From under the driver seat, release the tab on the connector bracket and remove the driver seat side air bag electrical connector.

28. Disconnect the driver seat side air bag electrical connector.
1. Slide and disengage the driver seat side air bag electrical connector locking clip.
 2. Push down to release the tab and disconnect the driver seat side air bag electrical connector.

29. Attach the restraint system diagnostic tool to the driver seat side air bag floor electrical connector.

30. Remove the driver side B-pillar weatherstripping.
31. Position the safety belt D-ring to its highest point.
32. Remove the driver side B-pillar upper trim panel.

33. Remove the driver side front and rear door scuff plates.

34. Remove the driver side B-pillar lower trim panel.

35. Disconnect the driver side safety belt retractor pretensioner electrical connector.

36. Attach the restraint system diagnostic tool to the driver side safety belt retractor pretensioner floor electrical connector.

37. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).
38. With the restraint system diagnostic tools installed at all deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to [Section 501-20B](#).
39. Disconnect the battery ground cable and wait at least one minute to allow for the depletion of the restraint system backup power supply. For additional information, refer to [Section 414-01](#).

Reactivation

WARNING: To reduce the risk of serious personal injury, read and follow all warnings and notes at the beginning of the deactivation procedure.

1. Remove the restraint system diagnostic tool from the driver side safety belt retractor pretensioner floor electrical connector.

2. Connect the driver side safety belt retractor pretensioner electrical connector.

3. Install the driver side B-pillar lower trim panel.

4. Install the driver side front and rear door scuff plates.

5. **NOTE:** Position the safety belt D-ring to its highest point.

Install the driver side B-pillar upper trim panel.

6. Install the driver side B-pillar weatherstripping.
7. Remove the restraint system diagnostic tool from the driver seat side air bag floor electrical connector.

8. Connect the driver seat side air bag electrical connector.
 1. Connect the driver seat side air bag electrical connector.
 2. Slide and engage the driver seat side air bag electrical connector locking clip.

9. Install the driver seat side air bag electrical connector onto the connector bracket under the driver seat.

10. Remove the restraint system diagnostic tool from the passenger side safety belt retractor pretensioner electrical connector.

11. Connect the passenger side safety belt retractor pretensioner electrical connector.

12. Install the passenger side B-pillar lower trim panel.

13. Install the passenger side front and rear door scuff plates.

14. **NOTE:** Position the safety belt D-ring to its highest point.

Install the passenger side B-pillar upper trim panel.

15. Install the passenger side B-pillar weatherstripping.

16. Remove the restraint system diagnostic tool from the passenger seat side air bag floor electrical connector.

17. Connect the passenger seat side air bag electrical connector.

1. Connect the passenger seat side air bag electrical connector.
2. Slide and engage the passenger seat side air bag electrical connector locking clip.

18. Install the passenger seat side air bag electrical connector onto the connector bracket under the passenger seat.

19. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).

20. Position the front seats rearward.

21.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle workshop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, Disconnect the battery ground cable and wait at least one minute to allow for the depletion of the restraint system backup power supply. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute to allow for the depletion of the restraint system backup power supply. For additional information, refer to [Section 414-01](#).

22. Remove the restraint system diagnostic tool from the vehicle harness side of the passenger air bag electrical connector.

23. Connect the passenger air bag module electrical connector.
1. Reach into the glove box opening toward the center of the instrument panel, under the cross-car beam and connect the passenger air bag module electrical connector.
 2. Slide and engage the passenger air bag module electrical connector locking clip.

24. Install the glove compartment. For additional information, refer to [Section 501-12](#).
25. Remove the restraint system diagnostic tool from the vehicle harness side of the clockspring electrical connector.

26. Connect the clockspring electrical connector at the base of the steering column.

27. Position the steering column opening reinforcement and install the screws.

28. Tighten the two driver-side instrument panel tunnel brace bolts.

- Reposition the carpet.

29. Position the heater duct and install the screw.

30. Install the RH instrument panel insulator and the two pin-type retainers.

- Connect the courtesy lamp.

31. Position the hood latch release cable and handle assembly to the steering column opening reinforcement and install the screws.

32. Connect the electrical connectors to the switches in the lower steering column opening finish panel.

33. Install the lower steering column opening finish panel to the instrument panel.
1. Position the lower steering column opening finish panel to the instrument panel and push in, seating the retaining clips.
 2. Install the screws.

34. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).

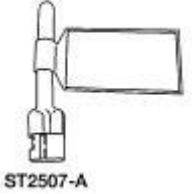

35.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to [Section 501-20B](#).

36. Check the active restraint system for correct operation. For additional information, refer to [Section 501-20A](#).
-

Seat Control Switch

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (1 Req'd) 418-F395
 ST2506-A	Diagnostic Tool, Restraint System (3 Req'd) 418-F088 (105-R0012)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)

Removal

 **WARNING:** Always wear safety glasses when repairing a air bag supplemental restraint system (SRS) vehicle and when handling an airbag module. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

 **WARNING:** Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

NOTE: The left side is shown, the right side is similar.

1. Prepare the vehicle for seat control switch removal.

1.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute.

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to [Section 414-01](#).

2.  **WARNING:** To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the supplemental restraint system (SRS) deactivation and reactivation procedure.

Deactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

3.  **WARNING:** To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the seat removal and installation procedure.

Remove the affected seat. For additional information, refer to [Front Seat](#) in this section.

2.  **CAUTION:** Do not use a screwdriver to remove the safety belt cover.

Remove the front safety belt cover by placing fingers behind the cover and pushing outward.

3. Remove the side trim panel screw.

4. Remove the side trim panel screw.

5. Remove the seat control knobs.

6. Position the seat regulator control switch plate aside.

7. Remove the screw and set aside the front cushion side shield.

8. Remove the seat regulator control switch.
 1. Remove the screws.
 2. Disconnect the electrical connector.

Installation

⚠ WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.

1. Install the seat regulator control switch.
 1. Connect the electrical connector.
 2. Install the screws.

2. Position the front cushion side shield and install the screw.

3. Install the seat regulator control switch plate.

4. Install the seat control knobs.

5. Install the side trim panel screw.

6. Install the side panel trim screw.

7. Install the front safety belt cover.

8. Restore the vehicle to operating condition.

1.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the seat removal and installation procedure.**

Install the affected seat. For additional information, refer to [Front Seat](#) in this section.

2.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the supplemental restraint system (SRS) deactivation and reactivation procedure.**

Reactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

3.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to [Section 501-20B](#).

4. Check the active restraint system for correct operation. For additional information, refer to [Section 501-20A](#).
-

Heated Seat Switch

Removal and Installation

All vehicles

1. Apply the parking brake.

Vehicles with manual transmission

2. If equipped with a manual transmission, place the selector lever in fourth gear.

Vehicles with automatic transmission

3. If equipped with an automatic transmission, place the selector lever in NEUTRAL.

All vehicles

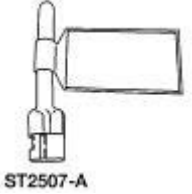

4. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
5. Remove the ashtray finish panel.

6. Remove the two screws and the ashtray assembly.
 - Disconnect the electrical connectors.
 7. Release the locking tabs and remove the heated seat switch.
 8. To install, reverse the removal procedure.
-

Lumbar Control Switch

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (1 Req'd) 418-F395

 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)

Removal

 **WARNING:** Always wear safety glasses when repairing a air bag supplemental restraint system (SRS) vehicle and when handling an airbag module. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

 **WARNING:** Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

NOTE: The left side is shown, the right side is similar.

1. Prepare the vehicle for lumbar control switch removal.

1.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to [Section 414-01](#).

2.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the supplemental restraint system (SRS) deactivation and reactivation procedure.**

Deactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

3.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the seat removal and installation procedure.**

Remove the affected seat. For additional information, refer to [Front Seat](#) in this section.

2. Remove the seat control knobs.

3. Position the seat regulator control switch plate aside.

4. Remove the lumbar control switch.
 1. Disconnect the connector.
 2. Remove the lumbar control switch.

Installation

⚠ WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.

1. Install the lumbar control switch.
 1. Connect the electrical connector.
 2. Install the lumbar control switch.

2. Install the seat regulator control switch plate.

3. Install the seat control knobs.

4. Restore the vehicle to operating condition.

1.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the seat removal and installation procedure.**

Install the affected seat. For additional information, refer to [Front Seat](#) in this section.

2.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation and reactivation procedure.**

Reactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

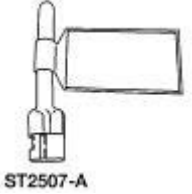

3.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to [Section 501-20B](#).

4. Check the active restraint system for correct operation. For additional information, refer to [Section 501-20A](#).

Front Seat Backrest

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F395
 ST2506-A	Diagnostic Tool, Restraint System (3 Req'd) 418-F088 (105-R0012)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)

Removal

All seats

 **WARNING:** Always wear safety glasses when repairing a air bag supplemental restraint system (SRS) vehicle and when handling an airbag module. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

 **WARNING:** Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

NOTE: If a side air bag deployment took place the seatback pad, trim cover, and side air bag module must be replaced. The seatback frame should be replaced if necessary.

NOTE: The left side is shown, the right side is similar.

1. Prepare the vehicle for front seat backrest removal.

1.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air

bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to [Section 414-01](#).

2.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the supplemental restraint system (SRS) deactivation and reactivation procedure.**

Deactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

3.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the seat removal and installation procedure.**

Remove the affected seat. For additional information, refer to [Front Seat](#) in this section.

2.  **WARNING: Front seat back trim covers installed on seats equipped with side air bags cannot be repaired, they are to be replaced (cleaning is permissible).**

 **CAUTION: When removing the seat backrest trim panel, be careful not to damage the J-hooks. If the seat backrest trim panel J-hooks are damaged, install a new seat backrest trim panel.**

 **CAUTION: When removing the seat backrest trim panel, be careful not to damage the pin-type retainers. Pulling towards you, use a smooth, controlled force to release the pin-type retainers.**

Remove the seat backrest trim panel.

1. Pull and release the pin-type retainers at the bottom of the seat backrest trim panel.
2. While holding the seat backrest trim panel at the bottom, push in on the left side of the panel at the lip of the map pocket and slide it to the right to disengage the J-hook. Repeat this process for the right side J-hook but slide the panel to the left to disengage the hook.
3. While pushing in at the top of the seat backrest trim panel, slide it down to disengage the top J-hooks.
4. Remove the seat backrest trim panel and inspect the J-hooks and pin-type retainers for damage.

Seats with manual lumbar

3. Remove the retaining hook.

4. Align the end of the adjusting cable in the slot.

5. Release the adjusting cable.

All seats

6. Disconnect the electrical connectors.

7. Disconnect the electrical connector.

8. Remove the front cushion side shield trim panel. For additional information, refer to [Seat—Front Cushion Side Shield](#) in this section.

9. Remove the two front seat backrest bolts on each side. Remove the front seat backrest.

Installation

 **WARNING:** To reduce the risk of serious personal injury, read and follow all warnings and notes at the beginning of the removal procedure.

All seats

1. Position the front seat backrest and install two bolts on each side.

2. Install the front cushion side shield trim panel. For additional information, refer to [Seat—Front Cushion Side Shield](#) in this section.
3. Connect the electrical connector.

4. Connect the electrical connectors.

Seats with manual lumbar

5. Install the retaining hook.

6. Align the end of the adjusting cable in the slot.

7. Install the adjusting cable.

8.  **CAUTION: Inspect the seat backrest trim panel J-hooks for damage. If damaged, install a new seat backrest trim panel.**

NOTE: If re-installing the original seat backrest trim panel, install new pin-type retainers.

Install the seat backrest trim panel.

1. Angle the top of the seat backrest trim panel inward and up to engage the upper J-hooks to the seat backrest frame.
2. While holding the seat backrest trim panel up, align the pin-type retainers at the bottom of the seat backrest trim panel and install them into the seat backrest frame.
3. With the palm of your hand, install the J-clips by pushing down on the seat backrest trim panel and towards the center of the seat.
 - Check the retention of the seat backrest trim panel by lightly pulling on the bottom, sides, and top where the retainers are located.

9. Restore the vehicle to operating condition.

1.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the seat removal and installation procedure.**

Install the affected seat. For additional information, refer to [Front Seat](#) in this section.

2.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation and reactivation procedure.**

Reactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

3.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to [Section 501-20B](#).

4. Check the active restraint system for correct operation. For additional information, refer to [Section 501-20A](#).
-

Seat Backrest —Rear Side Bolsters

Removal and Installation

1. Remove the rear seat cushions. For additional information, refer to [Seat—Rear Cushion](#).

2. From the luggage compartment, release and fold down the seat backrest.
3. Remove the rear seat bolster nut.

4. **NOTE:** Pull down the lever to release the LH latch. Push up the lever to release the RH latch.

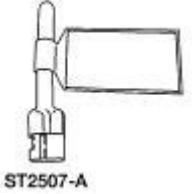

Release the latch and remove the rear seat bolster.

5. To install, reverse the removal procedure.

Front Seat

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F395
 ST2506-A	Diagnostic Tool, Restraint System (3 Req'd) 418-F088 (105-R0012)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)

Removal

 **WARNING:** Always wear safety glasses when repairing a air bag supplemental restraint system (SRS) vehicle and when handling an airbag module. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

 **WARNING:** Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

NOTE: The driver seat is shown, the passenger seat is similar.

NOTE: If a side air bag deployment took place the seatback pad, trim cover, and side air bag module must be replaced. The seatback frame should be replaced if necessary.

1. Prepare the vehicle for seat removal.

1.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to [Section 414-01](#).

2.  **WARNING:** To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation and reactivation procedure.

Deactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

2. Reconnect the battery ground cable.
3. Move the seat rearward.
4. Remove the bolts.

5. Position the seat forward.
6. Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to [Section 414-01](#).

7.  **CAUTION:** Do not use a screwdriver to remove the safety belt cover.

Remove the safety belt cover by placing fingers behind the cover and pushing outward.

8. Remove the nut and the front safety belt.

9. Remove the seat track rear covers.

10. Remove the nuts.

11. Disconnect the electrical connector.

12. Remove the seat.

Installation

 **WARNING:** To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.

1. Position the seat in the vehicle.
2. Connect the electrical connectors.

3. Install the nuts.

4. **NOTE:** Make sure the seat track covers are positioned below the level of the seat track rail to prevent damage to the cover during seat travel.

Install the seat track rear covers.

5. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).
6. Position the seat rearward.
7. Install the bolts.

8. Position the seat forward.
9. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
10. Remove the restraint system diagnostic tool from the driver seat side air bag floor electrical connector.

11. Connect the driver seat side air bag electrical connector.
 1. Connect the driver seat side air bag electrical connector.
 2. Slide and engage the driver seat side air bag electrical connector locking clip.

12. Install the driver seat side air bag electrical connector onto the connector bracket under the driver seat.

13. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).
14. With the restrain system diagnostic tools still installed at the remaining deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to [Section 501-20B](#).

15.  **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute. For additional information, refer to [Section 414-01](#).

16. Install the front safety belt.
 1. Install the safety belt.
 2. Install the bolt.

17. Install the safety belt cover.

18. Restore the vehicle to operating condition.

1.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation and reactivation procedure.**

Reactivate the supplemental restraint system (SRS). For additional information, refer to Supplemental Restraint System (SRS) Deactivation and Reactivation in this section.

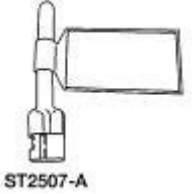

2.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Section 501-20B.

3. Check the active restraint system for correct operation. For additional information, refer to Section 501-20A.
-

Seat —Front Cushion Side Shield

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F395
 ST2506-A	Diagnostic Tool, Restraint System (3 Req'd) 418-F088 (105-R0012)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)

Removal and Installation

 **WARNING:** Always wear safety glasses when repairing a air bag supplemental restraint system (SRS) vehicle and when handling an airbag module. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

 **WARNING:** Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

NOTE: The left side is shown, the right side is similar.

1. Prepare the vehicle for front cushion side shield removal.

1.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to [Section 414-01](#).

2.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the supplemental restraint system (SRS) deactivation and reactivation procedure.**

Deactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

3.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the seat removal and installation procedure.**

Remove the affected seat. For additional information, refer to [Front Seat](#) in this section.

2.  **CAUTION: Do not use a screwdriver to remove the safety belt cover.**

Remove the safety belt cover by placing fingers behind the cover and pushing outward.

3. Remove the front cushion side shield screw.

4. Remove the front cushion side shield screw.

5. Remove the seat control switch knobs.

6. Position the seat control switch plate aside.

7. Disconnect the lumbar control switch electrical connector.

8. Remove the screw and the front cushion side shield.

Installation

⚠ WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.

1. Install the front cushion side shield. Install the screw.

2. Connect the lumbar control switch electrical connector.

3. Install the seat regulator control switch plate.

4. Install the seat control switch knobs.

5. Install the front cushion side shield screw.

6. Install the front cushion side shield screw.

7. Install the safety belt cover.

8. Restore the vehicle to operating condition.

1.  **WARNING:** To reduce the risk of serious personal injury, read and follow all

warnings, notes, and instructions in the seat removal and installation procedure.

Install the affected seat. For additional information, refer to [Front Seat](#) in this section.

2.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation and reactivation procedure.**

Reactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

3.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to [Section 501-20B](#).

4. Check the active restraint system for correct operation. For additional information, refer to [Section 501-20A](#).
-

Seat —Rear Cushion

Removal and Installation

1. Using a suitable tool, release the mini-buckle.

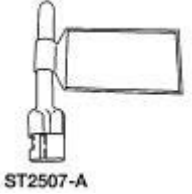

2. Release the two latches and remove the rear seat cushion.

3. To install, reverse the removal procedure.
 - Check the restraint system for correct operation.
-

Seat Track

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F395
 ST2506-A	Diagnostic Tool, Restraint System (3 Req'd) 418-F088 (105-R0012)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)

Removal

 **WARNING:** Always wear safety glasses when repairing a air bag supplemental restraint system (SRS) vehicle and when handling an airbag module. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

 **WARNING:** Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

 **CAUTION:** Use care when handling the seat and track assembly. Dropping the assembly or sitting on a seat not secured in the vehicle may result in damaged components.

NOTE: The left side is shown, the right side is similar.

1. Prepare the vehicle for seat track removal.

-  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to [Section 414-01](#).

2.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation and reactivation procedure.**

Deactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

3.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the seat removal and installation procedure.**

Remove the affected seat. For additional information, refer to [Front Seat](#) in this section.

4. Remove the front cushion side shield. For additional information, refer to [Seat—Front Cushion Side Shield](#) in this section.
5. Remove the seat backrest. For additional information, refer to [Front Seat Backrest](#) in this section.

2. Remove the nuts and the seat track.

3. Remove the wiring harness, driver seat module, seat track trim panel, and if equipped, the heated seat module.

Installation

WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.

1. Install the wiring harness, driver seat module, seat track trim panel, and if equipped, the heated seat module.

2. Install the seat track and nuts.

3. Restore the vehicle to operating condition.
 1. Install the seat backrest. For additional information, refer to [Front Seat Backrest](#) in this section.
 2. Install the front cushion side shield. For additional information, refer to [Seat—Front Cushion Side Shield](#) in this section.
 3.  **WARNING:** To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the seat removal and installation procedure.

Install the affected seat. For additional information, refer to [Front Seat](#) in this section.

4.  **WARNING:** To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation and reactivation procedure.

Reactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

5.  **WARNING:** The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to [Section 501-20B](#).

6. Check the active restraint system for correct operation. For additional information, refer to [Section 501-20A](#).

Seat —Rear Seatback

Removal and Installation

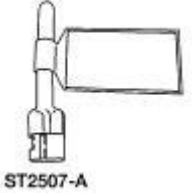

1. From the luggage compartment, release and fold down the seat backrest.
2. Remove the rear seat backrest nuts and remove the seat backrest.

3. To install, reverse the removal procedure.
-

Heated Seat Module

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F395
 ST2506-A	Diagnostic Tool, Restraint System (3 Req'd) 418-F088 (105-R0012)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)

Removal

 **WARNING:** Always wear safety glasses when repairing a air bag supplemental restraint system (SRS) vehicle and when handling an airbag module. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

 **WARNING:** Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

NOTE: The left side is shown, the right side is similar.

1. Prepare the vehicle for heated seat module removal.

1.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to [Section 414-01](#).

2.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation and reactivation procedure.**

Deactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

3.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the seat removal and installation procedure.**

Remove the affected seat. For additional information, refer to [Front Seat](#) in this section.

2. Remove the heated seat module.
 1. Disconnect the electrical connector.
 2. Remove the module.

Installation

1. Install the heated seat module.
 1. Connect the electrical connector.
 2. Install the module.

2. Restore the vehicle to operating condition.
 1.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the seat removal and installation procedure.**

Install the affected seat. For additional information, refer to [Front Seat](#) in this section.

2.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation and reactivation procedure.**

Reactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

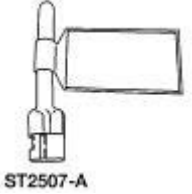

3.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to [Section 501-20B](#).

4. Check the active restraint system for correct operation. For additional information, refer to [Section 501-20A](#).
-

Motor —Front Seat Lumbar

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F395
 ST2506-A	Diagnostic Tool, Restraint System (3 Req'd) 418-F088 (105-R0012)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)

Removal

 **WARNING:** Always wear safety glasses when repairing a air bag supplemental restraint system (SRS) vehicle and when handling an airbag module. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

 **WARNING:** Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

NOTE: The left side is shown, the right side is similar.

1. Prepare the vehicle for front seat lumbar motor removal.

1.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to [Section 414-01](#).

2.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation and reactivation procedure.**

Deactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

3.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the seat removal and installation procedure.**

Remove the affected seat. For additional information, refer to [Front Seat](#) in this section.

2.  **WARNING: Front seat back trim covers installed on seats equipped with side air bags cannot be repaired, they are to be replaced (cleaning is permissible).**

 **CAUTION: When removing the seat backrest trim panel, be careful not to damage the J-hooks. If the seat backrest trim panel J-hooks are damaged, install a new seat backrest trim panel.**

 **CAUTION: When removing the seat backrest trim panel, be careful not to damage the pin-type retainers. Pulling towards you, use a smooth, controlled force to release the pin-type retainers.**

Remove the seat backrest trim panel.

1. Pull and release the pin-type retainers at the bottom of the seat backrest trim panel.
2. While holding the seat backrest trim panel at the bottom, push in on the left side of the panel at the lip of the map pocket and slide it to the right to disengage the J-hook. Repeat this process for the right side J-hook but slide the panel to the left to disengage the J-hook.
3. While pushing in at the top of the seat backrest trim panel, slide it down to disengage the top J-hooks.
4. Remove the seat backrest trim panel and inspect the J-hooks and pin-type retainers for damage. Discard any damaged retainers and install new.

3. Disconnect the electrical connectors.
 - Release the electrical connector locators.

4. Release the J-retainers and pin-type retainers.

5. Remove the retaining hook.

6. Disconnect the lumbar motor electrical connector.

7. Remove the screws and the front seat lumbar motor.

Installation

 **WARNING:** To reduce the risk of serious personal injury, read and follow all warnings and notes at the beginning of the removal procedure.

1. Install the front seat lumbar motor and the screws.

2. Connect the lumbar motor electrical connector.

3. Install the retaining hook.

4. Install the J-retainers and pin-type retainers.

5. Connect the electrical connectors.
 - Install the electrical connector locators.

6.  **CAUTION: Inspect the seat backrest trim panel J-hooks for damage. If damaged, install a new seat backrest trim panel.**

NOTE: If re-installing the original seat backrest trim panel, install new pin-type retainers.

Install the seat backrest trim panel.

1. Angle the top of the seat backrest trim panel inward and up to engage the upper J-hooks to the seat backrest frame.
2. While holding the seat backrest trim panel up, align the new pin-type retainers at the bottom of the seat backrest trim panel and install them into the seat backrest frame.
3. With the palm of your hand, install the J-clips by pushing down on the seat backrest trim panel and towards the center of the seat.
 - Check the retention of the seat backrest trim panel by lightly pulling on the bottom, sides, and top where the retainers are located.

7. Restore the vehicle to operating condition.

1.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the seat removal and installation procedure.**

Install the affected seat. For additional information, refer to [Front Seat](#) in this section.

2.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation and reactivation procedure.**

Reactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

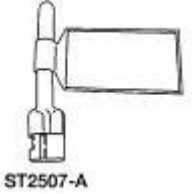

3.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to [Section 501-20B](#).

4. Check the active restraint system for correct operation. For additional information, refer to [Section 501-20A](#).

Front Seat Cushion

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F395
 ST2506-A	Diagnostic Tool, Restraint System (3 Req'd) 418-F088 (105-R0012)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)

Disassembly

 **WARNING:** Always wear safety glasses when repairing a air bag supplemental restraint system (SRS) vehicle and when handling an airbag module. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

 **WARNING:** Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

NOTE: The left side is shown, the right side is similar.

NOTE: If a side air bag deployment took place the seatback pad, trim cover, and side air bag module must be replaced. The seatback frame should be replaced if necessary.

All seats

1. Prepare the vehicle for front seat cushion disassembly.

1.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air

bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to [Section 414-01](#).

2.  **WARNING:** To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation and reactivation procedure.

Deactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

3.  **WARNING:** To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the seat removal and installation procedure.

Remove the affected seat. For additional information, refer to [Front Seat](#) in this section.

2.  **WARNING:** Front seat back trim covers installed on seats equipped with side air bags cannot be repaired, they are to be replaced (cleaning is permissible).

 **CAUTION:** When removing the seat backrest trim panel, be careful not to damage the J-hooks. If the seat backrest trim panel J-hooks are damaged, install a new seat backrest trim panel.

 **CAUTION:** When removing the seat backrest trim panel, be careful not to damage the pin-type retainers. Pulling towards you, use a smooth, controlled force to release the pin-type retainers.

Remove the seat backrest trim panel.

Seats with manual lumbar

3. Remove the retaining hook.

4. Align the end of the adjusting cable in the slot.

5. Release the adjusting cable.

6. Remove the manual lumbar knob.

7. Remove the manual lumbar screws.

All seats

8. Remove the front cushion side shield. For additional information, refer to [Seat—Front Cushion Side Shield](#) in this section.

9. Remove the seat track. For additional information, refer to [Seat Track](#) in this section.
10. Remove the seat regulator control switch. For additional information, refer to [Seat Control Switch](#) in this section.
11. Release the J-hooks and seat cushion trim cover.

Assembly

WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.

All seats

1. Install the J-hooks and the seat trim cover.

2. Install the front cushion side shield. For additional information, refer to [Seat—Front Cushion Side Shield](#) in this section.
3. Install the seat track. For additional information, refer to [Seat Track](#) in this section.
4. Install the seat regulator control switch. For additional information, refer to [Seat Control Switch](#) in this section.

Seats with manual lumbar

5. Install the retaining hook.

6. Align the end of the adjusting cable in the slot.

7. Install the adjusting cable.

8. Install the manual lumbar screws.

9. Install the manual lumbar knob.

All seats

10.  **CAUTION: Inspect the seat back trim panel J-hooks for damage. If damaged, install a new seat back trim panel.**

NOTE: If re-installing the original seat backrest trim panel, install new pin-type retainers.

Install the seat backrest trim panel.

1. Angle the top of the seat backrest trim panel inward and up to engage the upper J-hooks to the seat backrest frame.
2. While holding the seat backrest trim panel up, align the pin-type retainers at the bottom of the seat backrest trim panel and install them into the seat backrest frame.
3. With the palm of your hand, install the J-clips by pushing down on the seat backrest trim panel and towards the center of the seat.
 - Check the retention of the seat backrest trim panel by lightly pulling on the bottom, sides, and top where the retainers are located.

11. Restore the vehicle to operating condition.

1.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the seat removal and installation procedure.**

Install the affected seat. For additional information, refer to [Front Seat](#) in this section.

2.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation and reactivation procedure.**

Reactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

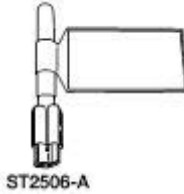

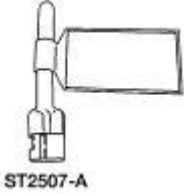

3.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to Section 501-20B .

4. Check the active restraint system for correct operation. For additional information, refer to Section 501-20A .
-

Front Seat Backrest

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F395
 ST2506-A	Diagnostic Tool, Restraint System (3 Req'd) 418-F088 (105-R0012)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)

Disassembly

 **WARNING:** Always wear safety glasses when repairing a air bag supplemental restraint system (SRS) vehicle and when handling an airbag module. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

 **WARNING:** Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

NOTE: If a side air bag deployment took place the seatback pad, trim cover, and side air bag module must be replaced. The seatback frame should be replaced if necessary.

NOTE: The left side is shown, the right side is similar.

1. Prepare the vehicle for front seat backrest removal.

1.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to [Section 414-01](#).

2.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation and reactivation procedure.**

Deactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

3.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the seat removal and installation procedure.**

Remove the affected seat. For additional information, refer to [Front Seat](#) in this section.

4. Remove the seat backrest. For more information, refer to [Front Seat Backrest](#) in this section.
2. Remove the front cushion side shield trim panel. For additional information, refer to [Seat—Front Cushion Side Shield](#) in this section.
3. Remove the bolt and the safety belt buckle.

4. Remove the headrest.

5. Release the electrical connector locators.

6. Release the J-retainers and pin-type retainers.

7. Reposition the seat backrest trim cover and pad and remove the side air bag module retaining nut cover.

8. Push the wire harness and grommet through the seat backrest frame.

9. **NOTE:** If installing a new side air bag module, use new retaining nuts. If the same side air bag module is to be reused then reuse the side air bag module nuts.

Remove the side air bag nuts. For additional information, refer to [Section 501-20B](#).

10. With one hand on the side air bag module, position the seat backrest trim cover and pad forward enough to access the side air bag module.

11. Remove the side air bag module from the deployment chute.
 1. Separate the side air bag module and deployment chute from the seat backrest mounting bracket.
 2. Pull the side air bag module mounting studs back through the deployment chute openings and remove the side air bag module from the deployment chute.

12. Disconnect and remove the side air bag module.
 1. Slide the side air bag electrical connector locking clip to disengage it.
 2. Release the two connector tabs (one shown) by pushing in on them and disconnect the side air bag module.
 3. Remove the side air bag module.

13. Pull back the cover to remove the headrest retaining clip.

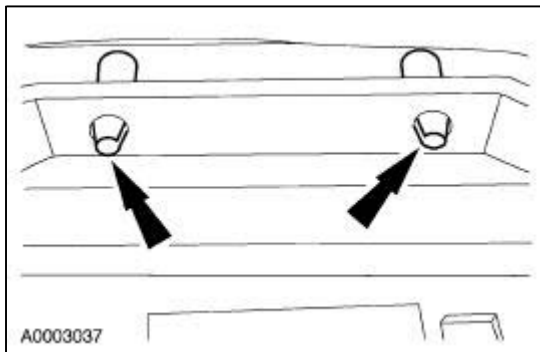

14. Remove the seat backrest cover from the frame.

Assembly

WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the removal procedure.

1. Position the seat backrest cover and install the headrest guides.

2. Install the seat backrest cover onto the frame.
3. Connect the side air bag module electrical connector.
 1. Install the connector to the side air bag module.
 2. Slide the side air bag module electrical connector locking clip to secure the connector to the side air bag module.

4. Make sure the electrical connector is securely fastened to the side air bag module.

⚠ WARNING: Inspect the mounting surfaces of the side air bag module for any foreign objects before installing the side air bag module. If any foreign objects are found, remove them. Failure to do so may result in personal injury in the event of an air bag deployment.

⚠ WARNING: Inspect the side air bag deployment chute and the side air bag cavity in the seat back pad for any foreign objects. If any foreign objects are found, remove them. Failure to do so may result in personal injury in the event of an air bag deployment.

⚠ WARNING: Before installing the side air bag module into the deployment chute, check it for damage and foreign objects. If the air bag module is damaged, replace it. If any foreign objects are found, remove them. Failure to do so may result in personal injury in the event of an air bag deployment.

⚠ WARNING: If the air bag cover has separated or the air bag material has been exposed, install a new side air bag module. Do not attempt to repair the air bag module. Failure to do so may result in personal injury in the event of an air bag deployment.

⚠ WARNING: Check the side air bag deployment chute for damage. The deployment chute must not be repaired. If there is any damage to the deployment chute, the seat back trim cover and deployment chute must be installed new as a unit.

⚠ WARNING: If the air bag deployment chute is not properly positioned, the side air bag may not deploy properly.

5. **NOTE:** The alignment pin will only allow the side air bag module to be installed to the seat backrest mounting bracket one way.

Position the side air bag module into the deployment chute.

- Position the side air bag module into the deployment chute with the alignment pin offset to the top and the electrical connector to the bottom of the seat backrest. This will position the alignment pin correctly when the side air bag module and deployment chute are mounted to the seat backrest frame mounting bracket.
- The side air bag module mounting studs must come through the deployment chute stud openings.

6.  **WARNING:** Inspect the mounting surfaces of the deployment chute and the seat back frame mounting bracket for any foreign objects before installing the side air bag module/deployment chute assembly. If any foreign objects are found, remove them. Failure to do so may result in personal injury in the event of an air bag deployment.

Install the new side air bag module retaining nuts and tighten to specification.

7. Pull the wire harness back through the hole in the seat backrest frame and seat the grommet.

8. Reposition the seat backrest pad and trim cover to the seat backrest frame.

9. Attach the side air bag retaining nut cover.

- Check that all three attaching clips on the side air bag nuts cover are correctly installed around the side air bag mounting bracket.

10. Install the electrical connector locators.

11. Install the headrest.

12. Position the front seat safety belt buckle. Install the bolt.

13. Install the front cushion side shield trim panel. For additional information, refer to [Seat—Front Cushion Side Shield](#) in this section.

14. Restore the vehicle to operating condition.

1. Install the seat backrest. For additional information, refer to [Front Seat Backrest](#) in this section.

2.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the seat removal and installation procedure.**

Install the affected seat. For additional information, refer to [Front Seat](#) in this section.

3.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation and reactivation procedure.**

Reactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

4.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to [Section 501-20B](#).

5. Check the active restraint system for correct operation. For additional information, refer to [Section 501-20A](#).

Rear door window regulator bolts and nuts	5	—	44

Glass, Frames and Mechanisms

The glass, frames and mechanisms include:

- front door window motor
- rear door window motor
- master window regulator control switch
- back window glass
- front door window glass
- rear door window glass
- rear quarter window glass
- front door window regulator
- rear door window regulator
- windshield glass

Window, One-Touch Down

The driver window one-touch down feature is activated by pressing the master window regulator control switch to the second down position. This allows the front door window glass to move downward until it is fully lowered. Momentarily pressing the window regulator control switch while the window is moving downward will stop the front door window glass.

Window Glass, Door

The bottom of the door window glass is mounted on a slider bracket which is part of the door window regulator. Door window glass bracket spacers provide attachment points for the door window glass and prevent direct contact between the slider bracket and the door window glass.

Switch, Window Regulator Control

Power windows are standard in the LS series. The master window regulator control switch can be used to power any or all of the power windows. A single window regulator control is located on all passenger door armrests to activate the individual power window only.

Motor, Window Regulator

The front and rear window regulator motors are replaced separately.

Glass, Frames and Mechanisms

Refer to Wiring Diagrams Section [501-11](#) for schematic and connector information.

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent diagnostic tool
 ST1137-A	73III Automotive Meter 105-R0057 or equivalent

Principles of Operation

Front Electronics Module (FEM) and Rear Electronics Module (REM)

The front electronics module (FEM) receives inputs and delivers outputs to a majority of the electronically controlled features which reside primarily in the front section of the vehicle. The rear electronics module (REM) receives inputs and delivers outputs to a majority of the electronically controlled features which reside primarily in the rear section of the vehicle. The FEM and REM are configurable modules and must be correctly configured to the vehicle. The modules may also be configured to allow additional features or functions to be added to the vehicle. The FEM and REM do not have any optional window control configurations.

Driver Door Module (DDM)

The DDM receives inputs from the remote keyless entry transmitter and hardwired components such as the master window regulator control switch and delivers outputs in the form of SCP network messages and hardwired component control. The DDM is a configurable module and must be correctly configured to the vehicle. The DDM may also be configured to allow additional features or functions to be added to the vehicle. The only DDM window feature that can be optionally configured is the window global open and close feature.

Module Inputs and Outputs

This system is unique in that many of the inputs that the FEM, REM and DDM receive are over the SCP communication network. These input messages come from other modules connected to the

network. The FEM, REM and DDM will interpret the inputs, and in turn command the correct output that was requested. The modules also receive inputs which come directly from components which are hardwired to the modules such as the window regulator control switches.

One type of output the modules provide is over the SCP communication network in the form of messages. These types of outputs are usually generated from a module monitoring a hardwired input and sending a status message to another module. These outputs are commonly required by other modules to carry out their functions. The second type of output is the control of a component directly hardwired to the module.

Master Window Regulator Control Switch

The master window regulator control switch is hardwired to the DDM. Activating the master window regulator control switch sends a voltage signal to the DDM. The DDM will interpret the signal and control the power and ground to the driver front window regulator electric drive.

Activation of any of the passenger window switches on the master window regulator control switch sends a voltage signal to the DDM. The DDM interprets the signal and sends out the appropriate message over the SCP communication network. For the passenger front window, the FEM will interpret the DDM message and control the passenger front window regulator electric drive. For the rear passenger windows, the REM will interpret the DDM message and control the appropriate rear window regulator electric drive.

The driver one-touch down feature allows the driver front window to be lowered without holding the master window regulator control switch. Activation of the master window regulator control switch to the second down position sends a separate voltage signal to the DDM. The DDM will then control the power and ground to the driver front window regulator electric drive until a switch input is received or the motor reaches a stalled condition.

Passenger Window Power Supply

The REM controls the power supply to all three remote window regulator control switches. To protect the REM from a potential failure, the REM will remove power from the common passenger window power supply when a short to ground is sensed in any remote window regulator control switch, associated circuitry or the power output circuit of the REM. Power will be restored to the power output circuit upon a cycling of the ignition switch. If the REM output circuit is shorted to ground, the REM will immediately remove power from the common power supply circuit. If any remote window regulator control switch or its associated circuits are shorted to ground, the power will remain on the REM output circuit until the switch or circuit containing the short to ground is activated.

Passenger Window Lock-Out

The master window regulator control switch incorporates a passenger window lock-out switch. Activating the passenger window lock-out switch sends a separate voltage signal to the DDM. The DDM will then output a message to the REM. The REM will in turn remove power from the common passenger window power supply circuit. The rear window operation will be allowed from the master window regulator control switch only.

Passenger Front Power Window

The passenger front power window is controlled by the FEM. The passenger front window regulator control switch is hardwired directly to the FEM. Activating the passenger front window regulator control

switch sends a voltage input to the FEM. The FEM then controls power and ground to the passenger front power window regulator electric drive, which is directly hardwired to the FEM. The voltage signal will only be received if the REM is supplying voltage to the remote window regulator control switch circuit.

The passenger front window can also be controlled by the master window regulator control switch. Activating the passenger front switch on the master window regulator control switch sends a voltage input to the DDM. The DDM will then send a message to the FEM over the network. The FEM then controls power and ground to the passenger front window regulator electric drive.

Left Rear (LR) and Right Rear (RR) Power Windows

The LR and RR power windows are controlled by the REM. Operating commands for the rear power windows are received in two forms, from the master window regulator control switch over the SCP communication network from the DDM, or directly from the LR or RR window regulator control switches, which are hardwired to the REM.

Activating the LR or RR switch on the master window regulator control switch causes the DDM to send a message to the REM over the SCP communication network. The REM will then control power and ground to the appropriate window regulator electric drive to raise or lower the window.

Activating either the LR or RR window regulator control switch sends a voltage signal to the REM. The REM will then control power and ground to the appropriate window regulator electric drive to raise or lower the window. A voltage signal will only be received if the window lock-out is OFF and the REM is supplying voltage to the remote window regulator control switch power circuit.

Rear Window Defrost

The rear window defrost feature is controlled by the REM, powertrain control module (PCM), and the dual automatic temperature control (DATC) module. The rear window defrost switch is incorporated in the climate control head. When the switch is selected ON, the DATC module will send a message over the SCP communication network to the REM. The REM will then check its other messages for vehicle rpm from the PCM. If the rpm message is received, the REM will then ground the rear window defrost relay coil control circuit which is hardwired to the REM. The ground signal closes the rear window defrost relay which applies power to the rear window grid through the antenna isolator module. Fault management of the rear window defrost feature will prevent the rear window defrost from operating when a rpm or ignition switch invalid/missing data message is received.

Diagnosis

The FEM, REM and DDM constantly monitor systems under their control and report a concern in the form of a diagnostic trouble code (DTC). DTCs can be retrieved with the diagnostic tool or an equivalent tester through the SCP communication network.

This vehicle's design makes it unique in that electronic functions are divided into zones. The DDM controls features near the driver front door. The FEM controls features in the front portion of the vehicle and the REM controls the features in the rear portion. These systems rely heavily on the SCP communication network in order to transmit and receive messages. It is vital when diagnosing this vehicle's electronic systems, to understand:

- where the input (command) originates.
- all input information messages necessary in order for a feature to operate correctly.

- which module(s) receive(s) the input (or command message).
- if the module which received the input (message) controls the output of the feature, or does it output a message over the communication network to another module.
- which module controls the output of the feature.

Delayed Accessory

Delayed accessory operation allows the power windows, radio and moon roof (if equipped) to operate for up to ten minutes after the ignition is turned to OFF. The delayed accessory function is controlled by the DDM. When the ignition switch is turned from RUN to OFF, the DDM will begin the timing sequence. If a door is opened or the ignition switch is activated to another position, the DDM will cancel the delayed accessory operation.

Heated Wiper Park

The heated wiper park grid (located within the lower painted area of the windshield) receives power from the heated wiper park relay located in the underhood auxiliary junction box (AJB). The heated wiper park relay coil is connected to a fused circuit from the underhood AJB. The heated wiper park relay is controlled by a switched ground from the DATC module controlled heated wiper park ON/OFF switch. The heated wiper park grid is automatically activated by the DATC module when ambient air temperature drops below 38° F (3° C), and can be manually activated by pushing the heated wiper park ON/OFF switch. The system can be manually switched OFF, and will shut off automatically when ambient air temperature rises above 38° F (3° C) or if the vehicle voltage is low.

Inspection and Verification

NOTE: The DATC module, DDM, FEM, and REM must be reconfigured upon replacement. For more information refer to [Section 418-01](#).

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
<ul style="list-style-type: none"> ● Window regulator ● Window run weatherstrip ● Door window glass 	<ul style="list-style-type: none"> ● Battery junction box (BJB) fuse(s): 409 (5A), 419 (30A), 420 (20A), 422 (30A), 425 (40A), 426 (30A), 427 (30A), 429 (30A), and 430 (20A) ● Central junction box (CJB) fuse 207 (5A) ● Underhood auxiliary junction box (AJB) fuse 113 (30A) ● Master window regulator control switch ● Remote window regulator control switch ● Window regulator electric drive ● DATC module ● DDM ● FEM ● REM ● Rear window defrost grid ● Heated wiper park grid ● Circuitry

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the diagnostic tool does not power up, refer to the diagnostic tool manual.
5. Carry out the DATA LINK DIAGNOSTICS test. If the diagnostic tool responds with:
 - CKT 914, CKT 915 or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to [Section 418-00](#).
 - NO RESP/NOT EQUIP for FEM, go to Pinpoint Test A.
 - NO RESP/NOT EQUIP for REM, go to Pinpoint Test B.
 - NO RESP/NOT EQUIP for DDM, go to Pinpoint Test C.
 - NO RESP/NOT EQUIP for DATC module, refer to [Section 412-00](#).
 - SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), clear the continuous DTCs and carry out self-test diagnostics for the FEM, REM, DDM, and DATC module.
6. If DTCs related to the DATC module are retrieved, refer to [Section 412-00](#).
7. If the DTCs retrieved are related to the concern, go to the FEM Diagnostic Trouble Code (DTC) Index, REM Diagnostic Trouble Code (DTC) Index, or DDM Diagnostic Trouble Code (DTC) Index.
8. If no DTCs related to the concern are retrieved, proceed to the Symptom Chart to continue the diagnostics.

FEM Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1319	Driver Door Ajar Circuit Failure	FEM	REFER to Section 417-02 .

<ul style="list-style-type: none"> The delayed accessory is inoperative/does not operate correctly 	<ul style="list-style-type: none"> DDM. 	<ul style="list-style-type: none"> INSTALL a new DDM. REFER to <u>Section 419-10</u>. TEST the system for normal operation.

Pinpoint Tests

PINPOINT TEST A: NO COMMUNICATION WITH THE FRONT ELECTRONIC MODULE (FEM)

CONDITIONS	DETAILS/RESULTS/ACTIONS
A1 CHECK CIRCUITS 29-DK20 (OG/GN) AND 29S-DK22 (OG/YE) FOR VOLTAGE	
NOTE: Cycle ignition switch from OFF to RUN to enable the switched system power feature.	
<p>1</p>  <p>2</p>  <p>FEM C201c</p> <p>3</p>  <p>FEM C201f</p> <p>4</p>  <p>5</p>  <p>A0006297</p>	<p>5</p> <p>Measure the voltage between FEM C201c pin 6, circuit 29-DK20 (OG/GN), harness side and ground; and between FEM C201f pin 1, circuit 29S-DK22 (OG/YE) harness side and ground.</p>

- Are the voltages greater than 10 volts?

→ **Yes**
GO to A2.

→ **No**
REPAIR the circuit(s) in question. TEST the system for normal operation.

A2 CHECK CIRCUITS 31-DK20 (BK/RD), 31-DK20A (BK/RD), 31-DK20B (BK/RD), 31-DK20C (BK/RD) AND 31-DK20D (BK/RD) FOR OPENS

1

2

FEM C201a

3

3 Using the following table, measure the resistance between FEM connectors, harness side and ground:

FEM	Pin	Circuit
C201c	12	31-DK20 (BK/RD)
C201a	11	31-DK20A (BK/RD)
C201a	13	31-DK20B (BK/RD)
C201a	14	31-DK20C (BK/RD)
C201a	15	31-DK20D (BK/RD)

- Is the resistance less than 5 ohms?

→ **Yes**
REFER to Section 418-00.

→ **No**
REPAIR the circuit(s) in question. TEST the system for normal operation.

PINPOINT TEST B: NO COMMUNICATION WITH THE REAR ELECTRONIC MODULE (REM)

CONDITIONS	DETAILS/RESULTS/ACTIONS
B1 CHECK CIRCUIT 29-DK31 (OG/BK) FOR VOLTAGE	
NOTE: Cycle ignition switch from OFF to RUN to enable the switched system power feature.	
1	

2

REM C420d

3

REM C420c

4

5

A0006299

5 Measure the voltage between REM C420d pin 3, circuit 29-DK31 (OG/BK), harness side and ground.

• Is the voltage greater than 10 volts?

→ Yes
GO to B2 .

→ No
REPAIR the circuit. TEST the system for normal operation.

B2 CHECK CIRCUITS 29S-DK31 (OG/BK), 31-DK30D (BK), 31-DK30E (BK), 31-DK30F (BK), 31-DK30G (BK) AND 31-DK30H (BK/OG), FOR OPENS

1

2

REM C420b

3

3 Using the following table, measure the resistance between REM connectors,

A0006300

harness side and ground:

REM	Pin	Circuit
C420c	13	29S-DK31 (OG/BK)
C420c	12	31-DK30E (BK)
C420c	11	31-DK30D (BK)
C420c	26	31-DK30G (BK)
C420c	25	31-DK30F (BK)
C420b	12	31-DK30H (BK)

- Is the resistance less than 5 ohms?

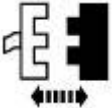

→ **Yes**

REFER to [Section 418-00](#).

→ **No**

REPAIR the circuit(s) in question. TEST the system for normal operation.

PINPOINT TEST C: NO COMMUNICATION WITH THE DRIVER DOOR MODULE (DDM)

CONDITIONS	DETAILS/RESULTS/ACTIONS
C1 CHECK CIRCUITS 29-AJ80 (OG/BU) AND 29S-AJ86 (OG/BU) FOR VOLTAGE	
NOTE: Cycle ignition switch from OFF to RUN to enable the switched system power feature.	
<p>1</p>  <p>2</p>  <p>DDM C501a</p> <p>3</p>  <p>4</p>	<p>4</p> <p>Measure the voltage between DDM C501a pin 11, circuit 29-AJ80 (OG/BU), harness side and ground; and between DDM C501a pin 12, circuit 29S-AJ86 (OG/BU), harness side and ground.</p>

A0006301

- Is the voltage greater than 10 volts?

→ **Yes**
GO to C2.

→ **No**
REPAIR the circuit(s) in question. TEST the system for normal operation.

C2 CHECK CIRCUITS 31-AJ80B (BK/OG) AND 91-AJ80 (BN/BU) FOR OPENS

1

2

A0006302

- 2 Measure the resistance between DDM C501a pin 7, circuit 91-AJ80 (BN/BU), harness side and ground; and between DDM C501a pin 8, circuit 31-AJ80B (BK/OG), harness side and ground.

- Is the resistance less than 5 ohms?

→ **Yes**
REFER to Section 418-00.

→ **No**
REPAIR the circuit(s) in question. TEST the system for normal operation.

PINPOINT TEST D: ALL POWER WINDOWS ARE INOPERATIVE — FROM THE MASTER WINDOW REGULATOR CONTROL SWITCH ONLY

CONDITIONS	DETAILS/RESULTS/ACTIONS
D1 CHECK VOLTAGE TO THE MASTER WINDOW REGULATOR CONTROL SWITCH	

1

2

Master Window Regulator Control Switch C504

3

4

4

Measure the voltage between master window regulator control switch C504 pin 9, circuit 7-AJ7 (YE/RD), harness side and ground.

● Is the voltage greater than 6 volts?

→ **Yes**
GO to D2.

→ **No**
GO to D3.

D2 CHECK THE MASTER WINDOW REGULATOR CONTROL SWITCH

1

Check the master window regulator control switch; Refer to Wiring Diagrams Section 700-09, Component Testing.

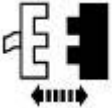

● **Did the master window regulator control switch pass the component test?**

→ **Yes**
INSTALL a new DDM. REFER to Section 419-10. CLEAR the DTCs. REPEAT the self-test.

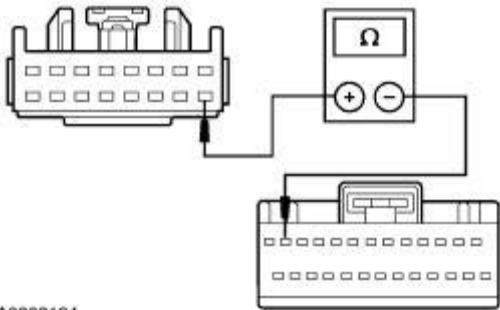

→ **No**
INSTALL a new master window regulator control switch. REFER to Switch—Master Window Regulator Control in this section. CLEAR the DTCs. REPEAT the self-test.

D3 CHECK CIRCUIT 7-AJ7 (YE/RD) FOR AN OPEN

1 

2 

DDM C501d

3 

A0003134

3 Measure the resistance between the master window regulator control switch C504 pin 9, circuit 7-AJ7 (YE/RD), harness side and DDM C501d pin 12, circuit 7-AD1 (YE), harness side.

- Is the resistance less than 5 ohms?

→ **Yes**
INSTALL a new DDM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST E: ALL PASSENGER POWER WINDOWS ARE INOPERATIVE — FROM THE REMOTE WINDOW REGULATOR CONTROL SWITCHES

CONDITIONS	DETAILS/RESULTS/ACTIONS
<p>NOTE: The REM supplies power to the three remote window regulator control switches through a single output circuit and splice. To protect the REM from potential failure, the REM will remove power when a short to ground is sensed in any remote window regulator control switch, associated circuitry or the power output circuit of the REM. Power will be restored to the power output circuit upon a cycling of the ignition switch. If the REM output circuit is shorted to ground, the REM will immediately remove power from the circuit. If any remote window regulator control switch or its associated circuits are shorted to ground, the REM will continue to supply power to the output circuit until the switch or circuit containing the failure is activated.</p>	
<p>E1 CHECK FOR FEM DTCS</p>	
	<p>1 Retrieve the recorded results from the FEM self-test.</p> <ul style="list-style-type: none"> • Were any FEM DTCs retrieved that are related to the concern?

- **Yes**
REFER to the FEM Diagnostic Trouble Code (DTC) Index.
- **No**
GO to E2.

E2 CHECK FOR REM DTCS

- 1 Retrieve the recorded results from the REM self-test.
 - **Were any REM DTCS retrieved that are related to the concern?**
- **Yes**
REFER to the REM Diagnostic Trouble Code (DTC) Index.
 - **No**
GO to E3.

E3 CHECK CIRCUIT 7-AJ14A (YE/BU) FOR POWER

NOTE: Cycle the ignition switch from OFF to RUN to enable the switched system power feature.

1

2

LR Window Regulator Control Switch C701

3

4

A0003135

- 4 Measure the voltage between LR window regulator control switch C701 pin 3, circuit 7-AJ14A (YE/BU), harness side and ground.

- **Is the voltage reading greater than 10 volts?**

- **Yes**
GO to E7.

→ **No**
GO to E4.

E4 CHECK CIRCUIT 7-AJ1 (YE) FOR AN OPEN

1

2

REM C420b

3

3 Measure the resistance between LR window regulator control switch C701 pin 3, circuit 7-AJ14A (YE/BU), harness side and REM C420b pin 5, circuit 7-AJ1 (YE), harness side.

- Is the resistance less than 5 ohms?

→ **Yes**
GO to E5.

→ **No**
REPAIR the circuit. CLEAR the DTCs.
REPEAT the self-test.

E5 CHECK CIRCUIT 7-AJ1 (YE) FOR A SHORT TO GROUND

1

2

3

2 Disconnect the remote passenger window regulator control switches:

- passenger front C604
- RR passenger C801
- LR passenger C701

3 Measure the resistance between REM C420b pin 5, circuit 7-AJ1 (YE), harness side and ground.

- Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to E6.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

E6 CHECK FOR A SHORTED REMOTE WINDOW REGULATOR CONTROL SWITCH

1

2 Check the RR, LR and passenger front window regulator control switches; Refer to Wiring Diagrams Section 700-09, Component Testing.

- Did the remote window regulator control switches pass the component test?

→ **Yes**
INSTALL a new REM. REFER to Section 419-10. CLEAR the DTCs. REPEAT the self-test.

→ **No**
INSTALL a new passenger window regulator control switch. CLEAR the DTCs. REPEAT the self-test.

E7 CHECK THE PASSENGER FRONT WINDOW OPERATION

1 Operate the passenger front window UP and DOWN using the passenger front window regulator control switch.

- Does the passenger front window operate correctly?

→ **Yes**
GO to E10.

→ **No**
GO to E8.

E8 CHECK THE PASSENGER FRONT WINDOW REGULATOR CONTROL SWITCH

1

2

Passenger Front Window Regulator Control Switch C604

3 Check the passenger front window regulator control switch; Refer to Wiring Diagrams Section 700-09, Component Testing.

- **Did the passenger front window regulator control switch pass the component test?**

→ **Yes**
GO to E9.

→ **No**
INSTALL a new passenger window regulator control switch. CLEAR the DTCs. REPEAT the self-test.

E9 CHECK CIRCUITS 8-AJ18 (WH/VT) AND 10-AJ18 (GY/WH) FOR A SHORT TO GROUND

1

2

FEM C201e

3

A0003137

3 Measure the resistance between passenger front window regulator control switch C604 pin 1, circuit 8-AJ18 (WH/VT), harness side and ground; and between passenger front window regulator control switch C604 pin 2, circuit 10-AJ18 (GY/WH), harness side and ground

- **Are the resistances greater than**

10,000 ohms?

- **Yes**
INSTALL a new FEM. REFER to Section 419-10. CLEAR the DTCs. REPEAT the self-test.
- **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

E10 CHECK THE LEFT REAR AND RIGHT REAR WINDOW OPERATION

1

2

LR Window Regulator Control Switch C701

3

- 4 Operate the rear windows UP and DOWN using the LR and RR window regulator control switches.

- **Do the rear windows operate correctly?**

- **Yes**
The system is operating correctly. VERIFY the concern and REFER to the Symptom Chart.

- **No**
GO to E11.

E11 CHECK THE LR AND RR WINDOW REGULATOR CONTROL SWITCH

1

2

LR C701 and RR C801 Window Regulator Control Switches

- 3 Check the LR and RR window regulator control switches; Refer to Wiring Diagrams Section 700-09, Component

Testing.

- **Did the window regulator control switches pass the component test?**

→ **Yes**
GO to E12.

→ **No**
INSTALL a new rear window regulator control switch. CLEAR the DTCs. REPEAT the self-test.

E12 CHECK CIRCUIT 8-AJ24 (WH), 10-AJ24 (GY), 8-AJ14A (WH/BU) and 10-AJ14A (GY/VT) FOR A SHORT TO GROUND

1

2

REM C420c and C420d

3

4

3 Measure the resistance between RR window regulator control switch C801 pin 1, circuit 8-AJ24 (WH), harness side and ground; and between RR window regulator control switch C801 pin 2, circuit 10-AJ24A (GY), harness side and ground.

4 Measure the resistance between LR window regulator control switch C701 pin 1, circuit 8-AJ14A (WH/BU), harness side and ground; and between LR window regulator control switch C701 pin 2, circuit 10-AJ14A (GY/VT), harness side and ground.

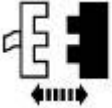

- **Are the resistances greater than 10,000 ohms?**

→ **Yes**
INSTALL a new REM. REFER to Section 419-10. CLEAR the DTCs.

REPEAT the self-test.

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST F: A SINGLE POWER WINDOW IS INOPERATIVE — DRIVER WINDOW FROM THE MASTER WINDOW REGULATOR CONTROL SWITCH

CONDITIONS	DETAILS/RESULTS/ACTIONS
F1 CHECK THE DDM DTCS	
NOTE: Cycle the ignition switch from OFF to RUN to enable the switched system power feature.	
	<p>1 Retrieve the recorded results from the DDM self-test.</p> <ul style="list-style-type: none">● Were any DDM DTCs retrieved that are related to the concern? <p>→ Yes IF DTC B1405 or B1408 was retrieved, GO to <u>F2</u>.</p> <p>Any other DDM DTCs, REFER to the DDM Diagnostic Trouble Code (DTC) Index.</p> <p>→ No GO to <u>F4</u>.</p>
F2 CHECK THE MASTER WINDOW REGULATOR CONTROL SWITCH	
<p>1</p>  <p>2</p>  <p>Master Window Regulator Control Switch C504</p>	<p>3 Check the master window regulator control switch; Refer to Wiring Diagrams Section 700-09, Component Testing.</p> <ul style="list-style-type: none">● Did the master window regulator control switch pass the component test? <p>→ Yes GO to <u>F3</u>.</p>

→ **No**
INSTALL a new master window regulator control switch. REFER to [Switch—Master Window Regulator Control](#) in this section. CLEAR the DTCs. REPEAT the self-test.

F3 CHECK CIRCUIT 7S-AJ40 (YE/RD) AND CIRCUIT 7S-AJ41 (YE/BU) FOR A SHORT TO BATTERY

1

2

DDM C501d

3

4

4 Measure the voltage between master window regulator control switch C504 pin 6, circuit 7S-AJ40 (YE/RD), harness side and ground; and between master window regulator control switch C504 pin 7, circuit 7S-AJ41 (YE/BU), harness side and ground.

● **Is the voltage greater than 10 volts?**

→ **Yes**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. GO to [E6](#).

→ **No**
INSTALL a new DDM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

F4 CHECK THE DDM OUTPUT

1

2

3

4

4 Select DDM active command FRONT WINDOW CONTROL.

5 Trigger DR UP to ON then OFF. Then trigger DR DOWN to ON then OFF.

• **Did the driver front window raise and lower?**

→ **Yes**
GO to F5.

→ **No**
GO to F9.

F5 CHECK THE DDM PIDS D_UP_SW AND D_DN_SW

1

1 Monitor the DDM PIDs D_UP_SW and D_DN_SW while operating the master window regulator control switch to the UP and DOWN positions.

• **Do the DDM PIDs agree with the master window regulator control switch positions?**

→ **Yes**
INSTALL a new DDM. REFER to Section 419-10. CLEAR the DTCs. REPEAT the self-test.

→ **No**
GO to F6.

F6 CHECK THE WINDOW REGULATOR CONTROL SWITCH

1

2

Master Window Regulator Control Switch C504

3 Check the master window regulator control switch; Refer to Wiring Diagrams Section 700-09, Component Testing.

• **Did the master window regulator**

control switch pass the component test?

→ **Yes**
GO to F7.

→ **No**
INSTALL a new master window regulator control switch. REFER to Switch—Master Window Regulator Control in this section. CLEAR the DTCs. REPEAT the self-test.

F7 CHECK CIRCUITS 7S-AJ40 (YE/RD) AND 7S-AJ41 (YE/BU) FOR AN OPEN

1

DDM C501d

2

2

Measure the resistance between master window regulator control switch C504 pin 6, circuit 7S-AJ40 (YE/RD), harness side and DDM C501d pin 20 circuit 7S-AJ40 (YE/RD), harness side; and between master window regulator control switch C504 pin 7, circuit 7S-AJ41 (YE/BU), harness side and DDM C501d pin 19 circuit 7S-AJ41 (YE/BU), harness side.

● **Are the resistances less than 5 ohms?**

→ **Yes**
GO to F8.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

F8 CHECK CIRCUITS 7S-AJ40 (YE/RD) AND 7S-AJ41 (YE/BU) FOR A SHORT TO GROUND

1

1

Measure the resistance between master window regulator control switch C504 pin 6, circuit 7S-AJ40 (YE/RD), harness side and ground; and between master window regulator control switch C504 pin 7, circuit 7S-AJ41 (YE/BU), harness side and ground.

● **Are the resistances greater than 10,000 ohms?**

→ **Yes**
INSTALL a new DDM. REFER to Section 419-10. CLEAR the DTCs. REPEAT the self-test.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

F9 CHECK POWER TO BJB FUSE 420 (20A)

1

2

BJB Fuse 420 (20A)

3

4

4 Measure the voltage between BJB fuse 420 (20A), input terminal and ground.

A0003141

● Is the voltage greater than 10 volts?

→ **Yes**
GO to F10.

→ **No**
REPAIR the circuit. CLEAR the DTCs.

REPEAT the self-test.

F10 CHECK FOR VOLTAGE FROM THE DDM

1

2

Driver Front Window Regulator Electric Drive C524

3

4

5

A0003143

6

A0003144

4 Select DDM active command FRONT WINDOW CONTROL.

5 Measure the voltage between driver front window regulator electric drive C524, circuit 32-AJ26 (WH), harness side and ground while triggering DR DOWN to ON. Note reading.

6 Measure the voltage between driver front window regulator electric drive C524, circuit 33-AJ26 (YE), harness side and ground while triggering DR UP to ON.

• Are the voltages greater than 10 volts when commanded ON?

→ Yes
GO to F11.

→ No
GO to F12.

F11 CHECK CIRCUIT 31-AJ80 (BK) FOR AN OPEN

1

2

DDM C501b

3

3

Measure the resistance between DDM C501b pin 3, circuit 31-AJ80 (BK), harness side and ground.

● **Is the resistance less than 5 ohms?**

→ **Yes**

INSTALL a new driver front window regulator electric drive. REFER to [Motor and Window Regulator—Front Door](#) in this section. CLEAR the DTCs. REPEAT the self-test.

→ **No**

REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

F12 CHECK WINDOW POWER TO THE DDM

1

2

DDM C501b

3

4

4

Measure the voltage between DDM C501b pin 4, circuit 30-AJ80 (RD), harness side and ground.

A0003146

- Is the voltage greater than 10 volts?

→ **Yes**

GO to F13.

→ **No**

REPAIR the circuit. CLEAR the DTCs.
REPEAT the self-test.

F13 CHECK CIRCUIT 32-AJ26 (WH) AND CIRCUIT 33-AJ26 (YE) FOR AN OPEN

1

2

A0003147

2

Measure the resistance between driver front window regulator electric drive C524, circuit 32-AJ26 (WH), harness side and DDM C501b pin 1, circuit 32-AJ26 (WH), harness side; and between driver front window regulator electric drive C524, circuit 33-AJ26 (YE), harness side and DDM C501b pin 2, circuit 33-AJ26 (YE), harness side.

- Are the resistances less than 5 ohms?

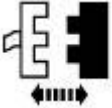

→ **Yes**

INSTALL a new DDM. REFER to Section 419-10. CLEAR the DTCs. REPEAT the self-test.

→ **No**

REPAIR the circuit. CLEAR the DTCs.
REPEAT the self-test.

PINPOINT TEST G: A SINGLE POWER WINDOW IS INOPERATIVE — PASSENGER FRONT FROM MASTER AND PASSENGER FRONT WINDOW REGULATOR CONTROL SWITCHES

CONDITIONS	DETAILS/RESULTS/ACTIONS
G1 CHECK THE DDM DTCS	
	<p data-bbox="815 243 1310 308">1 Retrieve the recorded results from the DDM self-test.</p> <ul data-bbox="855 357 1289 383" style="list-style-type: none"> • Were any DDM DTCs retrieved? <p data-bbox="815 433 1310 519">→ Yes REFER to the DDM Diagnostic Trouble Code (DTC) Index.</p> <p data-bbox="815 562 975 616">→ No GO to <u>G2</u>.</p>
G2 CHECK THE FEM DTCS	
	<p data-bbox="815 681 1310 745">1 Retrieve the recorded results from the FEM self-test.</p> <ul data-bbox="855 795 1326 849" style="list-style-type: none"> • Were any FEM DTCs retrieved that are related to the concern? <p data-bbox="815 896 1342 1015">→ Yes If DTC B2214 or B2215 were retrieved, GO to <u>G3</u>. All others, REFER to the FEM Diagnostic Trouble Code (DTC) Index.</p> <p data-bbox="815 1058 975 1112">→ No GO to <u>G5</u>.</p>
G3 CHECK THE PASSENGER FRONT WINDOW REGULATOR CONTROL SWITCH	
<p data-bbox="204 1177 228 1209">1</p>  <p data-bbox="204 1338 228 1371">2</p>  <p data-bbox="220 1500 767 1522">Passenger Front Window Regulator Control Switch C604</p>	<p data-bbox="815 1543 1334 1662">3 Check the passenger front window regulator control switch; Refer to Wiring Diagrams Section 700-09, Component Testing.</p> <ul data-bbox="855 1711 1310 1798" style="list-style-type: none"> • Did the passenger front window regulator control switch pass the component test? <p data-bbox="815 1845 975 1899">→ Yes GO to <u>G4</u>.</p> <p data-bbox="815 1942 1326 2028">→ No INSTALL a new passenger front window regulator control switch. CLEAR the</p>

DTCs. REPEAT the self-test.

G4 CHECK CIRCUIT 8-AJ18 (WH/VT) AND CIRCUIT 10-AJ18 (GY/WH) FOR A SHORT TO BATTERY

1

FEM C201e

2

2

Measure the voltage between FEM C201e pin 25, circuit 8-AJ18 (WH/VT), harness side and ground; and between FEM C201e pin 10, circuit 10-AJ18 (GY/WH), harness side and ground.

● Is the voltage greater than 10 volts?

→ **Yes**

REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test. GO to [G6](#).

→ **No**

INSTALL a new FEM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

G5 CHECK THE FEM OUTPUT

NOTE: Cycle the ignition switch from OFF to RUN to enable the switched system power feature.

1

2

3

4

4

Select FEM active command FRONT WINDOW CONTROL.

5

Trigger PR UP to ON then OFF. Then

trigger PR DOWN to ON then OFF.

- Did the passenger front window raise and lower?

→ **Yes**

INSTALL a new FEM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**

GO to [G6](#).

G6 CHECK POWER TO BJB FUSE 426 (20A)

1

2

BJB Fuse 426 (30A)

3

4

A0003149

4 Measure the voltage between BJB fuse 426 (30A), input terminal and ground.

- Is the voltage greater than 10 volts?

→ **Yes**
GO to G7.

→ **No**
REPAIR the BJB input circuit. CLEAR the DTCs. REPEAT the self-test.

G7 CHECK THE FEM OUTPUTS

1

2

Passenger Front Window Regulator Electric Drive C608

3

BJB Fuse 426 (30A)

4

5

5 Select FEM active command FRONT WINDOW CONTROL.

6

6 Measure the voltage between passenger front window regulator electric drive C608, circuit 32-AJ27 (WH/VT), harness side and ground while triggering PR DOWN to ON. Note reading.

7

7 Measure the voltage between passenger front window regulator electric drive C608, circuit 33-AJ27 (YE/VT), harness side and ground while triggering PR UP to ON.

A0003144

- Are the voltages greater than 10 volts when commanded ON?

→ **Yes**
GO to G8.

→ **No**
GO to G9.

G8 CHECK CIRCUIT 31-AJ71 (BK/YE) FOR AN OPEN

1

2

FEM C201d

3

A0003157

- 3 Measure the resistance between FEM C201d pin 4, circuit 31-AJ71 (BK/YE), harness side and ground.

- Is the resistance less than 5 ohms?

→ **Yes**
INSTALL a new passenger front window regulator electric drive. REFER to Motor and Window Regulator—Front Door. CLEAR the DTCs. REPEAT the self-test.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

G9 CHECK POWER TO THE FEM

1

2

FEM C201d

3

4

4 Measure the voltage between FEM C201d pin 3, circuit 30-AJ71 (RD/YE), harness side and ground.

• Is the voltage greater than 10 volts?

→ **Yes**
GO to G10.

→ **No**
REPAIR the circuit. CLEAR the DTCs.
REPEAT the self-test.

G10 CHECK CIRCUIT 32-AJ27 (WH/VT) AND CIRCUIT 33-AJ27 (YE/VT) FOR AN OPEN

1

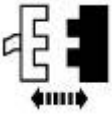

2

2 Measure the resistance between passenger front window electric drive C608, circuit 32-AJ27 (WH/VT), harness side and FEM C201d pin 2, circuit 32-AJ27 (WH/VT), harness side; and between passenger front window electric drive C608, circuit 33-AJ27 (YE/VT), harness side and FEM C201d pin 1, circuit 33-AJ27 (YE/VT), harness side.

	<ul style="list-style-type: none"> ● Are the resistances less than 5 ohms? <p>→ Yes INSTALL a new FEM. REFER to <u>Section 419-10</u> . CLEAR the DTCs. REPEAT the self-test.</p> <p>→ No REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.</p>
--	--

PINPOINT TEST H: A SINGLE POWER WINDOW IS INOPERATIVE — PASSENGER FRONT FROM THE MASTER WINDOW REGULATOR CONTROL SWITCH ONLY

CONDITIONS	DETAILS/RESULTS/ACTIONS
H1 CHECK THE DDM DTCS	
	<p>1 Retrieve the recorded results from the DDM self-test.</p> <ul style="list-style-type: none"> ● Were any DDM DTCs retrieved? <p>→ Yes If DTC B1420 was retrieved, GO to <u>H2</u> .</p> <p>For all other DDM DTCs, REFER to the FEM Diagnostic Trouble Code (DTC) Index.</p> <p>→ No GO to <u>H4</u> .</p>
H2 CHECK THE MASTER WINDOW REGULATOR CONTROL SWITCH	
<p>1</p>  <p>2</p>  <p>Master Window Regulator Control Switch C504</p>	<p>3 Check the master window regulator control switch; Refer to Wiring Diagrams Section 700-09, Component Testing.</p> <ul style="list-style-type: none"> ● Did the master window regulator control switch pass the component test?

→ **Yes**
GO to H3.

→ **No**
INSTALL a new master window regulator control switch; REFER to Switch—Master Window Regulator Control . CLEAR the DTCs. REPEAT the self-test.

H3 CHECK CIRCUIT 7S-AJ48 (YE/VT) AND CIRCUIT 7S-AJ47 (YE/BK) FOR A SHORT TO BATTERY

1

DDM C501d

2

3

3 Measure the voltage between master window regulator control switch C504 pin 3, circuit 7S-AJ48 (YE/VT), harness side and ground; and between master window regulator control switch C504 pin 2, circuit 7S-AJ47 (YE/BK), harness side and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

→ **No**
INSTALL a new DDM. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test.

H4 CHECK THE DDM PIDS P_UP_SW AND P_DN_SW

1

2

3

4

4

Monitor the DDM PIDS P_UP_SW and P_DN_SW while operating the passenger front window from the master window regulator control switch in the UP and DOWN positions.

- **Did the DDM PIDS P_UP_SW and P_DN_SW agree with the master window regulator control switch positions?**

→ **Yes**

INSTALL a new DDM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**

GO to [H5](#).

H5 CHECK THE WINDOW REGULATOR CONTROL SWITCH

1

2

Master Window Regulator Control Switch C504

3

Check the master window regulator control switch; Refer to Wiring Diagrams Section 700-09, Component Testing.

- **Did the master window regulator control switch pass the component test?**

→ **Yes**

GO to [H6](#).

→ **No**

INSTALL a new master window regulator control switch. REFER to [Switch—Master Window Regulator Control](#) in this section. CLEAR the DTCs. REPEAT the self-test.

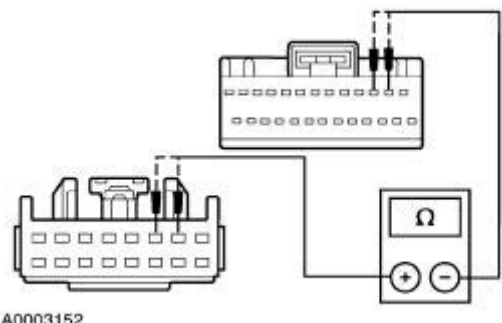

H6 CHECK CIRCUITS 7S-AJ48 (YE/VT) AND 7S-AJ41 (YE/BK) FOR AN OPEN

1

DDM C501d

2

A0003152

2

Measure the resistance between master window regulator control switch C504 pin 3, circuit 7S-AJ48 (YE/VT), harness side and DDM C501d pin 3 circuit 7S-AJ48 (YE/VT), harness side; and between master window regulator control switch C504 pin 2, circuit 7S-AJ47 (YE/BK), harness side and DDM C501d pin 2 circuit 7S-AJ41 (YE/BK), harness side.

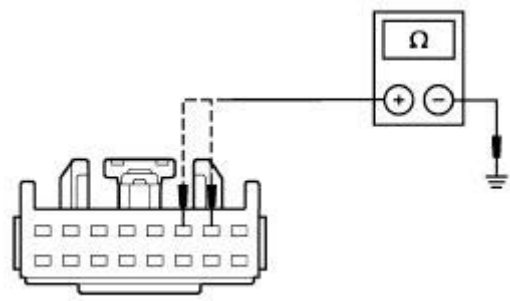

- Are the resistances less than 5 ohms?

→ Yes
GO to H7.

→ No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

H7 CHECK CIRCUITS 7S-AJ48 (YE/VT) AND 7S-AJ47 (YE/BK) FOR A SHORT TO GROUND

1

A0003153

1

Measure the resistance between master window regulator control switch C504 pin 3, circuit 7S-AJ48 (YE/VT), harness side and ground; and between master window regulator control switch C504 pin 2, circuit 7S-AJ47 (YE/BK), harness side and ground.

- Are the resistances greater than 10,000 ohms?

→ Yes
INSTALL a new DDM. REFER to Section 419-10. CLEAR the DTCs. REPEAT the self-test.

→ No
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST I: A SINGLE POWER WINDOW IS INOPERATIVE — PASSENGER FRONT FROM THE PASSENGER FRONT WINDOW REGULATOR CONTROL SWITCH ONLY

CONDITIONS	DETAILS/RESULTS/ACTIONS
------------	-------------------------

I1 CHECK THE FEM DTCS

1 Retrieve the recorded results from the FEM self-test.

- **Were any FEM DTCS retrieved that are related to the concern?**

→ **Yes**
REFER to the FEM Diagnostic Trouble Code (DTC) Index.

→ **No**
GO to I2.

I2 CHECK THE FEM PIDS P_UP_SW AND P_DN_SW

NOTE: Cycle the ignition switch to enable the switched system power feature.

1

2

3

4

4 Monitor the FEM PIDS P_UP_SW and P_DN_SW while operating the passenger front window regulator control switch in the UP and DOWN positions.

- **Did the FEM PIDS P_UP_SW and P_DN_SW PIDs agree with the passenger front window regulator control switch positions?**

→ **Yes**
INSTALL a new FEM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
GO to I3.

I3 CHECK THE PASSENGER FRONT WINDOW REGULATOR CONTROL SWITCH

1

2

Passenger Front Window Regulator Control Switch C604

3 Check the passenger front window regulator control switch; Refer to Wiring Diagrams Section 700-09, Component Testing.

- **Did the passenger front window regulator control switch pass the component test?**

→ **Yes**
GO to 14.

→ **No**
INSTALL a new passenger front window regulator control switch. CLEAR the DTCs. REPEAT the self-test.

14 CHECK THE POWER TO THE PASSENGER FRONT WINDOW REGULATOR CONTROL SWITCH

1

Passenger Front Window Switch C604

2

3

3 Measure the voltage between passenger front window regulator control switch C604 pin 3, circuit 7-AJ18 (YE/VT), harness side and ground.

- **Is the voltage greater than 10 volts?**

→ **Yes**
GO to 15.

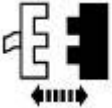

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

15 CHECK CIRCUITS 8-AJ18 (WH/VT) AND 8-AJ18 (GY/WH) FOR AN OPEN

1

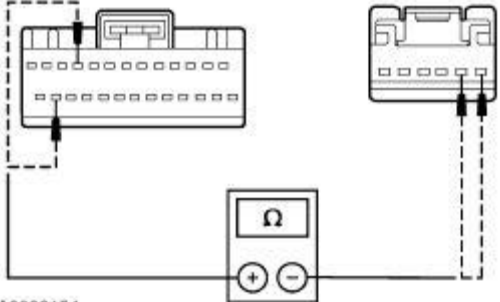

2

FEM C201e

3

A0003154

3 Measure the resistance between passenger front window regulator control switch C604 pin 1, circuit 8-AJ18 (WH/VT), harness side and FEM C201e pin 25 circuit 8-AJ18 (WH/VT), harness side; and between passenger front window regulator control switch C604 pin 2, circuit 8-AJ18 (GY/WH), harness side and FEM C201e pin 10 circuit 10-AJ18 (GY/WH), harness side.

- **Are the resistances less than 5 ohms?**

→ **Yes**
INSTALL a new FEM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST J: A SINGLE POWER WINDOW IS INOPERATIVE — RIGHT REAR FROM MASTER AND REMOTE WINDOW REGULATOR CONTROL SWITCHES

CONDITIONS	DETAILS/RESULTS/ACTIONS
J1 CHECK THE DDM DTCS	<p>1 Retrieve the recorded results from the DDM self-test.</p> <ul style="list-style-type: none"> ● Were any DDM DTCs retrieved? <p>→ Yes REFER to the DDM Diagnostic Trouble Code (DTC) Index.</p> <p>→ No GO to J2.</p>

J2 CHECK THE REM DTCS

1 Retrieve the recorded results from the REM self-test.

- **Were any REM DTCs retrieved that are related to the concern?**

→ **Yes**
If DTC B2190 or B2194 were retrieved, GO to J3.

For all other REM DTCs; REFER to the REM Diagnostic Trouble Code (DTC) Index.

→ **No**
GO to J5.

J3 CHECK THE RR WINDOW REGULATOR CONTROL SWITCH

1

2

RR Window Regulator Control Switch C801

3 Check the RR window regulator control switch; Refer to Wiring Diagrams Section 700-09, Component Testing.

- **Did the RR window regulator control switch pass the component test?**

→ **Yes**
GO to J4.

→ **No**
INSTALL a new RR window regulator control switch. CLEAR the DTCs. REPEAT the self-test.

J4 CHECK CIRCUIT 10-AJ24 (GY/WH) AND CIRCUIT 8-AJ24 (WH) FOR A SHORT TO BATTERY

1

2

REM C420d

3

4

4

Measure the voltage between REM C420d pin 7, circuit 8-AJ24 (WH), harness side and ground; and between REM C420d pin 20, circuit 10-AJ24 (GY/WH), harness side and ground.

● Is the voltage greater than 10 volts?

→ Yes

REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

→ No

INSTALL a new REM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

J5 CHECK THE REM OUTPUT

NOTE: Cycle the ignition switch from OFF to RUN to enable the switched system power feature.

1

2

3

4

4

Select REM active command REAR WINDOW CONTROL.

5

Trigger RR UP to ON then OFF. Then trigger RR DOWN to ON then OFF.

● Did the right rear window raise and lower?

→ **Yes**
INSTALL a new REM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
GO to [J6](#).

J6 CHECK POWER TO BJB FUSE 430 (20A)

1

2

BJB Fuse 430 (20A)

3

4

A0008637

4 Measure the voltage between BJB fuse 430 (20A), input terminal and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
GO to [J7](#).

→ **No**
REPAIR the BJB input circuit. CLEAR the DTCs. REPEAT the self-test.

J7 CHECK THE REM OUTPUTS

1

2

RR Window Regulator Electric Drive C803

3

BJB Fuse 430 (20A)

4

5

6

A0003144

7

A0003143

5 Select REM active command REAR WINDOW CONTROL.

6 Measure the voltage between RR window regulator electric drive C803, circuit 35-AJ23 (VT/WH), harness side and ground while triggering the REM active command RR DOWN to ON.

7 Measure the voltage between RR window regulator electric drive C803, circuit 34-AJ23 (BU/OG), harness side and ground while triggering the REM active command RR UP to ON.

- Are the voltages greater than 10 volts when the REM active commands are triggered to ON?

→ **Yes**
GO to J8.

→ **No**
GO to J9.

J8 CHECK CIRCUIT 31-DK30B (RD) FOR AN OPEN

1

2

REM C420g

3

3 Measure the resistance between REM C420g pin 1, circuit 31-DK30B (RD), harness side and ground.

● **Is the resistance less than 5 ohms?**

→ **Yes**
INSTALL a new RR window regulator electric drive. REFER to Motor and Window Regulator—Rear Door. CLEAR the DTCs. REPEAT the self-test.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

J9 CHECK WINDOW POWER TO THE REM

1

2

REM C420g

3

4

4 Measure the voltage between REM C420g pin 2, circuit 30-DK30 (RD), harness side and ground.

• Is the voltage greater than 10 volts?

→ **Yes**
GO to J10.

→ **No**
REPAIR the circuit. CLEAR the DTCs.
REPEAT the self-test.

J10 CHECK CIRCUIT 35-AJ23 (VT/WH) AND CIRCUIT 34-AJ23 (BU/OG) FOR AN OPEN

1

2

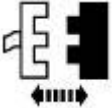

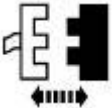

2 Measure the resistance between RR window regulator electric drive C803, circuit 34-AJ23 (BU/OG), harness side and REM C420g pin 3, circuit 34-AJ23 (BU/OG), harness side; and between RR window regulator electric drive C803, circuit 35-AJ23 (VT/WH), harness side and REM C420g pin 4, circuit 35-AJ23 (VT/WH), harness side.

• Are the resistances less than 5 ohms?

→ **Yes**
INSTALL a new REM. REFER to Section 419-10. CLEAR the DTCs. REPEAT the self-test.

→ **No**
REPAIR the circuit. CLEAR the DTCs.
REPEAT the self-test.

PINPOINT TEST K: A SINGLE POWER WINDOW IS INOPERATIVE — RIGHT REAR FROM THE MASTER WINDOW REGULATOR CONTROL SWITCH ONLY

CONDITIONS	DETAILS/RESULTS/ACTIONS
K1 CHECK THE DDM DTCS	
	<p>1 Retrieve the recorded results from the DDM self-test.</p> <ul style="list-style-type: none"> ● Were any DDM DTCs retrieved? <p>→ Yes If DTC B1424 was retrieved, GO to <u>K2</u>. For all other DDM DTCs; REFER to the DDM Diagnostic Trouble Code (DTC) Index.</p> <p>→ No GO to <u>K4</u>.</p>
K2 CHECK THE MASTER WINDOW REGULATOR CONTROL SWITCH	
<p>1</p>  <p>2</p>  <p style="text-align: center;">Master Window Regulator Control Switch C504</p>	<p>3 Check the master window regulator control switch. Refer to Wiring Diagrams Section 700-09, Component Testing.</p> <ul style="list-style-type: none"> ● Did the master window regulator control switch pass the component test? <p>→ Yes GO to <u>K3</u>.</p> <p>→ No INSTALL a new master window regulator control switch. REFER to <u>Switch—Master Window Regulator Control</u> in this section. CLEAR the DTCs. REPEAT the self-test.</p>
K3 CHECK CIRCUIT 7S-AJ52 (YE) AND CIRCUIT 7S-AJ51 (YE/RD) FOR A SHORT TO BATTERY	
<p>1</p> 	

DDM C501d

2

3

3

Measure the voltage between master window regulator control switch C504 pin 10, circuit 7S-AJ52 (YE), harness side and ground; and between master window regulator control switch C504 pin 12, circuit 7S-AJ51 (YE/RD), harness side and ground.

● Is the voltage greater than 10 volts?

→ Yes

REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

→ No

INSTALL a new DDM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

K4 CHECK THE DDM PIDS RRUP_SW AND RRDN_SW

1

2

3

3

Monitor the DDM PIDs RRUP_SW and RRDN_SW while operating the right rear window from the master window regulator control switch to the UP and DOWN positions.

● Did the DDM PIDs RRUP_SW and RRDN_SW agree with the master window regulator control switch positions?

→ Yes

INSTALL a new DDM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ No

GO to K5.

K5 CHECK THE WINDOW REGULATOR CONTROL SWITCH

1

2

Master Window Regulator Control Switch C504

3

Check the master window regulator control switch; Refer to Wiring Diagrams Section 700-09, Component Testing.

- **Did the master window regulator control switch pass the component test?**

→ **Yes**
GO to K6.

→ **No**
INSTALL a new master window regulator control switch. REFER to Switch—Master Window Regulator Control in this section. CLEAR the DTCs. REPEAT the self-test.

K6 CHECK CIRCUITS 7S-AJ52 (YE) AND 7S-AJ51 (YE/RD) FOR AN OPEN

1

DDM C501c

2

2

Measure the resistance between master window regulator control switch C504 pin 10, circuit 7S-AJ52 (YE), harness side and DDM C501c pin 5 circuit 7S-AJ52 (YE), harness side; and between master window regulator control switch C504 pin 12, circuit 7S-AJ51 (YE/RD), harness side and DDM C501d pin 4 circuit 7S-AJ51 (YE/RD), harness side.

- **Are the resistances less than 5 ohms?**

→ **Yes**
GO to K7.

→ **No**

REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

K7 CHECK CIRCUITS 7S-AJ52 (YE) AND 7S-AJ51 (YE/RD) FOR A SHORT TO GROUND

1

1

Measure the resistance between master window regulator control switch C504 pin 10, circuit 7S-AJ52 (YE), harness side and ground; and between master window regulator control switch C504 pin 12, circuit 7S-AJ51 (YE/RD), harness side and ground.

- Are the resistances greater than 10,000 ohms?

→ **Yes**

INSTALL a new DDM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**

REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST L: A SINGLE POWER WINDOW IS INOPERATIVE — RIGHT REAR FROM RR WINDOW REGULATOR CONTROL SWITCH ONLY

CONDITIONS	DETAILS/RESULTS/ACTIONS
L1 CHECK THE FEM DTCS	
	<p>1 Retrieve the recorded results from the REM self-test.</p> <ul style="list-style-type: none"> • Were any REM DTCs retrieved that are related to the concern? <p>→ Yes REFER to the REM Diagnostic Trouble Code (DTC) Index.</p> <p>→ No GO to L2.</p>
L2 CHECK THE REM PIDS RRUP_SW AND RRDN_SW	
NOTE: Cycle the ignition switch to enable the switched system power feature.	
1	

2

3

4

4 Monitor the REM PIDS RRUP_SW and RRDN_SW while operating the RR window regulator control switch to the UP and DOWN positions.

- Did the REM PIDS RRUP_SW and RRDN_SW agree with the RR window regulator control switch positions?

→ **Yes**
INSTALL a new REM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
GO to [L3](#).

L3 CHECK THE RR WINDOW REGULATOR CONTROL SWITCH

1

2

RR Window Regulator Control Switch C801

3 Check the RR window regulator control switch; Refer to Wiring Diagrams Section 700-09, Component Testing.

- Did the RR window regulator control switch pass the component test?

→ **Yes**
GO to [L4](#).

→ **No**
INSTALL a new RR window regulator

control switch. CLEAR the DTCs.
REPEAT the self-test.

L4 CHECK THE POWER TO THE RR WINDOW REGULATOR CONTROL SWITCH

1

RR Window Regulator Control Switch C801

2

3

3 Measure the voltage between RR window regulator control switch C801 pin 3, circuit 7-AJ24 (YE), harness side and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
GO to L5.

→ **No**
REPAIR the circuit. CLEAR the DTCs.
REPEAT the self-test.

L5 CHECK CIRCUITS 8-AJ24 (GYWH) AND 10-AJ24 (GY) FOR AN OPEN

1

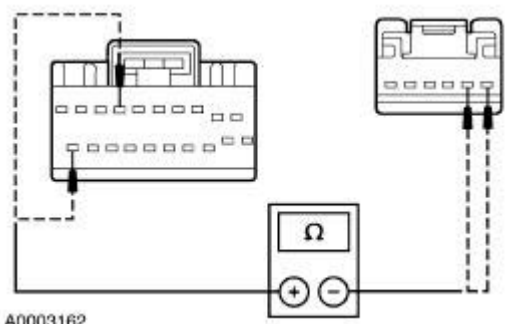

2

REM C420d

3

3 Measure the resistance between RR window regulator control switch C801 pin 7, circuit 8-AJ24 (WH), harness side and REM C420d pin 7 circuit 8-AJ24 (WH), harness side; and between RR window regulator control switch C801 pin 2, circuit 10-AJ24 (GY/WH), harness side and REM C420d pin 20 circuit 10-AJ24 (GY/WH), harness side.

A0003162

- **Are the resistances less than 5 ohms?**

→ **Yes**
 INSTALL a new REM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
 REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST M: A SINGLE POWER WINDOW IS INOPERATIVE — LEFT REAR FROM ALL WINDOW REGULATOR CONTROL SWITCHES

CONDITIONS	DETAILS/RESULTS/ACTIONS
M1 CHECK THE DDM DTCS	<p>1 Retrieve the recorded results from the DDM self-test.</p> <ul style="list-style-type: none"> ● Were any DDM DTCs retrieved? <p>→ Yes REFER to the DDM Diagnostic Trouble Code (DTC) Index.</p> <p>→ No GO to M2.</p>
M2 CHECK THE REM DTCS	<p>1 Retrieve the recorded results from the REM self-test.</p> <ul style="list-style-type: none"> ● Were any REM DTCs retrieved that are related to the concern? <p>→ Yes If DTC B2174 or B2178 were retrieved, GO to M3.</p>

For all other REM DTCs, REFER to the REM Diagnostic Trouble Code (DTC) Index.

→ **No**
GO to M5.

M3 CHECK THE LR WINDOW REGULATOR CONTROL SWITCH

1

2

LR Window Regulator Control Switch C701

3 Check the LR window regulator control switch; Refer to Wiring Diagrams Section 700-09, Component Testing.

- **Did the LR window regulator control switch pass the component test?**

→ **Yes**
GO to M4.

→ **No**
INSTALL a new LR window regulator control switch. CLEAR the DTCs. REPEAT the self-test.

M4 CHECK CIRCUIT 10-AJ14 (GY/VT) AND CIRCUIT 8-AJ14 (WH/BU) FOR A SHORT TO BATTERY

1

REM C420c

2

3

3 Measure the voltage between REM C420c pin 24, circuit 8-AJ14 (WH/BU), harness side and ground; and between REM C420c pin 22, circuit 10-AJ14 (GY/VT), harness side and ground.

A0003163

- Is the voltage greater than 10 volts?

→ **Yes**

REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

→ **No**

INSTALL a new REM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

M5 CHECK THE REM OUTPUT

NOTE: Cycle the ignition switch from OFF to RUN to enable the switched system power feature.

1

2

3

4

- 4 Trigger the REM active commands LR UP and LR DOWN to ON then OFF.

- Did the left rear window raise and lower?

→ **Yes**

INSTALL a new REM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**

GO to [M6](#).

M6 CHECK POWER TO BJB FUSE 419 (20A)

1

2

BJB Fuse 419 (20A)

3

4

A0003164

4 Measure the voltage between BJB fuse 419 (20A), input terminal and ground.

• Is the voltage greater than 10 volts?

→ Yes
GO to M7.

→ No
REPAIR the BJB input circuit. CLEAR the DTCs. REPEAT the self-test.

M7 CHECK THE REM OUTPUTS

1

2

LR Window Regulator Electric Drive C703

3

BJB Fuse 419 (20A)

4

5

6

6 Measure the voltage between LR window regulator electric drive C703, circuit 35-AJ13 (VT/BU), harness side and ground while triggering the REM active command LR DOWN to ON.

7

7 Measure the voltage between LR window regulator electric drive C703, circuit 34-AJ13 (BU/RD), harness side and ground while triggering the REM active command LR UP to ON.

- Are the voltages greater than 10 volts when the REM active commands LR DOWN and LR UP are triggered to ON?

→ **Yes**
GO to M8.

→ **No**
GO to M9.

M8 CHECK CIRCUIT 31-DK30A (BK/OG) FOR AN OPEN

1

2

REM C420f

3

3 Measure the resistance between REM C420f pin 3, circuit 31-DK30A (BK/OG), harness side and ground.

• Is the resistance less than 5 ohms?

→ **Yes**
INSTALL a new LR window regulator electric drive. REFER to Motor and Window Regulator—Rear Door in this section. CLEAR the DTCs. REPEAT the self-test.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

M9 CHECK WINDOW POWER TO THE REM

1

2

REM C420f

3

4

4 Measure the voltage between REM C420f pin 2, circuit 30-DK30A (RD), harness side and ground.

A0003146

- Is the voltage greater than 10 volts?

→ **Yes**

GO to M10.

→ **No**

REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

M10 CHECK CIRCUIT 35-AJ13 (VT/BU) AND CIRCUIT 34-AJ13 (BU/RD) FOR AN OPEN

1

2

A0003165

2

Measure the resistance between LR window regulator electric drive C703, circuit 34-AJ13 (BU/RD), harness side and REM C420f pin 1, circuit 34-AJ13 (BU/RD), harness side; and between LR window regulator electric drive C703, circuit 35-AJ13 (VT/BU), harness side and REM C420f pin 3, circuit 35-AJ13 (VT/BU), harness side.

- Are the resistances less than 5 ohms?

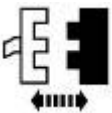

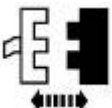

→ **Yes**

INSTALL a new REM. REFER to Section 419-10. CLEAR the DTCs. REPEAT the self-test.

→ **No**

REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST N: A SINGLE POWER WINDOW IS INOPERATIVE — LEFT REAR FROM THE MASTER WINDOW REGULATOR CONTROL SWITCH ONLY

CONDITIONS	DETAILS/RESULTS/ACTIONS
N1 CHECK THE DDM DTCS	
	<p>1 Retrieve the recorded results from the DDM self-test.</p> <ul style="list-style-type: none"> ● Were any DDM DTCs retrieved? <p>→ Yes If DTC B1416 was retrieved, GO to <u>N2</u>.</p> <p>For all other DDM DTCs, REFER to the DDM Diagnostic Trouble Code (DTC) Index.</p> <p>→ No GO to <u>N4</u>.</p>
N2 CHECK THE MASTER WINDOW REGULATOR CONTROL SWITCH	
<p>1</p>  <p>2</p>  <p>Master Window Regulator Control Switch C504</p>	<p>3 Check the master window regulator control switch; Refer to Wiring Diagrams Section 700-09, Component Testing.</p> <ul style="list-style-type: none"> ● Did the master window regulator control switch pass the component test? <p>→ Yes GO to <u>N3</u>.</p> <p>→ No INSTALL a new master window regulator control switch. REFER to <u>Switch—Master Window Regulator Control</u> in this section. CLEAR the DTCs. REPEAT the self-test.</p>
N3 CHECK CIRCUIT 7S-AJ50 (YE/BU) AND CIRCUIT 7S-AJ49 (YE/GN) FOR A SHORT TO BATTERY	
<p>1</p>  <p>DDM C501d</p> <p>2</p>	

3

A0003166

3

Measure the voltage between master window regulator control switch C504 pin 15, circuit 7S-AJ50 (YE/BU), harness side and ground; and between master window regulator control switch C504 pin 13, circuit 7S-AJ49 (YE/GN), harness side and ground.

● Is the voltage greater than 10 volts?

→ **Yes**

REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

→ **No**

INSTALL a new DDM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

N4 CHECK THE DDM PIDS LRUP_SW AND LRDN_SW

1

2

3

4

4

Monitor the DDM PIDS LRUP_SW and LRDN_SW while operating the left rear window to the UP and DOWN positions from the master window regulator control switch.

● Did the DDM PIDS LRUP_SW and LRDN_SW agree with the master window regulator control switch positions?

→ **Yes**

INSTALL a new DDM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the

self-test.

→ **No**
GO to N5.

N5 CHECK THE WINDOW REGULATOR CONTROL SWITCH

1

2

Master Window Regulator Control Switch C504

3 Check the master window regulator control switch; Refer to Wiring Diagrams Section 700-09, Component Testing.

- **Did the master window regulator control switch pass the component test?**

→ **Yes**
GO to N6.

→ **No**
INSTALL a new master window regulator control switch. REFER to Switch—Master Window Regulator Control in this section. CLEAR the DTCs. REPEAT the self-test.

N6 CHECK CIRCUITS 7S-AJ50 (YE/BU) AND 7S-AJ49 (YE/GN) FOR AN OPEN

1

DDM C501c

2

Master Window Regulator Control Switch C504

3

3 Measure the resistance between master window regulator control switch C504 pin 15, circuit 7S-AJ50 (YE/BU), harness side and DDM C501c pin 9 circuit 7S-AJ50 (YE/BU), harness side; and between master window regulator control switch C504 pin 13, circuit 7S-AJ49 (YE/GN), harness side and DDM C501c pin 8 circuit 7S-AJ49 (YE/GN), harness side.

- Are the resistances less than 5 ohms?

→ **Yes**
GO to N7.

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

N7 CHECK CIRCUITS 7S-AJ50 (YE/BU) AND 7S-AJ49 (YE/GN) FOR A SHORT TO GROUND

1

1

Measure the resistance between master window regulator control switch C504 pin 15, circuit 7S-AJ50 (YE/BU), harness side and ground; and between master window regulator control switch C504 pin 13, circuit 7S-AJ49 (YE/GN), harness side and ground.

- Are the resistances greater than 10,000 ohms?

→ **Yes**
INSTALL a new DDM. REFER to Section 419-10. CLEAR the DTCs. REPEAT the self-test.

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST O: A SINGLE POWER WINDOW IS INOPERATIVE — LEFT REAR FROM THE LR WINDOW REGULATOR CONTROL SWITCH ONLY

CONDITIONS	DETAILS/RESULTS/ACTIONS
O1 CHECK THE REM DTCS	

1 Retrieve the recorded results from the REM self-test.

- Were any REM DTCs retrieved that are related to the concern?

→ **Yes**
REFER to the REM Diagnostic Trouble Code (DTC) Index.

→ **No**
GO to Q2.

Q2 CHECK THE REM PIDS LRUP_SW AND LRDN_SW

NOTE: Cycle the ignition switch to enable the switched system power feature.

1

2

3

4

4 Monitor the REM PIDS LRUP_SW and LRDN_SW while operating the LR window regulator control switch to the UP and DOWN positions.

- Did the REM PIDS LRUP_SW and LRDN_SW agree with the LR window regulator control switch positions?

→ **Yes**
INSTALL a new REM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
GO to Q3.

Q3 CHECK THE LR WINDOW REGULATOR CONTROL SWITCH

1

2

LR Window Regulator Control Switch C701

3 Check the LR window regulator control switch; Refer to Wiring Diagrams Section 700-09, Component Testing.

- Did the LR window regulator control switch pass the component test?

→ Yes
GO to O4.

→ No
INSTALL a new LR window regulator control switch. CLEAR the DTCs. REPEAT the self-test.

O4 CHECK THE POWER TO THE LR WINDOW REGULATOR CONTROL SWITCH

1

2

A0003135

2 Measure the voltage between LR window regulator control switch C701 pin 3, circuit 7-AJ14A (YE/BU), harness side and ground.

- Is the voltage greater than 10 volts?

→ Yes
GO to O5.

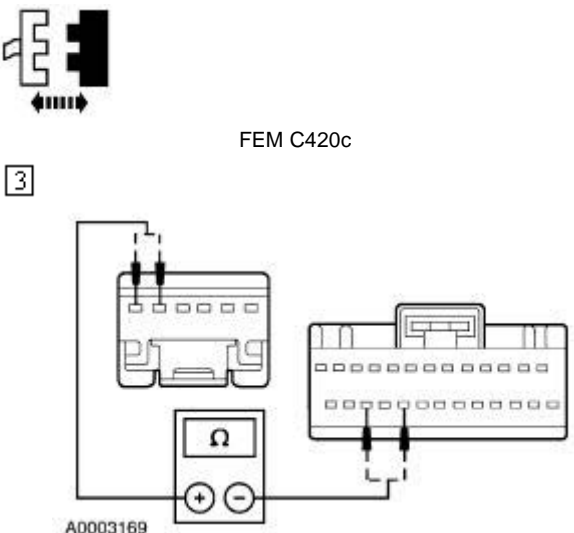

→ No
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

O5 CHECK CIRCUITS 8-AJ14A (WH/BU) AND 10-AJ14 (GY/VT) FOR AN OPEN

1

2

FEM C420c

3

3

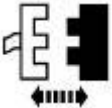

Measure the resistance between LR window regulator control switch C701 pin 1, circuit 8-AJ14A (WH/BU), harness side and REM C420c pin 24 circuit 8-AJ14A (WH/BU), harness side; and between LR window regulator control switch C701 pin 2, circuit 10-AJ14 (GY/VT), harness side and REM C420c pin 22 circuit 10-AJ14 (GY/VT), harness side.

- Are the resistances less than 5 ohms?

→ Yes
INSTALL a new REM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST P: ALL/SINGLE PASSENGER POWER WINDOWS ARE INOPERATIVE — PASSENGER WINDOW LOCK-OUT NOT OPERATING CORRECTLY

CONDITIONS	DETAILS/RESULTS/ACTIONS
P1 CHECK THE MASTER WINDOW REGULATOR CONTROL SWITCH	
<p>1</p>  <p>2</p>  <p>Master Window Regulator Control Switch C504</p>	<p>3</p> <p>Check the master window regulator control switch; Refer to Wiring Diagrams Section 700-09, Component Testing.</p> <ul style="list-style-type: none"> • Did the master window regulator control switch pass the component test?

- **Yes**
GO to P2.
- **No**
INSTALL a new master window regulator control switch. REFER to Switch—Master Window Regulator Control in this section. CLEAR the DTCs. REPEAT the self-test.

P2 CHECK CIRCUIT 7S-AJ20 (YE/BU) FOR A SHORT TO BATTERY

1

2

A0003170

- 2 Measure the voltage between master window regulator control switch C504 pin 5, circuit 7S-AJ20 (YE/BU), harness side and ground.

● Is the voltage greater than 10 volts?

- **Yes**
GO to P3.

- **No**
GO to P4.

P3 CHECK THE DDM FOR AN INTERNAL SHORT TO BATTERY

1

2

DDM C501d

3

4

- 4 Measure the voltage between master window regulator control switch C504 pin 5, circuit 7S-AJ20 (YE/BU), harness side and ground.

A0003170

- Is the voltage greater than 10 volts?

- **Yes**
REPAIR the circuit. CLEAR the DTCs.
REPEAT the self-test.
- **No**
INSTALL a new DDM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

P4 CHECK CIRCUIT 7S-AJ20 (YE/BU) FOR A SHORT TO GROUND

1

2

A0003171

- 2 Measure the resistance between master window regulator control switch C504 pin 5, circuit 7S-AJ20 (YE/BU), harness side and ground.

- Is the resistance greater than 10,000 ohms?

- **Yes**
GO to [P6](#).
- **No**
GO to [P5](#).

P5 CHECK THE DDM FOR AN INTERNAL SHORT TO GROUND

1

DDM C501d

2

A0003171

2

Measure the resistance between master window regulator control switch C504 pin 5, circuit 7S-AJ20 (YE/BU), harness side and ground.

● Is the resistance greater than 10,000 ohms?

→ **Yes**
INSTALL a new DDM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

P6 CHECK CIRCUIT 7S-AJ20 (YE/BU) FOR AN OPEN

1

DDM C501c

2

A0003172

2

Measure the resistance between master window regulator control switch C504 pin 5, circuit 7S-AJ20 (YE/BU), harness side and DDM C501c pin 22, circuit 7S-AJ20 (YE/BU), harness side.

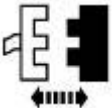

● Is the resistance less than 5 ohms?

→ **Yes**
INSTALL a new DDM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST Q: THE ONE TOUCH DOWN FEATURE IS

INOPERATIVE

CONDITIONS	DETAILS/RESULTS/ACTIONS
Q1 CHECK THE DDM DTCS	
	<p>1 Retrieve the recorded results from the DDM self-test.</p> <ul style="list-style-type: none"> ● Were any DDM DTCs retrieved? <p>→ Yes If DTC B1400 was retrieved, GO to <u>Q6</u>.</p> <p>For all other DTCs, REFER to the DDM Diagnostic Trouble Code (DTC) Index.</p> <p>→ No GO to <u>Q2</u>.</p>
Q2 CHECK THE MASTER WINDOW REGULATOR CONTROL SWITCH	
<p>1</p>  <p>2</p>  <p>Master Window Regulator Control Switch C504</p>	<p>3 Check the master window regulator control switch; Refer to Wiring Diagrams Section 700-09, Component Testing.</p> <ul style="list-style-type: none"> ● Did the master window regulator control switch pass the component test? <p>→ Yes GO to <u>Q3</u>.</p> <p>→ No INSTALL a new master window regulator control switch. REFER to <u>Switch—Master Window Regulator Control</u> in this section. CLEAR the DTCs. REPEAT the self-test.</p>
Q3 CHECK CIRCUIT 7S-AJ16 (YE/BK) FOR A SHORT TO GROUND	
<p>1</p>	<p>1 Measure the resistance between master window regulator control switch C504 pin 4, circuit 7S-AJ16 (YE/BK), harness side and ground.</p>

A0003173

- Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to Q5.

→ **No**
GO to Q4.

Q4 CHECK THE DDM FOR AN INTERNAL SHORT TO GROUND

1

DDM C501d

2

A0003173

- 2 Measure the resistance between master window regulator control switch C504 pin 4, circuit 7S-AJ16 (YE/BK), harness side and ground.

- Is the resistance greater than 10,000 ohms?

→ **Yes**
INSTALL a new DDM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

Q5 CHECK CIRCUIT 7S-AJ16 (YE/BK) FOR AN OPEN

1

DDM C501c

2

2

Measure the resistance between master window regulator control switch C504 pin 4, circuit 7S-AJ16 (YE/BK), harness side and DDM C501c pin 21, circuit 7S-AJ16 (YE/BK), harness side.

● Is the resistance less than 5 ohms?

→ Yes

INSTALL a new DDM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ No

REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

Q6 CHECK THE MASTER WINDOW REGULATOR CONTROL SWITCH FOR AN INTERNAL SHORT

1

2

3

4

Master Window Regulator Control Switch C504

3

Monitor the DDM PID OTD_SW.

● Did the DDM PID OTD_SW change when the master window regulator control switch C504 was disconnected?

→ **Yes**
 INSTALL a new master window regulator control switch. REFER to Switch—Master Window Regulator Control in this section. CLEAR the DTCs. REPEAT the self-test.

→ **No**
 GO to Q7.

Q7 CHECK CIRCUIT 7S-AJ16 (YE/BK) FOR A SHORT TO BATTERY

1

2

DDM C501d

3

4

A0003175

4 Measure the voltage between master window regulator control switch C504 pin 4, circuit 7S-AJ16 (YE/BK), harness side and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
 REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

→ **No**
 INSTALL a new DDM. REFER to Section 419-10. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST R: THE DEFROST SYSTEM IS INOPERATIVE — REAR WINDOW DEFROST

CONDITIONS	DETAILS/RESULTS/ACTIONS
R1 CHECK THE REM DTCS	

1 Retrieve the recorded results from the REM self-test.

● Are any REM DTCs retrieved?

→ **Yes**
REFER to the REM Diagnostic Trouble Code (DTC) Index.

→ **No**
GO to R2.

R2 CHECK THE REM OUTPUT

1

2

3

3 Trigger the REM active command R DEF RLY to ON then OFF while listening for the rear window defrost relay to click.

● Did the rear window defrost relay click when activated ON and OFF?

→ **Yes**
GO to R3.

→ **No**
GO to R6.

R3 CHECK THE REAR WINDOW DEFROST POWER

1

2

Rear Window Defrost Power Connector

3

4

4 Trigger the REM active command R DEF RLY to ON.

5

A0003178

5

Measure the voltage between rear window defrost power connector, circuit (BK), harness side and ground.

• Is the voltage greater than 10 volts?

→ **Yes**
GO to R4.

→ **No**
GO to R10.

R4 CHECK THE REAR WINDOW DEFROST GROUND CIRCUIT

1

2

Rear Window Defrost Ground Connector

3

A0003179

3

Measure the resistance between rear window defrost ground connector, circuit (BK), harness side and ground.

• Is the resistance less than 5 ohms?

→ **Yes**
GO to R5.

→ **No**
REPAIR the circuit. TEST the system for normal operation.

R5 CHECK THE REAR WINDOW DEFROST GRID

1 Carry out the grid wire component test. Refer to Component Tests.

- **Did the rear window defrost grid pass the component test?**

→ **Yes**

INSTALL a new DATC module; REFER to [Section 412-04](#) . CLEAR the DTCs.

REPEAT the self-test. If the rear window defrost is still inoperative, INSTALL a new REM, REFER to [Section 419-10](#) . CLEAR the DTCs. REPEAT the self-test.

→ **No**

REPAIR the rear window defrost grid. For additional information, REFER to [Lead Terminal Repair](#) in this section. TEST the system for normal operation.

R6 CHECK THE POWER SUPPLY TO THE REAR WINDOW DEFROST RELAY

1

2

Rear Window Defrost Relay C443

3

4

4 Measure the voltage between the rear window defrost relay C443 pin 86, circuit 30-HB23A (RD/WH), harness side and ground; and between rear window defrost relay C443 pin 30, circuit 30-HB23A (RD/WH), harness side and ground.

A0003176

- Are the voltages greater than 10 volts?

→ **Yes**
GO to R7.

→ **No**
GO to R9.

R7 CHECK THE REAR WINDOW DEFROST RELAY

- 1 Check the rear window defrost relay. Refer to Wiring Diagrams Section 700-09, Component Testing.

- Did the rear window defrost relay pass the component test?

→ **Yes**
GO to R8.

→ **No**
INSTALL a new rear window defrost relay. TEST the system for normal operation.

R8 CHECK CIRCUIT 91S-HB23 (BN/WH) FOR AN OPEN

1

2

REM C420b

3

A0003177

3

Measure the resistance between REM C420b pin 7, circuit 91S-HB23 (BN/WH), harness side and rear window defrost relay C443 pin 85, circuit 91S-HB23 (BN/WH), harness side.

● Is the resistance less than 5 ohms?

→ Yes

INSTALL a new DATC module; REFER to Section 412-04 . CLEAR the DTCs. REPEAT the self-test.

If rear window defrost is still inoperative, INSTALL a new REM, REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test.

→ No

REPAIR the circuit. TEST the system for normal operation.

R9 CHECK CIRCUIT 30-HB23 (RD/WH) FOR OPEN

1

2

BJB Fuse 429 (30A)

3

3

Measure the voltage between BJB fuse 429 (30A) pin 1, circuit 30-HB23 (RD/WH), harness side and ground.

• Is the voltage greater than 10 volts?

→ **Yes**
REPAIR circuit 30-HB23 (RD/WH). TEST the system for normal operation.

→ **No**
REPAIR the BJB input circuit. TEST the system for normal operation.

R10 CHECK THE OUTPUT TO THE ANTENNA ISOLATOR MODULE

1

2

Antenna Isolator Module C301

3

4

5

4

Trigger the REM active command R DEF RLY to ON.

5

Measure the voltage between antenna

A0003178

isolator module C301, circuit 15S-HB19 (GN/BU), harness side and ground.

- Is the voltage greater than 10 volts?

→ **Yes**
 INSTALL a new antenna isolator module. REFER to [Section 415-02](#). TEST the system for normal operation.

→ **No**
 GO to [R11](#).

R11 CHECK CIRCUIT 15S-HB19 (GN/BU) FOR AN OPEN

1

2

Rear Window Defrost Relay C443

3

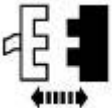

A0003180

3 Measure the resistance between antenna isolator module C301, circuit 15S-HB19 (GN/BU), harness side and rear window defrost relay C443 pin 87, circuit 15S-DA13 (GN/YE), harness side.

	<ul style="list-style-type: none"> ● Is the resistance less than 5 ohms? <p>→ Yes GO to <u>R12</u>.</p> <p>→ No REPAIR the circuit. TEST the system for normal operation.</p>
R12 CHECK THE REAR WINDOW DEFROST RELAY	
	<p>1 Check the rear window defrost relay. Refer to Wiring Diagrams Section 700-09, Component Testing.</p> <ul style="list-style-type: none"> ● Did the rear window defrost relay pass the component test? <p>→ Yes REPAIR circuit 30-HB23 (RD/WH). TEST the system for normal operation.</p> <p>→ No INSTALL a new rear window defrost relay. TEST the system for normal operation.</p>

PINPOINT TEST S: THE DEFROST SYSTEM IS INOPERATIVE — HEATED WIPER PARK

CONDITIONS	DETAILS/RESULTS/ACTIONS
S1 CHECK THE POWER TO THE HEATED WIPER PARK RELAY	
<p>1</p>  <p>2</p>  <p>Heated Wiper Park Relay C1014</p> <p>3</p>	<p>3 Measure the voltage between heated wiper park relay C1014 pin 86, circuit 30-HB8A (RD/OG), harness side and ground; and between heated wiper park relay C1014 pin 30, circuit 30-HB8 (RD/OG), harness side and ground.</p>

- Are both voltages greater than 10 volts?

→ **Yes**
GO to S2.

→ **No**
GO to S6.

S2 CHECK THE SWITCHED GROUND FROM THE DATC MODULE

1

3

2 Depress the heated wiper park switch to the ON position.

3 Measure the voltage between heated wiper park relay C1014 pin 85, circuit 91S-HB7 (BN/RD), harness side and heated wiper park relay C1014 pin 86, circuit 30-HB8A (RD/OG), harness side.

A0005751

● Is the voltage greater than 10 volts?

→ **Yes**
GO to S3.

→ **No**
GO to S7.

S3 CHECK THE HEATED WIPER PARK RELAY OUTPUT

1

2

Heated Wiper Park Relay C1014

3

Heated Wiper Park C247

4

5 Operate the heated wiper park switch to the ON position.

6

A0005160

6

Measure the voltage between heated wiper park C247 pin 1, circuit 30S-HB42 (BK), harness side and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
GO to S5.

→ **No**
GO to S4.

S4 CHECK CIRCUIT 30S-HB42 (BK) FOR AN OPEN

1

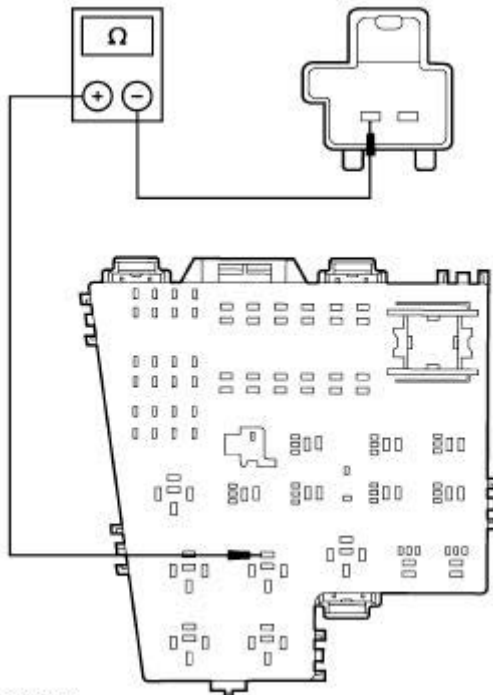

2

Heated Wiper Park Relay C1014

3

A0005162

3

Measure the resistance between heated wiper park relay C1014 pin 87, circuit 30S-HB42 (RD/YE), harness side and heated wiper park C247 pin 1, circuit 30S-HB42 (BK), harness side.

● Is the resistance less than 5 ohms?

→ **Yes**
INSTALL a new heated wiper park relay.
TEST the system for normal operation.

→ **No**
REPAIR the circuit. TEST the system for normal operation.

S5 CHECK THE HEATED WIPER PARK GROUND

1

2

Heated Wiper Park C246

3

5

4 Operate the heated wiper park switch to the ON position.

5 Measure the voltage between heated wiper park C247 pin 1, circuit 30S-HB42 (BK), harness side and heated wiper park C246 pin 1, circuit 31-HB42 (BK), harness side.

● Is the voltage greater than 10 volts?

→ **Yes**
INSTALL a new windshield. REFER to [Windshield Glass](#) in this section. TEST the system for normal operation.

→ **No**
REPAIR circuit 31-HB42 (BK). TEST the system for normal operation.

S6 CHECK THE UNDERHOOD AJB FOR POWER

1

Underhood AJB Fuse 113 (30A)

2

2

Measure the voltage between underhood AJB fuse 113 (30A) pin 1 (input circuit), harness side and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
REPAIR circuit 30-HB8. TEST the system for normal operation.

→ **No**
REPAIR the underhood AJB input circuit. TEST the system for normal operation.

S7 CHECK CIRCUIT 91S-HB7 (BN/RD) FOR AN OPEN

1

2

DATC Module C228b

3

3

Measure the resistance between heated wiper park relay C1014 pin 85, circuit 91S-HB7 (BN/RD), harness side and DATC module C228b pin 20, circuit 91S-HB7 (BN/RD), harness side.

PINPOINT TEST T: THE DEFROST SYSTEM WILL NOT SHUT OFF AUTOMATICALLY — REAR WINDOW DEFROST

CONDITIONS	DETAILS/RESULTS/ACTIONS
T1 CHECK THE REM DTCS	<p>1 Retrieve the recorded results from the REM self-test.</p> <ul style="list-style-type: none"> ● Are any REM DTCs retrieved? <p>→ Yes REFER to the REM Diagnostic Trouble Code (DTC) Index.</p> <p>→ No GO to T2.</p>
T2 CHECK FOR A STUCK OR STICKING REAR WINDOW DEFROST RELAY	
1	

2

Rear Window Defrost Relay C443

3

● Is the rear window defrost defroster off?

→ Yes
GO to T3.

→ No
GO to T5.

T3 CHECK THE REAR WINDOW DEFROST RELAY

1

2

Rear Window Defrost Relay C443

3 Check the rear window defrost relay; refer to Wiring Diagrams Section 700-09, Component Testing.

● Did the rear window defrost relay pass the component test?

→ Yes
GO to T4.

→ No
INSTALL a new rear window defrost relay. TEST the system for normal operation.

T4 CHECK CIRCUIT 91S-HB23 (BN/WH) FOR A SHORT TO GROUND

1

REM C420b

2

2

Measure the resistance between REM C420b pin 7, circuit 91S-HB23 (BN/WH), harness side and ground.

- Is the resistance greater than 10,000 ohms?

→ **Yes**

INSTALL a new REM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**

REPAIR the circuit. TEST the system for normal operation.

T5 CHECK CIRCUITS 15S-DC1 (GN/YE) AND 29S-HB1 (OG/YE) FOR SHORT TO POWER

1

2

BJB Fuse 409 (5A)

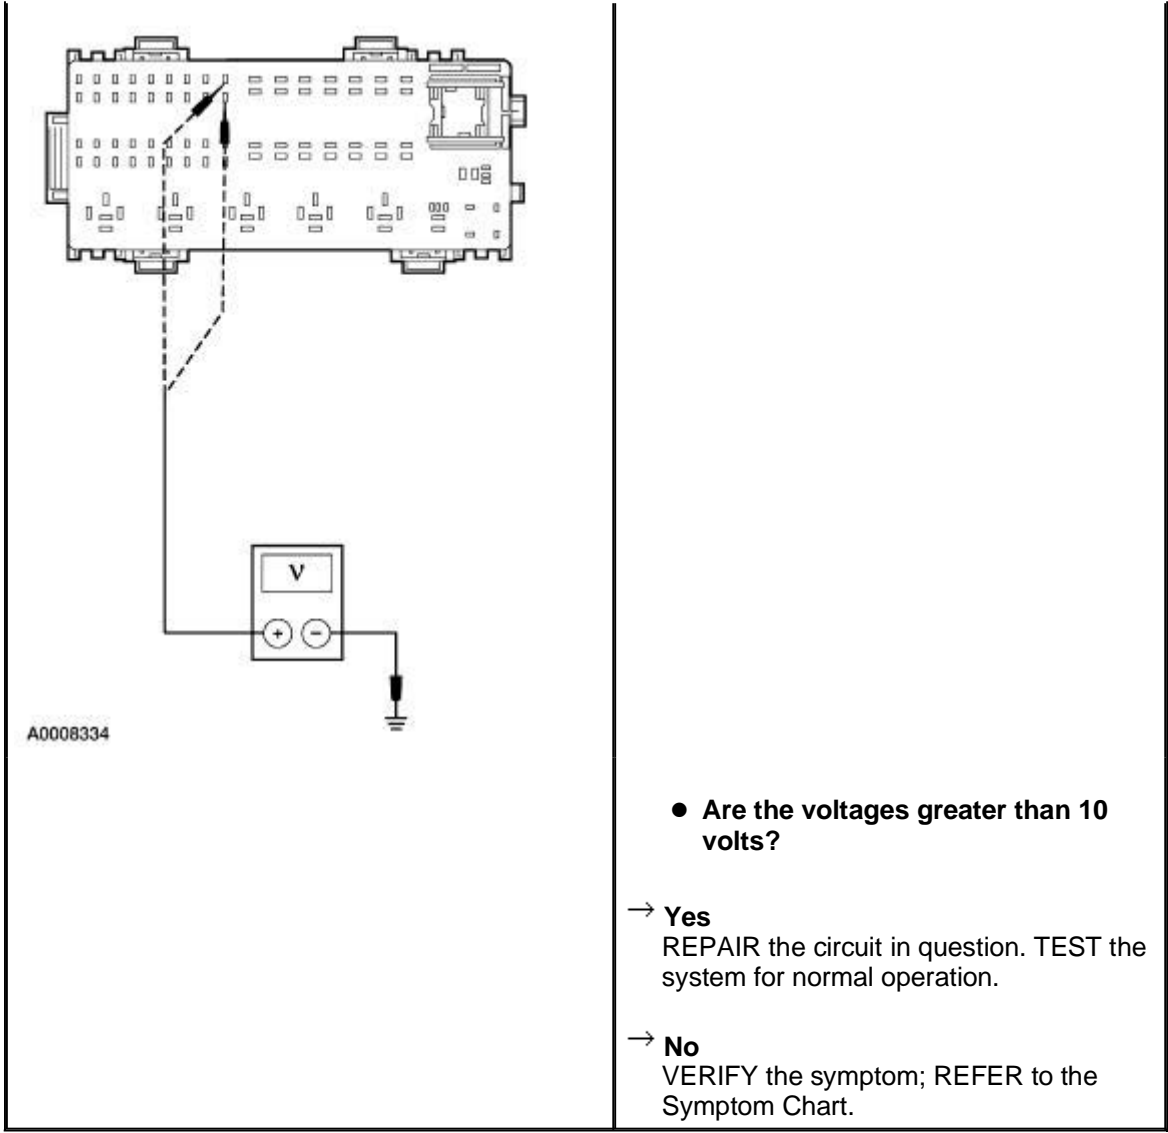

3

4

4

Measure voltage between BJB fuse 409 (5A) pin 1, circuit 15S-DC1 (GN/YE), harness side and ground and between BJB fuse 409 (5A) pin 2, circuit 29S-HB1 (OG/YE), harness side and ground.

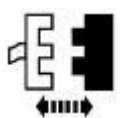

● Are the voltages greater than 10 volts?

→ **Yes**
REPAIR the circuit in question. TEST the system for normal operation.

→ **No**
VERIFY the symptom; REFER to the Symptom Chart.

PINPOINT TEST U: THE DEFROST SYSTEM WILL NOT SHUT OFF AUTOMATICALLY — HEATED WIPER PARK

CONDITIONS	DETAILS/RESULTS/ACTIONS
U1 CHECK FOR A SHORTED CONTROL CIRCUIT	
<p>1 </p> <p>2  Heated Wiper Park Relay C1014</p> <p>3</p>	<p>3 Measure the resistance between heated wiper park relay C1014 pin 85, circuit 91S-HB7 (BN/RD), harness side and ground.</p>

A0005157

● Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to U3.

→ **No**
GO to U2.

U2 CHECK CIRCUIT 91S-HB7 (BN/RD) FOR A SHORT TO GROUND

1

DATC Module C228b

2

2

Measure the resistance between heated wiper park relay C1014 pin 85, circuit 91S-HB7 (BN/RD), harness side and ground.

A0005157

- Is the resistance greater than 10,000 ohms?

- **Yes**
INSTALL a new DATC module. REFER to [Section 412-04](#). TEST the system for normal operation.
- **No**
REPAIR the circuit. TEST the system for normal operation.

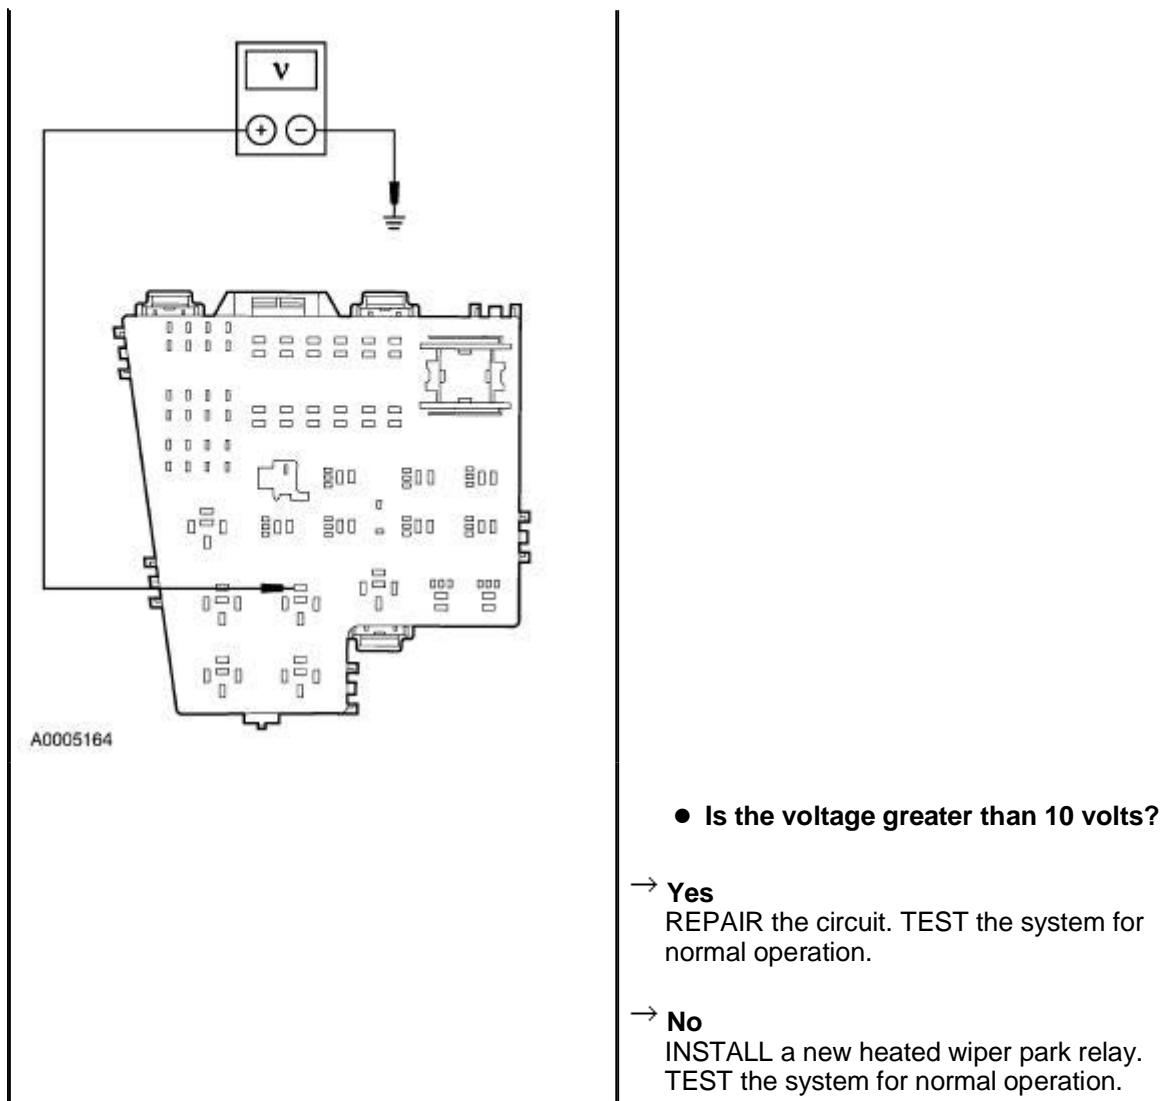

U3 CHECK CIRCUIT 30S-HB42 (RD/YE) FOR A SHORT TO BATTERY

1

2

- 2 Measure the voltage between heated wiper park relay C1014 pin 87, circuit 30S-HB42 (RD/YE), harness side and ground.

Component Test

Grid Wire Test

1. Using a bright lamp in the vehicle, inspect the wire grid from the exterior. A broken grid wire will appear as a brown spot.
2. Run the engine at idle. Set the rear window defrost switch to ON. The indicator light should come on.
3. Working in the vehicle with a voltmeter, contact the broad red-brown stripes of the rear glass window positive lead to battery side and the negative lead to ground side. The meter should read 10-13 volts. A lower voltage reading indicates a loose ground connection.
4. Contact a good ground point with the negative lead of the meter. The voltage reading should remain the same.
5. With the negative lead of the meter grounded, touch each grid line of the rear window defrost glass (42006) at its midpoint with the positive lead. A reading of approximately six volts indicates that the line is good. A reading of zero volts indicates that the line is broken between the midpoint and the B+ side of the grid line. A reading of 12 volts indicates that the circuit is broken between the midpoint of the grid line and ground.

Lead Terminal Repair

Special Tool(s)

 ST1110-A	Heat Gun 107-R0300 or equivalent
---	-------------------------------------

1. **NOTE:** The rear window glass (42006) must be at room temperature at the time of the repair.

Clean the bus bar in the area to be repaired with steel wool (3/0 to 4/0 grade).

2. **NOTE:** Allow 10 minutes of drying time between the coats.

Apply three coats of Rear Window Defroster Repair D8AZ-19562-AA or equivalent meeting Ford specification ESB-M4J58-A to the surface.

3.  **CAUTION:** Do not overheat the rear window glass or damage to the rear window glass may occur.

Tin the bus bar repair area with solder.

4.  **CAUTION:** To prevent overheating the rear window glass, remove the soldering gun as soon as the solder flows.

Preheat the rear window glass in the area to be repaired using the special tool and solder the terminal to the bus bar.

5. **NOTE:** Turn the heated back window switch ON for five minutes prior to the final inspection of the repair.

Apply Rear Window Defroster Repair D8AZ-19562-AA or equivalent meeting Ford specification ESB-M4J58-A to the repair area as needed.

Switch —Master Window Regulator Control

Removal and Installation

1.  **CAUTION:** Carefully lift out the master control regulator switch from the front of the door panel to avoid breaking the tab.

Remove the master window control regulator switch.

2. Disconnect the electrical connector.

3. To install, reverse the removal procedure.

Window Glass —Back

Special Tool(s)

 ST1320-A	Rotunda Interior Auto Glass Cut-Out Knife Kit 164-R2450 or equivalent
 ST1109-A	Rotunda Pneumatic Knife with Offset Blade 107-R1511 or equivalent
 ST2085-A	The Pumper 164-R2459 or equivalent

Removal

 **WARNING:** To prevent glass splinters from entering the eyes or cutting the hands, wear safety glasses and heavy gloves when cutting the glass from the vehicle.

 **CAUTION:** Do not scratch the pinch weld.

1. Remove the package tray trim panel. For additional information, refer to [Section 501-05](#).
2. Disconnect the three back window glass electrical connectors:
 - two rear defrost electrical connectors.
 - FM antenna electrical connector.
3. If equipped, disconnect the cellular phone antenna connector.
4. Lower the rear portion of the headliner.
5. Using a soft brush or vacuum, remove the dirt and foreign material from the pinch weld.

6.  **CAUTION:** Care must be taken to avoid scratching the pinch weld.

NOTE: Lubricate the existing urethane adhesive with water to aid the special tool while cutting.

Using the special tool, starting at the top center of the back window glass, cut the adhesive

away from the glass and work down the sides.

7. Using the special tool, distance the back window glass from the body.

8. Using the special tool, cut the remaining urethane adhesive and remove the back window glass.

9. Using a soft brush or vacuum, remove the dirt and foreign material from the pinch weld.

Installation

⚠ CAUTION: After installing the new urethane-installed glass, the vehicle should not be driven until the urethane adhesive has cured. The curing time at temperatures above 13° C (55° F) and relative humidity above 50% is 12-24 hours. (Refer to the Essex drive away chart for the cure times as the temperatures and humidity vary). Inadequate curing of the urethane adhesive may adversely affect the strength of the urethane adhesive bond.

1. Dry fit the replacement back window glass to the existing urethane bed on the body pinch weld. Align the back window glass in the opening for uniform fit.
2. Use tape or non-permanent marking pencil to make alignment marks on the back window glass (preferably at the setting blocks), and the body to aid in the installation alignment of the replacement back window glass.

3. After alignment, remove the back window glass and molding assemblies from the vehicle and place on a stable work surface.

4.  **CAUTION: Care must be taken to avoid scratching the pinch weld.**

Trim the remaining urethane adhesive on the pinch weld using only the full-cut method. In this method, most of the existing urethane adhesive is removed leaving a level bead around the entire pinch weld.

5.  **WARNING: All rust found on the pinch weld must be removed and the pinch weld restored to OEM specifications. If surface rust is found, remove completely down to clean, bare metal. Prime pinch weld metal with an OEM recommended curing automotive paint primer and allow to cure properly. If rust has penetrated through the pinch weld metal, repair the pinch weld sheet metal at a body shop before proceeding.**

Check the pinch weld for damaged sheet metal, raised sheet metal at the spot welds, rust or foreign material that may cause glass breakage. Clean or repair surface as necessary.

6. Use the wool applicator to apply Urethane Metal Primer Essex U-413 meeting Ford specification WSB-M2G234-C to any exposed metal on the pinch weld. Allow six to ten minutes to dry.
7. If reinstalling the original back window glass, remove any excess urethane adhesive.
8. Clean the inside of the glass surface with an alcohol-free cleaner to make sure the ceramic-coated area is clean.

9.  **CAUTION: Wipe off the urethane glass prep immediately after each application because it flash dries. Apply deliberate strokes, making sure not to overlap the applied area.**

If installing a new back window glass, apply Urethane Glass Prep Essex U-401 meeting Ford specification WSB-M2G314-B twice around the glass surface to be prepped.

10. If installing a new back window glass, apply Urethane Glass Primer Essex U-402 meeting Ford specification WSB-M5B280-C to the same area that was prepped in the previous step. Allow five minutes to dry.
11. Cut the urethane adhesive applicator tip to specification.

12.  **CAUTION:** If the vehicle is to be driven within 24 hours of urethane adhesive application, Urethane Adhesive Essex U-216 meeting Ford specification WSB-M2G316-B must be used due to its one-hour cure time.

Apply a bead of Urethane Adhesive Essex 400-HV or Essex U-216, meeting Ford specification WSB-M2G316-B to the pinch weld.

13.  **CAUTION:** Open the windows to prevent the back window glass from being pushed out by air pressure if a door is closed.

Install the back window glass on the pinch weld. Align the back window glass to the body using the alignment marks while pushing downward to set the stops.

14. Inspect the back window glass for air or water leaks and add urethane adhesive where needed.
15. If equipped, install the cellular phone antenna. For additional information, refer to [Section 419-05](#).
16. Connect the three back window electrical connectors:
- two rear defroster connectors.
 - FM antenna electrical connector.
17. Install the package tray trim panel. For additional information, refer to [Section 501-05](#).
-

Window Glass —Front Door

Removal and Installation

1. Remove the door trim panel. For additional information; refer to [Section 501-05](#).
2. Remove the interior garnish moulding.

3. Remove the watershield.
4. Remove the interior weatherstrip.

5. Position the forward front window regulator to glass bolt to the bottom of the access hole.

6. **NOTE:** Do not remove the bolts.

Loosen the front window regulator to glass bolts.

7. Hold the glass in place and lower the window regulator to the bottom of the door panel.
8. Remove the front door window glass.

9.  **CAUTION: Make sure the front door window glass correctly seats in the glass mounting brackets as the front door window glass is raised.**

NOTE: Position the front door window glass against the B-pillar.

NOTE: Support the front door window glass and raise the window regulator to the full upright position.

To install, reverse the removal procedure.

Window Glass —Rear Door

Removal and Installation

1. Remove the rear door trim panel. For additional information, refer to [Section 501-05](#).
2. Remove the interior garnish molding.

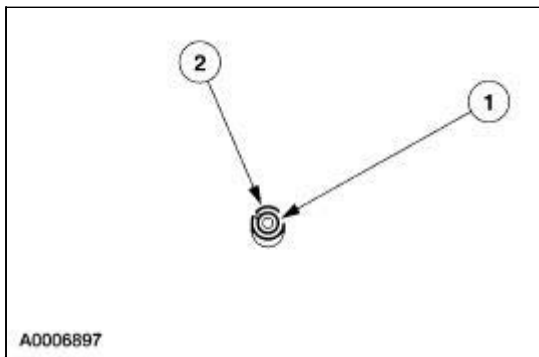

3. Remove the interior weather strip.

4. Lower the rear door window glass until the glass spacer bracket is visible in the access hole.

5. Remove the rear door window glass spacer bracket.
 1. Using a punch, remove the center portion of the spacer bracket.
 2. Remove the outer portion of the spacer bracket.

6. Remove the exterior weatherstrip.

7. Remove the rear door window glass.

- Lift the rear door window glass out of the window regulator.
- Lower the rear door window glass out of the channel.
- Lift the rear door window glass through the belt opening to the outside of the channel.

8. **NOTE:** Prior to the installation of the window, reinstall the outer and center portion of the spacer bracket into the rear door window glass. The spacer bracket should protrude equal distances on both sides of the window glass.

To install, reverse the removal procedure.

Window Glass —Rear Quarter

Removal and Installation

1. Remove the rear door window glass. For additional information, refer to [Window Glass—Rear Door](#) .
2. Remove the rear door glass run and the exterior moulding at the top of the glass.
3. Remove the quarter window glass nuts.

4. Remove the quarter window glass.
 1. Remove the screw.
 2. Remove the quarter window glass.

5. **NOTE:** If reinstalling the original quarter glass, clean off any remaining butyl prior to installation.

NOTE: Clean the area of any remaining foam or residue prior to installation of the quarter window glass.

NOTE: Apply the new butyl to the installation area.

To install, reverse the removal procedure.

Window Regulator —Front Door

Removal and Installation

1. Remove the front door window glass. For additional information, refer to [Window Glass—Front Door](#).
2. Disconnect the door latch electrical connector.

3. Remove the anti-theft shield screw.

4. Remove the nut and position the anti-theft shield aside.

5. Release the clip and disconnect the exterior door handle actuating rod.

6. Remove the nut and the door lock cylinder (driver door only).

7. Remove the latch screws.

8. Remove the two nuts, the bolt and the inner front door support bracket.

9. Remove the bolts and the front door inner support.

10. Remove the bolts and the window regulator assembly.
 - Disconnect the harness locators and reposition the harness.

11. To install, reverse the removal procedure.
-

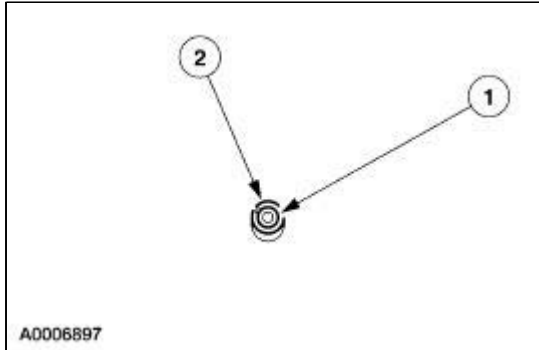

Window Regulator —Rear Door

Removal

1. Remove the rear door trim panel. For additional information, refer to [Section 501-05](#).
2. Lower the rear door window glass until the glass spacer bracket is visible in the access hole.

3. Remove the rear door window glass spacer bracket.
 1. Using a punch, remove the center portion of the spacer bracket.
 2. Remove the outer portion of the spacer bracket.

4. Position the rear window glass to the top of the window opening and tape around the door frame to hold in place.
5. Position the inner door module assembly aside.
 1. Remove the bolts.
 2. Position the support aside.

6. Remove the rear door window regulator.
 1. Remove the two nuts.
 2. Remove the bolt.
 3. Remove the rear door window regulator.
 - Disconnect the electrical connector.

Installation

1. **NOTE:** Prior to the attaching the window to the regulator, reinstall the outer and center portions of the spacer bracket into the rear door window glass. The spacer bracket should protrude equal distances on both sides of the window glass.

Install the spacer bracket into the rear door window glass.

2. Install the rear door window regulator.
 1. Position the window regulator.
 2. Install the two nuts and one bolt.
 - Connect the electrical connector.

3. Position the inner door module assembly to the door and install the bolts.

4. Operate the rear door window regulator to the full up position until the rear window glass spacer bracket is engaged with the regulator.
 - An audible click should be heard when the spacer bracket is engaged.
 5. Install the rear door trim panel. For additional information, refer to Section 501-05.
 6. Check the rear door window glass for proper operation.
-

Motor and Window Regulator —Front Door

Removal and Installation

1. Remove the front door window regulator. For additional information, refer to [Window Regulator—Front Door](#).
2. Remove the screws and the motor from the front door window regulator.

3. To install, reverse the removal procedure.
-

Motor and Window Regulator —Rear Door

Removal and Installation

1. Remove the rear door window regulator. For additional information, refer to [Window Regulator—Rear Door](#) .
2. Remove the screws and the motor from the rear door window regulator.

3. To install, reverse the removal procedure.
-

Windshield Glass

Special Tool(s)

 ST1109-A	Pneumatic Knife with Offset Blade 107-R1511 or equivalent
 ST1320-A	Interior Auto Glass Cut-Out Knife Kit 164-R2450 or equivalent
 ST2085-A	The Pumper 164-R2459 or equivalent

Removal

WARNING: To prevent glass splinters from entering the eyes or cutting the hands, wear safety glasses and heavy gloves when cutting the glass from the vehicle.

1. Remove the cowl vent screen. For additional information, refer to [Section 501-02](#).
2. Remove the interior rear view mirror. For additional information, refer to [Section 501-09](#).
3. Remove the rain sensor module (if equipped). For additional information, refer to [Section 501-16](#).
4. Remove the screws and the sun visors.
 - Disconnect the electrical connectors.

5. Remove the screws and the sun visor clips.

6. Remove the LH and RH windshield side garnish mouldings. For additional information, refer to [Section 501-05](#).
7. Partially remove the front door weatherstrip.
8. Partially drop the headliner near the windshield glass opening and block with suitable material.
9. Disconnect the two heated wiper park grid electrical connectors.
10. Remove the instrument panel defroster opening grille assembly.
 - Disconnect the electrical connectors.

11. Remove the eight screws and the windshield drip mouldings.
12. Using a soft brush or vacuum, remove dirt and foreign material from the pinch weld.
13.  **CAUTION: Cover the instrument panel in order to prevent possible damage.**

 **CAUTION: Care must be used to avoid scratching the pinch weld.**

NOTE: Lubricate the existing urethane adhesive with water to aid the special tool while cutting.

NOTE: When cutting foam inside, first cut foam dam to access urethane adhesive.

Using the special tool, starting at the top center of the windshield glass, cut the urethane adhesive away from the glass and work down the sides.

14. Remove the windshield glass and mouldings assembly using a suitable suction tool.

15. Remove the dual lock windshield glass stops from the sheet metal frame.
16. Using a soft brush or vacuum, remove dirt and foreign material from the pinch weld.

Installation

CAUTION: After installing the new urethane-installed glass, the vehicle should not be driven until the urethane adhesive has cured. The curing time at temperatures above 13° C (55° F) and relative humidity above 50% is 12-24 hours. (Refer to the Essex drive away chart for the cure times as the temperatures and humidity vary). Inadequate curing of the urethane adhesive may adversely affect the strength of the urethane adhesive bond.

1. Dry fit the replacement windshield glass to the existing urethane bed on the body pinch weld. Align the windshield in the opening for uniform fit and adjust setting blocks as needed for best fit.
2. Use tape or non-permanent marking pencil to make alignment marks on the windshield (preferably at the setting blocks), and the body to aid in the installation alignment of the replacement windshield.
3. After alignment, remove the windshield glass and moulding assemblies from the vehicle and place on a stable work surface.
4.  **CAUTION:** Care must be taken to avoid scratching the pinch weld.

Trim the remaining urethane adhesive on the pinch weld. The urethane must be smooth and free of cuts and contamination after trimming. Avoid touching the urethane surface after preparation.

5.  **CAUTION: All rust found on the pinch weld must be removed and the pinch weld restored to OEM specifications. If surface rust is found, remove completely down to clean, bare metal. Prime pinch weld metal with an OEM recommended curing automotive paint primer and allow to cure properly. If rust has penetrated through the pinch weld metal, repair the pinch weld sheet metal at a body shop before proceeding.**

Check the pinch weld for damaged sheet metal, raised sheet metal at the spot welds, rust or foreign material that may cause glass breakage. Clean or repair surface as necessary.

6. Use the wool applicator to apply Urethane Metal Primer Essex U-413 meeting Ford specification WSB-M2G234-C to any exposed metal on the pinch weld. Allow six to ten minutes to dry.
7. If re-installing the same windshield glass that was removed, trim the remaining urethane adhesive from the windshield surface, leaving a thin layer for adhering to the new urethane bead.
8. Clean the inside of the glass surface with an alcohol-free cleaner to make sure the ceramic-coated area is clean.
9. **NOTE:** If the moulding is already on the windshield glass, proceed to the next step.

Align the "V" notch in the ceramic paint and windshield outside molding at top center. Fully seat the windshield outside molding along the top edge of the windshield glass and along the sides and bottom edges of the windshield glass.

10. Remove the dual lock windshield glass stop adhesive backing.

11.  **CAUTION: Wipe off the urethane glass prep immediately after each application because it flash dries. Apply deliberate strokes, making sure not to overlap the applied area.**

If installing a new windshield glass, apply Urethane Glass Prep Essex U-401 meeting Ford specification WSB-M2G314-B twice around the glass surface to be prepped.

12. If installing a new windshield glass, apply Urethane Glass Primer Essex U-402 meeting Ford specification WSB-M5B280-C to the same area that was prepped in the previous step. Allow five minutes to dry.
13. Cut the urethane adhesive applicator tip to specification.

14.  **CAUTION:** If the vehicle is to be driven within 24 hours of urethane adhesive application, Urethane Adhesive Essex U-216 meeting Ford specification WSB-M2G316-B must be used due to its one-hour cure time.

Apply a bead of Urethane Adhesive Essex 400-HV or Essex U-216 meeting Ford specification WSB-M2G316-B to the pinch weld just outside the foam dam.

15.  **CAUTION:** Before installing the windshield glass, open the windows slightly to prevent the windshield from being pushed out by air pressure as the door is closed.

NOTE: The windshield glass must be positioned within 10 minutes of applying the urethane adhesive.

Install the windshield glass on the vehicle, aligning it with marks made previously.

16. Check the windshield installation for air or water leaks through the urethane bead and add urethane adhesive where needed.
17. Place two strips of duct tape onto the windshield glass and secure it to the roof panel. This will help avoid misalignment while the urethane cures.
18. Install the windshield drip mouldings.
- Install the eight screws.
19. Install the instrument panel defrost opening grille assembly.
- Connect the electrical connector.

20. Connect the two heated wiper park grid electrical connectors.
21. Position the headliner.
22. Install the weatherstrips.
23. Install the LH and RH windshield side garnish mouldings. For additional information, refer to [Section 501-05](#).
24. Install the sun visor clips and screws.

25. Install the sun visors and screws.
 - Connect the electrical connectors.

26. Install the rain sensor module. For additional information, refer to [Section 501-16](#).
27. Install the rear view mirror. For additional information, refer to [Section 501-09](#).
28. Install the cowl vent screen. For additional information, refer to [Section 501-02](#).

Torque Specifications

Description	Nm	lb-ft	lb-in
Bulkhead electrical connector bolt	3	—	27
Floor console assembly rear screws	8	—	71
Floor console air conditioning duct mounting screw	2	—	18
Floor console assembly front screws	1	—	9
Glove compartment bin screws	1	—	9
Glove compartment door bolts	6	—	53
Hood release handle screws	2	—	18
Instrument panel cowl side bolts	20	15	—
Instrument panel cowl side nuts	20	15	—
Instrument panel cowl top screws	3	—	27
Instrument panel reinforcement bolts	20	15	—
Instrument panel tunnel brace bolts	20	15	—
Intermediate shaft to steering column pinch bolt	35	26	—

Instrument Panel

The instrument panel consists of the following components:

- passenger air bag module
 - instrument panel cluster finish panel
 - glove compartment
 - instrument cluster
 - audio unit
 - climate control head
 - instrument panel finish panels
 - instrument panel defroster opening grille
 - instrument panel steering column opening cover reinforcement
 - instrument panel steering column cover
-

Console —Floor

The floor console consists of the following components:

- console air condition duct
- console base assembly (automatic transmission)
- console base assembly (manual transmission)
- console rear finish panel assembly
- console finish panel assembly

The console finish panel assembly consists of the following components:

- armrest assembly
 - single cupholder assembly (manual transmission)
 - dual cupholder assembly (automatic transmission)
 - phone presenter assembly
-

Instrument Panel

Removal

 **CAUTION:** Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

1. Position the steering wheel in the straight ahead position.
2. Remove the driver air bag module. For additional information, refer to [Section 501-20B](#).
3. Remove the floor console. For additional information, refer to [Console—Floor](#) in this section.
4. Remove the console A/C duct.

5. If equipped, remove the automatic transmission selector lever assembly. For additional information, refer to [Section 307-05](#).
6. Remove the three pin-type retainers and the LH instrument panel insulator.
 - Disconnect the courtesy lamp.

7. Remove the two pin-type retainers and the RH instrument panel insulator.
 - Disconnect the courtesy lamp.

8. Remove the LH and RH scuff plates.

9. Position the LH and RH door weatherstrips aside.

10. Remove the LH and RH A-pillar lower trim panels.

11. Remove the LH and RH windshield side garnish mouldings.

12. Remove the instrument panel defroster opening grille assembly.
 - Disconnect the electrical connector.

13. Remove the instrument panel cowl top screws.

14. Loosen the instrument panel upper reinforcement bolts.

15. Remove the LH and RH instrument panel side finish panels.

16. Position the hood release handle and cable aside.
 1. Remove the screws.
 2. Position the hood release handle and cable aside.

17. Disconnect the upper RH bulkhead electrical connector.
 1. Loosen the bolt.
 2. Disconnect the upper RH bulkhead electrical connector.

18. Disconnect the RH electrical connectors through the instrument panel side opening.

19. Disconnect the passenger side tunnel electrical connector.

20.  **CAUTION: Secure the steering wheel to prevent any rotation or damage to the air bag sliding contact.**

Separate the intermediate shaft from the steering column.

1. Remove the pinch bolt.
2. Separate the intermediate shaft from the steering column.

21. Disconnect the LH junction box electrical connector.
- Position the carpet aside to gain access to the connector.

22. Disconnect the LH electrical connectors through the instrument panel side opening.

23. If equipped, disconnect the ignition shift interlock electrical connector.

24. Remove the four instrument panel tunnel brace bolts.
● Position the carpet aside to gain access to the bolts.

25. Remove the driver side outer instrument panel cowl side cover and reinforcement bolt.

26. Remove the LH instrument panel cowl side bolt and nut.

27. Remove the RH instrument panel cowl side bolt and nut.

28. **NOTE:** Two technicians are required to carry out this step.

Remove the instrument panel.

Installation

CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

1. **NOTE:** Two technicians are required to carry out this step.

Install the instrument panel.

2. Install the instrument panel cowl top screws.

3. Install the RH instrument panel cowl side bolt and nut.

4. Install the LH instrument panel cowl side bolt and nut.

5. Install the driver side outer instrument panel cowl side reinforcement bolt and cover.

6. Tighten the instrument panel upper reinforcement bolts.

7.  **CAUTION:** Be sure the steering column cover reinforcement is in place before completing this step.

Install the four instrument panel tunnel brace bolts.

- Reposition the carpet.

8. If equipped, connect the ignition shift interlock electrical connector.

9. Connect the LH electrical connectors through the instrument panel side opening.

10. Connect the LH junction box electrical connector.

- Reposition the carpet.

11. Connect the intermediate shaft to the steering column.

1. Connect the intermediate shaft to the steering column.
2. Install the pinch bolt.

12. Connect the passenger side tunnel electrical connector.

13. Connect the RH electrical connectors through the instrument panel side opening.

14. Connect the RH bulkhead electrical connector.
 1. Connect the RH bulkhead electrical connector.
 2. Tighten the bolt.

15. Position the hood release handle and cable and install the screws.

16. Install the LH and RH instrument panel side finish panels.

17. Install the instrument panel defroster opening grille assembly.

- Connect the electrical connector.

18. Install the LH and RH windshield side garnish mouldings.

19. Install the LH and RH A-pillar lower trim panels.

20. Install the LH and RH door weatherstrips.

21. Install the LH and RH scuff plates.

22. Position the LH instrument panel insulator and install the three pin-type retainers.

- Connect the courtesy lamp.

23. Position the RH instrument panel insulator and install the two pin-type retainers.

- Connect the courtesy lamp.

24. If equipped, install the automatic transmission selector lever assembly. For additional information, refer to [Section 307-05](#).
25. Install the console A/C duct.

26. Install the floor console. For additional information, refer to [Console—Floor](#) in this section.
 27. Install the driver air bag module. For additional information, refer to [Section 501-20B](#).
-

Instrument Panel —Cluster Finish Panel

Removal and Installation

1. Adjust the steering column to the full tilt down and full extended position.
2. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
3. Remove the instrument panel steering column cover.
 1. Remove the pin-type retainers.
 2. Remove the instrument panel steering column cover.
 - Disconnect the electrical connectors.

4. Remove the outer instrument panel finish panel.
 - Disconnect the electrical connectors.

5. Remove the inner instrument panel finish panel.

6. Position the instrument panel cluster finish panel aside.
 1. Remove the screws.
 2. Position the instrument panel cluster finish panel aside.

7. Disconnect the in-car air temperature sensor and remove the instrument panel cluster finish panel.

8. To install, reverse the removal procedure.
-

Console —Floor

Removal and Installation

1. Apply the parking brake.
2. If equipped with a manual transmission, place the selector lever in fourth gear.
3. If equipped with an automatic transmission, place the selector lever in neutral.
4. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
5. Remove the ashtray finish panel.
 - Disconnect the electrical connectors.

6. If equipped with a manual transmission, remove the gearshift lever knob.
7. If equipped, disconnect the cellular phone electrical connectors.
8. Remove the console finish panel assembly by pulling upward from the front first.
 - If equipped, disconnect the traction control switch electrical connector.
 - If equipped, release the cellular phone wiring harness from the console finish panel assembly.

9. Remove the console rear finish panel assembly.
 - Unclip by pulling rearward.

10. Unclip the parking brake boot from the console base.

11. Remove the console assembly front screws.

12. Remove the console assembly rear screws.

13. Remove the console air condition duct mounting screw.

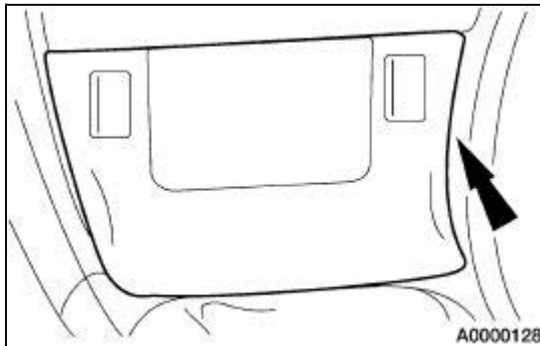

14. Remove the console assembly by sliding rearward.
 15. To install, reverse the removal procedure.
-

Console —Floor, Finish Panel Assembly

Removal and Installation

1. Apply the parking brake.
2. If equipped with a manual transmission, place the selector lever in fourth gear.
3. If equipped with an automatic transmission, place the selector lever in neutral.
4. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
5. Remove the ashtray finish panel.
 - Disconnect the electrical connectors.

6. If equipped with a manual transmission, remove the gearshift lever knob.
7. If equipped, disconnect the cellular phone electrical connectors.
8. Remove the console finish panel assembly by pulling upward from the front first.
 - If equipped, disconnect the traction control switch electrical connector.
 - If equipped, release the cellular phone wiring harness from the console finish panel assembly.

9. To install, reverse the removal procedure.

Glove Compartment

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Remove the two pin-type retainers and the instrument panel insulator.
 - Disconnect the courtesy lamp.

3. Remove the screw and the floor heat duct.

4. From under the instrument panel, release the assist cable from the glove compartment door arm.

5. Open the glove compartment.
6. Remove the instrument panel finish panel.

7. Pull up on the glove compartment door arms and lower the glove compartment door.
8. Remove the assist cable bracket screws.

9. Remove the screws and the glove compartment bin.
 - Disconnect the electrical connector.

10. Remove the bolts and the glove compartment door.
 - Disconnect the electrical connector.

11. To install, reverse the removal procedure.

General Specifications

Item	Specification
Lubricants	
Multi-Purpose Grease Spray F5AZ-19G209-AA	ESR-M1C159-A
Penetrating and Lock Lubricant E8AZ-19A501-B	—

Exterior door handle nut, front door	10	—	89
Lock cylinder nut	10	—	89

**LOCK REPAIR/REPLACEMENT
 SPECIFICATIONS**

Part Number	Lock Repair Package Name
11582	Ignition Cylinder
5421990	Door Lock
5443262	Luggage Compartment Lid
5406082	Glove Box
5421970	Lock Lever Kit

Handles, Locks, Latches and Mechanisms

Actuator

The actuator is not repairable and is a part of the latch assembly.

Fuel Filler Door Lock Switch

The fuel filler door lock switch actuates a solenoid integral to the fuel filler door latch to release the fuel tank filler door.

Global Window Open/Close

WARNING: Disconnect the battery ground cable when working on or near the driver side door cylinder lock rod or door latch. Failure to follow these instructions may result in personal injury.

This vehicle is equipped with a global window open/close feature activated by turning the key to either the lock or unlock position and holding it there for at least three seconds. Turning the key to the lock position will close all of the windows. Turning the key to the unlock position will open all of the windows. This function can accidentally be activated when working around or with the driver side door cylinder lock rod or door latch causing the windows to abruptly open or close. To avoid personal injury, always disconnect the battery ground cable when working on or near the driver side door cylinder lock rod or door latch.

Lock Cylinder Repair

Individual lock cylinders are repaired by discarding the inoperative cylinder and building a new lock cylinder using the appropriate lock repair package. The lock repair package includes a detailed instruction sheet to build the new lock cylinder to the current key code of the vehicle.

Luggage Compartment Remote Control Lock Switch

Refer to [Section 501-14B](#) for diagnostics.

Power Locks

The door lock system consists of:

- interior front door latch remote control assembly
- front door latch and cable assembly
- exterior door handle and front door latch actuating rod
- lock cylinder rod
- door latch striker plate

- door lock cylinder
- adjunct actuator
- circuit wiring and circuit protection
- front door lock switch

Refer to [Section 501-14B](#) for diagnostics.

Theft Shield

The theft shield is:

- located inside the driver door panel.
- fastened near the bottom of the door and the door handle.

Trunk Release Lockout Switch

The trunk release lockout switch is:

- located within the glove compartment.
 - disables the trunk release switch.
-

Locks, Latches and Mechanisms

Refer to [Section 501-14B](#) for power door lock diagnostics.

Refer to [Section 501-14B](#) for luggage compartment lid remote control lock switch diagnostics.

Latch —Front Door

Removal and Installation

 **WARNING:** Disconnect the battery ground cable when working on or near the driver side door cylinder lock rod or door latch. Failure to follow these instructions may result in personal injury.

Driver and Passenger Front Door

1. Disconnect the battery ground cable (14301). For additional information, refer to [Section 414-01](#).
2. Remove the front door trim panel. For additional information, refer to [Section 501-05](#).
3. Remove the lower theft shield screw.

4. Remove the nut and position the theft shield aside .

Driver Door Only

5. Remove the nut and the lock cylinder.

Driver and Passenger Front Door

6. Release the clip and disconnect the exterior door handle actuator rod.
 - If equipped, disconnect the door lock cylinder switch electrical connector.

7. Disconnect the electrical connector.

8. Remove the door latch screws.

9. Remove the interior handle actuating cable.

10. Remove the door latch.

11. To install, reverse the removal procedure.

Latch —Rear Door

Removal and Installation

1. Remove the rear door trim panel. For additional information, refer to [Section 501-05](#).
2. Release the clip and disconnect the exterior door handle actuating rod.

3. Remove the door latch screws.

4. Disconnect the electrical connector.

5. Remove the interior door handle release cable and remove the rear door latch.

6. To install, reverse the removal procedure.

Handle —Exterior Front Door

Removal and Installation

Driver and Passenger Front Door

WARNING: Disconnect the battery ground cable when working on or near the driver side door cylinder lock rod or door latch. Failure to follow these instructions may result in personal injury.

1. Disconnect the battery ground cable (14301). For additional information, refer to [Section 414-01](#).
2. Remove the front door trim panel. For additional information, refer to [Section 501-05](#).
3. Remove the lower theft shield screw.

4. Remove the nut and position the theft shield aside.

5. Release the clip and disconnect the exterior door handle actuating rod.
 - If equipped, disconnect the door lock cylinder switch electrical connector.

6. Remove the nut and position the door lock cylinder aside.

Driver and Passenger Front Door

7. Remove the nut and the exterior door handle.

8. To install, reverse the removal procedure.
-

Handle —Exterior Rear Door

Removal and Installation

1. Remove the rear door trim panel. For additional information, refer to [Section 501-05](#).
2. Release the clip and disconnect the exterior door handle actuator rod.

3. Remove the grommet.

4. Remove the nuts and exterior door handle.

5. To install, reverse the removal procedure.

Handle —Interior Door

Special Tool(s)

Removal and Installation

1. Disconnect the battery ground cable (14301). For additional information, refer to [Section 414-01](#).
2. Remove the door trim panel. For additional information, refer to [Section 501-05](#).
3. **NOTE:** Using the special tool is required to install the rivets.

Remove the rivets.

4. Release the cable and remove the interior door handle.

5. To install, reverse the removal procedure.

Lock Cylinder —Door

Removal and Installation

 **WARNING:** Disconnect the battery ground cable when working on or near the driver side door cylinder lock rod or door latch. Failure to follow these instructions may result in personal injury.

NOTE: Individual lock cylinders are repaired by discarding the inoperative cylinder and building a new lock cylinder using the appropriate lock repair package. The lock repair package includes a detailed instruction sheet to build the new lock cylinder to the current key code of the vehicle.

1. Disconnect the battery ground cable (14301). For additional information, refer to [Section 414-01](#).
2. Remove the front door trim panel. For additional information, refer to [Section 501-05](#).
3. Remove the lower theft shield screw.

4. Remove the nut and the theft shield.

5. Remove the lock cylinder nut and remove the lock cylinder.
 - If equipped, disconnect the door lock cylinder switch electrical connector.

6. To install, reverse the removal procedure.

Latch Remote Control —Fuel Door Release

Removal and Installation

1. Remove the fuel filler cap.
2. Remove the bolts and position the fuel door release latch remote control aside.

3. Disconnect the electrical connector and remove the latch remote control.

4. To install, reverse the removal procedure.
-

Switch —Fuel and Luggage Compartment Lid Release

Removal and Installation

1. Remove the instrument panel steering column cover.

2. Disconnect the electrical connector.

3. Remove the fuel luggage compartment lid release switch.

4. To install, reverse the removal procedure.

Switch —Luggage Compartment Lid Lockout

Removal and Installation

1. Remove the glove compartment. For additional information, refer to [Section 501-12](#).
2. Remove the screws and the luggage compartment lid lockout switch.

3. To install, reverse the removal procedure.
-

Keyless Entry

The keyless entry system consists of the following:

- driver door module (DDM)
- four button remote transmitter
- front electronic module (FEM)
- rear electronic module (REM)

For removal and installation of the actuator, refer to [Section 501-14A](#) .

For removal and installation of the driver door module (DDM), refer to [Section 419-10](#) .

For removal and installation of the rear electronic module (REM), refer to [Section 419-10](#) .

For removal and installation of the front electronic module (FEM), refer to [Section 419-10](#) .

Keyless Entry

Refer to Wiring Diagrams Section [501-14B](#) for schematic and connector information.

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent diagnostic tool
 ST1137-A	73III Automotive Meter or equivalent 105-R0057

Principles of Operation

The rear electronics module (REM) controls the output functions of the door locks for the following:

- Passenger front door lock actuator
- Passenger rear door lock actuator
- Driver rear door lock actuator

The REM controls the input functions of the door locks for the following:

- Passenger door lock and unlock switch

The driver door module (DDM) controls the output functions of the door locks for the following:

- Driver door lock actuator

The DDM controls the input functions of the door locks for the following:

- Driver door lock and unlock switch

Operating commands for the passenger front, passenger rear and driver rear lock actuators are received in two forms: the standard corporate protocol (SCP) communication network from the DDM or directly from the passenger door lock and unlock switch, which is hardwired to the REM. The driver door lock and unlock switch is hardwired to the DDM. When the driver switch is activated, the DDM will activate the driver door lock actuator and also sends a message through the SCP network. In turn, the REM will output the desired command to the appropriate lock actuators. When the passenger door lock and unlock switch is activated, the REM will activate the lock actuators, which it controls, and it

will also send a message through the SCP network to the DDM to activate the driver door lock actuator.

Operating commands for the driver actuator are received in two forms: through the SCP communication network from the REM or directly from the driver door lock and unlock switch, which is hardwired to the DDM. The passenger door lock and unlock switch is hardwired to the REM. When the passenger switch is activated, the REM will activate the passenger front, passenger rear, and driver rear door lock actuators and also send a message through the SCP network. In turn, the DDM will output the desired command to the driver front door lock actuator. When the driver door lock and unlock switch is activated, the DDM will activate the driver lock actuator, which it controls, and it will also send a message through the SCP network to the REM to activate the appropriate door lock actuators.

Operating commands for the luggage compartment release lock motor are received in two forms: directly from the luggage compartment release switch which is hardwired to the REM, or through the SCP network from the DDM. When the luggage compartment release switch is activated, the REM will activate the luggage compartment lock actuator, which is hardwired to the REM. The luggage compartment unlock operation is also possible when activated from the remote transmitter through the DDM, with the DDM sending a message over the SCP network. The REM will then activate the luggage compartment release motor.

The DDM receives inputs from the remote transmitter(s) and delivers outputs enabling the driver to lock and unlock the vehicle's power lock system, or to arm and disarm the perimeter alarm. The DDM can be programmed to accept up to four transmitter ID codes from four remote transmitters.

Remote locking and unlocking of the doors is accomplished by the DDM receiving a command message from the remote transmitter. The DDM then processes the command and sends a signal directly to the driver door lock actuator, and sends a message through the SCP network, to the REM which will drive the appropriate passenger door lock actuators. Fault management will disable the remote locking and unlocking feature in the event of an ignition switch or PRNDL invalid or missing message to the front electronic module (FEM).

All power door locks and the luggage compartment release motor are powered by the switched system power (SSP) feature. A failure of any or all of the SSP features could cause inoperative power door locks. When diagnosing power door locks, it is essential to determine if all the related symptoms and DTCs are controlled by the SSP feature.

Inspection and Verification

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical
<ul style="list-style-type: none"> ● Door lock mechanisms 	<ul style="list-style-type: none"> ● Central junction box (CJB) Fuses: <ul style="list-style-type: none"> ■ 222 (10A) ■ 207 (5A) ● Battery junction box (BJB) Fuses: <ul style="list-style-type: none"> ■ 401 (15A) ■ 422 (20A) ■ 425 (40A) ● DDM ● REM

- FEM
- Circuitry
- Remote transmitter

3. If the concern remains after the inspection, connect the diagnostic tool to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
 - check that the program card is correctly installed.
 - check the connections to the vehicle.
 - check the ignition switch position.
4. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool manual.
5. Carry out the DATA LINK DIAGNOSTICS. If the diagnostic tool responds with:
 - CKT914, CKT915 or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to [Section 418-00](#).
 - NO RESP/NOT EQUIP for DDM, go to Pinpoint Test A.
 - NO RESP/NOT EQUIP for REM, go to Pinpoint Test B.
 - NO RESP/NOT EQUIP for FEM, go to Pinpoint Test R.
 - SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs, and carry out self-test diagnostics for the DDM, FEM or REM.
6. If the DTCs retrieved are related to the concern, go to DDM Diagnostic Trouble Code (DTC) Index, REM Diagnostic Trouble Code (DTC) Index, FEM Diagnostic Trouble Code (DTC) Index, or SSP Relay Index to continue diagnostics.
7. If no DTCs related to the concern are retrieved, proceed to Symptom Chart to continue diagnostics.

Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1309	Power Door Lock Circuit Short to Ground	DDM	GO to Pinpoint Test C .

SSP Relay Index

Relay	Fuse	Controlled System(s)
SSP1	BJB Fuse 430 (30A)	<ul style="list-style-type: none"> • • Driver power door lock (FEM) • LH and RH high beam headlamps (FEM) • RF park, turn, and side marker lamps (FEM) <ul style="list-style-type: none"> • RH low beam headlamp • Driver power mirror
SSP2	BJB Fuse 431 (30A)	<ul style="list-style-type: none"> • • LH low beam headlamp (FEM) • LF park, turn, and sidemarker lamps (FEM) <ul style="list-style-type: none"> • Interior courtesy and demand lighting • Windshield wiper washer pump • Switch illumination backlighting
SSP3	BJB Fuse 424 (30A)	<ul style="list-style-type: none"> • • High mounted stoplamp (REM) • RR park and stoplamps (REM) <ul style="list-style-type: none"> • Reversing lamps (REM) • LR turn signals (REM) • Passenger power mirror • Trailer stoplamps and turn signals (if equipped with trailer tow)
SSP4	BJB Fuse 423 (30A)	<ul style="list-style-type: none"> • • LR park and stoplamps (REM) <ul style="list-style-type: none"> • RR turn signals (REM) • Passenger door and side locks (REM) <ul style="list-style-type: none"> • License lamps • Trunk release solenoid and switch • Fuel door release solenoid and switch <ul style="list-style-type: none"> • Trunk lamp • Trailer park lamps (if equipped with trailer tow)

When diagnosing an SSP relay, check that all systems for that relay are inoperative. Refer to [Section 417-01](#) if:

- all systems for one SSP relay are inoperative
- all systems for all SSP relays are inoperative

Symptom Chart

Pinpoint Tests

PINPOINT TEST A: NO COMMUNICATION WITH THE DRIVER DOOR MODULE (DDM)

CONDITIONS	DETAILS/RESULTS/ACTIONS
A1 CHECK CIRCUITS 29-AJ80 (OG) AND 29S-AJ86 (OG/BU) FOR VOLTAGE	
NOTE: Cycle the ignition switch from OFF to RUN to enable the switched system power feature.	
<p>1</p>  <p>2</p>  <p>DDM C501a</p> <p>3</p> 	

4

4

Measure the voltage between DDM C501a pin 11, circuit 29-AJ80 (OG), harness side and ground; and between DDM C501a pin 12, circuit 29S-AJ86 (OG/BU), harness side and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
GO to A2.

→ **No**
REPAIR the circuit. TEST the system for normal operation.

A2 CHECK CIRCUITS 31-AJ80B (BK/OG) AND 91-AJ80 (BN/BU) FOR OPENS

1

2

2

Measure the resistance between DDM C501a pin 7, circuit 91-AJ80 (BN/BU), harness side and ground; and between DDM C501a pin 8, circuit 31-AJ80B (BK/OG), harness side and ground.

● Is the resistance less than 5 ohms?

→ **Yes**
REFER to Section 418-00.

→ **No**
REPAIR the circuits in question. TEST the system for normal operation.

PINPOINT TEST B: NO COMMUNICATION WITH THE REAR ELECTRONIC MODULE (REM)

CONDITIONS	DETAILS/RESULTS/ACTIONS
B1 CHECK CIRCUIT 29-DK31 (OG/BK) FOR VOLTAGE	

1

2

REM C420d

3

REM C420c

4

5

A0006299

5 Measure the voltage between REM C420d pin 3, circuit 29-DK31 (OG/BK), harness side and ground.

• Is the voltage greater than 10 volts?

→ Yes
GO to B2.

→ No
REPAIR the circuit. TEST the system for normal operation.

B2 CHECK CIRCUITS 29S-DK31 (OG/BK), 31-DK30D (BK), 31-DK30E (BK), 31-DK30F (BK), 31-DK30G (BK) AND 31-DK30H (BK/OG), FOR OPENS

1

2

REM C420b

3

3 Using the following table, measure the

resistance between REM connectors, harness side and ground:

REM	Pin	Circuit
C420c	13	29S-DK31 (OG/BK)
C420c	12	31-DK30E (BK)
C420c	11	31-DK30D (BK)
C420c	26	31-DK30G (BK)
C420c	25	31-DK30F (BK)
C420b	12	31-DK30H (BK/OG)

● **Is the resistance less than 5 ohms?**

→ **Yes**

REFER to [Section 418-00](#).

→ **No**

REPAIR the circuit(s) in question. TEST the system for normal operation.

PINPOINT TEST C: ALL DOOR LOCKS ARE INOPERATIVE — FROM DRIVER DOOR SWITCH

CONDITIONS	DETAILS/RESULTS/ACTIONS
C1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TEST — DDM	<p>1 Use the recorded DDM DTCs from the continuous and on-demand self-test.</p> <p>● Are any DDM DTCs recorded?</p> <p>→ Yes If DTC B1309 or DTC B1341, GO to C4.</p> <p>For all other DDM DTCs, REFER to the DDM Diagnostic Trouble Code (DTC) Index.</p> <p>→ No GO to C2.</p>
C2 CHECK DRIVER DOOR LOCK SWITCH AND CIRCUITS — MONITOR THE DDM PID DR_LOCK AND DR_UNLK	
NOTE: Cycle the ignition switch from OFF to RUN to enable the switched system power feature.	
<p>1</p>  <p>2</p>	

Diagnostic Tool

3

4

4

Monitor the DDM PIDs DR_LOCK and DR_UNLK, while locking and unlocking the driver door using the driver power door lock switch.

- Do the DDM PID values agree with the driver power door lock switch positions?

→ Yes

INSTALL a new DDM. For additional information, REFER to Section 419-10. REPEAT the self-test. CLEAR the DTCs.

→ No

If the PID(s) read YES at all times GO to C3.

If the PID(s) read NO at all times GO to C5.

C3 CHECK DRIVER POWER DOOR LOCK SWITCH

1

2

Driver Power Door Lock Switch C505

3

Carry out the driver power door lock switch component test. Refer to Wiring Diagrams Section 700-09-00, Component Testing.

- Is the driver power door lock switch OK?

→ Yes

GO to C4.

→ No

INSTALL a new driver power door lock switch. REFER to Section 501-14A.

REPEAT the self-test. CLEAR the DTCs.

C4 CHECK CIRCUITS 8-AA10 (WH/BK) AND 8-AA11 (WH/VT) FOR SHORT TO GROUND

1

DDM C501d

2

2

Measure the resistance between DDM C501d pin 23, circuit 8-AA10 (WH/BK), harness side and ground; and between DDM C501d pin 24, circuit 8-AA11 (WH/VT), harness side and ground.

- Are the resistances greater than 10,000 ohms?

→ **Yes**
INSTALL a new DDM. REFER to [Section 419-10](#). REPEAT the self-test. CLEAR the DTCs.

→ **No**
REPAIR the circuit(s) in question. REPEAT the self-test. CLEAR the DTCs.

C5 CHECK DRIVER POWER DOOR LOCK SWITCH

1

2

Driver Power Door Lock Switch C505

3

Carry out the driver power door lock switch component test. Refer to Wiring Diagrams Section 700-09-00, Component Testing.

- Is the driver power door lock switch OK?

→ **Yes**
GO to [C6](#).

→ **No**
INSTALL a new driver power door lock switch. REFER to [Section 501-14A](#) .
REPEAT the self-test. CLEAR the DTCs.

C6 CHECK CIRCUIT 31-LH28 (BK) FOR OPEN

1

1 Measure the resistance between driver power door lock switch C505 pin 4, circuit 31-LH28 (BK), harness side and ground.

● Is the resistance less than 5 ohms?

→ **Yes**
GO to [C7](#) .

→ **No**
REPAIR the circuit. REPEAT the self-test.
CLEAR the DTCs.

C7 CHECK CIRCUITS 8-AA10 (WH/BK) AND 8-AA11 (WH/VT) FOR OPEN

1

DDM C501d

2

2 Measure the resistance between DDM C501d pin 23, circuit 8-AA10 (WH/BK), harness side and driver power door lock switch C505 pin 1, circuit 8-AA10 (WH/BK), harness side; and between DDM C501d pin 24, circuit 8-AA11 (WH/VT), harness side and driver power door lock switch C505 pin 2, circuit 8-AA11 (WH/VT), harness side.

● Are the resistances less than 5 ohms?

→ **Yes**
INSTALL a new DDM. REFER to [Section 419-10](#) . REPEAT the self-test. CLEAR the DTCs.

→ **No**

REPAIR the circuit(s) in question.
 REPEAT the self-test. CLEAR the DTCs.

PINPOINT TEST D: ALL DOOR LOCKS ARE INOPERATIVE — FROM PASSENGER DOOR SWITCH

CONDITIONS	DETAILS/RESULTS/ACTIONS
<p>D1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TEST — REM</p>	<p>1 Use the recorded REM DTCs from the continuous and on-demand self-test.</p> <ul style="list-style-type: none"> ● Are any REM DTCs recorded? <p>→ Yes For DTC B1300 or B1310, GO to <u>D3</u>.</p> <p>For all other REM DTCs, REFER to the REM Diagnostic Trouble Code (DTC) Index.</p> <p>→ No GO to <u>D2</u>.</p>
<p>D2 CHECK PASSENGER DOOR LOCK SWITCH AND CIRCUITS — MONITOR THE REM PID PD_LOCK AND PD_UNLK</p>	<p>NOTE: Cycle the ignition switch from OFF to RUN to enable the switched system power feature.</p>
<p>1</p>  <p>2</p>  <p>Diagnostic Tool</p> <p>3</p>  <p>4</p> 	<p>4 Monitor the REM PIDs PD_LOCK and PD_UNLK, while locking and unlocking the passenger door using the passenger power door lock switch.</p> <ul style="list-style-type: none"> ● Do the REM PID values agree with the passenger power door lock switch positions? <p>→ Yes INSTALL a new REM. REFER to <u>Section</u></p>

419-10. REPEAT the self-test. CLEAR the DTCs.

→ **No**
If the PID(s) read YES at all times GO to D3.

If the PID(s) read NO at all times GO to D5.

D3 CHECK PASSENGER POWER DOOR LOCK SWITCH

1

2

Passenger Power Door Lock Switch C605

3 Carry out the passenger power door lock switch component test. Refer to Wiring Diagrams Section 700-09-00, Component Testing.

● **Is the passenger power door lock switch OK?**

→ **Yes**
GO to D4.

→ **No**
INSTALL a new passenger power door lock switch. REFER to Section 501-14A. REPEAT the self-test. CLEAR the DTCs.

D4 CHECK CIRCUITS 8-AA20 (WH/BU) AND 8-AA21 (WH/GN) FOR SHORT TO GROUND

1

REM C420c

2

A0004041

2 Measure the resistance between REM C420c pin 20, circuit 8-AA20 (WH/BU), harness side and ground; and between REM C420c pin 21, circuit 8-AA21 (WH/GN), harness side and ground.

- Are the resistances greater than 10,000 ohms?

→ **Yes**
 INSTALL a new REM. REFER to [Section 419-10](#) . REPEAT the self-test. CLEAR the DTCs.

→ **No**
 REPAIR the circuit(s) in question. REPEAT the self-test. CLEAR the DTCs.

D5 CHECK PASSENGER POWER DOOR LOCK SWITCH

1

2

Passenger Power Door Lock Switch C605

3 Carry out the passenger power door lock switch component test. Refer to Wiring Diagrams Section 700-09-00, Component Testing.

- Is the passenger power door lock switch OK?

→ **Yes**
 GO to [D6](#) .

→ **No**
 INSTALL a new passenger power door lock switch. REFER to [Section 501-14A](#) . REPEAT the self-test. CLEAR the DTCs.

D6 CHECK CIRCUIT 31-LH42 (BK) FOR OPEN

1

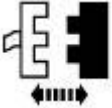

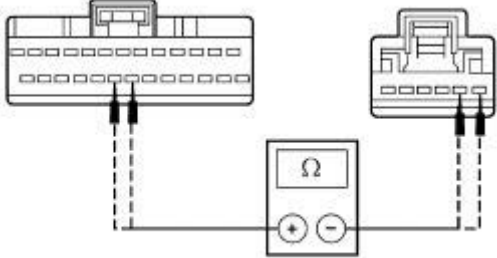

A0004130

1 Measure the resistance between passenger power door lock switch C605 pin 4, circuit 31-LH42 (BK), harness side and ground.

- Is the resistance less than 5 ohms?

	<p>→ Yes GO to <u>D7</u>.</p> <p>→ No REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.</p>
--	---

D7 CHECK CIRCUITS 8-AA20 (WH/BU) AND 8-AA21 (WH/GN) FOR OPEN

<p>1</p>  <p>REM C420c</p> <p>2</p>  <p>A0004113</p>	<p>2 Measure the resistance between REM C420c pin 20, circuit 8-AA20 (WH/BU), harness side and passenger power door lock switch C605 pin 1, circuit 8-AA20 (WH/BU), harness side; and between REM C420c pin 21, circuit 8-AA21 (WH/GN), harness side and passenger power door lock switch C605 pin 2, circuit 8-AA21 (WH/GN), harness side.</p> <p>● Are the resistances less than 5 ohms?</p> <p>→ Yes INSTALL a new REM. REFER to <u>Section 419-10</u>. REPEAT the self-test. CLEAR the DTCs.</p> <p>→ No REPAIR the circuit(s) in question. REPEAT the self-test. CLEAR the DTCs.</p>
--	---

PINPOINT TEST E: ALL DOOR LOCKS ARE INOPERATIVE — FROM DRIVER DOOR LOCK CYLINDER

CONDITIONS	DETAILS/RESULTS/ACTIONS
<p>E1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TEST — DDM</p>	<p>1 Use the recorded DDM DTCs from the continuous and on-demand self-test.</p> <p>● Are any DDM DTCs recorded?</p> <p>→ Yes For DTC B2112 or DTC B2116, GO to <u>E3</u>.</p> <p>For all other DDM DTCs, REFER to the</p>

DDM Diagnostic Trouble Code (DTC) Index.

→ **No**
GO to E2.

E2 CHECK DRIVER DOOR LOCK CYLINDER AND CIRCUITS — MONITOR THE DDM PID DRLKCYL AND DR_DSRM

NOTE: Cycle the ignition switch from OFF to RUN to enable the switched system power feature.

1

2

Diagnostic Tool

3

4

4 Monitor the DDM PIDs DRLKCYL AND DR_DSRM, while locking and unlocking the driver door using the driver door lock cylinder.

5

• **Do the DDM PID values agree with the driver door lock cylinder positions?**

→ **Yes**
INSTALL a new DDM. REFER to Section 419-10. REPEAT the self-test. CLEAR the DTCs.

→ **No**
GO to E3.

E3 CHECK CIRCUITS 31S-AA78 (BK/BU) AND 31S-AA79 (BK/WH) FOR SHORT TO GROUND

1

2

DDM C501c

3

3 Measure the resistance between DDM

A0003773

C501c pin 16, circuit 31S-AA78 (BK/BU), harness side and ground; and between DDM C501c pin 17, circuit 31S-AA79 (BK/WH), harness side and ground.

- Are the resistances greater than 10,000 ohms?

→ **Yes**
GO to E5.

→ **No**
GO to E4.

E4 CHECK DRIVER DOOR LOCK ACTUATOR FOR SHORT TO GROUND

1

Driver Door Lock Actuator C525

2

A0003773

2 Measure the resistance between DDM C501c pin 16, circuit 31S-AA78 (BK/BU), harness side and ground; and between DDM C501c pin 17, circuit 31S-AA79 (BK/WH), harness side and ground.

- Are the resistances greater than 10,000 ohms?

→ **Yes**
INSTALL a new driver door lock actuator. REFER to Section 501-14A. REPEAT the self-test. CLEAR the DTCs.

→ **No**
REPAIR the circuit(s) in question. REPEAT the self-test. CLEAR the DTCs.

E5 CHECK DDM FOR INTERNAL SHORT TO GROUND

1

2

Driver Door Lock Actuator C525

3

3

Measure the resistance between driver door lock actuator C525 pin 7, circuit 31S-AA78 (BK/BU), harness side and ground; and between driver door lock actuator C525 pin 5, circuit 31S-AA79 (BK/WH), harness side and ground.

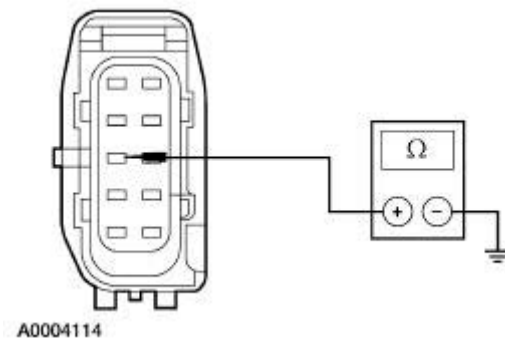

- Are the resistances greater than 10,000 ohms?

→ **Yes**
GO to E6.

→ **No**
INSTALL a new DDM. REFER to Section 419-10. REPEAT the self-test. CLEAR the DTCs.

E6 CHECK CIRCUIT 31-AA58 (BK) FOR OPEN

1

1

Measure the resistance between driver door lock actuator C525 pin 6, circuit 31-AA58 (BK), harness side and ground.

- Is the resistance less than 5 ohms?

→ **Yes**
GO to E7.

→ **No**
REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

E7 CHECK DRIVER SET AND RESET SWITCH

1

Driver Door Lock Actuator C525

2

DDM C501c

3

A0003773

3

Measure the resistance between DDM C501c pin 16, circuit 31S-AA78 (BK/BU), harness side and ground, while turning the key cylinder to the SET position; and between DDM C501c pin 17, circuit 31S-AA79 (BK/WH), harness side and ground, while turning the key cylinder to the RESET position.

- Are the resistances less than 5 ohms?

→ Yes

INSTALL a new DDM. REFER to [Section 419-10](#). REPEAT the self-test. CLEAR the DTCs.

→ No

GO to [E8](#).

E8 CHECK CIRCUITS 31S-AA78 (BK/BU) AND 31S-AA79 (BK/WH) FOR OPEN

1

Driver Door Lock Actuator C525

2

A0004115

2

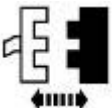

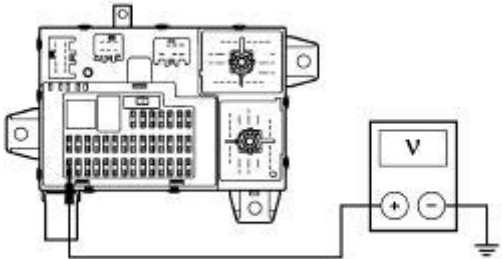

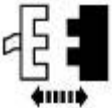

Measure the resistance between DDM C501c pin 16, circuit 31S-AA78 (BK/BU), harness side and driver door lock actuator C525 pin 7, circuit 31S-AA78 (BK/BU), harness side; and between DDM C501c pin 17, circuit 31S-AA79 (BK/WH), harness side and driver door lock actuator C525 pin 5, circuit 31S-AA79 (BK/WH), harness side.

- Are the resistances less than 5 ohms?

→ **Yes**
 INSTALL a new driver door lock actuator.
 REFER to Section 501-14A . REPEAT
 the self-test. CLEAR the DTCs.

→ **No**
 REPAIR the circuit(s) in question.
 REPEAT the self-test. CLEAR the DTCs.

PINPOINT TEST F: A SINGLE DOOR LOCK IS INOPERATIVE — DRIVER DOOR

CONDITIONS	DETAILS/RESULTS/ACTIONS
F1 CHECK CENTRAL JUNCTION BOX FUSE (CJB) 222 (10A) FOR VOLTAGE	
NOTE: Cycle the ignition switch from OFF to RUN to enable the switched system power feature.	
<p>1</p>  <p>CJB Fuse 222 (10A)</p> <p>2</p>  <p>A0004116</p>	<p>2</p> <p>Measure the voltage between CJB Fuse 222 (10A) pin 1, circuit 30-DD3 (RD/OG), component side and ground.</p> <ul style="list-style-type: none"> ● Is the voltage greater than 10 volts? <p>→ Yes RECONNECT the CJB Fuse 222 (10A).GO to <u>F2</u>.</p> <p>→ No REPAIR circuit 30-DD3 (RD/OG). REPEAT the self-test. CLEAR the DTCs.</p>
F2 CHECK CIRCUIT 29S-AJ86 (OG/BU) FOR OPEN	
<p>1</p>  <p>2</p>  <p>DDM C501a</p>	

3

4

4 Measure the voltage between DDM C501a pin 12, circuit 29S-AJ86 (OG/BU), harness side and ground.

• Is the voltage greater than 10 volts?

→ Yes
GO to F3.

→ No
REPAIR the circuit. REPEAT the self-test.
CLEAR the DTCs.

F3 CHECK DRIVER DOOR LOCK OPERATION USING ACTIVE COMMANDS

1

2

DDM C501a

3

Diagnostic Tool

4

5

5 Trigger the DDM active commands DD LOCK and DD UNLOCK ON and OFF.

• Do the DDM active commands DD

LOCK and DD UNLOCK operate correctly?

→ **Yes**

INSTALL a new DDM. REFER to [Section 419-10](#) . REPEAT the self-test. CLEAR the DTCs.

→ **No**

GO to [F4](#) .

F4 CHECK DDM LOCK AND UNLOCK OUTPUTS USING ACTIVE COMMANDS

1

2

Driver Door Lock Actuator C525

3

4

A0004118

4

Measure the voltage between driver power door lock actuator C525 pin 2, circuit 33-AA10 (YE/BK), harness side and ground, while triggering the DDM active command DD LOCK to ON; and measure the voltage between driver power door lock actuator C525 pin 10, circuit 32-AA11 (WH/VT), harness side and ground, while triggering the DDM active command DD UNLOCK to ON.

● **Are the voltages greater than 10 volts?**

→ **Yes**

INSTALL a new door lock actuator. REFER to [Section 501-14A](#) . REPEAT the self-test. CLEAR the DTCs.

→ **No**

GO to [F5](#) .

F5 CHECK CIRCUITS 33-AA10 (YE/BK) AND 32-AA11 (WH/VT) FOR OPEN

1

2

DDM C501c

3

A0004119

3

Measure the resistance between driver power door lock actuator C525 pin 2, circuit 33-AA10 (YE/BK), harness side and DDM C501c pin 8, circuit 33-AA10 (YE/BK) harness side; and between driver power door lock actuator C525 pin 10, circuit 32-AA11 (WH/VT) harness side and DDM C501c pin 9, circuit 32-AA11 (WH/VT) harness side.

- Are the resistances less than 5 ohms?

→ **Yes**
GO to F6.

→ **No**
REPAIR the circuit(s) in question.
REPEAT the self-test. CLEAR the DTCs.

F6 CHECK CIRCUITS 33-AA10 (YE/BK) AND 32-AA11 (WH/VT) FOR SHORT TO GROUND

1

A0004120

1

Measure the resistance between driver power door lock actuator C525 pin 2, circuit 33-AA10 (YE/BK), harness side and ground; and between driver power door lock actuator C525 pin 10, circuit 32-AA11 (WH/VT), harness side and ground.

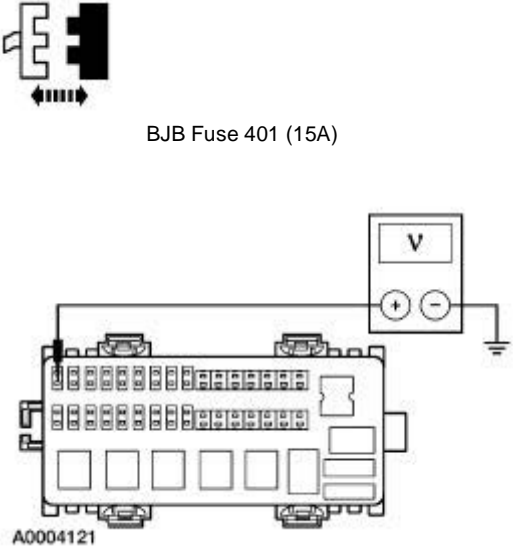

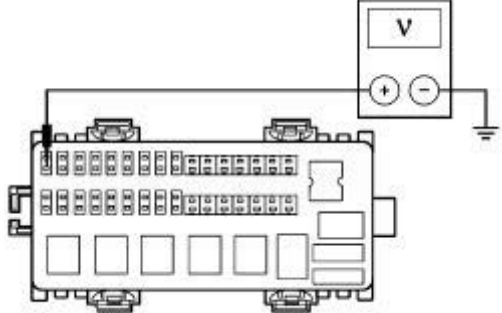

- Are the resistances greater than 10,000 ohms?

→ **Yes**
INSTALL a new DDM. REFER to Section 419-10. REPEAT the self-test. CLEAR the DTCs.

→ **No**
REPAIR the circuit(s) in question.
REPEAT the self-test. CLEAR the DTCs.

PINPOINT TEST G: MORE THAN ONE DOOR LOCK IS INOPERATIVE

— PASSENGER DOOR, RIGHT REAR DOOR, AND LEFT REAR DOOR

CONDITIONS	DETAILS/RESULTS/ACTIONS
G1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TEST — REM	
	<p>1 Use the recorded REM DTCs from the continuous and on-demand self-test.</p> <ul style="list-style-type: none"> • Are any DTCs recorded? <p>→ Yes REFER to the REM Diagnostic Trouble Code (DTC) Index.</p> <p>→ No GO to <u>G2</u>.</p>
G2 CHECK BATTERY JUNCTION BOX (BJB) FUSE 401 (15A) FOR VOLTAGE	
NOTE: Cycle the ignition switch from OFF to RUN to enable the switched system power feature.	
<p>1</p>  <p>BJB Fuse 401 (15A)</p> <p>2</p>  <p>A0004121</p>	<p>2 Measure the voltage between BJB Fuse 401 (15A) pin 1, component side and ground.</p> <ul style="list-style-type: none"> • Is the voltage greater than 10 volts? <p>→ Yes RECONNECT the BJB Fuse 401 (15A). GO to <u>G3</u>.</p> <p>→ No REPAIR the BJB. REPEAT the self-test. CLEAR the DTCs.</p>
G3 CHECK CIRCUIT 29S-DK31 (OG/BK) FOR OPEN	
<p>1</p> 	

2

REM 420c

3

4

A0004122

4

Measure the voltage between REM C420c pin 13, circuit 29S-DK31 (OG/BK), harness side and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
GO to G4.

→ **No**
REPAIR circuit 29S-DK31 (OG/BK).
REPEAT the self-test. CLEAR the DTCs.

G4 CHECK REM OUTPUT USING ACTIVE COMMANDS

1

2

REM 420c

3

Diagnostic Tool

4

5

5

Trigger the REM active commands LR LOCK and LR UNLOCK ON and OFF while observing the passenger, right rear and left rear lock actuators.

- Do the REM active commands LR LOCK and LR UNLOCK operate correctly?

→ Yes

INSTALL a new REM. REFER to [Section 419-10](#). REPEAT the self-test. CLEAR the DTCs.

→ No

If only an individual lock does not operate, REFER to Symptom Chart.

If two or more do not operate, GO to [G5](#).

G5 CHECK CIRCUITS 33-AA2 (YE/RD), 32-AA1 (WH/RD), 33-AA15 (YE/GN) AND 32-AA16 (WH/BK) FOR SHORT TO GROUND

1

2

REM C420c

3

A0004123

3

Measure the resistance between the REM connector, harness side and ground as follows:

Connector Pin	Circuit
C420c Pin 5	33-AA2 (YE/RD)
C420c Pin 6	32-AA1 (WH/RD)
C420c Pin 4	33-AA15 (YE/GN)
C420c Pin 7	32-AA16 (WH/BK)

- Are the resistances greater than 10,000 ohms?

→ Yes

INSTALL a new REM. REFER to [Section 419-10](#). REPEAT the self-test. CLEAR the DTCs.

→ No

REPAIR the circuit(s) in question.

REPEAT the self-test. CLEAR the DTCs.

PINPOINT TEST H: MORE THAN ONE DOOR LOCK IS INOPERATIVE — PASSENGER DOOR AND RIGHT REAR DOOR

CONDITIONS	DETAILS/RESULTS/ACTIONS
H1 RETRIEVE THE RECORDED DTCs FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TEST — REM	
	<p>1 Use the recorded REM DTCs from the continuous and on-demand self-test.</p> <ul style="list-style-type: none">● Are any DTCs recorded? <p>→ Yes REFER to the REM Diagnostic Trouble Code (DTC) Index.</p> <p>→ No GO to <u>H2</u>.</p>
H2 CHECK REM OUTPUT USING ACTIVE COMMANDS	
<p>1</p>  <p>2</p>  <p>Diagnostic Tool</p> <p>3</p>  <p>4</p> 	<p>4 Trigger the REM active commands LR LOCK and LR UNLOCK ON and OFF while observing the passenger and right rear lock actuators.</p> <ul style="list-style-type: none">● Do the REM active commands LR LOCK and LR UNLOCK operate correctly? <p>→ Yes INSTALL a new REM. REFER to Section 419-10. REPEAT the self-test. CLEAR the DTCs.</p> <p>→ No GO to <u>H3</u>.</p>

H3 CHECK REM OUTPUT TO PASSENGER AND RIGHT REAR LOCK ACTUATORS

NOTE: Disconnect the inoperative lock actuator. If both actuators are inoperative you must disconnect both actuators.

1

2

Right Rear Door Lock Actuator C804

3

Passenger Door Lock Actuator C609

4

5

A0004118

6

A0004118

5 Measure the voltage between passenger door lock actuator C609 pin 2, circuit 33-AA20 (YE/BU), harness side and ground, while triggering the REM active command LR LOCK to ON; and measure the voltage between passenger door lock actuator C609 pin 10, circuit 32-AA21 (WH/GN), harness side and ground, while triggering the REM active command LR UNLOCK to ON.

6 Measure the voltage between right rear door lock actuator C804 pin 2, circuit 33-AA25 (YE/RD), harness side and ground, while triggering the REM active command LR LOCK to ON; and measure the voltage between right rear door lock actuator C804 pin 10, circuit 32-AA26 (WH/BU), harness side and ground, while triggering the REM active command LR UNLOCK to ON.

- Are the voltages greater than 10 volts?

→ **Yes**
INSTALL a new door lock actuator(s).
REFER to Section 501-14A. REPEAT

the self-test. CLEAR the DTCs.

→ **No**
GO to H4.

H4 CHECK CIRCUITS 33-AA20 (YE/BU), 32-AA21 (WH/GN), 33-AA25 (YE/RD) AND 32-AA26 (WH/BU) FOR OPEN

NOTE: Disconnect the inoperative lock actuator. If both actuators are inoperative you must disconnect both actuators.

1

2

REM C420c

3

A0004124

4

A0004124

3 Measure the resistance between passenger door lock actuator C609 pin 2, circuit 33-AA20 (YE/BU), harness side and REM C420c pin 5, circuit 33-AA25 (YE/RD), harness side; and between passenger door lock actuator C609 pin 10, circuit 32-AA21 (WH/GN), harness side and REM C420c pin 6, circuit 32-AA26 (WH/BU), harness side.

4 Measure the resistance between right rear door lock actuator C804 pin 2, circuit 33-AA25 (YE/RD), harness side and REM C420c pin 5, circuit 33-AA25 (YE/RD), harness side; and between rear door lock actuator C804 pin 10, circuit 32-AA26 (WH/BU), harness side and REM C420c pin 6, circuit 32-AA26 (WH/BU), harness side.

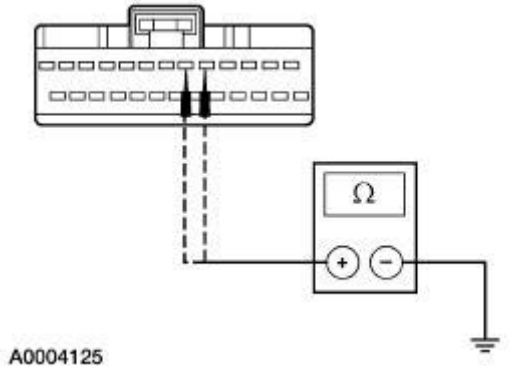

● **Are the resistances less than 5 ohms?**

→ **Yes**
GO to H5.

→ **No**
REPAIR the circuit(s) in question.
REPEAT the self-test. CLEAR the DTCs.

H5 CHECK CIRCUITS 33-AA25 (YE/RD) AND 32-AA26 (WH/BU) FOR SHORT TO GROUND

NOTE: Disconnect the inoperative lock actuator. If both actuators are inoperative you must disconnect both actuators.

<div style="border: 1px solid black; padding: 5px; margin-bottom: 10px;">1</div>  <p style="margin-top: 20px;">A0004125</p>	<div style="border: 1px solid black; padding: 5px; margin-bottom: 10px;">1</div> <p>Measure the resistance between REM C420c pin 5, circuit 33-AA25 (YE/RD) harness side and ground; and between REM C420c pin 6, circuit 32-AA26 (WH/BU), harness side and ground.</p> <ul style="list-style-type: none"> ● Are the resistances greater than 10,000 ohms? <p>→ Yes INSTALL a new REM. REFER to Section 419-10. REPEAT the self-test. CLEAR the DTCs.</p> <p>→ No REPAIR the circuit(s) in question. REPEAT the self-test. CLEAR the DTCs.</p>
--	--

PINPOINT TEST I: A SINGLE DOOR LOCK IS INOPERATIVE — LEFT REAR DOOR

CONDITIONS	DETAILS/RESULTS/ACTIONS
I1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TEST — REM	<div style="border: 1px solid black; padding: 5px; margin-bottom: 10px;">1</div> <p>Use the recorded REM DTCs from the continuous and on-demand self-test.</p> <ul style="list-style-type: none"> ● Are any DTCs recorded? <p>→ Yes REFER to the REM Diagnostic Trouble Code (DTC) Index.</p> <p>→ No GO to I2.</p>
I2 CHECK REM OUTPUT USING ACTIVE COMMANDS	
<div style="border: 1px solid black; padding: 5px; margin-bottom: 10px;">1</div> 	<div style="border: 1px solid black; padding: 5px; margin-bottom: 10px;">2</div>

Diagnostic Tool

3

4

4

Trigger the REM active commands LR LOCK and LR UNLOCK ON and OFF while observing the left rear lock actuator.

- Do the REM active commands LR LOCK and LR UNLOCK operate correctly?

→ Yes

INSTALL a new REM. REFER to [Section 419-10](#). REPEAT the self-test. CLEAR the DTCs.

→ No

GO to [I3](#).

I3 CHECK REM OUTPUT TO LEFT REAR LOCK ACTUATOR

1

2

Left Rear Door Lock Actuator C704

3

4

A0005708

4

Measure the voltage between left rear door lock actuator C704 pin 2, circuit 33-AA15 (YE/GN), harness side and ground, while triggering the REM active command LR LOCK to ON; and measure the voltage between left rear door lock actuator C704 pin 10, circuit 32-AA16 (WH/BK), harness side and ground, while triggering the REM active command LR UNLOCK to ON.

- Are the voltages greater than 10

volts?

→ **Yes**
INSTALL a new door lock actuator.
REFER to [Section 501-14A](#). REPEAT
the self-test. CLEAR the DTCs.

→ **No**
GO to [I4](#).

I4 CHECK CIRCUITS 33-AA15 (YE/GN) AND 32-AA16 (WH/BK) FOR OPEN

1

2

REM C420c

3

3 Measure the resistance between left rear door lock actuator C704 pin 2, circuit 33-AA15 (YE/GN), harness side and REM C420c pin 4, circuit 33-AA15 (YE/GN), harness side; and between left rear door lock actuator C704 pin 10, circuit 32-AA16 (WH/BK), harness side and REM C420c pin 7, circuit 32-AA16 (WH/BK), harness side.

● **Are the resistances less than 5 ohms?**

→ **Yes**
GO to [I5](#).

→ **No**
REPAIR the circuit(s) in question.
REPEAT the self-test. CLEAR the DTCs.

I5 CHECK CIRCUITS 33-AA15 (YE/GN) AND 32-AA16 (WH/BK) FOR SHORT TO GROUND

1

1 Measure the resistance between REM C420c pin 4, circuit 33-AA15 (YE/GN), harness side and ground; and between REM C420c pin 7, circuit 32-AA16 (WH/BK), harness side and ground.

A0004141

- Are the resistances greater than 10,000 ohms?

- **Yes**
 INSTALL a new REM. REFER to [Section 419-10](#). REPEAT the self-test. CLEAR the DTCs.
- **No**
 REPAIR the circuit(s) in question. REPEAT the self-test. CLEAR the DTCs.

PINPOINT TEST J: THE LUGGAGE COMPARTMENT DOOR IS INOPERATIVE — FROM RELEASE SWITCH

CONDITIONS	DETAILS/RESULTS/ACTIONS
J1 RETRIEVE THE RECORDED DTCs FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TEST — REM	<p>1 Use the recorded REM DTCs from the continuous and on-demand self-test.</p> <ul style="list-style-type: none"> • Are any DTCs recorded? <p>→ Yes For DTC B1551, GO to J3.</p> <p>For all other DTCs, REFER to the REM Diagnostic Trouble Code (DTC) Index.</p> <p>→ No GO to J2.</p>
J2 CHECK REM OUTPUT USING ACTIVE COMMANDS	
NOTE: Cycle the ignition switch from OFF to RUN to enable the switched system power feature.	
<p>1</p> <p>2</p>	

Diagnostic Tool

3

4

4 Trigger the REM active command RELEASE ON.

● Does the REM active command RELEASE operate correctly?

→ Yes
GO to J3.

→ No
GO to the Symptom Chart.

J3 CHECK LUGGAGE COMPARTMENT RELEASE SWITCH INPUT TO REM

NOTE: Cycle the ignition switch from OFF to RUN to enable the switched system power feature.

1

2

Diagnostic Tool

3

4

4 Monitor the REM PID DLIDRLS.

5 Depress and release the luggage compartment release switch.

● Does the REM PID DLIDRLS agree with the luggage compartment release switch position?

→ Yes
INSTALL a new REM. REFER to Section

419-10. REPEAT the self-test. CLEAR the DTCs.

→ **No**
REM PID DLIDRLS indicates ON GO to J4.

REM PID DLIDRLS indicates OFF GO to J6.

J4 CHECK LUGGAGE COMPARTMENT RELEASE SWITCH

1

2

Luggage Compartment Release Switch C207

1 Monitor the REM PID DLIDRLS.

- Did the REM PID DLIDRLS change from ON to OFF?

→ **Yes**
INSTALL a new luggage compartment release switch. REPEAT the self-test. CLEAR the DTCs.

→ **No**
GO to J5.

J5 CHECK CIRCUIT 8-AA30 (WH) FOR SHORT TO GROUND

1

2

REM C420a

3

3 Measure the resistance between REM C420a pin 9, circuit 8-AA30 (WH), harness side and ground.

A0004128

- Is the resistance greater than 10,000 ohms?

- **Yes**
INSTALL a new REM. REFER to [Section 419-10](#). REPEAT the self-test. CLEAR the DTCs.
- **No**
REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

J6 CHECK CIRCUIT 8-AA30 (WH) FOR OPEN

1

Luggage Compartment Release Switch C207

2

3

A0004135

- 2 Monitor the REM PID DLIDRLS.
- 3 Connect a 10A fused jumper between luggage compartment release switch C207 pin 6, circuit 8-AA30 (WH), harness side and ground, while monitoring the REM PID DLIDRLS.

- Did the REM PID DLIDRLS change from OFF to ON?

- **Yes**
GO to [J7](#).
- **No**
REPAIR the circuit. REPEAT the self-test.

CLEAR the DTCs.

J7 CHECK LUGGAGE COMPARTMENT RELEASE SWITCH

1

2

A0004136

1

Monitor the REM PID DLIDRLS.

2

Connect a 10A fused jumper between luggage compartment release switch C207 pin 6, circuit 8-AA30 (WH), harness side and luggage compartment release switch C207 pin 5, circuit 31-AA30 (BK), harness side, while monitoring the REM PID DLIDRLS.

- Did the REM PID DLIDRLS change from OFF to ON?

→ Yes

INSTALL a new luggage compartment release switch. REPEAT the self-test. CLEAR the DTCs.

→ No

GO to J8.

J8 CHECK CIRCUIT 31-AA30 (BK) FOR OPEN

1

2

A0004137

2

Measure the resistance between luggage compartment release switch C207 pin 5, circuit 31-AA30 (BK), harness side and ground.

- Is the resistance less than 5 ohms?

→ Yes

INSTALL a new REM. REFER to Section 419-10. REPEAT the self-test. CLEAR the DTCs.

→ **No**
REPAIR the circuit. REPEAT the self-test.
CLEAR the DTCs.

PINPOINT TEST K: THE LUGGAGE COMPARTMENT DOOR IS INOPERATIVE — FROM RELEASE SWITCH AND REMOTE TRANSMITTER

CONDITIONS	DETAILS/RESULTS/ACTIONS
K1 RETRIEVE THE RECORDED DTCs FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TEST — REM	
	<p>1 Use the recorded REM DTCs from the continuous and on-demand self-test.</p> <ul style="list-style-type: none"> • Are any DTCs recorded? <p>→ Yes REFER to the REM Diagnostic Trouble Code (DTC) Index.</p> <p>→ No GO to <u>K2</u>.</p>
K2 CHECK REM OUTPUT USING ACTIVE COMMANDS	
NOTE: Cycle the ignition switch from OFF to RUN to enable the switched system power feature.	
<p>1</p>  <p>2</p>  <p>Diagnostic Tool</p> <p>3</p>  <p>4</p> 	<p>4 Trigger the REM active command RELEASE ON.</p> <ul style="list-style-type: none"> • Does the luggage compartment unlock? <p>→ Yes INSTALL a new REM. REFER to <u>Section 419-10</u>. REPEAT the self-test. CLEAR</p>

the DTCs.

→ **No**
GO to K3.

K3 CHECK LUGGAGE COMPARTMENT RELEASE SWITCH INPUT TO REM

NOTE: Cycle the ignition switch from OFF to RUN to enable the switched system power feature.

1

1 Monitor the REM PID DLIDRLS.

2 Depress and release the luggage compartment release switch.

- **Does the REM PID DLIDRLS agree with the luggage compartment release switch position?**

→ **Yes**
GO to K4.

→ **No**
INSTALL a new REM. REFER to Section 419-10. REPEAT the self-test. CLEAR the DTCs.

K4 CHECK LUGGAGE COMPARTMENT RELEASE SWITCH INPUT TO REM

1

Luggage Compartment Release Solenoid C430

2

3

A0004138

2 Trigger the REM active command RELEASE ON.

3 Measure the voltage between the luggage compartment release solenoid C430 pin 2, circuit 29S-AA83 (OG), harness side and ground.

- **Is the voltage greater than 10 volts?**

→ **Yes**
GO to K5.

→ **No**
GO to K6.

K5 CHECK CIRCUIT 31-AA83 (BK/OG) FOR OPEN

1

2

2 Measure the resistance between the luggage compartment release solenoid C430 pin 1, circuit 31-AA83 (BK/OG), harness side and ground.

● **Is the resistance less than 5 ohms?**

→ **Yes**
INSTALL a new luggage compartment release solenoid. REPEAT the self-test. CLEAR the DTCs.

→ **No**
REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.

K6 CHECK CIRCUIT 29S-AA83 (OG) FOR OPEN

1

2

REM C420c

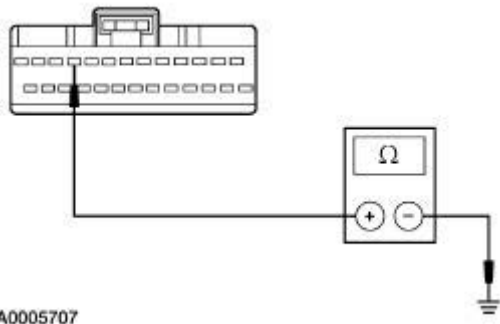

3

3 Measure the resistance between REM C420c pin 10, circuit 29S-AA83 (OG) harness side and luggage compartment release solenoid C430 pin 2, circuit 29S-AA83 (OG), harness side.

	<ul style="list-style-type: none"> ● Is the resistance less than 5 ohms? <p>→ Yes GO to <u>K7</u>.</p> <p>→ No REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.</p>
--	---

K7 CHECK CIRCUIT 29S-AA83 (OG) FOR SHORT TO GROUND

<p>1</p>  <p>2</p>  <p>A0005707</p>	<p>2</p> <p>Measure the resistance between REM C420c pin 10, circuit 29S-AA83 (OG) harness side and ground.</p> <ul style="list-style-type: none"> ● Is the resistance greater than 10,000 ohms? <p>→ Yes INSTALL a new REM. REFER to <u>Section 419-10</u>. REPEAT the self-test. CLEAR the DTCs.</p> <p>→ No REPAIR the circuit. REPEAT the self-test. CLEAR the DTCs.</p>
--	---

PINPOINT TEST L: THE DOORS DO NOT LOCK AND UNLOCK USING THE REMOTE TRANSMITTER

CONDITIONS	DETAILS/RESULTS/ACTIONS
	<p>L1 CHECK THE DOOR LOCKS AT THE DRIVER DOOR LOCK SWITCH</p> <p>1</p> <p>Check the locks from the driver door lock switch.</p> <ul style="list-style-type: none"> ● Do the doors lock and unlock? <p>→ Yes GO to <u>L2</u>.</p> <p>→ No</p>

GO to Pinpoint Test C.

L2 CHECK REMOTE TRANSMITTER BUTTONS WITH DIAGNOSTIC TOOL

1

2

Diagnostic Tool

3

4

4 Monitor the DDM FUNCTION TEST TIC/DATA, while pressing the lock, then the unlock button on the remote transmitter.

● Does the data received indicate LOCK, then UNLOCK?

→ **Yes**
INSTALL a new DDM. REFER to Section 419-10. REPEAT the self-test. CLEAR the DTCs.

→ **No**
GO to L3.

L3 CHECK THE BATTERY IN REMOTE TRANSMITTER

2

1 Install a new battery in the remote transmitter.

2 Monitor the DDM FUNCTION TEST TIC/DATA, while pressing the lock, then the unlock button on the remote transmitter.

● Does the data received indicate LOCK, then UNLOCK?

→ **Yes**
TEST all remote transmitter functions. REPEAT the self-test. CLEAR the DTCs.

→ **No**
GO to L4.

L4 CHECK THE PROGRAMMING OF THE REMOTE TRANSMITTER

2

1 Reprogram the remote transmitter; REFER to Programming—Remote Keyless Entry Transmitter.

2 Monitor the DDM FUNCTION TEST TIC/DATA, while pressing the lock, then the unlock button on the remote transmitter.

- Does the data received indicate LOCK, then UNLOCK?

→ **Yes**

Fault found as remote transmitter not programmed. REPEAT the self-test. CLEAR the DTCs.

→ **No**

PROGRAM a new remote transmitter to the vehicle. REFER to Programming—Remote Keyless Entry Transmitter . REPEAT the self-test. CLEAR the DTCs.

PINPOINT TEST M: THE MEMORY SEAT DOES NOT OPERATE CORRECTLY USING THE REMOTE TRANSMITTER

CONDITIONS	DETAILS/RESULTS/ACTIONS
M1 CHECK THE MEMORY SET SWITCH	
	<p>1 Operate the memory seat using the memory set switch.</p> <ul style="list-style-type: none"> ● Does the memory seat operate correctly? <p>→ Yes GO to <u>M2</u> .</p> <p>→ No REFER to <u>Section 501-10</u> .</p>
M2 CHECK REMOTE TRANSMITTER BUTTONS WITH DIAGNOSTIC TOOL	
<p>1 </p> <p>2 </p> <p>Diagnostic Tool</p> <p>3 </p> <p>4 </p>	<p>4 Monitor the DDM FUNCTION TEST TIC/DATA, while pressing the lock, then the unlock button on the remote transmitter.</p>

	<ul style="list-style-type: none"> ● Does the data received indicate LOCK, then UNLOCK? <p>→ Yes INSTALL a new DDM. REFER to Section 419-10. REPEAT the self-test. CLEAR the DTCs.</p> <p>→ No GO to M3.</p>
M3 CHECK THE BATTERY IN REMOTE TRANSMITTER	
<p>2</p> 	<p>1 Install a new battery in the remote transmitter.</p> <p>2 Monitor the DDM FUNCTION TEST TIC/DATA, while pressing the lock, then the unlock button on the remote transmitter.</p> <ul style="list-style-type: none"> ● Does the data received indicate LOCK, then UNLOCK? <p>→ Yes TEST all the remote transmitter functions. REPEAT the self-test. CLEAR the DTCs.</p> <p>→ No GO to M4.</p>
M4 CHECK THE PROGRAMMING OF THE REMOTE TRANSMITTER	
<p>2</p> 	<p>1 Reprogram the remote transmitter; refer to Programming—Remote Keyless Entry Transmitter.</p> <p>2 Monitor the DDM FUNCTION TEST TIC/DATA, while pressing the lock, then the unlock button on the remote transmitter.</p> <ul style="list-style-type: none"> ● Does the data received indicate LOCK, then UNLOCK? <p>→ Yes The remote transmitter was not programmed. REPEAT the self-test. CLEAR the DTCs.</p> <p>→ No PROGRAM a new remote transmitter to the vehicle. REFER to Programming—Remote Keyless Entry Transmitter. REPEAT the self-test. CLEAR the DTCs.</p>

PINPOINT TEST N: THE AUTO-LOCK DOES NOT OPERATE CORRECTLY

CONDITIONS	DETAILS/RESULTS/ACTIONS
N1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TEST — FEM	
	<p>1 Use the recorded FEM DTCs from the continuous and on-demand self-test.</p>

● Are any FEM DTCs recorded?

→ **Yes**

For DTC U1041, carry out the ABS self-test. REFER to [Section 206-09A](#).

For DTC U1059, REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual Section 3.

For all other FEM DTCs, REFER to the FEM Diagnostic Trouble Code (DTC) Index.

→ **No**

GO to [N2](#).

N2 CHECK DRIVER DOOR AJAR PID D_DOOR

1

2

Diagnostic Tool

3

5

4 Close all doors and luggage compartment.

5 Monitor the FEM driver door ajar PID D_DOOR.

● Does the PID read AJAR?

→ **Yes**

REFER to [Section 417-02](#).

→ **No**

GO to [N3](#).

N3 CHECK PASSENGER DOOR AJAR PID P_DOOR

1

1 Monitor the FEM passenger door ajar PID P_DOOR.

● Does the PID read AJAR?

→ **Yes**

REFER to [Section 417-02](#).

→ **No**
GO to N4.

N4 CHECK LR DOOR AJAR PID LRDR_SW

1

1 Monitor the REM LR door ajar PID LRDR_SW.

● **Does the PID read AJAR?**

→ **Yes**
REFER to Section 417-02.

→ **No**
GO to N5.

N5 CHECK RIGHT REAR DOOR AJAR PID RRDR_SW

1

1 Monitor the REM RR door ajar PID RRDR_SW.

● **Does the PID read AJAR?**

→ **Yes**
REFER to Section 417-02.

→ **No**
GO to N6.

N6 CHECK LUGGAGE COMPARTMENT AJAR PID DECKLID

1

1 Monitor the REM luggage compartment ajar PID DECKLID.

● **Does the PID read AJAR?**

→ **Yes**
REFER to Section 417-02.

→ **No**
GO to N7.

N7 CHECK IGNITION SWITCH STATUS

1

1 Monitor the FEM ignition switch PID IGN_R.

● **Does the PID read YES?**

	<p>→ Yes INSTALL a new DDM. REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs.</p> <p>→ No REFER to Section 211-05 .</p>
--	---

PINPOINT TEST O: THE SMART LOCK DOES NOT OPERATE CORRECTLY

CONDITIONS	DETAILS/RESULTS/ACTIONS
O1 CHECK COURTESY LIGHTS	
	<p>1 Open the driver door.</p> <ul style="list-style-type: none"> ● Do the courtesy lights illuminate? <p>→ Yes GO to O2 .</p> <p>→ No REFER to Section 417-02 .</p>
O2 CHECK WARNING CHIMES	
<p>1</p> 	<p>1 Open the driver door.</p> <ul style="list-style-type: none"> ● Do the warning chimes operate? <p>→ Yes INSTALL a new DDM. REFER to Section 419-10 . REPEAT the self-test. CLEAR the DTCs</p> <p>→ No REFER to Section 413-09 .</p>

PINPOINT TEST P: PANIC FEATURE IS INOPERATIVE

CONDITIONS	DETAILS/RESULTS/ACTIONS
P1 CHECK FEM INPUT	
<p>1</p>  <p>2</p>	

Diagnostic Tool

3

4

4 Monitor the FEM PID AL_1.

5 Press the PANIC button.

● Does the FEM PID indicate PANIC?

→ Yes
REFER to [Section 419-01A](#).

→ No
GO to [P2](#).

P2 CHECK THE REMOTE TRANSMITTER LUGGAGE COMPARTMENT RELEASE BUTTON WITH DIAGNOSTIC TOOL

1

1 Monitor the DDM FUNCTION TEST TIC/DATA, while pressing the luggage compartment release button on the remote transmitter.

● Does last received data indicate TRUNK?

→ Yes
INSTALL a new DDM. REFER to [Section 419-10](#). REPEAT the self-test. CLEAR the DTCs.

→ No
GO to [P3](#).

P3 CHECK THE BATTERY IN THE REMOTE TRANSMITTER

2

1 Install a new battery in the remote transmitter.

2 Monitor the DDM FUNCTION TEST TIC/DATA, while pressing the luggage compartment release button on the remote transmitter.

● Does last received data indicate TRUNK?

→ Yes
TEST all remote transmitter functions. REPEAT the self-test. CLEAR the DTCs.

→ No

GO to P4.

P4 CHECK THE PROGRAMMING OF THE REMOTE TRANSMITTER

2

1 Reprogram the remote transmitter. Refer to Programming—Remote Keyless Entry Transmitter.

2 Monitor the DDM FUNCTION TEST TIC/DATA, while pressing the decklid release button on the remote transmitter.

● **Does last received data indicate TRUNK?**

→ **Yes**

The remote transmitter was not programmed. REPEAT the self-test. CLEAR the DTCs.

→ **No**

PROGRAM a new remote transmitter to the vehicle. REFER to Programming—Remote Keyless Entry Transmitter. REPEAT the self-test. CLEAR the DTCs.

PINPOINT TEST Q: THE LUGGAGE COMPARTMENT DOOR IS INOPERATIVE USING THE REMOTE TRANSMITTER

CONDITIONS	DETAILS/RESULTS/ACTIONS
Q1 TEST LUGGAGE COMPARTMENT RELEASE AT THE LUGGAGE COMPARTMENT RELEASE SWITCH	
	<p>1 Press the luggage compartment release switch.</p> <p>● Did the decklid open?</p> <p>→ Yes GO to <u>Q2</u>.</p> <p>→ No GO to <u>Pinpoint Test K</u>.</p>
Q2 CHECK THE REMOTE TRANSMITTER LUGGAGE COMPARTMENT RELEASE BUTTON WITH DIAGNOSTIC TOOL	
<p>1</p>  <p>2</p>  <p>Diagnostic Tool</p> <p>3</p>	

4

4 Monitor the DDM FUNCTION TEST TIC/DATA, while pressing the luggage compartment release button on the remote transmitter.

● **Does last received data indicate TRUNK?**

→ **Yes**
INSTALL a new DDM. REFER to Section 419-10. REPEAT the self-test. CLEAR the DTCs.

→ **No**
GO to Q3.

Q3 CHECK THE BATTERY IN THE REMOTE TRANSMITTER

2

1 Install a new battery in the remote transmitter.

2 Monitor the DDM FUNCTION TEST TIC/DATA, while pressing the luggage compartment release button on the remote transmitter.

● **Does last received data indicate TRUNK?**

→ **Yes**
TEST all remote transmitter functions. REPEAT the self-test. CLEAR the DTCs.

→ **No**
GO to Q4.

Q4 CHECK THE PROGRAMMING OF THE REMOTE TRANSMITTER

2

1 Reprogram the remote transmitter. Refer to Programming—Remote Keyless Entry Transmitter.

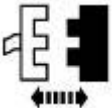

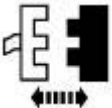

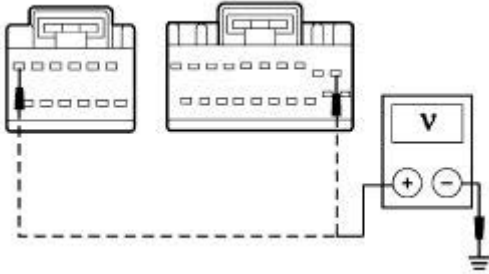

2 Monitor the DDM FUNCTION TEST TIC/DATA, while pressing the luggage compartment release button on the remote transmitter.

● **Does last received data indicate TRUNK?**

→ **Yes**
The remote transmitter was not programmed. REPEAT the self-test. CLEAR the DTCs.

→ **No**
PROGRAM a new remote transmitter to the vehicle. REFER to Programming—Remote Keyless Entry Transmitter. REPEAT the self-test. CLEAR the DTCs.

PINPOINT TEST R: NO COMMUNICATION WITH THE FRONT ELECTRONIC MODULE (FEM)

CONDITIONS	DETAILS/RESULTS/ACTIONS
R1 CHECK CIRCUITS 29-DK20 (OG/GN) AND 29S-DK22 (OG/YE) FOR VOLTAGE	
NOTE: Cycle ignition switch from OFF to RUN to enable the switched system power feature.	
<div style="display: flex; flex-direction: column; align-items: flex-start;"> <div style="margin-bottom: 10px;"> 1  </div> <div style="margin-bottom: 10px;"> 2  <p style="margin-left: 100px;">FEM C201c</p> </div> <div style="margin-bottom: 10px;"> 3  <p style="margin-left: 100px;">FEM C201f</p> </div> <div style="margin-bottom: 10px;"> 4  </div> <div> 5  <p style="margin-left: 20px;">A0006297</p> </div> </div>	<div style="margin-top: 20px;"> 5 Measure the voltage between FEM C201c pin 6, circuit 29-DK20 (OG/GN), harness side and ground; and between FEM C201f pin 1, circuit 29S-DK22 (OG/YE) harness side and ground. </div> <div style="margin-top: 20px;"> <ul style="list-style-type: none"> ● Are the voltages greater than 10 volts? </div> <div style="margin-top: 10px;"> <p>→ Yes GO to <u>R2</u>.</p> </div> <div style="margin-top: 10px;"> <p>→ No REPAIR the circuit(s) in question. TEST the system for normal operation.</p> </div>
R2 CHECK CIRCUITS 31-DK20 (BK/RD), 31-DK20A (BK/RD), 31-DK20B (BK/RD), 31-DK20C (BK/RD) AND 31-DK20D (BK/RD) FOR OPENS	
1	

2

FEM C201a

3

3 Using the following table, measure the resistance between FEM connectors, harness side and ground:

FEM	Pin	Circuit
C201c	12	31-DK20 (BK/RD)
C201a	11	31-DK20A (BK/RD)
C201a	13	31-DK20B (BK/RD)
C201a	14	31-DK20C (BK/RD)
C201a	15	31-DK20D (BK/RD)

● Is the resistance less than 5 ohms?

→ **Yes**
REFER to [Section 418-00](#) .

→ **No**
REPAIR the circuit(s) in question. TEST the system for normal operation.

Programming —Remote Keyless Entry Transmitter

Special Tool(s)

	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052 or equivalent
---	--

NOTE: All remote transmitters are programmable and must be set at the same time.

NOTE: To program (or reprogram) the remote transmitters into the driver door module (DDM), carry out the following steps:

1. Connect the New Generation STAR/Service Bay Diagnostic System (diagnostic tool/SBDS) tester. Turn the ignition from OFF to RUN.
2. From diagnostic tool/SBDS: Using the Ford Service Function (FSF) card, select SERVICE BAY FUNCTION.
3. Select DDM.
4. Select KEY FOB PROGRAMMING.
5. Press any button on the remote transmitter.
6. Select the FOB 1, 2, 3, or 4, and select STORE. It may be necessary to select CANCEL more than once to exit the menu.
7. Repeat steps five and six for additional transmitters.
8. **NOTE:** It may be necessary to select CANCEL more than once to exit the menu.

Select CANCEL to exit the menu.

General Specifications

Item	Specification
RH wiper blade adjustment tolerance	12mm (.47in)
LH wiper blade adjustment tolerance	10mm (.39in)

Torque Specifications

Description	Nm	lb-ft	lb-in
Battery ground cable	10	—	89
Degas bottle bolts	10	—	89
Mounting arm and pivot shaft bolts	12	9	—
Pivot arm nuts	25	18	—
Strut support brace bolts	20	15	—
Windshield washer fluid reservoir bolt	6	—	53
Windshield wiper motor bolts	12	9	—
Windshield wiper motor crank bolt	12	9	—

Wipers And Washers

The wiper and washer system consists of:

- pivot arms
 - mounting arm and pivot shaft
 - windshield wiper motor
 - windshield washer fluid pump
 - headlamp washer fluid pump (if equipped)
 - windshield washer fluid reservoir
 - front electronic module (FEM)
 - rear electronic module (REM)
 - rain sensor module (RSM) (if equipped)
-

Wipers And Washers

Refer to Wiring Diagrams Section [501-16](#) for schematic and connector information.

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent diagnostic tool
 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST1453-A	Alternator, Regulator, Battery and Starter Tester (ARBST) 010-00725 or equivalent

Principles of Operation

Wipers and Washers

The wiper and washer systems are controlled by the front electronic module (FEM). The wiper/washer portion of the multifunction switch is hardwired to the FEM. When the switch is moved to the desired position, the FEM processes this information and outputs the appropriate command(s) to one of three relays. The relays control the wiper high and low motor speeds and washer pump actuation.

Intermittent wiper speed control can vary dependent upon vehicle speed. This is accomplished by the FEM receiving vehicle speed information from the anti-lock brake control module and throttle position status from the powertrain control module (PCM). When the wiper switch is in any of the intermittent positions, the FEM will process the information from the PCM and anti-lock brake control module and decrease the wiper delay time as vehicle speed increases.

Rain Sensor Wiper Function—Rain Sensor Module

The rain sensor module (RSM) is located on the inside of the windshield below the interior rear view mirror and the direct pattern of the wiper blades, if equipped. When the ignition switch is turned to the RUN position, the RSM starts monitoring both the DELAY/WASH and the wiper mode circuits. When the multifunction switch is placed into the INT and AUTO positions, the rain sensor takes control of the mode circuit. In dry conditions the RSM keeps the mode circuit at the correct voltage for the OFF position. In the presence of moisture the RSM directs the mode circuit into individual low pulse, or continuous LOW or HIGH operation, based on the amount of moisture.

Low Washer Fluid Level Lamp/Indicator

The low washer fluid lamp/indicator feature is controlled by the FEM and instrument cluster. The low washer fluid switch is hardwired to the FEM. If fluid is low, the FEM will send a message via the standard corporate protocol (SCP) communication network to the instrument cluster. The instrument cluster will then process the message and output an audible and visual warning. If equipped with a message center, a warning message will be displayed. For additional information, refer to [Section 413-08](#).

Heated Wiper Park

The heated wiper park feature is controlled by the dual automatic temperature control (DATC) module. For additional information, refer to [Section 501-11](#).

Inspection and Verification

1. Verify the customer concern by operating the windshield wiper and washer system to duplicate the condition.
2. Visually inspect for the obvious signs of mechanical or electrical damage; refer to the following chart.

Visual Inspection Chart

Mechanical	Electrical
<ul style="list-style-type: none"> ● Wiper blade ● Binding wiper pivot arm ● Binding wiper mounting arm and pivot shaft ● Empty washer reservoir ● Washer hoses 	<ul style="list-style-type: none"> ● Underhood auxiliary junction box (AJB) Fuses: <ul style="list-style-type: none"> ■ 102 (10A) ■ 120 (30A) ● Battery junction box (BJB) Fuses: <ul style="list-style-type: none"> ■ 422 (20A) ■ 423 (30A) ■ 424 (30A) ■ 425 (40A) ■ 427 (30A) ■ 432 (30A) ● Central junction box (CJB) Fuse 205 (5A) ● Wiper motor ● Washer pump ● Connectors or connections ● Circuitry ● Multifunction switch ● Wire harness routing ● FEM ● Instrument cluster

3. If the fault is not visually evident, connect the diagnostic tool to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
 - check that the program card is correctly installed.
 - check the connections to the vehicle.
 - check the ignition switch position.

4. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool manual.
5. Carry out the DATA LINK DIAGNOSTICS test. If the diagnostic tool responds with:
 - CKT914, CKT915, or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to [Section 418-00](#).
 - NO RESP/NOT EQUIP for FEM, go to Pinpoint Test A.
 - SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out the self-test diagnostics for the generic electronic module.
6. If the DTCs retrieved are related to the concern, go to FEM Diagnostic Trouble Code (DTC) Index to continue diagnostics.
7. If no DTCs related to the concern are retrieved, proceed to Symptom Chart.

FEM Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1319	Driver Door Ajar Circuit Failure	FEM	REFER to Section 417-02 .
B1327	Passenger Door Ajar Circuit Failure	FEM	REFER to Section 417-02 .
B1342	ECU Is Defective	FEM	CLEAR the DTC. REPEAT the FEM self-test. If DTC B1342 is retrieved, INSTALL a new FEM. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self-test.
B1438	Wiper Mode Select Switch Circuit Failure	FEM	GO to Pinpoint Test D .
B1446	Wiper Park Sense Circuit Failure	FEM	GO to Pinpoint Test B .
B1479	Wiper Washer Fluid Level Sensor Circuit Failure	FEM	REFER to Section 413-01 .
B1499	Lamp Turn Signal Left Circuit Failure	FEM	REFER to Section 417-01 .
B1501	Lamp Turn Signal Left Circuit Short to Battery	FEM	REFER to Section 417-01 .
B1503	Lamp Turn Signal Right Circuit Failure	FEM	REFER to Section 417-01 .
B1505	Lamp Turn Signal Right Circuit Short to Battery	FEM	REFER to Section 417-01 .

Pinpoint Tests

CAUTION: Electronic modules are sensitive to electrical charges. If exposed to these charges, damage may result.

PINPOINT TEST A: NO COMMUNICATION WITH THE FRONT ELECTRONIC MODULE (FEM)

CONDITIONS	DETAILS/RESULTS/ACTIONS
A1 CHECK CIRCUITS 29-DK20 (OG/GN) AND 29S-DK22 (OG/YE) FOR VOLTAGE	
NOTE: Cycle ignition switch from OFF to RUN to enable the switched system power feature.	
<p>1</p>  <p>2</p>  <p>FEM C201c</p>	

3

FEM C201f

4

5

A0006297

5

Measure the voltage between FEM C201c pin 6, circuit 29-DK20 (OG/GN), harness side and ground; and between FEM C201f pin 1, circuit 29S-DK22 (OG/YE) harness side and ground.

• Are the voltages greater than 10 volts?

→ **Yes**
GO to A2.

→ **No**
REPAIR the circuit(s) in question. TEST the system for normal operation.

A2 CHECK CIRCUITS 31-DK20 (BK/RD), 31-DK20A (BK/RD), 31-DK20B (BK/RD), 31-DK20C (BK/RD) AND 31-DK20D (BK/RD) FOR OPENS

1

2

FEM C201a

3

3

Using the following table, measure the resistance between FEM connectors, harness side and ground:

FEM	Pin	Circuit
C201c	12	31-DK20 (BK/RD)
C201a	11	31-DK20A (BK/RD)
C201a	13	31-DK20B (BK/RD)
C201a	14	31-DK20C (BK/RD)

C201a | 15 | 31-DK20D (BK/RD)

- Is the resistance less than 5 ohms?

→ **Yes**

REFER to Section 418-00.

→ **No**

REPAIR the circuit(s) in question. TEST the system for normal operation.

PINPOINT TEST B: THE WIPERS ARE INOPERATIVE

CONDITIONS	DETAILS/RESULTS/ACTIONS
B1 CHECK THE FEM PID WPMODE	
<p>1</p> 	<p>2</p> <p>Monitor the FEM PID WPMODE, while activating the multifunction switch to the OFF, Low, High, Pulse, Intermittent, and Positions 1 through 7.</p> <ul style="list-style-type: none"> ● Do the FEM PID WPMODE values agree with the multifunction switch position? <p>→ Yes GO to <u>B10</u>.</p> <p>→ No If equipped with rain sensor module, GO to <u>B2</u>. Otherwise GO to <u>B3</u>.</p>
B2 CHECK THE RAIN SENSOR MODULE	
<p>1</p>  <p>2</p>	

Rain Sensor Module C914 (If equipped)

3

4 Monitor the FEM PID WPMODE, while activating the multifunction switch to the OFF, Low, Medium, High, Pulse, intermittent, and positions 1 through 7.

- Do the wiper FEM PID WPMODE values agree with the multifunction switch?

→ Yes
INSTALL a new rain sensor module. REFER to Module—Rain Sensor in this section. TEST the system for normal operation.

→ No
GO to B3.

B3 CHECK THE MULTIFUNCTION SWITCH OPERATION

1

2

Multifunction Switch C202

3 Carry out the multifunction switch component test. Refer to Wiring Diagrams Section 700–09.

- Is the multifunction switch OK?

→ Yes
GO to B4.

→ No
INSTALL a new multifunction switch. REFER to Section 211-05. TEST the system for normal operation.

B4 CHECK VOLTAGE TO THE MULTIFUNCTION SWITCH

1

2

A0006307

2

Measure the voltage between multifunction switch C202 pin1, circuit (OG/GN) harness side and ground; and between multifunction switch C202 pin 3, circuit (BU/WH), harness side and ground.

• Are the voltages greater than 10 volts?

→ Yes
GO to B5.

→ No
GO to B8.

B5 CHECK THE MULTIFUNCTION SWITCH FOR SHORT TO POWER

1

2

FEM C201f

3

4

A0006307

4

Measure the voltage between multifunction switch C202 pin1, circuit (OG/GN) harness side and ground; and between multifunction switch C202 pin 3, circuit (BU/WH), harness side and ground.

• Are the voltages greater than 10 volts?

→ **Yes**

REPAIR the circuit(s) in question. TEST the system for normal operation.

→ **No**
GO to B6.

B6 CHECK CIRCUIT 7-KA19 (YE/BK) FOR SHORT TO POWER

1

1 Measure the voltage between multifunction switch C202 pin 2, circuit (BN/WH), harness side and ground.

• **Is the voltage greater than 10 volts?**

→ **Yes**
REPAIR the circuit. TEST the system for normal operation.

→ **No**
GO to B7.

B7 CHECK CIRCUIT 7-KA19 (YE/BK) AND CIRCUIT 7-KA1 (YE/RD) FOR AN OPEN

1

2

2 Measure the resistance between multifunction switch C202 pin 2, circuit (BN/WH), harness side and FEM C201 pin 14, circuit 7-KA1 (YE/RD), harness side.

• **Is the resistance less than 5 ohms?**

→ **Yes**
INSTALL a new FEM. REFER to Section 419-10. TEST the system for normal operation.

→ **No**
REPAIR the circuit(s) in question. TEST the system for normal operation.

B8 CHECK CIRCUITS 7-KA1 (YE/BK), 8-KA2 (WH/RD) AND 10-KA3 (GY/VT) FOR OPENS

1

2

FEM C201f

3

Multifunction Switch C202

4

A0006310

4 Using the following table measure the resistance between multifunction switch C202 harness side and FEM C201f harness side:

Multifunction Switch C202	FEM C201f
pin 1, circuit (OG/GN)	pin 2, circuit 8-KA2 (WH/RD)
pin 2, circuit (BN/WH)	pin 14, circuit 7-KA1 (YE/BK)
pin 3, circuit (BU/WH)	pin 13, circuit 10-KA3 (GY/VT)

● **Is the resistance less than 5 ohms?**

→ **Yes**
GO to B9.

→ **No**
REPAIR the circuit(s) in question. TEST the system for normal operation.

B9 CHECK WIPER DELAY AND WIPER MODE CIRCUITS FOR SHORTS TO GROUND

1

1 Measure the resistance between multifunction switch C202 pin 1, (OG/GN) harness side and ground; and between multifunction switch C202 pin 3, (BU/WH) harness side and ground.

A0006315

- Is the resistance greater than 10,000 ohms?

→ **Yes**

INSTALL a new FEM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**

REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self-test.

B10 CHECK CIRCUIT 91S-KA39 (BN/YE) FOR VOLTAGE

1

2

Underhood AJB Wiper Park Relay

3

4

A0003784

- 4 Measure the voltage between wiper park relay C1002 pin 2, Circuit 91S-KA39 (BN/YE), harness side and ground.

- Is the voltage greater than 10 volts?

→ **Yes**

GO to B11.

→ **No**
GO to B12.

B11 CHECK CIRCUIT 91S-KA39 (BN/YE) FOR SHORT TO POWER

1

2

FEM C201b

3

4

A0003784

4 Measure the voltage between wiper park relay C1002 Pin 2, Circuit 91S-KA39 (BN/YE), harness side and ground.

● **Is the voltage greater than 10 volts?**

→ **Yes**
REPAIR the circuit. TEST the system for normal operation.

→ **No**
INSTALL a new FEM. REFER to Section 419-10. TEST the system for normal operation.

B12 ACTIVATE WIPER PARK RELAY COMMAND AND TEST FOR GROUNDING FROM FEM

1

1 Trigger the FEM active command WIPER RLY to ON, while measuring the resistance between wiper park relay C1002 Pin 2, Circuit 91S-KA39 (BN/YE), harness side and ground.

A0003785

● Is the resistance less than 5 ohms?

→ **Yes**
GO to B14.

→ **No**
GO to B13.

B13 CHECK CIRCUIT 91S-KA39 (BN/YE) FOR AN OPEN

1

2

FEM C201b

3

A0003786

3 Measure the resistance between wiper park relay C1002 Pin 2, Circuit 91S-KA39 (BN/YE), harness side and FEM C201b Pin 1, Circuit 91S-KA39 (BN/YE), harness side.

● Is the resistance less than 5 ohms?

→ **Yes**
INSTALL a new FEM. REFER to Section 419-10. TEST the system for normal operation.

→ **No**
REPAIR the circuit. TEST the system for normal operation.

B14 CHECK UNDERHOOD AJB FUSE 120 (30A) FOR VOLTAGE

1

2

Underhood AJB Fuse 120 (30A)

3

4

4 Measure the voltage between underhood AJB Fuse 120 (30 A) input side and ground.

• Is the voltage greater than 10 volts?

→ **Yes**
GO to B15.

→ **No**
REPAIR the power source. TEST the system for normal operation.

B15 CHECK BETWEEN UNDERHOOD AJB FUSE 120 (30A) AND WIPER PARK RELAY FOR OPENS

1

2

Underhood AJB Wiper Park Relay

3

3 Measure the resistance between underhood AJB Fuse 120 (30A), input side, and wiper park relay C1002 Pin 1.

● Is the resistance less than 5 ohms?

→ **Yes**
 INSTALL a new underhood AJB Fuse 120 (30A), GO to B16.

→ **No**
 INSTALL a new underhood AJB. TEST the system for normal operation.

B16 CHECK CIRCUIT 75-KA39 (YE/BK) FOR VOLTAGE

1

Windshield Wiper Relay C1009

2

3

3 Measure the voltage between windshield wiper relay C1009 pin 2, circuit 75-KA39 (YE/BK) and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
 GO to B20.

→ **No**
 GO to B17.

B17 CHECK CIRCUIT 75-DD1 (YE) FOR VOLTAGE

1

CJB Fuse 226 (3A)

2

2

Measure the voltage between CJB fuse 226 (3A) input side and ground.

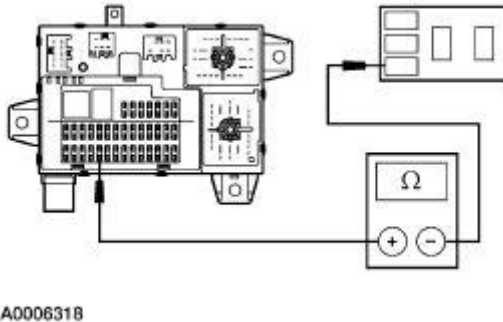

• Is the voltage greater than 10 volts?

→ **Yes**
GO to B18.

→ **No**
GO to B19.

B18 CHECK CIRCUIT 75-KA39 (YE/BK) FOR OPENS

1

1

Measure the resistance between windshield wiper relay C1009 pin 3, circuit 75-KA39 (YE/BK), and CJB fuse 226 (3A), circuit 75-KA39 (YE/BK) output side.

• Is the resistance less than 5 ohms?

→ **Yes**
INSTALL a new AJB. TEST the system for normal operation.

→ **No**
REPAIR the circuit. TEST the system for normal operation.

B19 CHECK CIRCUIT 75-DD1 (YE) FOR OPENS

1

Ignition Switch C250

2

2

Measure the resistance between ignition

A0008595

switch C250 pin 4, circuit 75-DD1 (YE), harness side and CJB fuse 226 (3A), circuit 75-DD1 (YE) input side.

● Is the resistance less than 5 ohms?

→ **Yes**
INSTALL a new CJB. TEST the system for normal operation.

→ **No**
REPAIR the circuit. TEST the system for normal operation.

B20 CHECK CIRCUIT 31-KA39 (BK/RD) FOR OPENS

1

Windshield Wiper Relay C1009

2

A0006326

2 Measure the resistance between windshield wiper relay C1009 pin 1, circuit 31-KA39 (BK/RD), harness side and ground.

● Is the resistance less than 5 ohms?

→ **Yes**
GO to B21.

→ **No**
REPAIR the circuit. TEST the system for normal operation.

B21 CHECK WIPER PARK AND WIPER HIGH/LOW RELAYS

1

2

Underhood AJB Wiper High/Low Relay C1001

3 Carry out the wiper park and wiper high/low relay component tests. Refer to the Wiring Diagrams Section 700–09.

- Are the wiper park and wiper high/low relays OK?

→ **Yes**
GO to B22.

→ **No**
INSTALL a new relay(s) as necessary.
TEST the system for normal operation.

B22 CHECK CIRCUIT 75S-KA12 (YE/VT) FOR OPENS

1

1 Measure the resistance between wiper park relay C1002 pin 3, circuit 75S-KA12 (YE/VT), harness side and wiper high/low relay C1001 pin 3, circuit 75S-KA12 (YE/VT), harness side.

- Is the resistance less than 5 ohms?

→ **Yes**
GO to B23.

→ **No**
REPAIR the circuit. TEST the system for normal operation.

B23 CHECK AJB FOR OPENS

1

Wiper Run/Park Relay C1002

2

2 Measure the resistance between wiper run/park relay C1002 pin 1, harness side and wiper run/park relay C1002 pin 5, harness side

A0006320

● Is the resistance less than 5 ohms?

→ **Yes**
GO to B24.

→ **No**
INSTALL a new AJB. TEST the system for normal operation.

B24 CHECK AJB BETWEEN WIPER PARK AND WIPER HIGH/LOW RELAYS FOR OPENS

1

Wiper Run/Park Relay C1002

2

A0006321

2 Measure the resistance between wiper run/park relay C1002 pin 1, harness side and wiper high/low relay C1001 pin 1, harness side

● Is the resistance less than 5 ohms?

→ **Yes**
GO to B25.

→ **No**
INSTALL a new AJB. TEST the system for normal operation.

B25 CHECK CIRCUIT 31S-KA12 (BK/WH) FOR VOLTAGE

1

2

Wiper Motor C125

3

4

A0003790

4 Measure the voltage between wiper park relay C1002 Pin 4, Circuit 31S-KA12 (BK/WH), harness side and ground.

• Is the voltage greater than 10 volts?

→ Yes
GO to B26.

→ No
GO to B27.

B26 CHECK CIRCUITS 31S-KA12 (BK/WH), 31S-KA1 (BK/YE), AND 31S-KA8 (BK/BU) FOR SHORTS TO POWER

1

2

FEM C201b

3

4

4 Measure the voltage between wiper park relay C1002 Pin 4, Circuit 31S-KA12 (BK/WH), harness side and ground.

A0003790

● Is the voltage greater than 10 volts?

→ **Yes**
REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self-test.

→ **No**
INSTALL a new FEM. REFER to [Section 419-10](#). TEST the system for normal operation.

B27 CHECK CIRCUIT 31S-KA12 (BK/WH) FOR CONTINUITY

1

2

A0003791

2 Measure the resistance between wiper park relay C1002 Pin 4, Circuit 31S-KA12 (BK/WH), harness side and ground.

● Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to [B29](#).

→ **No**
GO to [B28](#).

B28 CHECK CIRCUIT 31S-KA12 (BK/WH), 31S-KA1 (BK/YE) AND 31S-KA8 (BK/BU) FOR SHORTS TO GROUND

1

FEM C201b

2

2

Measure the resistance between wiper park relay C1002 Pin 4, Circuit 31S-KA12 (BK/WH), harness side and ground.

● Is the resistance greater than 10,000 ohms?

→ **Yes**
INSTALL a new FEM. REFER to [Section 419-10](#). TEST the system for normal operation.

→ **No**
REPAIR Circuit 31S-KA12 (BK/WH), Circuit 31S-KA1 (BK/YE) or Circuit 31S-KA8 (BK/BU). CLEAR the DTCs. REPEAT the self-test.

B29 CHECK CIRCUIT 75S-KA2 (YE/RD) BETWEEN WIPER RUN/PARK AND WINDSHIELD WIPER RELAYS FOR OPENS

1

1

Measure the resistance between wiper run/park relay C1002 pin 5, circuit 75S-KA2 (YE/RD) harness side and windshield wiper relay C1009 pin 5, circuit 75S-KA1 (YE/BK) harness side.

● Is the resistance less than 5 ohms?

→ **Yes**
GO to [B30](#).

→ **No**
REPAIR the circuit(s) in question. TEST the system for normal operation.

B30 CHECK CIRCUITS 75S-KA2 (YE/RD) AND 30-KA9 (RD/OG) BETWEEN WIPER MOTOR AND WINDSHIELD WIPER RELAYS FOR OPENS

1

Wiper Motor C125

2

2

Measure the resistance between wiper run/park relay C1002 pin 5, circuit 75S-KA2 (YE/RD), harness side and windshield wiper motor C125 pin 4, circuit 30-KA9 (RD/OG), harness side.

● Is the resistance less than 5 ohms?

→ **Yes**
GO to B31.

→ **No**
REPAIR the circuit(s) in question. TEST the system for normal operation.

B31 CHECK CIRCUIT 31-KA9 (BK) FOR OPENS

1

1

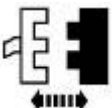

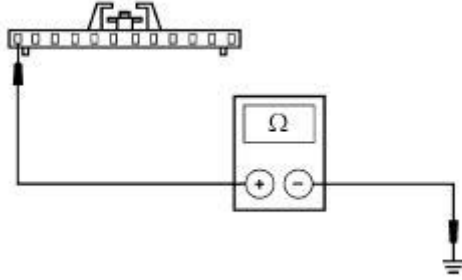

Measure the resistance between wiper motor C125 Pin 3, Circuit 31-KA9 (BK), harness side and ground.

● Is the resistance less than 5 ohms?

→ **Yes**
CHECK the wiper motor; REFER to Component Test in this section. If the wiper motor does not pass the test, INSTALL a new wiper motor, REFER to Windshield Wiper Motor in this section. TEST the system for normal operation.

→ **No**
REPAIR the circuit. TEST the system for normal operation.

PINPOINT TEST C: THE WIPERS STAY ON CONTINUOUSLY

CONDITIONS	DETAILS/RESULTS/ACTIONS
C1 CHECK THE MULTIFUNCTION SWITCH OPERATION	
<p>1 </p> <p>2 </p> <p>Multifunction Switch C202</p>	<p>3 Carry out the multifunction switch component test. Refer to Wiring Diagrams Section 700-09.</p> <ul style="list-style-type: none"> ● Is the multifunction switch OK? <p>→ Yes GO to <u>C2</u>.</p> <p>→ No INSTALL a new multifunction switch. REFER to <u>Section 211-05</u>. TEST the system for normal operation.</p>
C2 CHECK CIRCUIT 8-KA41 (WH/GN), 8-KA19 (WH/BK) AND 8-KA2 (WH/RD) FOR SHORTS TO GROUND	
<p>1 </p> <p>A0006327</p>	<p>1 Measure the resistance between multifunction switch C202 pin 1, (OG/GN), harness side and ground.</p> <ul style="list-style-type: none"> ● Is the resistance greater than 10,000 ohms? <p>→ Yes GO to <u>C5</u>.</p> <p>→ No If equipped with moisture sensitive wipers GO to <u>C3</u>. All others GO to <u>C4</u>.</p>
C3 CHECK FOR A FAULTY RAIN SENSOR MODULE	
<p>1</p>	

Rain Sensor Module C914

2

A0006327

2

Measure the resistance between multifunction switch C202 pin 1, (OG/GN), harness side and ground.

● Is the resistance greater than 10,000 ohms?

→ **Yes**
INSTALL a new rain sensor module. REFER to Module—Rain Sensor in this section.

→ **No**
GO to C4.

C4 CHECK CIRCUITS 8-KA2 (WH/RD), 8-KA19 (WH/BK) AND 8-KA41 (WH/GN) FOR SHORTS TO GROUND

1

FEM C201f

2

A0006327

2

Measure the resistance between multifunction switch C202 pin 1, (OG/GN), harness side and ground.

● Is the resistance greater than 10,000 ohms?

→ **Yes**
INSTALL a new FEM. REFER to Section 419-10. TEST the system for normal operation.

→ **No**
REPAIR circuit(s) in question. TEST the system for normal operation.

C5 CHECK WIPER PARK AND WIPER HIGH/LOW RELAYS

- 1 Remove the AJB wiper park and wiper high/low relays.
- 2 Carry out the relay component test. Refer to Wiring Diagrams Section 700–09.

● **Are both relays OK?**

→ **Yes**
GO to C6.

→ **No**
INSTALL a new relay(s). TEST the system for normal operation.

C6 CHECK CIRCUIT 91S-KA39 (BN/YE) FOR CONTINUITY

1

- 1 Measure the resistance between wiper park relay C1002 Pin 2, Circuit 91S-KA39 (BN/YE), harness side and ground.

● **Is the resistance greater than 10,000 ohms?**

→ **Yes**
GO to C8.

→ **No**
GO to C7.

C7 CHECK CIRCUIT 91S-KA39 (BN/YE) FOR SHORTS TO GROUND

1

FEM C201b

2

- 2 Measure the resistance between wiper park relay C1002 Pin 2, Circuit 91S-KA39 (BN/YE), harness side and ground.

A0003785

- Is the resistance greater than 10,000 ohms?

- **Yes**
INSTALL a new FEM. REFER to [Section 419-10](#). TEST the system for normal operation.
- **No**
REPAIR the circuit. TEST the system for normal operation.

C8 CHECK CIRCUIT 75S-KA12 (YE/VT) FOR SHORTS TO BATTERY

1

A0006325

- 1 Measure the voltage between wiper park relay C1002 pin 3, circuit 75S-KA12 (YE/VT) and ground.

- Is the voltage greater than 10 volts?

- **Yes**
REPAIR the circuit. TEST the system for normal operation.
- **No**
GO to [C9](#).

C9 CHECK CIRCUIT 75S-KA11 (YE/BK) AND CIRCUIT 75S-KA10 (YE/GN) FOR SHORT TO BATTERY

1

Wiper Motor C125

2

3

A0003793

3

Measure the voltage between wiper high/low relay C1001 pin 4, circuit 75S-KA10 (YE/GN), harness side and ground; and between wiper high/low relay C1001 pin 5, circuit 75S-KA11 (YE/BK), harness side and ground.

● Is the voltage greater than 10 volts?

→ **Yes**

REPAIR circuit(s) in question. TEST the system for normal operation.

→ **No**

INSTALL a new FEM. REFER to [Section 419-10](#). TEST the system for normal operation.

PINPOINT TEST D: THE HIGH/LOW WIPER SPEEDS DO NOT OPERATE CORRECTLY

CONDITIONS	DETAILS/RESULTS/ACTIONS
D1 CHECK THE FEM PID WPMODE	
	<p>1 Monitor the FEM PID WPMODE, while activating the multifunction switch to the high and low positions.</p> <p>● Do the FEM PID WPMODE values agree with the multifunction switch positions?</p> <p>→ Yes GO to D2.</p> <p>→ No GO to D3.</p>
D2 ACTIVATE THE FRONT WINDSHIELD WIPER/WASHER COMMAND	
<p>1</p> 	<p>2 Trigger the FEM active command</p>

SPEED RLY to the LOW and HIGH speeds.

- **Do the wipers work in LOW and HIGH?**

→ **Yes**
INSTALL a new FEM. REFER to [Section 419-10](#). TEST the system for normal operation.

→ **No**
GO to [D6](#).

D3 CHECK THE MULTIFUNCTION SWITCH OPERATION

1

2

Multifunction Switch C202

3 Carry out the multifunction switch component test. Refer to Wiring Diagrams Section 700–09.

- **Is the multifunction switch OK?**

→ **Yes**
If equipped with moisture sensitive wipers. GO to [D4](#).

All others GO to [D5](#).

→ **No**
INSTALL a new multifunction switch. REFER to [Section 211-05](#). TEST the system for normal operation.

D4 CHECK RAIN SENSOR MODULE

1

Multifunction Switch C202

2

Rain Sensor Module C914

3

4

4

Monitor the FEM PID WPMODE while activating the multifunction switch to the high and low positions.

- Does the FEM PID WPMODES agree with the multifunction switch positions?

→ Yes

INSTALL a new rain sensor module. REFER to Module—Rain Sensor in this section. TEST the system for normal operation.

→ No

GO to D5.

D5 CHECK CIRCUITS 8-KA2 (WH/RD), 8-KA19 (WH/GN) AND 8-KA41 (WH/GN) FOR SHORTS TO GROUND

1

FEM C201f

2

Multifunction Switch C202

3

A0006327

3

Measure the resistance between multifunction switch C202 pin 1, circuit (OG/GN), harness side and ground.

- Is the resistance greater than 10,000 ohms?

→ Yes

INSTALL a new FEM. REFER to Section 419-10. TEST the system for normal operation.

→ **No**
REPAIR circuit(s) in question. TEST the system for normal operation.

D6 CHECK WIPER HIGH/LOW RELAY PIN 2 FOR VOLTAGE

1

2

Underhood AJB Wiper HIGH/LOW Relay

3

4

A0003784

4 Measure the voltage between wiper high/low relay C1001 pin 2, circuit 91S-KA16 (BN/GN), harness side and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
GO to D7.

→ **No**
GO to D8.

D7 CHECK CIRCUIT 91S-KA16 (BN/GR) FOR SHORTS TO POWER

1

2

FEM C201b

3

4

A0003784

- 4 Measure the voltage between wiper high/low relay C1001 pin 2, circuit 91S-KA16 (BN/GN), harness side and ground.

● Is the voltage greater than 10 volts?

- **Yes**
REPAIR the circuit. TEST the system for normal operation.
- **No**
INSTALL a new FEM. REFER to [Section 419-10](#). TEST the system for normal operation.

D8 CHECK WIPER HIGH/LOW RELAY PIN 2 FOR CONTINUITY TO GROUND

1

2

A0003785

- 2 Measure the resistance between wiper high/low relay C1001 pin 2, circuit 91S-KA16 (BN/GN), harness side and ground.

● Is the resistance greater than 10,000 ohms?

- **Yes**
GO to [D10](#).
- **No**
GO to [D9](#).

D9 CHECK CIRCUIT 91S-KA16 (BN/GN) FOR SHORTS TO GROUND

1

FEM C201b

2

2

Measure the resistance between wiper high/low relay C1001 pin 2, circuit 91S-KA16 (BN/GN), harness side and ground.

● Is the resistance greater than 10,000 ohms?

→ Yes

INSTALL a new FEM. REFER to [Section 419-10](#). TEST the system for normal operation.

→ No

REPAIR the circuit. TEST the system for normal operation.

D10 ACTIVATE WIPER HIGH/LOW RELAY

1

2

2

Trigger the FEM active command SPEED RLY to ON, while measuring the resistance between wiper high/low relay C1001 Pin 2, Circuit 91S-KA16 (BN/GN) and ground.

● Is the resistance less than 5 ohms?

→ Yes

GO to [D11](#).

→ No

GO to [D14](#).

D11 CHECK UNDERHOOD AJB WIPER HIGH/LOW RELAY

- 1 Carry out the wiper high/low relay component test. Refer to Wiring Diagrams Section 700–09.
- Is the wiper high/low relay OK?
- **Yes**
GO to D12.
- **No**
INSTALL a new wiper high/low relay.
TEST the system for normal operation.

D12 CHECK WIPER HIGH/LOW RELAY PIN 1 FOR VOLTAGE

1

- 1 Measure the voltage between wiper high/low relay C1001 Pin 1, harness side and ground.
- Is the voltage greater than 10 volts?
- **Yes**
GO to D13.
- **No**
INSTALL a new underhood AJB. TEST the system for normal operation.

D13 CHECK CIRCUITS 75S-KA10 (YE/GN) AND 75S-KA11 (YE/BK) FOR OPENS

1

2

Wiper Motor C125

3

- 3 Measure the resistance between wiper high/low relay C1001 pin 4, circuit 75S-KA10 (YE/GN), harness side and wiper motor C125 pin 4, circuit 75S-KA10 (YE/GN), harness side; and between wiper high/low relay C1001 pin 5, circuit 75S-KA11 (YE/BK), harness side and wiper motor C125 Pin 5, circuit 75S-

A0005358

KA11 (YE/BK), harness side.

- Is the resistance greater than 10,000 ohms?

→ Yes

CHECK the wiper motor; REFER to Component Test. If the wiper motor does not pass the test, INSTALL a new wiper motor, REFER to [Windshield Wiper Motor](#) in this section. TEST the system for normal operation.

→ No

REPAIR circuit(s) in question. TEST the system for normal operation.

D14 CHECK CIRCUIT 91S-KA16 (BN/GN) FOR OPENS

1

FEM C201b

2

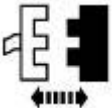

A0003796

2

Measure the resistance between wiper high/low relay C1001 pin 2, circuit 91S-KA16 (BN/GN), harness side and FEM C201b pin 3, circuit 91S-KA16 (BN/GN), harness side.

	<ul style="list-style-type: none"> ● Is the resistance less than 5 ohms? <p>→ Yes INSTALL a new FEM. REFER to Section 419-10. TEST the system for normal operation.</p> <p>→ No REPAIR the circuit. TEST the system for normal operation.</p>
--	--

PINPOINT TEST E: THE WASH AND WIPE FUNCTION DOES NOT OPERATE CORRECTLY

CONDITIONS	DETAILS/RESULTS/ACTIONS
E1 MONITOR THE FEM PID WPMODE	
<p>1</p> 	<p>2</p> <p>Monitor the FEM PID WPMODE while activating the wash and wipe functions.</p> <ul style="list-style-type: none"> ● Do the FEM PID WPMODE values agree with the multifunction switch positions? <p>→ Yes GO to E6.</p> <p>→ No If equipped with moisture sensitive wipers GO to E2. All others GO to E3.</p>
E2 CHECK RAIN SENSOR MODULE	
<p>1</p>  <p>2</p>  <p style="text-align: center;">Rain Sensor Module C914</p>	<p>3</p> <p>Monitor the FEM PID WPMODE while activating the wash and wipe functions.</p> <ul style="list-style-type: none"> ● Do the FEM PID WPMODE values

agree with the multifunction switch positions?

→ **Yes**
INSTALL a new rain sensor module.
REFER to Module—Rain Sensor in this section. TEST the system for normal operation.

→ **No**
GO to E3.

E3 CHECK THE MULTIFUNCTION SWITCH OPERATION

1

Multifunction Switch C202

2 Carry out the multifunction switch component test. Refer to Wiring Diagrams Section 700-09.

● **Is the multifunction switch OK?**

→ **Yes**
GO to E4.

→ **No**
INSTALL a new multifunction switch.
REFER to Section 211-05. TEST the system for normal operation.

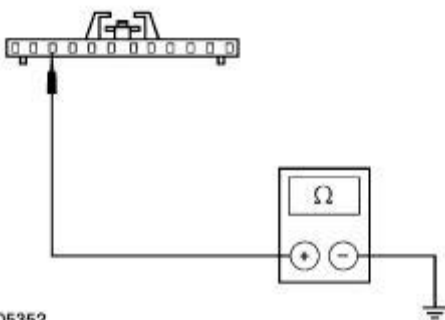

E4 CHECK CIRCUITS 10-KA3 (GY/VT), 10-KA19 (GY/BK) AND 10-KA41 (GY/OG) FOR SHORTS TO GROUND

1

FEM C201f

2

A0005352

2 Measure the resistance between multifunction switch C202 pin 3, circuit (BU/WH), harness side and ground.

● **Is the resistance greater than 10,000 ohms?**

→ **Yes**

GO to E5.

→ **No**
REPAIR circuit(s) in question. TEST the system for normal operation.

E5 CHECK CIRCUITS 10-KA3 (GY/VT), 10-KA19 (GY/BK) AND 10-KA41 (GY/OG) FOR OPENS

1

A0006686

1

Measure the resistance between multifunction switch C202 pin 3, circuit (BU/WH), harness side and FEM C201f pin 13, circuit 10-KA3 (GY/VT); and between multifunction switch C202 pin 2, circuit (BN/WH), harness side and FEM C201f pin 14, circuit 7-KA1 (YE), harness side.

● **Is the resistance less than 5 ohms?**

→ **Yes**
GO to E6.

→ **No**
REPAIR the circuit(s) in question. TEST the system for normal operation.

E6 CHECK CIRCUITS 31S-KA8 (BK/BU) AND 31S-KA1 (BK/YE) FOR OPENS

1

FEM C201b

2

2

Measure the resistance between wiper motor C125 pin 5, circuit 31S-KA1 (BK/YE), and FEM C201b pin 13, circuit 31S-KA8 (BK/BU).

A0008597

- Is the resistance less than 5 ohms?

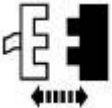

→ **Yes**

INSTALL a new FEM. REFER to [Section 419-10](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**

REPAIR the circuit(s) in question. TEST the system for normal operation.

PINPOINT TEST F: THE WASH AND WIPE FUNCTION DOES NOT OPERATE CORRECTLY

CONDITIONS	DETAILS/RESULTS/ACTIONS
F1 CHECK POWER TO THE WASHER PUMP	
<p>1 </p> <p>2  Washer Pump C137</p> <p>3 </p> <p>4</p>	<p>4 Measure the voltage at washer pump C137 pin 2, Circuit 75-KA7 (YE/VT).</p>

A0044173

● Is the voltage greater than 10 volts?

→ **Yes**
GO to F2.

→ **No**
REPAIR the power supply circuit(s).
RESTORE the system and TEST the system for correct operation.

F2 CHECK CIRCUIT 31S-KA7 (BK/WH) FOR AN OPEN

1

FEM C201b

2

A0044174

2 Measure the resistance between washer pump C137 pin 1, Circuit 31S-KA7 (BK/WH) harness side and FEM C201b pin 14, Circuit 31S-KA7 (BK/WH) harness side.

● Is resistance less than 5 ohms?

→ **Yes**
GO to F3.

→ **No**
REPAIR circuit 31S-KA7 (BK/WH).
RESTORE the system and TEST for correct operation.

F3 CHECK CIRCUIT 31S-KA7 (BK/WH) FOR A SHORT TO GROUND

1

1 Measure the resistance between FEM C201b pin 14, Circuit 31S-KA7 (BK/WH), harness side and ground.

A0044175

- Is the resistance greater than 10,000 ohms?

- **Yes**
GO to F4.
- **No**
REPAIR circuit 31S-KA7 (BK/WH).
RESTORE the system and TEST the system for normal operation.

F4 CHECK WASHER PUMP

1

Washer Pump C137

2

A0044176

- 2 Connect a 10A fused jumper wire between FEM C201b pin 1, Circuit 31S-KA7 (BK/WH), harness side and ground.

- Does the washer pump operate?

- **Yes**
GO to F5.
- **No**
INSTALL a new washer pump.
RESTORE the system and TEST the system for normal operation.

F5 CHECK FOR CORRECT MODULE OPERATION

- 1 Connect any disconnected connectors.

- check for corrosion
- check for pushed-out pins

	<ul style="list-style-type: none"> ■ check that connector seats correctly <p>2 Make sure all other system connectors are fully seated.</p> <p>3 Operate the system and verify the concern is still present.</p> <p>● Is the concern still present?</p> <p>→ Yes INSTALL a new FEM. REFER to <u>Section 419-10</u>. CLEAR the DTCs. REPEAT the self-test.</p> <p>→ No The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.</p>
--	---

PINPOINT TEST G: THE SPEED DEPENDENT INTERVAL MODE DOES NOT OPERATE CORRECTLY

CONDITIONS	DETAILS/RESULTS/ACTIONS
G1 CHECK THE FEM PID WPMODE	
<p>1</p> 	<p>2 Monitor the FEM PID WPMODE, while activating the intermittent washers through all speeds (positions) at the multifunction switch.</p> <p>● Do the FEM PID WPMODE values agree with the multifunction switch position?</p> <p>→ Yes GO to <u>G7</u>.</p> <p>→ No If equipped with moisture sensitive wipers. GO to <u>G2</u>. All others GO to <u>G3</u>.</p>
G2 CHECK THE RAIN SENSOR MODULE	
<p>1</p> 	

2

Rain Sensor Module C914

3

4 Monitor the FEM PID WPMODE, while activating the intermittent washers through all speeds (positions) at the multifunction switch.

- Do the FEM PID WPMODE values agree with the multifunction switch position?

→ **Yes**
INSTALL a new rain sensor module. REFER to Module—Rain Sensor in this section. TEST the system for normal operation.

→ **No**
GO to G3.

G3 CHECK THE MULTIFUNCTION SWITCH OPERATION

1

2

Multifunction Switch C202

3

4 Carry out the multifunction switch component test. Refer to the Wiring Diagrams Section 700–09.

- Is the multifunction switch OK?

→ **Yes**
GO to G4.

→ **No**
INSTALL a new multifunction switch. REFER to Section 211-05. TEST the

system for normal operation.

G4 CHECK CIRCUITS 10-KA3 (GY/VT), 10-KA19 (GY/BK) AND 10-KA41 (GY/OG) FOR VOLTAGE

1

1

Measure the voltage between multifunction switch C202 pin 3, (BU/WH), harness side and ground.

● Is the voltage greater than 10 volts?

→ Yes
GO to G5.

→ No
GO to G6.

G5 CHECK CIRCUITS 10-KA3 (GY/VT), 10-KA19 (GY/BK) AND 10-KA41 (GY/OG) FOR SHORTS TO POWER

1

2

FEM C201f

3

4

4

Measure the voltage between multifunction switch C202 pin 3, circuit (BU/WH), harness side and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
REPAIR the circuit(s) in question. TEST the system for normal operation.

→ **No**
INSTALL a new FEM. REFER to [Section 419-10](#). TEST the system for normal operation.

G6 CHECK CIRCUITS 10-KA3 (GY/VT), 10-KA19 (GY/BK) AND 10-KA41 (GY/OG) FOR OPENS

1

2

FEM C201f

3

A0006680

3 Measure the resistance between multifunction switch pin 3, circuit (BU/WH), harness side and FEM C201f pin 13, circuit 10-KA3 (GY/VT), harness side.

● Is the resistance less than 5 ohms?

→ **Yes**
INSTALL a new FEM. REFER to [Section 419-10](#). TEST the system for normal operation.

→ **No**
REPAIR the circuit(s) in question. TEST the system for normal operation.

G7 MONITOR THE FEM PID WPPRKS

1

2 Trigger the FEM active command WIPER RLY ON and OFF while monitoring the FEM PID WPPRKS.

● Did the PID change from PARKED to notPRK?

→ **Yes**
INSTALL a new FEM. REFER to [Section 419-10](#). TEST the system for normal operation.

→ **No**
GO to [G8](#).

G8 CHECK WIPER PARK RELAY

1 Remove the underhood AJB wiper park relay.

2 Carry out the relay component test. Refer to the Wiring Diagrams Section 700-09.

● **Is the wiper park relay OK?**

→ **Yes**
GO to [G9](#).

→ **No**
INSTALL a new wiper park relay. TEST the system for normal operation.

G9 CHECK THE WIPER MOTOR

1

2

Wiper Motor C125

3

4

A0003780

4 Monitor the FEM PID WPPRKS while connecting a (20 A) fused jumper wire between wiper motor C125 pin 5, circuit 31S-KA1 (BK/YE), harness side and wiper motor C125 pin 4, circuit 75S-KA9 (YE/BU), harness side.

● **Did the PID change from notPRK to PARKED?**

→ **Yes**
INSTALL a new wiper motor. REFER to Windshield Wiper Motor in this section.
TEST the system for normal operation.

→ **No**
GO to G10.

G10 CHECK CIRCUITS 31S-KA1 (BK/YE) AND 31S-KA12 (BK/WH) FOR OPENS

1

1 Measure the resistance between the wiper park relay C1002 Pin 4, Circuit 31S-KA12 (BK/WH), harness side and wiper motor C125 pin 5, circuit 31S-KA1 (BK/YE), harness side.

● Is the resistance less than 5 ohms?

→ **Yes**
GO to G11.

→ **No**
REPAIR the circuit(s) in question. TEST the system for normal operation.

G11 CHECK CIRCUIT 31S-KA8 (BK/BU) FOR OPENS

1

2

3

3 Measure the resistance between the wiper park relay C1002 pin 4, circuit 31S-KA12 (BK/WH), harness side and FEM C201b pin 13, circuit 31S-KA8 (BK/BU), harness side.

● Is the resistance less than 5 ohms?

→ **Yes**
 INSTALL a new FEM. REFER to [Section 419-10](#). TEST the system for normal operation.

→ **No**
 REPAIR the circuit(s) in question. TEST the system for normal operation.

PINPOINT TEST H: THE RAIN MOISTURE SENSITIVE FUNCTION DOES NOT OPERATE CORRECTLY

CONDITIONS	DETAILS/RESULTS/ACTIONS
H1 RETRIEVE THE FEM DIAGNOSTIC TROUBLE CODES	
	<p>1 Using recorded results from the FEM self-test.</p> <ul style="list-style-type: none"> ● Are any DTCs recorded? <p>→ Yes GO to the FEM Diagnostic Trouble Code (DTC) Index.</p> <p>→ No GO to H2.</p>
H2 QUICK VISUAL CHECKS	
	<p>1 Check if the rain sensor module is mounted correctly.</p> <ul style="list-style-type: none"> ■ Interior side of the windshield. ■ Near and behind the mirror. ■ The optical windows must be within the wiper pattern. <p>2 Check if the rain sensor module connector is in place.</p> <p>3 Check if the green slides are fully closed.</p> <p>4 Check presence and proper coupling of silicon pads (About 80% of pad area should form a seal to the glass).</p> <p>5 Check if brackets are in place (not broken off the windscreen).</p> <p>6 Check windscreen, over the optical windows, for cracks, scratches, covered, etc.</p> <p>7 Make sure multifunction switch was set in AUTO, in order for the moisture sensitive wiper function to work.</p>

	<ul style="list-style-type: none"> ● Does everything check out OK? <p>→ Yes GO to <u>H3</u>.</p> <p>→ No REPAIR as necessary. TEST the system for normal operation.</p>
--	---

H3 VERIFY WIPER AUTO FUNCTION

	<p>1 Verify the moisture sensitive wiper system is continuously wiping when the multifunction switch is placed in AUTO.</p> <ul style="list-style-type: none"> ● Do wipers wipe continuously when switch is placed in AUTO? <p>→ Yes GO to <u>H10</u>.</p> <p>→ No GO to <u>H4</u>.</p>
--	--

H4 VERIFY SYMPTOM

	<p>1 Verify if the wipers are totally inoperative or working erratically.</p> <ul style="list-style-type: none"> ● Are the wipers totally inoperative? <p>→ Yes GO to <u>H5</u>.</p> <p>→ No REMOVE rain sensor module, clean the interior windshield glass and RE-INSTALL. For additional information, refer to <u>Module—Rain Sensor</u> in this section. TEST system for normal operation.</p>
--	--

H5 CHECK THE FEM PID WPMODE

<p>1</p> 	<p>2 Monitor the FEM PID WPMODE, while activating the multifunction switch to the AUTO position.</p> <ul style="list-style-type: none"> ● Do the wiper FEM PID WPMODE values agree with the multifunction switch? <p>→ Yes GO to <u>H7</u>.</p> <p>→ No</p>
---	--

GO to H6.

H6 CHECK THE FEM PID WPMODE WHILE SELECTING OTHER POSITIONS WITH THE MULTIFUNCTION SWITCH

1 Monitor the FEM PID WPMODE, while activating the multifunction switch positions 2 through 7.

- Do the wiper FEM PID WPMODE values agree with the multifunction switch?

→ **Yes**
INSTALL a new multifunction switch. REFER to Section 211-05. TEST the system for normal operation.

→ **No**
GO to the Symptom Chart for further diagnosis.

H7 CHECK RAIN SENSOR MODULE CIRCUIT 20-AD15 (PK) FOR VOLTAGE

1

Rain Sensor Module C914

2

3

3 Measure the voltage between the rain sensor module C914 pin 6, circuit 20-AD15 (PK), harness side and ground.

- Is the voltage greater than 10 volts?

→ **Yes**
GO to H9.

→ **No**
GO to H8.

H8 CHECK CJB FUSE 216 (5A) VOLTAGE SUPPLY

1

CJB Fuse 216 (5A)

2

3

A0006682

3 Measure the voltage between CJB Fuse 216 (5A) input side and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
REPAIR the circuit(s) in question. TEST the system for normal operation.

→ **No**
INSTALL a new CJB power supply. TEST the system for normal operation.

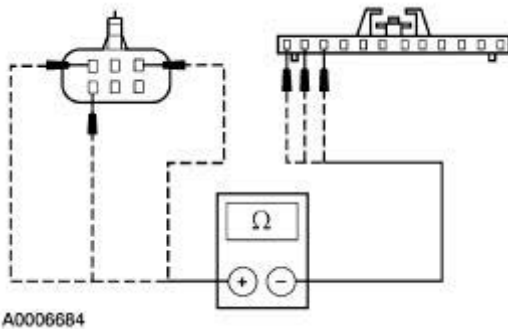

H9 CHECK CIRCUITS 7-KA41 (YE/GN), 8-KA41 (WH/GN) AND 10-KA41 (GY/OG) FOR AN OPEN

1

Multifunction Switch C202

2

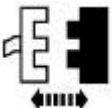

A0006684

2 Using the following table measure the resistance between multifunction switch C202 harness side and rain sensor module C914 harness side:

Multifunction Switch C202	Rain Sensor Module C914
pin 1, circuit (OG/GN)	pin 1, circuit 8-KA41 (WH/GN)
pin 2, circuit (BN/WH)	pin 4, circuit 7-KA41 (YE/GN)
pin 3, circuit (BU/WH)	pin 3, circuit 10-KA41 (GY/OG)

● Is the resistance less than 5 ohms?

	<p>→ Yes INSTALL a new rain sensor module. For additional information, refer to Module—Rain Sensor in this section .</p> <p>→ No REPAIR the circuit(s) in question. TEST the system for normal operation.</p>
<p>H10 VERIFY CONTINUOUSLY RUNNING WIPERS</p>	
	<p>1 Verify if the moisture sensitive wipers system is continuously wiping in interval #1 speed (longest delay time) or running in a higher speed when in AUTO.</p> <ul style="list-style-type: none"> ● Are wipers running in a higher speed? <p>→ Yes GO to H11 .</p> <p>→ No INSTALL a new rain sensor module. For additional information, refer to Module—Rain Sensor in this section.</p>
<p>H11 CHECK THE RAIN SENSOR MODULE</p>	
<p>1</p>  <p>3</p>  <p>Rain Sensor Module C914</p>	<p>2 Select AUTO with the multifunction switch.</p> <ul style="list-style-type: none"> ● Did the wipers turn off? <p>→ Yes INSTALL a new rain sensor module. REFER to Module—Rain Sensor in this section. TEST the system for normal operation.</p> <p>→ No GO to Pinpoint Test C .</p>

Component Test

Windshield Wiper Motor

⚠ CAUTION: Do not handle the wiper motor abusively when diagnosing the wiper operations. Failure to follow this caution may result in damage to the motor magnets and will make the wiper motor inoperative. Rough handling of new replacement wiper motors may also damage the motor magnets.

Use Alternator, Regulator, Battery and Starter Tester (ARBST) to test the wiper motor on the vehicle.

To test the wiper motor, disconnect the windshield wiper mounting arm and pivot shaft from the windshield wiper motor; refer to [Pivot Arm](#).

Disconnect the wiper motor. Connect the (1) green lead from (2) (ARBST) to the battery negative (-) post. Connect the (3) red lead from ARBST to the wiper motor (4) common brush terminal (terminal 3).

Test the low speed mode by connecting a (5) cable from the battery positive (+) post to the (6) low speed brush terminal (terminal 4) and measure the current draw. If the current draw is greater than 3.5 amperes, install a new windshield wiper motor.

Test the high speed mode by connecting a cable from the battery positive (+) post to the (7) high speed brush terminal (terminal 5) and measure the current draw. If the current draw is greater than 5.5 amperes, install a new wiper motor.

Wiper Blade and Pivot Arm Adjustment

1. Cycle and park the windshield wipers.
2. Remove the pivot arm(s).
 1. Remove the pivot arm nut cover(s).
 2. Remove the nut(s).
 3. Remove the pivot arm(s).

3. Install the wiper blade and pivot arm onto the pivot shaft and align the blade to the silver dots in the windshield.

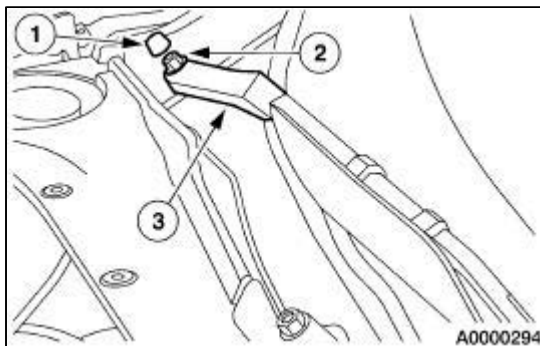

4. Tighten the windshield wiper pivot arm nut(s).
 - Install the pivot arm nut cover(s).

Pivot Arm

Removal

1. Remove the pivot arm (RH shown, LH similar).
 1. Remove the pivot arm nut cover.
 2. Remove the nut.
 3. Remove the pivot arm.

Installation

1. Cycle and park the windshield wipers.
2. Install the wiper blade and pivot arm onto the pivot shaft and align the blade to the silver dots in the windshield.

3. Tighten the windshield pivot arm nuts.
 - Install the pivot arm nut covers.

Mounting Arm and Pivot Shaft

Removal and Installation

1.  **CAUTION:** The windshield wiper system has an auto park feature. It is necessary to disconnect the battery.

Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).

2. Remove the cowl top vent panels. For additional information, refer to [Section 501-02](#).
3. Remove the bolts and the strut tower support brace.

4. Partially drain the engine cooling system. For additional information, refer to [Section 303-03](#).
5. Disconnect the degas return hose from the degas return tube.

6. **NOTE:** When positioning the degas bottle aside it will be necessary to reroute the degas bottle lower hose in front of the brake booster.

Remove the bolts and position the degas bottle aside.

7. Remove the windshield wiper mounting arm and pivot shaft bolts.

8. Disconnect the drain boot from the windshield wiper mounting arm and pivot shaft assembly.
9. Position the windshield wiper mounting arm and pivot shaft assembly aside, and loosen the upper windshield wiper motor bolt.

10. Remove the windshield wiper mounting arm and pivot shaft assembly.
 1. Rotate wiper output arm to the six o'clock position.
 2. Remove the lower wiper motor bolts.
 3. **NOTE:** It is necessary to rotate the bottom of the windshield wiper mounting arm and pivot shaft assembly upward.

Remove the windshield wiper mounting arm and pivot shaft assembly.

- Disconnect the electrical connector.

11. To install, reverse the removal procedure.

Windshield Wiper Motor

Removal and Installation

1. Remove the windshield wiper mounting arm and pivot shaft (17566) assembly; refer to Mounting Arm and Pivot Shaft in this section.
2. Remove the windshield wiper motor (17508).
 1. Remove the bolt.
 2. Remove the windshield wiper motor crank bolt.
 3. Remove the windshield wiper motor.

3. To install, reverse the removal procedure.

Washer Pump and Reservoir

Removal and Installation

1.  **CAUTION:** Do not make electrical connections prior to filling the windshield washer reservoir. Do not operate the windshield washer pump prior to filling the windshield washer reservoir.

Disconnect the battery ground cable. Refer to [Section 414-01](#).

2. Remove the RF wheel and tire assembly. For additional information, refer to [Section 204-04](#).
3. Position RF fender splash shield aside.
 1. Remove the screws.
 2. Remove the pin-type retainers.
 3. Position the RF splash shield aside.

4. **NOTE:** Windshield washer fluid should be collected in a container after the windshield washer hose is disconnected.

Disconnect the washer hose.

5. Remove the washer fluid reservoir.
 1. Disconnect the two electrical connectors.
 2. Remove the bolts.
 3. Remove the washer reservoir.

6. If necessary remove the windshield washer pump and if equipped remove the headlamp washer pump.

7. To install, reverse the removal procedure.
-

Module —Rain Sensor

Removal and Installation

1. **NOTE:** To avoid damage to the rain sensor module cover, push up on the cover while rotating the top of the cover toward the rear of the vehicle.

NOTE: Prior to installing the rain sensor module, the windshield glass area between the rain sensor module brackets must be cleaned.

NOTE: When installing the rain sensor module, it is necessary to apply inward pressure on the module prior to locking the rain sensor module retaining slides in place.

Remove the rain sensor module cover (17D550).

2. Remove the rain sensor module 17D547.
 1. Pull the latch on the connector away from the harness and disconnect the electrical connector.
 2. **NOTE:** When removing the rain sensor module, it is necessary to apply inward pressure on the module prior to releasing the rain sensor module retaining slides.
- Release the rain sensor module retaining slides.
3. Remove the rain sensor module.

3. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-in
Roof opening panel assembly bolts	10	89
Roof opening glass assembly screws	4	35
Roof opening panel control module bolts	3	27
Roof opening panel motor assembly bolts	6	53

Roof Opening Panel

The roof opening panel consists of the following components:

- Left sight shield
- Right sight shield
- Water trough
- Roof opening panel opening shield
- Roof opening panel assembly
- Roof opening panel track and rail assembly
- Roof opening panel control module
- Roof opening panel motor assembly
- Roof opening glass assembly
- Roof opening glass seal

The roof opening panel is available as an option. The roof opening panel control module controls the roof opening panel. The roof opening panel may be operated from the roof opening panel switch or the global open and close function.

Roof Opening Panel

Refer to Wiring Diagrams Section 501-17, Roof Opening Panel for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool

Principles of Operation

Roof Opening Panel Control Module

Battery power is continuously supplied to the roof opening panel control module. However, the roof opening panel will only operate from the roof opening panel switch with the ignition switch in the RUN or ACCY position. The global open and close feature is controlled by two circuits from the rear electronic module (REM). The two circuits must be at ground potential before the roof opening panel control module will acknowledge the roof opening panel switch. When the ignition switch is turned to RUN or ACCY, the REM provides ground to these circuits.

The roof opening panel control module incorporates soft stops at the end of all travel positions. The roof opening panel control module monitors the internal switches to determine the roof opening glass position and the soft stops. The internal switches are activated by the roof opening panel motor rotation.

The roof opening panel control module supplies the power and ground to the roof opening panel motor depending on the ordered function. Power is supplied to the roof opening panel motor for a maximum of 12 seconds. Under normal operation, position is monitored by the roof opening panel control module and power is removed from the roof opening panel motor as soon as the roof opening panel reaches the commanded position.

Roof Opening Panel Switch

Four circuits connect the roof opening panel switch to the roof opening panel control module. One circuit is the common return. The other three are the control circuits open, close and tilt. The roof opening panel control module monitors these lines for voltage fluctuation to determine which function was selected.

With the ignition switch in the RUN or ACCY position, the roof opening panel supplies a five volt

reference voltage to the three control lines. Activation of the roof opening panel switch connects one or more of these lines to the common return which pulls the line low. The roof opening panel control module will sense the line or lines being connected to the common line and carry out the appropriate function.

The express open function connects the open and tilt circuits to the common return when the roof opening panel switch is moved rearward to the second detent position. The operator-controlled open function connects the open circuit to the common return. The close function connects the close circuit to the common causing the roof opening panel to close from a slide or vent position.

Global Open and Close

Two circuits connect the REM to the roof opening panel control module for these functions. Global open and close operation for the roof opening panel is controlled by one of these two circuits being grounded by the REM.

Global open and close operation is only available with the ignition in the OFF position and the ignition key removed.

When the ignition switch is in the RUN or ACCY position, the REM grounds both of these circuits allowing normal operation of the roof opening panel from the roof opening panel switch.

When global open or close operation is selected, the roof opening panel switch is not recognized by the roof opening panel control module throughout the operation and five seconds after the operation is completed.

With the ignition switch in the OFF position, the roof opening panel control module supplies a constant voltage to these two circuits. The roof opening panel control module monitors these lines for a low state, caused by the REM grounding the line, to determine the ordered global function by the REM.

Global open is commanded by the REM grounding control line two. Line one will remain at previous voltage.

Global close is commanded by the REM grounding control line one. Line two will remain at previous voltage.

If both lines have voltage, the roof opening panel will be inoperative.

The global open function is activated by:

- unlocking the driver door using the remote keyless entry transmitter. Within five seconds, press and hold the unlock button.
- unlocking the driver door using the driver door lock cylinder and the key. Hold the key in the unlock position.

The global close function is activated by:

- turning the driver door lock cylinder to the lock position and holding.

Global open and close operates as follows:

- With the roof opening glass in the flush position, activating global open will operate the roof opening glass to the full open position.
- With the roof opening glass in the open position, activating global close will close the roof opening glass to the flush position.
- If a global open is commanded within five seconds of a completed global operation, the roof

opening panel control module will reverse the previous completed global operation. If the roof opening glass was globally closed from the vent position, a global open within five seconds would tilt the roof opening glass back up.

- If the roof opening glass was globally closed from the slide open position, a global open within five seconds would slide the roof opening glass back open.

Inspection and Verification

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
<ul style="list-style-type: none"> ● Roof opening panel track and rail assembly ● Roof opening glass seal ● Roof opening glass adjustment ● Roof opening panel assembly timing 	<ul style="list-style-type: none"> ● Battery junction box (BJB) Fuse 416 (20A) ● Central junction box (CJB) Mini Fuse 207 (5A) ● Roof opening panel switch ● Roof opening panel motor assembly ● Rear electronics module (REM) ● Roof opening panel control module ● Wiring harness ● Loose or corroded connections

3. If the concern remains after the inspection, connect the diagnostic tool to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
 - check that the program card is correctly installed.
 - check the connections to the vehicle.
 - check the ignition switch position.
4. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool manual.
5. Carry out the DATA LINK DIAGNOSTIC TEST. If the diagnostic tool responds with:
 - CKT914, CKT915 or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to [Section 418-00](#).
 - NO RESP/NOT EQUIP for REM, go to Pinpoint Test A.
 - SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the REM.
6. If the DTCs retrieved are related to the concern, go to REM Diagnostic Trouble Code (DTC) Index to continue diagnostics.
7. If no DTCs related to the concern are retrieved, proceed to Symptom Chart to continue diagnostics.

REM Diagnostic Trouble Code (DTC) Index

--	--	--	--

DTC	Description	Source	Action
B1201	Fuel Sender Circuit Failure	REM	REFER to Section 413-01 .
B1300	Power Door Lock Circuit Failure	REM	REFER to Section 501-14B .
B1310	Power Door Unlock Circuit Failure	REM	REFER to Section 501-14B .
B1331	Decklid Ajar Rear Door Circuit Failure	REM	REFER to Section 417-02 .
B1335	Door Ajar RR Circuit Failure	REM	REFER to Section 417-02 .
B1342	ECU Is Defective	REM	CLEAR the DTC. RETRIEVE the DTCs. If DTC B1342 is retrieved, INSTALL a new REM. REFER to Section 419-10 . CLEAR the DTCs. REPEAT the self test.
B1483	Brake Pedal Input Circuit Failure	REM	REFER to Section 417-01 .
B1499	Lamp Turn Signal Left Circuit Failure	REM	REFER to Section 417-01 .
B1501	Lamp Turn Signal Left Circuit Short to Battery	REM	REFER to Section 417-01 .
B1503	Lamp Turn Signal Right Circuit Failure	REM	REFER to Section 417-01 .
B1505	Lamp Turn Signal Right Circuit Short to Battery	REM	REFER to Section 417-01 .
B1551	Decklid Release Circuit Failure	REM	REFER to Section 501-14B .
B1571	Door Ajar LR Circuit Failure	REM	REFER to Section 417-02 .
B1676	Battery Pack Voltage Out of Range	REM	REFER to Section 414-00 .
B2172	Inertia Switch Input Circuit Open	REM	REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.
B2174	Window Driver Rear Remote Up Switch Short to Battery	REM	REFER to Section 501-11 .
B2178	Window Driver Rear Remote Down Switch Short to Battery	REM	REFER to Section 501-11 .
B2190	Window Passenger Rear Remote Up Switch Short to Battery	REM	REFER to Section 501-11 .
B2194	Window Passenger Rear Remote Down Switch Short to Battery	REM	REFER to Section 501-11 .
B2477	Module Configuration Failure	REM	REFER to Section 418-01 .
U1041	SCP (J1850) Invalid or Missing Data for Vehicle Speed	ABS	CARRY OUT the Anti-lock Brake Control Module (ABS) self-test. REFER to Section 206-09A , Section 206-09B , or Section 206-09C .
U1059	SCP (J1850) Invalid or Missing Data for Transmission/Transaxle/PRNDL	PCM	CARRY OUT the Powertrain Control Module (PCM) self-test. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
U1218	SCP (J1850) Invalid or Missing Data for External Lamps	ICM	CARRY OUT the Instrument Cluster self-test. REFER to Section 413-01 .

REM Parameter Identification (PID) Index

PID	Description	Expected Value

Pinpoint Tests

PINPOINT TEST A: NO COMMUNICATION WITH THE REAR ELECTRONIC MODULE (REM)

CONDITIONS	DETAILS/RESULTS/ACTIONS
A1 CHECK BJB FUSE 425 (40A) FOR POWER	
<p>1</p>  <p>2</p>  <p>BJB Fuse 425 (40A)</p> <p>3</p>  <p>A0003586</p>	<p>3</p> <p>Measure the voltage between BJB Fuse 425 (40A) pin 1, and ground.</p> <ul style="list-style-type: none"> ● Is the voltage greater than 10 volts? <p>→ Yes GO to A2.</p> <p>→ No REPAIR the power supply to BJB Fuse 425 (40A). TEST the system for normal operation.</p>
A2 CHECK CIRCUIT 30-DD1 (RD/YE) FOR AN OPEN	

1

CJB Mini Fuse 207 (5A)

2

A0003615

2

Measure the resistance between BJB Fuse 425 (40A) pin 2, circuit 30-DD1 (RD/YE), and CJB Mini Fuse 207 (5A) pin 1, circuit 30-DD1 (RD/YE).

● Is the resistance less than 5 ohms?

→ Yes

REFER to [Section 418-00](#). TEST the system for normal operation.

→ No

REPAIR the circuit. TEST the system for normal operation.

PINPOINT TEST B: THE ROOF OPENING PANEL LEAKS

CONDITIONS	DETAILS/RESULTS/ACTIONS
B1 CHECK THE ROOF OPENING PANEL OPERATION	
	<p>1 Cycle the roof opening glass from the full-open position to the full-closed position.</p> <p>● Does the roof opening glass operate smoothly and close tightly?</p> <p>→ Yes GO to B2.</p> <p>→ No</p>

	CHECK the roof opening glass adjustment. REFER to Height Adjustment . If the roof opening glass closes unevenly, CHECK the roof opening panel timing. REFER to Timing Adjustment . TEST the system for normal operation.
B2 CHECK THE ROOF OPENING PANEL FRAME DRAIN TUBES	
	<p>1 Gain access to the roof opening panel frame drain tubes.</p> <ul style="list-style-type: none"> ● Is there blockage or damage to the roof opening panel frame drain tubes? <p>→ Yes CLEAR the blockage or if necessary, INSTALL a new drain tube. TEST the system for normal operation.</p> <p>→ No GO to B3 .</p>
B3 CHECK THE ROOF OPENING GLASS SEAL	
	<p>1 Actuate the roof opening glass to the full-open position.</p> <ul style="list-style-type: none"> ● Is the roof opening glass seal damaged? <p>→ Yes INSTALL a new roof opening glass seal. REFER to Glass—Roof Opening Assembly . TEST the system for normal operation.</p> <p>→ No REPAIR as necessary. TEST the system for normal operation.</p>

PINPOINT TEST C: THE ROOF OPENING PANEL IS NOISY DURING OPERATION

CONDITIONS	DETAILS/RESULTS/ACTIONS
C1 CHECK THE OPERATION OF THE ROOF OPENING GLASS	
	<p>1 Cycle the roof opening glass from the full-open to the full-closed position.</p> <ul style="list-style-type: none"> ● Is the roof opening glass loose? <p>→ Yes ADJUST the roof opening glass. REFER to Height Adjustment . TEST the system for normal operation.</p> <p>→ No GO to C2 .</p>
C2 CHECK FOR OBSTRUCTIONS	
	<p>1 Check the roof opening panel track and rail assembly for foreign material, damage or looseness.</p> <ul style="list-style-type: none"> ● Is the roof opening panel obstructed or damaged? <p>→ Yes</p>

REMOVE the obstruction. If necessary, INSTALL a new roof opening panel track and rail assembly. REFER to Panel—Roof Opening Assembly. TEST the system for normal operation.

→ **No**
GO to C3.

C3 CHECK THE ROOF OPENING PANEL MOTOR

1 Cycle the roof opening glass from the full-open to the full-closed position.

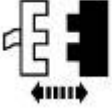

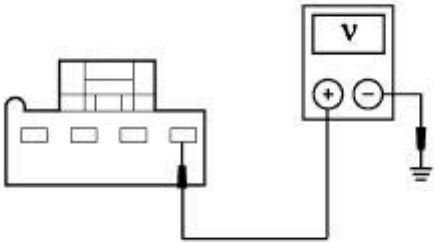

● **Does the roof opening panel motor make excessive noise?**

→ **Yes**
CHECK the roof opening panel motor for the correct mounting. If necessary, INSTALL a new roof opening panel motor assembly. REFER to Motor—Roof Opening Panel Assembly. TEST the system for normal operation.

If the roof opening panel opens or closes unevenly, ADJUST the roof opening panel timing. REFER to Timing Adjustment. TEST the system for normal operation.

→ **No**
CHECK the flushness. REFER to Height Adjustment. ADJUST the roof opening panel glass as necessary. TEST the system for normal operation.

PINPOINT TEST D: THE ROOF OPENING PANEL DOES NOT OPEN OR CLOSE

CONDITIONS	DETAILS/RESULTS/ACTIONS
D1 CHECK THE POWER SUPPLY TO THE ROOF OPENING PANEL CONTROL MODULE	
<p>1</p>  <p>Roof Opening Panel Module C921b</p> <p>2</p>  <p>A0001447</p>	<p>2 Measure the voltage between roof opening panel control module C921b pin 1, circuit 30-AG12 (RD), harness side and ground.</p> <p>● Is the voltage between 9 and 16 volts?</p> <p>→ Yes GO to <u>D4</u>.</p>

→ **No**
GO to D2.

D2 CHECK CIRCUIT 30-AG12 (RD) FOR AN OPEN

1

BJB Fuse 416 (20A)

● **Is BJB Fuse 416 (20A) OK?**

→ **Yes**
REPAIR the circuit. TEST the system for normal operation.

→ **No**
GO to D3.

D3 CHECK CIRCUITS 30-AG12 (RD), 32-AG6 (WH) AND 33-AG6 (YE) FOR A SHORT TO GROUND

1

1 Using the following table, measure the resistance between roof opening panel control module C921b pins, harness side and ground:

Pin	Circuit
1	30-AG12 (RD)
2	33-AG6 (YE)
3	32-AG6 (WH)

● **Are the resistances greater than 10,000 ohms?**

→ **Yes**
INSTALL a new BJB Fuse 416 (20A). TEST the system for normal operation. If BJB Fuse 416 (20A) opens again, INSTALL a new roof opening panel control module. REFER to Module—Roof Opening Panel Control. TEST the system for normal operation.

→ **No**
REPAIR the circuit. TEST the system for normal operation.

D4 CHECK THE ROOF OPENING PANEL CONTROL MODULE GROUND

1

1 Measure the resistance between roof opening panel control module C921b pin 4, circuit 31-AG12 (BK/GN), harness side and ground.

A0001449

● Is the resistance less than 5 ohms?

→ **Yes**
GO to D5.

→ **No**
REPAIR the circuit. TEST the system for normal operation.

D5 CHECK THE REM INPUT TO THE ROOF OPENING PANEL CONTROL MODULE

1

Roof Opening Panel Control Module C921a

2

3

A0001450

3 Measure the resistance between roof opening panel control module C921a pin 5, circuit 5-AG12 (BU/BK), harness side and ground; and between roof opening panel control module C921a pin 6, circuit 4-AG12 (GY/OG), harness side and ground.

● Are the resistances less than 5 ohms?

→ **Yes**
GO to D7.

→ **No**
GO to D6.

D6 CHECK CIRCUIT 5-AG12 (BU/BK) AND 4-AG12 (GY/OG) FOR AN OPEN

1

2

REM C420c

3

3

Measure the resistance between roof opening panel control module C921a pin 5, circuit 5-AG12 (BU/BK), harness side and REM C420c pin 14, circuit 5-AG12 (BU/BK), harness side; and between roof opening panel control module C921a pin 6, circuit 4-AG12 (GY/OG), harness side and REM C420c pin 15, circuit 4-AG12 (GY/OG), harness side.

- Are the resistances less than 5 ohms?

→ Yes

INSTALL a new REM. REFER to [Section 419-10](#). TEST the system for normal operation.

→ No

REPAIR the circuit. TEST the system for normal operation.

D7 CHECK CIRCUIT 5-AG12 (BU/BK) AND 4-AG12 (GY/OG) FOR A SHORT TO GROUND

1

2

REM C420c

3

A0001450

3

Measure the resistance between roof opening panel control module C921a pin 5, circuit 5-AG12 (BU/BK), harness side and ground; and between roof opening panel control module C921a pin 6, circuit 4-AG12 (GY/OG), harness side and ground.

- Are the resistances greater than 10,000 ohms?

→ **Yes**
GO to D8.

→ **No**
REPAIR the circuit. TEST the system for normal operation.

D8 CHECK THE ROOF OPENING PANEL CONTROL MODULE FOR REFERENCE VOLTAGE OUTPUT

1

2

REM C420c

3

Roof Opening Panel Control Module C921a

4

Roof Opening Panel Switch C912

5

6

6 Using the following table, measure the voltage between roof opening panel switch C912 pins, harness side and ground:

Pin	Circuit
4	32-AG12 (WH/GN)
2	32-AG10 (WH/BU)
5	33-AG10 (YE/BU)

- Are the voltages approximately 5 volts?

→ **Yes**

GO to D9.

→ **No**
GO to D10.

D9 CHECK THE ROOF OPENING PANEL SWITCH INPUT

1

Roof Opening Panel Control Module C921a

2

Roof Opening Panel Switch C912

3

A0001453

3 Using the following table, measure the resistance between roof opening panel control module C921a pin 8, circuit 9-AG7 (BN/RD), harness side and roof opening panel control module pins, harness side, while the roof opening panel switch is activated to each position.

Pin	Circuit	Switch Position
4	32-AG10 (WH/BU)	Depress the switch to open (first detent position)
4	32-AG10 (WH/BU)	Depress the switch to express open (second detent position)
7	32-AG12 (WH/GN)	Depress the switch to tilt
7	32-AG12 (WH/GN)	Depress the switch to express open (second detent position)
3	33-AG10 (YE/BU)	Depress the switch to close

- Are the resistances greater than 10,000 ohms with the switch in the resting state and less than 5 ohms when activated?

→ **Yes**
GO to D12.

→ **No**
INSTALL a new roof opening panel switch. REFER to Switch—Roof Opening Panel. TEST the system for normal

operation.

D10 CHECK CIRCUITS 9-AG7 (BN/RD), 32-AG12 (WH/GN), 32-AG10 (WH/BU) AND 33-AG10 (YE/BU) FOR A SHORT TO GROUND

1

1

Using the following table, measure the resistance between roof opening panel control module C921a pins, harness side and ground:

Pin	Circuit
3	33-AG10 (YE/BU)
4	32-AG10 (WH/BU)
7	32-AG12 (WH/GN)
8	9-AG7 (BN/RD)

- Are the resistances greater than 10,000 ohms?

→ **Yes**
GO to D11.

→ **No**
REPAIR the circuit. TEST the system for normal operation.

D11 CHECK CIRCUITS 9-AG7 (BN/RD), 32-AG12 (WH/G), 32-AG10 (WH/BU) AND 33-AG10 (YE/BU) FOR AN OPEN

1

Roof Opening Panel Switch C912

2

2

Using the following table, measure the resistance between roof opening panel control module C921a pins, harness side and the roof opening panel switch C912 pins, harness side:

Roof Opening Panel Control Module C921a Pin	Circuit	Roof Opening Panel Switch C912 Pin
3	33-AG10 (YE/BU)	5
4	32-AG10 (WH/BU)	2
7	32-AG12 (WH/GN)	4
8	9-AG7 (BN/RD)	3

- Are the resistances less than 5 ohms?

→ **Yes**

INSTALL a new roof opening panel switch. REFER to Switch—Roof Opening Panel. TEST the system for normal operation.

→ **No**

REPAIR the circuit. TEST the system for normal operation.

D12 CHECK THE OUTPUT TO THE ROOF OPENING PANEL MOTOR ASSEMBLY

1

Roof Opening Panel Motor Assembly C920

2

Roof Opening Panel Control Module C921a

3

4

A0001456

4

Measure the voltage between roof opening panel motor assembly C920 pin 1, circuit 32-AG6 (WH), harness side and roof opening panel motor assembly C920 pin 2, circuit 33-AG6 (YE), harness side.

5

Depress the roof opening panel switch to the open position; then the closed position.

- Is the voltage greater than 9 volts in both directions?

→ **Yes**

GO to D14.

→ **No**

GO to D13.

D13 CHECK CIRCUIT 32-AG6 (WH) AND 33-AG6 (YE) FOR AN OPEN

1

2

Roof Opening Panel Control Module C921b

3

3

Measure the resistance between roof opening panel control module C921b pin 3, circuit 32-AG6 (WH), harness side and roof opening panel motor assembly C920 pin 1, circuit 32-AG6 (WH), harness side; and between roof opening panel control module C921b pin 2, circuit 33-AG6 (YE), harness side and roof opening panel motor assembly C920 pin 2, circuit 33-AG6 (YE), harness side.

- Are the resistances less than 5 ohms?

→ Yes

INSTALL a new roof opening panel control module. REFER to [Module—Roof Opening Panel Control](#). TEST the system for normal operation.

→ No

REPAIR the circuit. TEST the system for normal operation.

D14 CHECK THE ROOF OPENING PANEL MOTOR ASSEMBLY

1

3

Roof Opening Panel Motor Assembly C920

4

2

Remove the roof opening panel motor assembly. For additional information, refer to [Motor—Roof Opening Panel Assembly](#).

5

Firmly hold the roof opening panel motor

	<p>making sure not to make contact with the motor gear.</p> <p>6 Depress the roof opening panel switch to the open position.</p> <ul style="list-style-type: none"> ● Does the roof opening panel motor operate? <p>→ Yes CHECK the roof opening panel for obstructions. If no obstructions are found, Install a new roof opening panel assembly. REFER to <u>Panel—Roof Opening Assembly</u>. TEST the system for normal operation.</p> <p>→ No INSTALL a new roof opening panel motor assembly. REFER to <u>Motor—Roof Opening Panel Assembly</u>. TEST the system for normal operation.</p>
--	---

PINPOINT TEST E: THE ROOF OPENING PANEL DOES NOT OPEN OR CLOSE IN VENT POSITION

CONDITIONS	DETAILS/RESULTS/ACTIONS
E1 CHECK THE ROOF OPENING PANEL OPEN/CLOSE OPERATION	
<p>1</p> 	<p>2 Depress the roof opening panel switch rearward and then forward.</p> <ul style="list-style-type: none"> ● Did the roof opening panel open and close? <p>→ Yes GO to <u>E2</u>.</p> <p>→ No GO to <u>Pinpoint Test D</u>.</p>
E2 CHECK THE ROOF OPENING PANEL VENT UP OPERATION	
<p>1</p> 	<p>2 Make sure the roof opening panel is in the flush position.</p> <p>3 Depress the roof opening panel switch</p>

up to the vent position.

- **Did the roof opening panel vent up?**

→ **Yes**

VERIFY the symptom. Circuit 33-AG10 (YE/BU) is used for close and vent down operation. If the roof opening panel is still inoperative in the vent down position, CHECK for loose connections, a binding roof opening panel track, a sticking switch or intermittent operation of the roof opening panel control module.

→ **No**

GO to E3.

E3 CHECK THE ROOF OPENING PANEL EXPRESS OPERATION

1 Depress the roof opening panel switch rearward to the second detent position and release.

- **Did the roof opening panel express operation work correctly?**

→ **Yes**

INSTALL a new roof opening panel switch. REFER to Switch—Roof Opening Panel. TEST the system for normal operation.

→ **No**

GO to E4.

E4 CHECK FOR REFERENCE VOLTAGE TO THE ROOF OPENING PANEL SWITCH

1

2

Roof Opening Panel Switch C912

3

4

4 Measure the voltage between roof opening panel switch C912 pin 4, circuit 32-AG12 (WH/GN), harness side and ground.

A0001458

● Is the voltage approximately 5 volts?

→ **Yes**
GO to E7.

→ **No**
GO to E5.

E5 CHECK CIRCUIT 32-AG12 (WH/GN) FOR AN OPEN

1

2

Roof Opening Panel Module C921a

3

A0001459

3 Measure the resistance between roof opening panel control module C921a pin 7, circuit 32-AG12 (WH/GN), harness side and roof opening panel switch C912 pin 4, circuit 32-AG12 (WH/GN), harness side.

● Is the resistance less than 5 ohms?

→ **Yes**
GO to E6.

→ **No**
REPAIR the circuit. TEST the system for normal operation.

E6 CHECK CIRCUIT 32-AG12 (WH/GN) FOR A SHORT TO GROUND

1

1 Measure the resistance between roof opening panel control module C921a pin

A0001460

7, circuit 32-AG12 (WH/GN), harness side and ground.

- Is the resistance greater than 10,000 ohms?

→ **Yes**
 INSTALL a new roof opening panel control module. REFER to Module—Roof Opening Panel Control. TEST the system for normal operation.

→ **No**
 REPAIR the circuit. TEST the system for normal operation.

E7 CHECK THE INPUT TO THE ROOF OPENING PANEL CONTROL MODULE

1

Roof Opening Panel Switch C912

2

Roof Opening Panel Control Module C921a

3

A0001461

3 Measure the resistance between roof opening panel control module C921a pin 7, circuit 32-AG12 (WH/GN), harness side and roof opening panel control module C921a pin 8, circuit 9-AG7 (BU/RD), harness side.

4 Depress the roof opening panel switch to the VENT position.

- Is the resistance less than 5 ohms?

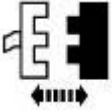

→ **Yes**
 INSTALL a new roof opening panel control module. REFER to Module—Roof

	<p><u>Opening Panel Control</u> . TEST the system for normal operation.</p> <p>→ No INSTALL a new roof opening panel switch. REFER to <u>Switch—Roof Opening Panel</u> . TEST the system for normal operation.</p>
--	--

PINPOINT TEST F: THE ROOF OPENING PANEL DOES NOT STOP IN FLUSH FROM ANY POSITION

CONDITIONS	DETAILS/RESULTS/ACTIONS
F1 CHECK THE ROOF OPENING GLASS ADJUSTMENT	
	<p>1 Check the roof opening glass adjustment. Refer to <u>Height Adjustment</u> .</p> <p style="text-align: center;">● Is the roof opening glass adjusted correctly?</p> <p>→ Yes GO to <u>F2</u> .</p> <p>→ No ADJUST the roof opening glass as necessary. TEST the system for normal operation.</p>
F2 CHECK THE ROOF OPENING GLASS SEAL	
	<p>1 Inspect the roof opening glass seal for looseness, damage and correct installation.</p> <p style="text-align: center;">● Is the roof opening glass seal OK and installed correctly?</p> <p>→ Yes GO to <u>F3</u> .</p> <p>→ No REPAIR or INSTALL a new roof opening glass seal as necessary. REFER to <u>Glass—Roof Opening Assembly</u> . TEST the system for normal operation.</p>
F3 CHECK FOR OBSTRUCTION IN THE ROOF OPENING PANEL	
	<p>1 Inspect the roof opening panel assembly for obstructions in the track.</p> <p style="text-align: center;">● Are any obstructions found?</p> <p>→ Yes REMOVE the obstruction. If necessary, INSTALL a new roof opening panel track and rail assembly. REFER to <u>Panel—Roof Opening Assembly</u> . TEST the system for normal operation.</p> <p>→ No INSTALL a new roof opening panel control module. REFER to <u>Module—Roof Opening Panel Control</u> . TEST the system for normal operation.</p>

PINPOINT TEST G: THE EXPRESS OPEN IS INOPERATIVE

CONDITIONS	DETAILS/RESULTS/ACTIONS
G1 CHECK THE ROOF OPENING PANEL OPEN/CLOSE OPERATION	
<p>1</p> 	<p>2 Depress the roof opening panel switch rearward and then forward.</p> <ul style="list-style-type: none"> ● Did the roof opening panel open and close? <p>→ Yes GO to <u>G2</u>.</p> <p>→ No GO to <u>Pinpoint Test D</u>.</p>
G2 CHECK THE ROOF OPENING PANEL VENT UP OPERATION	
<p>1</p> 	<p>2 Make sure the roof opening panel is in the flush position.</p> <p>3 Depress the roof opening panel switch up to the vent position.</p> <ul style="list-style-type: none"> ● Did the roof opening panel vent up? <p>→ Yes GO to <u>G7</u>.</p> <p>→ No GO to <u>G3</u>.</p>
G3 CHECK FOR REFERENCE VOLTAGE TO THE ROOF OPENING PANEL SWITCH	
<p>1</p>  <p>2</p>  <p>Roof Opening Panel Switch C912</p> <p>3</p>	

4

A0001458

4

Measure the voltage between roof opening panel switch C912 pin 4, circuit 32-AG12 (WH/GN), harness side and ground.

● Is the voltage approximately 5 volts?

→ Yes
GO to G6.

G4 CHECK CIRCUIT 32-AG12 (WH/GN) FOR AN OPEN

1

2

Roof Opening Panel Module C921a

3

A0001459

3

Measure the resistance between roof opening panel control module C921a pin 7, circuit 32-AG12 (WH/GN), harness side and roof opening panel switch C912 pin 4, circuit 32-AG12 (WH/GN), harness side.

● Is the resistance less than 5 ohms?

→ Yes
GO to G5.

→ No
REPAIR the circuit. TEST the system for

normal operation.

G5 CHECK CIRCUIT 32-AG12 (WH/GN) FOR A SHORT TO GROUND

1

A0001460

1

Measure the resistance between roof opening panel control module C921a pin 7, circuit 32-AG12 (WH/GN), harness side and ground.

- Is the resistance greater than 10,000 ohms?

→ **Yes**
INSTALL a new roof opening panel control module. REFER to Module—Roof Opening Panel Control . TEST the system for normal operation.

→ **No**
REPAIR the circuit. TEST the system for normal operation.

G6 CHECK THE INPUT TO THE ROOF OPENING PANEL CONTROL MODULE

1

Roof Opening Panel Switch C912

2

Roof Opening Panel Control Module C921a

3

A0001461

3

Measure the resistance between roof opening panel control module C921a pin 7, circuit 32-AG12 (WH/GN), harness side and roof opening panel control module C921a pin 8, circuit 9-AG7 (BU/RD), harness side.

4 Depress the roof opening panel switch to the vent position.

- Is the resistance less than 5 ohms?

→ **Yes**
INSTALL a new roof opening panel control module. REFER to Module—Roof Opening Panel Control . TEST the system for normal operation.

→ **No**
INSTALL a new roof opening panel switch. REFER to Switch—Roof Opening Panel . TEST the system for normal operation.

G7 CHECK FOR AN INTERMITTENT OPEN SIGNAL

1

2

Roof Opening Panel Control Module C921a

3

A0001462

3 Measure the resistance between roof opening panel control module C921a pin 4, circuit 32-AG10 (WH/BU), harness side and roof opening panel control module C921a pin 8, circuit 9-AG7 (BU/RD), harness side.

4 Monitor the resistance as the roof opening panel is moved to the open (first detent) position, then express open (second detent) position.

- **Is the resistance continuously less than 5 ohms through the open position to the express open position?**

→ **Yes**
GO to G8 .

→ **No**
INSTALL a new roof opening panel switch. REFER to Switch—Roof Opening Panel . TEST the system for normal operation.

G8 CHECK FOR AN INTERMITTENT EXPRESS OPEN SIGNAL

1

1 Measure the resistance between roof opening panel control module C921a pin

A0001461

7, circuit 32-AG12 (WH/GN), harness side and roof opening panel control module C921a pin 8, circuit 9-AG7 (BU/RD), harness side.

2 Monitor the resistance as the roof opening panel is moved to the open (first detent) position, then express open (second detent) position.

- Is the resistance greater than 10,000 ohms in the open position and continuously less than 5 ohms in the express open position?

→ **Yes**
 INSTALL a new roof opening panel control module. REFER to Module—Roof Opening Panel Control. TEST the system for normal operation.

→ **No**
 INSTALL a new roof opening panel switch. REFER to Switch—Roof Opening Panel. TEST the system for normal operation.

PINPOINT TEST H: THE ROOF OPENING PANEL HAS EXCESSIVE WIND NOISE

CONDITIONS	DETAILS/RESULTS/ACTIONS
H1 CHECK THE ROOF OPENING GLASS FIT	
	<p>1 Cycle the roof opening glass from the full-open to the full-closed position.</p> <p>2 Inspect the roof opening glass seal for correct fit or damage.</p> <ul style="list-style-type: none"> ● Is the roof opening glass seal OK? <p>→ Yes GO to <u>H2</u>.</p> <p>→ No INSTALL a new roof opening glass seal. REFER to <u>Glass—Roof Opening Assembly</u>. TEST the system for normal operation.</p>
H2 CHECK THE ROOF OPENING GLASS OPERATION	
	<p>1 Cycle the roof opening glass from the full-open to the full-closed position.</p>

- **Does the roof opening glass travel to the full-open and the full-closed position?**

→ **Yes**

ADJUST the roof opening glass. REFER to Height Adjustment . If the roof opening glass closes unevenly, CHECK the roof opening panel timing. REFER to Timing Adjustment . TEST the system for normal operation.

→ **No**

CHECK the roof opening glass seal. If necessary, INSTALL a new roof opening glass seal. REFER to Glass—Roof Opening Assembly . TEST the system for normal operation.

Height Adjustment

1. Operate the roof opening glass assembly to the closed position.
2. Swing the left sight shield and right sight shield rearward and loosen the screws on each side.

3. Adjust the front glass edge to between flush and 1.7 - 2.7 mm (0.07 - 0.11 in) low.

4. Adjust the rear glass edge to between flush and 0.7 - 1.7 mm (0.02 - 0.07 in) low.

5. **NOTE:** Make sure to carefully align the sight shield to the snap retainer prior to positioning into place.

Tighten the four screws and swing the left and right sight shields forward and snap into place.

Timing Adjustment

1. Remove the roof opening panel assembly. For additional information, refer to [Panel—Roof Opening Assembly](#) in this section.
2. Remove the roof opening glass assembly.
 1. Swing the left and right sight shields rearward.
 2. Remove the screws on each side.
 3. From the exterior of the vehicle, lift the roof opening glass assembly from the vehicle.

3. Disconnect the connectors.

4. Remove screws and the roof opening panel motor assembly.

5. Remove the screw and the roof opening panel control module.

6. **NOTE:** It may be necessary to slightly separate the rail assembly to visually see the two alignment holes.

Align the holes in the mechanism on each side.

7. Make sure the flush locating pin is centered in the slot on each side.

8. **NOTE:** The alignment pins must remain in place until the roof opening panel control module is installed.

NOTE: A number 33 drill bit may be used as an alignment pin.

Install an alignment pin in the alignment hole in each side of the mechanism.

- The alignment pin should be approximately 2.83 mm (0.11 in) in diameter

9. Position the roof opening panel motor assembly on the roof opening panel control module.

10.  **CAUTION: Do not snug or overtighten the roof opening panel mounting screws. Damage to the roof opening panel control module may result.**

Install the screws approximately two to three turns.

11. Remove the harness from the roof opening panel assembly.

12. Position the headlining panel against the right rear quarter panel.

- The rear of the headliner should be towards the right rear door opening and the cloth side towards the vehicle.

13. Connect the headlining panel body harness connector at the right rear C-pillar.

14. Connect the roof opening panel harness between the module motor assembly and the roof opening panel switch.

15. **NOTE:** Make sure the battery is fully charged.

Turn the ignition switch to RUN.

16. Firmly hold the roof opening panel control module and roof opening panel motor together.

17. Operate the roof opening panel switch rearward (OPEN position) until the motor stops.
18. Operate the roof opening panel switch forward (CLOSE position) until the motor stops.
19. Disconnect the front body harness connector.

20. **NOTE:** Make sure the roof opening panel control module gear position is not altered.

Remove the screws.

21. Make sure the alignment hole is visible in the view hole.

22. **NOTE:** Make sure the roof opening panel control module gear position is not altered.

Install the roof opening panel control module on the cable sleeves.

- Make sure the shoulder of each cable sleeve is correctly seated in the roof opening panel control module.

23. Make sure the roof opening panel control module is seated flush to the bracket and install the screw.

24. **NOTE:** Make sure the roof opening panel motor is correctly aligned and inserted into the control module. The roof opening panel motor should be sitting flush with the frame before installing the bolts.

Position the roof opening panel motor assembly and install the screws.

25. Connect the connectors.

26. Install the roof opening panel harness tie down and clip into place.

27. Remove the alignment pins from each side.

28. Install the roof opening glass assembly.

1. Install the roof opening glass assembly in place aligning screw holes.
2. Install the screws on each side.
3. **NOTE:** Make sure to carefully align the sight shield to the snap retainer prior to positioning into place.

Swing the left and right sight shields forward and snap into place.

29. Position the roof opening panel assembly near the headliner and connect the roof opening panel harness to the headliner harness.

30. **NOTE:** Make sure the battery is fully charged.

Operate the roof opening panel to the full open and full close position. Make sure both sides activate at the same time and the roof opening panel operates smoothly without jerking or binding. Make sure both sides reach flush at the same time.

31. Install the roof opening panel assembly. For additional information, refer to [Panel—Roof Opening Assembly](#) in this section.

32. Adjust the roof opening glass height. For additional information, refer to [Height Adjustment](#) in this section.

Panel —Roof Opening Assembly

Removal

1. Remove the headliner. For additional information, refer to [Section 501-05](#).
2. Remove the roof opening panel assembly.
 1. Disconnect the drain tubes.
 2. Remove the bolts.
 3. **NOTE:** Support the roof opening panel assembly to prevent the unit from dropping.

Remove the bolts.

Installation

NOTE: The roof opening panel is available as an assembly or a track and rail assembly. The track and rail assembly must have the roof opening glass and the roof opening panel opening shield transferred from the old unit. The roof opening panel assembly can be installed without transferring parts from the old unit.

1. If necessary, transfer the roof opening glass assembly and the roof opening panel opening shield to the new roof opening panel assembly.
2. Install and support the roof opening panel assembly in the vehicle.
 - Make sure the alignment pins are correctly seated on each side.

3. Install the roof opening panel assembly bolts.

4. Connect the drain tubes.

5. Install the headliner. For additional information, refer to [Section 501-05](#).
 6. Adjust the roof opening glass height. For additional information, refer to [Height Adjustment](#).
-

Glass —Roof Opening Assembly

Removal

1. Operate the roof opening glass assembly to the closed position.
2. Remove the roof opening glass assembly.
 1. Swing the left and right sight shields rearward.
 2. Remove the four screws.
 3. From the exterior of the vehicle, lift the roof opening glass assembly from the vehicle.

3. Remove the roof opening glass seal.

Installation

1. Install the roof opening glass seal.
 - Position the roof opening glass seal seam in the center of the passenger side of the roof opening glass.

2. Install the roof opening glass assembly.
 1. Install the roof opening glass assembly in place aligning screw holes.
 2. Install the four screws.
 3. **NOTE:** Make sure to carefully align the sight shield to the snap retainer prior to positioning into place.

Swing the left and right sight shields forward and snap into place.

3. Adjust the roof opening glass height. For additional information, refer to [Height Adjustment](#).
-

Opening Shield —Roof Opening Panel

Removal

1. Remove the roof opening glass assembly. For additional information, refer to [Glass—Roof Opening Assembly](#).
2. Remove the water trough.
 1. Remove the two screws.
 2. Remove the water trough.

3. Pull the roof opening panel opening shield forward, lifting up slightly at the front openings until the front and rear tabs are disengaged from the track.

Installation

1. Insert the rear tabs into the track and slide the roof opening panel opening shield rearward until the front tabs insert into the track.

2. Install the water trough under the tab on each side.

3. Position the water trough and install the two screws.

4. Install the roof opening glass assembly. For additional information, refer to [Glass—Roof Opening Assembly](#).
-

Motor —Roof Opening Panel Assembly

Removal and Installation

 **CAUTION:** Make sure the roof opening glass assembly is not moved during motor removal or installation. The roof opening panel assembly timing may be affected and cause the roof opening panel assembly to bind or be damaged.

1. Remove the headliner. For additional information, refer to [Section 501-05](#).
2. Remove the roof opening panel motor assembly.
 1. Disconnect the electrical connector.
 2. Remove the tie strap.
 3. Remove the bolts.

3. **NOTE:** If the roof opening glass assembly was moved while the roof opening panel motor was removed, the timing must be reset. Refer to [Timing Adjustment](#).

To install, reverse the removal procedure.

Trough Assembly

Removal

1. Remove the roof opening glass assembly. For additional information, refer to [Glass—Roof Opening Assembly](#).
2. Remove the water trough (5454022).
 1. Remove the two screws.
 2. Remove the water trough.

Installation

1. Install the water trough under the tab on each side.

2. Position the water trough and install the two screws.

3. Install the roof opening glass assembly. For additional information, refer to [Glass—Roof](#)

Opening Assembly.

Air Deflector

Removal and Installation

1. Move the roof opening glass assembly fully rearward.
2. Remove the two air deflector screws.

3. Move the air deflector to the complete vertical position.

4. Slide the air deflector rearward to unhook from the frame.

5. To install, reverse the removal procedure.

Switch —Roof Opening Panel

Removal and Installation

1. Position the dome/map lamp assembly aside.
2. Disconnect the electrical connector, remove the screws and the roof opening panel switch.

3. To install, reverse the removal procedure.
-

Module —Roof Opening Panel Control

Removal

1. **NOTE:** Make sure the roof opening glass assembly is in the closed position.

Remove the roof opening panel assembly. For additional information, refer to [Panel—Roof Opening Assembly](#).

2. Remove the bolts and position the roof opening panel motor assembly aside.

3. Remove the roof opening panel control module.
 1. Disconnect the electrical connectors.
 2. Remove the screw.
 3. Remove the roof opening panel control module.

Installation

1. **NOTE:** Before a new roof opening panel control module can be installed, the roof opening panel and control module must be timed. The timing procedure will install the roof opening panel control module once the unit is timed.

Carry out the roof opening panel assembly timing. Refer to [Timing Adjustment](#).

Torque Specifications

Description	Nm	lb-ft	lb-in
Front bumper cover bracket bolts	7	—	62
Rear bumper cover nuts	7	—	62
Rear bumper cover bolts	7	—	62
Front bumper bolts (8mm)	25	18	—
Rear bumper bolts	23	17	—
Exhaust hanger bracket bolt	30	22	—
Front bumper bolts (6mm)	10	—	89

Bumpers

The bumper system consists of the following components:

- Front bumper cover (17D957)
 - Front bumper cover trim
 - Front bumper (17750)
 - Front bumper isolator (17E898)
 - Rear bumper cover (17K835)
 - Rear bumper cover trim
 - Rear bumper (17775)
 - Rear bumper isolator (17E899)
-

Bumper Cover —Front

Removal and Installation

1. Remove the screws.

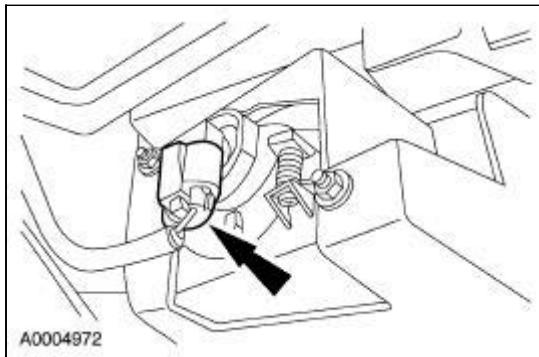

2. Remove the two screws from the inner fender splash shields.

3. Remove the six screws from inner fender splash shields.

4. Disconnect the two fog lamp electrical connectors.

5. Disconnect the two side marker lamp electrical connectors.
6. Remove the four front bumper cover bracket bolts from the fenders.

7. Release the ambient air temperature sensor.

8. Remove the radiator grille opening cover at the top shelf of the bumper.

9. Remove the front bumper cover by pulling the center tabs downward and the outboard tabs on each side outward.

Item	Description
1	Grille opening panel reinforcement
2	Bumper cover
3	Fender

10. To install, reverse the removal procedure.

Bumper Cover —Rear

Removal and Installation

RH and LH Side

1. Remove the screws.

2. Remove the four inner fender screws.

RH Side Only

3. Remove the rear bumper cover bolt and the nut located in the wheelwell area.

LH Side Only

4. Remove the rear bumper cover bolt.

RH and LH Side

5. Remove the luggage compartment scuff plate.

6. Remove the luggage compartment back and side panel trim.
7. From the luggage compartment, remove the rear bumper cover nuts.

8. From the luggage compartment, remove the 10 rear bumper cover nuts (five each side).
 9. Remove the rear bumper cover.
 10. To install, reverse the removal procedure.
-

Bumper Cover —Trim, Front

Removal and Installation

1. Remove the front bumper cover. For additional information, refer to [Bumper Cover—Front](#).
2. Remove the retaining clips and the poly foam.

3. Remove the retaining clips and the trim.

4. To install, reverse the removal procedure.
-

Bumper Cover —Trim, Rear

Removal and Installation

1. Remove the rear bumper cover. For additional information, refer to [Bumper Cover—Rear](#) .
2. Remove the retaining clips and the poly foam.

3. Remove the retaining clips and the trim.

4. To install, reverse the removal procedure.
-

Bumper —Front

Removal

1. Remove the front bumper cover. For additional information, refer to [Bumper Cover—Front](#) in this section.
2. Disconnect the horn electrical connector.
3. Remove the front bumper.
 1. Drill out the six spot welds.
 2. Remove the eight bolts.

Installation

1. **NOTE:** Transfer the horns if required.
NOTE: Spot welding the bumper is not required.
To install, reverse the removal procedure.

Bumper —Rear

Removal and Installation

1. Remove the rear bumper cover. For additional information, refer to [Bumper Cover—Rear](#) .
2. Remove the exhaust hanger bracket.
 1. Remove the bolt.
 2. Remove the bracket.

3. Remove the bolts and the rear bumper.

4. To install, reverse the removal procedure.

Safety Belt System

 **WARNING:** All safety belt assemblies including retractors, buckles, front seat belt buckle support assemblies (slide bar), if equipped, shoulder belt height adjusters, if equipped, child safety seat tether bracket assemblies, if equipped, and attaching hardware should be inspected after any collision. All belt assemblies should be installed new unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected. New safety belt assemblies should be installed if either damage or incorrect operation is noted.

 **WARNING:** Each seating position in the vehicle has a specific safety belt assembly which consists of one buckle and one tongue. The safety belt assembly is designed to be used as a pair and is not to be used across seating positions.

The active restraint system consists of:

- the front safety belt retractors with pretensioners secured to the body under the B-pillar lower trim panel.
- the rear LH and RH safety belt retractors secured to the body behind the quarter trim panels.
- the rear center safety belt retractor secured to the body under the package tray trim panel.
- the front inboard buckle end secured to the front seat assembly.
- the rear LH, RH, and center buckle ends secured to the rear floor pan under the rear seat cushion.
- the safety belt shoulder height adjuster, attached at the B-pillar under the trim panel.
- the child safety seat tether anchors attached to the package tray under the trim panel.
- the child safety seat LATCH system, attached to the floor pan under the second row seating.

A continuous-loop, single retractor active restraint system is used on both the front and rear seat safety belt assemblies.

Pretensioner System

The front safety belt and retractor assembly uses a pretensioner system which works in conjunction with the front air bag system mounted in the steering wheel and instrument panel. When the front air bag system is deployed, the pretensioner in the retractor deploys, causing the retractor spool to rotate. The rotating spool action removes excess webbing from the safety belt assembly, tightening the webbing around the occupant.

New driver and front passenger seat belt system (including belt and retractor assembly, buckles, and height adjusters) must be installed if the vehicle is involved in a collision that results in deployment of the front air bags and safety belt pretensioners.

For diagnostic information, refer to [Section 501-20B](#).

For pretensioner retractor disposal information, refer to [Section 501-20B](#).

Safety Belt, Lap/Shoulder

While the vehicle is in motion, the combination lap and shoulder belt adjusts to the occupant's movement. However, if the vehicle is braked hard, cornered hard or if the vehicle receives an impact of 8 km/h (5 mph) or more, the lap and shoulder belt locks and helps reduce the occupant's forward movement.

Safety Belt, Buckle End—Front

The inboard front safety belt buckle end and outboard anchor is secured to the front seat. This allows the front safety belt buckle end and outboard anchor to move with the front seat.

Safety Belt, Lap/Shoulder—Dual Locking Mode

WARNING: Rear-facing infant seats should never be placed in the front seats.

The dual locking mode retractor on the shoulder belt portion of the combination lap/shoulder safety belt for the front seat passenger and rear seat passengers operates in two ways:

1. In the vehicle-sensitive (emergency locking) mode, the shoulder belt retractor will allow the occupant freedom of movement, locking tight only on hard braking, hard cornering or impacts of approximately 8 km/h (5 mph) or more. The front and rear outboard safety belt retractors can also be made to lock by pulling/jerking on the belt.
2. In the automatic locking mode, the shoulder belt retractor will be automatically locked and remain locked when the combination lap/shoulder safety belt is buckled and does not allow the occupant freedom of movement. This mode provides tight lap/shoulder belt fit on the occupant and on a child safety seat or infant carrier installation restraint.

When the combination lap/shoulder belt is unbuckled and allowed to retract completely, the retractor will switch to the vehicle sensitive (emergency locking) mode.

The automatic locking mode must be used when installing a child safety seat.

Child Safety Seat Tether Anchors

Child safety seat tether anchors, located in the package tray, have been provided at all three rear seating positions. If a child safety seat was in use during a collision, inspect the tether anchor and all surrounding sheet metal for damage. Install a new tether anchor if necessary. Rework the sheet metal to its original condition and structural integrity. For additional information, refer to [Child Safety Seat Tether Anchor](#).

Attaching Safety Seats With Tether Straps

Some manufacturers make child safety seats that include a tether strap that goes over the back of the vehicle seat and attaches to an anchoring point. Other manufacturers offer the tether strap as an accessory. Contact the manufacturer of the child safety seat for information about ordering a tether strap.

Lower Anchors and Tethers for CHildren (LATCH)

The Lower Anchors and Tethers for CHildren (LATCH) system is a standardized and uniform attachment system for installing child safety seats in passenger vehicles. LATCH-equipped child safety seats have two lower attachments that connect to the vehicle portion of the LATCH system.

The vehicle portion of the system consists of two brackets, with two attachment points (6 mm wires) welded to each bracket. The attachment points protrude from the biteline between the seat cushion and seat backrest of the second row seating.

If a child safety seat was in use during a collision, inspect the vehicle portion of the system for damage. If any of the attachment points (6 mm wires) are damaged, install a new LATCH bracket.

Safety Belt Warning System

The safety belt warning indicator illuminates and a chime sounds to remind the occupants to fasten their safety belts.

The conditions of operation for the safety belt warning indicator and chime are as follows:

- If the driver safety belt is not buckled before the ignition switch is turned to RUN, then the safety belt warning indicator illuminates for one to two minutes and the warning chime sounds for four to eight seconds.
- If the driver safety belt is buckled while the warning indicator is illuminated and the reminder chime is sounding, then the safety belt warning indicator and reminder chime turn off.
- If the driver safety belt is buckled before the ignition switch is turned to RUN, then the safety belt warning indicator and reminder chime remain off.

Belt Minder

The Belt Minder feature is a supplemental warning to the safety belt warning function. This feature provides additional reminders to the driver that the driver's safety belt is unbuckled by intermittently sounding a chime and illuminating the safety belt warning lamp in the instrument cluster.

To activate or deactivate the Belt Minder feature, refer to [Section 413-09](#).

If...	Then...
The driver's safety belt is not buckled before the vehicle has reached at least 5 km/h (3 mph) and 1-2 minutes have elapsed since the ignition switch has been turned to ON...	The Belt Minder feature is activated — the safety belt warning light illuminates and the warning chime sounds for 6 seconds every 30 seconds, repeating for approximately 5 minutes or until the safety belt is buckled.
The driver's safety belt is buckled while the safety belt indicator light is illuminated and the safety belt warning chime is sounding...	The Belt Minder feature will not activate.
The driver's safety belt is buckled before the ignition switch is turned to the ON position...	The Belt Minder feature will not activate.

Safety Belt System

Inspection and Verification

1. Verify the customer's original concern by operating the active restraint system to duplicate the condition.
2. Inspect to determine if any of the following mechanical or electrical concerns apply:

Visual Inspection Chart

Mechanical	Electrical
<ul style="list-style-type: none"> ● Inspect the safety belt webbing for integrity. 	<ul style="list-style-type: none"> ● Open fuse. ● Bare, broken or disconnected wire. ● Connector not tightly engaged. ● Safety belt warning indicator lamp burned out or broken.

3. If the inspection reveals an obvious concern(s) that can be readily identified, repair the concern (s) as necessary.
4. If the concern remains after the inspection, determine the symptom. GO to [Symptom Chart](#).

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
<ul style="list-style-type: none"> ● The safety belt warning chime does not operate, the safety belt warning indicator lamp is OK 	<ul style="list-style-type: none"> ● Virtual image cluster (VIC). ● Circuitry. ● Driver seat module (DSM). 	<ul style="list-style-type: none"> ● REFER to Section 413-09.
<ul style="list-style-type: none"> ● The safety belt warning indicator lamp does not operate, the safety belt warning chime is OK 	<ul style="list-style-type: none"> ● Burned-out bulb. ● Circuitry. ● DSM. 	<ul style="list-style-type: none"> ● REFER to Section 413-01.
<ul style="list-style-type: none"> ● Neither the safety belt warning chime nor the safety belt warning indicator lamp operates 	<ul style="list-style-type: none"> ● Safety belt switch. ● DSM. ● Circuitry. 	<ul style="list-style-type: none"> ● REFER to Section 413-01.

slack in webbing does not retract	belt retractor and tongue.	new safety belt retractor and tongue, if necessary.
<ul style="list-style-type: none"> ● Front safety belt and retractor does not function and a supplemental restraint system (SRS) fault code is present 	<ul style="list-style-type: none"> ● Pretensioner deployment. 	<ul style="list-style-type: none"> ● INSTALL a new driver and passenger safety belt system (including safety belt and retractor assembly, buckles, and height adjusters).

Component Test

Functional Test

1. **NOTE:** If the RH or the rear safety belts are to be tested, a passenger must be used.

Fasten the safety belts and proceed to a safe area.

2. Attain a speed of 8 km/h (5 mph).

3.  **WARNING: The driver and passenger must be prepared to brace themselves if the retractor does not lock.**

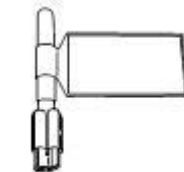

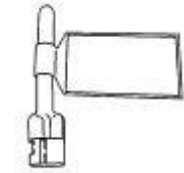

Test the safety belts.

1. Grasp the shoulder harness and prepare to lean forward.
 2. Make maximum brake application without a skid.
 3. **NOTE:** Do not jerk on the safety belt webbing when carrying out this test. Lean forward slightly when the brake application is made.
4. The safety belts should lock up with minimum webbing extension.
 5. If there is a lockup of both shoulder straps, the safety belt assemblies are functioning correctly. Should either or both retractors fail to lock up at the 8 km/h (5 mph) speed, repeat the test at a constant 24 km/h (15 mph) speed. (This test must be carried out with a RH front or rear passenger if the RH front or rear outboard safety belts are to be tested).
 6. **NOTE:** If either or both the shoulder belts do not lock up, the sheet metal in the retractor's mounting surface may need to be returned to its original shape and structural integrity.

If either or both shoulder belts do not lock up at the 24 km/h (15 mph) test, replace the suspect retractor with a new retractor.

Supplemental Restraint System (SRS) Deactivation and Reactivation

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (1 Req'd) 418-F395
 ST2506-A	Diagnostic Tool, Restraint System (3 Req'd) 418-F088 (105-R0012)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)

Deactivation

 **WARNING:** Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Do not set a live air bag module down with the trim cover face down. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

 **WARNING:** Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

 **WARNING:** The safety belt buckle pretensioner and safety belt retractor pretensioner are pyrotechnic devices. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: Vehicle sensor orientation is critical for proper system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. Replace and properly position the sensor or any other damaged supplemental restraint system (SRS) components whether or not the air bag is deployed.

WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

NOTE: If a seat equipped with a seat mounted side air bag and/or a safety belt pretensioner (if equipped) system is being serviced, **the air bag system must be deactivated.**

NOTE: Restraint system diagnostic tools **MUST** be installed under the seats in the seat side air bag (if equipped) and safety belt pretensioner (if equipped) to floor connectors.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute. For additional information, refer to [Section 414-01](#).

- Remove the two screws and pull out on the lower steering column opening finish panel enough to access the electrical connectors.

3. Remove the lower steering column opening finish panel.
 1. Disconnect the electrical connectors.
 2. Remove the lower steering column opening finish panel.

4. Remove the screws. Separate the hood latch release cable and handle assembly from the steering column opening reinforcement.

5. Remove the two pin-type retainers and the RH instrument panel insulator.
 - Disconnect the courtesy lamp.

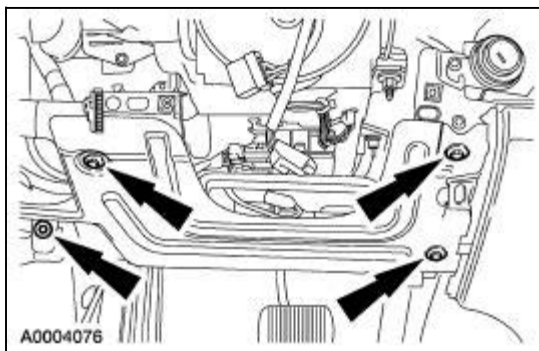

6. Remove the screw and the heater duct.

7. Loosen the two driver-side instrument panel tunnel brace bolts.
- Position the carpet aside to gain access to the bolts.

8. Remove the screws and the steering column opening reinforcement.

9. Disconnect the clockspring electrical connector at the base of the steering column.

10. Attach the restraint system diagnostic tool to the vehicle harness side of the clockspring

electrical connector.

11. Remove the glove compartment. For additional information, refer to [Section 501-12](#).
12. Disconnect the passenger air bag module electrical connector.
 1. Reaching into the glove box opening toward the center of the instrument panel, under the cross-car beam, slide and disengage the passenger air bag module electrical connector locking clip.
 2. Push in on the two release tabs and disconnect the passenger air bag module electrical connector.

13. Attach the restraint system diagnostic tool to the vehicle harness side of the passenger air bag electrical connector.

14. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).
15. Move and tilt the front seats to their highest and most forward position.
16.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors,

instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute. For additional information, refer to [Section 414-01](#).

17. From under the passenger seat, release the tab on the connector bracket and remove the passenger seat side air bag electrical connector.

18. Disconnect the passenger seat side air bag electrical connector.
 1. Slide and disengage the passenger seat side air bag electrical connector locking clip.
 2. Push in to release the tab and disconnect the passenger seat side air bag electrical connector.

19. Attach the restraint system diagnostic tool to the passenger seat side air bag floor electrical connector.

20. Remove the passenger side B-pillar weatherstripping.
21. Position the safety belt D-ring to its highest point.
22. Remove the passenger side B-pillar upper trim panel.

23. Remove the passenger side front and rear door scuff plates.

24. Remove the passenger side B-pillar lower trim panel.

25. Disconnect the passenger side safety belt retractor pretensioner floor electrical connector.

26. Attach the restraint system diagnostic tool to the passenger side safety belt retractor pretensioner floor electrical connector.

27. From under the driver seat, release the tab on the connector bracket and remove the driver seat side air bag electrical connector.

28. Disconnect the driver seat side air bag electrical connector.
1. Slide and disengage the driver seat side air bag electrical connector locking clip.
 2. Push down to release the tab and disconnect the driver seat side air bag electrical connector.

29. Attach the restraint system diagnostic tool to the driver seat side air bag floor electrical connector.

30. Remove the driver side B-pillar weatherstripping.
31. Position the safety belt D-ring to its highest point.
32. Remove the driver side B-pillar upper trim panel.

33. Remove the driver side front and rear door scuff plates.

34. Remove the driver side B-pillar lower trim panel.

35. Disconnect the driver side safety belt retractor pretensioner electrical connector.

36. Attach the restraint system diagnostic tool to the driver side safety belt retractor pretensioner floor electrical connector.

37. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).
38. With the restraint system diagnostic tools installed at all deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to [Section 501-20B](#).
39. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to [Section 414-01](#).

Reactivation

WARNING: To reduce the risk of serious personal injury, read and follow all warnings and notes at the beginning of the deactivation procedure.

1. Remove the restraint system diagnostic tool from the driver side safety belt retractor pretensioner floor electrical connector.

2. Connect the driver side safety belt retractor pretensioner electrical connector.

3. Install the driver side B-pillar lower trim panel.

4. Install the driver side front and rear door scuff plates.

5. **NOTE:** Position the safety belt D-ring to its highest point.

Install the driver side B-pillar upper trim panel.

6. Install the driver side B-pillar weatherstripping.
7. Remove the restraint system diagnostic tool from the driver seat side air bag floor electrical connector.

8. Connect the driver seat side air bag electrical connector.
 1. Connect the driver seat side air bag electrical connector.
 2. Slide and engage the driver seat side air bag electrical connector locking clip.

9. Install the driver seat side air bag electrical connector onto the connector bracket under the driver seat.

10. Remove the restraint system diagnostic tool from the passenger side safety belt retractor pretensioner electrical connector.

11. Connect the passenger side safety belt retractor pretensioner electrical connector.

12. Install the passenger side B-pillar lower trim panel.

13. Install the passenger side front and rear door scuff plates.

14. **NOTE:** Position the safety belt D-ring to its highest point.

Install the passenger side B-pillar upper trim panel.

15. Install the passenger side B-pillar weatherstripping.

16. Remove the restraint system diagnostic tool from the passenger seat side air bag floor electrical connector.

17. Connect the passenger seat side air bag electrical connector.

1. Connect the passenger seat side air bag electrical connector.
2. Slide and engage the passenger seat side air bag electrical connector locking clip.

18. Install the passenger seat side air bag electrical connector onto the connector bracket under the passenger seat.

19. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).

20. Position the front seats rearward.

21.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute. For additional information, refer to [Section 414-01](#).

22. Remove the restraint system diagnostic tool from the vehicle harness side of the passenger air bag electrical connector.

23. Connect the passenger air bag module electrical connector.
1. Reach into the glove box opening toward the center of the instrument panel, under the cross-car beam and connect the passenger air bag module electrical connector.
 2. Slide and engage the passenger air bag module electrical connector locking clip.

24. Install the glove compartment. For additional information, refer to [Section 501-12](#).

25. Remove the restraint system diagnostic tool from the vehicle harness side of the clockspring electrical connector.

26. Connect the clockspring electrical connector at the base of the steering column.

27. Position the steering column opening reinforcement and install the screws.

28. Tighten the two driver-side instrument panel tunnel brace bolts.

- Reposition the carpet.

29. Position the heater duct and install the screw.

30. Install the RH instrument panel insulator and the two pin-type retainers.

- Connect the courtesy lamp.

31. Position the hood latch release cable and handle assembly to the steering column opening reinforcement and install the screws.

32. Connect the electrical connectors to the switches in the lower steering column opening finish panel.

33. Install the lower steering column opening finish panel to the instrument panel.
1. Position the lower steering column opening finish panel to the instrument panel and push in, seating the retaining clips.
 2. Install the screws.

34. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).

35.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to [Section 501-20B](#).

36. Check the active restraint system for correct operation. For additional information, refer to [Safety Belt System](#) in the Diagnosis and testing portion of this section.
-

Safety Belt Cleaning

1.  **WARNING: Do not bleach or re-dye the webbing, as the webbing may weaken.**

Clean the safety belt webbing only with a mild soap solution recommended for cleaning upholstery or carpets. Follow the instructions provided with the soap.

Safety Belt Maintenance

WARNING: All safety belt assemblies include retractors, buckles, front seat belt buckle support assemblies (slide bar), if equipped, shoulder belt height adjuster, if equipped, child safety seat tether bracket assemblies, if equipped, and attaching hardware should be inspected after any collision. All belt assemblies should be installed new unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected. New safety belt assemblies should be installed if either damage or incorrect operation is noted.

1. The safety belt assemblies should be periodically inspected to make sure that they have not become damaged and that they remain in correct operating condition, particularly if they have been subjected to severe stress.
 2. Before installing the new safety belt assembly; the safety belt retaining areas must be inspected for damage and distortion. If the retaining points are damaged and distorted, the sheet metal must be reworked back to its original shape and structural integrity.
 3. Install the new safety belt(s) using the appropriate instructions. Carry out the Functional Test Procedure. For additional information, refer to [Safety Belt System](#) in this section.
-

Replacement of the Weld Nut and Reinforcement

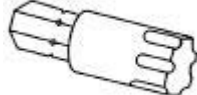

1. **NOTE:** If the safety belt anchor nuts or reinforcements are stripped or missing, a new nut/reinforcement plate must be installed.

Expose the suspect anchor point.

2. Drill out two 8 mm (5/16 inch) diameter access holes adjacent to the weld nut clearance hole.
 3. Thread a length of copper welding wire through the clearance hole and position to secure the weld nut and washer.
 4. Use MIG wire feed welder and plug weld a M10 weld nut and standard washer in place at the two 8 mm (5/16 inch) holes.
 5. Metal finish as necessary.
 6. Install the restraint system.
 7. Carry out the Functional Test. For additional information, refer to [Safety Belt System](#) in this section.
-

Safety Belt Shoulder Height Adjuster With Stripped Weld Nuts

Special Tool(s)

 <p>ST1657-A</p>	D-Ring Installation Kit 100-F012 (134-00018) or equivalent
 <p>ST1181-A</p>	Safety Belt Bolt Bit 501-010 (T77L-2100-A) or equivalent

1. Remove the shoulder safety belt height adjuster. For additional information, refer to [Height Adjuster—Front Shoulder Safety Belt](#) in this section.
2. Use the half-inch drill provided in the D-Ring Installation Kit to drill out the damaged threads in the upper pillar structure.

3. **NOTE:** After each rotation, back off the tap slightly to remove the new cuttings and be sure to blow out any chips before proceeding.

Apply a suitable lubricant to the M14x1.5 tap provided in the D-Ring Installation Kit and tap new threads.

4. Use a threaded insert (Part of #N807170-S190) provided in the D-Ring Installation Kit and screw it into the retapped hole until it is slightly below the surface.

5. Use a hammer to lightly tap the installation tool provided in the D-Ring Installation Kit several times to seat the insert keys.

6. **NOTE:** If the shoulder safety belt height adjuster bolts are stripped, install a new height adjuster.

Insert the shoulder safety belt height adjuster in the opening of the upper B-pillar structure, making sure the shoulder belt height adjuster knob on the shoulder safety belt height adjuster is positioned above the D-ring attachment nut. (The tab is located at the top and is to be inserted in the hole provided in the B-pillar structure).

7. Hand tighten the height adjuster bolts until they are snug.

8. Using the special tool, tighten the height adjuster bolts.

9. **NOTE:** Make sure the D-ring rotates freely.

Install the safety belt D-ring and tighten the nut.

10. **NOTE:** Position the safety belt D-ring to its highest point before installing B-pillar trim.

Install the B-pillar trim.

11. Operate the front seat shoulder strap adjuster. Make sure it travels from top to bottom and locks correctly in each position.

12. Check the restraint system for correct operation.
-

Safety Belt Procedure After a Collision

WARNING: All safety belt assemblies include retractors, buckles, front seat belt buckle support assemblies (slide bar), if equipped, shoulder belt height adjuster, if equipped, child safety seat tether bracket assemblies, if equipped, and attaching hardware should be inspected after any collision. All belt assemblies should be installed new unless a qualified technician finds the assemblies show no damage and operate correctly. Belt assemblies not in use during a collision should also be inspected. New safety belt assemblies should be installed if either damage or incorrect operation is noted.

NOTE: The driver and front passenger seat belt system (including belt and retractor assembly, buckles, and height adjusters) must be replaced if the vehicle is involved in a collision that results in deployment of the front air bags and safety belt pretensioners.

1. Before installing a new safety belt assembly, the safety belt attaching areas must be inspected for damage and distortion. If the attaching points are damaged and distorted, the sheet metal must be worked back to its original shape and structural integrity.
 2. Install the new safety belt(s). For additional information, refer to the procedure in this section. Carry out the Functional Test. For additional information, refer to [Safety Belt System](#) in this section.
-

Safety Belt Tongue Rotated on Belt

1. Grasp the belt tongue and pull the belt webbing down to form a loop through the slot in the tongue.

2. Rotate and fold the belt webbing over itself within the slot to remove the twist.
3. Pull the excess belt webbing back through the slot in the belt tongue.
4. Pull the excess belt webbing through the slot.
5. The safety belt tongue should face inward when completed.

Retractor —Rear Center Safety Belt

Special Tool(s)

Removal

1. Using a suitable tool, release the mini-buckle.

2. Remove the retractor cover.
3. Using the special tool, remove the retractor.

Installation

1. To install, reverse the removal procedure.
 - Check the restraint system for correct operation.

Retractor —Rear LH and RH Safety Belt

Special Tool(s)

Removal

1. Remove the seat backrest rear side bolsters. For additional information, refer to [Section 501-10](#).
2. Using the special tool, remove the rear safety belt anchor bolt.

3. Remove the quarter trim panel.

4. Using the special tool, remove the D-ring bolt.

5. Using the special tool, remove the bolt and the retractor.

Installation

1. Using the special tool, install the retractor.

2. Remove the shipping clip from the safety belt webbing.

3. Using the special tool, install the D-ring bolt.

4. Install the rear quarter trim panel.

5. Using the special tool, install the rear safety belt anchor bolt.

6. Install the seat backrest rear side bolsters. For additional information, refer to [Section 501-10](#).

7. Check the restraint system for correct operation.
-

Child Safety Seat Tether Anchor

Removal and Installation

1. Remove the package tray trim panel. For additional information, refer to [Section 501-05](#).
2. Remove the child safety seat tether anchors.
 1. Remove the bolts.
 2. Remove the child safety seat tether anchors.

3.  **WARNING:** It is important that the bolt/anchor be securely tightened to specification. Otherwise, the child's safety seat may not be properly secured, and the child could be injured in case of a sudden stop or accident.

NOTE: Rework the sheet metal to its original condition and structural integrity.

NOTE: Make sure to tighten the bolts to specification.

To install, reverse the removal procedure.

- See the removal procedure or Specifications for torque specifications.

4. Check the active restraint system for correct operation.

Height Adjuster —Front Shoulder Safety Belt

Special Tool(s)

Removal and Installation

1. Pull back the weather-strip surrounding the upper B-pillar trim.
2. **NOTE:** Position the safety belt D-ring to its highest point.

Remove the upper B-pillar trim.

3. Remove the D-ring nut.

4. Using the special tool, remove the height adjuster bolts.

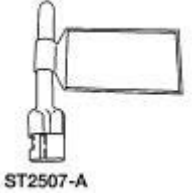

5. **NOTE:** Position the safety belt D-ring to its highest point.

To install, reverse the removal procedure.

- Check the restraint system for correct operation.
-

Safety Belt Buckle —Front

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (1 Req'd) 418-F395
 ST2506-A	Diagnostic Tool, Restraint System (3 Req'd) 418-F088 (105-R0012)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)

Removal

 **WARNING:** Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** After deployment, the air bag surface could contain deposits of sodium hydroxide, a product of the gas gernerant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

 **WARNING:** Never probe the connectors on the air bag module. Doing so could result in air bag deployment which could result in personal injury.

All vehicles

1. Prepare the vehicle for seat removal.

1.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to [Section 414-01](#).

2.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the supplemental restraint system deactivation/reactivation procedure.**

Deactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in the General Procedures portion of this section.

3.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the seat removal and installation procedure.**

Remove the seat on the side with the affected safety belt buckle. For additional information, refer to [Section 501-10](#).

Driver seat only

2. Disconnect the safety belt buckle usage detection switch electrical connector.

All front safety belt buckles

3. Remove the bolt and the safety belt buckle.

Installation

All front safety belt buckles

1. Position the safety belt buckle to the seat. Install the bolt.

Driver seat only

2. Connect the safety belt buckle usage detection switch electrical connector.

All vehicles

3. Restore the vehicle to operating condition.
 1. **⚠ WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the seat removal and installation procedure.**

Install the seat with the affected safety belt buckle. For additional information, refer to [Section 501-10](#).

2. **⚠ WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

Reactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in the General Procedures portion of this section.

3. **⚠ WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to [Section 501-20B](#).

4. Check the active restraint system for correct operation. For additional information, refer to [Safety Belt System](#) in this section.

Child Safety Seat Tether Anchor —LATCH

Removal and Installation

NOTE: The left-hand side is shown, the right-hand side is similar.

1. Remove the rear seat backrest side bolster. For additional information, refer to [Section 501-10](#).
2. Remove the rear seatback. For additional information, refer to [Section 501-10](#).
3. Remove the five pin-type retainers (three shown) and remove the finish panel.

4. Remove the bolts and the LATCH bracket.

5. To install, reverse the removal procedure.
 - Make sure the wire harness is positioned correctly before installing the LATCH bracket.

Safety Belt Buckle —Rear

Removal and Installation

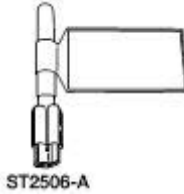

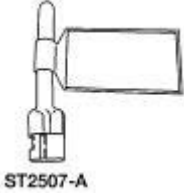

1. Remove the rear seat cushion. For additional information, refer to [Section 501-10](#).
2. Remove the nut and the rear safety belt buckle.

3. To install, reverse the removal procedure.
 - Check the restraint system for correct operation.
-

Safety Belt Retractor and Pretensioner

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (1 Req'd) 418-F395
 ST2506-A	Diagnostic Tool, Restraint System (3 Req'd) 418-F088 (105-R0012)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)
 ST1181-A	Safety Belt Bolt Bit 501-010 (T77L-2100-A)

Removal

 **WARNING:** The safety belt buckle pretensioner and safety belt retractor pretensioner are pyrotechnic devices. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner.

 **WARNING:** The safety belt buckle pretensioner and safety belt retractor pretensioner are pyrotechnic devices. Never probe an electrical connector pretensioner. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

 **WARNING:** After deployment, the air bag surface could contain deposits of sodium hydroxide, a product of the gas gernerant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

 **WARNING:** Never probe the connectors on the air bag module. Doing so could result in air bag deployment which could result in personal injury.

NOTE: The driver side is shown, the passenger side is similar.

1. Prepare the vehicle for safety belt retractor and pretensioner removal.

1.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to [Section 414-01](#).

2.  **WARNING:** To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.

Deactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in the General Procedures portion of this section.

2.  **CAUTION:** Do not use a screwdriver to remove the safety belt cover.

Remove the front safety belt anchor cover by placing fingers behind the cover and pushing outward.

3. Remove the nut and the front safety belt anchor.

4. Remove the D-ring nut and route the safety belt out of the B-pillar trim panel.

5. Remove the web guide.

6. **NOTE:** For pretensioner retractor disposal procedure, refer to [Section 501-20B](#).

Remove the safety belt retractor and pretensioner assembly.

1. Using the special tool, remove the bolt.
2. Remove the safety belt retractor and pretensioner.

Installation

WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions and notes at the beginning of the removal procedure.

1. Install the safety belt retractor and pretensioner assembly.
 1. Position the safety belt retractor and pretensioner.
 2. Using the special tool, install the bolt.
 3. Remove the restraint system diagnostic tool from the driver side safety belt retractor pretensioner electrical connector.
 4. Connect the electrical connector.

2. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).
3. With the restraint system diagnostic tools still installed at the remaining deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to [Section 501-20B](#).

4.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute. For additional information, refer to [Section 414-01](#).

5. Install the web guide.

6. Install the D-ring and nut.

7. Remove the shipping clip from the safety belt webbing.

8. Install the B-pillar lower trim panel.

9. Install the driver side front and rear door scuff plates.

10. **NOTE:** Position the D-ring to its highest point.

Route the safety belt through the B-pillar upper trim panel. Install the upper B-pillar trim panel.

11. Position the front safety belt anchor and install the nut.

12. Install the front safety belt anchor cover.

13. Restore the vehicle to operating condition.

1.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

Reactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in the General Procedures portion of this section.

2.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to [Section 501-20B](#).

3. Check the active restraint system for correct operation. For additional information, refer to [Safety Belt System](#).

Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)

The air bag supplemental restraint system (SRS) is designed to provide increased collision protection for front seat occupants in addition to that provided by the three-point safety belt system. Safety belt use is necessary to obtain the best occupant protection and to receive the full advantages of the SRS.

The air bag supplemental restraint system (SRS) components are shown in the following illustration.

Air Bag Supplemental Restraint System (SRS) Components

A0005395

Item	Part Number	Description
1	044A74	Passenger air bag module
2	14B345	Side impact sensor (RH)
3	611B08	Belt retractor pretensioner, passenger
4	611D10	Passenger side air bag module
5	14B321	Restraints control module (RCM)
6	043B13	Driver air bag module
7	611B09	Belt retractor pretensioner, driver
8	14A664	Clockspring

9	611D11	Driver side air bag module
10	14B345	Side impact sensor (LH)

Driver Air Bag Module

NOTE: References to the driver air bag module must not be confused with the seat-mounted air bag components of the supplemental restraint system (SRS).

The driver air bag module:

- is steering wheel mounted.
- will deploy upon receiving a signal from the RCM.
- has no subassemblies.

Clockspring

The clockspring:

- is mounted on the steering column, behind the steering wheel.
- provides a continuous electrical path from the driver air bag module to the restraints control module (RCM).

Driver Seat Side Air Bag Module

NOTE: References to side air bag modules refer to the seat-mounted and not to the steering wheel or instrument panel mounted air bag components of the supplemental restraint system (SRS).

The driver seat side air bag module:

- is installed as an assembly.
- is mounted in the driver seat back.

Passenger Seat Side Air Bag Module

NOTE: References to side air bag modules refer to the seat-mounted and not to the steering wheel or instrument panel mounted air bag components of the supplemental restraint system (SRS).

The passenger seat side air bag module:

- is installed as an assembly.
- is mounted in the passenger seat back.

Passenger Air Bag Module

NOTE: References to the passenger air bag module must not be confused with the seat-mounted air bag components of the supplemental restraint system (SRS).

The passenger air bag module:

- is installed as an assembly.
- is mounted in the passenger side of the instrument panel.

Safety Belt Pretensioners

As part of the supplemental restraint system (SRS), the safety belt retractors are equipped with pretensioners. The safety belt retractor pretensioners rotate the safety belt retractors to remove excess slack from the safety belt webbing. The pretensioners are activated by the restraints control module (RCM) when the module detects a crash event force exceeding a programmed limit.

Restraints Control Module (RCM)

The restraints control module (RCM) is mounted on the center tunnel under the instrument panel. The RCM performs the following functions:

- signals the inflators to deploy the air bags in the event of a deployable crash.
- activates the belt retractor pretensioners to remove slack from the safety belt webbing.
- monitors the air bag supplemental restraint system (SRS) for faults.
- illuminates the air bag indicator if a fault is detected.
- flashes the air bag indicator to indicate the lamp fault code (LFC) detected.
- communicates the current or historical diagnostic trouble codes (DTCs) through the data link connector (DLC).
- signals the instrument cluster to activate a chime if the air bag indicator is not available and another SRS fault exists.
- contains an internal safing sensor which is not serviced separately.

The RCM monitors the SRS for possible faults. If a fault is detected while the ignition switch is in the RUN position, the RCM will illuminate the air bag indicator located in the instrument cluster.

When the ignition is cycled (turned off and then on), the air bag indicator will remain lit for six seconds and then go out. If an SRS fault exists, the air bag indicator will then flash the two-digit LFC associated with that fault. The air bag indicator will flash the LFC five times, then remain illuminated for the rest of the key cycle. The RCM will also communicate the current and historical DTCs through the data link connector (DLC), using the New Generation Star (NGS) Tester. If the air bag indicator does not function, and the system detects a fault condition, the RCM will signal the instrument cluster to activate an audible chime. The chime is a series of five sets of five tone bursts. If the chime is heard, the SRS and the air bag indicator require repair.

LFCs are prioritized. If two or more faults occur at the same time, the fault having the highest priority will be displayed first. After that fault has been corrected, the next highest priority fault will be displayed.

The RCM includes a backup power supply. This feature provides sufficient backup power to deploy the air bags and belt retractor pretensioners in the event that the ignition circuit is damaged in a collision before the safing and air bag sensors determine that an air bag deployment is required. The backup

power supply will deplete its stored energy approximately one minute after the battery ground cable is disconnected.

Electrical System

The electrical system that supports the air bag supplemental restraint system (SRS):

- is powered from the battery through the ignition circuit.
- provides the electrical path from the restraints control module (RCM) to the SRS components.
- provides the electrical path from the RCM to the air bag indicator.
- provides the electrical path from the RCM to the data link connector (DLC).
- provides the electrical path from the RCM to the instrument cluster.

Sensors

WARNING: The restraints control module (RCM) orientation is critical for proper system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) has been involved in a collision in which the center tunnel area has been damaged, inspect the mounting and bracket for deformation. If damaged, the RCM must be replaced whether or not the air bags have deployed. In addition, make sure the area of the RCM mounting is restored to its original production configuration.

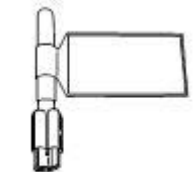

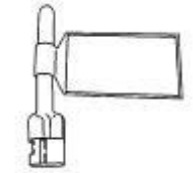

CAUTION: Sensors are repaired by replacement only. Do not attempt to determine whether a sensor is OK. Always replace the sensor even if it does not appear to be damaged.

For this vehicle the SRS employs four impact sensors. Two of the sensors are integral to the RCM and are not separately serviceable. In addition, there are two side impact sensors located at the base of the B-pillars. The RCM is mounted on the center tunnel under the instrument panel. Mounting orientation is critical for correct operation of all impact sensors.

Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F395 (014-R1079)
 ST2506-A	Diagnostic Tool, Restraint System (3 Req'd) 418-F088 (105-R0012)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)

Restraint System Diagnostic Tool Warning

 **WARNING:** This tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

Diagnosing Customer Concerns Without Hard Diagnostic Trouble Codes (DTCs)

If a lamp fault code (LFC) is reported by the customer but is not present when the vehicle comes in for repair, follow the Diagnostic Instructions procedure in this section to identify the intermittent diagnostic trouble code (DTC).

Once the DTC is known, read the Normal Operation section for the code involved.

- Follow the deactivation procedure in this section.
- Determine the location of components involved in creating that code.
- Carry out a thorough visual inspection of:
 - components.
 - connectors.
 - splices and wiring harnesses.

- pinched wires.
- worn insulation on conductors.
- opens, shorts or loosely mounted sensors.

Refer to Possible Causes, which lists the common concerns that relate to a particular code. Concerns are listed according to priority.

Diagnosing Customer Concerns with Hard Diagnostic Trouble Codes (DTCs)

Most air bag supplemental restraint system (SRS) diagnostic procedures will require the use of the deactivation and reactivation procedures in this section.

The deactivation and reactivation require the installation and removal of restraint system diagnostic tools. These procedures require removal of driver air bag module, and the disconnection of the passenger air bag module, driver side air bag module, passenger side air bag module, driver safety belt retractor pretensioner, and passenger safety belt retractor pretensioner. This reduces the risk of deployment of air bag modules and safety belt pretensioners while diagnostics are being carried out.

Restraint system diagnostic tools are required to carry out diagnosis and testing of the supplemental restraint system (SRS). It is not acceptable to short-circuit the air bag module connections with a jumper wire. If a jumper wire is used to short-circuit the air bag module connections, a lamp fault code (LFC) will be displayed.

Deactivation and Reactivation Procedures

There are two deactivation and reactivation procedures.

- One procedure requires removal of the front seats. This procedure will be used when diagnosing or repairing a seat side air bag concern. This procedure will also be used when diagnosing or repairing any in-seat or seat mounted component of a seat equipped with a seat side air bag.
- The other procedure does not require front seat removal during the diagnostic and repair process. This procedure will be used when diagnosing or repairing a concern that is not related to a seat equipped with a seat side air bag.

Deactivation Procedure — Seats Removed

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301). For additional information, refer to [Section 414-01](#).

2. Wait at least one minute for the backup power supply in the restraints control module (RCM) to deplete its stored energy.
3.  **WARNING:** Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Do not set a live air bag module down with the trim cover face down. This will reduce the risk of injury in the event of an accidental deployment.

Remove the driver air bag module from the vehicle. For additional information, refer to [Driver Air Bag Module](#) in this section.

4. Attach a restraint system diagnostic tool 418-F395 to the clockspring side of the driver air bag module electrical connector.
5. Remove the glove compartment. For additional information, refer to [Section 501-12](#).

6. Disconnect the passenger air bag electrical connector.
 1. Reaching over the cross-car beam, slide the passenger air bag module electrical connector lock downward.

2. Squeeze the electrical connector locking tabs and pull the electrical connector from the passenger air bag module.
7. Attach a restraint system diagnostic tool 418-F395 to the harness side of the passenger air bag module electrical connector.
8. Remove the affected front seat(s). For additional information, refer to [Section 501-10](#).
9. Disconnect (if necessary) and attach a restraint system diagnostic tool 418-133 to the passenger side air bag module electrical connector.
10. Access the passenger safety belt retractor pretensioner in the passenger side B-pillar.
11. Disconnect the passenger side safety belt retractor pretensioner electrical connector.
12. Attach a restraint system diagnostic tool 418-F088 to the passenger safety belt retractor pretensioner electrical connector.
13. Disconnect (if necessary) and attach a restraint system diagnostic tool 418-133 to the driver side air bag electrical connector.
14. Access the driver safety belt retractor pretensioner in the driver side B-pillar.
15. Disconnect the driver safety belt retractor pretensioner electrical connector.
16. Attach a restraint system diagnostic tool 418-F088 to the driver safety belt retractor pretensioner electrical connector.
17. Reconnect the battery ground cable. For additional information, refer to [Section 414-01](#).

Reactivation Procedure — Seats Removed

WARNING: The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

WARNING: To reduce the risk of serious personal injury, read and follow all warnings and notes at the beginning of the deactivation procedure.

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Wait at least one minute for the backup power supply in the restraints control module (RCM) to deplete its stored energy.

3. **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

Remove the restraint system diagnostic tool from the driver side air bag module electrical connector.

4. **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and**

possible violation of vehicle safety standards.

Remove the restraint system diagnostic tool from the driver seat belt retractor pretensioner electrical connector.

5. Connect the driver seat belt retractor pretensioner electrical connector.
6. Install the driver side B-pillar trim panels.

7.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

Remove the restraint system diagnostic tool from the passenger side air bag electrical connector.

8.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

Remove the restraint system diagnostic tool from the passenger seat belt buckle pretensioner electrical connector.

9. Connect the passenger seat belt retractor pretensioner electrical connector.
10. Install the passenger side B-pillar trim panels.
11. Install the affected front seat(s). For additional information, refer to [Section 501-10](#).
12. Connect the driver and passenger side air bag module electrical connectors.

13.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

Remove the restraint system diagnostic tool from the passenger air bag module electrical connector.

14. Reconnect the passenger air bag module electrical connector electrical connector.
15. Install the glove compartment. For additional information, refer to [Section 501-12](#).

16.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

Remove the restraint system diagnostic tool from the driver air bag module electrical connector.

17. Install the driver air bag module from the vehicle. For additional information, refer to [Driver Air Bag Module](#) in this section.
18. Reconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
19. Prove out the system.

Deactivation Procedure — Seats Not Removed

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301). For additional information, refer to [Section 414-01](#).

2. Wait at least one minute for the backup power supply in the restraints control module (RCM) to deplete its stored energy.
3.  **WARNING:** Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

WARNING: Do not set a live air bag module down with the trim cover face down. This will reduce the risk of injury in the event of an accidental deployment.

Remove the driver air bag module from the vehicle. For additional information, refer to [Driver Air Bag Module](#) in this section.

4. Attach a restraint system diagnostic tool 418-F395 to the clockspring side of the driver air bag module electrical connector.

5. Remove the glove compartment. For additional information, refer to [Section 501-12](#).

6. Disconnect the passenger air bag electrical connector.
 1. Reaching over the cross-car beam, slide the passenger air bag module electrical connector lock downward.
 2. Squeeze the electrical connector locking tabs and pull the electrical connector from the passenger air bag module.
7. Attach a restraint system diagnostic tool 418-F395 to the harness side of the passenger air bag module electrical connector.
8. Reconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
9. Move and tilt the front seats to their highest and most forward position.
10.  **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301). For additional information, refer to [Section 414-01](#).

11. Disconnect the passenger side air bag module electrical connector beneath the passenger seat.
12. Attach a restraint system diagnostic tool 418-133 to the passenger side air bag floor electrical connector.
13. Access the passenger safety belt retractor pretensioner in the passenger side B-pillar.
14. Disconnect the passenger side safety belt retractor pretensioner electrical connector.
15. Attach a restraint system diagnostic tool 418-F088 to the passenger safety belt retractor pretensioner electrical connector.
16. Disconnect the driver side air bag module electrical connector beneath the driver seat.
17. Attach a restraint system diagnostic tool 418-133 to the driver side air bag module electrical connector.

18. Access the driver safety belt retractor pretensioner in the driver side B-pillar.
19. Disconnect the driver safety belt retractor pretensioner electrical connector.
20. Attach a restraint system diagnostic tool 418-F088 to the driver safety belt retractor pretensioner electrical connector.
21. Reconnect the battery ground cable. For additional information, refer to [Section 414-01](#).

Reactivation Procedure — Seats Not Removed

WARNING: The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

WARNING: To reduce the risk of serious personal injury, read and follow all warnings and notes at the beginning of the deactivation procedure.

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Wait at least one minute for the backup power supply in the restraints control module (RCM) to deplete its stored energy.

3.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

Remove the restraint system diagnostic tool from the driver side air bag module electrical connector.

4. Connect the driver side air bag module electrical connector.

5.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

Remove the restraint system diagnostic tool from the driver seat belt retractor pretensioner electrical connector.

6. Connect the driver seat belt retractor pretensioner electrical connector.
7. Install the driver side B-pillar trim panels.

8.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

Remove the restraint system diagnostic tool from the passenger side air bag module electrical connector.

9. Connect the passenger side air bag module electrical connector.

10.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

Remove the restraint system diagnostic tool from the passenger seat belt buckle pretensioner electrical connector.

11. Connect the passenger seat belt retractor pretensioner electrical connector.
12. Reconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
13. Move and tilt the front seats rearward.

14.  **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301). For additional information, refer to [Section 414-01](#).

15.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

Remove the restraint system diagnostic tool from the passenger air bag module electrical connector.

16. Reconnect the passenger air bag module electrical connector electrical connector.
17. Install the glove compartment. For additional information, refer to [Section 501-12](#).

18.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

Remove the restraint system diagnostic tool from the driver air bag module electrical connector.

19. Install the driver air bag module from the vehicle. For additional information, refer to [Driver Air Bag Module](#) in this section.
20. Reconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
21. Prove out the system.

Prove Out Procedure

Turn the ignition switch from the OFF to the RUN position and visually monitor the air bag indicator with the air bag modules or restraint system diagnostic tools installed. The air bag indicator will light continuously for approximately six seconds and then turn off. If an air bag supplemental restraint system (SRS) fault is present, the air bag indicator will either:

- fail to light.
- remain lit continuously.
- flash.

The flashing might not occur until approximately 30 seconds after the ignition switch has been turned from the OFF to the RUN position. This is the time required for the restraints control module (RCM) to complete the testing of the SRS. If the air bag indicator is inoperative and an SRS fault exists, a chime will sound in a pattern of five sets of five beeps. If this occurs, the air bag indicator will need to be repaired before diagnosis can continue.

Glossary

Restraint System Diagnostic Tools

Restraint system diagnostic tools are used to simulate air bag module connections to the system.

Disconnect the Component

Disconnect the component means disconnect the component vehicle harness connector. It does not mean remove the component. Do not reconnect a disconnected component unless instructed to do so.

Deactivate the System

Deactivate the system means to carry out the deactivation procedure. Refer to Deactivation Procedure in this section.

Prove Out the System

Prove out the system means to turn the ignition switch from the OFF to the RUN position and visually monitor the air bag indicator with the air bag modules installed. Refer to Prove Out Procedure in this section.

Reactivate the System

Reactivate the system means to carry out the reactivation procedure. Refer to Reactivation Procedure in this section.

Reconnect the System

Reconnect the system means to reconnect all system components. Refer to Air Bag Reconnect Checklist in this section.

Install a New Component

Install a new component means to remove the existing component and install a new authorized part obtained from Ford Customer Service Division.

Verify the System

Verify the system means to prove out the system with restraint system diagnostic tools for the air bag

modules in place of the components.

Air Bag Reconnect Checklist

The checklist below should be completed following diagnosis or repair of any air bag system concern:

1. All restraint system diagnostic tools removed?
 2. All in-seat electrical connectors connected?
 3. All air bag modules connected?
 4. Restraints control module (RCM) connected?
 5. All safety belt pretensioners connectors connected?
 6. All sensors (side impact) connected?
 7. Battery connected?
-

Diagnostic Instructions — Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)

Special Tool(s)

	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent scan tool
---	---

The symptom chart can be used to help locate the air bag supplemental restraint system (SRS) concerns if no diagnostic trouble codes (DTCs) are retrieved and the listed symptoms are observed. Whether or not the listed symptoms are observed, always carry out the following:

1. Retrieve all DTCs stored in the restraints control module (RCM) memory. For additional information, refer to Retrieve/Clear Continuous DTCs in this section.
2. Run the On-Demand Self Test to determine what DTCs are currently being sensed by the RCM. For additional information, refer to On-Demand Self Test in this section.
3. If the stored DTCs are different than the current DTCs, always repair the current DTCs first.
4. If memory displays different continuous DTCs than the On-Demand Self Test, perform in the following order:
 - On-Demand Self Test.
 - Memory (Retrieve/Clear Continuous DTCs).

A DTC can indicate several concerns. The DTCs are to assist in system diagnosis and are not to be considered definitive. Always refer to the pinpoint test corresponding to the DTC to determine where the concern lies and to repair the concern correctly.

The SRS diagnostics can be divided into three sections:

- diagnostic test modes.
- PID/data monitor and record.
- active command modes.

Diagnostic Test Modes

Two menu options are available under the diagnostic test modes:

- Retrieve/Clear Continuous DTCs.

- On-Demand Self Test.

Retrieve/Clear Continuous DTCs

During vehicle operation the restraints control module (RCM) will detect and store both intermittent and hard fault DTCs in nonvolatile memory. The DTC strategy employed by the RCM incorporates a time-out scheme for determining when a concern exists in the system. This requires a concern to exist for up to one minute in the system before the RCM will detect it. For the RCM to determine that a concern no longer exists, the concern must be absent for up to one minute. The actual detection time-outs vary with each DTC. The DTCs can be retrieved with the scan tool. Any DTCs stored in the RCM will be displayed on the scan tool along with a brief description of the DTC. If no DTCs are present, the scan tool will display a SYSTEM PASSED message. The scan tool can also be used to clear DTCs from the RCM memory, as long as the concern no longer exists. Once 254 key cycles have been recorded since the concern was last detected, the DTC will automatically be removed from memory.

To retrieve or clear DTCs, connect the scan tool to the data link connector (DLC). Follow the instructions for the scan tool being used. All continuous DTCs will be displayed on the screen. Before proceeding with the clearing operation, make note of the DTCs displayed, because once cleared, they cannot be retrieved. Hard DTCs will be redisplayed after clearing DTCs since they cannot be cleared from the RCM.

On-Demand Self Test

The On-Demand Self Test option is used to verify that no electrical concerns exist with the air bag supplemental restraint system (SRS). Upon entering the self test, the restraint control module (RCM) will make an electrical check of each electrical component in the system. If a concern is detected, a DTC is displayed on the scan tool with a brief description of the DTC. Concerns detected during the self test are not stored in memory, unless the same concern was also detected during normal vehicle operation. The self test should always be run after any repair to verify that the repair was successful.

To run the On-Demand Self Test, connect the scan tool to the data link connector (DLC). Follow the instructions for the scan tool being used. The RCM will run the On-Demand Self Test and display on-demand DTCs (reflecting hard system concerns) on the screen.

PID/Data Monitor and Record

The PID/Data Monitor and Record option allows the scan tool operator to read the state of several parameter IDs (PIDs) to aid in diagnosing the system. PIDs are real time measurements of parameters such as voltages, resistances, etc., calculated by the restraints control module (RCM) and sent to the scan tool for display. Many of the PIDs supported by the RCM are calculated periodically and therefore are not true real time readings.

To retrieve PIDs, connect the scan tool to the data link connector (DLC). Follow the instructions for the scan tool being used. PIDs are updated continuously on the display.

Active Commands

This command allows the technician to verify operation of the air bag indicator and chime. When the air bag output command is executed, the indicator and the chime are activated simultaneously for approximately four seconds. Both devices are deactivated automatically.

Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table

DTC^a	LFC^b	LFC Priority	Description	Action To Take
—	—	1	RCM Disconnected, Inoperative, or Lost/Low Ignition Feed	<u>Go To Pinpoint Test A.</u>
B1342	24	2	RCM is Faulted	INSTALL a new RCM.
B1231	19	3	RCM Crash Data Memory Full	INSTALL a new RCM and impact sensors.
B1921	21	4	RCM Bracket Ground Resistance High	<u>Go To Pinpoint Test B.</u>

B1870	Tone ^c	—	Air Bag Indicator Shorted to Battery	Go To Pinpoint Test AI .
—	—	—	No Communication with the Restraints Control Module (RCM)	Go To Pinpoint Test AJ .
—	5Hz	—	RCM in Plant Mode	Go To Pinpoint Test AK .

^a DTC: Diagnostic trouble code, retrieved using scan tool.

^b LFC: Lamp fault code, flashed on air bag indicator.

^c Tone will sound only if additional DTCs are present.

Inspection and Verification

1. Verify the customer concern by checking the air bag indicator in the instrument cluster. For additional information, refer to Prove Out Procedure in this section.
2. Visually inspect for obvious signs of mechanical and electrical damage using the following chart.

Visual Inspection Chart

Mechanical	Electrical
<ul style="list-style-type: none"> ● Damaged restraints control module (RCM) bracket ● Loose component mounting 	<ul style="list-style-type: none"> ● Open fuse(s) ● Damaged wiring harness ● Loose or corroded connectors ● Circuitry open/shorted ● Damaged shorting bars

3. If the concern is not visually evident, use the scan tool to retrieve diagnostic trouble codes (DTCs) and carry out the on-demand self test.
4. If the on-demand self test is passed and no DTCs are retrieved, GO to [Symptom Chart .](#)

5. If DTCs are retrieved, refer to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
<ul style="list-style-type: none"> ● Air bag indicator is illuminated continuously 	<ul style="list-style-type: none"> ● Connector shorting bar. ● Circuitry. ● RCM disconnected. ● RCM. ● Instrument cluster. 	<ul style="list-style-type: none"> ● <u>Go To Pinpoint Test A.</u>

Restraint System Diagnostic Tool Warning

WARNING: Restraint system diagnostic tools are for service only. Tools must be removed prior to operating the vehicle over the road. Failure to remove diagnostic tools could result in injury and possible violation of vehicle safety standards.

Pinpoint Test A: Air Bag Warning Indicator Is Illuminated Continuously — RCM Disconnected, Inoperative or Lost/Low Ignition Feed

Normal Operation

NOTE: Be sure to cycle the ignition switch and look for a 6 second indicator prove-out without LFCs.

During normal operation the air bag indicator will illuminate continuously for 6 seconds after the ignition switch is placed in the RUN position. The air bag indicator will also illuminate after five cycles of a lamp fault code (LFC) if a fault exists. The restraints control module (RCM) will communicate diagnostic trouble codes (DTCs) to the scan tool through the data link connector (DLC). If the scan tool displays NO COMMUNICATION when retrieving continuous DTCs, use Pinpoint Test AL to troubleshoot the system.

Possible Causes

An air bag indicator that is illuminated continuously can be caused by:

- a damaged shorting bar or other electrical connector component.
- the ignition circuit damaged.
- the RCM disconnected from the vehicle harness.
- a loss of RCM ground circuit.
- the RCM is faulted.
- air bag indicator circuit shorted to ground.

PINPOINT TEST A: AIR BAG WARNING INDICATOR IS ILLUMINATED CONTINUOUSLY — RCM DISCONNECTED, INOPERATIVE OR LOST/LOW IGNITION FEED

CONDITIONS	DETAILS/RESULTS/ACTIONS
A1 CHECK FOR CONTINUOUS OR ON-DEMAND SELF TEST DTCs	
<div style="display: flex; flex-direction: column; align-items: center;"> <div style="margin-bottom: 20px;"> <div style="border: 1px solid black; padding: 5px; width: 100px; text-align: center;">1</div>  <p style="text-align: center;">Retrieve/Clear Continuous DTCs</p> </div> <div> <div style="border: 1px solid black; padding: 5px; width: 100px; text-align: center;">2</div>  <p style="text-align: center;">On-Demand Self Test</p> </div> </div>	<div style="margin-bottom: 20px;"> <div style="border: 1px solid black; padding: 5px; width: 100px; text-align: center;">1</div> <p>Retrieve and record any continuous DTCs for use later in this pinpoint test.</p> </div> <ul style="list-style-type: none"> ● Were any continuous or on-demand self test DTCs retrieved? <p>→ Yes If continuous DTCs were retrieved, GO to A3. If on-demand DTCs were retrieved, GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table in this section for pinpoint test direction.</p>

→ **No**
GO to A2.

A2 CHECK THE RCM CONNECTION

 **WARNING:** If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

RCM C310a

1

Make sure RCM C310a is fully connected and the locking tab is engaged.

- Is RCM C310a fully connected and are the locking tabs engaged?

→ **Yes**
GO to A3.

→ **No**
CONNECT C310a and ENGAGE the locking tabs. GO to A7.

A3 CHECK THE RCM CONNECTOR

1

RCM C310a

2

2

Inspect RCM C310a component side for worn, or damaged camming beam.

DR1540-A

3

DR1541-A

3 Inspect C310a harness side for worn, damaged or dislodged shorting bar at pins 20 and 21.

● Were any connector concerns found?

→ **Yes**
CORRECT connector concerns. GO to A7.

→ **No**
GO to A4.

A4 CHECK THE IGNITION CIRCUIT 20-JA10A (PK/OG) FOR AN OPEN

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

3

4

DR0994-A

2 Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

4 Measure the voltage to ground at RCM C310a pin 2, circuit 20-JA10A (PK/OG), harness side.

- Is the voltage between 9 and 16 volts?

→ **Yes**
GO to A5.

→ **No**
REPAIR the circuit. GO to A7.

A5 CHECK THE GROUND CIRCUIT 31-JA10A (BK/RD) FOR AN OPEN

1

2

DR0995-A

2 Measure the resistance between RCM C310a pin 21, circuit 31-JA10A (BK/RD), harness side and a sheet metal ground near the RCM.

- Is the resistance less than 10 ohms?

- **Yes**
GO to A6.
- **No**
REPAIR the circuit. GO to A7.

A6 CHECK CIRCUIT 31S-JA14 (BK/GN) FOR A SHORT TO GROUND

1

DR1217-A

- 1 Measure the resistance between RCM C310a pin 20, circuit 31S-JA14 (BK/GN), harness side and RCM C310a pin 21, circuit 31-JA10 (BK/RD), harness side.

- **Is the resistance less than 5 ohms?**

- **Yes**
REPAIR the circuit. GO to A7.
- **No**
INSTALL a new RCM. GO to A7.

A7 CHECK FOR ADDITIONAL DTCs

- 1 Refer to the continuous DTCs recorded during Step A1.

- **Were any continuous DTCs retrieved during Step A1?**

- **Yes**
Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table in this section for pinpoint test direction.
- **No**
RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS). CLEAR all DTCs.

Pinpoint Test B: LFC 21/DTC B1921 — RCM Bracket Ground Resistance High

Normal Operation

WARNING: The tightening torque of the restraints control module (RCM) retaining bolts is

critical for proper air bag supplemental restraint system (SRS) operation. Refer to Restraints Control Module (RCM) in this section for correct torque values.

The restraints control module (RCM) monitors the resistance between the ground connections at its housing and the reference ground at pin 21. If the RCM detects a resistance greater than 100 ohms, it will store a diagnostic trouble code (DTC) B1921 in memory and flash a lamp fault code (LFC) 21 (or higher priority code if one exists) on the air bag indicator.

Possible Causes

High resistance between the RCM housing ground and pin ground can be caused by:

- incorrect seating of the RCM retaining bolts.
- incorrect tightening torque of the RCM retaining bolts.
- high resistance on RCM logic ground circuit 31-JA10A (BK/RD).

PINPOINT TEST B: LFC 21/DTC B1921 — RCM BRACKET GROUND RESISTANCE HIGH

CONDITIONS	DETAILS/RESULTS/ACTIONS
B1 CHECK FOR A HARD OR INTERMITTENT DTC	
<p>1  Retrieve/Clear Continuous DTCs</p> <p>2  On-Demand Self Test</p>	<p>1 Retrieve and record any continuous DTCs for use later in this pinpoint test.</p> <p>● Was DTC B1921 retrieved during the on-demand self test?</p> <p>→ Yes This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to <u>B2</u>.</p> <p>→ No This is an intermittent fault. The fault condition is not present at this time. GO to <u>B6</u>.</p>
B2 INSPECT THE RCM MOUNTING, MOUNTING BRACKET AND MOUNTING SURFACE	
	<p>1 Remove the RCM. Refer to <u>Restraints Control Module (RCM)</u> in this section.</p> <p>2 Visually inspect the RCM, mounting</p>

bracket and mounting surface for damage, corrosion or dirt.

3 Inspect the RCM mounting and make sure that the retaining bolts are fully seated and tightened correctly. Refer to Restraints Control Module (RCM) in this section for correct tightening torque.

- **Was a significant amount of corrosion or dirt found, the RCM mounting bracket attached to the mounting surface incorrectly or were the four RCM retaining bolts not fully seated and tightened correctly?**

→ **Yes**
MAKE SURE the RCM, mounting bracket and mounting surface are free of damage, corrosion or dirt, and the four retaining bolts are fully seated and correctly tightened. REATTACH the RCM and mounting bracket to the mounting surface. GO to B7.

→ **No**
GO to B3.

B3 CHECK THE RCM HARNESS CONNECTION

1 Check the RCM harness connection.

- **Are the RCM harness connectors connected to the RCM correctly with the red locking clips engaged?**

→ **Yes**
GO to B4.

→ **No**
ATTACH the RCM harness connectors correctly. GO to B7.

B4 CHECK THE VEHICLE CHASSIS GROUND

1 Measure the resistance between a known good chassis ground and the mounting surface of the RCM.

- **Is the resistance greater than 100 ohms?**

→ **Yes**
REPAIR the chassis grounding system. GO to B7.

→ **No**
GO to B5.

B5 CHECK THE GROUND CIRCUIT 31-JA10A (BK/RD) FOR AN OPEN

1

2

RCM C310a

3

3

Measure the resistance between RCM C310a pin 21, circuit 31-JA10A (BK/RD), harness side and a sheet metal ground near the RCM.

- Is the resistance greater than 100 ohms?

→ Yes

REPAIR the circuit. GO to B7.

→ No

INSTALL a new RCM. GO to B7.

B6 CHECK FOR AN INTERMITTENT FAULT

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

3

On-Demand Self Test

2 Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS).

● **Was DTC B1921 retrieved during the on-demand self test?**

→ **Yes**
GO to B2.

→ **No**
CHECK for causes of intermittent high resistance on circuit 31-JA10A (BK/RD). ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to B7.

B7 CHECK FOR ADDITIONAL DTCs

1 Refer to the continuous DTCs recorded during Step B1.

● **Were any continuous DTCs retrieved during Step B1?**

→ **Yes**
Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table in this section for pinpoint test direction.

→ **No**
RECONNECT the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS). CLEAR all DTCs.

Pinpoint Test C: LFC 29/DTC C1414 — Incorrect Vehicle Identification Code

Normal Operation

The restraints control module (RCM) monitors the electrical condition at C310a pins 10, 13 and 14 to determine if it is installed on the correct vehicle. If the RCM detects an unexpected condition on any of these pins, it will store a diagnostic trouble code (DTC) C1414 in memory and flash a lamp fault code (LFC) 29 (or higher priority code if one exists) on the air bag indicator.

Possible Causes

An incorrect vehicle ID code can be caused by:

- incorrect RCM.
- RCM incorrectly programmed.
- a wiring concern at RCM C310a pins 10, 13 and 14.

PINPOINT TEST C: LFC 29/DTC C1414 — INCORRECT VEHICLE IDENTIFICATION CODE

CONDITIONS	DETAILS/RESULTS/ACTIONS
C1 CHECK FOR A HARD OR INTERMITTENT DTC	
<p>1  Retrieve/Clear Continuous DTCs</p> <p>2  On-Demand Self Test</p>	<p>1 Retrieve and record any continuous DTCs for use later in this pinpoint test.</p> <ul style="list-style-type: none"> ● Was DTC C1414 retrieved during the on-demand self test? <p>→ Yes This is a hard fault. 1

PID/Data Monitor and Record

2 Select PID VID No.1, VID No. 2 and VID No. 3.

- Was vehicle ID No. 1 open circuit, ID No. 2 ignition and No. 3 ground?

→ Yes
GO to C6.

→ No
INSTALL a new RCM. GO to C7.

C6 CHECK FOR AN INTERMITTENT FAULT

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

3

On-Demand Self Test

2 Deactivate the system. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#).

- Was DTC C1414 retrieved during the on-demand self test?

→ Yes
GO to C2.

→ No

	CHECK for causes of intermittent open circuits. ATTEMPT to recreate the failure by flexing the wire harness and cycling the key frequently. REPAIR any intermittent concerns found. GO to <u>C7</u> .
C7 CHECK FOR ADDITIONAL DTCs	
	<p>1 Refer to the continuous DTCs recorded during Step C1.</p> <ul style="list-style-type: none"> ● Were any continuous DTCs retrieved during Step C1? <p>→ Yes Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table in this section for pinpoint test direction.</p> <p>→ No RECONNECT the system. PROVE OUT the system. CLEAR all DTCs.</p>

Pinpoint Test D: LFC 15/DTC B1887 — Driver Air Bag Circuit Shorted to Ground

Normal Operation

The restraints control module (RCM) checks for driver air bag circuit shorts to ground by monitoring the voltage of circuits 30S-JA8 (RD/OG) and 31S-JA8 (BK/OG) at pins 3 and 4. If the RCM detects a short to ground on either of these pins, it will store a diagnostic trouble code (DTC) B1887 in memory and flash a lamp fault code (LFC) 15 (or higher priority code if one exists) on the air bag indicator.

Possible Causes

A driver air bag circuit short to ground can be caused by:

- a short to ground on circuit 30S-JA8 (RD/OG).
- a short to ground on circuit 31S-JA8 (BK/OG).
- a short to ground on the clockspring (14A664).
- a short to ground on the driver air bag module.

PINPOINT TEST D: LFC 15/DTC B1887 — DRIVER AIR BAG CIRCUIT SHORTED TO GROUND

CONDITIONS	DETAILS/RESULTS/ACTIONS
D1 CHECK FOR A HARD OR INTERMITTENT DTC	
1	1 Retrieve and record any continuous DTCs for use later in this pinpoint test.

Retrieve/Clear Continuous DTCs

2

On-Demand Self Test

- Was DTC B1887 retrieved during the on-demand self test?

→ **Yes**

This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to D2.

→ **No**

This is an intermittent fault. The fault condition is not present at this time. GO to D2.

D2 CHECK THE DRIVER AIR BAG MODULE

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

2

Deactivate the system. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in the Diagnosis and Testing portion of this section.

3

On-Demand Self Test

● Was DTC B1887 retrieved?

→ Yes
GO to D3.

→ No
INSTALL a new driver air bag module.
GO to D6.

D3 CHECK THE DRIVER AIR BAG MODULE CIRCUIT

1

2

RCM C310a

3

DR0999-B

3 **NOTE:** Do not separate or remove the shorting bars from RCM C310a.

Measure the resistance between RCM C310a pin 3, circuit 30S-JA8 (RD/OG), harness side and RCM C310a pin 21, circuit 31-JA10A (BK/RD), harness side.

● Is the resistance less than 10,000 ohms?

→ Yes
GO to D4.

→ No
INSTALL a new RCM. GO to D6.

D4 CHECK THE DRIVER AIR BAG MODULE WIRING AND THE CLOCKSPrING

1

Driver Air Bag Module Restraint System Diagnostic Tool

2

Clockspring C218C

3 Inspect all crimps, terminals, wires and connectors in circuit 30S-JA8 (RD/OG) feeding the RCM pin 3, circuit 31S-JA8 (BK/OG) feeding pin 4, the clockspring assembly and the clockspring connector C218C. Check for pinched wires and damaged connector pin terminals.

• Was any damage found?

→ Yes REPAIR as necessary. GO to D6.

→ No GO to D5.

D5 CHECK FOR AN INTERMITTENT FAULT

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

3

On-Demand Self Test

2 Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS).

	<ul style="list-style-type: none"> ● Was DTC B1887 retrieved during the on-demand self test? <p>→ Yes CHECK for causes of intermittent fault at or near the driver air bag module connector. Pinpoint Test E: LFC 16/DTC B1888 — Passenger Air Bag Circuit Shorted to Ground

Normal Operation

The restraints control module (RCM) checks for passenger air bag circuit shorts to ground by monitoring the voltage of circuits 30S-JA11 (RD/WH) and 31S-JA11 (BK/WH) at pins 6 and 7. If the RCM detects a short to ground on either of these pins, it will store a diagnostic trouble code (DTC) B1888 in memory and flash a lamp fault code (LFC) 16 (or higher priority code if one exists) on the air bag indicator.

Possible Causes

A passenger air bag circuit short to ground can be caused by:

- a short to ground on circuit 30S-JA11 (RD/WH).
- a short to ground on circuit 31S-JA11 (BK/WH).
- a short to ground on the passenger air bag module.

Pinpoint Test H: LFC 32/DTC B1932 — Driver Air Bag Circuit Resistance High

Normal Operation

The restraints control module (RCM) monitors the resistance of the driver air bag ignitor by measuring the resistance between pins 3 and 4. If the RCM detects high resistance between these pins, it will store a diagnostic trouble code (DTC) B1932 in memory and flash a lamp fault code (LFC) 32 (or higher priority code if one exists) on the air bag indicator.

Possible Causes

Driver air bag high resistance can be caused by:

- a poor connection or corrosion in the driver air bag module circuits or the clockspring.
- high resistance in the clockspring.
- high resistance in the wiring harness.
- high resistance in the driver air bag module.
- RCM is faulted.

REPAIR the circuit(s) as necessary. GO to H6.

→ **No**
INSTALL a new clockspring. GO to H6.

H5 CHECK FOR AN INTERMITTENT FAULT

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision,

resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

3

On-Demand Self Test

2

Deactivate the system. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in the Diagnosis and Testing portion of this section.

● **Was DTC B1932 retrieved during the on-demand self test?**

→ **Yes**

CHECK for causes of intermittent fault at or near the driver air bag module connector. REPAIR any intermittent concerns found.

If an intermittent concern **was** found and repaired, GO to [H6](#).

If an intermittent concern **was not** found, GO to [H3](#).

→ **No**

CHECK for causes of intermittent short to battery or ignition on circuits 30S-JA8 (RD/OG) and 31S-JA8 (BK/OG) and the clockspring. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the key frequently. REPAIR any intermittent concern found. GO to [H6](#).

H6 CHECK FOR ADDITIONAL DTCs

1

Refer to the continuous DTCs recorded during Step H1.

	<ul style="list-style-type: none"> ● Were any continuous DTCs retrieved during Step H1? <p>→ Yes Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table in this section for pinpoint test direction.</p> <p>→ No RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS). CLEAR all DTCs.</p>
--	---

Pinpoint Test I: LFC 33/DTC B1933 — Passenger Air Bag Circuit Resistance High

Normal Operation

The restraints control module (RCM) monitors the resistance of the passenger air bag ignitor by measuring the resistance between pins 6 and 7. If the RCM detects high resistance between these pins, it will store a diagnostic trouble code (DTC) B1933 in memory and flash a lamp fault code (LFC) 33 (or higher priority code if one exists) on the air bag indicator.

Possible Causes

A passenger air bag high resistance can be caused by:

- a poor connection or corrosion in the passenger air bag module circuits.
- high resistance in the wiring harness.
- high resistance in the passenger air bag module.
- RCM is faulted.

PINPOINT TEST I: LFC 33/DTC B1933 — PASSENGER AIR BAG CIRCUIT RESISTANCE HIGH

CONDITIONS	DETAILS/RESULTS/ACTIONS
I1 CHECK FOR A HARD OR INTERMITTENT DTC	
<p>1 </p> <p>Retrieve/Clear Continuous DTCs</p> <p>2 </p>	<p>1 Retrieve and record any continuous DTCs for use later in this pinpoint test.</p>

On-Demand Self Test

- Was DTC B1933 retrieved during the on-demand self test?

→ **Yes**

This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to I2.

→ **No**

This is an intermittent fault. The fault condition is not present at this time. GO to I4.

I2 CHECK THE PASSENGER AIR BAG MODULE

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

3

On-Demand Self Test

2

Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

- Was DTC B1933 retrieved?

→ **Yes**
GO to I3.

→ **No**
INSTALL a new passenger air bag module. GO to I5.

I3 CHECK THE PASSENGER AIR BAG MODULE CIRCUIT

1

2

RCM C310a

3

Passenger Air Bag Module Restraint System Diagnostic Tool

4

DR0292-B

4 **NOTE:** By disconnecting the RCM connector, circuit 30S-JA11 (RD/WH) and circuit 31S-JA11 (BK/WH) of the RCM connector are shorted together with a shunting bar. Do not remove the shunting bar.

Measure the resistance between passenger air bag C256, circuit 30S-JA11 (RD/WH), harness side and passenger air bag C256, circuit 31S-JA11 (BK/WH) harness side.

- Is the resistance greater than 1.0 ohm?

→ **Yes**
REPAIR the circuit(s) as necessary. GO to I5.

→ **No**
INSTALL a new RCM. GO to I5.

I4 CHECK FOR AN INTERMITTENT FAULT

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when

equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

3

On-Demand Self Test

2

Deactivate the system. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in the Diagnosis and Testing portion of this section.

● **Was DTC B1933 retrieved during the on-demand self test?**

→ **Yes**

CHECK for causes of intermittent fault at or near the passenger air bag module connector. REPAIR any intermittent concerns found.

If an intermittent concern **was** found and repaired, GO to 15.

If an intermittent concern **was not** found, GO to 13.

→ **No**

CHECK for causes of intermittent short to battery or ignition on circuits 30S-JA11 (RD/WH) and 31S-JA11 (BK/WH). ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the key frequently. REPAIR any intermittent concern found. GO to 15.

15 CHECK FOR ADDITIONAL DTCs

1

Refer to the continuous DTCs recorded during Step 11.

● **Were any continuous DTCs retrieved during Step 11?**

	<p>→ Yes Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table in this section for pinpoint test direction.</p> <p>→ No RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) . CLEAR all DTCs.</p>
--	--

Pinpoint Test J: LFC 34/DTC B1934 — Driver Air Bag Circuit Resistance Low

Normal Operation

The restraints control module (RCM) monitors the resistance of the driver air bag ignitor by measuring the resistance between pins 3 and 4. If the RCM detects low resistance between these pins, it will store a diagnostic trouble code (DTC) B1934 in memory and flash a lamp fault code (LFC) 34 (or higher priority code if one exists) on the air bag indicator.

Possible Causes

Driver air bag low resistance can be caused by:

- a short in the clockspring.
- a short in the wiring harness.
- a low resistance in the driver air bag module.
- worn or damaged electrical connector shorting bar.
- worn or damaged electrical connector camming beam.
- RCM is faulted.

PINPOINT TEST J: LFC 34/DTC B1934 — DRIVER AIR BAG CIRCUIT RESISTANCE LOW

CONDITIONS	DETAILS/RESULTS/ACTIONS
J1 J1 CHECK FOR A HARD OR INTERMITTENT DTC	
<p>1 </p> <p>Retrieve/Clear Continuous DTCs</p> <p>2</p>	<p>1 Retrieve and record any continuous DTCs for use later in this pinpoint test.</p>

On-Demand Self Test

- Was DTC B1934 retrieved during the on-demand self test?

→ Yes

This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to J2.

→ No

This is an intermittent fault. The fault condition is not present at this time. GO to J5.

J2 CHECK THE DRIVER AIR BAG MODULE

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

3

On-Demand Self Test

2

Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

● Was DTC B1934 retrieved?

→ **Yes**
GO to J3.

→ **No**
INSTALL a new driver air bag module.
GO to J6.

J3 CHECK THE DRIVER AIR BAG MODULE CIRCUIT

1

2

Driver Air Bag Module Restraint System Diagnostic Tool

3

3 Measure the resistance between driver air bag C216, circuit 30S-JA8 (RD/OG), harness side and driver air bag C216, circuit 31S-JA8 (BK/OG), harness side.

● Is the resistance greater than 10,000 ohms?

→ **Yes**
INSTALL a new RCM. GO to J6.

→ **No**
GO to J4.

J4 CHECK THE CLOCKSPRING

1

Clockspring C218C

2

2 Measure the resistance between clockspring C218C, circuit 30S-JA8 (RD/OG) and circuit 31S-JA8 (BK/OG), harness side.

- Is the resistance greater than 10,000 ohms?

- **Yes**
INSTALL a new clockspring. GO to J6.
- **No**
REPAIR the circuit(s) as necessary. GO to J6.

J5 CHECK FOR AN INTERMITTENT FAULT

⚠ WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

3

- 2 Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

<p>On-Demand Self Test</p>	<p>● Was DTC B1934 retrieved during the on-demand self test?</p> <p>→ Yes CHECK for causes of intermittent fault at or near the driver air bag module connector. Pinpoint Test K: LFC 35/DTC B1935 — Passenger Air Bag Circuit Resistance Low

Normal Operation

The restraints control module (RCM) monitors the resistance of the passenger air bag ignitor by measuring the resistance between pins 6 and 7. If the RCM detects low resistance between these pins, it will store a diagnostic trouble code (DTC) B1935 in memory and flash a lamp fault code (LFC) 35 (or higher priority code if one exists) on the air bag indicator.

Possible Causes

Passenger air bag low resistance can be caused by:

- a short in the wiring harness.
- a low resistance in the passenger air bag module.
- an RCM internal concern.
- a worn or damaged electrical connector shorting bar.
- a worn or damaged electrical connector camming beam.

Pinpoint Test L: LTC 48/DTC B2444 — Driver Seat Side Impact Sensor Is Faulted

Normal Operation

The driver seat side impact sensor monitors the severity of a crash event. If the crash is severe enough, the sensor will signal the restraints control module (RCM) to deploy the driver seat side air bag.

The RCM monitors the two-wire current loop to the driver seat side impact sensor for a signal that is out of the expected range. If the RCM detects an out-of-range signal from the driver seat side impact

sensor, indicating a fault, it will store diagnostic trouble code (DTC) B2444 and flash a lamp fault code (LFC) 48 (or a higher priority code if one exists) on the air bag indicator.

Possible Causes

A driver seat side impact sensor fault can be caused by:

- Faulted driver seat side impact sensor.

PINPOINT TEST L: LFC 48/DTC B2444 — DRIVER SEAT SIDE IMPACT SENSOR IS FAULTED

CONDITIONS	DETAILS/RESULTS/ACTIONS

Pinpoint Test M: LFC 43/DTC B2440 — Passenger Seat Side Impact Sensor Mounting Fault

Normal Operation

The passenger seat side impact sensor monitors the severity of a crash event. If the crash is severe enough, the sensor will signal the restraints control module (RCM) to deploy the passenger seat side air bag.

The RCM monitors the two-wire current loop to the passenger seat side impact sensor for a signal that is out of the expected range. If the RCM detects an out-of-range signal from the passenger seat side impact sensor, indicating a sensor mounting fault, it will store diagnostic trouble code (DTC) B2440 and flash a lamp fault code (LFC) 43 (or a higher priority code if one exists) on the air bag indicator.

Possible Causes

A passenger seat side impact sensor mounting fault can be caused by:

- a passenger seat side impact sensor internal fault.
- a passenger seat side impact sensor mounting fault.
- RCM is faulted.

PINPOINT TEST M: LFC 43/DTC B2440 — PASSENGER SEAT SIDE IMPACT SENSOR MOUNTING FAULT

CONDITIONS	DETAILS/RESULTS/ACTIONS
M1 CHECK FOR A HARD OR INTERMITTENT DTC	
<p>1 </p> <p>Retrieve/Clear Continuous DTCs</p> <p>2 </p> <p>On-Demand Self Test</p>	<p>1 Retrieve and record any continuous DTCs for use later in this pinpoint test.</p> <p>● Was DTC B2440 retrieved during the on-demand self test?</p> <p>→ Yes This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to <u>M2</u>.</p> <p>→ No This is an intermittent fault. The fault condition is not present at this time. GO to <u>M5</u>.</p>
M2 CHECK THE MOUNTING OF THE PASSENGER SEAT SIDE IMPACT SENSOR	

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- 1 Deactivate the system. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in the Diagnosis and Testing portion of this section.
 - 2 Remove the passenger seat side impact sensor. Refer to [Side Impact Sensor](#) in the Removal and Installation portion of this section.
 - 3 Visually inspect the passenger seat side impact sensor, mounting bracket and mounting surface for damage, corrosion or dirt.
 - 4 Inspect the passenger seat side impact sensor mounting and make sure that the retaining bolts are fully seated and tightened correctly. Refer to [Side Impact Sensor](#) in the Removal and Installation portion of this section for correct tightening torque.
- **Was a significant amount of corrosion or dirt found, the passenger seat side impact sensor mounting bracket attached to the mounting surface in correctly, or the two passenger seat side impact sensor retaining bolts not fully seated and tightened correctly?**
- **Yes**
MAKE SURE the passenger seat side impact sensor, mounting bracket and mounting surface are free of damage, corrosion or dirt and the two retaining bolts are fully seated and correctly tightened. REATTACH the passenger seat side impact sensor and mounting bracket to the mounting surface. GO to [M6](#).
- **No**
GO to [M3](#).

M3 CHECK THE PASSENGER SEAT SIDE IMPACT SENSOR HARNESS CONNECTION

- 1 Check the passenger seat side impact sensor harness connection.
- **Is the passenger seat side impact sensor harness connector connected to the passenger seat side impact sensor correctly?**
- **Yes**
GO to [M4](#).

→ **No**
ATTACH the passenger seat side impact sensor harness connector correctly. GO to M6.

M4 CHECK THE VEHICLE CHASSIS GROUND

1 Measure the resistance between a known good chassis ground and the mounting surface of the passenger seat side impact sensor.

- **Is the resistance greater than 100 ohms?**

→ **Yes**
REPAIR the chassis grounding system. GO to M6.

→ **No**
INSTALL a new RCM. GO to M6.

M5 CHECK FOR AN INTERMITTENT FAULT

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

2

On-Demand Self-test

1 Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

3 Refer to the continuous DTCs recorded during Step M1.

- **Was DTC B2440 retrieved during the on-demand self test?**

→ **Yes**
GO to M2.

→ **No**

	CHECK for causes of an intermittent mounting fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to <u>M6</u> .
M6 CHECK FOR ADDITIONAL DTCs	
	<p>1 Refer to the continuous DTCs recorded during Step M1.</p> <ul style="list-style-type: none"> ● Were any continuous DTCs retrieved during Step M1? <p>→ Yes Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table in this section for pinpoint test direction.</p> <p>→ No RECONNECT the system. PROVE OUT the system. CLEAR all DTCs.</p>

Pinpoint Test N: LFC 42/DTC B2441 — Driver Seat Side Impact Sensor Mounting Fault

Normal Operation

The driver seat side impact sensor monitors the severity of a crash event. If the crash is severe enough, the sensor will signal the restraints control module (RCM) to deploy the driver seat side air bag.

The RCM monitors the two-wire current loop to the driver seat side impact sensor for a signal that is out of the expected range. If the RCM detects an out-of-range signal from the driver seat side impact sensor, indicating a sensor mounting fault, it will store diagnostic trouble code (DTC) B2441 and flash a lamp fault code (LFC) 42 (or a higher priority code if one exists) on the air bag indicator.

Possible Causes

A driver seat side impact sensor mounting fault can be caused by:

- a driver seat side impact sensor internal fault.
- a driver seat side impact sensor mounting fault.
- RCM is faulted.

PINPOINT TEST N: LFC 42/DTC B2441 — DRIVER SEAT SIDE IMPACT SENSOR MOUNTING FAULT

CONDITIONS	DETAILS/RESULTS/ACTIONS
N1 CHECK FOR A HARD OR INTERMITTENT DTC	
<p>1</p>  <p>Retrieve/Clear Continuous DTCs</p> <p>2</p>	<p>1 Retrieve and record any continuous DTCs for use later in this pinpoint test.</p>

On-Demand Self Test

- Was DTC B2441 retrieved during the on-demand self test?

→ Yes

This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to [N2](#).

→ No

This is an intermittent fault. The fault condition is not present at this time. GO to [N5](#).

N2 CHECK THE MOUNTING OF THE DRIVER SIDE CRASH SENSOR

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- 1 Deactivate the system. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in the Diagnosis and Testing portion of this section.
- 2 Remove the driver seat side impact sensor. Refer to [Side Impact Sensor](#) in the Removal and Installation portion of this section.
- 3 Visually inspect the driver seat side impact sensor, mounting bracket and mounting surface for damage, corrosion or dirt.
- 4 Inspect the driver seat side impact sensor mounting and make sure that the retaining bolts are fully seated and tightened correctly. Refer to [Side Impact Sensor](#) in this section for correct tightening torque.

- Was a significant amount of corrosion or dirt found, the driver seat side impact sensor mounting bracket attached to the mounting surface incorrectly, or the two driver seat side impact sensor retaining bolts not fully seated and tightened correctly?

→ Yes

MAKE SURE the driver seat side impact sensor, mounting bracket and mounting surface are free of damage, corrosion or dirt and the two retaining bolts are fully seated and correctly tightened. REATTACH the driver seat side impact sensor and mounting bracket to the mounting surface. GO to [N6](#).

→ **No**
GO to [N3](#).

N3 CHECK THE DRIVER SEAT SIDE CRASH SENSOR HARNESS CONNECTION

1 Check the driver seat side impact sensor harness connection.

- **Is the driver seat side impact sensor harness connector connected to the driver seat side impact sensor correctly?**

→ **Yes**
GO to [N4](#).

→ **No**
ATTACH the driver seat side impact sensor harness connector correctly.
GO to [N6](#).

N4 CHECK THE VEHICLE CHASSIS GROUND

1 Measure the resistance between a known good chassis ground and the mounting surface of the driver seat side impact sensor.

- **Is the resistance greater than 100 ohms?**

→ **Yes**
REPAIR the chassis grounding system. GO to [N6](#).

→ **No**
INSTALL a new RCM. GO to [N6](#).

N5 CHECK FOR AN INTERMITTENT FAULT

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1 Deactivate the system. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in the Diagnosis and Testing

<p>2</p>  <p>On-Demand Self Test</p>	<p>portion of this section.</p> <ul style="list-style-type: none"> ● Was DTC B2441 retrieved during the on-demand self test? <p>→ Yes GO to <u>N2</u>.</p> <p>→ No CHECK for causes of an intermittent mounting fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to <u>N6</u>.</p>
<p>N6 CHECK FOR ADDITIONAL DTCs</p>	
	<p>1 Refer to the continuous DTCs recorded during Step N1.</p> <ul style="list-style-type: none"> ● Were any continuous DTCs retrieved during Step N1? <p>→ Yes Do not clear any DTCs until all DTCs have been resolved. CLEAR all DTCs.</p>

Pinpoint Test O: LFC 49/DTC B2445 — Passenger Seat Side Impact Sensor Is Faulted

Normal Operation

The passenger seat side impact sensor monitors the severity of a crash event. If the crash is severe enough, the sensor will signal the restraints control module (RCM) to deploy the passenger seat side air bag.

The RCM monitors the two-wire current loop to the passenger seat side impact sensor for a signal that is out of the expected range. If the RCM detects an out-of-range signal from the passenger seat side impact sensor, indicating a fault, it will store diagnostic trouble code (DTC) B2445 and flash a lamp fault code (LFC) 49 (or a higher priority code if one exists) on the air bag indicator.

Possible Causes

A passenger seat side impact sensor fault can be caused by:

- damaged passenger seat side impact sensor.

PINPOINT TEST O: LFC 49/DTC B2445 — PASSENGER SEAT SIDE IMPACT SENSOR IS FAULTED

CONDITIONS	DETAILS/RESULTS/ACTIONS
O1 CHECK FOR A HARD OR INTERMITTENT DTC	
<p>1 </p> <p>Retrieve/Clear Continuous DTCs</p> <p>2 </p> <p>On-Demand Self Test</p>	<p>1 Retrieve and record any continuous DTCs for use later in this pinpoint test.</p> <p>● Was DTC B2445 retrieved during the on-demand self test?</p> <p>→ Yes This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. INSTALL a new passenger seat side impact sensor. GO to <u>O2</u>.</p> <p>→ No This is an intermittent fault. The fault condition is not present at this time. O2 CHECK FOR ADDITIONAL DTCs	
	<p>1 Refer to the continuous DTCs recorded during Step O1.</p> <p>● Were any continuous DTCs retrieved during Step O1?</p> <p>→ Yes Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table in this section for pinpoint test direction.</p> <p>→ No CLEAR all DTCs.</p>

Pinpoint Test P: LFC 44/DTC U2017 — Driver Side Impact Sensor Communication Fault

Normal Operation

The driver seat side impact sensor monitors the severity of a crash event. If the crash is severe enough, the sensor will signal the restraints control module (RCM) to deploy the driver seat side air bag.

The RCM monitors the two-wire current loop to the driver seat side impact sensor for a signal that is out of the expected range. If the RCM detects an out-of-range signal from the driver seat side impact sensor, indicating a sensor communication fault, it will store diagnostic trouble code (DTC) U2017 and flash a lamp fault code (LFC) 44 (or a higher priority code if one exists) on the air bag indicator.

Possible Causes

A driver seat side impact sensor communication fault can be caused by:

- damaged wiring on circuit 7-JA39 (YE).
- damaged wiring on circuit 9-JA39 (BN).
- damaged driver seat side impact sensor.

PINPOINT TEST P: LFC 44/DTC U2017 — DRIVER SEAT SIDE IMPACT SENSOR COMMUNICATION FAULT

CONDITIONS	DETAILS/RESULTS/ACTIONS
P1 CHECK FOR CONTINUOUS OR ON-DEMAND SELF TEST DTCs

REPAIR the circuit. GO to P10.

→ **No**
GO to P7.

P7 CHECK CIRCUIT 7-JA39 (YE) FOR A SHORT TO BATTERY OR IGNITION

1

2

A0042307

2 Measure the voltage between RCM C310b pin 8, circuit 7-JA39 (YE), harness side and ground.

- Is the voltage less than 0.2 volt?

→ **Yes**
GO to P8.

→ **No**
REPAIR the circuit. GO to P10.

P8 CHECK CIRCUIT 9-JA39 (BN) FOR A SHORT TO BATTERY OR IGNITION

1

A0030433

1 Measure the voltage between RCM C310b pin 9, circuit 9-JA39 (BN), harness side and ground.

- Is the voltage less than 0.2 volt?

→ **Yes**
INSTALL a new driver seat side impact sensor. GO to P10.

→ **No**
REPAIR the circuit. GO to P10.

P9 CHECK FOR AN INTERMITTENT FAULT

 **WARNING:** If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

2

On-Demand Self Test

1 Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

- Was DTC U2017 retrieved during the on-demand self test?

→ **Yes**
GO to P2.

→ **No**
CHECK for causes of a communication fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to P10.

P10 CHECK FOR ADDITIONAL DTCs

1 Refer to the continuous DTCs recorded during Step P1.

- Were any continuous DTCs retrieved during Step P1?

	<p>→ Yes Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table in this section for pinpoint test direction.</p> <p>→ No RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) . CLEAR all DTCs.</p>
--	--

Pinpoint Test Q: LFC 45/DTC U2018 — Passenger Seat Side Impact Sensor Communication Fault

Normal Operation

The passenger seat side impact sensor monitors the severity of a crash event. If the crash is severe enough, the sensor will signal the restraints control module (RCM) to deploy the passenger seat side air bag.

The RCM monitors the two-wire current loop to the passenger seat side impact sensor for a signal that is out of the expected range. If the RCM detects an out-of-range signal from the passenger seat side impact sensor, indicating a sensor communication fault, it will store diagnostic trouble code (DTC) U2018 and flash a lamp fault code (LFC) 45 (or a higher priority code if one exists) on the air bag indicator.

Possible Causes

A passenger seat side impact sensor communication fault can be caused by:

- damaged wiring on circuit 7-JA40 (YE/VT).
- damaged wiring on circuit 9-JA40 (BN/WH).
- damaged passenger seat side impact sensor.

PINPOINT TEST Q: LFC LFC 45/DTC U2018 — PASSENGER SIDE IMPACT SENSOR COMMUNICATION FAULT

CONDITIONS	DETAILS/RESULTS/ACTIONS
Q1 CHECK FOR CONTINUOUS OR ON-DEMAND SELF TEST DTCs	
<p>1 </p> <p>Retrieve/Clear Continuous DTCs</p> <p>2</p>	<p>1 Retrieve and record any continuous DTCs for use later in this pinpoint test.</p>

On-Demand Self Test

- **Was DTC U2018 retrieved during the on-demand self test?**

→ **Yes**

This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to Q2.

→ **No**

This is an intermittent fault. The fault condition is not present at this time. GO to Q9.

Q2 CHECK THE PASSENGER SIDE IMPACT SENSOR HARNESS CONNECTOR

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1 Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

2 Check the passenger seat side impact sensor electrical connector for a correct connection.

- **Is the passenger seat side impact sensor connected correctly?**

→ **Yes**

GO to Q3.

→ **No**
CONNECT the passenger seat side impact sensor connector correctly. GO to Q6.

Q3 CHECK CIRCUIT 7-JA40 (YE/VT) FOR AN OPEN

1

2

RCM C310

3

Passenger Side Crash Sensor C304

4

DR1004-A

4 Measure the resistance between RCM C310b pin 10, circuit 7-JA40 (YE/VT), harness side and passenger seat side impact sensor C304, circuit 7-JA40 (YE/VT), harness side.

- Is the resistance greater than 10,000 ohms?

→ **Yes**
REPAIR the circuit. GO to Q10.

→ **No**
GO to Q4.

Q4 CHECK CIRCUIT 9-JA40 (BN/WH) FOR AN OPEN

1

DR1005-A

1 Measure the resistance between RCM C310b pin 11, circuit 9-JA40 (BN/WH), harness side and passenger seat side impact sensor C304, circuit 9-JA40 (BN/WH), harness side.

● Is the resistance greater than 10,000 ohms?

→ **Yes**
REPAIR the circuit. GO to Q10.

→ **No**
GO to Q5.

Q5 CHECK CIRCUIT 7-JA40 (YE/VT) FOR A SHORT TO GROUND

1

RCM C310a

2

DR1023-A

2 Measure the resistance between RCM C310b pin 10, circuit 7-JA40 (YE/VT), harness side and RCM C310a pin 21, circuit 31-JA10A (BK/RD), harness side.

● Is the resistance less than 10,000 ohms?

→ **Yes**
REPAIR the circuit. GO to Q10.

→ **No**
GO to Q6.

Q6 CHECK CIRCUIT 9-JA40 (BN/WH) FOR A SHORT TO GROUND

1

1 Measure the resistance between RCM C310b pin 11, circuit 9-JA40 (BN/WH), harness side and RCM C310a pin 21, circuit 31-JA10A (BK/RD), harness side.

DR1057-A

- Is the resistance less than 10,000 ohms?

→ **Yes**
REPAIR the circuit. GO to Q10.

→ **No**
GO to Q7.

Q7 CHECK CIRCUIT 7-JA40 (YE/VT) FOR A SHORT TO BATTERY OR IGNITION

1

2

A0042310

- 2 Measure the voltage between RCM C310b pin 10, circuit 7-JA40 (YE/VT), harness side and ground.

- Is the voltage less than 0.2 volt?

→ **Yes**
GO to Q8.

→ **No**
REPAIR the circuit. GO to Q10.

Q8 CHECK CIRCUIT 9-JA40 (BN/WH) FOR A SHORT TO BATTERY OR IGNITION

1

1 Measure the voltage between the RCM C310b pin 11, circuit 9-JA40 (BN/WH), harness side and ground.

● **Is the voltage less than 0.2 volt?**

→ **Yes**
INSTALL a new passenger seat side impact sensor. GO to Q10.

→ **No**
REPAIR the circuit. GO to Q10.

Q9 CHECK FOR AN INTERMITTENT FAULT

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

2

On-Demand Self Test

1 Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

	<ul style="list-style-type: none"> ● Was DTC U2018 retrieved during the on-demand self test? <p>→ Yes GO to <u>Q2</u>.</p> <p>→ No CHECK for causes of a communication fault. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to <u>Q10</u>.</p>
Q10 CHECK FOR ADDITIONAL DTCs	
	<p>1 Refer to the continuous DTCs recorded during Step Q1.</p> <ul style="list-style-type: none"> ● Were any continuous DTCs retrieved during Step Q1? <p>→ Yes Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table in this section for pinpoint test direction.</p> <p>→ No RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to <u>Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)</u>. CLEAR all DTCs.</p>

Pinpoint Test R: LFC 36/DTC B1993 — Driver Seat Side Air Bag Circuit Shorted to Ground

Normal Operation

The restraints control module (RCM) monitors the resistance to ground at RCM C310b pins 2 and 3. If the resistance is less than 10,000 ohms at either pin, the RCM will interpret that as a ground short, store diagnostic trouble code (DTC) B1993 and flash lamp fault code (LFC) 36.

Possible Causes

A driver seat side air bag circuit short to ground can be caused by:

- grounded wiring on circuit 30S-JA37 (RD/GN).
- damaged wiring on circuit 31S-JA37 (BK/GN).
- ground short in the driver seat side air bag module.
- RCM is faulted.

PINPOINT TEST R: LFC 36/DTC B1993 — DRIVER SIDE AIR BAG CIRCUIT SHORTED TO GROUND

CONDITIONS	DETAILS/RESULTS/ACTIONS
R1 CHECK FOR A HARD OR INTERMITTENT DTC	
<p>1  Retrieve/Clear Continuous DTCs</p> <p>2  On-Demand Self Test</p>	<p>1 Retrieve and record any continuous DTCs for use later in this pinpoint test.</p> <p>● Was DTC B1993 retrieved during the on-demand self test?</p> <p>→ Yes This is a hard fault. The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.</p> <p>NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.</p> <p>NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.</p> <p>NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.</p>	
<p>1</p>	

3

On-Demand Self Test

2 Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

● **Was DTC B1993 retrieved?**

→ **Yes**
GO to R3.

→ **No**
INSTALL a new driver seat side air bag module. GO to R6.

R3 CHECK THE DRIVER SIDE AIR BAG MODULE CIRCUITS

1

2

RCM C310b

3

RCM C310a

4

4 **NOTE:** Do not separate or remove shorting bars from RCM C310b.

Measure the resistance between RCM C310b pin 2, circuit 30S-JA37 (RD/GN), harness side and RCM C310a pin 21, circuit 31-JA10A (BK/RD), harness side.

DR1011-A

- Is the resistance less than 10,000 ohms?

→ **Yes**
REPAIR the circuit(s) as necessary. GO to R6.

→ **No**
GO to R4.

R4 CHECK THE WIRING TO DRIVER SIDE AIR BAG MODULE

1

Driver Side Air Bag Module Restraint System Diagnostic Tool

2

Inspect all crimps, terminals, wires and connectors in circuit 30S-JA37 (RD/GN) between the driver seat side air bag module connector C367 and RCM C310b pin 2 and circuit 31S-JA37 (BK/GN) between the driver seat side air bag module connector C367 and RCM C310b pin 3. Check for pinched wires and damaged connector pin terminals.

- Was any damage found?

→ **Yes**
REPAIR as necessary. GO to R6.

→ **No**
INSTALL a new RCM. GO to R6.

R5 CHECK FOR AN INTERMITTENT FAULT

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

3

On-Demand Self Test

2

Deactivate the system. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in the Diagnosis and Testing portion of this section.

- Was DTC B1993 retrieved during the on-demand self test?

→ **Yes**

CHECK for causes of intermittent fault at or near the driver air bag module connector. REPAIR any intermittent concerns found.

If an intermittent concern **was** found and repaired, GO to [R6](#).

If an intermittent concern **was not** found, GO to [R3](#).

→ **No**

CHECK for causes of intermittent short to battery or ignition on circuits 30S-JA8 (RD/OG) and 31S-JA8 (BK/OG) and the clockspring. ATTEMPT to recreate the

	hard fault by flexing the wire harness and cycling the key frequently. REPAIR any intermittent concern found. GO to <u>R6</u> .
R6 CHECK FOR ADDITIONAL DTCs	
	<p>1 Refer to the continuous DTCs recorded during Step R1.</p> <ul style="list-style-type: none"> ● Were any continuous DTCs retrieved during Step R1? <p>→ Yes Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table in this section for pinpoint test direction.</p> <p>→ No RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to <u>Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)</u>. CLEAR all DTCs.</p>

Pinpoint Test S: LFC 37/DTC B1997 — Passenger Seat Side Air Bag Circuit Shorted to Ground

Normal Operation

The restraints control module (RCM) monitors the resistance to ground at RCM C310b pins 5 and 6. If the resistance is less than 10,000 ohms at either pin, the RCM will interpret that as a ground short, store diagnostic trouble code (DTC) B1997 and flash lamp fault code (LFC) 37.

Possible Causes

A passenger seat side air bag circuit short to ground can be caused by:

- grounded wiring on circuit 30S-JA38 (RD/BK).
- damaged wiring on circuit 31S-JA38 (BK/RD).
- ground short in the passenger seat side air bag module.
- RCM is faulted.

PINPOINT TEST S: LFC 37/DTC B1997 — PASSENGER SEAT SIDE AIR BAG CIRCUIT SHORTED TO GROUND

CONDITIONS	DETAILS/RESULTS/ACTIONS
S1 CHECK FOR A HARD OR INTERMITTENT DTC	
<p>1</p> 	<p>1 Retrieve and record any continuous DTCs for use later in this pinpoint test.</p>

Retrieve/Clear Continuous DTCs

2

On-Demand Self Test

● Was DTC B1997 retrieved during the on-demand self test?

→ Yes

This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to S2.

→ No

This is an intermittent fault. The fault condition is not present at this time. GO to S5.

S2 CHECK THE PASSENGER SEAT SIDE AIR BAG MODULE

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

3

2 Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

On-Demand Self Test

● Was DTC B1997 retrieved?

→ **Yes**

GO to S3.

→ **No**

INSTALL a new passenger seat side air bag module. GO to S6.

S3 CHECK THE PASSENGER SEAT SIDE AIR BAG MODULE CIRCUITS

1

2

RCM C310b

3

RCM C310a

4

4

Measure the resistance between RCM C310b pin 5, circuit 30S-JA38 (RD/BK), harness side and RCM C310a pin 21, circuit 31-JA10A (BK/RD), harness side.

● Is the resistance less than 10,000 ohms?

→ **Yes**
REPAIR the circuit(s) as necessary. GO to S6.

→ **No**
GO to S4.

S4 CHECK THE WIRING TO THE PASSENGER SEAT SIDE AIR BAG MODULE

1

Passenger Seat Side Air Bag Module Restraint System Diagnostic Tool

2 Inspect all crimps, terminals, wires and connectors in circuit 30S-JA38 (RD/BK) between the passenger seat side air bag module connector C314 and RCM C310b pin 5 and circuit 31S-JA38 (BK/RD) between the passenger seat side air bag module connector C314 and RCM C310b pin 6. Check for pinched wires and damaged connector pin terminals.

● Was any damage found?

→ **Yes**
REPAIR as necessary. GO to S6.

→ **No**
INSTALL a new RCM. GO to S6.

S5 CHECK FOR AN INTERMITTENT FAULT

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

3

On-Demand Self Test

2 Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

● **Was DTC B1997 retrieved during the on-demand self test?**

→ **Yes**

CHECK for causes of intermittent fault at or near the passenger seat air bag module connector. REPAIR any intermittent concerns found.

If an intermittent concern **was** found and repaired, GO to S6.

If an intermittent concern **was not** found, GO to S3.

→ **No**

CHECK for causes of intermittent short to ground on circuits 30S-JA38 (RD/BK) and 31S-JA38 (BK/RD). ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the key frequently. REPAIR any intermittent concern found. GO to S6.

S6 CHECK FOR ADDITIONAL DTCs

1 Refer to the continuous DTCs recorded during Step S1.

● **Were any continuous DTCs retrieved during Step S1?**

→ **Yes**

Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table in this section for pinpoint test direction.

→ **No**

RECONNECT the system. REACTIVATE the system. PROVE OUT the system.

REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS). CLEAR all DTCs.

Pinpoint Test T: LFC 36/DTC B1992 — Driver Seat Side Air Bag Circuit Shorted to Battery or Ignition

Normal Operation

The restraints control module (RCM) monitors the driver seat side air bag circuits at RCM C310b pins 2 and 3 for a short to battery or ignition. If battery or ignition voltage is detected, the RCM will store diagnostic trouble code (DTC) B1992 and flash lamp fault code (LFC) 36.

Possible Causes

A driver seat side air bag circuit short to battery or ignition can be caused by:

- battery or ignition voltage on circuit 30S-JA38 (RD/BK).
- battery or ignition voltage on circuit 31S-JA38 (BK/RD).
- battery or ignition voltage short in the driver seat side air bag module.
- RCM is faulted.

If an intermittent concern **was not** found, GO to U3.

→ **No**

CHECK for causes of intermittent short to battery or ignition on circuits 30S-JA38 (RD/BK) and 31S-JA38 (BK/RD). ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the key frequently. REPAIR any intermittent concern found. GO to U6.

U6 CHECK FOR ADDITIONAL DTCs

1 Refer to the continuous DTCs recorded during Step U1.

- **Were any continuous DTCs retrieved during Step U1?**

→ **Yes**

Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table in this section for pinpoint test direction.

→ **No**

RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS). CLEAR all DTCs.

Pinpoint Test V: LFC 36/DTC B1994 — Driver Seat Side Air Bag Circuit Resistance High

Normal Operation

The restraints control module (RCM) monitors the resistance of the driver seat side air bag circuit loop and the air bag module igniter at RCM C301b pins 2 and 3. If the resistance is greater than 3.6 ohms, the RCM will store diagnostic trouble code (DTC) B1994 and flash lamp fault code (LFC) 36.

Possible Causes

A high resistance on the driver seat side air bag circuit can be caused by:

- damaged wiring on circuit 30S-JA37 (RD/GN).
- damaged wiring on circuit 31S-JA37 (BK/GN).
- damaged driver seat side air bag module.
- RCM is faulted.

W2 CHECK THE PASSENGER SIDE AIR BAG MODULE	
<p> WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to <u>Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)</u> in this section.</p> <p>The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.</p> <p>NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.</p> <p>NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.</p> <p>NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.</p>	

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

3

On-Demand Self Test

2 Deactivate the system. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in the Diagnosis and Testing portion of this section.

● Was DTC B1998 retrieved?

→ Yes
GO to [W3](#).

→ No
INSTALL a new passenger seat side air bag module. GO to [W5](#).

W3 CHECK THE PASSENGER SIDE AIR BAG MODULE CIRCUIT

1

2

RCM C310b

3

Passenger Seat Side Air Bag Module Restraint System Diagnostic Tool

4

4 **NOTE:** By disconnecting RCM C310b, circuit 30S-JA38 (RD/BK) and circuit 31S-JA38 (BK/RD) of the RCM connector are shorted together with a shorting bar. Do not remove the shorting bar.

Measure the resistance between passenger seat side air bag C337, circuit 30S-JA38 (RD/BK), harness side and passenger seat side air bag

DR1050-A

C337, circuit 31S-JA38 (BK/RD), harness side.

- Is the resistance greater than 1.0 ohm?

→ **Yes**
REPAIR the circuit(s) as necessary. GO to W6.

→ **No**
GO to W4.

W4 CHECK THE WIRING TO THE PASSENGER SIDE AIR BAG MODULE

- 1 Inspect all crimps, terminals, wires and connectors in circuits 30S-JA38 (RD/BK) and 31S-JA38 (BK/RD) between passenger seat side air bag module connector C337 and RCM C310b pins 5 and 6. Check for pinched wires and damaged connector pin terminals.

- Was any damage found?

→ **Yes**
REPAIR as necessary. GO to W6.

→ **No**
INSTALL a new RCM. GO to W6.

W5 CHECK FOR AN INTERMITTENT FAULT

⚠ WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools

must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

3

On-Demand Self Test

2 Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

● **Was DTC B1998 retrieved during the on-demand self test?**

→ **Yes**

CHECK for causes of intermittent fault at or near the passenger seat air bag module connector. REPAIR any intermittent concerns found.

If an intermittent concern **was** found and repaired, GO to W6.

If an intermittent concern **was not** found, GO to W3.

→ **No**

CHECK for causes of intermittent high resistance on circuit 30S-JA38 (RD/BK) and circuit 31S-JA38 (BK/RD).

ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to W6.

W6 CHECK FOR ADDITIONAL DTCs

1 Refer to the continuous DTCs recorded during Step W1.

● **Were any continuous DTCs retrieved during Step W1?**

→ **Yes**

Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table in this section for pinpoint test direction.

→ **No**
 RECONNECT the system.
 REACTIVATE the system. PROVE OUT
 the system. REFER to [Air Bag and
 Safety Belt Pretensioner Supplemental
 Restraint System \(SRS\)](#). CLEAR all
 DTCs.

Pinpoint Test X: LFC 36/DTC B1995 — Driver Seat Side Air Bag Circuit Resistance Low

Normal Operation

The restraints control module (RCM) monitors the resistance of the driver seat side air bag circuit loop and the air bag module igniter at RCM C310b pin 2 and 3. If the resistance is less than 0.7 ohms, the RCM will store diagnostic trouble code (DTC) B1995 and flash lamp fault code (LFC) 36.

Possible Causes

A low resistance on the driver seat side air bag circuit can be caused by:

- damaged wiring on circuit 30S-JA37 (RD/GN).
- damaged wiring on circuit 31S-JA37 (BK/GN).
- damaged driver seat side air bag module.
- RCM is faulted.
- damaged electrical connector shorting bar.
- damaged electrical connector camming beam.

PINPOINT TEST X: LFC 36/DTC B1995 — DRIVER SEAT SIDE AIR BAG CIRCUIT RESISTANCE LOW

CONDITIONS	DETAILS/RESULTS/ACTIONS
X1 CHECK FOR A HARD OR INTERMITTENT DTC	
<div style="display: flex; flex-direction: column; align-items: center;"> <div style="margin-bottom: 20px;"> <div style="border: 1px solid black; padding: 5px; width: 100px; text-align: center;">1</div>  <p>Retrieve/Clear Continuous DTCs</p> </div> <div> <div style="border: 1px solid black; padding: 5px; width: 100px; text-align: center;">2</div>  <p>On-Demand Self-Test</p> </div> </div>	<div style="margin-bottom: 20px;"> <div style="border: 1px solid black; padding: 5px; width: 100px; text-align: center;">1</div> <p>Retrieve and record any continuous DTCs for use later in this pinpoint test.</p> </div> <ul style="list-style-type: none"> ● Was DTC B1995 retrieved during the on-demand self test? <p>→ Yes This is a hard fault. The fault condition is</p>

still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to X2.

→ **No**
This is an intermittent fault. The fault condition is not present at this time. GO to X4.

X2 CHECK THE DRIVER SIDE AIR BAG MODULE

 **WARNING:** If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

3

On-Demand Self Test

2 Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

● Was DTC B1995 retrieved?

→ **Yes**
GO to X3.

→ **No**
INSTALL a new driver seat side air bag module. GO to X5.

X3 CHECK THE DRIVER SIDE AIR BAG MODULE CIRCUIT TO THE SEAT HARNESS

1

2

Driver Seat Side Air Bag Module Restraint System Diagnostic Tool

3

DR1050-A

3

Measure the resistance between driver seat side air bag C367, circuit 30S-JA37 (RD/GN), harness side and driver seat side air bag C367, circuit 31S-JA37 (BK/GN), harness side.

- Is the resistance greater than 10,000 ohms?

→ Yes

INSTALL a new RCM. GO to X5.

→ No

REPAIR the circuit(s) as necessary. GO to X5.

X4 CHECK FOR AN INTERMITTENT FAULT

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

3

On-Demand Self Test

- 2 Deactivate the system. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in the Diagnosis and Testing portion of this section.

● **Was DTC B1995 retrieved during the on-demand self test?**

→ **Yes**

CHECK for causes of intermittent fault at or near the driver seat air bag module connector. REPAIR any intermittent concerns found.

If an intermittent concern **was** found and repaired, GO to [X5](#).

If an intermittent concern **was not** found, GO to [X3](#).

→ **No**

CHECK for causes of intermittent high resistance on circuits 30S-JA37 (RD/GN) and 31S-JA37 (BK/GN). ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the key frequently. REPAIR any intermittent concern found. GO to [X5](#).

X5 CHECK FOR ADDITIONAL DTCs

- 1 Refer to the continuous DTCs recorded during Step X1.

● **Was the continuous DTC retrieved during Step X1?**

→ **Yes**

Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table in this section for pinpoint test direction.

→ **No**

RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to [Air Bag and](#)

Pinpoint Test Y: LFC 37/DTC B1999 — Passenger Seat Side Air Bag Circuit Resistance Low

Normal Operation

The restraints control module (RCM) monitors the resistance of the passenger seat side air bag circuit loop and the air bag module igniter at RCM C310b pins 5 and 6. If the resistance is less than 0.7 ohms, the RCM will store diagnostic trouble code (DTC) B1999 and flash lamp fault code (LFC) 37.

Possible Causes

A low resistance on the passenger seat side air bag circuit can be caused by:

- damaged wiring on circuit 30S-JA38 (RD/BK).
- damaged wiring on circuit 31S-JA38 (BK/RD).
- damaged passenger seat side air bag module.
- RCM is faulted.
- damaged electrical connector shorting bar.
- damaged electrical connector camming beam.

PINPOINT TEST Y: LFC 37/DTC B1999 — PASSENGER SIDE AIR BAG CIRCUIT RESISTANCE LOW

CONDITIONS	DETAILS/RESULTS/ACTIONS
Y1 CHECK FOR A HARD OR INTERMITTENT DTC	
<p>1  Retrieve/Clear Continuous DTCs</p> <p>2  On-Demand Self Test</p>	<p>1 Retrieve and record any continuous DTCs for use later in this pinpoint test.</p> <p>● Was DTC B1999 retrieved during the on-demand self test?</p> <p>→ Yes This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to <u>Y2</u>.</p>

→ **No**
This is an intermittent fault. The fault condition is not present at this time. GO to Y4.

Y2 CHECK THE PASSENGER SIDE AIR BAG MODULE

 **WARNING:** If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

3

On-Demand Self Test

2 Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

● **Was DTC B1999 Retrieved?**

→ **Yes**
GO to Y3.

→ **No**
INSTALL a new passenger seat side air bag module. GO to Y5.

Y3 CHECK THE PASSENGER SIDE AIR BAG MODULE CIRCUIT

1

2

Passenger Side Air Bag Module Restraint System Diagnostic Tool

3

DR1050-A

3

Measure the resistance between passenger seat side air bag C337, circuit 30S-JA38 (RD/BK), harness side and circuit 31S-JA38 (BK/RD), harness side.

- Is the resistance greater than 10,000 ohms?

→ Yes

INSTALL a new RCM. GO to Y5.

→ No

REPAIR the circuit(s) as necessary. GO to Y5.

Y4 CHECK FOR AN INTERMITTENT FAULT

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

2

Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner

3

On-Demand Self Test

Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

- **Was DTC B1999 retrieved during the on-demand self test?**

→ **Yes**

CHECK for causes of intermittent fault at or near the passenger seat air bag module connector. REPAIR any intermittent concerns found.

If an intermittent concern **was** found and repaired, GO to Y5.

If an intermittent concern **was not** found, GO to Y3.

→ **No**

CHECK for causes of intermittent high resistance on circuits 30S-JA38 (RD/BK) and 31S-JA38 (BK/RD). ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the key frequently. REPAIR any intermittent concern found. GO to Y5.

Y5 CHECK FOR ADDITIONAL DTCs

1 Refer to the continuous DTCs recorded during Step Y1.

- **Were any continuous DTCs retrieved during Step Y1?**

→ **Yes**

Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table in this section for pinpoint test direction.

→ **No**

RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS). CLEAR all DTCs.

Normal Operation

The restraints control module (RCM) monitors the resistance of the circuit to the driver safety belt retractor pretensioner. When the RCM detects a resistance that is out of the expected range (high or low) it will set lamp fault code (LFC) 46 and diagnostic test code (DTC) B1885 or B1877.

Possible Causes

An out of range resistance on the driver safety belt retractor pretensioner circuit can be caused by:

- out of range resistance on circuit 30S-JA33 (RD/BU).
- out of range resistance on circuit 31S-JA33 (BK/BU).
- out of range resistance on the driver safety belt retractor pretensioner.
- RCM is faulted.

PINPOINT TEST Z: LFC 46/DTC B1885/B1877 — DRIVER SAFETY BELT RETRACTOR PRETENSIONER CIRCUIT RESISTANCE HIGH OR LOW

Z2 CHECK THE DRIVER SAFETY BELT RETRACTOR PRETENSIONER CIRCUIT	
1	

PID/Data Monitor and Record

2 Select PID D_PRTNR.

● Is the resistance greater than 3.2 or less than 1.7 ohms?

→ Yes
GO to Z3.

→ No
INSTALL a new RCM. GO to Z5.

Z3 CHECK THE DRIVER SAFETY BELT RETRACTOR PRETENSIONER

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

2 Deactivate the system. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in the Diagnosis and Testing portion of this section.

3

PID/Data Monitor and Record

3 Select PID D_PRTNR.

● Is the resistance greater than 3.2 or less than 1.7 ohms?

→ Yes
REPAIR the resistance concern on circuit 30S-JA33 (RD/BU) or 31S-JA33

(BK/BU). GO to Z5.

→ **No**
INSTALL a new driver safety belt retractor pretensioner. GO to Z5.

Z4 CHECK FOR AN INTERMITTENT FAULT

 **WARNING:** If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

2

Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

3

On-Demand Self Test

- Was DTC B1877 or B1885 retrieved during the on-demand self test?

→ **Yes**

CHECK for causes of intermittent fault at or near the driver safety belt retractor pretensioner connector. REPAIR any intermittent concerns found.

If an intermittent concern **was** found and repaired, GO to Z5.

If an intermittent concern **was not** found, GO to Z2.

→ **No**

CHECK for causes of intermittent high resistance on circuits 30S-JA33 (RD/BU) and circuit 31S-JA33 (BK/BU). ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to Z5.

Z5 CHECK FOR ADDITIONAL DTCs

	<p>1 Refer to the continuous DTCs recorded during Step Z1.</p> <ul style="list-style-type: none"> ● Were any continuous DTCs retrieved during Step Z1? <p>→ Yes Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table in this section for pinpoint test direction.</p> <p>→ No RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to <u>Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)</u>. CLEAR all DTCs.</p>
--	---

Pinpoint Test AA: LFC 47/DTC B1881/B1886 — Passenger Safety Belt Retractor Pretensioner Circuit Resistance High or Low

Normal Operation

The restraints control module (RCM) monitors the resistance of the circuit to the passenger safety belt retractor pretensioner. When the RCM detects a resistance that is out of the expected range (high or low) it will set lamp fault code (LFC) 47 and diagnostic test code (DTC) B1881 or B1886.

Possible Causes

An out of range resistance on the passenger safety belt retractor pretensioner circuit can be caused by:

- out of range resistance on circuit 30S-JA34 (RD/BK).
- out of range resistance on circuit 31S-JA34 (BK/RD).
- out of range resistance on the passenger safety belt retractor pretensioner.
- RCM is faulted.

PINPOINT TEST AA: LFC 47/DTC B1881/B1886 — PASSENGER SAFETY BELT RETRACTOR PRETENSIONER CIRCUIT RESISTANCE HIGH OR LOW

CONDITIONS	DETAILS/RESULTS/ACTIONS
AA1 CHECK FOR A HARD OR INTERMITTENT DTC	
<p>1</p>  <p>Retrieve/Clear Continuous DTCs</p> <p>2</p>	<p>1 Retrieve and record any continuous DTCs for use later in this pinpoint test.</p>

On-Demand Self Test

- Was DTC B1881 or B1886 retrieved during the on-demand self test?

→ **Yes**

This is a hard fault. This fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to [AA2](#).

→ **No**

This is an intermittent fault. The fault condition is not present at this time. GO to [AA4](#).

AA2 CHECK THE PASSENGER PRETENSIONER CIRCUIT

1

PID/Data Monitor and Record

2 Select PID P_PRTNR.

- Is the resistance greater than 3.2 or less than 1.7 ohms?

→ **Yes**

GO to [AA3](#).

→ **No**

INSTALL a new RCM. GO to [AA5](#).

AA3 CHECK THE PASSENGER PRETENSIONER

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

3

PID/Data Monitor and Record

2 Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

3 Select PID P_PRTNR

● Is the resistance greater than 3.2 or less than 1.7 ohms?

→ Yes

REPAIR the resistance concern on circuit 30S-JA34 (RD/BK) or 31S-JA34 (BK/RD). GO to AA5.

→ No

INSTALL a new passenger pretensioner. GO to AA5.

AA4 CHECK FOR AN INTERMITTENT FAULT

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

3

2 Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

On-Demand Self Test	<ul style="list-style-type: none"> ● Was DTC B1881 or B1886 retrieved during the on-demand self test? <p>→ Yes CHECK for causes of intermittent fault at or near the passenger safety belt retractor pretensioner electrical connector. Pinpoint Test AB: LFC 17/DTC B1878 — Driver Safety Belt Retractor Pretensioner Circuit Shorted to Battery or Ignition

Normal Operation

The restraints control module (RCM) monitors the circuit to the driver safety belt retractor pretensioner. When the RCM detects a circuit short to battery or ignition it will set lamp fault code (LFC) 17 and diagnostic test code (DTC) B1878.

Possible Causes

A short to battery or ignition on the driver safety belt retractor pretensioner circuit can be caused by:

- a short to battery or ignition on circuit 30S-JA33 (RD/BU).
- a short to battery or ignition on circuit 31S-JA33 (BK/BU).
- a short to battery or ignition on the driver safety belt retractor pretensioner.
- RCM is faulted.

PINPOINT TEST AB: LFC 17/DTC B1878 — DRIVER SAFETY BELT RETRACTOR PRETENSIONER CIRCUIT SHORTED TO BATTERY OR IGNITION

CONDITIONS	DETAILS/RESULTS/ACTIONS
AB1 CHECK FOR A HARD OR INTERMITTENT DTC	
<p>1  Retrieve/Clear Continuous DTCs</p> <p>2  On-Demand Self Test</p>	<p>1 Retrieve and record any continuous DTCs for use later in this pinpoint test.</p> <p>● Was DTC B1878 retrieved during the on-demand self test?</p> <p>→ Yes This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to AB2.</p> <p>→ No This is an intermittent fault. The fault condition is not present at this time. GO to AB4.</p>
AB2 CHECK THE DRIVER PRETENSIONER	
<p> WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.</p> <p>The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.</p> <p>NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.</p> <p>NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.</p> <p>NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.</p> <p>NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.</p>

NOTE: After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1 Refer to the continuous DTCs recorded during Step AE1.

● **Was DTC B1883 retrieved during the on-demand self test?**

→ **Yes**

CHECK for causes of intermittent fault at or near the passenger safety belt retractor pretensioner connector. REPAIR any intermittent concerns found.

If an intermittent concern **was** found and repaired, GO to [AE5](#).

If an intermittent concern **was not** found, GO to [AE3](#).

→ **No**

CHECK for causes of intermittent short to ground on circuit 30S-JA34 (RD/BK) and circuit 31S-JA34 (BK/RD).

ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to [AE5](#).

AE5 CHECK FOR ADDITIONAL DTCs

1 Refer to the continuous DTCs recorded during Step AE1.

● **Were any continuous DTCs retrieved during Step AE1?**

→ **Yes**

Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table in this section for pinpoint test direction.

→ **No**
 RECONNECT the system.
 REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS). CLEAR all DTCs.

Pinpoint Test AF: B1892 — Air Bag Tone Warning Indicator Circuit Shorted to Ground or Open

Normal Operation

The restraints control module (RCM) monitors its connection to the instrument cluster at C310a at pin 26. This connection is used to signal a chime if the air bag indicator is inoperative and another SRS fault exists. If the RCM detects a short to ground or open on the connection to the instrument cluster, it will store a diagnostic trouble code (DTC) B1892 in memory.

Possible Causes

An air bag tone warning indicator circuit short to ground or open can be caused by:

- a short to ground or open on circuit 8-JA13 (WH/BK).
- a damaged or inoperative instrument cluster.
- RCM is faulted.

PINPOINT TEST AF: DTC B1892 — AIR BAG TONE WARNING INDICATOR CIRCUIT SHORTED TO GROUND OR OPEN

CONDITIONS	DETAILS/RESULTS/ACTIONS

1

A0003425

1

Measure the resistance between RCM C310a pin 26, circuit 8-JA13 (WH/BK), harness side and instrument cluster C220B pin 14, circuit 8-JA13 (WH/BK), harness side.

- Is the resistance greater than 100 ohms?

→ **Yes**
REPAIR the circuit. GO to AF6.

→ **No**
GO to AF4.

AF4 CHECK THE AIR BAG TONE WARNING INDICATOR

1

Instrument Cluster C220B

2

3

3

Measure the voltage between RCM C310a pin 26, circuit 8-JA13 (WH/BK), harness side and ground.

● Is the voltage less than 1.0 volt?

→ **Yes**
REPAIR the instrument cluster. GO to AF6.

→ **No**
INSTALL a new RCM. GO to AF6.

AF5 CHECK FOR AN INTERMITTENT FAULT

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

3

On-Demand Self Test

2 Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

● **Was DTC B1892 retrieved during the on-demand self test?**

→ **Yes**
GO to AF2.

→ **No**
CHECK for causes of intermittent short to ground or open on circuit 8-JA13 (WH/BK). ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to AF6.

AF6 CHECK FOR ADDITIONAL DTCs

1 Refer to the continuous DTCs recorded during Step AF1.

● **Were any continuous DTCs retrieved during Step AF1?**

→ **Yes**
Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table in this section for pinpoint test direction.

→ **No**
RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS). CLEAR all DTCs.

Pinpoint Test AG DTC B1891 — Air Bag Tone Warning Indicator Circuit Shorted to Battery or Ignition

Normal Operation

The restraints control module (RCM) monitors its connection to the instrument cluster at pin 26. This connection is used to signal a chime if the air bag indicator is inoperative and another SRS fault exists. If the RCM detects a short to battery or ignition on the connection to the instrument cluster, it will store a diagnostic trouble code (DTC) B1891 in memory.

Possible Causes

An air bag tone warning indicator circuit short to battery or ignition can be caused by:

- a short to battery or ignition on circuit 8-JA13 (WH/BK).
- a damaged or inoperative instrument cluster.
- RCM is faulted.

PINPOINT TEST AG: DTC B1891 — AIR BAG TONE WARNING INDICATOR CIRCUIT SHORTED TO BATTERY OR IGNITION

CONDITIONS	DETAILS/RESULTS/ACTIONS
AG1 CHECK FOR A HARD OR INTERMITTENT DTC	
<div style="display: flex; flex-direction: column; align-items: center;"> <div style="margin-bottom: 20px;"> <div style="border: 1px solid black; padding: 2px; width: 20px; text-align: center; margin-bottom: 5px;">1</div>  <p>Retrieve/Clear Continuous DTCs</p> </div> <div> <div style="border: 1px solid black; padding: 2px; width: 20px; text-align: center; margin-bottom: 5px;">2</div>  <p>On-Demand Self Test</p> </div> </div>	<div style="margin-bottom: 20px;"> <div style="border: 1px solid black; padding: 2px; width: 20px; text-align: center; margin-bottom: 5px;">1</div> <p>Retrieve and record any continuous DTCs for use later in this pinpoint test.</p> </div> <ul style="list-style-type: none"> ● Was DTC B1891 retrieved during the on-demand self test? <div style="margin-top: 10px;"> <p>→ Yes This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to AG2.</p> <p>→ No This is an intermittent fault. The fault condition is not present at this time. GO to AG4.</p> </div>
AG2 CHECK THE AIR BAG TONE WARNING INDICATOR CIRCUIT	
<p> WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.</p> <p>The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision,</p>	

resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

PROVE OUT the system. REFER to <u>Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)</u>. CLEAR all DTCs.</p>
--	---

Pinpoint Test AH: DTC B1869 — Air Bag Indicator Inoperative

Normal Operation

The air bag indicator is designed to illuminate for 6 (+/-2) seconds when the ignition switch is turned to the RUN position. This initial 6 seconds of illumination is considered normal operation and is called prove out of the air bag indicator. The air bag indicator is then used to warn the driver that there is a fault in the air bag supplemental restraint system (SRS).

The restraints control module (RCM) monitors the air bag indicator for open and short to ground conditions. If the RCM detects an open or short to ground condition on the air bag indicator circuit, it will store a diagnostic trouble code (DTC) B1869 in memory.

If the RCM detects an air bag indicator failure in addition to another SRS failure, the RCM will send a signal to the air bag tone warning indicator to produce five sets of five tone bursts.

Possible Causes

An air bag indicator inoperative condition can be caused by:

- damaged wiring on circuit 31S-JA14.
- a damaged or burned out air bag indicator.
- an instrument cluster malfunction.
- RCM is faulted.

PINPOINT TEST AH: DTC B1869 — AIR BAG INDICATOR INOPERATIVE

CONDITIONS	DETAILS/RESULTS/ACTIONS
AH1 CHECK FOR A HARD OR INTERMITTENT DTC	
1	1 Retrieve and record any continuous

DTCs for use later in this pinpoint test.

- Was DTC B1869 retrieved during the on-demand self test?

→ **Yes**

This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to [AH2](#).

→ **No**

This is an intermittent fault. The fault condition is not present at this time. GO to [AH5](#).

AH2 CHECK THE RCM

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

2

Deactivate the system. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in the Diagnosis and Testing portion of this section.

3

RCM C310a

4

4

Measure the resistance between the RCM C310a, pin 20, component side, and a known good chassis ground.

● Is the resistance less than 100 ohms?

→ Yes
INSTALL a new RCM. GO to AH6.

→ No
GO to AH3.

AH3 CHECK CIRCUIT 31S-JA14 FOR A SHORT TO GROUND

1

DR1217-A

1

Measure the resistance between RCM C310a pin 20, circuit 31S-JA14, harness side and RCM C310a pin 21, circuit 31-JA10 (BK/RD), harness side.

● Is the resistance less than 100 ohms?

→ Yes
REPAIR the circuit. GO to AH6.

→ No
GO to AH4.

AH4 CHECK CIRCUIT 31S-JA14 (BK/GN) FOR AN OPEN

1

Instrument Cluster C220A

2

A0003426

2

Measure the resistance between RCM C310a pin 20, circuit 31S-JA14, harness side and instrument cluster C220A pin 22, circuit 31S-JA14, harness side.

- Is the resistance greater than 10 ohms?

→ **Yes**
REPAIR the circuit. GO to [AH6](#).

→ **No**
REPAIR the instrument cluster. REFER to [Section 413-01](#). GO to [AH6](#).

AH5 CHECK FOR AN INTERMITTENT FAULT

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

3

On-Demand Self-Test

2 Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

● **Was DTC B1869 retrieved during the on-demand self test?**

→ **Yes**
GO to AH2 .

→ **No**
CHECK for causes of intermittent short to ground or open on circuit 31S-JA14. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to AH6 .

AH6 CHECK FOR ADDITIONAL DTCs

1 Refer to the continuous DTCs recorded during Step AH1.

● **Were any continuous DTCs retrieved during Step AH1?**

→ **Yes**
Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table in this section for pinpoint test direction.

→ **No**
RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) . CLEAR all DTCs.

Pinpoint Test AI: DTC B1870 — Air Bag Indicator Shorted to Battery

Normal Operation

The air bag indicator is designed to illuminate for 6 seconds when the ignition switch is turned to the

RUN position. This is considered normal operation and is called SRS prove out . The air bag indicator is used to warn the driver that there is a fault in the (SRS).

The restraints control module (RCM) monitors the air bag indicator for short to battery conditions. If the RCM detects a short to battery condition on the air bag indicator circuit, it will store a diagnostic trouble code (DTC) B1870 in memory.

If the RCM detects an air bag indicator failure in addition to another SRS failure, the RCM will send a signal to the air bag tone warning indicator to produce five sets of five tone bursts.

Possible Causes

An air bag indicator short to battery condition can be caused by:

- damaged wiring on circuit 31S-JA14.
- an instrument cluster concern.
- RCM is faulted.

PINPOINT TEST AI: DTC B1870 — AIR BAG INDICATOR SHORTED TO BATTERY

CONDITIONS	DETAILS/RESULTS/ACTIONS
AI1 CHECK FOR A HARD OR INTERMITTENT DTC	
<div style="display: flex; flex-direction: column; align-items: center;"> <div style="margin-bottom: 20px;"> <div style="border: 1px solid black; width: 60px; height: 20px; margin-bottom: 5px;"></div>  <p>Retrieve/Clear Continuous DTCs</p> </div> <div> <div style="border: 1px solid black; width: 60px; height: 20px; margin-bottom: 5px;"></div>  <p>On-Demand Self Test</p> </div> </div>	<div style="margin-bottom: 20px;"> <p>1 Retrieve and record any continuous DTCs for use later in this pinpoint test.</p> </div> <div style="margin-bottom: 20px;"> <ul style="list-style-type: none"> ● Was DTC B1870 retrieved during the on-demand self test? </div> <div style="margin-bottom: 20px;"> <p>→ Yes This is a hard fault. The fault condition is still present. This fault cannot be cleared until it is corrected and the DTC is no longer retrieved during the on-demand self test. GO to AI2.</p> </div> <div> <p>→ No This is an intermittent fault. The fault condition is not present at this time. GO to AI3.</p> </div>
AI2 CHECK THE AIR BAG INDICATOR CIRCUIT	
<p> WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.</p>	

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

2

Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

3

RCM C310a

4

● Is the air bag indicator illuminated?

→ **Yes**
INSTALL a new RCM. GO to AI4.

→ **No**
CHECK the air bag indicator. REFER to Section 413-01. If the air bag indicator is OK, REPAIR the circuit. GO to AI4.

AI3 CHECK FOR AN INTERMITTENT FAULT

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The**

restraint system diagnostic tools must be removed prior to operating the vehicle over the road.

NOTE: After diagnosing or repairing an SRS, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: After diagnosing or repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

<p>1</p> 	<p>2</p> <p>Deactivate the system. Refer to <u>Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)</u> in the Diagnosis and Testing portion of this section.</p> <ul style="list-style-type: none">● Was DTC B1870 retrieved during the on-demand self test? <p>→ Yes GO to <u>A12</u>.</p> <p>→ No CHECK for causes of intermittent short to battery on circuit 31S-JA14. ATTEMPT to recreate the hard fault by flexing the wire harness and cycling the ignition key frequently. REPAIR any intermittent concerns found. GO to <u>A14</u>.</p>
<p>A14 CHECK FOR ADDITIONAL DTCs</p>	
	<p>1</p> <p>Refer to the continuous DTCs recorded during Step A11.</p> <ul style="list-style-type: none">● Were any continuous DTCs retrieved during Step A11? <p>→ Yes Do not clear any DTCs until all DTCs have been resolved. GO to the Restraints Control Module (RCM) Diagnostic Trouble Code (DTC) Priority Table in this section for pinpoint test direction.</p> <p>→ No RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to <u>Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)</u>. CLEAR all DTCs.</p>

Pinpoint Test AJ: No Communication with the Restraints Control Module (RCM)

Normal Operation

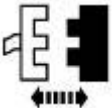

The RCM communicates with the scan tool using ISO 9141 communication mode through the data link connector (DLC).

Possible Causes

A no communication condition can be caused by:

- damage to circuit 4-EE1 (GY).
- DLC connection open.
- scan tool inoperative.
- RCM is faulted.

PINPOINT TEST AJ: NO COMMUNICATION WITH THE RESTRAINTS CONTROL MODULE (RCM)

CONDITIONS	DETAILS/RESULTS/ACTIONS
AJ1 CHECK THE RCM CONNECTOR C310a AND CONNECTOR PIN 5 FOR DAMAGE	
<p>NOTE: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.</p> <p>NOTE: Restraint system diagnostic tools MUST be installed under the seats in the side airbag and safety belt retractor pretensioner electrical connectors.</p> <p>NOTE: Diagnostics or repairs are not to be performed on a side airbag system or safety belt retractor pretensioner with the seat in the vehicle. Prior to attempting to diagnose/repair the side airbag system or safety belt retractor pretensioner the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the side airbag and the safety belt retractor pretensioner electrical connectors. The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.</p> <p>NOTE: Diagnostics may be performed on seat systems other than the side airbag or the safety belt retractor pretensioner such as (lumbar, climate controlled, heated, power seat track) with the seat installed in the vehicle as long as the SRS system is deactivated and the restraint system diagnostic tools are installed under the seats in the side airbag and safety belt retractor pretensioner electrical connectors.</p> <p>NOTE: After diagnosing/repairing a seat system, the restraint system diagnostic tools must be removed before operating the vehicle over the road.</p>	
<p>1</p>  <p>3</p>  <p>RCM C310a</p>	<p>2 Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.</p> <p>4 Inspect RCM C310a and RCM C310a pin 5 for damage.</p> <ul style="list-style-type: none"> ● Are RCM C310a and RCM C310a pin 5 OK?

→ **Yes**
GO to AJ2.

→ **No**
REPAIR RCM C310a or RCM C310a pin 5 as necessary. RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS).

AJ2 CHECK THE DLC CONNECTOR C251 AND CONNECTOR PIN 7 FOR DAMAGE

1 Inspect DLC C251 and DLC C251 pin 7 for damage.

- **Are DLC C251 and DLC C251 pin 7 OK?**

→ **Yes**
GO to AJ3.

→ **No**
REPAIR DLC C251 or DLC C251 pin 7 as necessary. RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS).

AJ3 CHECK CIRCUIT 4-EE1 (GY) FOR AN OPEN

1

DR1019-A

1 Measure the resistance between RCM C310a pin 5, circuit 4-EE1 (GY), harness side and DLC C251 pin 7, circuit 4-EE1 (GY), harness side.

- **Is the resistance less than 5 ohms?**

	<p>→ Yes INSTALL a new RCM. RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to <u>Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)</u>.</p> <p>→ No REPAIR the circuit. RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to <u>Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS)</u>.</p>
--	---

Pinpoint Test AK: LFC 5 Hz — RCM in Plant Mode

Normal Operation

A new restraints control module (RCM) is programmed to flash a special code. The code is 5 Hz and is used during vehicle assembly. The code indicates that both (driver and passenger) side air bags are not installed correctly. The code will normally occur when both (and only both) of the following conditions are met:

- a new RCM is installed.
- both side air bags are not correctly installed.

Possible Causes

A 5 Hz LFC can be caused by:

- both front seats not installed.
- both side air bags not correctly installed.
- RCM is faulted.

PINPOINT TEST AK: PINPOINT TEST AG: LFC 5 HZ — RCM IN PLANT MODE

CONDITIONS	DETAILS/RESULTS/ACTIONS
AK1 CHECK THE LAMP FAULT CODE (LFC)	<p>1 Observe the flashing air bag indicator.</p> <p>● Is the air bag indicator flashing rapidly with no pauses?</p> <p>→ Yes GO to <u>AK2</u>.</p> <p>→ No REFER to the Restraints Control Module (RCM) Diagnostic Trouble</p>

Code (DTC) Priority Table for the indicated LFC.

AK2 CHECK FRONT SEAT INSTALLATION

- 1 Check that both front seats are installed.
 - **Are both front seats correctly installed?**
- **Yes**
GO to AK3.
- **No**
INSTALL the front seats. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS).

AK3 CHECK SIDE AIR BAG INSTALLATION

- 1 Check that both side air bags are correctly installed and connected.
 - **Are both side air bags correctly installed and connected?**
- **Yes**
GO to AK4.
- **No**
Correctly INSTALL and CONNECT both side air bags. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS).

AK4 CHECK BOTH SIDE AIR BAG LOOP RESISTANCES

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1

3

Battery Ground Cable

4

Driver and Passenger Side Air Bag Module Restraint System Diagnostic Tools

5

RCM C310b

6

DR1050-A

2

Deactivate the system. Refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in the Diagnosis and Testing portion of this section.

6

NOTE: By disconnecting RCM C310b each driver and passenger seat side air bag loop circuit will be shorted through a shorting bar. Do not remove the shorting bar.

Measure the resistances through C367 circuits 30S-JA37 (RD/GN) and 31S-JA37 (BK/GN) and through C337 circuits 30S-JA38 (RD/BK) and 31S-JA38 (BK/RD).

● **Is the resistance more than 1.0 ohm for both measurements?**

→ **Yes**

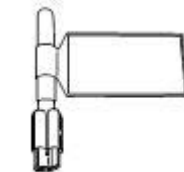

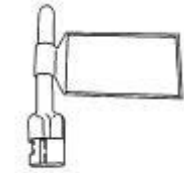

REPAIR the circuits. RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS).

→ **No**

INSTALL a new RCM. RECONNECT the system. REACTIVATE the system. PROVE OUT the system. REFER to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS).

Supplemental Restraint System (SRS) Deactivation and Reactivation

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (1 Req'd) 418-F395 (014-R1079)
 ST2506-A	Diagnostic Tool, Restraint System (3 Req'd) 418-F088 (105-R0012)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)

Deactivation

 **WARNING:** Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Do not set a live air bag module down with the trim cover face down. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

 **WARNING:** Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

 **WARNING:** The safety belt buckle pretensioner and safety belt retractor pretensioner are pyrotechnic devices. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: Vehicle sensor orientation is critical for proper system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. Replace and properly position the sensor or any other damaged supplemental restraint system (SRS) components whether or not the air bag is deployed.

WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

NOTE: If a seat equipped with a seat mounted side air bag and/or a safety belt pretensioner (if equipped) system is being serviced, **the air bag system must be deactivated.**

NOTE: Restraint system diagnostic tools **MUST** be installed under the seats in the seat side air bag (if equipped) and safety belt pretensioner (if equipped) to floor connectors.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute. For additional information, refer to [Section 414-01](#).

- Remove the two screws and pull out on the lower steering column opening finish panel enough to access the electrical connectors.

3. Remove the lower steering column opening finish panel.
 1. Disconnect the electrical connectors.
 2. Remove the lower steering column opening finish panel.

4. Remove the screws. Separate the hood latch release cable and handle assembly from the steering column opening reinforcement.

5. Remove the two pin-type retainers and the RH instrument panel insulator.
 - Disconnect the courtesy lamp.

6. Remove the screw and the heater duct.

7. Loosen the two driver-side instrument panel tunnel brace bolts.
- Position the carpet aside to gain access to the bolts.

8. Remove the screws and the steering column opening reinforcement.

9. Disconnect the clockspring electrical connector at the base of the steering column.

10. Attach the restraint system diagnostic tool to the vehicle harness side of the clockspring

electrical connector.

11. Remove the glove compartment. For additional information, refer to [Section 501-12](#).
12. Disconnect the passenger air bag module electrical connector.
 1. Reaching into the glove box opening toward the center of the instrument panel, under the cross-car beam, slide and disengage the passenger air bag module electrical connector locking clip.
 2. Push in on the two release tabs and disconnect the passenger air bag module electrical connector.

13. Attach the restraint system diagnostic tool to the vehicle harness side of the passenger air bag electrical connector.

14. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).
15. Move and tilt the front seats to their highest and most forward position.
16.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors,

instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute. For additional information, refer to [Section 414-01](#).

17. From under the passenger seat, release the tab on the connector bracket and remove the passenger seat side air bag electrical connector.

18. Disconnect the passenger seat side air bag electrical connector.
 1. Slide and disengage the passenger seat side air bag electrical connector locking clip.
 2. Push in to release the tab and disconnect the passenger seat side air bag electrical connector.

19. Attach the restraint system diagnostic tool to the passenger seat side air bag floor electrical connector.

20. Remove the passenger side B-pillar weatherstripping.
21. Position the safety belt D-ring to its highest point.
22. Remove the passenger side B-pillar upper trim panel.

23. Remove the passenger side front and rear door scuff plates.

24. Remove the passenger side B-pillar lower trim panel.

25. Disconnect the passenger side safety belt retractor pretensioner floor electrical connector.

26. Attach the restraint system diagnostic tool to the passenger side safety belt retractor pretensioner floor electrical connector.

27. From under the driver seat, release the tab on the connector bracket and remove the driver seat side air bag electrical connector.

28. Disconnect the driver seat side air bag electrical connector.
1. Slide and disengage the driver seat side air bag electrical connector locking clip.
 2. Push down to release the tab and disconnect the driver seat side air bag electrical connector.

29. Attach the restraint system diagnostic tool to the driver seat side air bag floor electrical connector.

30. Remove the driver side B-pillar weatherstripping.
31. Position the safety belt D-ring to its highest point.
32. Remove the driver side B-pillar upper trim panel.

33. Remove the driver side front and rear door scuff plates.

34. Remove the driver side B-pillar lower trim panel.

35. Disconnect the driver side safety belt retractor pretensioner electrical connector.

36. Attach the restraint system diagnostic tool to the driver side safety belt retractor pretensioner floor electrical connector.

37. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).
38. With the restraint system diagnostic tools installed at all deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in this section.
39. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to [Section 414-01](#).

Reactivation

WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, and notes at the beginning of the deactivation procedure.

1. Remove the restraint system diagnostic tool from the driver side safety belt retractor pretensioner floor electrical connector.

2. Connect the driver side safety belt retractor pretensioner electrical connector.

3. Install the driver side B-pillar lower trim panel.

4. Install the driver side front and rear door scuff plates.

5. **NOTE:** Position the safety belt D-ring to its highest point.

Install the driver side B-pillar upper trim panel.

6. Install the driver side B-pillar weatherstripping.
7. Remove the restraint system diagnostic tool from the driver seat side air bag floor electrical connector.

8. Connect the driver seat side air bag electrical connector.
 1. Connect the driver seat side air bag electrical connector.
 2. Slide and engage the driver seat side air bag electrical connector locking clip.

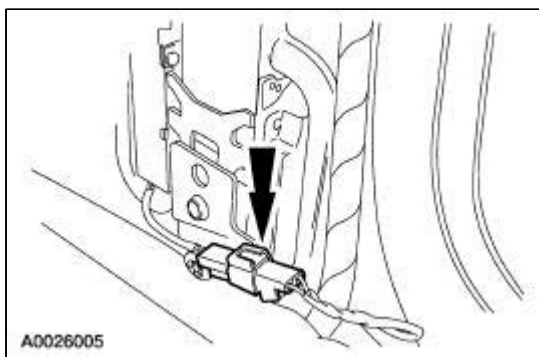

9. Install the driver seat side air bag electrical connector onto the connector bracket under the driver seat.

10. Remove the restraint system diagnostic tool from the passenger side safety belt retractor pretensioner electrical connector.

11. Connect the passenger side safety belt retractor pretensioner electrical connector.

12. Install the passenger side B-pillar lower trim panel.

13. Install the passenger side front and rear door scuff plates.

14. **NOTE:** Position the safety belt D-ring to its highest point.

Install the passenger side B-pillar upper trim panel.

15. Install the passenger side B-pillar weatherstripping.

16. Remove the restraint system diagnostic tool from the passenger seat side air bag floor electrical connector.

17. Connect the passenger seat side air bag electrical connector.

1. Connect the passenger seat side air bag electrical connector.
2. Slide and engage the passenger seat side air bag electrical connector locking clip.

18. Install the passenger seat side air bag electrical connector onto the connector bracket under the passenger seat.

19. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).

20. Position the front seats rearward.

21.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute. For additional information, refer to [Section 414-01](#).

22. Remove the restraint system diagnostic tool from the vehicle harness side of the passenger air bag electrical connector.

23. Connect the passenger air bag module electrical connector.
1. Reach into the glove box opening toward the center of the instrument panel, under the cross-car beam and connect the passenger air bag module electrical connector.
 2. Slide and engage the passenger air bag module electrical connector locking clip.

24. Install the glove compartment. For additional information, refer to [Section 501-12](#).
25. Remove the restraint system diagnostic tool from the vehicle harness side of the clockspring electrical connector.

26. Connect the clockspring electrical connector at the base of the steering column.

27. Position the steering column opening reinforcement and install the screws.

28.  **CAUTION: Be sure the steering column opening reinforcement is in place before tightening the driver-side instrument panel tunnel brace bolts.**

Tighten the two driver-side instrument panel tunnel brace bolts.

- Reposition the carpet.

29. Position the heater duct and install the screw.

30. Install the RH instrument panel insulator and the two pin-type retainers.

- Connect the courtesy lamp.

31. Position the hood latch release cable and handle assembly to the steering column opening reinforcement and install the screws.

32. Connect the electrical connectors to the switches in the lower steering column opening finish panel.

33. Install the lower steering column opening finish panel to the instrument panel.
1. Position the lower steering column opening finish panel to the instrument panel and push in, seating the retaining clips.
 2. Install the screws.

34. Connect the battery ground cable. For additional information, refer to [Section 414-01](#) .

35.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in this section.

36. Check the active restraint system for correct operation. For additional information, refer to [Section 501-20A](#) .

Inspection and Repair After a Supplemental Restraint System (SRS) Deployment

WARNING: If the supplemental restraint system (SRS) is being serviced, the system must be deactivated and restraint system diagnostic tools must be installed. For additional information, refer to Air Bag and Safety Belt Pretensioner Supplemental Restraint System (SRS) in this section.

The air bag restraint system diagnostic tools must be removed and the air bag modules reconnected when the system is reactivated to avoid non-deployment in a collision, resulting in possible personal injury.

NOTE: Diagnostics or repairs are not to be carried out on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

1. When any deployable device (driver air bag, passenger air bag, seat side air bag, safety belt pretensioner, etc.) or combination of devices are deployed and/or the RCM has the DTC B1231 (Crash Data Memory Full) in memory, the repair of the vehicle's supplemental restraint system (SRS) is to include the removal of all deployed devices and the installation of new deployable devices, the removal and installation of new impact sensors, and the removal and installation of a new RCM.
2. When any damage to the impact sensor mounting points or mounting hardware has occurred, repair or install new mounting points and mounting hardware as needed.
3. When the driver air bag module has deployed a new clockspring must be installed.
4. Inspect the entire vehicle for damage, including the following components:
 - steering column.
 - instrument panel knee bolsters and mounting points.
 - instrument panel braces and brackets.
 - instrument panel and mounting points.
 - seats and seat mounting points.
 - safety belts, safety belt buckles, and safety belt retractors. For additional information, refer to Section 501-20A.
 - supplemental restraint system (SRS) wiring, wiring harnesses, and connectors.
5. After carrying out the review and inspection of the entire vehicle for damage, repair or install

new components as needed.

Air Bag Disposal —Deployed

1.  **WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.**

Dispose of the deployed air bag modules and safety belt pretensioners in the same manner as any other part to be scrapped.

Air Bag Disposal —Undeployed Inoperative

 **WARNING:** Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

 **WARNING:** Carry a live air bag module with the air bag and trim cover or deployment door pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

NOTE: All inoperative air bag modules and safety belt pretensioners have been placed on the Mandatory Return List. All discolored or damaged air bag modules must be treated the same as any inoperative live air bag being returned.

1. Remove the inoperative component from the vehicle. For additional information, refer to the appropriate air bag procedure in this section.

AIR BAG MODULE VERIFICATION

VEHICLE SERIAL NO.

This 17 digit number can be found (1) on your vehicle registration (2) on the dash panel at left side close to lower edge of windshield.

ATTENTION INSTALLER

Please complete and mail this postcard with your New Air Bag Module Serial Number (see sample below) and the Vehicle Identification Number (VIN) of the vehicle in which you are installing this module.

LOOK FOR YOUR REPLACEMENT AIR BAG MODULE SERIAL NUMBER (SN) AT THE LOCATION SHOWN IN THIS SAMPLE AND ENTER IT IN THE SPACE PROVIDED BELOW

SAMPLE

REPLACEMENT AIR BAG MODULE SERIAL NO.

A0005406

2. **NOTE:** When installing a new air bag module, a prepaid return postcard is provided with the replacement air bag module. The serial number for the new part and the vehicle identification number (VIN) must be recorded and sent to Ford Motor Company.

If installing a new air bag module, record the necessary information and return the inoperative air bag module to Ford Motor Company.

Air Bag Disposal —Driver, Undeployed, Scrapped Vehicle

Remote Deployment

 **WARNING:** Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module or safety belt retractor/pretensioner assembly. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Carry a live air bag module with the air bag and trim cover or deployment door pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Remote deployment is to be performed outdoors with all personnel at least 6.1 meters (20 feet) away to ensure personal safety. Due to the loud report which occurs when the air bag is deployed, hearing protection is required.

 **WARNING:** Do not place the driver or passenger air bag module with the trim cover or deployment door facing down, as the forces of the deploying air bag can cause it to ricochet and cause personal injury.

1. Remove the driver air bag from the vehicle. For additional information, refer to [Driver Air Bag Module](#) in this section.
2. Obtain two wires (20 gauge minimum) at least 6.1 meters (20 feet) long and attach one end of each wire to the connector pins on the air bag module.

3. Place the air bag module on a flat surface in an open outdoor area with the trim cover facing upward.
4. Remain at least 6.1 meters (20 feet) away from the air bag module.
5. Deploy the air bag module by touching the other ends of the two wires to the terminals of a 12-volt battery.

6. To allow for cooling, wait at least ten minutes before approaching the deployed air bag.
 7. Dispose of the deployed air bag module in the same manner as any other part to be scrapped.
-

Air Bag Disposal —Passenger, Undeployed, Scrapped Vehicle

Remote Deployment

 **WARNING:** Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module or safety belt retractor/pretensioner assembly. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Carry a live air bag module with the air bag and trim cover or deployment door pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Remote deployment is to be performed outdoors with all personnel at least 6.1 meters (20 feet) away to ensure personal safety. Due to the loud report which occurs when the air bag is deployed, hearing protection is required.

 **WARNING:** Do not place the driver or passenger air bag module with the trim cover or deployment door facing down, as the forces of the deploying air bag can cause it to ricochet and cause personal injury.

1. Remove the passenger air bag from the vehicle. For additional information, refer to [Passenger Air Bag Module](#) in this section.
2. Obtain two wires (20 gauge minimum) at least 6.1 meters (20 feet) long and attach one end of each wire to the connector pins on the air bag module.

3. Place the air bag module on a flat surface in an open outdoor area with the deflector can facing downward.
4. Remain at least 6.1 meters (20 feet) away from the air bag module.
5. Deploy the air bag module by touching the other ends of the two wires to the terminals of a 12-volt battery.

6. To allow for cooling, wait at least ten minutes before approaching the deployed air bag.
 7. Dispose of the deployed air bag module in the same manner as any other part to be scrapped.
-

Air Bag Disposal —Side, Undeployed, Scrapped Vehicle

Remote Deployment

 **WARNING:** Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module or safety belt retractor/pretensioner assembly. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Carry a live air bag module with the air bag and trim cover or deployment door pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Remote deployment is to be carried out outdoors with all personnel at least 6.1 meters (20 feet) away to ensure personal safety. Due to the loud report which occurs when the air bag is deployed, hearing protection is required.

 **WARNING:** Do not place the side air bag module with the tear seam facing down or the attaching studs facing upward, as the forces of the deploying air bag can cause it to ricochet and cause personal injury.

1. Remove the side air bag from the vehicle. For additional information, refer to [Side Air Bag Module](#) in this section.
2. Cut and strip the wires and connect the connector to the air bag module.

3. Obtain two wires (20 gauge minimum) at least 6.1 meters (20 feet) long and attach one end of each wire to the connector pins on the air bag module.

4. Place the air bag module on a flat surface in an open outdoor area with the tear seam facing upward and the attaching studs facing downward.
5. Remain at least 6.1 meters (20 feet) away from the air bag module.
6. Deploy the side air bag module by touching the other ends of the two wires to the terminals of a 12-volt battery.

7. To allow for cooling, wait at least ten minutes before approaching the deployed air bag.
 8. Dispose of the deployed side air bag module in the same manner as any other part to be scrapped.
-

Safety Belt Pretensioner Disposal —Deployed

1.  **WARNING:** The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

Dispose of the deployed safety belt pretensioner in the same manner as any other part to be scrapped.

Safety Belt Pretensioner Disposal —Undeployed, Inoperative

WARNING: The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: Carry a live safety belt retractor pretensioner or safety belt buckle pretensioner so as to keep fingers and clothing away from moveable parts. This will reduce the risk of injury in the event of an accidental deployment.

NOTE: All inoperative safety belt buckle pretensioners and safety belt retractor pretensioners have been placed on the Mandatory Return List. All damaged safety belt buckle pretensioners and safety belt retractor pretensioners must be treated the same as any inoperative live safety belt buckle pretensioner or safety belt retractor pretensioner being returned.

1. Remove the inoperative safety belt buckle pretensioner or safety belt retractor pretensioner from the vehicle. For additional information, refer to [Section 501-20A](#).
 2. Package and return the inoperative safety belt buckle pretensioner or safety belt retractor pretensioner to Ford Motor Company.
-

Safety Belt Pretensioner Disposal —Undeployed, Scrapped Vehicle

Remote Deployment

 **WARNING:** The safety belt pretensioner is a pyrotechnic device. Always wear safety glasses when repairing an air bag equipped vehicle and when handling a safety belt buckle pretensioner or safety belt retractor pretensioner. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

 **WARNING:** Carry a live safety belt retractor/pretensioner assembly so as to keep fingers and clothing away from moveable parts. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Remote deployment is to be carried out outdoors with all personnel at least 6.1 meters (20 feet) away to ensure personal safety. Due to the loud report which occurs when the safety belt pretensioner is deployed, hearing protection is required.

 **WARNING:** Do not position the safety belt retractor/pretensioner assembly so that moveable parts contact the support surface, as the forces of the deploying pretensioner can cause it to ricochet and cause personal injury.

1. Remove the safety belt retractor/pretensioner assembly from the vehicle. For additional information, refer to [Section 501-20A](#).
2. Cut off the electrical connector and strip 25 mm (1 inch) of insulation off the wires.

3. Obtain two wires (20 gauge minimum) at least 6.1 meters (20 feet) long and attach one end of each wire to the safety belt pretensioner wires.

4. Position the safety belt retractor/pretensioner assembly on a flat surface in an open outdoor area so that moveable parts do not contact the support surface.
5. Remain at least 6.1 meters (20 feet) away from the safety belt retractor/pretensioner assembly.
6. Deploy the safety belt pretensioner by touching the other ends of the two wires to the terminals of a 12-volt battery.

7. To allow for cooling, wait at least ten minutes before approaching the deployed safety belt pretensioner retractor/pretensioner assembly.
 8. Dispose of the deployed safety belt retractor/pretensioner assembly in the same manner as any other part to be scrapped.
-

Wiring Repair

1. Inspect the supplemental restraint system (SRS) wiring and the wiring harness for any damage that may have occurred as a result of the accident. Inspect and repair or install new, as required, any damaged:
 - wires.
 - insulation.
 - terminal.
 - connectors.
 - splices.

 2. Splice damaged wires using the specified butt-splice connector or equivalent.
 - For splices required in adjacent wiring, stagger the splices 51 mm (2 inches) apart from each other.
 - Use waterproof butt-splice type connectors.
 - Use the correct size heat shrink nylon tube to prevent water, salt, condensation, and heat from affecting the wiring repair. Make sure the tube extends 25 mm (1 inch) each side of the repair.
 - Use a splice connector that is lined with a sealer that melts when heated with a heat gun and flows from the tubing, sealing and splice.
 - Use the correct gauge connector for the wire being repaired.
 - Use connectors that are transparent to allow inspection of the finished splice.
-

Weld Nut Repair — "J" Nut, Restraints Control Module (RCM) and Side Impact Sensor

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side impact sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

NOTE: There are two procedures to repair a vehicle having missing restraints control module or side impact sensor attaching weld nut(s). Read both this procedure and [Weld Nut Repair—Missing Weld Nut, Restraints Control Module \(RCM\) and Side Impact Sensor](#) before proceeding with the repair.

NOTE: If two or more weld nuts are missing, do not install the "J" nuts as outlined in this procedure. Weld nuts must be installed as outlined in [Weld Nut Repair—Missing Weld Nut, Restraints Control Module \(RCM\) and Side Impact Sensor](#).

NOTE: The following procedure applies to vehicles that have a rectangular hole in the sheet metal that is in close proximity to the missing weld nut.

1. Obtain a "J" nut (part number N623332-S301) or any of the following optional "J" nuts (part numbers: N623342-S101, N800854-S100, N800925-S100).
2. Obtain a 6 mm (0.24 in) grounding screw (part number N806327-S190) or equivalent.
3. Install the "J" nut through the rectangular hole in the sheet metal.
4. **NOTE:** Be sure the threaded portion of the "J" nut is aligned with the clearance hole in the sheet metal.

Install the crash sensor.

5. Tighten the attaching screws to specification. For additional information, refer to Torque Specifications in this section.
-

Weld Nut Repair —Missing Weld Nut, Restraints Control Module (RCM) and Side Impact Sensor

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side impact sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

NOTE: There are two procedures to repair a vehicle having missing restraints control module or side impact sensor attaching weld nut(s). Read both this procedure and [Weld Nut Repair—"J" Nut, Restraints Control Module \(RCM\) and Side Impact Sensor](#) before proceeding with the repair.

NOTE: Use only this procedure if two or more weld nuts are missing, do not install the "J" nuts as outlined in [Weld Nut Repair — "J" Nut, Restraints Control Module \(RCM\) and Side Crash Sensor](#).

NOTE: Radiator support repair shown, others are similar.

1. Obtain a 6 mm (0.24 in) weld nut (part number N806285-S190).
2. Obtain a 6 mm (0.24 in) grounding screw (part number N806327-S190).
3. Route a sufficient length of copper welding wire through the weld nut clearance hole and back out an adjacent access hole.

4. Feed the copper welding wire through the weld nut, then through a standard flatwasher.

5. Secure the flatwasher so that it cannot be pulled off the end of the copper welding wire.
 6. Pull the copper welding wire back through the clearance hole, allowing the weld nut and flatwasher to follow the copper welding wire through.
 7. Position the weld nut to the weld nut clearance hole, firmly pulling on the copper welding wire allowing the secured flatwasher to hold the weld nut in position.
 8. Holding the weld nut securely in place and using a MIG welder, weld in four places around the edge of the weld nut.
 9. Metal finish as required.
 10. Verify the nut is securely in place.
 11. Install the crash sensor.
 12. Tighten the attaching screws to specification. For additional information, refer to Torque Specifications in this section.
-

Weld Nut Repair —Stripped Weld Nut, Restraints Control Module (RCM) and Side Impact Sensor

WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

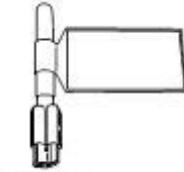

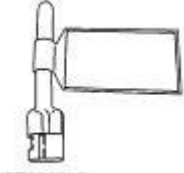

The side impact sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

1. Obtain an 8 mm (0.32 in) grounding screw (part number N802455-S190).
 2. Drill out the internal threads of the stripped-out weld nut to 7.37 mm (0.29 in) using a letter "L" size drill bit.
 3. Position the crash sensor to the vehicle.
 4. Install the 8 mm (0.32 in) grounding screw into the drilled-out weld nut.
 5. Install the remaining attaching screws.
 6. Tighten the attaching screws to specification. For additional information, refer to Torque Specifications in this section.
-

Side Impact Sensor

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (1 Req'd) 418-F395 (014-R1079)
 ST2506-A	Diagnostic Tool, Restraint System (3 Req'd) 418-F088 (105-R0012)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)

Removal

 **WARNING:** Vehicle sensor orientation is critical for proper system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. Replace and properly position the sensor or any other damaged supplemental restraint system (SRS) components whether or not the air bag is deployed.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and perform the diagnostic procedure again.

NOTE: The left side is shown, the right side is similar.

1. Prepare the vehicle for side impact sensor removal.

1.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power

supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to [Section 414-01](#).

2.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

Deactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in the General Procedures portion of this section.

3.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the seat removal and installation procedure.**

Remove the seat on the side with the affected side impact sensor. For additional information, refer to [Section 501-10](#).

2. Position the carpet away from the B-pillar.
3. Remove the side impact sensor.
 1. Disconnect the side impact sensor electrical connector.
 2. Remove the bolts.
 3. Remove the side impact sensor with bracket.

Installation

 **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions and notes at the beginning of the removal procedure.**

1.  **WARNING: The tightening torque of the air bag side impact sensor retaining bolts is critical for proper system operation.**

Install the side impact sensor.

1. Position the side impact sensor with bracket.
2. Install the bolts.
3. Connect the side impact sensor.

2. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).
3. With the restraint system diagnostic tools installed at all deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#), in the Diagnosis and Testing portion of this section.
4. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to [Section 414-01](#).
5. Reposition the carpet back at the B-pillar.
6. Restore the vehicle to operating condition.

1.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the seat removal and installation procedure.**

Install the seat on the side with the affected side impact sensor. For additional information, refer to [Section 501-10](#).

2.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

Reactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in the General Procedures portion of this section.

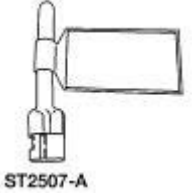

3.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in the [Diagnosis and Testing](#) portion of this section.

4. Check the active restraint system for correct operation. For additional information, refer to [Section 501-20A](#).
-

Restraints Control Module (RCM)

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (1 Req'd) 418-F395 (014-R1079)
 ST2506-A	Diagnostic Tool, Restraint System (3 Req'd) 418-F088 (105-R0012)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)

Removal

 **WARNING:** The restraints control module (RCM) orientation is critical for proper air bag supplemental restraint system (SRS) operation. If a vehicle equipped with an SRS system has been involved in a collision in which the center tunnel area has been damaged, inspect the mounting and bracket for deformation. If damaged, the RCM must be replaced whether or not the air bags have deployed. In addition, make sure the area of the RCM mounting is restored to its original condition.

 **WARNING:** Vehicle sensor orientation is critical for proper system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. Replace and properly position the sensor or any other damaged supplemental restraint system (SRS) components whether or not the air bag is deployed.

 **CAUTION:** Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage can result.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and perform the diagnostic procedure again.

All vehicles

1. Prepare the vehicle for restraints control module (RCM) removal.

1.  **WARNING:** To avoid accidental deployment and possible personal injury, the

backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to [Section 414-01](#).

2.  **WARNING:** To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.

Deactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

2. Remove the center console. For more information, refer to [Section 501-12](#).
3. Remove the rear vent duct.

Vehicles with automatic transmission

4. Position the shifter out of the way.
 1. Disconnect and separate the shifter interlock cable and casing from the shifter.
 2. Remove the shifter retaining bolts (two shown).
 3. Position the shifter out of the way.

All vehicles

5. Remove the extension duct.

6. **NOTE:** The instrument panel has been removed for clarity.

Remove the bolts.

7. Remove the RCM.
 1. Slide and disengage the RCM electrical connector locking clips.
 2. Depressing the locking tab, disconnect the RCM electrical connectors.
 3. Remove the RCM.

Installation

 **WARNING:** To reduce the risk of serious personal injury, read and follow all warnings, cautions and notes at the beginning of the removal procedure.

All vehicles

1.  **WARNING:** The tightening torque of the air bag restraints control module (RCM)

retaining bolts is critical for correct system operation.

Position the RCM. Install the bolts.

2. Connect the RCM electrical connector.
 1. Connect the RCM electrical connectors.
 2. Slide and engage the RCM electrical connector locking clips.

3. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).
4. With the restraint system diagnostic tools installed at all deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#), in the Diagnosis and Testing portion of this section.
5. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to [Section 414-01](#).
6. Install the extension duct.

Vehicles with automatic transmission

7. Install the shifter.

1. Position the shifter.
2. Install the shifter bolts (two shown).
3. Connect the shifter interlock cable and casing to the shifter.

All vehicles

8. Install the rear vent duct.

9. Install the center console. For additional information, refer to [Section 501-12](#).
10. Restore the vehicle to operating condition.
 1.  **WARNING:** To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.

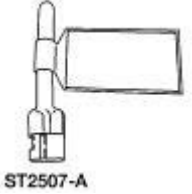

Reactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

2.  **WARNING:** The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in this section.

Driver Air Bag Module

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F395 (014-R1079)
 ST2506-A	Diagnostic Tool, Restraint System (3 Req'd) 418-F088 (105-R0012)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)

Removal

 **WARNING:** Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Do not set a live air bag module down with the trim cover face down. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

 **WARNING:** Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

 **WARNING:** Air bag modules with discolored or damaged trim covers must be replaced, not repainted.

NOTE: A repair is made by installing a new part only. If the new part does not correct the condition,

install the original part and perform the diagnostic procedure again.

1. Prepare the vehicle for driver air bag module removal.

1.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to [Section 414-01](#).

2.  **WARNING:** To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.

Deactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

2. Remove the two steering wheel plugs.

3. Remove the two driver air bag module retaining bolts.

4. Disconnect and remove the driver air bag module.
 1. Slide and disengage the driver air bag electrical connector locking clip.

2. Depress the locking tabs and disconnect the driver air bag module electrical connector.
3. Remove the driver air bag module.

5. Remove the restraint system diagnostic tool from the vehicle harness side of the clockspring electrical connector at the base of the steering column.

6. Connect the clockspring electrical connector at the base of the steering column.

7. Attach the restraint system diagnostic tool to the clockspring electrical connector at the top of the steering column.

8. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).
9. With the restraint system diagnostic tools installed at all deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in this section.
10. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to [Section 414-01](#).

Installation

 **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions and notes at the beginning of the removal procedure.**

1. Remove the restraint system diagnostic tool from the clockspring electrical connector at the top of the steering column.

2. Connect and position the driver air bag module to the steering wheel.
 1. Connect the driver air bag module electrical connector.
 2. Slide and engage the driver air bag module electrical connector locking clip.
 3. Position the driver air bag module to the steering wheel.

3. Install the two driver air bag module bolts.

4. Install the two steering wheel back cover plugs.

5. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).
6. With the restraint system diagnostic tools still installed at the remaining deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in this section.

7.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute. For additional information, refer to [Section 414-01](#).

8. Restore the vehicle to operating condition.
 1.  **WARNING:** To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.

Reactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

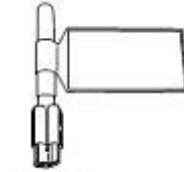

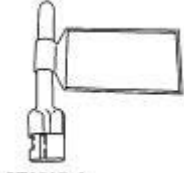

2.  **WARNING:** The restraint system diagnostic tool is for restraint system

service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in this section.

Passenger Air Bag Module

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (3 Req'd) 418-F395 (014-R1079)
 ST2506-A	Diagnostic Tool, Restraint System (1 Req'd) 418-F088 (105-R0012)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)

Removal

 **WARNING:** Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Do not set a live air bag module with the trim cover in the face down position. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

 **WARNING:** Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

 **WARNING:** If the air bag module is discolored or damaged it must be replaced, not repaired.

NOTE: A repair is made by installing a new part only. If the new part does not correct the condition,

install the original part and perform the diagnostic procedure again.

1. Prepare the vehicle for passenger air bag module removal.

1.  **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side impact sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to [Section 414-01](#).

2.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

Deactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in the General Procedures portion of this section.

2. Remove the instrument panel. For additional information, refer to [Section 501-12](#).
3. Position the instrument panel face down on the bench.
 - Cover the work area with something clean and nonabrasive to protect the instrument panel.
4. Remove the screw for the passenger side A/C duct near the center of the instrument panel.

5. Remove the screws from the passenger side A/C and demister duct.

6. Remove the passenger side air conditioning register.
 1. Separate the A/C duct from the register.
 2. Push in on the retaining clips and remove the passenger side air conditioning register.

7. Remove the eight screws. Separate the driver side demister duct and remove the defrost nozzle.

8. Remove the plenum chamber. For additional information, refer to [Section 412-01](#).
9. Remove the center A/C duct.
 1. Remove the screws.
 2. Pull out on the center A/C duct, separating the passenger A/C duct.
 3. Remove the center A/C duct.

10. **NOTE:** If installing a new passenger air bag module, install new retaining nuts and bolts.

Remove the passenger air bag module nuts.

1. Remove the passenger air bag module nuts.
2. Release the three retainers and position the wire harness out of the way.

11. **NOTE:** If installing a new passenger air bag module, install new retaining nuts and bolts.

Remove the passenger air bag module nuts.

- Position the passenger side A/C duct out of the way to access the passenger air bag nuts.

12. **NOTE:** If installing a new passenger air bag module, install new retaining nuts and bolts.

Remove the passenger air bag module bolts.

13. Remove the passenger air bag module through the back of the instrument panel.

Installation

⚠ WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions and notes at the beginning of the removal procedure.

1. Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to [Section 414-01](#).
2. **NOTE:** If installing a new passenger air bag module, install new retaining nuts and bolts.

Position the passenger air bag module to the instrument panel. Start all nuts and bolts by hand. Do not tighten at this time.

3. Tighten the passenger air bag module nuts.
 1. Tighten the passenger air bag module nuts to specification.
 2. Route the wire harness. Install the retainers.

4. Tighten the passenger air bag module nuts to specification.
 - Position the glove box and passenger side A/C duct out of the way to access the passenger air bag nuts.

5. Tighten the passenger air bag module bolts.

6. Remove the restraint system diagnostic tool from the vehicle harness side of the passenger air bag module electrical connector.

7. **NOTE:** The passenger air bag module is shown with instrument panel removed for clarity.

This is a blind operation due to the passenger air bag module electrical connector mounting location.

Connect the passenger air bag module electrical connector (this is a blind operation).

1. Connect the passenger air bag module electrical connector.
2. Slide and engage the driver air bag module electrical connector locking clip.

8. Position the center A/C duct into the passenger A/C duct.

9. Position the center A/C duct to the instrument panel. Install the screws.

10. Install the plenum chamber. For additional information, refer to [Section 412-01](#).
11. Position the defrost nozzle to the instrument panel while installing the driver side demister duct. Install the eight screws.

12. Position the passenger side demister duct to the instrument panel. Install the screw.

13. Install the passenger side air conditioning register into the instrument panel and engage the retaining clips.
 - Attach the passenger side air conditioning duct to the register.

14. Position the A/C duct and install the screw near the center of the instrument panel.

15. Install the screw for the A/C duct near the passenger register.

16. Install the instrument panel. Do not install the driver air bag module at this time. For additional information, refer to [Section 501-12](#).

17. Install the glove compartment. For additional information, refer to [Section 501-12](#).
18. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).
19. With the restraint system diagnostic tools still installed at the remaining deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in the Diagnosis and Testing portion of this section.

20.  **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side impact sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute. For additional information, refer to [Section 414-01](#).

21.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the driver air bag module procedure.**

Install the driver air bag module. For additional information, refer to [Driver Air Bag Module](#) in this section.

22. Restore the vehicle to operating condition.

1.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

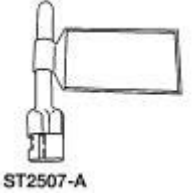

Reactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in the General Procedures portion of this section.

2.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in the Diagnosis and Testing portion of this section.

Side Air Bag Module

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (1 Req'd) 418-F395 (014-R1079)
 ST2506-A	Diagnostic Tool, Restraint System (3 Req'd) 418-F088 (105-R0012)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)

Removal

 **WARNING:** Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Carry a live side air bag module with the air bag and tear seam pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Do not set a live side air bag module down on the cover tear seam. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

 **WARNING:** Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

 **WARNING:** Side air bag modules with damaged covers must be replaced.

NOTE: If a side air bag deployment took place the seat back pad, trim cover, and side air bag module must be replaced. The seat back frame should be replaced if necessary.

NOTE: When replacing the side air bag after deployment, refer to [Section 501-10](#) for additional information concerning the installation of a new side air bag.

NOTE: Repair is made by installing a new part only. If the new part does not correct the condition, install the original part and perform the diagnostic procedure again.

NOTE: The passenger seat is shown, the driver seat is similar.

1. Prepare the vehicle for side air bag module removal.

1.  **WARNING: To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.**

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to [Section 414-01](#).

2.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

Deactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

3.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the seat removal and installation procedure.**

Remove the seat on the side with the affected side air bag module. For additional information, refer to [Section 501-10](#).

2.  **WARNING: Front seat back trim covers installed on seats equipped with side air bags cannot be repaired, they are to be replaced (cleaning is permissible).**

 **CAUTION: When removing the seat back trim panel, be careful not to damage the J-hooks. If the seat back trim panel J-hooks are damaged, install a new seat back trim panel.**

Remove the seat back trim panel.

1. Pull and release the pin-type retainers at the bottom of the seat back trim panel.
2. While pushing in at the top of the seat back trim panel, slide it down to disengage the J-hooks.
3. Pull out evenly at the top of the seat back trim panel and remove it.
4. Inspect the seat back trim panel J-hooks and pin-type retainers for damage.

3. Disconnect the electrical connectors.

4. Separate the pin-type retainers from the seat back frame as indicated.

5. Detach the seat back trim cover J-clips.

6. Reposition the seat back trim cover and pad and remove the side air bag module retaining nut cover.

7. Push the wire harness and grommet through the seat back frame.

8. **NOTE:** If installing a new side air bag module, use new retaining nuts. If the same side air bag module is to be reused then reuse the side air bag module nuts.

Remove the side air bag module retaining nuts.

9. With one hand on the side air bag module, position the seat back trim cover and pad forward

enough to access the side air bag module.

10. Remove the side air bag module from the deployment chute.
 1. Separate the side air bag module and deployment chute from the seat back mounting bracket.
 2. Pull the side air bag module mounting studs back through the deployment chute openings and remove the side air bag module from the deployment chute.

11. Remove the side air bag module.
 1. Slide the side air bag electrical connector locking clip to disengage it.
 2. Release the two connector tabs (one shown) by pushing in on them and disconnect the side air bag module.
 3. Remove the side air bag module.

Installation

WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions and notes at the beginning of the removal procedure.

1. Connect the side air bag module electrical connector.
 1. Install the connector to the side air bag module.
 2. Slide the side air bag module electrical connector locking clip to secure the connector to the side air bag module.

2. Make sure the electrical connector is securely fastened to the side air bag module.

3.  **WARNING:** Inspect the mounting surfaces of the side air bag module for any foreign objects before installing the side air bag module. If any foreign objects are found, remove them. Failure to do so may result in personal injury, in the event of an air bag deployment.

 **WARNING:** Inspect the side air bag deployment chute and the side air bag cavity in the seat back pad for any foreign objects. If any foreign objects are found remove them. Failure to do so may result in personal injury, in the event of an air bag deployment.

 **WARNING:** Before installing the side air bag module into the deployment chute, check it for damage and foreign objects. If the air bag module is damaged, replace it. If any foreign objects are found, remove them. Failure to do so may result in personal injury, in the event of an air bag deployment.

 **WARNING:** If the air bag cover has separated or the air bag material has been exposed, install a new side air bag module. Do not attempt to repair the air bag module. Failure to do so may result in personal injury, in the event of an air bag deployment.

 **WARNING:** Check the side air bag deployment chute for damage. The deployment chute must not be repaired. If there is any damage to the deployment chute, the seat back trim cover and deployment chute must be installed new as a unit.

 **WARNING:** If the air bag deployment chute is not properly positioned, the side air bag may not deploy properly.

NOTE: The alignment pin will only allow the side air bag module to be installed to the seat back mounting bracket one way.

Position the side air bag module into the deployment chute.

- Position the side air bag module into the deployment chute with the alignment pin offset to the top and the electrical connector to the bottom of the seat back. This will position the alignment pin correctly when the side air bag module and deployment chute are mounted to the seat back frame mounting bracket.
- The side air bag module mounting studs must come through the deployment chute stud openings.

4.  **WARNING: Inspect the mounting surfaces of the deployment chute and the seat back frame mounting bracket for any foreign objects, before installing the side air bag module/deployment chute assembly. If any foreign objects are found, remove them. Failure to do so may result in personal injury, in the event of an air bag deployment.**

Install the side air bag module onto the front seat back frame mounting bracket. Install the nuts.

- The deployment chute should not have any wrinkles or folds where it contacts the seat back frame mounting bracket.

5. Pull the wire harness back through the hole in the seat back frame and seat the grommet.

6. Reposition the seat back pad and trim cover to the seat back frame.

7. Attach the side air bag retaining nuts cover.

- Check that all three attaching clips on the side air bag nuts cover are correctly installed around the side air bag mounting bracket.

8. Fasten the seat back trim cover J-clips.

9. Install the pin-type retainers indicated.

10. Connect the electrical connectors.

11.  **CAUTION: Inspect the seat back trim panel J-hooks for damage. If damaged, install a new seat back trim panel.**

Install the seat back trim panel.

1. Angle the top of the seat back trim panel inward and up to engage the upper J-hooks to the seat back frame.
2. While holding the seat back trim panel up, align the pin-type retainers at the bottom of the seat back trim panel and install them into the seat back frame.

12. Restore the vehicle to operating condition.

1.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the seat removal and installation procedure.**

Install the seat on the side with the affected side air bag. For additional information, refer to [Section 501-10](#).

2.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

Reactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

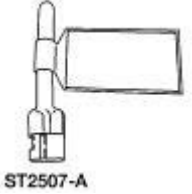

3.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in this section.

4. Check the active restraint system for correct operation. For additional information, refer to [Section 501-20A](#).
-

Clockspring

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (2 Req'd) 418-F395 (014-R1079)
 ST2506-A	Diagnostic Tool, Restraint System (3 Req'd) 418-F088 (105-R0012)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)

Removal

 **WARNING:** Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Do not set a live air bag module down with the trim cover face down. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

 **WARNING:** Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

 **WARNING:** Air bag modules with discolored or damaged trim covers must be replaced, not repainted.

NOTE: A repair is made by installing a new part only. If the new part does not correct the condition,

install the original part and perform the diagnostic procedure again.

All vehicles

1. Prepare the vehicle for clockspring removal.

1.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable (14301) and wait at least one minute. For additional information, refer to [Section 414-01](#).

2.  **WARNING:** To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.

Deactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

2. Remove the two steering wheel back cover plugs.

3. Remove the two driver air bag module bolts.

4. Remove the driver air bag module.
 1. Slide and disengage the driver air bag module electrical connector locking clip.
 2. Depressing the locking tabs, disconnect the driver air bag module electrical connector.
 3. Remove the driver air bag module.

5. **NOTE:** Make sure the wheels are in the straight-ahead position.

Remove the steering wheel. For additional information, refer to [Section 211-04](#).

6. Apply two strips of masking tape across the clockspring to prevent accidental rotation when the clockspring is removed.

7. Remove the two screws and the lower steering column shroud.

8. Pull out and remove the ignition switch finish panel.

9. Remove the headlight switch finish panel by pulling out on it enough to disconnect the electrical connectors and remove it.

10. Lower the steering column.
 1. Remove the two steering column retaining nuts.
 2. Loosen the two steering column retaining nuts enough to pivot the steering column and remove the instrument cluster finish panel.

11. Remove the screws and the instrument cluster finish panel enough to access the automatic temperature control sensor assembly.

12. Separate the automatic temperature control sensor assembly from the instrument cluster finish panel by pushing in and releasing the tabs.

13. Remove the instrument cluster finish panel.
14. Remove the upper steering column shroud.

Vehicles with hands free microphone

15. Disconnect the microphone electrical connector.

All vehicles

16. Disconnect the steering column position sensor electrical connector.

17. Separate the clockspring electrical connector assembly from the steering column.
1. Disconnect the remaining clockspring electrical connectors.
 2. Release the four clockspring connector assembly retaining clips (two shown).
 3. Separate the clockspring electrical connector assembly from the steering column.

18. Releasing the three clips, remove the clockspring with the multi-function switch.

19. Cut the tie strap. Disconnect the electrical connector.

20. Releasing the tabs, separate the clockspring from the multi-function switch.

Installation

WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions and notes at the beginning of the removal procedure.

All vehicles

1. Align the clockspring to the multi-function switch and attach the two, engaging the retaining tabs.

2. Connect the electrical connector. Install a new tie strap to secure the wire harness.

Vehicles receiving a new clockspring

3. **NOTE:** A new clockspring is supplied in a centralized position and held there with a key.

Remove the key from the clockspring, holding the rotor in its centralized position.

- Do not allow the clockspring rotor to turn from this position.

Vehicles needing clockspring recentering

4.  **WARNING:** Incorrect centralization may result in premature component failure. If in doubt when centralizing the clockspring, repeat the centralizing procedure. Failure to follow this instruction may result in personal injury.

 **CAUTION:** Make sure the road wheels are in the straight ahead position.

NOTE: If a clockspring has rotated out of center, follow through with this step.

Centralize the clockspring.

1. Hold the clockspring outer housing stationary.
2.  **CAUTION:** Overturning will destroy the clockspring. The internal ribbon wire acts as the stop and can be broken from its internal connection.

While turning the rotor clockwise, carefully feel for the ribbon wire to run out of length, and a slight resistance is felt. Stop turning at this point.

3. Turn the rotor counterclockwise 2-1/2 turns. This is the center point of the clockspring.
 - Do not allow the rotor to turn from this position.

Vehicle repairs reusing the same clockspring

5. **NOTE:** When the tape is removed, do not allow the clockspring to turn.

Remove the tape applied during clockspring removal.

All vehicles

6. **NOTE:** Slight turning of the clockspring rotor is allowable for alignment purposes to the steering column.

With the flats of the clockspring aligned to the flats of the steering column, slide the clockspring onto the steering column engaging the retaining tabs.

7. Remove the restraint system diagnostic tool from the vehicle harness side of the clockspring electrical connector.

8. Install and connect the clockspring electrical connector assembly.
 1. Align the clockspring electrical connector assembly to the steering column and engage the four retaining tabs (two shown).
 2. Connect the clockspring electrical connector assembly electrical connectors.

9. Connect the steering column position sensor electrical connector.

Vehicles with hands free microphone

10. Connect the microphone electrical connector.

All vehicles

11. Position the upper steering column shroud.

12. Align the instrument cluster finish panel to the instrument panel and install the four screws.
 - Install the automatic temperature sensor to the instrument cluster finish panel (not shown).

13. Install the nuts.

14. Install the steering wheel. Do not install the driver air bag module at this time. For additional information, refer to [Section 211-04](#).
15. Attach the restraint system diagnostic tool to the clockspring electrical connector at the top of the steering column.

16. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).
17. With the restraint system diagnostic tools installed at all deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in this section.
18. Disconnect the battery ground cable and wait at least one minute. For additional information, refer to [Section 414-01](#).
19. Connect the electrical connectors. Aligning the retaining clips, install the headlight switch panel.

20. Align the ignition switch finish panel and push in, seating the retaining clips.

21. Position the lower steering column shroud. Install the screws.

22. Remove the restraint system diagnostic tool from the clockspring electrical connector at the top of the steering column.

23. Connect and position the driver air bag module to the steering wheel.
1. Connect the driver air bag module electrical connector.
 2. Slide and engage the driver air bag module electrical connector locking clip.
 3. Position the driver air bag module to the steering wheel.

24. Install the two driver air bag module bolts.

25. Install the two steering wheel back cover plugs.

26. Restore the vehicle to operating condition.

1.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes, and instructions in the supplemental restraint system (SRS) deactivation/reactivation procedure.**

Reactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

2.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from the vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to [Air Bag and Safety Belt Pretensioner Supplemental Restraint System \(SRS\)](#) in this section.

General Specifications

Item	Specification
Fluid/Lubricant Specification	
Premium Life Long Grease XG-1-K	ESA-M1C75-B

Torque Specifications

Description	Nm	lb-ft	lb-in
A/C and power steering bracket bolts	10	—	89
Balance nuts	24	18	—
Center bearing bracket bolts	40	30	—
Control arm cam nuts	175	129	—
Driveshaft yoke adjuster	90	66	—
Engine crossmember bolts	103	76	—
Engine mount nuts	63	46	—
Flex coupling bolts	85	63	—
Flex coupling nuts	85	63	—
Front brake capiler bolts	35	26	—
Front I-brace bolts (front)	55	41	—
Front I-brace bolts (rear)	30	22	—
Front I-brace bracket shoulder bolt	30	22	—
Front strut mount bolts	175	129	—
Power steering gear bolts	103	76	—
Radiator support crossmember bolts	103	76	—
Rear anti-lock brake sensor bolts	9	—	80
Rear brake hose bolts	47	35	—
Rear shock mount bolts	133	98	—
Rear subframe bolts	103	76	—
Stabilizer bar bolts	55	41	—
Stabilizer bar link nuts	55	41	—
Tie rod end nuts	80	59	—
Upper ball joint nuts	90	66	—
Water control valve bracket nuts	9	—	80

Body Misalignment Check

CAUTION: Do not attempt to correct any serious misalignment with one pulling/pushing operation. Damage to the structure could occur.

NOTE: All body alignment measurements should be made without trim and from metal to metal.

1. To check the body alignment, take two opposite diagonal measurements between the front, center or rear pillars. Take the measurements between reference points, such as crease lines or weld joints which are diagonally opposite each other on the two pillars being measured.
-

Underbody Misalignment Check

1. The dimensions of the underbody must be restored to provide the correct front and rear wheel alignment geometry.
2. All the dimensions are measured between the centers of the existing holes in the underbody unless otherwise specified.
3. Inspect all underbody structural members for cracks, twists or bends. Check all welded connections for cracks. Inspect the support brackets for looseness. Carry out any necessary repairs or install new components as necessary.
4. The X axis is referenced from the front of the vehicle. The Y axis is referenced from the center line of the vehicle.

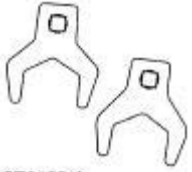

Underbody Dimensions

Dimension	X axis mm(in)	Y axis mm(in)
1	2,044.59 mm (80.49 in)	614 mm (24.17 in)
2	2,164 mm (85.19 in)	273 mm (10.74 in)
3	2,643 mm (104.05 in)	614 mm (24.17 in)
4	3,258 mm (128.26 in)	224 mm (8.81 in)
5	3,275 mm (146.65 in)	675 mm (26.57 in)
6	4,150 mm (163.38 in)	365 mm (14.37 in)
7	4,490 mm (176.77 in)	240 mm (9.44 in)
8	5,100 mm (200.78 in)	500 mm (19.68)
9	5,250 mm (206.69 in)	50 mm (1.96)
10	2,044.59 mm (80.49 in)	614 mm (24.17 in)
11	2,164 mm (85.19 in)	273 mm (10.74 in)
12	2,643 mm (104.05 in)	614 mm (24.17 in)
13	3,258 mm (128.26 in)	224 mm (8.81 in)
14	3,725 mm (146.65 in)	675 mm (26.57 in)
15	4,150 mm (163.38 in)	365 mm (14.37 in)
16	4,490 mm (176.77 in)	240 mm (9.44 in)
17	5,100 mm (200.78 in)	500 mm (19.68 in)
18	1,118 mm (44.01 in)	—
19	1,825 mm (71.85 in)	—
20	1,990 mm (78.34 in)	—
21	2,300 mm (90.55 in)	—
22	3,258 mm (128.26 in)	—

Subframe —Rear

Special Tool(s)

 ST2455-A	Torque Wrench, Driveshaft Coupler 205-474
---	---

Removal

NOTE: If a new rear subframe is to be installed, the differential and halfshafts must be removed prior to removal of the rear subframe. For all other procedures, the differential, halfshafts and rear subframe are to be removed as an assembly.

All

1. Drain the fuel tank. For additional information, refer to [Section 310-00](#).
2. Remove the rear wheel and tire assemblies. For additional information, refer to [Section 204-04](#).

Installing a new rear subframe only

3. Remove the differential and halfshafts. Refer to [Section 205-02](#).

Removing rear subframe assembly (differential and halfshafts attached)

4. Remove the muffler and rear heat shield. For additional information, refer to [Section 309-00](#).
5.  **CAUTION: The differential companion flange bolts, nuts and washers must be removed as matched pairs and installed in the original location. The system balance add-on nuts must be installed in the original location.**

NOTE: Make sure to disconnect the flexible coupling only from the differential companion flange.

Using different color paint markers, place index matchmarks on the differential companion flange, driveshaft flexible coupling and the differential companion flange bolts, nuts, washers and system balance add-on nuts so the driveshaft and differential may be realigned during installation.

6. Remove the flex coupling bolts, nuts and washers.
 - If equipped, remove the balance nuts prior to the removal of the flex coupling nuts.

7. Support the driveshaft at the center and rear.

8. Using the special tools, loosen the driveshaft yoke adjuster nut.

9. **NOTE:** There are shims between the center bearing mounting bracket and the body.

NOTE: The shims must be installed in the original location.

Remove the center bearing bracket bolts and the shims.

10. Slide the rear driveshaft to the full forward position.

11. Using the special tools, tighten the driveshaft yoke adjuster nut.

All

12. Remove the two bolts and position the rear anti-lock brake sensors aside.

13. Disconnect the two rear parking brake cables.

14. Disconnect the two parking brake cables from the junction bracket located to the rear of the fuel tank.

15. Remove the two bolts and position the rear brake hoses aside.

16. Remove and discard the two lower rear shock mount bolts.

17. Paint or mark the position of the subframe to the body for assembly reference.

18.  **CAUTION:** Make sure to remove any residual fuel from the fuel filler hose prior to removal to avoid potential spillage.

Loosen the clamp and remove the fuel filler hose from the fuel tank.

19. Support the vehicle with jack stands at the engine crossmember.

20.  **WARNING:** Make sure the rear subframe is secured to the lift table. Failure to follow these instructions may result in personal injury.

Position the lift table under the rear subframe and remove the rear subframe bolts.

21. **NOTE:** Make sure to clear the fuel filler tube and the differential pinion stem during the subframe removal.

Lower the rear subframe.

Installation

All

1. **NOTE:** Make sure the subframe clears the fuel filler tube and that the differential pinion stem aligns with the driveshaft.

Raise the subframe into contact with the body and hand-start the rear subframe bolts.

2. Align the location marks.
3. Tighten the rear subframe bolts.

Installing a new rear subframe only

4. Install the differential and halfshafts. Refer to [Section 205-02](#).

All

5. Install the two new lower rear shock mount bolts.

6. Position the two rear brake hoses and install the bolts.

7. Connect the two parking brake cables to the junction bracket located to the rear of the fuel tank.

8. Connect the two rear parking brake cables.

9. Position the two rear anti-lock brake sensors and install the bolts.

10. Using the special tools, loosen the driveshaft yoke adjuster nut.

11. **NOTE:** Install one gram (0.04 ounce) of Premium Long Life Grease, XG-1-K or equivalent meeting Ford specification ESA-M1C75-B, in the alignment bushing prior to installation.

Slide the driveshaft rearward until the flexible coupling engages with the differential companion

flange.

12. **NOTE:** Make sure to install the shims between the center bearing bracket and the floor pan. Install the shims in their original position and loosely install the center bearing bracket bolts.

13. **NOTE:** Align the driveshaft index matchmarks.

NOTE: Make sure to match the bolts, washers, attaching nuts and balance nuts (if equipped) to their original locations.

Install the flex coupling bolts, attaching nuts and washers.

- If equipped, install the balance nut(s).

14. **NOTE:** Tighten the bolts using hand tools only.

NOTE: Avoid twisting the center bearing bracket when tightening.

Tighten the center bearing bracket bolts evenly.

- Using the special tools, tighten the driveshaft yoke adjuster nut.

- Install the rear heat shield and muffler exhaust system. For additional information, refer to [Section 309-00](#).
- Install the fuel filler hose and tighten the clamp.

- Install the rear wheel and tire assemblies. For additional information, refer to [Section 204-04](#).
 - Bleed the brake system. For additional information, refer to [Section 206-00](#).
 - Refill the fuel tank.
 - Check and adjust rear alignment. For additional information, refer to [Section 204-00](#).
 - Test drive the vehicle. If any vibration is present, refer to [Section 100-04](#).
-

Crossmember —Front

Removal

All vehicles

1. Remove the upper radiator sight shield.
2. Support the radiator to the upper radiator support.
3. Install the three-bar engine support.
4. Remove the front wheel and tire assemblies. For additional information, refer to [Section 204-04](#).
5. Remove the eight bolts and the two front I-braces.
 - Discard the bolts.

6. Remove the two clips and position the front anti-lock brake sensors aside.

7. Remove the four bolts, support and position the front brake calipers aside.

8.  **CAUTION: Hold the external hex of the tie rods when removing the nuts.**

Remove and discard the two nuts and separate the tie rod ends from the front spindles.

9.  **CAUTION: Hold the external hex of the stabilizer bar links when removing the nuts.**

Remove and discard the two nuts and separate the stabilizer bar links from the lower control arm and position aside.

10.  **CAUTION: Hold the external hex of the ball joints when removing the nuts.**

Remove and discard the nuts and separate the upper ball joint from the spindle.

11. Remove the underbody splash shields.
12. Remove the A/C and power steering line bracket bolts.

13. **NOTE:** The nut is most easily accessed from above the front of the radiator support crossmember.

Loosen the nut two turns, remove the bolt and position the water control valve aside.

3.9L only

14. Remove the block heater harness retainer.

All vehicles

15. Remove the bolts, position and support the power steering gear aside.
 - Discard the nuts.

16. Remove the engine mount nuts.

17. Remove and discard the lower front strut mount bolts.

18.  **WARNING:** Make sure the front crossmembers are secured to the lift table. Failure to follow these instructions may result in personal injury.

NOTE: Mark the right and left crossmember locations to the body.

Position the lifting table under the two crossmembers and remove the four engine crossmember bolts and the four radiator support crossmember bolts.

19. Lower the radiator support and engine crossmembers as an assembly.

20. **NOTE:** Discard the control arm nuts and bolts.

Remove the control arm nuts and bolts.

Radiator support crossmember removal

21. Remove the bolts and the water control valve bracket.

22. Remove and discard the bolts and position the stabilizer bar aside.

Installation

Radiator support crossmember

1. **NOTE:** The front I-brace shoulder bolt will have 1.5mm (0.059in) of clearance between the front I-brace bracket and the bolt. This is normal and the bolt should not be tightened any further.

Position the stabilizer bar and install the new bolts.

2. Position the water control valve bracket and install the bolts.

All vehicles

3. Loosely install the new control arm cam bolts and nuts.

4. Position the radiator support and engine crossmembers as an assembly.
5. **NOTE:** Align the crossmember markings.

NOTE: Make sure the weight of the engine is not contacting the crossmember and make sure the crossmember assembly is in contact with the body before tightening the bolts.

Install the four engine crossmember bolts and the four radiator support crossmember bolts.

6. Install the engine mount nuts.

7. Install the new lower front strut mount bolts.

8.  **CAUTION: Hold the external hex of the ball joints when installing the nuts.**

Position the upper ball joints into the spindles and install the new nuts.

9.  **CAUTION: Hold the external hex of the stabilizer bar links when installing the nuts.**

Position the two stabilizer bar links into the lower control arm and install the new nuts.

10. Position the power steering gear and install the bolts.

11.  **CAUTION: Hold the external hex of the tie rods when installing the nuts.**

Position the two tie rod ends into the spindles and install the new nuts.

12. Position the two front brake calipers and install the bolts.

13. Position the two front anti-lock brake sensors and install the clips.

3.9L only

14. Install the block heater harness.

All vehicles

15. Position the water control valve and tighten the nut.

16. Position the A/C and power steering brackets and install the bolts.

17. Position the two front I-braces and loosely install the four bolts.
 1. Loosely install the front bolts.
 2. Position the I-braces.
 3. Loosely install the rear bolts.

18. Make sure that the four front I-brace insulators are correctly positioned.

19. Install the four front I-brace bolts.

20. Tighten the four front I-brace bolts.

21. Install the underbody splash shields.
 22. Install the front wheel and tire assemblies. For additional information, refer to [Section 204-04](#).
 23. Remove the three-bar engine support.
 24. Remove the support from the radiator.
 25. Install the upper radiator sight shield.
 26. Align the front suspension. For additional information, refer to [Section 204-00](#).
-

Crossmember —Front I-Brace Bracket

Removal

1. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
2. Remove the four bolts and the front I-brace. Discard the bolts.

3. Remove and discard the front I-brace bracket shoulder bolt.

4. Remove the rear lower control arm nut and the front I-brace bracket. Discard the nut.

5. Remove the bolts and position the power steering gear aside.
 - Discard the nuts.

6. Remove and discard the rear lower control arm bolt.

Installation

1. Position the front I-brace bracket and install the rear lower control arm cam bolt and nut.

2. Position the power steering gear and install the bolts.

3. **NOTE:** The front I-brace shoulder bolt will have 1.5mm (0.059in) if clearance between the front I-brace bracket and the bolt. This is normal and the bolt should not be tightened any further.

Install the front I-brace bracket shoulder bolt.

4. Position the front I-brace and loosely install the bolts.
 1. Loosely install the front bolt.
 2. Position the front I-brace.
 3. Loosely install the rear bolt.

5. Make sure that the front I-brace insulators are correctly positioned.

6. Install the front I-brace bolts.

7. Tighten the front I-brace bolts.

8. Align the front suspension. For additional information, refer to [Section 204-00](#).
-

GENERAL INFORMATION

INTRODUCTION

In the past, when cars were simpler, diagrams were simpler. All components were connected by wires, and diagrams seldom exceeded 4 pages in length. Today, some wiring diagrams require more than 16 pages. It would be impractical to expect a service technician to trace a wire from page 1 across every page to page 16.

Components shown with a dashed line instead of a solid line indicate not all circuits are shown in this particular diagram (circuits shown in system diagrams are typically applicable to that system only). The remaining circuits connected to that component will be shown in the appropriate system that they apply to.

Today, the wiring diagram necessary to support a given repair procedure is included within that article or a link is provided to the appropriate SYSTEM WIRING DIAGRAM article. For example, the wiring diagram for a Ford EEC-IV system may be included in ENGINE PERFORMANCE and WIRING DIAGRAMS articles for Ford Motor Co. The wiring diagram for a cruise control system may be included in ACCESSORIES & EQUIPMENT section for the specific vehicle manufacturer, and the wiring diagram for an anti-lock brake system may be included in BRAKES and WIRING DIAGRAMS for the specific manufacturer.

WIRING DIAGRAMS contains all wiring diagrams not included in STARTING & CHARGING SYSTEMS and ACCESSORIES & EQUIPMENT. This includes: Data Link Connectors, Ground Distribution, Power Distribution, Engine Performance, Electric Cooling Fans, Anti-Lock Brakes, Electronic Suspension and Electronic Steering wiring diagrams. The Data Link Connectors wiring diagrams show the circuits by which the various on-board computers exchange information, and the diagnostic connectors used for diagnosis and their location. The Ground Distribution wiring diagrams show all vehicle ground points, their location, and the components common to those ground points. The Power Distribution wiring diagrams show the power feed circuits and the components common to those power feeds.

Wiring diagrams used to support the information in ACCESSORIES & EQUIPMENT are drawn in a "top-down" format. The diagrams are drawn with the power source at the top of the diagram and the ground point at the bottom of the diagram. Component locations are identified on the wiring diagrams. Any wires that do not connect directly to a component are identified on the diagram to indicate where they go.

WIRING DIAGRAM SYMBOLS

NOTE: Standard wiring symbols are used on all wiring diagrams. The list below will help clarify any symbols that are not easily understood at a glance. Most components are labeled "Motor", "Switch" or "Relay" in addition to being drawn with the standard symbol.

G50E03637

Fig. 1: Identifying Standard Wiring Diagram Symbols

WIRING DIAGRAM GROUND NUMBER LOCATIONS

NOTE: The following illustration depicts standardized ground numbers and locations to be used in conjunction with wiring diagrams applying to 2001 and prior model years only. See [Fig. 2](#). Wiring diagrams applying to newer model years depict manufacturer-specified ground numbers and locations. Do not utilize the illustration with 2002 and newer

model year wiring diagrams.

Fig. 2: Ground Numbers & Locations (2001 & Prior Model Years)

WIRING DIAGRAM COMPONENT LOCATIONS

When trying to locate a component in a wiring diagram and you don't know the specific system where it is located, use this handy component locator to find the system wiring diagram in which the component is located. Then, go to that system and locate the component within the wiring diagram.

For example, if you don't know the specific system in which the ignition switch is located, look up ignition switch in the wiring diagram component location tables and go to the appropriate wiring diagram(s) which contain either full or partial views of the ignition switch. The full view of the ignition switch is located in Power Distribution.

The first listing for the component will be the full or most complete view of the component. Additional listings will be partial views of the component. Not all components are used on all models.

All components will have a partial view in Ground Distribution and Power Distribution. Data Link Connectors show connecting circuits between modules. Alternate names for components may be listed in wiring diagram component locations tables.

WIRING DIAGRAM COMPONENT LOCATIONS

Component	Wiring Diagram
ABS Electronic Control Unit	Anti-Lock Brakes; Data Link Connectors
ABS Hydraulic Unit	Anti-Lock Brakes
Acceleration Sensor	Anti-Lock Brakes
Accessory Delay Relay	Power Windows
A/C Compressor Clutch Relay	Engine Performance
A/C Sensor	Engine Performance
A/C Pressure Switch	Engine Performance
Adaptive Lamp Control Module	Exterior Lights
Air Bag(s)	Air Bag Restraint System
Air Bag Module	Air Bag Restraint System
Air Bag Sensor(s)	Air Bag Restraint System
Air Injection Pump Relay	Engine Performance
Air Temperature Sensor	Overhead Console
Alternator (Generator)	Generators & Regulators
Anti-Theft Control Module	Anti-Theft System; Starters
Autolamp Control Relay	Headlight Systems; Daytime Running Lights
Automatic Shutdown (ASD) Relay	Engine Performance; Generators & Regulators
Autostick Switch	Engine Performance
Auxiliary Battery Relay	Generators & Regulators
Back-Up Lights	Back-Up Lights; Exterior Lights
Barometric (BARO) Pressure Sensor	Engine Performance
Battery	Power Distribution
Battery Temperature Sensor	Engine Performance
Body Control Module	Body Control Computer; Anti-Theft System; Daytime Running Lights; Engine Performance; Headlight Systems; Warning Systems
Boost Control Solenoid	Engine Performance
Boost Sensor	Engine Performance
Brake Fluid Level Switch	Analog Instrument Panels
Brake On/Off (BOO) Switch	Cruise Control Systems; Engine Performance; Shift Interlock Systems
Buzzer Module	Warning Systems

Camshaft Position (CMP) Sensor	Engine Performance
Central Control Module	Anti-Theft System
Clockspring	Air Bag Restraint System; Cruise Control Systems; Steering Column Switches
Clutch Pedal Position Switch	Starters
Clutch Start Switch	Starters
Combination Meter	Analog Instrument Panels
Constant Control Relay Module (CCRM)	Engine Performance; Electric Cooling Fans
Convenience Center	Power Distribution; Illumination/Interior Lights
Convertible Top Motor	Power Convertible Top
Convertible Top Switch	Power Convertible Top
Crankshaft Position (CKP) Sensor	Engine Performance
Cruise Control Module	Cruise Control Systems
Cruise Control Switch	Cruise Control Systems
Condenser Fan Relay(s)	Electric Cooling Fans
Data Link Connector (DLC)	Engine Performance
Daytime Running Lights Module	Daytime Running Lights; Exterior Lights
Defogger Relay	Rear Window Defogger
Diagnostic Energy Reserve Module (DERM)	Air Bag Restraint System
Discriminating Sensor (Air Bag)	Air Bag Restraint System
Distributor	Engine Performance
Door Lock Actuators	Power Door Locks; Remote Keyless Entry
Door Lock Relay(s)	Power Door Locks
Electrochromic Mirror	Power Mirrors
Electronic Level Control (ELC) Height Sensor	Electronic Suspension
Electronic Level Control (ELC) Module	Electronic Suspension
Engine Coolant Temperature (ECT) Sending Unit	Analog Instrument Panels
Engine Coolant Temperature (ECT) Sensor	Engine Performance
Engine Control Module	Engine Performance; Generators & Regulators; Starters
ETACS ECU	Warning Systems; Power Windows; Remote Keyless Entry
Evaporative (EVAP) Emissions Canister	Engine Performance
EVAP Canister Purge Solenoid	Engine Performance
EVAP Canister Vent Solenoid	Engine Performance
Exhaust Gas Recirculation (EGR) Valve	Engine Performance
Fuel Tank Vacuum Sensor	Engine Performance
Fog Lights	Headlight Systems; Daytime Running Lights
Fog Light Relay	Headlight Systems; Daytime Running Lights
Fuel Door Release Solenoid	Power Fuel Door Release
Fuel Gauge Sending Unit	Analog Instrument Panels
Fuel Injectors	Engine Performance
Fuel Pump	Engine Performance
Fuel Pump Relay	Engine Performance; Power Distribution

Fuse/Relay Block	Power Distribution
Fusible Links	Power Distribution; Generators & Regulators; Starters
Generator	Generators & Regulators; Engine Performance; Power Distribution
Generic Electronic Module (GEM)	Body Control Modules; Electronic Suspension
Glow Plug Relay	Engine Performance
Glow Plugs	Engine Performance
Grounds	Ground Distribution
Headlight Door Module	Headlight Doors
Headlight Relay	Headlight Systems; Daytime Running Lights
Headlights	Headlight Systems; Daytime Running Lights
Heated Oxygen Sensor(s) (HO2S)	Engine Performance
Heated Windshield Control Module	Heated Windshields
Height Sensor	Electronic Suspension
Horns	Steering Column Switches
Horn Relay	Steering Column Switches
Idle Air Control (IAC) Motor/Valve	Engine Performance
Ignition Coil(s)	Engine Performance
Ignition Key Lock Cylinder	Anti-Theft System
Ignition Module	Engine Performance
Ignition Switch	Power Distribution; Engine Performance; Generators & Regulators; Starters
Illuminated Entry Module	Illumination/Interior Lights
Illumination Lights	Illumination/Interior Lights
Impact Sensor	Air Bag Restraint System
Inertia Fuel Shutoff Switch	Engine Performance
Inhibit Relay	Starters
Instrument Cluster	Analog Instrument Panels
Intake Air Temperature (IAT) Sensor	Engine Performance
Interior Lights	Illumination/Interior Lights
Interlock Switch	Starters
Junction Block	Power Distribution
Keyless Entry Receiver	Remote Keyless Entry
Key Reminder Switch	Starters
Knock Sensor	Engine Performance
Lamp Control Module	Exterior Lights
License Plate Lamp	Exterior Lights
Lighting Control Module	Lighting Control Modules; Anti-Theft System; Daytime Running Lights; Headlight Systems
Lower Relay	Power Convertible Top
Malfunction Indicator Light (MIL)	Engine Performance; Instrument Panels
Manifold Absolute Pressure (MAP) Sensor	Engine Performance
Mass Airflow (MAF) Sensor	Engine Performance

Mega Fuse	Generators & Regulators
Memory Seat/Mirror Module	Memory Systems
Mirror Defogger	Rear Window Defogger
Moon Roof Motor	Power Moon Roof
Moon Roof Relay	Power Moon Roof
Multi-Function Control Module	Warning Systems
Neutral Safety Switch	Starters
Oil Level Switch	Engine Performance
Oil Pressure Switch/Sending Unit	Analog Instrument Panels; Engine Performance
Overhead Console	Overhead Console
Oxygen Sensor(s) (O2S)	Engine Performance
Parking Brake Switch	Analog Instrument Panels
Park Lights	Exterior Lights
Park/Neutral Position Switch	Starters; Engine Performance; Anti-Theft System; Body Control Module
Perimeter Lighting Control Relay	Exterior Lights
Power Amplifier	Power Antennas
Power Antenna Module	Power Antennas
Power Antenna Motor	Power Antennas
Power Distribution Center	Power Distribution; Generators & Regulators; Starters
Power Door Lock Motors	Power Door Locks
Power Mirror Motors	Power Mirrors; Memory Systems
Power Sliding Door Controller	Power Sliding Side Door
Power Seat Motors	Power Seats; Memory Systems
Power Steering Pressure Switch	Engine Performance
Power Top Motor	Power Convertible Top
Power Top Relay(s)	Power Convertible Top
Powertrain Control Module	Engine Performance; Analog Instrument Panels; Cruise Control Systems; Data Link Connectors; Generators & Regulators; Starters
Power Window Motors	Power Windows
Power Window Relay(s)	Power Windows
Radiator Fan Motor(s)	Electric Cooling Fans
Radiator Fan Relay(s)	Engine Performance; Electric Cooling Fans;
Rainsense Module	Wiper/Washer Systems
Raise Relay	Power Convertible Top
Remote Anti-Theft Personality (RAP) Module	Anti-Theft System; Starters; Warning Systems
Seat Belt Pretensioners	Air Bag Restraint System
Seat Belt Retractor Solenoid	Passive Restraints
Seat Belt Switch	Air Bag Restraint System; Passive Restraints
Shift Interlock Solenoid	Shift Interlock Systems
Shift Lock Actuator	Shift Interlock Systems
Side Marker Lights	Exterior Lights

SIR Coil Assembly (Clockspring)	Air Bag Restraint System
Slip Ring (Clockspring)	Air Bag Restraint System; Steering Column Switches
SRS Control Module	Air Bag Restraint System
Starter Motor	Starters
Starter Interrupt Relay	Starters
Starter Solenoid	Starters
Starter Relay	Starters
Steering Wheel Position Sensor	Anti-Lock Brakes
Stoplights	Exterior Lights
Stoplight Switch	Engine Performance; Cruise Control Systems; Anti-Lock Brakes
Sun Roof ECU	Power Sun Roof
Sun Roof Motor	Power Sun Roof
Sun Roof Position Sensor	Power Sun Roof
Taillights	Exterior Lights
Throttle Position (TP) Sensor	Engine Performance
Torque Converter Clutch Solenoid/Switch	Engine Performance
Traction Control Switch	Anti-Lock Brakes
Trailer Tow Connector	Exterior Lights
Trailer Tow Relay	Exterior Lights
Transmission/Transaxle	Engine Performance
Transmission Control Module (TCM)	Engine Performance; Starters
Transmission Range Sensor	Starters; Back-Up Lights; Engine Performance
Transmission Range Switch	Back-Up Lights; Engine Performance; Anti-Theft System
Turn Signal Flasher	Exterior Lights
Turn Signal Lights	Exterior Lights
Twilight Sentinel Switch	Headlight Systems; Daytime Running Lights
Vapor Canister Leak Detection Pump	Engine Performance
Vehicle Control Module (VCM)	Engine Performance
Vehicle Dynamic Module	Electronic Suspension
Vehicle Speed Control Servo	Cruise Control Systems
Vehicle Speed Sensor	Data Link Connectors; Analog Instrument Panels; Cruise Control Systems; Electronic Suspension
Voltage Regulator	Generators & Regulators
Water-In-Fuel Sensor	Engine Performance; Analog Instrument Panels
Wheel Speed Sensors	Anti-Lock Brakes
Window Timer Module	Power Convertible Top
Windshield Intermittent Wiper Relay	Wiper/Washer Systems
Windshield Washer Motor	Wiper/Washer Systems
Wiper Motor	Wiper/Washer Systems

2001 FORD MOTOR CO. LS

2001 FORD MOTOR CO.**LS****BUZZERS, RELAYS & TIMERS****BUZZERS, RELAYS & TIMERS**

Component	Location
A/C Clutch Relay	In underhood auxiliary junction box.
Air Pump Relay	Front of left front wheelwell.
Auxiliary Coolant Pump Relay	In underhood auxiliary junction box.
Blower Motor Relay	In underhood auxiliary junction box.
Compressor Relay	In front center of engine compartment, above right cooling fan.
COPS & Heated Oxygen Sensor (HO2S) Relay	In underhood auxiliary junction box.
Foglight Relay	In underhood auxiliary junction box.
Fuel Pump Relay	In battery junction box.
Heated Wiper Park Relay	In underhood auxiliary junction box.
Horn Relay	In underhood auxiliary junction box.
PCM Power Relay	In underhood auxiliary junction box.
Rear Window Defrost Relay	In battery junction box.
SSP 1 Relay	In battery junction box.
SSP 2 Relay	In battery junction box.
SSP 3 Relay	In battery junction box.
SSP 4 Relay	In battery junction box.
Starter Relay	In underhood auxiliary junction box.
Trailer Exterior Light Relay	Rear end of vehicle.
Windshield Wiper Relay	In underhood auxiliary junction box.
Wiper High/Low Relay	In underhood auxiliary junction box.
Wiper Run/Park Relay	In underhood auxiliary junction box.

CIRCUIT PROTECTION DEVICES**CIRCUIT PROTECTION DEVICES**

Component	Location
Auxiliary Junction Box (Interior)	Under left side of dash. See Fig. 10 .
Auxiliary Junction Box (Underhood)	In right front of engine compartment. See Fig. 7 .
Battery Junction Box	In luggage compartment, near battery. See Fig. 11 .
Central Junction Box	Behind right kick panel.
Mega Fuse	In luggage compartment, near battery junction box. See Fig. 11 .

CONTROL UNITS**CONTROL UNITS**

2001 Lincoln LS

2001 FORD MOTOR CO. LS

Component	Location
ABS Control Module	Right front side of engine compartment. See Fig. 8 .
Audio Unit	Behind center of dash.
Cellular Phone Module	In left side of luggage compartment.
Driver Door Lock Unit	In driver's door.
Driver Door Module (DDM)	In driver's door.
Driver Heated Seat Module	Under driver's seat.
Driver Seat Module	Under driver's seat.
Electrochromatic Inside Mirror Unit	In center of roof panel.
Electronic Automatic Temperature Control (ETAC) Unit	Behind center of dash.
Front Electronic Module (FEM)	In left "A" pillar.
Fuel Pump Module	Under rear of vehicle.
Heater Blower Control Module	Behind left side of dash. See Fig. 10 .
Instrument Panel Dimming Module	Behind left side of dash.
Intake Manifold Runner Control (IMRC) Module (3.0L)	Right rear of engine compartment. See Fig. 1 .
Intake Manifold Runner Control (IMRC) Module (3.9L)	Right rear of engine compartment.
Passenger Door Lock Unit	In passenger's door.
Passenger Heated Seat Module	Under passenger's seat.
Passive Anti-Theft Transceiver Module	Behind center of dash.
Powertrain Control Module (PCM)	Right rear of engine compartment.
Rain Sensor Module	In rear center of roof panel opening.
Rear Electronic Module (REM)	In right side of luggage compartment. See Fig. 11 .
Remote Emergency Satellite Cellular Unit (RESCU)	In left side of luggage compartment.
Restraint Control Module (RCM)	In center console.
Roof Opening Panel Module	In center of roof panel opening.
Trailer Tow Control Unit	Rear center of luggage compartment.

MOTORS**MOTORS**

Component	Location
Air Pump Motor	Front of left front wheelwell.
Auxiliary Coolant Pump Motor	In right front of engine compartment. See Fig. 6 .
Blower Motor	Behind center of dash.
Speed Control Servo	In left rear of engine compartment.
Steering Column Position Motor	On steering column.
Washer Pump Motor	On windshield washer fluid reservoir.
Windshield Wiper Motor	On center of firewall. See Fig. 5 .

2001 Lincoln LS

2001 FORD MOTOR CO. LS

SENDING UNITS & SENSORS**SENDING UNITS & SENSORS**

Component	Location
Ambient Air Temperature Sensor	Right front of engine compartment.
Autolamp Sensor	Behind right side of dash.
Brake Booster Sensor	In left rear of engine compartment. See Fig. 5 .
Camshaft Position (CMP) Sensor (3.0L)	On top left side of engine compartment. See Fig. 1 .
Camshaft Position (CMP) Sensor (3.9L)	On top left rear of cylinder head. See Fig. 2 .
Crankshaft Position (CKP) Sensor (3.0L)	Lower left front of engine. See Fig. 1 .
Crankshaft Position (CKP) Sensor (3.9L)	Lower left front of engine.
Cylinder Head Temperature Sensor (3.0L)	On middle of left cylinder head. See Fig. 1 .
Cylinder Head Temperature Sensor (3.9L)	On right cylinder head, under intake. See Fig. 2 .
Digital Transmission Range (DTR) Sensor	On left side of transmission. See Fig. 9 .
Discharge Temperature Sensor (Left)	Behind left side of dash.
Discharge Temperature Sensor (Right)	Behind right side of dash.
Driver Memory Backrest Sensor	In driver's seat.
Driver Memory Seat Front Height Sensor	Under driver's seat.
Driver Memory Seat Horizontal Sensor	Under driver's seat.
Driver Memory Seat Rear Height Sensor	Under driver's seat.
Dual Axis Acceleration Sensor	In center console.
Evaporator Discharge Air Temperature Sensor	Behind center of dash.
Exhaust Pressure Transducer (EPT) Sensor (3.0L)	Left rear side of engine compartment. See Fig. 1 .
Exhaust Pressure Transducer (EPT) Sensor (3.9L)	Left rear side of engine compartment. See Fig. 4 .
Fuel Pump/Fuel Gauge Sender	On top of fuel tank.
Fuel Rail Pressure Transducer Sensor (3.0L)	On left side of engine.
Fuel Rail Pressure Transducer Sensor (3.9L)	On left side of engine. See Fig. 4 .
Fuel Tank Pressure Transducer Sensor	Under rear of vehicle.
Heated Oxygen Sensor (HO2S) No. 11 (Front)	Lower right rear of engine in exhaust manifold.
Heated Oxygen Sensor (HO2S) No. 12 (Rear)	In exhaust, rear of catalyst.
Heated Oxygen Sensor (HO2S) No. 21 (Front)	Lower left rear of engine in exhaust manifold.
Heated Oxygen Sensor (HO2S) No. 22 (Rear)	In exhaust, rear of catalyst.
Intake Air Temperature (IAT) Sensor	On left side of engine compartment.
Intermediate Shaft Speed (ISS) Sensor	On left side of transmission. See Fig. 9 .
In-Vehicle Temperature Sensor	Behind center of dash.
Knock Sensor 1 (3.0L)	On top right side of engine. See Fig. 1 .
Knock Sensor 1 (3.9L)	On top right side of engine. See Fig. 2 .
Knock Sensor 2 (3.9L)	On top left side of engine. See Fig. 2 .
Mass Airflow (MAF) Sensor	On air intake assembly.
Output Shaft Speed (OSS) Sensor	On left side of transmission. See Fig. 9 .
Primary Brake Pressure Sensor	In left rear of engine compartment. See Fig. 5 .
Secondary Brake Pressure Sensor	In left rear of engine compartment. See Fig. 5 .
Side Air Bag Sensor (Left)	Under driver's seat.
Side Air Bag Sensor (Right)	Under passenger's seat.

2001 Lincoln LS

2001 FORD MOTOR CO. LS

Steering Column Position Sensor	On steering column.
Steering Position Sensor	On steering column.
Sun Load Sensor	On top of dash, above glove box.
Throttle Position (TPS) Sensor (3.0L)	On right side of engine. See Fig. 1 .
Throttle Position (TPS) Sensor (3.9L)	On right side of engine. See Fig. 3 .
Turbine Shaft Speed (TSS) Sensor	On lower rear of transmission. See Fig. 9 .
Wheel Speed Sensor (Left Front)	On left front wheel assembly, on spindle assembly.
Wheel Speed Sensor (Left Rear)	On left rear wheel assembly, on brake knuckle.
Wheel Speed Sensor (Right Front)	On right front wheel assembly, on spindle assembly.
Wheel Speed Sensor (Right Rear)	On right rear wheel assembly, on brake knuckle.
Yaw Velocity Sensor	In center console.

SOLENOIDS & SOLENOID VALVES**SOLENOIDS & SOLENOID VALVES**

Component	Location
A/C Clutch Field Coil (3.0L)	In left side of engine compartment. See Fig. 1 .
A/C Clutch Field Coil (3.9L)	In left side of engine compartment.
Brake Shift Interlock	Behind left side of dash, near steering column.
Coolant Control Valve Solenoid	In right front of engine compartment. See Fig. 6 .
Electronic Vacuum Regulator (EVR) Solenoid Valve (3.0L)	On left rear of engine. See Fig. 1 .
Electronic Vacuum Regulator (EVR) Solenoid Valve (3.9L)	On left rear of engine. See Fig. 4 .
EVAP Canister Purge Valve	In left side of engine compartment. See Fig. 5 .
Evaporative Emission (EVAP) Canister Vent Valve	Under rear of vehicle.
Fuel Door Release Solenoid	On right side of luggage compartment. See Fig. 11 .
Hydraulic Fan Solenoid (3.0L)	On top right side of engine. See Fig. 1 .
Hydraulic Fan Solenoid (3.9L)	On top right side of engine. See Fig. 3 .
Inlet Air Control Valve Solenoid (3.0L)	On top right side of engine. See Fig. 1 .
Inlet Air Control Valve Solenoid (3.9L)	On top right side of engine. See Fig. 3 .
Luggage Compartment Lid Release Solenoid	In luggage compartment deck lid.
Power Steering Valve Solenoid	On left side of engine compartment. See Fig. 5 .
Shift Lock Actuator	In top of steering column.
Vacuum Diverter Valve Solenoid (3.0L)	On front of engine. See Fig. 1 .
Vacuum Diverter Valve Solenoid (3.9L)	On front of engine.

SWITCHES**SWITCHES**

Component	Location

2001 Lincoln LS

2001 FORD MOTOR CO. LS

A/C Clutch Cycling Pressure Switch	In left front of engine compartment.
Anti-Theft Hood Switch	In top left front of engine compartment.
Brake Fluid Level Switch	In left rear of engine compartment, on brake fluid reservoir. See Fig. 5 .
Brake Pedal Position Switch	On top of brake pedal support.
Brake Pressure Switch	On top of brake pedal support.
Clutch Pedal Position Switch	On top of clutch pedal support.
Emergency Message Switch	In center of roof panel.
Inertia Fuel Shut-Off (IFS) Switch	Inside left kick panel. See Fig. 10 .
Luggage Compartment Lid Ajar Switch	In deck lid.
Luggage Compartment Lid Release Switch	On left side of dash panel.
Oil Pressure Switch (3.0L)	On lower left side of engine. See Fig. 1 .
Oil Pressure Switch (3.9L)	On lower left side of engine.
Park Brake Switch	At base of parking brake assembly, in center console.
Power Steering Pressure Switch	In left side of engine compartment. See Fig. 5 .
Safety Belt Buckle Switch	In seat belt buckle.
Valet Lockout Switch	In glove box.
Washer Fluid Level Switch	In windshield washer fluid reservoir.

MISCELLANEOUS**MISCELLANEOUS**

Component	Location
ABS Test Connector	In left rear of engine compartment. See Fig. 5 .
Battery	In right side of luggage compartment.
Data Link Connector (DLC)	Under left side of dash.
Fuel Pump Motor Diode	In luggage compartment under floor lining.
Ignition Transformer Capacitor 1 (3.0L)	In left rear of engine compartment. See Fig. 1 .
Ignition Transformer Capacitor 1 (3.9L)	In left rear of engine compartment. See Fig. 4 .
Ignition Transformer Capacitor 2 (3.0L)	In right rear of engine compartment. See Fig. 1 .
Ignition Transformer Capacitor 2 (3.9L)	In right rear of engine compartment. See Fig. 3 .
Joint Connector 1	Behind right side of dash.
Joint Connector 2	Behind right side of dash.
Joint Connector 3	Behind left side of dash.
Joint Connector 4	Behind left side of dash.
PCM Module Power Diode	In right front side of engine compartment.
Remote Amplifier	Behind front center of dash.
Subwoofer Amplifier	In front of luggage compartment.

CONNECTORS**CONNECTORS**

Component	Location
C110 (8 Pin)	At left front of vehicle.

2001 Lincoln LS

2001 FORD MOTOR CO. LS

C133 (8 Pin)	At right front of vehicle.
C134 (6 Pin)	At right front of engine compartment. See Fig. 6 .
C139 (A/T) (6 Pin)	At upper rear of engine. See Fig. 9 .
C139 (M/T) (6 Pin)	At upper rear of engine.
C140 (3.0L) (Black, 12 Pin)	At right rear of engine compartment. See Fig. 1 .
C140 (Black, 12 Pin) (3.9L)	At right rear of engine compartment. See Fig. 3 .
C144 (20 Pin)	At right front footwell.
C145 (Gray, 4 Pin)	At right front footwell.
C146 (2 Pin)	At right front wheelwell.
C192 (12 Pin) (3.0L)	At rear of engine. See Fig. 1 .
C192 (3.9L) (12 Pin)	At rear of engine.
C210 (12 Pin)	Under left side of dash, at footwell. See Fig. 10 .
C211 (20 Pin)	Under left side of dash, at footwell. See Fig. 10 .
C212 (20 Pin)	Under left side of dash, at footwell. See Fig. 10 .
C213 (16 Pin)	Under left side of dash, at footwell. See Fig. 10 .
C214 (3 Pin)	Under left side of dash, at footwell. See Fig. 10 .
C215 (3 Pin)	Under left side of dash, at footwell. See Fig. 10 .
C219 (7 Pin)	Behind right side of dash.
C248 (4 Pin)	On steering column.
C260 (16 Pin)	Behind center of dash. See Fig. 10 .
C263 (20 Pin)	Under right side of dash, at footwell.
C264 (16 Pin)	Under right side of dash, at footwell.
C265 (3 Pin)	Under right side of dash, at footwell.
C274 (1 Pin)	Under left side of dash, at footwell. See Fig. 10 .
C275 (2 Pin)	Behind center of dash. See Fig. 10 .

2001 STARTING & CHARGING SYSTEMS**Generators & Regulators - LS****DESCRIPTION**

System consists of 110-amp generator, internal voltage regulator, battery, Powertrain Control Module (PCM), warning indicator, related fuses and wiring. PCM and generator communicate using pulse-width modulated signals. A dedicated line communicates desired charging rate from PCM to generator and a second dedicated line communicates load from generator to PCM.

Warning indicator should illuminate with ignition on, engine off. Warning indicator should not illuminate with ignition off, or with engine running. Generator and regulator cannot be serviced separately, and must be replaced as an assembly.

ADJUSTMENTS**BELT TENSION**

Vehicles are equipped with automatic drive belt tensioner. Drive belt does not require adjustment. Inspect condition and tension of generator drive belt prior to performing any on-vehicle charging system tests. Replace belt and/or repair tensioner mechanism if necessary.

TROUBLE SHOOTING

NOTE: See **TROUBLE SHOOTING** article in **GENERAL INFORMATION**.

Verify customer's concern. Verify battery condition. Inspect accessory drive belt and tensioner. Inspect battery junction box fuse No. 415 (5-amp). Inspect central junction box fuse No. 217 (5-amp). Check all connections for looseness or corrosion. If problem is found, repair as necessary. If problem is not found, perform self-diagnostics. See **SELF-DIAGNOSTIC SYSTEM**.

ON-VEHICLE TESTING**BATTERY DRAIN TEST**

1. Ensure junction box/fuse panels are accessible without turning on interior and hood lights. Drive vehicle over 30 MPH for at least 5 minutes. Park vehicle and allow to sit with ignition off for at least 40 minutes to allow electronic modules to power down. Go to next step.
2. Connect a fused jumper wire between negative battery cable and negative battery post. Disconnect negative battery cable from negative battery post, without breaking the jumper wire connection to prevent modules from resetting. Go to next step.

NOTE: **It is very important that continuity is not broken between negative battery post and negative battery cable when disconnecting battery cable or connecting ammeter. If continuity is broken, go to step 1 .**

3. Ensure ammeter is set to read milliamps with at least a 10 amp capability. Connect ammeter between negative battery cable and negative battery post. Remove fused jumper wire. Go to next step.

2001 Lincoln LS

2001 STARTING & CHARGING SYSTEMS Generators & Regulators - LS

4. If excessive current draw is present, pull fuses from battery/central junction box one at a time and note any current drop when each fuse is removed. DO NOT reinstall fuses until test is complete. Go to next step.
5. Check wiring diagrams for any circuits that run from battery without passing through battery/central junction box. Disconnect these circuits if current draw still exists.

BATTERY DRAINS THAT SHUT OFF WHEN BATTERY CABLE IS DISCONNECTED TEST

1. Perform battery drain test. See **BATTERY DRAIN TEST**. Ensure all doors are closed and accessories are off. Without starting engine, turn ignition switch to RUN position for a moment, and then turn ignition OFF. Wait a few minutes for illuminated entry lamps to turn off (if equipped).
2. Connect ammeter between negative battery cable and negative battery post. Disconnect negative battery cable from negative battery post, without breaking the ammeter connection to prevent modules from resetting. Read amperage draw.
3. Amperage draw should be less than 50 milliamps. If current draw exceeds 50 milliamps, remove fuses from battery/central junction box one at a time to locate problem circuit.

LOAD TEST

1. Ensure drive belt is in good condition. Replace belt as necessary. If belt is okay, connect charging system load tester in accordance with manufacturer's instructions. Start and run engine at 2000 RPM, and apply load until generator output levels off. Generator amperage should be at least 58 amps with engine at 2000 RPM. Go to next step.
2. Turn A/C system on. Turn blower speed to high. Turn headlights on to high beams. Voltage should increase a minimum of .5 volts. If voltage is as specified, system is operating properly at this time. If voltage is not as specified, perform **NO-LOAD TEST**.

NO-LOAD TEST

Switch tester to voltmeter function. Connect voltmeter positive lead to B+ terminal on generator and negative lead to ground. Turn all electrical accessories off. Start and run engine up to 2000 RPM. Read voltmeter when voltage stabilizes. Voltage should be 13-15 volts. If voltage is not as specified, repair by symptom. See **SYMPTOM INDEX** table under SYSTEM TESTS.

SELF-DIAGNOSTIC SYSTEM

Connect New Generation Star (NGS) tester to Data Link Connector (DLC). Using NGS tester, perform Powertrain Control Module (PCM) self-test. If any DTCs exist, perform appropriate test in accordance with DTC retrieved. See appropriate SELF-DIAGNOSTICS article in ENGINE PERFORMANCE. If no DTCs are present, repair by symptom. See **SYMPTOM INDEX** table under SYSTEM TESTS.

SYSTEM TESTS

SYMPTOM INDEX

Symptom	Perform Test
Battery Is Discharged Or Voltage Is Low	<u>A</u>
Warning Indicator On With Engine Running, System Not Charging	<u>B</u>
System Overcharges	<u>C</u>
Warning Indicator On With Engine Running, System Is Charging	<u>D</u>

2001 Lincoln LS

2001 STARTING & CHARGING SYSTEMS Generators & Regulators - LS

Warning Indicator Off With Ignition On	<u>E</u>
Warning Indicator Flickers, Or Is Intermittent	<u>F</u>
Generator Noisy	<u>G</u>
Radio Interference	<u>H</u>

TEST A: BATTERY IS DISCHARGED OR VOLTAGE IS LOW

1. Perform generator load and no-load tests. See **LOAD TEST** and **NO-LOAD TEST** under ON-VEHICLE TESTING. If generator is okay, go to next step. If generator is not okay, perform **TEST B: WARNING INDICATOR ON WITH ENGINE RUNNING, SYSTEM NOT CHARGING** .
2. Perform **BATTERY DRAIN TEST** under ON-VEHICLE TESTING. If no excessive current draw was not found, go to next step. If any excessive current draw was found, repair as necessary.
3. Perform **BATTERY DRAINS THAT SHUT OFF WHEN BATTERY CABLE IS DISCONNECTED TEST** under ON-VEHICLE TESTING. If there are any current drains that shut off when the battery is disconnected, repair as necessary. If no drains were found, perform **TEST B: WARNING INDICATOR ON WITH ENGINE RUNNING, SYSTEM NOT CHARGING** .

TEST B: WARNING INDICATOR ON WITH ENGINE RUNNING, SYSTEM NOT CHARGING

1. Connect New Generation Star (NGS) tester to Data Link Connector (DLC). Turn ignition on. Using NGS tester, perform Powertrain Control Module (PCM) self-test. If no DTCs are retrieved, go to next step. If any Diagnostic Trouble Codes (DTC) are retrieved, perform appropriate test in accordance with DTC retrieved. See appropriate SELF-DIAGNOSTICS article in ENGINE PERFORMANCE.
2. Turn ignition off. Disconnect NGS tester. Disconnect generator 3-pin harness connector. Turn ignition on. Measure voltage between ground and Gray/Red wire terminal at generator harness connector. If voltage is present, go to next step. If voltage is not present, go to step 4 .
3. Turn ignition off. Disconnect PCM harness connector C175c. Measure resistance of Gray/Red wire between generator harness connector and terminal No. 28 at PCM harness connector C175c. See **Fig. 1** . If resistance is 5 ohms or less, go to next step. If resistance is greater than 5 ohms, repair open in Gray/Red wire between generator and PCM.
4. Connect PCM harness connector C175c. Check generator output. Perform **LOAD TEST** and **NO-LOAD TEST** under ON-VEHICLE TESTING. If generator is okay, go to next step. If generator is not okay, replace generator. See **GENERATOR** under REMOVAL & INSTALLATION.
5. Disconnect PCM harness connector C175c. Inspect harness connector for pushed out pins, corrosion or bent terminals. Repair as necessary. If harness connector is okay, reconnect and retest system operation. If fault is still present, replace PCM. Clear DTCs and repeat PCM self-test. If fault is still not present, system is operating correctly at this time.

C175a

C175b

C175c

G00011081

Fig. 1: Identifying Powertrain Control Module Harness Connector Terminals
 Courtesy of FORD MOTOR CO.

TEST C: SYSTEM OVERCHARGES

1. Connect New Generation Star (NGS) tester to Data Link Connector (DLC). Turn ignition on. Using NGS tester, perform Powertrain Control Module (PCM) self-test. If no DTCs are retrieved, go to next step. If any Diagnostic Trouble Codes (DTC) are retrieved, perform appropriate test in accordance with DTC retrieved. See appropriate SELF-DIAGNOSTICS article in ENGINE PERFORMANCE.

2. Turn ignition off. Disconnect NGS tester. Start engine. With engine running and all accessories turned off, measure voltage between battery terminals while varying engine speed. If voltage is less than 15 volts, go to next step. If voltage is greater than 15 volts, go to step 4 .
3. Turn ignition off. Disconnect generator 3-pin harness connector. Start engine. Check generator output. See **LOAD TEST** under ON-VEHICLE TESTING. If generator tests okay, go to next step. If generator does not test okay, replace generator. See **GENERATOR** under REMOVAL & INSTALLATION.
4. Measure voltage between ground and Red wire terminal at generator harness connector. If voltage is less than .5 volt from battery voltage, replace generator. See **GENERATOR** under REMOVAL & INSTALLATION. If voltage is greater than .5 volt from battery voltage, repair high resistance in Red wire. See **WIRING DIAGRAMS** .

TEST D: WARNING INDICATOR ON WITH ENGINE RUNNING, SYSTEM IS CHARGING

1. Connect New Generation Star (NGS) tester to Data Link Connector (DLC). Turn ignition on. Using NGS tester, perform Powertrain Control Module (PCM) self-test. If no DTCs are retrieved, go to next step. If any Diagnostic Trouble Codes (DTC) are retrieved, perform appropriate test in accordance with DTC retrieved. See appropriate SELF-DIAGNOSTICS article in ENGINE PERFORMANCE.
2. Turn ignition off. Disconnect NGS tester. Start engine. With engine running and all accessories turned off, measure voltage between battery terminals while varying engine speed. If voltage is less than 15 volts, go to next step. If voltage is greater than 15 volts, perform **TEST B: SYSTEM OVERCHARGES** .
3. Turn ignition off. Disconnect generator 3-pin harness connector. Turn ignition on. Measure voltage between ground and Red wire terminal at generator harness connector. If battery voltage is present, go to next step. If voltage is not present, repair open or short in Red wire. See **WIRING DIAGRAMS** .
4. Turn ignition off. Disconnect PCM harness connector C175c. Turn ignition on and observe warning indicator. If warning indicator is not illuminated, go to next step. If warning indicator is illuminated, repair short to ground in Gray/Red wire between generator and PCM. See **WIRING DIAGRAMS** .
5. Turn ignition off. Reconnect PCM harness connector C175c. Disconnect generator 3-pin harness connector. Check generator output. See **LOAD TEST** under ON-VEHICLE TESTING. If generator tests okay, go to next step. If generator does not test okay, replace generator. See **GENERATOR** under REMOVAL & INSTALLATION.
6. Disconnect PCM harness connector C175c. Inspect harness connector for pushed out pins, corrosion or bent terminals. Repair as necessary. If harness connector is okay, reconnect and retest system operation. If fault is still present, replace PCM. Clear DTCs and repeat PCM self-test. If fault is still not present, system is operating correctly at this time.

TEST E: WARNING INDICATOR OFF WITH IGNITION ON

1. Connect New Generation Star (NGS) tester to Data Link Connector (DLC). Turn ignition on. Using NGS tester, perform Powertrain Control Module (PCM) self-test. If no DTCs are retrieved, go to next step. If any Diagnostic Trouble Codes (DTC) are retrieved, perform appropriate test in accordance with DTC retrieved. See appropriate SELF-DIAGNOSTICS article in ENGINE PERFORMANCE.
2. Turn ignition off. Disconnect NGS tester and generator 3-pin harness connector. Turn ignition on. Connect a fused (15-amp) jumper wire between generator 3-pin Gray/Red wire terminal and ground. If warning indicator does not illuminate, go to next step. If warning indicator illuminates, replace generator. See **GENERATOR** under REMOVAL & INSTALLATION.
3. Disconnect PCM harness connector C175c. Inspect harness connector for pushed out pins, corrosion or bent terminals. Repair as necessary. If harness connector is okay, reconnect and retest system

operation. If fault is still present, replace PCM. Clear DTCs and repeat PCM self-test. If fault is still not present, system is operating correctly at this time.

TEST F: WARNING INDICATOR FLICKERS, OR IS INTERMITTENT

1. Connect New Generation Star (NGS) tester to Data Link Connector (DLC). Turn ignition on. Using NGS tester, perform Powertrain Control Module (PCM) self-test. If no DTCs are retrieved, go to next step. If any Diagnostic Trouble Codes (DTC) are retrieved, perform appropriate test in accordance with DTC retrieved. See appropriate SELF-DIAGNOSTICS article in ENGINE PERFORMANCE.
2. Disconnect generator 3-pin harness connector. Inspect generator, battery and battery junction box for looseness, corrosion or bent terminals. Clean and tighten any loose connection. If connections are okay, reconnect generator harness connector and go to next step.
3. Start engine. With engine running, inspect battery junction box fuse No. 415 (5-amp), by wiggling fuse and observing warning indicator. If warning indicator flickers, repair loose fuse connection. Retest system operation. If warning indicator does not flicker, go to next step.
4. With engine running and all accessories turned off, measure voltage between battery terminals. If battery voltage is less than 15 volts, go to next step. If battery voltage is greater than 15 volts, perform **TEST B: SYSTEM OVERCHARGES** .
5. Turn ignition off. Disconnect generator 3-pin harness connector. Connect a fused (15-amp) jumper wire between generator 3-pin Gray/Red wire terminal and ground. Turn ignition on and observe warning indicator. If warning indicator illuminates, go to next step. If warning indicator does not illuminate, repair open in Gray/Red wire. See **WIRING DIAGRAMS** .
6. Turn ignition off. Connect generator harness connector. Turn ignition on and observe warning indicator. If warning indicator does not illuminate, go to next step. If warning indicator illuminates, system is operating correctly at this time. Inspect circuits for intermittent opens or shorts.
7. Disconnect PCM harness connector C175c. Inspect harness connector for pushed out pins, corrosion or bent terminals. Repair as necessary. If harness connector is okay, reconnect and retest system operation. If fault is still present, replace PCM. Clear DTCs and repeat PCM self-test. If fault is still not present, system is operating correctly at this time.

TEST G: GENERATOR NOISY

1. Turn ignition off. Check accessory drive belt for damage and correct installation. Check mounting brackets and pulleys for looseness and damage. If problem does not exist, go to next step. If problem exists, repair as necessary.
2. Check generator installation. Ensure all fasteners are tight. If problem does not exist, go to next step. If problem exists, repair as necessary.
3. Disconnect generator 3-pin harness connector. Start engine and let idle. Turn headlights on. Turn rear defogger on. Turn blower motor to high speed. If noise still exists, go to next step. If noise does not still exist, replace generator.
4. Turn ignition off. Connect generator harness connector. Start engine and let idle. Turn all accessories off. Using a stethoscope, check generator for unusual mechanical noise. If generator is source of noise, replace generator. If generator is not source of noise, isolate noise and repair as necessary.

TEST H: RADIO INTERFERENCE

Start engine and let idle. Tune radio to station where interference is present. Turn ignition off. Disconnect generator 3-pin harness connector. Start engine and let idle. If interference is still present, repair radio concern. If interference is not still present, replace generator.

REMOVAL & INSTALLATION

CAUTION: When battery is disconnected, vehicle computer and memory systems may lose memory data. Driveability problems may exist until computer systems have completed a relearn cycle. See **COMPUTER RELEARN PROCEDURES** article in **GENERAL INFORMATION** before disconnecting battery.

GENERATOR

Removal & Installation (3.0L)

Disconnect negative battery cable. Remove drive belt from pulley. Raise and support vehicle. Remove bolts, pin-type retainers and lower splash shield. Remove 3 mounting bolts from generator. Hand support generator and rotate to access electrical connections. Disconnect wiring from generator. Remove generator. To install reverse removal procedure. Tighten fasteners to specification. See **TORQUE SPECIFICATIONS** .

Removal (3.9L)

Disconnect negative battery cable. Remove engine cover and air cleaner inlet tube. Remove drive belt from pulley. Raise and support vehicle. Remove 5 bolts and lower splash shield. Remove generator mounting bolts. Rotate generator to access B+ terminal, and remove nut. Slightly lower generator and disconnect harness connectors. Rotate and remove generator.

Installation

Position generator and connect harness connectors. Rotate generator to access B+ terminal, install cable and nut. Install pivot bolt and nut, leave loose. Install generator expanding bushing/bolt assembly and tighten to specification in 2 steps. Install remaining mounting bolts and tighten to specification. See **TORQUE SPECIFICATIONS** table. Install lower splash shield. Lower vehicle, install drive belt to generator pulley and air cleaner inlet tube. Reconnect negative battery cable.

TORQUE SPECIFICATIONS

TORQUE SPECIFICATIONS

Application	Ft. Lbs. (N.m)
Generator Mounting Bolts (3.0L)	33 (45)
Generator Mounting Bolts (3.9L)	
Pivot & Lower Mounting Bolts	35 (48)
Generator Expanding Bushing/Bolt Assembly	
Step 1	15 (20)

WIRING DIAGRAMS

2001 Lincoln LS

2001 STARTING & CHARGING SYSTEMS Generators & Regulators - LS

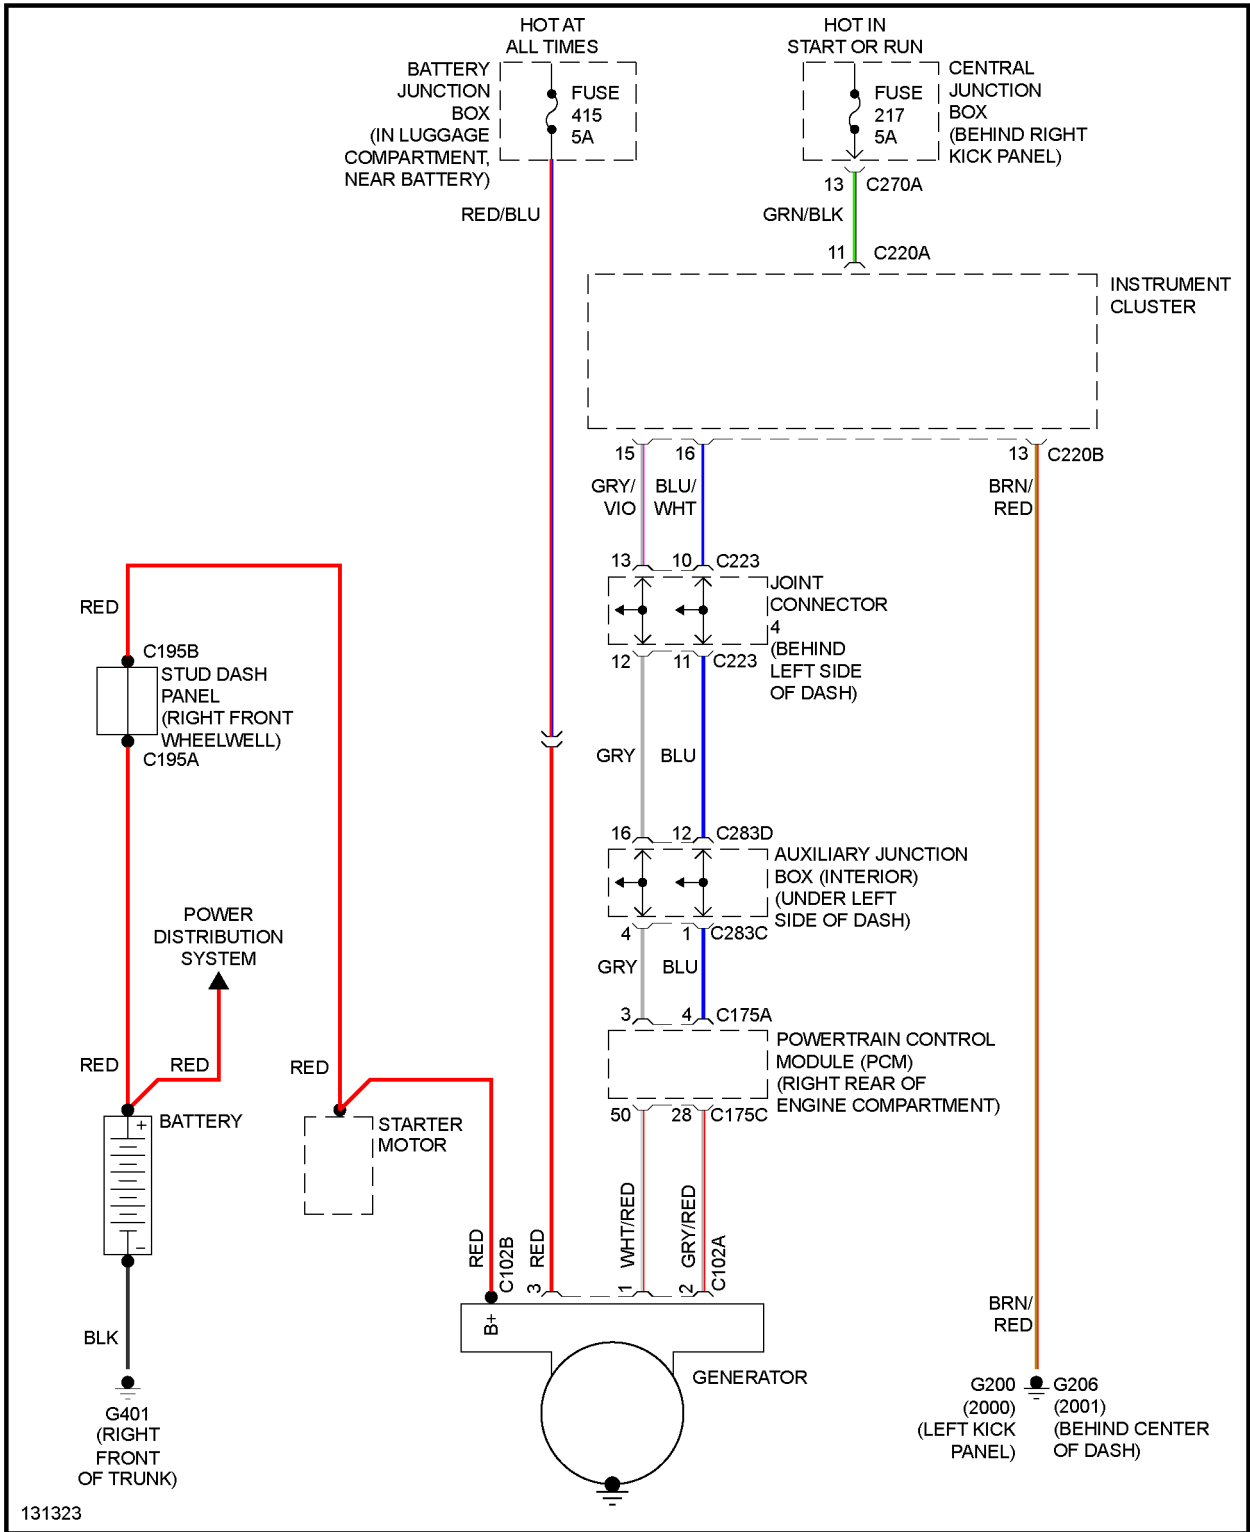

Fig. 2: Charging System Wiring Diagram (LS)

2001 Lincoln LS

2001 STARTING & CHARGING SYSTEMS Starters - LS

2001 STARTING & CHARGING SYSTEMS

Starters - LS

DESCRIPTION

The starter is a gear-reduction motor with an externally-mounted solenoid. Starting system consists of a starter motor, solenoid, battery, ignition switch, Digital Transmission Range (DTR) sensor, starter relay, and interconnecting cables and wires.

COMPONENT LOCATIONS

COMPONENT LOCATIONS

Component	Location
Auxiliary Junction Box	Under Left Side Of Dash
Battery Junction Box	Left Side Of Engine Compartment On Fenderwell
Central Junction Box	Behind Right Side Kick Panel
Inertia Fuel Shutoff Switch	Behind Left Side Kick Panel
Starter Motor	Lower Right Hand Corner Of Engine
Starter Relay	In Auxiliary Relay Box
Digital Transmission Range Sensor	Side Of Transmission

ADJUSTMENTS

DIGITAL TRANSMISSION RANGE SENSOR

1. Place transmission in Neutral. Raise and support vehicle. Remove catalytic converter. Remove heat shield. Mark front driveshaft flex coupling components to ensure installation is in same position. Using Driveshaft Coupler Torquing Wrenches (205-474), loosen driveshaft coupler nut, located in front of driveshaft bushing.
2. Remove front driveshaft flex coupling nuts. DO NOT remove flex coupling bolts. Slide driveshaft back to clear transmission flange. Support driveshaft. Support transmission. Remove transmission mount. Lower transmission to access Digital Transmission Range (DTR) sensor. Disconnect manual shift control cable.
3. Disconnect DTR harness connector. Loosen DTR sensor bolts. Using DTR Sensor Aligner (T97L-70010-A), align DTR sensor slots. Tighten DTR sensor bolts to specification. See **TORQUE SPECIFICATIONS** . To complete assembly, reverse removal procedure. Use marks to align components in original positions. Use Loctite on flex coupling nuts.

TROUBLE SHOOTING

Verify customer concern by operating starting system. Check battery for state of charge. Check cable connections at battery and starter motor. Ensure transmission is fully engaged in Park or Neutral. Check fuse No. 121 (30-amp) in auxiliary junction box, located underhood. Check fuse No. 22 (20-amp) in battery junction box, located on right side of trunk. Check fuse No. 201 (5-amp) in central junction box, located under right side of instrument panel. If problem exists, repair as necessary. If problem does not exist, repair by symptom. See **SYMPTOM INDEX** table under SYSTEM TESTS.

ON-VEHICLE TESTING

CAUTION: When battery is disconnected, vehicle computer and memory systems may lose memory data. Driveability problems may exist until computer systems have completed a relearn cycle. See **COMPUTER RELEARN PROCEDURES** article in **GENERAL INFORMATION** before disconnecting battery. Before testing starter, ensure transmission is in Park or Neutral.

CAUTION: Before testing starter, ensure transmission is in Park or Neutral.

VOLTAGE DROP TEST

NOTE: Make all DVOM connections at component terminal rather than at cable or wire end.

1. Verify battery condition. Battery voltage should be 12 volts or more. Load test battery at approximately one-half cold cranking amperage rating. See load tester manufacturer's instructions. If battery voltage is less than 12 volts or loaded battery voltage is less than 9.6 volts, service battery or charging system as necessary.
2. Disconnect inertia fuel shutoff switch to disable fuel system. Connect remote starter switch between starter solenoid terminal "S" (Gray wire) and positive battery post. See **Fig. 1**.

G95B12519

Fig. 1: Testing Voltage Drop
 Courtesy of FORD MOTOR CO.

3. Connect positive DVOM lead to positive battery post, and negative lead to solenoid terminal "M" (solenoid-to-motor connection).
4. Engage remote starter switch. DVOM should indicate .8 volt or less. If DVOM indicates more than .8 volt, go to next step. If DVOM indicates .8 volt or less, go to **STARTER GROUND CIRCUIT TEST**.
5. Move negative DVOM lead to solenoid terminal "B". Engage remote starter switch. If DVOM still indicates more than .8 volt at terminal "B", go to next step. If DVOM indicates less than .8 volt, solenoid connections or contacts are bad. Clean solenoid terminals "B", "S" and "M". Repeat steps 2 - 5. If DVOM still indicates more than .8 volt at terminal "M" and less than .8 volt at terminal "B", solenoid contacts are bad. Replace starter motor. See **STARTER MOTOR** under REMOVAL & INSTALLATION.
6. Clean cables and connections at solenoid and battery. If DVOM still indicates more than .8 volt at terminal "B", replace battery cable.

NOTE: To locate excessive voltage drop, move DVOM negative lead toward battery, and check each connection point. When high DVOM reading disappears, problem is between last connection point and previous connection point.

STARTER GROUND CIRCUIT TEST

NOTE: Make all DVOM connections at component terminal rather than at cable or wire end.

1. Disconnect inertia fuel shutoff switch to disable fuel system. Connect remote starter switch between starter solenoid terminal "S" (Gray wire) and positive battery post. See **Fig. 2** . Using a digital DVOM set at lowest voltage scale, connect positive DVOM lead to starter housing, and negative lead to negative battery post.
2. Engage remote starter switch while observing DVOM. DVOM should indicate .5 volt or less. If DVOM indicates more than .5 volt, clean negative cable connections at battery and chassis. Also clean engine ground cable connections at front cover and engine mount bracket. If voltage drop is still excessive, repair or replace negative battery cable and/or engine ground cable as necessary. Repeat starter circuit test after repair to ensure problem has been corrected. If battery and cables test okay and starter motor still cranks slowly or not at all, replace starter motor. See **STARTER MOTOR** under REMOVAL & INSTALLATION.

Fig. 2: Testing Ground Circuit
Courtesy of FORD MOTOR CO.

SYSTEM TESTS

CAUTION: When battery is disconnected, vehicle computer and memory systems may lose memory data. Driveability problems may exist until computer

2001 Lincoln LS

2001 STARTING & CHARGING SYSTEMS Starters - LS

systems have completed a relearn cycle. See **COMPUTER RELEARN PROCEDURES** article in **GENERAL INFORMATION** before disconnecting battery. Before testing starter, ensure transmission is in **Park or Neutral**.

SYMPTOM INDEX

Symptom	Perform Test
Engine Does Not Crank	<u>A</u>
Unusual Starter Noise	<u>B</u>
Engine Cranks Slowly	(1)
Starter Spins But Engine Does Not Crank	(2)
Engine Cranks With Clutch Pedal Not Applied	(3)

(1) Perform **VOLTAGE DROP TEST** under ON-VEHICLE TESTING.

(2) Inspect starter motor mounting. Inspect flywheel ring gear and starter motor gear for damaged and missing teeth. Repair or replace components as necessary.

(3) Install a new clutch pedal position switch.

TEST A: ENGINE DOES NOT CRANK

1. Check for Passive Anti-Theft System (PATS) Diagnostic Trouble Codes (DTC). See **PASSIVE ANTI-THEFT SYSTEMS - LS** article. If no PATS DTCs exist, go to next step. If any PATS DTCs exist, diagnose and repair as necessary.
2. Verify battery condition. Battery voltage should be 12 volts or more. Load test battery at approximately one-half cold cranking amperage rating. See load tester manufacturer's instructions. If battery is okay, go to next step. If battery voltage is less than 12 volts or loaded battery voltage is less than 9.6 volts, service battery or charging system as necessary. Check system operation.
3. Measure voltage between positive battery post and negative battery cable connection at engine block. If voltage is more than 10 volts, go to next step. If voltage is 10 volts or less, replace battery ground cable. Check system operation.
4. Measure voltage between positive battery post and starter motor case. If voltage is more than 10 volts, go to next step. If voltage is 10 volts or less, clean starter mounting flange and ensure starter is mounted properly. Check system operation.
5. Measure voltage between starter motor terminal "B" and ground. See **Fig. 3**. If voltage is more than 10 volts, go to next step. If voltage is 10 volts or less, replace battery positive cable. Check system operation.

G98J12277

Fig. 3: Identifying Starter Solenoid Terminals
Courtesy of FORD MOTOR CO.

6. Connect a fused jumper wire to starter terminal "B". Momentarily touch other end of jumper wire to starter terminal "S". If starter cranked engine, go to next step. If starter did not crank engine, replace starter. See **STARTER MOTOR** under REMOVAL & INSTALLATION. Check system operation.
7. Disconnect starter harness connector "S" (Gray wire). Measure voltage between starter harness connector "S" (Gray wire) and ground while turning ignition switch to START position. If voltage is 10 volts or less, go to next step. If voltage is more than 10 volts, clean or repair "S" terminal and connector. Check system operation.
8. Remove starter relay from Auxiliary Junction Box (AJB), located underhood. On manual transmission models, have a helper depress clutch. On all models, measure voltage between starter relay cavity No. 86 and ground while turning ignition switch to START position. See **Fig. 4** . If voltage is more than 10 volts, go to next step. If voltage is 10 volts or less, go to step 17 .

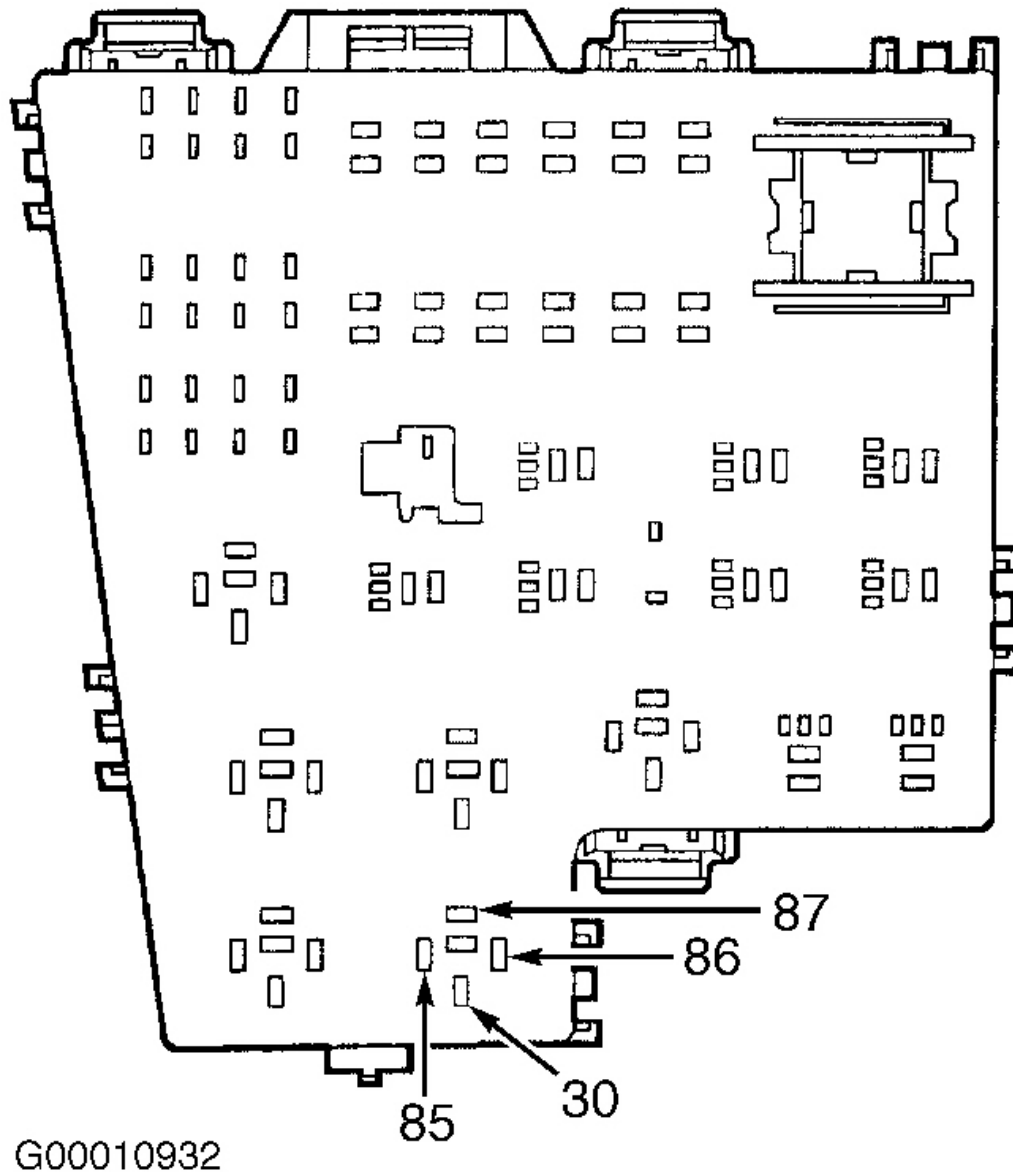

Fig. 4: Identifying Starter Relay Cavities
 Courtesy of FORD MOTOR CO.

9. On manual transmission models, have a helper depress clutch. On all models, measure resistance between starter relay cavity No. 85 and ground while turning ignition switch to START position. If resistance is 5 ohms or more, go to step 11 (M/T), or next step (A/T). If resistance is less than 5 ohms, go to step 14.
10. Disconnect 20-pin instrument cluster connector C220B. Measure resistance of Black/Yellow wire between starter relay cavity No. 85 and instrument cluster connector C220B terminal No. 18. See **Fig. 4** and **Fig. 5**. If resistance is less than 5 ohms, replace instrument cluster. See ANALOG INSTRUMENT PANELS - LS article. If resistance is 5 ohms or more, repair open on Black/Yellow wire. After repairs, check system operation.

Fig. 5: Identifying Instrument Cluster Connector C220B Terminals
 Courtesy of FORD MOTOR CO.

11. Disconnect 2-pin Clutch Pedal Position (CPP) switch connector. Measure resistance between CPP switch harness connector terminal No. 2 (Black/Yellow wire) and ground while turning ignition switch to START position. If resistance is less than 5 ohms, go to next step. If resistance is 5 ohms or more, go to step 13 .
12. Measure resistance of Black/Yellow wire between CPP harness connector terminal No. 1 and starter relay cavity No. 85. If resistance is less than 5 ohms, replace CPP switch. If resistance is 5 ohms or more, repair open in Black/Yellow wire. After repairs, check system operation.
13. Measure resistance of Black/Yellow wire between CPP switch harness connector terminal No. 2 and instrument cluster connector C220B terminal No. 18. If resistance is less than 5 ohms, replace instrument cluster. See ANALOG INSTRUMENT PANELS - LS article. If resistance is 5 ohms or more, repair open in Black/Yellow wire. After repairs, check system operation.
14. Measure voltage between starter relay cavity terminal No. 30 and ground. See **Fig. 4** . If voltage is more than 10 volts, go to next step. If voltage is less than 10 volts, repair open in power and distribution circuit to starter relay. See **WIRING DIAGRAMS** . Check system operation.

15. Disconnect starter terminal "S" connector (Gray wire). Measure resistance of Gray wire between starter relay cavity terminal No. 87 and starter harness connector. If resistance is less than 5 ohms, go to next step. If resistance is 5 ohms or more, repair open in Gray wire. Check system operation.
16. Measure resistance between starter relay cavity terminal No. 87 (Gray wire) and ground. If resistance is less than 10,000 ohms, repair short to ground in Gray wire. If resistance is 10,000 ohms or more, replace starter relay. After repairs, check system operation.
17. Remove fuse No. 201 (5-amp), located in Central Junction Box (CJB). CJB is located under right side of instrument panel. Check fuse No. 201. If fuse is okay, go to next step. If fuse is faulty, go to step 24 .
18. Measure voltage between input side of fuse No. 201 cavity in CJB and ground while turning ignition switch to START position. If voltage is less than 10 volts, go to next step. If voltage is 10 volts or more, go to step [22](#) .
19. Disconnect 8-pin ignition switch connector C250. Measure voltage between ignition switch harness connector C250 terminal No. 1 (Red wire) and ground. See [Fig. 6](#) . If voltage is 10 volts or more, go to next step. If voltage is less than 10 volts, repair open power feed circuit to ignition switch. See [WIRING DIAGRAMS](#) . Check system operation.

Fig. 6: Identifying Ignition Switch Connector Terminals
Courtesy of FORD MOTOR CO.

20. Measure resistance of Gray/Black wire between ignition switch harness connector C250 terminal No. 3 and input side of fuse No. 201 cavity in CJB. If resistance is less than 5 ohms, go to next step. If resistance is 5 ohms or more, repair open in Gray/Black wire. Check system operation.
21. Measure resistance between ignition switch harness connector C250 terminal No. 3 (Gray/Black wire) and ground. If resistance is less than 10,000 ohms, repair short to ground in Gray/Black wire. If resistance is 10,000 ohms or more, replace ignition switch. After repairs, check system operation.
22. Install fuse No. 201 (5-amp) in CJB. Disconnect Digital Transmission Range (DTR) sensor connector. DTR is located on left side of transmission. Measure voltage between DTR sensor harness connector terminal No. 10 (Gray/Orange wire) and ground while turning ignition switch to START position. See **Fig. 7** . If voltage is 10 volts or more, go to next step. If voltage is less than 10 volts, repair open in Gray/Orange wire. Check system operation.

G98F01752

Fig. 7: Identifying Digital Transmission Range Switch Harness Connector
Courtesy of FORD MOTOR CO.

23. Measure resistance of Gray wire between DTR harness connector terminal No. 12 and starter relay cavity No. 86. If resistance is less than 5 ohms, adjust DTR switch. See **DIGITAL TRANSMISSION RANGE SENSOR** under ADJUSTMENTS. If resistance is 5 ohms or more, repair open in Gray wire. After repairs, check system operation.
24. Measure resistance between output side of fuse No. 201 cavity in CJB (Gray/Orange wire) and ground. If resistance is 10,000 ohms or more, go to next step. If resistance is less than 10,000 ohms,

repair short to ground in Gray/Orange wire. Check system operation.

25. Measure resistance between DTR harness connector terminal No. 12 (Gray wire) and ground. If resistance is 10,000 ohms or more, go to next step. If resistance is less than 10,000 ohms, repair short to ground in Gray wire. Check system operation.
26. Connect DTR sensor connector. Install new fuse No. 201 (5-amp). Check system operation. If fuse fails, replace shorted DTR sensor. Recheck system operation.

TEST B: UNUSUAL STARTER NOISE

1. Verify starter is installed properly. Ensure bolts are tight. Repair as necessary and check system for normal operation. If starter is mounted properly, go to next step.
2. Connect remote starter switch between starter terminal "B" (Red wire) and starter motor terminal "S" (Gray wire). Engage starter motor and verify noise is coming from starter motor. If noise is coming from starter motor, go to next step. If noise is not coming from starter motor, diagnose engine mechanical concern. See appropriate article in ENGINES.
3. Remove starter motor. See **STARTER MOTOR** under REMOVAL & INSTALLATION. Inspect flywheel ring gear for wear or damage. If ring gear is okay, replace starter motor. If ring gear is worn or damaged, replace ring gear and inspect starter drive gear. If drive gear is also damaged, replace starter motor.

COMPONENT TESTS

STARTER RELAY

1. Remove starter relay from relay box. Check relay continuity. Continuity should exist between relay terminals No. 85 and 86, and between relay terminals No. 30 and 87a. See **Fig. 8**. Continuity should not exist between relay terminals No. 30 and 87. If continuity is as specified, go to next step. If continuity is not as specified, replace relay.
2. Using a jumper wire, apply battery voltage to relay terminal No. 85. Using a second jumper wire, ground relay terminal No. 86. Continuity should now exist between relay terminals No. 30 and 87. If continuity is not as specified, replace relay. If continuity is as specified, relay is okay at this time.

Fig. 8: Identifying Starter Relay Terminals
 Courtesy of FORD MOTOR CO.

REMOVAL & INSTALLATION

CAUTION: When battery is disconnected, vehicle computer and memory systems may lose memory data. Driveability problems may exist until computer systems have completed a relearn cycle. See **COMPUTER RELEARN PROCEDURES** article in **GENERAL INFORMATION** before disconnecting battery.

STARTER MOTOR

Removal & Installation

Disconnect negative battery cable. Raise and support vehicle. Disconnect ground strap. Remove wiring. Remove starter bolts and starter. To install, reverse removal procedure. Tighten fasteners to specification. See **TORQUE SPECIFICATIONS**.

Powertrain Control/Emissions Diagnosis Manual

2001

On Board Diagnostics II

Introduction

Note: The descriptions and specifications contained in this manual were in effect at the time this manual was approved for publication. Ford Motor Company reserves the right to discontinue models at any time, or change specifications or design without notice and without incurring obligation.

Important Safety Notice

Appropriate service methods and procedures are essential for the safe, reliable operation of all motor vehicles as well as the personal safety of the individual doing the work. This manual provides general directions for performing service with tested, effective techniques. Following them will help assure reliability.

There are numerous variations in procedures, techniques, tools, and parts for servicing vehicles, as well as in the skill of the individual doing the work. This manual cannot possibly anticipate all such variations and provide advice or cautions as to each. Accordingly, anyone who departs from the instructions provided in this manual must first establish that he compromises neither his personal safety nor the vehicle integrity by his choice of methods, tools or parts.

Notes, Cautions, and Warnings

As you read through the procedures, you will come across NOTES, CAUTIONS and WARNINGS. Each one is there for a specific purpose. NOTES give you added information that will help you to complete a particular procedure. CAUTIONS are given to prevent you from making an error that could damage the vehicle. WARNINGS remind you to be especially careful in those areas where carelessness can cause you personal injury. The following list contains some general WARNINGS that you should follow when you work on a vehicle.

- Always wear safety glasses for eye protection.
- Use safety stands whenever a procedure requires you to be under the vehicle.
- Make sure that the ignition switch is always in the OFF position, unless otherwise required by the procedure.
- Set the parking brake when working on the vehicle. If you have an automatic transmission, set it in PARK unless instructed otherwise for a specific operation. If you have a manual transmission, it should be in REVERSE (engine OFF) or NEUTRAL (engine ON) unless instructed otherwise for a specific operation. Place wood blocks (4" x 4" or larger) against the front and rear surfaces of the tires to help prevent the vehicle from moving.
- Operate the engine only in a well-ventilated area to avoid the danger of carbon monoxide poisoning.
- Keep yourself and your clothing away from moving parts when the engine is running, especially the drive belts.
- To prevent serious burns, avoid contact with hot metal parts such as the radiator, exhaust manifold, tail pipe, three-way catalytic converter and muffler.
- Do not smoke while working on a vehicle.
- To avoid injury, always remove rings, watches, loose hanging jewelry, and loose clothing before beginning to work on a vehicle.
- When it is necessary to work under the hood, keep hands and other objects clear of the radiator fan blades!

Preface

This manual provides a step-by-step approach for diagnosing drivability, emission and powertrain control system symptoms. Before beginning diagnosis, it may be helpful to reference any Technical Service

Bulletins (TSBs) or On-line Automotive Service Information System (OASIS) information when this is available.

Note: For Villager and 7.3L diesel, go to the VILLAGER or 7.3L DIESEL tab in this manual.

This manual is used in conjunction with the Body, Chassis, Electrical, Powertrain Workshop Manuals and the Wiring Diagram Manuals. The Workshop Manuals are used to provide additional diagnostics when directed by this manual. The Workshop Manuals are also used for component removal and replacement information. Refer to the Wiring Diagram Manuals for vehicle specific wiring information and component, connector and splice location.

The following is a description of the information contained in each section of this manual.

Section 1: Description And Operation

This section contains description and operation information on powertrain control systems and components. This section is designed to give the technician a general knowledge of the powertrain control system. It should be used when general information about the powertrain control system is desired, and is rarely referenced from other sections of the manual.

Section 2: Diagnostic Methods

The Diagnostic Methods section contains information on specific diagnostic tasks that are used during diagnosis. Descriptions of specific diagnostic methods are included, as well as detailed instructions on how to access or perform the tasks. This section provides the technician with step-by-step instructions for performing routine diagnostic tasks.

Section 3: Symptom Charts

All diagnosis begins in Section 3 with Step 1: PCM Quick Test. If the PCM Quick Test is completed and no DTCs are received, the technician may be directed to Step 2: No DTCs Present Symptom Chart Index (refer to [Section 3](#) for details). The No DTCs Present Symptom Chart Index contains the list of symptoms addressed in this manual, and will send the technician to the appropriate Step 3: No DTCs Present Symptom Chart. If no PCM DTCs are present and the vehicle symptom is not listed in the Step 2: No DTCs Present Symptom Chart Index, the technician should go the appropriate Workshop Manual to continue diagnosis.

Section 4: Powertrain DTC Charts and Description

Section 4 contains the Powertrain Diagnostic Trouble Code (DTC) "Go To" Charts. These charts will be referenced if a DTC is received in Section 3. Also included in this section are the Powertrain DTC descriptions and list of possible causes.

Section 5: Pinpoint Tests

All pinpoint tests are included in Section 5. Never enter a Pinpoint Test unless directed there. When directed to a Pinpoint Test, always read the information and look at the schematic included at the beginning of the Pinpoint Test.

Section 6: Reference Values

Section 6 contains the "Typical Diagnostic Reference Values" charts. The technician will be directed to these charts from Pinpoint Test Z in Section 5.

How To Use The Diagnostic Procedures

- Use the information about the vehicle driveability or emission concern to attempt to verify/re-create the symptom. Look for any vehicle modifications or aftermarket items that may contribute to the symptom. A check of any applicable TSBs or OASIS messages may be useful, if this information is available.
- Go to Section 3, Step 1: PCM Quick Test. Perform the PCM Quick Test step(s). Follow any notes as directed.
- If PCM Quick Test is completed, no DTCs were received and no special notes applied, go to Step 2: No DTCs Present Symptom Chart Index.
- Select the symptom that best describes the vehicle symptom (for multiple symptoms select the one that is most noticeable). Go to the Step 3: No DTCs Present Symptom Chart that is indicated. If no PCM DTCs are present and the vehicle's symptom is not listed in the No DTCs Present Symptom Chart Index, go to the appropriate Workshop Manual to continue diagnosis.
- The No DTCs Present Symptom Chart contains areas to be tested for diagnosis of the vehicle's symptom. The chart is arranged to place the higher probability, or easiest to test items toward the top of the chart. The technician, however, is not required to follow this order due to reasons such as variations in vehicle type, vehicle repair history or technician experience.
 - The System/Component column indicates the areas that will be tested. This column may also contain a quick system/component test.
 - The Reference column indicates where to go for the System/Component testing. All references are to pinpoint test steps in Section 5 of this manual unless noted otherwise. If referenced to a Pinpoint Test Step in this manual or a Workshop Manual section, go to the procedures. Follow the directions given in those procedures, including directions to other tests or sections. If a damaged part is found, repair/replace as directed. If no fault is found, and diagnosis in that area is complete, return to the No DTCs Present Symptom chart and continue to the next item.
 - If a quick system/component test is in the System/Component column, the reference column will indicate where to go if the test failed.
- During diagnosis, if directed to test a system/component that is not contained on that vehicle, proceed to the next step.
- If the No DTCs Present Symptom Chart for the vehicle symptom is completed and no fault is found, return to Step 2: No DTCs Present Symptom Chart Index to address the next most prominent symptom. If all diagnosis is complete and no fault is found, it may be helpful to go to Section 5, Pinpoint Test Step Z1, for further diagnosis.
- After service, restore vehicle by reconnecting any components, removing test equipment, etc. Verify that the vehicle is operating properly and the original complaint is eliminated. If a DTC was present, rerun Quick Test to verify repair and complete a PCM Reset to clear any Continuous Memory DTCs.

Note: If a symptom is determined to be intermittent, careful visual and physical underhood inspection of connectors, wiring harnesses, vacuum lines, components, etc. is required. The Customer Information Worksheet may contain more detailed symptom information. Before an in-depth diagnosis begins, start the engine and wiggle wires, tap on components, etc., while listening for an indication of a concern (such as rpm change or relay clicking).

Information about engine conditions is stored when a Diagnostic Trouble Code (DTC) that lights the Malfunction Indicator Lamp (MIL) is set. This information is called Freeze Frame Data and may be helpful in diagnosing intermittents. (Refer to Section 2, Freeze Frame Data, for more information.)

What's New In This Manual

The following is a list of changes to this manual for 2001:

New Vehicles:

- 2.3L 4V Ranger
- Escape
- 4.0L FFV Explorer Sport
- 4.6L Explorer/Mountaineer

- Blackwood

Note: The Blackwood and 150 pin PTEC PCM Explorer/Mountaineer, which are planned as 2002 models, are included in this manual to cover their early introduction.

Deleted Vehicles

- Contour/Mystique
- 3.0L Windstar

Other Changes

- New Thermal Manifold Absolute Pressure (TMAP) pinpoint test has been added to Section 5 (Pinpoint Test DM).
 - New Electric Exhaust Gas Recirculation (EGR) pinpoint test has been added to Section 5 (Pinpoint Test KD).
 - New Thermostat Heater Control (THTRC) pinpoint test has been added to Section 5 (Pinpoint Test KQ).
 - New Swirl Control Valve and Swirl Control Valve Monitor diagnostics have been added to Section 5 (Pinpoint Test HU).
 - A list of acronyms with their definitions has been included at the end of this section.
-

Acronyms and Definitions

Note: This Acronyms and Definitions listing contains technical terms applicable to Ford Motor Company products. It is not intended to be an all—inclusive dictionary of components and their functions. If a detailed description of a particular system or component is desired, refer to the applicable section within this PC/ED Service Manual or consult the Workshop Manual for the specific vehicle being serviced.

2V: Two Valves per engine cylinder.

4V: Four Valves per engine cylinder.

ABS: Anti—lock Brake System.

A/C: Air Conditioning. A vehicle accessory system that modifies the passenger compartment air by cooling and dehydrating the air.

ACC: Air Conditioning Clutch. Indicates status of the A/C clutch.

ACCS: Air Conditioning Cycling Switch. Indicates status of the A/C cycling switch.

ACD: Air Conditioning Demand. A signal input to the PCM from the Air Conditioning control panel.

ACP: Air Conditioning Head Pressure or A/C cycling switch input state.

ACPSW: Air Conditioning Pressure Switch.

ACP V: Air Conditioning Head Pressure Volts. A voltage input to the PCM from the ACP switch or sensor.

ACR: Air Conditioning Relay. Commanded output controlled by the PCM and acts as an A/C cutout control during heavy acceleration.

A/D: Analog—to—Digital. Analog—to—Digital signal conversion.

ADC: See ATDC.

AFCM: Alternative Fuel Control Module.

AIR: Secondary Air Injection.

AIRB: Secondary Air Injection Bypass.

Air Diverter: Air Diverter Valve. Part of the EAIR system. Diverts fresh air to the exhaust system when the electric air pump is commanded on.

AIR EVAL: Air System Evaluated. Displays a YES or NO status indicating whether the Air System has been evaluated for OBD (On—Board Diagnostic) II purposes.

Air/Fuel Ratio: Air to fuel mixture ratio. An air/fuel mixture that is 14.7:1 is also called stoichiometry.

AIRM: Secondary AIR pump monitor.

Ambient Air Temperature: Temperature of the air surrounding an object.

Analog (Electrical/Electronic): An electrical signal that can obtain any value within the voltage limits of the signal.

ARB: Air Resource Board.

ARPMIDES: Ancillary RPM Desired. RPM required to maintain the vehicle speed commanded by Speed Control Command Switch (SCCS) inputs.

ASCII: American Standard Code for Information Interchange.

ATDC: After Top Dead Center. The location of the piston after it has reached the top of its stroke. Measured in degrees of crankshaft rotation.

AVOM: Analog Volt—Ohm Multimeter. Readings are indicated by a sweep hand on a printed scale, rather than a digital display.

AWD: All—Wheel Drive.

BARO: Barometric Pressure.

Base Idle: Idle rpm determined by the throttle lever hardset on the throttle body with the IAC solenoid disconnected.

Base Timing: Spark advance in degrees before top dead center of the base engine without any control from the PCM or ICM.

Battery Positive Voltage (B+): The positive (+) voltage from the battery or any circuit connected directly to the battery. Compare "Vehicle Power (VPWR)."

BATTEMP: Battery Temperature.

BJB: Battery Junction Box.

BOB: Breakout Box. A test device which connects in series to the PCM and PCM harness.

BPA: Brake Pedal Applied switch. Typically located on the braking system master cylinder. Can be hydraulic or electric.

BPP: Brake Pedal Position. Indicates the position of the brake pedal, based on input from the Brake Pedal Position (BPP) switch.

BRAKE _LMP or BRKL: Brake Warning Lamp Status. Activates the Brake Warning Lamp by applying voltage to the control line.

BTDC: Before Top Dead Center. The location of the piston before it has reached the top of its stroke. Measured in degrees of crankshaft rotation.

Bus + or Bus — : Multiplex circuits that carry SCP data from module to module and to the DLC.

CAC: Charge Air Cooler. Formerly known as Intercooler. A device which lowers the temperature of pressurized intake air.

CAFE: Corporate Average Fuel Economy. A set of federal requirements and regulations which govern fuel economy standards.

CANVNT: Canister Vent Solenoid.

Catalyst: Catalytic converter. An in—line exhaust system device used to reduce the level of engine exhaust emissions.

CAT EVAL: Catalyst System Evaluated. This item indicates YES when the Catalyst Efficiency Monitor has successfully completed.

CCM: Comprehensive Component Monitor.

CCRM: Constant Control Relay Module. A relay module that provides ON—OFF control of various EEC components.

CD A through J: Coil Driver 1 through 10.

Centralized Testing Facility: State government operation. Provides Inspection/Maintenance (IM) and safety inspections.

CGND or CSE GND: Case Ground. Provides a ground source for the PCM or ECU case.

CHT: Cylinder Head Temperature. Units are displayed in either degrees Fahrenheit or Centigrade.

CHTIL: Cylinder Head Temperature Indicator Lamp.

CHTV: Cylinder Head Temperature Voltage. The actual voltage drop across the CHT sensor thermistor.

CID: Cylinder Identification. PCM input signal from Camshaft Position Sensor.

CKP: Crankshaft Position. Senses the position of the crankshaft.

CKP+, CKP—: CKP+ is the Crankshaft Position (CKP) sensor signal wire. CKP— is the signal return.

CL: Closed Loop. An operating condition or mode which enables operation based on sensor feedback.

CMP: Camshaft Position. Indicates camshaft position.

CMPFM: Camshaft Position Failure Mode. Indicates when the PCM identifies a CID/CMP fault.

CMS: Catalyst Monitor Sensor. Downstream HO₂S.

CMVSS: Canadian Motor Vehicle Safety Standards.

CNG: Compressed Natural Gas.

CO: Carbon Monoxide. A colorless, odorless and toxic gas that is a component of auto exhaust emissions.

CO₂: Carbon Dioxide. A colorless, odorless gas that is a normal by—product of the combustion of fuel.

Coil: A device consisting of windings around an iron core. In a spark ignition system, designed to increase voltage.

Cold Soak: Time given to a vehicle to sit at a low temperature (typically below 68° F / 20° C) until the temperature of external and internal components stabilize.

CONT: Continuous Memory. The portion of KAM (keep alive memory) used to store DTCs generated during Continuous Memory Self—Test.

Continuous Memory Self—Test: A continuous test of the EEC system conducted by the PCM whenever the vehicle is operating.

CPP: Clutch Pedal Position. Indicates clutch pedal position.

CPP Switch: Clutch Pedal Position Switch. Located on the clutch pedal and detects when the

clutch pedal is depressed.

CQIS: Common Quality Indicator System.

CSE GND: Case Ground.

CT: Closed Throttle Mode. A mode when the PCM varies the pulse width of the fuel injectors to obtain the air/fuel mixture appropriate for closed throttle operation.

CTO: Clean Tach Output. Signal used to drive the instrument panel tachometer.

Data Communications Link: A communication path between various in—vehicle electronic modules. Accessed by scan tools through the Data Link Connector (DLC).

DC: 1. Direct Current. Electric current flowing in one direction. 2. Duty Cycle. The voltage measurement of ON time versus the full cycle period, expressed in percent.

DCL: Data Communication Link.

DI: Distributor Ignition. A system in which the ignition coil secondary circuit is sequenced by a distributor.

Digital: Controls process information by switching the current or voltage ON and OFF.

DLC: Data Link Connector. J1962 connector providing access to vehicle diagnostic information.

DOHC: Dual Overhead Cam. An engine configuration that uses two camshafts positioned above the valves.

DOL: Data Output Line. A circuit that sends certain information from the PCM to the instrument cluster.

DPFEGR: Differential Pressure Feedback Exhaust Gas Recirculation. System that uses a pressure transducer to control the operation of the EGR Vacuum Regulator Valve.

DRI: Deposit Resistant Injector. A fuel injector designed to prevent build—up of carbon and other unwanted deposits.

DRL: Daytime Running Lamps. A system that keeps the vehicle running lamps on at all times while the vehicle is operating.

DTM: Diagnostic Test Mode. A level of capability in an On—Board Diagnostic (OBD) system.

DTC: Diagnostic Trouble Code. An alpha/numeric identifier for a fault condition identified by the On—Board Diagnostic System.

DVOM: Digital Volt—Ohm Meter.

E—85: Fuel containing 85% ethanol alcohol.

EAIR: Electric Secondary Air Injection. A pump—driven system for providing secondary air using an electric air pump.

EAIM: Electric Secondary Air Pump circuit Monitor.

ECT: Engine Coolant Temperature. Displayed in either Fahrenheit or Centigrade.

ECTV: Engine Coolant Temperature Voltage. The actual voltage drop across the ECT sensor thermistor.

ECU: Electronic Control Unit. A module that handles the control strategy and monitors system inputs or outputs.

EEC: Electronic Engine Control system.

EEC—V: Fifth generation EEC system.

EFT: Engine Fuel Temperature.

EFTA: Bank 1 input. EFTA is displayed in either Fahrenheit or Centigrade.

EFTAV: Voltage drop across the EFTA (Bank 1) sensor thermistor.

EFTB: Bank 2 input. EFTB is displayed in either Fahrenheit or Centigrade.

EFTBV: Voltage drop across the EFTB (Bank 2) sensor thermistor.

EGR: Exhaust Gas Recirculation. A process in which a small amount of exhaust gas is routed into the combustion chamber.

EGR EVAL: Exhaust Gas Recirculation System Evaluated. EGR EVAL will display YES when the monitor is complete.

EGRMDS: Electric Exhaust Gas Recirculation Motor Desired position. The PID name used to operate the EGR valve with scan tool's output state control.

EGRS: EGR Shutoff. A normally closed solenoid that applies vacuum to the EGR valve when energized by the PCM.

EGRT: Exhaust Gas Recirculation Valve Temperature Sensor. A temperature sensor that is threaded into the bottom of the intake plenum.

EGR Vacuum Regulator: Controls vacuum to the EGR valve by a duty cycle signal from the PCM.

EGRVR: Exhaust Gas Recirculation Vacuum Regulator. Solenoid which varies the vacuum to the EGR valve by varying the duty cycle to the regulator.

EGRVRA: Exhaust Gas Recirculation Vacuum Regulator Actual (volt). The actual state of the commanded output.

EGRVRF: Exhaust Gas Recirculation Vacuum Regulator Fault. Represents whether a fault exists in the EGRV circuit.

EI: Integrated Electronic Ignition. An Electronic Ignition system that has the Ignition Control Module (ICM) integrated into the PCM.

EI—HDR: Electronic Ignition, High Data Rate. Formerly known as Electronic Distributorless Ignition System.

EI—LDR: Electronic Ignition, Low Data Rate. Formerly known as Distributorless Ignition System.

EMI: Electromagnetic Interference. Usually caused by ignition voltage spikes, solenoids, relay operation or noisy generator contacts.

EOL: End Of Line. A system designed specifically for use at assembly plants to make sure all new vehicles perform to design specifications.

EPA: Environmental Protection Agency (U.S. Government).

EPROM: Erasable Programmable Read—Only Memory. An electronic component in the PCM that requires the electronic storage of information.

ESOF: Electronic Shift—on—the—Fly.

EVAP: Evaporative Emissions. A system to prevent fuel vapor from escaping into the atmosphere.

EVAPCP: Evaporative Canister Purge Solenoid. Controls a solenoid which allows venting of the evaporative purge canister.

EVAPCPF: Evaporative Canister Purge Solenoid Fault. Identifies whether an electrical fault exists for the current commanded state.

EVAPCV: Evaporative Canister Vent Solenoid. Controls a solenoid which seals the EVAP system canister from atmospheric pressure during the EVAP OBD II Monitor test.

Evaporative Emissions Canister: An evaporative emission canister, containing activated charcoal which absorbs and holds fuel vapors.

EVAPPDC: Evaporative Canister Purge Duty Cycle. The duty cycle commanded to the Evap Canister Purge Solenoid by the PCM.

EVO: Electronic Variable Orifice.

EWP: Electric Water Pump.

Exciter Ring: A toothed or notched iron or steel disk, which is the moveable part of a wheel speed sensor.

FAN: Fan Speed. Used in conjunction with vehicles having multiple fan speed control. Displays OFF, LOW, or HIGH status.

FC: Fan Control.

FCS: Fuel Control Solenoid.

FCIL: Fuel Cap Off Indicator Lamp. Indicates that the fuel filler cap was not properly installed.

FEAD: Front End Accessory Drive.

FEPS: Flash EEPROM Programming Signal. 18 volt DC signal sent by the scan tool to initiate PCM reprogramming.

FF: 1. Flexible Fuel. A system capable of using a variety of fuels for vehicle operation. 2. A PID that displays the % alcohol content in fuel.

FF_LRN: Flex Fuel Learned. Displays when the PCM's Flex Fuel strategy has completed calculating the inferred alcohol content of fuel.

FFFM: Flexible Fuel Failure Mode. Indicates whether the current Flex Fuel Sensor reading (FF) is reliable or not. Displays a YES or NO.

FF_TEMP: Flexible Fuel Sensor — Temperature. Alcohol concentration derived from the signal pulse width.

FFV: Flexible Fuel Vehicle.

FIFO: First In First Out.

FILO: First In Last Out.

FIM: Fuel Indicator Module.

FLI: Fuel Level Input. Used by the Evap monitor to calculate fuel tank vapor volume. Displayed as a percentage.

FLI V: Fuel Level Input Voltage.

FMEM: Failure Mode Effects Management. Operating strategy that maintains limited vehicle function in the event of a PCM or EEC component failure.

FP: 1. Fuel Pump. Indicates whether the pump has been commanded ON or OFF by the PCM. 2. Fuel Pump (Modulated). Fuel pump duty cycle percentage.

FPDM: Fuel Pump Driver Module. A module that controls the electric fuel pump.

FPF: Fuel Pump Fault. Identifies whether a fault exists in the FP circuit.

FPM: Fuel Pump Monitor. Monitors the Fuel Pump / circuits for faults.

Freeze Frame: A block of memory containing the vehicle operating conditions at a specific time.

FRP: Fuel Rail Pressure. Based on FRP V.

FRP V: Fuel Rail Pressure Voltage. A voltage input to the PCM from the Fuel Rail Pressure Sensor.

FSC: Fail—Safe Cooling.

FSV: Fuel Shut—Off Valve. A component of Natural Gas Vehicles. This valve either allows or prevents Natural Gas flow to the fuel rail.

FSVF: Fuel Shut—Off Valve Fault. Indicates if there is a fault in the FSV circuit. Displayed as YES or NO.

FSVM: Fuel Shut—Off Valve Monitor. Monitors operation of the Fuel Shut—Off Valve / circuit.

FTP: Fuel Tank Pressure. Displayed as inches of water, kPa, or volts.

FTP V: Fuel Tank Pressure Voltage. From the FTP transducer.

FUEL PR: Fuel Pressure. Measurement of the force of the fuel delivered via the fuel pump.

FUEL PW: Fuel Pulse Width. Displays the commanded pulse width at time of last data update.

FUEL PW1: Fuel Injector Pulse Width #1. Corresponds to injectors normally affected by O2S1 (HEGO1).

FUEL PW2: Fuel Injector Pulse Width #2. Corresponds to injectors normally affected by O2S2 (HEGO2).

FUELSYS: Fuel System Status (OPEN/CLOSED Loop). Formerly known as LOOP.

Fuel Tank Vapor Valve: A valve mounted in the top of the fuel tank that vents excess vapor and pressure from the fuel tank into the Evaporative Emission Control System.

FWD: Front Wheel Drive.

GEM: Generic Electronic Module.

GEN: Generator.

GENF: Generator output fault.

GENFDC: Generator field control output.

GFS: Generator field signal monitor.

GND: Ground.

GPM: Grams Per Mile. Also known as Gallons Per Minute.

GPS: Global Positioning Satellite.

Green State Vehicle: Formally known as California Emissions. A vehicle that is equipped with California on—board diagnostics.

GSS: Gear Select Solenoid.

GVW: Gross Vehicle Weight.

Hall Effect: A process where current is passed through a small slice of semi—conductor material and a magnetic field to produce a small voltage in the semi—conductor.

Hard Fault: A fault currently present in the system.

HC: 1. Hydrocarbon. A by—product of combustion and a component of auto exhaust emissions. 2. High Compression.

HCF: Hydraulic Cooling Fan.

HCFD: Hydraulic Cooling Fan Drive.

HFC: Hydraulic Cooling Fan.

HFCF: High Fan Control Fault. Identifies if there is a fault in the HFC circuit.

HFP: High Fuel Pump.

HLOS: Hardware Limited Operating Strategy. A mode of operation where the PCM replaces output commands with fixed values in response to internal PCM malfunctions.

HO: High Output.

HO2S: Heated Oxygen Sensor. Formerly known as Heated Exhaust Gas Oxygen (HEGO) Sensor. Provides information on rich or lean exhaust conditions to the PCM.

Hot Soak: Period of time after an engine operates where localized combustion heat dissipates throughout the engine.

HTR, HTR11, HTR12, HTR21, HTR22, HTRX1, HTRX2: HO2S Heater. Heater element for the HO2S sensor.

Hydrogen: Chemical symbol H. Highly flammable gas.

Hz: Hertz. Cycles per second.

IAC: Idle Air Control. Electrical control of throttle bypass air.

IAT: Intake Air Temperature.

IATV: Intake Air Temperature Voltage. Actual voltage drop across the IAT sensor.

IAT2: Intake Air Temperature 2. Displayed in either Fahrenheit or Centigrade. Used on supercharged vehicles.

IAT2V: Intake Air Temperature 2 Voltage. Actual voltage drop across the IATV2 sensor.

IC: Integrated Circuit. A small semi—conductor device capable of doing many separate circuit functions.

ICM: Ignition Control Module. The module that controls the ignition system.

IFDM: Integrated Fuel Delivery Module.

IFS: Inertia Fuel Shutoff.

IGN GND: Ignition Ground.

Ignition: System used to provide high voltage spark for internal combustion engines.

IGN_KEY (IGKY): Ignition Key status.

IGN_SW (IGSW): Ignition Switch Position.

IMRC: Intake Manifold Runner Control. Controls airflow through the high—speed runners in the intake manifold.

IMRCM: Intake Manifold Runner Control Monitor. Monitors the IMRC / circuits for faults.

IMTV: Intake Manifold Tuning Valve. Controls airflow through runners in a split intake manifold.

INJ1, INJ2, INJ3, INJ4, INJ5, INJ6, INJ7, INJ8, INJ9, INJ10: Injector number or its signal output from the PCM.

Injector: A device for delivering metered pressurized fuel to the intake system or the cylinders.

Intake Air: Air drawn through a filter and distributed to each cylinder for use in combustion.

Intercooler: See CAC.

IPATS: Integrated Passive Anti—Theft System.

ISO: International Standards Organization.

KAM: Keep Alive Memory. A portion of the memory within the PCM that must have power even when the vehicle is not operating.

KAPWR: Keep Alive Power. Dedicated, unswitched power circuit that maintains KAM.

Key On Engine Off Self—Test: A test of the EEC system conducted by the PCM with power applied and the engine at rest.

Key On Engine Running Self—Test: A test of the EEC system conducted by the PCM with the engine running and the vehicle at rest.

KEYPWR: Key Power. Battery voltage supplied when the ignition key is in the ON position.

Knock: The sharp metallic sound produced when two combustion pressure fronts collide in the combustion chamber of an engine.

KOEC: Key On Engine Continuous.

KOEO: Key On Engine Off.

KOER: Key On Engine Running.

KPA: Kilopascal. Unit of pressure. 3.386 kPa = 1 inch of mercury (Hg.).

KPH: Kilometers Per Hour.

KS: Knock Sensor. Detects engine knock.

L: Liters. The unit of volume in the metric measuring system. One liter equals 1.06 quarts.

LEV: Low Emissions Vehicle.

LFC: Low Fan Control.

LFP: Low Fuel Pump. Reduced operating speed for multi—speed fuel pumps.

LIFO: Last In First Out.

LILO: Last In Last Out.

LONGFT1, LONGFT2: Long—Term Fuel Trim. Fuel flow adjustment determined by the PCM.

LOOP: Indicates OPEN or CLOSED loop status.

LPG: Liquefied Petroleum Gas.

LPLR: Low Pressure Low Resistance fuel injector.

M—85: Fuel containing 85% methanol alcohol.

MAF: Mass Air Flow. Used to measure the mass (weight) of the air entering the engine.

MAF RTN: Mass Air Flow Return. A return circuit for the MAF sensor.

MAP: Manifold Absolute Pressure. The internal pressure of the intake manifold.

MFC: Medium Fan Control.

MFI: Multiport Fuel Injection. A fuel—delivery system in which each cylinder is individually fueled.

MFP: Modulated Fuel Pump.

Microprocessor: A digital processor on a chip which performs arithmetic and control logic.

MIL: Malfunction Indicator Lamp. An indicator lamp alerting the driver of an emission related malfunction. May also read "CHECK ENGINE" or "SERVICE ENGINE SOON."

MISF: Misfire. Any event in the cylinder that causes a sudden change in acceleration of the crankshaft.

MON: Motor Octane Number.

Monolithic Substrate: The ceramic honeycomb structure used in the catalytic converter.

MSOF: Manual Shift—on—the—Fly.

MY: Model Year.

NA: Naturally Aspirated. Engine that is not supercharged or turbocharged.

NAAO: North American Automotive Operations.

NC: Normally Closed.

NG: Natural Gas. A system capable of using natural gas for vehicle operation.

NGS: New Generation STAR (Self—Test Automatic Readout) tester.

NGVM: Natural Gas Vehicle Module.

NO: Normally Open.

NO_x: Oxides of Nitrogen. Formed at high combustion temperatures.

NVH: Noise, Vibration, Harshness. A classification of vehicle concerns.

OASIS: On—line Automotive Service Information System.

OBD, OBD—II: On—Board Diagnostics, On—Board Diagnostics Second Generation. A system that monitors PCM input and output control signals.

On—Demand Test: Technician initiated "KOEO" and "KOER" tests performed by the PCM.

OC: Oxidation Catalytic converter. A catalytic converter system that reduces levels of HC and CO.

OCT ADJ: Octane Adjust. Compensating strategy that adjusts for changes in fuel octane.

OEM: Original Equipment Manufacturer.

OHC: OverHead Cam. An engine configuration that uses a single camshaft positioned above the valves.

OWL: Overheat Warning Lamp or its signal output from the PCM. Turns the TEMP warning lamp ON when engine oil temperature exceeds safe limits.

Open Circuit: A circuit which does not provide a complete path for flow of current.

OL: Open Loop. An operating condition based on instructions not modified by PCM feedback.

O₂ S 11/12/21/22: Oxygen Sensor and its relative position in the exhaust system. Detects oxygen content in exhaust gasses.

OSC: Output State Control.

OSS: Output Shaft Speed.

Ozone: A blue gaseous form of oxygen (O₃) formed naturally by electric discharge or exposure to ultraviolet radiation.

Particulate: Small solid matter found in exhaust gases, especially prevalent in diesel engines.

PATS: Passive Anti—Theft System.

PATSIL: Passive Anti—Theft System Indicator Light.

PATSIN: Passive Anti—Theft System Receive Signal.

PATSOUT: Passive Anti—Theft System Transmit Signal.

PATSTRT: Passive Anti—Theft System Starter Relay Control

PCM: Powertrain Control Module. Formerly known as the EEC (Electronic Engine Control) Processor.

PCV: Positive Crankcase Ventilation. A system which allows the controlled flow of crankcase vapors into the combustion chamber.

PF: Purge Flow. Amount of fuel vapor burned in the engine.

Photochemical: Term describing the action of light on air pollutants which results in creating smog.

PID: Parameter Identifier. Identifies an address in PCM memory which contains operating information.

Powertrain: Engine and transmission/transaxle components.

Pressure — Absolute: A pressure referenced to a perfect vacuum.

Pressure — Atmospheric: The pressure of the surrounding air at any given temperature and altitude. Sometimes called Barometric Pressure.

Pressure — Barometric: Pertaining to atmospheric pressure or the results obtained by a barometer.

Pressure — Differential: The pressure difference between two regions, such as between the intake manifold and atmospheric pressure.

Pressure — Gage: The amount by which absolute pressure exceeds the ambient atmospheric pressure.

PIP: Profile Ignition Pickup. Provides crankshaft position information for ignition synchronization.

Potentiometer: An adjustable resistance component commonly used as a sensor (Example: TP Sensor).

PPM: Parts Per Million. A measure used in emission analysis.

PROM: Programmable Read—Only Memory. Similar to ROM except without program instructions.

Protocol: A set of rules for the exchange of information on a network.

PSOM: Programmable Speedometer/Odometer Module. A module that processes vehicle speed information.

PSP: Power Steering Pressure. Indicates the pressure in the power steering system.

PSP V: Power Steering Pressure Input Voltage.

PTEC: PowerTrain Electronic Controller.

PTO: Power Take—Off.

PW: Pulse Width. The length of time an actuator, such as a fuel injector, remains energized.

PWM: Pulse Width Modulation. Controls the intensity of an output by varying the signal duty cycle.

PWR GND: Power Ground. The main ground circuit in the EEC system.

Quick Test: A series of diagnostic tests of the EEC system consisting of KOEO, KOER and Continuous Memory Self—Tests. Results are displayed as a series of DTCs.

RABS: Rear Antilock Brake System.

RAM: Random Access Memory. Memory into which information can be written as well as read.

REDOX: Reduction Oxidation Catalytic converter. A catalytic converter system designed to operate at high temperatures.

Regulator: Controls the alternator/generator field current to maintain proper battery charge. Contained within the PCM in smart charging applications.

Relay: An electromechanical device in which connections in one circuit are opened or closed by changes in another circuit.

REM: Rear Electronic Module.

Repetitive Spark: Multiple firings of individual spark plugs at engine speeds below 1000 RPM to improve idle quality and improve emissions.

RF: Radio Frequency.

RFI: Radio Frequency Interference.

RFS: Returnless Fuel System.

RM: Relay Module. A module containing two or more relays.

ROM: Read—Only Memory. Computer memory that can be accessed and utilized, but not altered.

RON: Research Octane Number.

Routine: A group of related tasks, such as a series of diagnostic tests.

RPM: Revolutions Per Minute.

RS: Reverse Switch.

RTN: Return. A dedicated sensor ground circuit.

RWD: Rear Wheel Drive.

SAE: Society of Automotive Engineers.

SBS: Supercharger Bypass Solenoid or its signal output from the PCM.

SC: Supercharged or Supercharger.

SCB: Supercharger Bypass Control. A system that allows manifold vacuum to be bled away from the supercharger wastegate actuator to allow for maximum boost.

SCBF: Supercharger Bypass Control Fault. Identifies whether a fault exists in the Supercharger Bypass circuit.

SCICP: Supercharger Intercooler Pump Control.

SCICPF: Supercharger Intercooler Pump Control Fault.

SCIPC: The PID to monitor the operation of the Supercharger and Charge Air Cooler pump.

SCP: Standard Corporate Protocol.

Self—Test: See Quick Test.

Sensor: A device that detects the value or change in a physical quantity, such as temperature, pressure or flow rate, and converts the data into an electrical signal.

SFI: Sequential Multiport Fuel Injection. A multiport fuel delivery system where each injector is individually energized and timed relative to its cylinder intake event.

Shield: A conducting sleeve that surrounds wires to be electronically isolated from electromagnetic interference (EMI).

Short Circuit: An undesirable condition in a circuit where it is terminated at a point other than that intended.

SHRT FT: Short—Term Fuel Trim. Fuel flow adjustment in response to the HO₂S sensor(s) input during closed—loop operation.

SIG RTN: Signal Return. A dedicated sensor ground circuit that is common to two or more sensors.

SIL: Shift Indicator Lamp.

Smart Driver: A PCM or ECU output driver that can detect faults (open or shorts) on its output circuit.

SME: Society of Manufacturing Engineers.

SOF: Shift—On—the—Fly.

SOHC: Single Overhead Cam.

Solenoid: A device consisting of an electrical coil which produces a magnetic field in a plunger and pulled to a central position.

ST: Scan Tool. A device that interfaces with and communicates information on a data link.

Stoichiometry: An air/fuel mixture that is neither too rich nor too lean. Stoichiometric ratio is 14.7 parts of air for every 1 part of fuel.

Switch: A device for making, breaking, or changing the connections in an electrical circuit.

TA: Traction Assist.

TACH: Tachometer.

TB: Throttle Body. A device that controls airflow through the engine via a butterfly valve, and has an air bypass channel around the throttle plate.

TC: 1. Traction Control. Combines anti—lock braking and axle torque reduction to control wheel slippage. 2. Turbocharger.

TDC: Top Dead Center.

Tear Tag: The two—piece adhesive label attached to the PCM to identify its calibration.

Thermistor: A temperature dependent resistor, like that used in CHT and ECT sensors.

Timing: Relationship between spark plug firing and piston position expressed in crankshaft degrees before (BTDC) or after (ATDC) top dead center of the compression stroke.

TMAP: Thermal Manifold Absolute Pressure Sensor. A MAP Sensor that includes a thermistor to measure intake air temperature.

TP: Throttle Position (sensor). A three—wire potentiometer that provides throttle angle and rate

information for the PCM.

TP V: Throttle Position Sensor Voltage.

Transducer: A device that receives energy from one medium and transfers it to another. For example, thermal energy is converted to an electrical signal through a temperature probe.

Transmissions/Transaxles:

Note: All related items are grouped under the general heading "TRANSMISSIONS" located at the end of this section.

TSB: Technical Service Bulletin. Notifies service personnel of any known vehicle concerns, procedures, or general service information.

Underspeed Mode: A control mode that prevents the engine from stalling in the event it stumbles while running. Also used during engine crank.

Vacuum: Manifold pressure that is reduced below the ambient atmospheric pressure.

Variable Reluctance: A process of passing a varying magnetic field through wire windings and inducing a voltage.

VCT: Variable Camshaft Timing.

VECI: Vehicle Emission Control Information label.

VIN: Vehicle Identification Number. A unique identification number given to every vehicle produced. Includes information about the year, model, engine, and plant origin of the vehicle.

VMV: Vapor Management Valve. Controls the flow of fuel vapors out of the carbon canister.

VOM: Volt—Ohm Meter. Readings are indicated by sweep hand on a printed scale rather than a digital (DVOM) display.

VPWR: Vehicle Power. A switched circuit that provides power to the EEC system. Compare "Battery Voltage (B+)."

VREF: Reference Voltage. A dedicated circuit that provides approximately a 5.0 volt signal used as a reference by certain sensors.

WAC: Wide Open Throttle A/C Cut—Off. Turns A/C system off during wide open throttle or certain other operating conditions.

Wastegate Control: A device that opens the wastegate in case of overboost from a turbocharger.

WOT: Wide Open Throttle. A condition of maximum airflow through the throttle body.

Zip Tube: Another name for "fresh air duct" or "air inlet duct".

T R A N S M I S S I O N S :

Note: The transmission naming convention is as follows:

- The first character, a number, is the number of forward gears.
- The second character, either the letter "F" or "R," represents front (transaxle) or rear (transmission) wheel drive.
- The next set of characters, a grouping of numbers, represents the design torque capacity of the transmission/transaxle (for example, "27" represents 270ft./lbs. in the 4F27E transaxle).
- The last character, if used, is one of the following:
 - "E" for electronic shift
 - "N" for non—synchronous shift
 - "S" for synchronous shift
 - "W" for wide ratio

4F27E: Also known as the FN Focus automatic transmission.

4F44E: Formerly known as the CD4E.

4F46S: Formerly known as the AX4S and regular—duty AXOD—E.

4F50N: Formerly known as the AX4N and heavy—duty AXOD—E.

4R44E: Formerly known as A4LD for 3.0L applications.

4R55E: Formerly known as A4LD for 4.0L applications.

4R70W: Formerly known as AOD—E.

4R100: Formerly known as E4OD.

5R44E: Formerly known as A5LD for 3.0L applications.

5R55E: Formerly known as A5LD for 4.0L applications.

5R55N: Lincoln LS automatic transmission.

5R55W: Wide—ratio truck transmission.

4x4L: 4x4 Low.

A/T: Automatic Transmission.

CCS: Coast Clutch Solenoid.

CCSF: Coast Clutch Solenoid Fault. Displays a YES if fault exists.

EPC: Electronic Pressure Control.

EPCV: Electronic Pressure Control Volts.

ESS: Electronic Shift Scheduling.

HCDSS: High Clutch Drum Speed Sensor. PCM input from the 4R44E and 4R55E.

M5OD: Manual 5—Speed transmission with overdrive (RWD).

M/T: Manual Transmission/Transaxle.

NPS: Neutral Pressure Switch or its signal input to the PCM.

OCS: Overdrive Cancel Switch.

OSS: Output Shaft Speed. Indicates rotational speed of the transmission output shaft.

PNP: Park/Neutral Position switch. Also known as Neutral Drive Switch (NDS), Neutral Gear Switch (NGS), and Transmission Switch Neutral (TSN).

REVERSE or REV: Transmission Reverse Switch Input.

SIL: Shift Indicator Lamp. A lamp that indicates the preferred shift points on select manual transmission/transaxle vehicles.

SS1/SS2/SS3: Shift solenoids. Devices that control the shifting in an automatic transmission.

TCC: Torque Converter Clutch. When energized, causes a mechanical engagement and disengagement of the Torque Converter Clutch.

TCIL: Transmission Control Indicator Lamp. Indicates that the TCS has been activated.

TCS: Transmission Control Switch. Modifies the operation of electronically controlled transmissions.

Torque converter: A device which by its design multiplies the torque in a fluid coupling between an engine and transmission/transaxle.

TFT: Transmission Fluid Temperature. Indicates temperature of transmission fluid.

Transaxle: A device consisting of a transmission and axle drive gears assembled in the same case. Front—wheel drive applications.

Transmission: A device which selectively increases or decreases the ratio of relative rotation between its input and output shafts. Rear—wheel drive applications.

TR: Transmission Range. The range in which the transmission is operating.

TR Sensor: Formerly known as Manual Lever Position Sensor (MLPS). Provides information to the PCM on the transmission range selector position.

TR V: Transmission Range Voltage.

TSS: Turbine Shaft Speed. Indicates rotational speed of the transmission turbine shaft.

VSS: Vehicle Speed Sensor. A magnetic pickup device that generates an AC signal that is proportional to vehicle speed.

Powertrain Control/Emissions Diagnosis Manual

2001

On Board Diagnostics II

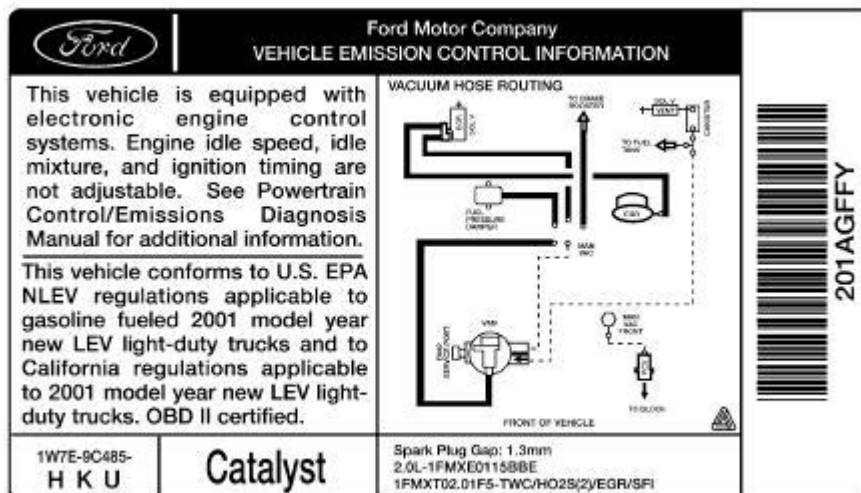

SECTION 1: Description and Operation

Choose an item on the left side to display section contents.

Vehicle Emission Control Information

Decal

Each vehicle has a decal (Figure 1) containing emission control information that applies specifically to the vehicle and engine. The specifications on the decal are critical to servicing emissions systems.

A0028396

Figure 1: Typical Vehicle Emission Control Information Decal.

Decal Location

Typical location of the decal will be on the underside of the hood or the radiator support sight shield.

Powertrain Base Calibration Information

Powertrain Base Calibration Information is located in the lower right corner of the Vehicle Certification Label. Only the Base Calibration will appear on this label (Figure 2). The Revision Level is no longer printed on the label; however, it can be found in On-Line Automotive Service Information System (OASIS). For the current model year Ford Motor Company is using two different Protocols which describe Powertrain Base Calibration. The Protocols are designed to provide worldwide standardization for vehicle calibration. If Electronic EC's strategy is two years old and carried over to the current model year, Protocol 1 is used (see table 1 below). One year old and new strategies for the current model year use Protocol 2 (see table 2 below). For more information on Vehicle Certification Label or Powertrain Calibration, refer to the Workshop Manual.

CALIBRATION LABEL
 WITHOUT REVISION LEVEL
 EXAMPLE: PROTOCOL 1

Figure 2: Typical Vehicle Certification Label with Powertrain Calibration Information

Decal Location

Typical location of Vehicle Certification label is on LH door or door post pillar.

Calibration Code

Table 1: Protocol 1 — 1999 Strategy Carried Over To The 2001 Model Year

9 EQ M - B A A	
9	MODEL YEAR — Model year in which calibration was first introduced. Example: "9" = 1999
EQ	ENGINE CODE — Engine description. Example: "EQ" = 2.0L DOHC EFI NA I-4 Zeta
M	TRANSMISSION CODE — Transmission description. Example: "M" = manual, "A" = Automatic
B	EMISSION STANDARD — Designates the specific country emission standard. Example: "B" = U.S. California
A	DESIGN LEVEL — Design level assigned to the engine.
A ^a	REVISION LEVEL — Revision level of the calibration. Will advance as revisions occur.

^a not printed on label

Table 2: Protocol 2 — 2000 or 2001 Model Year Strategy

0 AJ 1 AA 6 A 00	
0	MODEL YEAR — Model year in which calibration was first introduced. Example: "0" = 2000
AJ	VEHICLE CODE — Vehicle line description. Example: "AJ" = CT120
1	TRANSMISSION CODE — Transmission description. Example: "1" = automatic, "2" = manual
AA	UNIQUE CALIBRATION — Designates different hardware to similar vehicles. Example: tires, drive ratios.
6	FLEET CODE — Describes fleet to which vehicle belongs to. Example: "6" = evaporative emissions fleet.
A	CERTIFICATION REGION — Lead region code where multiple regions are included in one

	Calibration. Example "A" = U.S. Federal
00 a	REVISION LEVEL — Revision level of the calibration. Will advance as revisions occur.

^a not printed on label

Engine/Evaporative Emission System Information

Manufacturers must use a standardized system for identifying their individual engine families. The system described below was developed by the Environmental Protection Agency (EPA) in 1991 to meet new regulatory requirements for 1994 and later model years.

The ENGINE FAMILY name and EVAPORATIVE FAMILY name consists of 12 characters each.

Both the engine family name and the evaporative family names are listed in the box on the emission decal as indicated in Figure 3 and 4, in the area marked as engine/evaporative family information. The first line is the spark plug information. The second line contains the engine size and the evaporative family name (12 characters). The third line contains the engine family name (12 characters) and other vehicle specific information.

Figure 3: Typical Decal Used As An Example.

Figure 4.

VECI Acronym Definitions

ALVW—Adjusted Loaded Vehicle Weight, (Curb Weight + GVWR) /2.
Averaging Bank/Trade—Used for Nox Credits on Heavy Duty Trucks Only.
BBL—Barrel.
CALIFORNIA ARB—California Air Resource Board.
CARB—California Air Resource Board.
CARB LEV—Low Emission Vehicle.
CARB TLEV—Transitional Low Emission Vehicle.
CARB ULEV—Ultra Low Emission Vehicle.
CARB ZEV—Zero Emission Vehicle.
CPI—Central Port Injection.
CI—Cylinder Injection.
CNG—Compressed Natural Gas.
EPA—Environmental.
EVAP—Evaporative Emissions.
GVW—Gross Vehicle Weight.
GVWR—Gross Vehicle Weight Rating, Curb weight plus payload.
HHDE—Heavy Heavy Duty Engine.
HHDE—Heavy Heavy Duty Diesel Engine.
MHDE—Medium Heavy Duty Diesel Engine.
MPI—Multi Port Injection.
LDDT—Light Duty Diesel Truck categories.
LDT—Light Duty Truck (gasoline) categories based on weight as defined in the table.
LDV—Light Duty Vehicle, generally passenger cars and light trucks under 6000 pounds GVWR.
LHDE—Light Heavy Duty Engine (several weight categories).
LVW—Loaded Vehicle Weight, curb weight plus 300 pounds.
MDT—Medium Duty Truck categories based on weight as defined in the table.
MDV—Medium Duty Vehicle.
MHDE—Medium Heavy Duty Engine.
MY—Model Year.
NCP—Non Compliance Penalty.
OBD—On-Board Diagnostic.
ORVR—On-Board Refueling Vapor Recovery.
PC—Passenger Car.
SI—Sequential Injection.
SULEV—Super Ultra Low Emission Vehicle.
Tier 0—California and Federal regulations effective prior to Tier 1 phase in dates.
Tier 1—California regulations beginning in 1993 model year and Federal regulations beginning in 1994 model year.
TBI—Throttle Body Injection.
LEV—Low Emission Vehicle.
ZEV—Zero Emission Vehicle.
ULEV—Ultra Low Emission Vehicle.
ILEV—Inherently Low Emission Vehicle.

On Board Diagnostics II Monitors

Overview

The California Air Resources Board (ARB) began regulating On Board Diagnostic (OBD) systems for vehicles sold in California beginning with the 1988 model year. The initial requirements, known as OBD I, required identifying the likely area of malfunction with regard to the fuel metering system, Exhaust Gas Recirculation (EGR) system, emission-related components and the Powertrain Control Module (PCM). A malfunction indicator lamp (MIL) labeled CHECK ENGINE or SERVICE ENGINE SOON was required to illuminate and alert the driver of the malfunction and the need to service the emission control system. A fault code or Diagnostic Trouble Code (DTC) was required to assist in identifying the system or component associated with the fault.

Starting with the 1994 model year, both CARB and Environmental Protection Agency (EPA) mandated enhanced OBD systems, commonly known as OBD-II. The objectives of the OBD-II system are to improve air quality by reducing high in-use emissions caused by emission-related malfunctions, reducing the time between the occurrence of a malfunction and its detection and repair, and assisting in the diagnosis and repair of emission-related problems. By the 1996 model year, all California passenger cars and trucks (up to 14,000 lb GVWR) and all federal passenger cars and trucks (up to 8,500 lb GVWR) are required to comply with either CARB-OBD II or EPA OBD requirements. These requirements apply to gasoline vehicles, diesel vehicles and are being phased in on alternative-fuel vehicles as well.

The OBD II system monitors virtually all emission control systems and components that can affect tailpipe or evaporative emissions. In most cases, malfunctions must be detected before emissions exceed 1.5 times the applicable 50K- or 100K-mile emission standards. If a system or component exceeds emission thresholds or fails to operate within a manufacturer's specifications, a DTC will be stored and the MIL will be illuminated within two driving cycles.

The OBD II system monitors for malfunctions either continuously, regardless of driving mode, or non-continuously, once per drive cycle during specific drive modes. A pending DTC is stored in the PCM Keep Alive Memory (KAM) when a malfunction is initially detected. This pending DTC may be erased on the third vehicle restart after two consecutive drive cycles with no malfunction. However if the malfunction is still present after two consecutive drive cycles, the MIL is illuminated. Once the MIL is illuminated, three consecutive drive cycles without a malfunction detected are required to extinguish the MIL. The DTC is erased after 40 engine warm-up cycles once the MIL is extinguished.

In addition to specifying and standardizing much of the diagnostics and MIL operation, OBD-II requires the use of a standard Diagnostic Link Connector (DLC), standard communication links and messages, standardized DTCs and terminology. Examples of standard diagnostic information are freeze frame data and Inspection Maintenance (IM) Readiness Indicators.

Freeze frame data describes data stored in KAM at the point the malfunction is initially detected. Freeze frame data consists of parameters such as engine rpm and load, state of fuel control, spark, and warm-up status. Freeze frame data is stored at the time the first malfunction is detected, however, previously stored conditions will be replaced if a fuel or misfire fault is detected. This data is accessible with the scan tool to assist in repairing the vehicle.

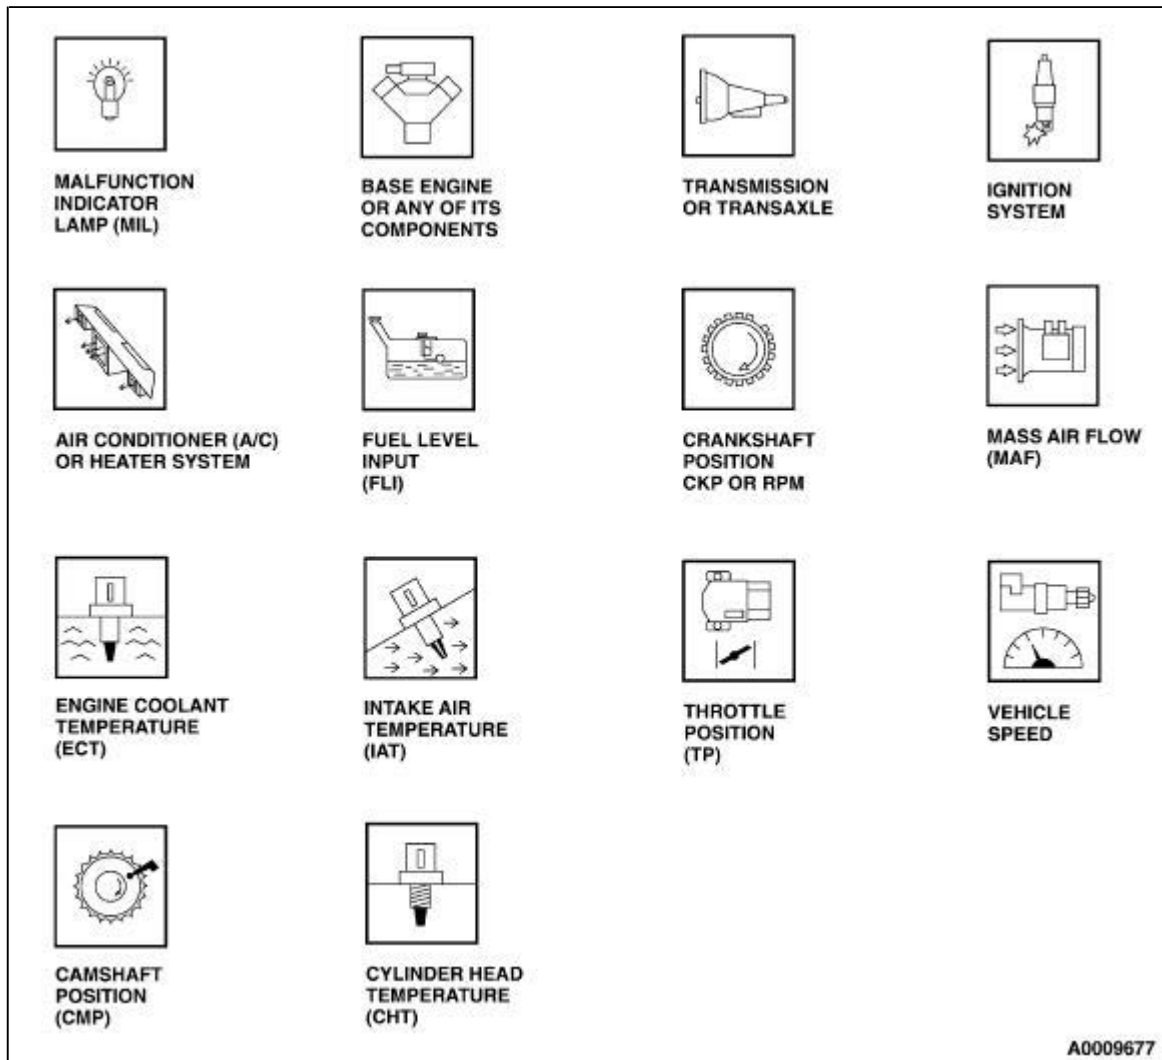

OBD II Inspection Maintenance (IM) Readiness indicators show whether all of the OBD II monitors have been completed since KAM was last cleared. Ford also stores a P1000 DTC to indicate that some monitors have not completed. In some states, it may be necessary to perform an OBD check in order to renew a vehicle registration. The IM Readiness indicators must show that all monitors have been completed prior to the OBD check.

This section provides a general description of each OBD II monitor. In these descriptions, the monitor strategy, hardware, testing requirements and methods are presented to provide an overall understanding of monitor operation. An illustration of each monitor is also provided. These illustrations

should be used as typical examples and are not intended to represent all possible vehicle configurations.

Each illustration depicts the PCM as the main focus with primary inputs and outputs for each monitor. The icons to the left of the PCM represent the inputs used by each of the monitor strategies to enable or activate the monitor. The components and subsystems to the right of the PCM represent the hardware and signals used while performing the tests and the systems being tested. The Comprehensive Component Monitor (CCM) illustration has numerous components and signals involved and is shown generically. When referring to the illustrations, match the numbers to the corresponding numbers in the monitor descriptions for a better comprehension of the monitor and associated DTC's.

These icons are used in the illustrations of the OBD II monitors and throughout this section.

Catalyst Efficiency Monitor - Federal Test Procedure

The Catalyst Efficiency Monitor uses an oxygen sensor before and after the catalyst to infer the hydrocarbon efficiency based on oxygen storage capacity of the catalyst. Under normal, close-loop fuel conditions, high efficiency catalysts have significant oxygen storage. This makes the switching frequency of the rear heated oxygen sensor (HO2S) very slow and reduces the amplitude of those switches as compared to the switching frequency and amplitude of the front HO2S. As the catalyst efficiency deteriorates, its ability to store oxygen declines. The post-catalyst or downstream HO2S signal begins to switch more rapidly with increasing amplitude, approaching the switching frequency and amplitude of the pre-catalyst or upstream HO2S.

All applications utilize an FTP-based (Federal Test Procedure) catalyst monitor. This simply means that the catalyst monitor must run during a standard FTP emission test as opposed to the 20-second steady state catalyst monitor used in 1994 through some 1996 vehicles. Two slightly different versions of the catalyst monitor are used in the 2001 model year.

Switch Ratio Method (1996 - 2001)

1. In order to assess catalyst oxygen storage, the monitor counts front and rear HO2S switches during part-throttle, close-loop fuel condition after the engine is warmed-up and inferred catalyst temperature is within limits. Front switches are accumulated in up to nine different air mass regions or cells although three air mass regions is typical. Rear switches are counted in a single cell for all air mass regions. When the required number of front switches has accumulated in each cell, the total number of rear switches is divided by the total number of front switches to compute a switch ratio. A switch ratio near 0.0 indicates high oxygen storage capacity, hence high HC efficiency. A switch ratio near 1.0 indicates low oxygen storage capacity, hence low HC efficiency. If the actual switch ratio exceeds a calibrated threshold switch ratio, the catalyst is considered failed.

Inputs from ECT or CHT (warm engine), IAT (not extreme ambient temperatures), MAF (greater than minimum engine load), VSS (within vehicle speed widow) and TP (at part-throttle) are required to enable the Catalyst Efficiency Monitor.

2. The DTCs associated with this test are DTC P0420 (Bank 1) and P0430 (Bank 2). Because an Exponentially Weight Moving Average algorithm is use for malfunction determination, up to six driving cycles may be required to illuminate the MIL during normal customer driving. If KAM is reset, a malfunction will illuminate the MIL in 2 drive cycles.

Index Ratio Method (some 2001 and beyond)

1. In order to assess catalyst oxygen storage, the catalyst monitor counts front HO2S switches during part-throttle, closed-loop fuel conditions after the engine is warmed-up and inferred catalyst temperature is within limits. Front switches are accumulated in up to three different air mass regions or cells. While catalyst monitoring entry conditions are being met, the front and rear HO2S signal lengths are continually being calculated. When the required number of front switches has accumulated in each cell, the total signal length of the rear HO2S is divided by the total signal length of the front HO2S to compute a catalyst index ratio. An index ratio near 0.0 indicates high oxygen storage capacity, hence high efficiency. A switch ratio near 1.0 indicates low oxygen storage capacity, hence low HC efficiency. If the actual index ratio exceeds the threshold index ratio, the catalyst is considered failed.

Inputs from ECT or CHT (warm engine), IAT (not extreme ambient temperatures), MAF (greater than minimum engine load), VSS (within vehicle speed widow) and TP (at part-throttle) are required to enable the Catalyst Efficiency Monitor.

2. The DTCs associated with this test are DTC P0420 (Bank 1) and P0430 (Bank 2). Because an Exponentially Weighted Moving Average algorithm is use for malfunction determination, up to six driving cycles may be required to illuminate the MIL during normal customer driving. If KAM is

reset, a malfunction will illuminate the MIL in 2 drive cycles.

If the catalyst monitor does not complete during a particular driving cycle, the already accumulated switch/signal data is retained in Keep Alive Memory and is used during the next driving cycle to allow the catalyst monitor a better opportunity to complete.

Figure 5: Catalyst Efficiency Monitor - Federal Test Procedure

Comprehensive Component Monitor

The Comprehensive Component Monitor (CCM) monitors for malfunctions in any powertrain electronic component or circuit that provides input or output signals to the PCM that can affect emissions and is not monitored by another OBD II monitor. Inputs and outputs are, at a minimum, monitored for circuit continuity or proper range of values. Where feasible, inputs are also checked for rationality, outputs are also checked for proper functionality.

CCM covers many components and circuits and tests them in various ways depending on the hardware, function, and type of signal. For example, analog inputs such as Throttle Position or Engine Coolant Temperature are typically checked for opens, shorts and out-of-range values. This type of monitoring is performed continuously. Some digital inputs like Vehicle Speed or Crankshaft Position rely on rationality checks - checking to see if the input value makes sense at the current engine operating conditions. These types of tests may require monitoring several components and can only be performed under appropriate test conditions.

Outputs such as the Idle Air Control solenoid are checked for opens and shorts by monitoring a feedback circuit or "smart driver" associated with the output. Other outputs, such as relays, require additional feedback circuits to monitor the secondary side of the relay. Some outputs are also monitored for proper function by observing the reaction of the control system to a given change in the output command. An Idle Air Control solenoid can be functionally tested by monitoring idle rpm relative to the target idle rpm. Some tests can only be performed under appropriate test conditions; for example, transmission shift solenoids can only be tested when the PCM commands a shift.

The following is an example of some of the input and output components monitored by the CCM. The components monitor may belong to the engine, ignition, transmissions, air conditioning, or any other PCM supported subsystem.

1. Inputs:

mass air flow (MAF) sensor, intake air temperature (IAT) sensor, engine coolant temperature (ECT) sensor, throttle position (TP) sensor, camshaft position (CMP) sensor, air conditioning pressure sensor (ACPS), fuel tank pressure (FTP) sensor.

2. Outputs:

fuel pump (FP), wide open throttle A/C cutout (WAC), idle air control (IAC), shift solenoid (SS), torque converter clutch (TCC) solenoid, intake manifold runner control (IMRC), EVAP canister purge valve, canister vent (CV) solenoid.

3. CCM is enabled after the engine starts and is running. A Diagnostic Trouble Code (DTC) is stored in Keep Alive Memory and the MIL is illuminated after two driving cycles when a malfunction is detected. Many of the CCM tests are also performed during on demand self-test.

Figure 6: Comprehensive Component Monitor

Evaporative Emission (EVAP) Leak Check Monitor

The Evaporative Emission (EVAP) Leak Check Monitor is an on-board strategy designed to detect a leak from a hole (opening) equal to or greater than 1.016 mm (0.040 inch) in the Enhanced EVAP system. The proper function of the individual components of the Enhanced EVAP system as well as its ability to flow fuel vapor to the engine is also examined. The EVAP Leak Check Monitor relies on the individual components of the Enhanced EVAP system to apply vacuum to the fuel tank and then seal the entire Enhanced EVAP system from atmosphere. The fuel tank pressure is then monitored to determine the total vacuum lost (bleed-up) for a calibrated period of time. Inputs from the engine coolant temperature (ECT) or cylinder head temperature (CHT) sensor, intake air temperature (IAT) sensor, mass air flow (MAF) sensor, vehicle speed, fuel level input (FLI) and fuel tank pressure (FTP) sensor are required to enable the EVAP Leak Check Monitor.

Note: During the EVAP Leak Check Monitor Repair Verification Drive Cycle a PCM reset will bypass the minimum soak time required to complete the monitor. The EVAP Leak Check Monitor will not run if the key is turned off after a PCM reset. The EVAP Leak Check Monitor will not run if a MAF sensor failure is indicated. The EVAP Leak Check Monitor will not initiate until the Heated Oxygen Sensor (HO2S) Monitor has completed.

The EVAP Leak Check Monitor is executed by the individual components of the Enhanced EVAP system as follows:

1. The function of the EVAP canister purge valve is to create a vacuum on the fuel tank. A minimum duty cycle on the EVAP canister purge valve (75%) must be met before the EVAP Leak Check Monitor can begin.
2. The canister vent (CV) solenoid will close (100% duty cycle) with the EVAP canister purge valve at its minimum duty cycle to seal the Enhanced EVAP system from atmosphere and obtain a target vacuum on the fuel tank.
3. The fuel tank pressure (FTP) sensor will be used by the EVAP Leak Check Monitor to determine if the target vacuum on the fuel tank is being reached to perform the leak check. Some vehicle applications with the EVAP Leak Check Monitor use a remote in-line FTP sensor. Once the target vacuum on the fuel tank is achieved, the change in fuel tank vacuum for a calibrated period of time will determine if a leak exists.
4. If the initial target vacuum cannot be reached, DTC P0455 (gross leak detected) will be set. The EVAP Leak Check Monitor will abort and not continue with the leak check portion of the test.

For some vehicle applications: If the initial target vacuum cannot be reached after a refueling event and the purge vapor flow is excessive, DTC P0457 (fuel cap off) is set. If the initial target vacuum cannot be reached and the purge flow is too small, DTC P1443 (no purge flow condition) is set.

If the initial target vacuum is exceeded, a system flow fault exists and DTC P1450 (unable to bleed-up fuel tank vacuum) is set. The EVAP Leak Check Monitor will abort and not continue with the leak check portion of the test.

If the target vacuum is obtained on the fuel tank, the change in the fuel tank vacuum (bleed-up) will be calculated for a calibrated period of time. The calculated change in fuel tank vacuum will be compared to a calibrated threshold for a leak from a hole (opening) of 1.016 mm (0.040 inch) in the Enhanced EVAP system. If the calculated bleed-up is less than the calibrated threshold, the Enhanced EVAP system passes. If the calibrated bleed-up exceeds the calibrated threshold, the test will abort and rerun the test up to three times.

If the bleed-up threshold is still being exceeded after three tests, a vapor generation check must be performed before DTC P0442 (small leak detected) will be set. This is accomplished by returning the Enhanced EVAP system to atmospheric pressure by closing the EVAP canister purge valve and opening the CV solenoid. Once the FTP sensor observes the fuel tank is at

atmospheric pressure, the CV solenoid closes and seals the Enhanced EVAP system.

The fuel tank pressure build-up for a calibrated period of time will be compared to a calibrated threshold for pressure build-up due to vapor generation.

If the fuel tank pressure build-up exceeds the threshold, the leak test results are invalid due to vapor generation. The EVAP Leak Check Monitor will attempt to retest again.

If the fuel tank pressure build-up does not exceed the threshold, the leak test results are valid and DTC P0442 will be set.

5. If the 1.016 mm (0.40 inch) test passes, the test time is extended to allow the 0.508 mm (0.020 inch) test to run.

The calculated change in fuel vacuum over the extended time is compared to a calibrated threshold for a leak from a 0.508 mm (0.020 inch) hole (opening).

If the calculated bleed-up exceeds the calibrated threshold, vapor generation is run. If vapor generation passes (no vapor generation), an internal flag is set in the PCM to run a 0.508 mm (0.020 inch) test at idle (vehicle stopped).

On the next start following a long engine off period, the Enhanced EVAP system will be sealed and evacuated for the first 10 minutes of operation.

If the appropriate conditions are met, a 0.508 mm (0.020 inch) leak check is conducted at idle.

If the test at idles fails, a DTC P0456 will be set. There is no vapor generation test with the idle test.

Note: If the vapor generation is high on some vehicle Enhanced EVAP Systems, where the monitor does not pass, the result is treated as a no test. Thereby, the test is complete for the day.

6. The malfunction indicator lamp (MIL) is activated for DTCs P0442, P0455, P0456, P0457, P1443 and P1450 (or P446) after two occurrences of the same fault. The MIL can also be activated for any Enhanced EVAP system component DTCs in the same manner. The Enhanced EVAP system component DTCs P0443, P0452, P0453 and P1451 are tested as part of the Comprehensive Component Monitor (CCM).

Figure 7: Evaporative Emission (EVAP) Leak Check Monitor

Exhaust Gas Recirculation (EGR) System Monitor—Differential Pressure Feedback EGR

The Differential Pressure Feedback EGR System Monitor is an on-board strategy designed to test the integrity and flow characteristics of the EGR system. The monitor is activated during EGR system operation and after certain base engine conditions are satisfied. Input from the ECT, CHT, IAT, TP and CKP sensors is required to activate the EGR System Monitor. Once activated, the EGR System Monitor will perform each of the tests described below during the engine modes and conditions indicated. Some of the EGR System Monitor tests are also performed during on demand self-test.

1. The differential pressure feedback EGR sensor and circuit are continuously tested for opens and shorts. The monitor looks for the Differential Pressure Feedback EGR circuit voltage to exceed the maximum or minimum allowable limits.

The DTCs associated with this test are DTCs P1400 and P1401.

2. The EGR vacuum regulator solenoid is continuously tested for opens and shorts. The monitor looks for an EGR Vacuum Regulator circuit voltage that is inconsistent with the EGR Vacuum Regulator circuit commanded output state.

The DTC associated with this test is DTC P1409.

3. The test for a stuck open EGR valve or EGR flow at idle is continuously performed whenever at idle (TP sensor indicating closed throttle). The monitor compares the Differential Pressure Feedback EGR circuit voltage at idle to the Differential Pressure Feedback EGR circuit voltage stored during key on engine off to determine if EGR flow is present at idle.

The DTC associated with this test is DTC P0402.

4. The differential pressure feedback EGR sensor upstream hose is tested once per drive cycle for disconnect and plugging. The test is performed with EGR valve closed and during a period of acceleration. The PCM will momentarily command the EGR valve closed. The monitor looks for the differential pressure feedback EGR sensor voltage to be inconsistent for a no flow voltage. A voltage increase or decrease during acceleration while the EGR valve is closed may indicate a fault with the signal hose during this test.

The DTC associated with this test is DTC P1405.

5. The EGR flow rate test is performed during a steady state when engine speed and load are moderate and EGR vacuum regulator duty cycle is high. The monitor compares the actual Differential Pressure Feedback EGR circuit voltage to a desired EGR flow voltage for that state to determine if EGR flow rate is acceptable or insufficient. This is a system test and may trigger a DTC for any fault causing the EGR system to fail.

The DTC associated with this test is DTC P0401. DTC P1408 is similar to P0401 but performed during KOER Self-Test conditions.

6. The MIL is activated after one of the above tests fails on two consecutive drive cycles.

A0013917

Figure 8: EGR System Monitor - Differential Pressure Feedback EGR

Electric Exhaust Gas Recirculation (EGR) System Monitor

The Electric EGR System Monitor is an on-board strategy designed to test the integrity and flow characteristics of the EGR system. The monitor is activated during EGR system operation and after certain base engine conditions are satisfied. Input from the ECT or CHT, IAT, TP, CPS, MAF, and MAP sensors is required to activate the EGR System Monitor. Once activated, the EGR System Monitor will perform each of the tests described below during the engine modes and conditions indicated. Some of the EGR System Monitor tests are also performed during on demand self-test

The Stepper Motor EGR Monitor consists of an electrical and functional test that checks the stepper motor and the EGR system for proper flow. The PCM controls the EGR valve by commanding from 0 to 52 discreet increments or "steps" to get the valve from fully closed to fully open. The stepper motor electrical test is a continuous check of the four electric stepper motor coils and circuits to the PCM. A malfunction is indicated if an open circuit, short to power, or short to ground has occurred in one or more of the stepper motor coils / circuits for a calibrated period of time. If a malfunction has been detected, the EGR system will be disabled, setting the KOER, and Cont. P0403 DTC. Additional monitoring will be suspended for the remainder of the driving cycle, or until the next engine startup.

After the vehicle has warmed up and normal EGR rates are being commanded by the PCM, the EGR flow check is performed. The flow test is performed once per drive-cycle when a minimum amount of EGR is requested and the remaining entry conditions required to initiate the test are satisfied. If a malfunction is detected, the EGR system as well as the EGR monitor is disabled until the next engine startup.

The EGR flow test is done by observing the behavior of two different values of MAP - the analog MAP sensor reading, and inferred MAP (MAP calculated from the Mass Air Flow Sensor, throttle position, rpm, etc.). During normal, steady-state operating conditions, EGR is intrusively commanded ON to a specified percentage. Then, EGR is commanded OFF. If the EGR system is working properly, there is a significant difference in both the observed and the calculated values of MAP, between the EGR-ON and the EGR-OFF states.

When the flow test entry conditions have been satisfied, EGR is commanded to flow at a calibrated test rate (about 10%). At this time, the value of MAP is recorded (EGR-ON MAP). The value of inferred MAP EGR-ON IMAP is also recorded. Next the EGR is commanded off (0%). Again, the value of MAP is recorded (EGR-OFF MAP). The value of EGR-OFF IMAP is also recorded. Typically, seven such ON/OFF samples are taken. After all the samples have been taken, the average EGR-ON MAP, EGR-ON IMAP, EGR-OFF MAP and EGR-OFF IMAP values are stored.

Next, the differences between the EGR-ON and EGR-OFF values are calculated:

- $\text{MAP-delta} = \text{EGR-ON MAP} - \text{EGR-OFF MAP}$ (analog MAP)
- $\text{IMAP-delta} = \text{EGR-ON IMAP} - \text{EGR-OFF IMAP}$ (inferred MAP)

If the sum of MAP-delta and IMAP-delta exceeds a maximum threshold or falls below a minimum threshold, a P0400 (high or low flow malfunction) is registered.

As an additional check, if the EGR-ON MAP exceeds a maximum threshold (BARO - a calibrated value), a P0400 low flow malfunction is registered. This check is performed to detect reduced EGR flow on systems where the MAP pickup point is not located in the intake manifold, but is located just upstream of the EGR valve in the EGR delivery tube.

Note: BARO is inferred at engine startup using the KOEO MAP sensor reading. It is updated during high, part-throttle or high rpm engine operation.

If the inferred ambient temperature is less than 20° F (-7° C), greater than 130° F (54° C), or the altitude is greater than 8,000 feet (BARO <22.5 " Hg), the EGR flow test cannot be reliably done. In these conditions, the EGR flow test is suspended and a timer starts to accumulate the time in these conditions. If the vehicle leaves these extreme conditions, the timer starts decrementing, and if conditions permit,

will attempt to complete the EGR flow monitor. If the timer reaches 500 seconds, the EGR flow test is disabled for the remainder of the current driving cycle and the EGR Monitor I/M Readiness bit will be set to a "ready" condition.

A DTC of P1408, like the P0400, will indicate a EGR flow failure (outside the minimum or maximum limits) but is only set during the KOER self test. The P0400 and P0403 are MIL codes, the P1408 is a non-MIL code.

Figure 9: EEGR System Monitor - Electric EGR System

Fuel System Monitor

The Fuel System Monitor is an on-board strategy designed to monitor the fuel trim system. The fuel control system uses fuel trim tables stored in the PCM's Keep Alive Random Access Memory (RAM) to compensate for variability in fuel system components due to normal wear and aging. During closed-loop vehicle operation, the fuel trim strategy learns the corrections needed to correct a "biased" rich or lean fuel system. The correction is stored in the fuel trim tables. The fuel trim has two means of adapting; a Long Term Fuel Trim and a Short Term Fuel Trim. Long Term relies on the fuel trim tables and Short Term refers to the desired air/fuel ratio parameter "LAMBSE". Both are described in greater detail in this section under Powertrain Control Software, Fuel Trim. Input from the ECT or CHT, IAT, and MAF sensors is required to activate the fuel trim system, which in turn activates the Fuel System Monitor. Once activated, the Fuel System Monitor looks for the fuel trim tables to reach the adaptive clip and LAMBSE to exceed a calibrated limit. The Fuel System Monitor will store the appropriate DTC when a fault is detected as described below.

1. The heated oxygen sensor (HO2S) detects the presence of oxygen in the exhaust and provides the PCM with feedback indicating air/fuel ratio.
2. A correction factor is added to the fuel injector pulsewidth calculation according to the Long and Short Term Fuel Trims as needed to compensate for variations in the fuel system.
3. When deviation in the parameter LAMBSE increases, air/fuel control suffers and emissions increase. When LAMBSE exceeds a calibrated limit and the fuel trim table has clipped, the Fuel System Monitor sets a Diagnostic Trouble Code (DTC) as follows:

The DTCs associated with the monitor detecting a lean shift in fuel system operation are DTCs P0171 and P0174.

The DTCs associated with the monitor detecting a rich shift in fuel system operation are DTCs P0172 and P0175.

4. The MIL is activated after a fault is detected on two consecutive drive cycles.

A0013918

Figure 10: Fuel System Monitor

Heated Oxygen Sensor (HO2S) Monitor

The HO2S Monitor is an on-board strategy designed to monitor the HO2S sensors for a malfunction or deterioration which can affect emissions. The fuel control or upstream HO2S is checked for proper output voltage and response rate (the time it takes to switch from lean to rich or rich to lean). Downstream HO2S used for Catalyst Monitor are also monitored for proper output voltage. The following illustration shows that input is required from the ECT or CHT, IAT, MAF and CKP sensors to activate the HO2S Monitor. The Fuel System Monitor and Misfire Detection Monitor must also have completed successfully before the HO2S Monitor is enabled.

1. The HO2S sensor senses the oxygen content in the exhaust flow and outputs a voltage between zero and 1.0 volt. Lean of stoichiometric (air/fuel ratio of approximately 14.7:1), the HO2S will generate a voltage between zero and 0.45 volt. Rich of stoichiometric, the HO2S will generate a voltage between 0.45 and 1.0 volt. The HO2S Monitor evaluates both the upstream (fuel control) and downstream (Catalyst Monitor) HO2S for proper function.
2. Once the HO2S Monitor is enabled, the upstream HO2S signal voltage amplitude and response frequency are checked. Excessive voltage is determined by comparing the HO2S signal voltage to a maximum calibratable threshold voltage. A fixed frequency closed loop fuel control routine is executed and the upstream HO2S voltage amplitude and output response frequency are observed. A sample of the upstream HO2S signal is evaluated to determine if the sensor is capable of switching or has a slow response rate. A HO2S heater circuit fault is determined by turning the heater on and off and looking for a corresponding change in the Output State Monitor (OSM) and by measuring the current going through the heater circuit. The HO2S Monitor DTCs can be categorized as follows:

The DTCs associated with HO2S lack of switching are DTCs P1130, P1131, P1132, P1150, P1151 and P1152.

The DTCs associated with HO2S slow response rate are DTCs P0133 and P0153.

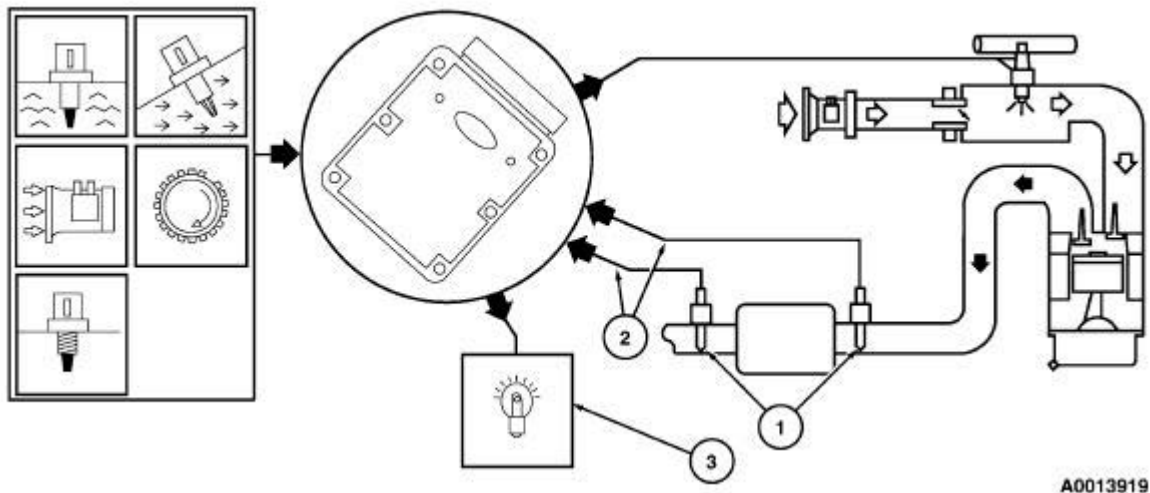

The DTCs associated with HO2S signal circuit malfunction are DTCs P0131, P0136, P0148, P0151 and P0156.

The DTCs associated with a HO2S heater circuit malfunction are DTCs P0135, P0141, P0155 and P0161.

The DTC associated with the downstream HO2S not running in on-demand is DTC P1127.

The DTCs associated with swapped HO2S connectors are DTCs P1128 and P1129.

3. The MIL is activated after a fault is detected on two consecutive drive cycles.

A0013919

Figure 11: Heated Oxygen Sensor Monitor

Misfire Detection Monitor

The Misfire Detection Monitor is an on-board strategy designed to monitor engine misfire and identify the specific cylinder in which the misfire has occurred. Misfire is defined as lack of combustion in a cylinder due to absence of spark, poor fuel metering, poor compression, or any other cause. The Misfire Detection Monitor will be enabled only when certain base engine conditions are first satisfied. Input from the ECT or CHT, MAF and CKP sensors is required to enable the monitor. The Misfire Detection Monitor is also performed during on demand self-test.

1. The PCM synchronized ignition spark is based on information received from the CKP sensor. The CKP signal generated is also the main input used in determining cylinder misfire.
2. The input signal generated by the CKP sensor is derived by sensing the passage of teeth from the crankshaft position wheel mounted on the end of the crankshaft.
3. The input signal to the PCM is then used to calculate the time between CKP edges and also crankshaft rotational velocity and acceleration. By comparing the accelerations of each cylinder event, the power loss of each cylinder is determined. When the power loss of a particular cylinder is sufficiently less than a calibrated value and other criteria is met, then the suspect cylinder is determined to have misfired.
4. Misfire type A:

Upon detection of a Misfire type A (200 revolutions) which would cause catalyst damage, the MIL will blink once per second during the actual misfire, and a DTC will be stored.

Misfire type B:

Upon detection of a Misfire type B (1000 revolutions) which will exceed the emissions threshold or cause a vehicle to fail an inspection and maintenance tailpipe emissions test, the MIL will illuminate and a DTC will be stored.

The DTC associated with multiple cylinder misfire for a Type A or Type B misfire is DTC P0300.

The DTCs associated with an individual cylinder misfire for a Type A or Type B misfire are DTCs P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308, P0309 and P0310.

A0013920

Figure 12: Misfire Detection Monitor

PCV System Monitor

The PCV Monitor consists of a modified PCV system design. The PCV valve is installed into the rocker cover using a quarter-turn cam-lock design to prevent accidental disconnection. High retention force molded plastic lines are used from the PCV valve to the intake manifold. The diameter of the lines and the intake manifold entry fitting are increased so that inadvertent disconnection of the lines after a vehicle is serviced will cause either an immediate engine stall or will not allow the engine to be restarted.

Secondary Air Injection (AIR) System Monitor—Electric Secondary Air Injection Pump System

The Secondary Air Injection (AIR) System Monitor is an on-board strategy designed to monitor the proper function of the secondary air injection system. The AIR Monitor for the Electric Secondary Air Injection Pump system consists of two monitor circuits: an AIR circuit to diagnose concerns with the primary circuit side of the solid state relay (SSR), and an AIR Monitor circuit to diagnose concerns with the secondary circuit side of the SSR. A functional check is also performed that tests the ability of the AIR system to inject air into the exhaust. The functional check relies upon HO2S sensor feedback to determine the presence of air flow. The monitor is enabled during AIR system operation and only after certain base engine conditions are first satisfied. Input is required from the ECT, IAT, and CKP sensors and the HO2S Monitor test must also have passed without a fault detection to enable the AIR Monitor. The AIR Monitor is also activated during on demand self-test.

1. The AIR circuit is normally held high through the AIR bypass solenoid and SSR when the output driver is off. Therefore a low AIR circuit indicates a driver is always on and a high circuit indicates an open in the PCM.

The DTC associated with this test is DTC P0412.

2. The AIR Monitor circuit is held low by the resistance path through the AIR pump when the pump is off. If the AIR Monitor circuit is high there is either an open circuit to the PCM from the pump or there is power supplied to the AIR Pump. If the AIR Monitor is low when the pump is commanded on, there is either an open circuit from the SSR or the SSR has failed to supply power to the pump.

The DTCs associated with this test are DTCs P1413 and P1414.

3. The functional check may be done in two parts: at startup when the AIR pump is normally commanded on, or during a hot idle if the startup test was not able to be performed. The flow test relies upon the HO2S to detect the presence of additional air in the exhaust when introduced by the Secondary Air Injection system.

The DTC associated with this test is DTC P0411.

4. The MIL is activated after one of the above tests fail on two consecutive drive cycles.

Figure 13: AIR System Monitor

Thermostat Monitor

The Thermostat Monitor is designed to verify proper thermostat operation. This monitor will be phased in on certain applications beginning with the 2000 model year and replaces the original "Insufficient temperature for closed-loop test" (DTC P0125). This monitor will be executed once per drive cycle, after a two hour, engine-off soak period. If a malfunction is indicated by the thermostat monitor a diagnostic trouble code P0125 will be set and the malfunction indicator lamp will be illuminated.

The monitor checks to see if the engine is being operated in a manner that is generating sufficient heat. While the engine is at moderate load (greater than 30%) and the vehicle is moving (greater than 15 mph/24 km), the ECT or CHT should warm up in a predictable manner, therefore, a timer is incremented. The target timer value is based on ambient air temperature at start-up. If the timer exceeds the target time and the ECT or CHT has not warmed up to the target temperature, a malfunction is indicated.

The target temperature will be calibrated to the thermostat regulating temperature minus 20°F (11°C). For a typical 195°F (90°C) thermostat, the warm-up temperature would be calibrated to 175°F (79°C).

1. Inputs: ECT or CHT, IAT, engine LOAD (from MAF sensor) and vehicle speed input.
2. Output: MIL.

A0009696

Figure 14: Thermostat Monitor

Malfunction Indicator Lamp (MIL)

The malfunction indicator lamp (MIL) (Figure 15) alerts the driver that the powertrain control module (PCM) has detected an OBD II emission-related component or system fault. When this occurs, an OBD II Diagnostic Trouble Code (DTC) will be set.

- The MIL is located on the instrument cluster and is labeled CHECK ENGINE, SERVICE ENGINE SOON or ISO standard engine symbol (Figure 16).
- Power is supplied to the MIL whenever the ignition switch is in the RUN or START position.
- The MIL will remain on in the RUN/START mode as a bulb check during the instrument cluster proveout for approximately 4 seconds.
- If the MIL remains on after the bulb check:
 - The PCM illuminates the MIL for an emission related concern and a DTC will be present.
 - The instrument cluster will illuminate the MIL if the PCM does not send a control message to the instrument cluster.
 - The PCM is operating in the Hardware Limited Operation Strategy (HLOS).
 - The MIL circuit is shorted to ground.
- If the MIL remains off (during the bulb check):
 - Bulb is damaged.
 - MIL circuit is open.
- To turn off the MIL after a repair, a reset command from the Scan Tool must be sent, or three consecutive drive cycles must be completed without a fault.
- For any MIL concern, go to Section 3, Symptom Charts.
- If the MIL blinks at a steady rate, a severe misfire condition could possibly exist.
- If the MIL blinks erratically, an intermittent open B+ to the bulb or an intermittent short to ground in the MIL circuit exist. Also, the PCM can reset while cranking if battery voltage is low.

Electronic Engine Control (EC) System

Overview

The Electronic Engine Control (Electronic EC) system provides optimum control of the engine and transmission through the enhanced capability of the powertrain control module (PCM). The Electronic EC system also has an on-board diagnostics monitoring system (On Board Diagnostics II) with features and functions to meet federal regulations on exhaust emissions.

The Electronic EC system has two major divisions: hardware and software. The hardware includes the powertrain control module (PCM), natural gas vehicle (NGV) module, constant control relay module (CCRM), sensors, switches, actuators, solenoids, and interconnecting terminals. The software in the PCM provides the strategy control for outputs (engine hardware) based on the values of the inputs to the PCM. Electronic EC hardware and software are discussed in this section.

This section contains detailed descriptions of the operation of Electronic EC system input sensors and switches, output actuators, solenoids, relays and connector pins (including other power-ground signals).

The PCM receives information from a variety of sensor and switch inputs. Based on the strategy and calibration stored within the memory chip, the PCM generates the appropriate output. The system is designed to minimize emissions and optimize fuel economy and driveability. The software strategy controls the basic operation of the engine and transmission, provides the OBD II strategy, controls the malfunction indicator lamp (MIL), communicates to the scan tool via the data link connector (DLC), allows for Flash Electrically Erasable Programmable Read Only Memory (EEPROM), provides idle air and fuel trim, and controls Failure Mode Effects Management (FMEM).

Modifications to OBD II Vehicles

Modifications or additions to the vehicle may cause incorrect operation of the OBD II system. Anti-theft systems, cellular telephones and CB radios must be carefully installed. **Do not install these devices by tapping into or running wires close to powertrain control system wires or components.**

Powertrain Control Software

Multiplexing

The increased number of modules on the vehicle dictates a more efficient method of communication. Multiplexing is the process of communicating several messages over the same signal path. This process allows multiple modules to communicate with each other through the signal path (BUS+/BUS-). Modules communicate with the powertrain control module using Standard Corporate Protocol (SCP) which determines the priority in which the signals are sent. (Refer to Standard Corporate Protocol for more information.) Multiplexing reduces the weight of the vehicle by reducing electrical wiring.

Standard Corporate Protocol

The Standard Corporate Protocol (SCP) is a communication language used by Ford Motor Company for exchanging bi-directional messages (signals) between stand-alone modules and devices. Two or more signals can be sent over one circuit.

Included in these messages is diagnostic data that is output over the BUS+ and BUS - lines to the data link connector (DLC). This information is accessible with a scan tool. Information on this equipment is described in Section 2, Diagnostic Methods.

Flash Electrically Erasable Programmable Read Only Memory

The Flash Electrically Erasable Programmable Read Only Memory (EEPROM) is an Integrated Circuit (IC) within the PCM. This IC contains the software code required by the PCM to control the powertrain. One feature of the EEPROM is that it can be electrically erased and then reprogrammed without removing the PCM from the vehicle. If a software change is required to the PCM, the module no longer needs to be replaced, but can be reprogrammed at the dealership through the DLC.

Idle Air Trim

Idle Air Trim is designed to adjust the Idle Air Control (IAC) calibration to correct for wear and aging of components. When engine conditions meet the learning requirement, the strategy monitors the engine and determines the values required for ideal idle calibration. The Idle Air Trim values are stored in a table for reference. This table is used by the PCM as a correction factor when controlling idle speed. The table is stored in Keep Alive Random Access Memory (RAM) and retains the learned values even after the engine is shut off. A Diagnostic Trouble Code (DTC) is output if the Idle Air Trim has reached its learning limits.

Whenever an IAC component is replaced or cleaned or a service affecting idle is performed, it is recommended that Keep Alive RAM be cleared. This is necessary so the idle strategy does not use the previously learned Idle Air Trim values.

To clear Keep Alive RAM, refer to PCM Reset in Section 2. It is important to note that erasing DTCs with a scan tool does not reset the Idle Air Trim table.

Once Keep Alive RAM has been reset, the engine must idle for 15 minutes (actual time varies between strategies) to learn new idle air trim values. Idle quality will improve as the strategy adapts. Adaptation occurs in four separate modes. The modes are shown in the following table.

IDLE AIR TRIM LEARNING MODES

Transmission Range	Air Conditioning Mode
NEUTRAL	A/C ON
NEUTRAL	A/C OFF
DRIVE	A/C ON
DRIVE	A/C OFF

Fuel Trim

The fuel control system uses the fuel trim table to compensate for normal variability of the fuel system components caused by wear or aging. During closed loop vehicle operation, if the fuel system appears "biased" lean or rich, the fuel trim table will shift the fuel delivery calculations to remove the bias. The fuel system monitor has two means of adapting Short Term Fuel Trim (FT) and Long Term Fuel Trim (FT). Short Term FT is referred to as LAMBSE and Long Term FT references the fuel trim table.

Short Term Fuel Trim (Short Term FT) (displayed as SHRTFT1 and SHRTFT2 on the scan tool) is a parameter that indicates short-term fuel adjustments. Short Term FT is commonly referred to as LAMBSE. LAMBSE is calculated by the PCM from HO2S inputs and helps maintain a 14.7:1 air/fuel ratio during closed loop operation. This range is displayed in percentage (%). A negative percentage means that the HO2S is indicating RICH and the PCM is attempting to lean the mixture. Ideally, Short Term FT may remain near 0% but can adjust between -25% to +35%.

Long Term Fuel Trim (Long Term FT) (displayed as LONGFT1 and LONGFT2 on the scan tool) is the other parameter that indicates long-term fuel adjustments. Long Term FT is also referred to as Fuel Trim. Long Term FT is calculated by the PCM using information from the Short Term FT to maintain a 14.7:1 air/fuel ratio during closed loop operation. The Fuel Trim strategy is expressed in percentages. The range of authority for Long Term FT is from -35% to +35%. The ideal value is near 0% but variations of $\pm 20\%$ are acceptable. Information gathered at different speed load points are stored in fuel trim cells in the fuel trim tables, which can be used in the fuel calculation.

Short Term FT and Long Term FT work together. If the HO2S indicates the engine is running rich, the PCM will correct the rich condition by moving Short Term FT in the negative range (less fuel to correct for a rich combustion). If after a certain amount of time Short Term FT is still compensating for a rich condition, the PCM "learns" this and moves Long Term FT into the negative range to compensate and allows Short Term FT to return to a value near 0%.

As the fuel control and air metering components age and vary from nominal values, the fuel trim learns corrections while in closed loop fuel control. The corrections are stored in a table that is a function of engine speed and load. The tables reside in Keep Alive Random Access Memory (RAM) and are used to correct fuel delivery during open and closed loop. As changing conditions continue the individual cells are allowed to update for that speed load point. If, during the adaptive process, both Short Term FT and Long Term FT reach their high or low limit and can no longer compensate, the MIL is illuminated and a DTC is stored.

Whenever a fuel injector or fuel pressure regulator is replaced, Keep Alive RAM should be cleared. This is necessary so the PCM does not use the previously learned fuel trim values.

To clear Keep Alive RAM, refer to PCM Reset in Section 2, Diagnostic Methods.

Idle Speed Control Closed Throttle Determination

One of the fundamental criteria for entering rpm control is an indication of closed throttle. Throttle mode is always calculated to the lowest learned throttle position (TP) voltage seen since engine start. This lowest learned value is called "ratch," since the software acts like a one-way ratch. The ratch value

(voltage) is displayed as the TPREL PID. The ratch value is relearned after every engine start. Ratch will learn the lowest, steady TP voltage seen after the engine starts. In some cases, ratch can learn higher values of TP. The time to learn the higher values is significantly longer than the time to learn the lower values. The brakes must also be applied to learn the longer values.

All PCM functions are done using this ratch voltage, including idle speed control. The PCM goes into closed throttle mode when the TP voltage is at the ratch (TPREL PID) value. Increase in TP voltage, normally less than 0.05 volts, will put the PCM in part throttle mode. Throttle mode can be viewed by looking at the TP MODE PID. With the throttle closed, the PID must read C/T (closed throttle). Slightly corrupt values of ratch can prevent the PCM from entering closed throttle mode. An incorrect part throttle indication at idle will prevent entry into closed throttle rpm control, and could result in a high idle. Ratch can be corrupted by a throttle position sensor or circuit that "drops out" or is noisy, or by loose/worn throttle plates that close tight during a decel and spring back at a normal engine vacuum.

Fail-Safe Cooling Strategy

Only vehicles that have a cylinder head temperature (CHT) sensor will have the fail-safe cooling strategy. This strategy is activated by the PCM only in the event that an overheating condition has been identified. This strategy provides engine temperature control when the cylinder head temperature exceeds certain limits. The cylinder head temperature is measured by the CHT sensor. For additional information, refer to PCM Inputs for a description of the CHT sensor.

A cooling system failure such as low coolant or coolant loss could cause an overheating condition. As a result, damage to major engine components could occur. Along with a CHT sensor, a special cooling strategy is used to prevent damage by allowing air cooling of the engine. The vehicle can be safely driven for a short time with some loss of performance.

Engine temperature is controlled by varying and alternating the number of disabled fuel injectors. This allows all cylinders to cool. When the fuel injectors are disabled, their respective cylinders work as air pumps, and this air is used to cool the cylinders. The more fuel injectors that are disabled, the cooler the engine runs, but the engine has less power.

Note: A wide open throttle (WOT) delay is incorporated if the CHT temperature is exceeded during WOT operation. At WOT, the injectors will function for a limited amount of time allowing the customer to complete a passing maneuver.

Before injectors are disabled, the fail-safe cooling strategy alerts the customer to a cooling system problem by moving the instrument cluster temperature gauge to the hot zone. Depending on the vehicle, other indicators, such as an audible chime or warning lamp, can be used to alert the customer of fail-safe cooling. If overheating continues, the strategy begins to disable the fuel injectors, a DTC is stored in the PCM memory, and a malfunction indicator light (MIL) (either CHECK ENGINE or SERVICE ENGINE SOON), comes on. If the overheating condition continues and a critical temperature is reached, all fuel injectors are turned off and the engine is disabled.

Failure Mode Effects Management

Failure Mode Effects Management (FMEM) is an alternate system strategy in the PCM designed to maintain engine operation if one or more sensor inputs fail.

When a sensor input is perceived to be out-of-limits by the PCM, an alternative strategy is initiated. The PCM substitutes a fixed value and continues to monitor the incorrect sensor input. If the suspect sensor operates within limits, the PCM returns to the normal engine operational strategy.

All FMEM sensors display a sequence error message on the scan tool. The message may or may not be followed by Key On Engine Off or Continuous Memory DTCs when attempting Key On Engine Running Self-Test Mode.

Engine RPM/Vehicle Speed Limiter

The powertrain control module (PCM) will disable some or all of the fuel injectors whenever an engine rpm or vehicle overspeed condition is detected. The purpose of the engine rpm or vehicle speed limiter is to prevent damage to the powertrain. The vehicle will exhibit a rough running engine condition, and the PCM will store a Continuous Memory DTC P1270. Once the driver reduces the excessive speed, the engine will return to the normal operating mode. No repair is required. However, the technician should clear the PCM and inform the customer of the reason for the DTC.

Excessive wheel slippage may be caused by sand, gravel, rain, mud, snow, ice, etc. or excessive and sudden increase in rpm while in NEUTRAL or while driving.

Powertrain Control Hardware

Constant Control Relay Module

The constant control relay module (CCRM) interfaces with the Electronic EC system to provide vehicle power (VPWR) to the powertrain control module (PCM) and the Electronic EC system, and for the control of the cooling fan and A/C clutch. The CCRM also contains the fuel pump driver module (FPDM) power supply relay, which supplies power to the FPDM. If any of the internal components of the CCRM fail, the entire unit must be replaced. The descriptions of the specific CCRM functions, as well as the Dual Function A/C high pressure switch are found under the individual hardware - PCM inputs and outputs in this section.

Fuel Pump Driver Module

Note: For the LS6/LS8, the FPDM functions are incorporated in the Rear Electronic Module (REM). Fuel pump operation is the same as applications using the stand-alone FPDM. The REM will, however, communicate diagnostic information through the BUS +/- circuits (SCP) instead of using a fuel pump monitor (FPM) circuit.

The fuel pump driver module (FPDM) receives a duty cycle signal from the PCM and controls the fuel pump operation in relation to this duty cycle. This results in variable speed fuel pump operation. The FPDM sends diagnostic information to the PCM on the fuel pump monitor circuit. For additional information, refer to PCM Outputs, Fuel Pump and PCM Inputs, Fuel Pump Monitor in this section.

Generic Electronic Module

For information on the generic electronic module, refer to the description of the Transfer Case 4x4 System in the vehicle drivetrain workshop manual.

Natural Gas (NG) Vehicle Module

The natural gas (NG) vehicle module (Figure 17) provides two functions. The first function operates the fuel injectors and is referred to as the injector driver module (IDM). The second function sends a fuel level indicator signal to drive the fuel gauge and is called the fuel indicator module (FIM). IDM NG vehicle fuel indicator driver signals are based on powertrain control module (PCM) fuel injector driver signals and are controlled directly by the corresponding injector drivers in the PCM. The IDM must be used to provide the NG fuel injectors with the required high current necessary for proper operation. The greater demand of NG fuel injector current warrants an increased size of the injector driver and increased heat dissipation. Given these conditions, the PCM would not be suitable for placement of these drivers. The IDM closely resembles the Electronic Engine Control IV PCM module in appearance.

The IDM injector drivers are capable of controlling the amount of current flow to each NG fuel injector. Once the fuel injector is open, the IDM NG fuel injector driver will reduce current flow sufficient to continue to hold the fuel injector open. This is done by the IDM in an effort to reduce heat. If the IDM driver does not detect the required peak current to initially open the NG fuel injector within a specified amount of time, the IDM driver will drop current to fuel injector hold open current.

The fuel indicator module (FIM) is not part of the powertrain control subsystem and will not be discussed here.

Figure 17: Natural Gas (NG) Vehicle Module

Powertrain Control Module

The center of the Electronic EC system is a microprocessor called the powertrain control module (PCM). LS6/LS8 and 2002 Explorer/Mountaineer applications use a 150-pin PCM (Figure 19). This PCM will have three separate electrical harness connectors. All other applications will continue to use the standard 104-pin PCM (Figure 18). The PCM receives input from sensors and other electronic components (switches, relays). Based on information received and programmed into its memory, the PCM generates output signals to control various relays, solenoids and actuators.

Figure 18: Typical Powertrain Control Module (PCM)

Figure 19: 150-Pin PCM

TABLE 1—150-PIN PCM POWER AND GROUNDS

Function	Description	Connector/Pin
VPWR	Voltage input to module	A-32
VPWR	Voltage input to module	A-33
PWRGND	Power ground	A-24
PWRGND	Power ground	A-25
PWRGND	Power ground	A-26
PWRGND	Power ground	A-27
CSEGND	Case ground	A-43
SIGRTN	Connector A signal return	A-17
SIGRTN	Connector B signal return	B-17

VREF	Buffered 5V reference	A-20
VREF	Buffered 5V reference	C-20
KAPWR	Keep alive power	A-44
FEPS	Flash EPROM Programming Supply	A-13

Keep Alive Random Access Memory (RAM)

The PCM stores information in Keep Alive RAM (a memory integrated circuit chip) about vehicle operating conditions, and then uses this information to compensate for component variability. Keep Alive

RAM remains powered when the ignition switch is off so that this information is not lost.

Hardware Limited Operation Strategy (HLOS)

This system of special circuitry provides minimal engine operation should the PCM (mainly the central processing unit (CPU) or EEPROM) stop functioning correctly. All modes of Self-Test are not functional at this time. Electronic hardware is in control of the system while in HLOS.

HLOS Allowable Output Functions:

- Spark output controlled directly by the CKP signal.
- Fixed fuel pulse width synchronized with the CKP signal.
- Fuel pump relay energized.
- Idle speed control output signal functional.

HLOS Disabled Outputs To Default State:

- EGR solenoids
- No torque converter clutch lock-up

PCM Locations

- Focus - passenger side behind kick panel.
- Escort - passenger side under instrument panel.
- Cougar, Taurus/Sable, Windstar, 5.4L F-Series - behind glove compartment (access from engine compartment dash panel) on passenger side.
- Mustang - behind kick panel cover on passenger side, near instrument panel.
- Crown Victoria/Grand Marquis - behind kick panel cover on driver side, near instrument panel.
- Continental, Town Car - behind instrument panel (cowl), center to both driver and passenger sides.
- LS6/LS8 - above driver's feet, passenger side and near side cowl.
- Ranger, Escape - behind instrument panel (cowl), center to both driver and passenger sides.
- Explorer/Mountaineer - behind instrument panel (cowl), (access from engine compartment dash panel) on passenger side to center of vehicle.
- All other F-Series, Expedition/Navigator/Blackwood - lower dash panel on passenger side.
- Excursion - lower dash panel on driver side.
- All E-Series - lower dash panel on driver side.

Integrated Electronic Ignition System

The Integrated Electronic Ignition (EI) System consists of a crankshaft position (CKP) sensor, coil pack (s), connecting wiring, and PCM. The Coil On Plug (COP) Integrated EI System uses a separate coil for each spark plug and each coil is mounted directly onto the plug. The COP Integrated EI System eliminates the need for spark plug wires but does require input from the camshaft position (CMP) sensor.

Power and Ground Signals

Vehicle Power

When the ignition switch is turned to the START or RUN position, battery positive voltage (B+) is applied to the coil of the Electronic EC power relay. Since the other end of the coil is wired to ground, this

energizes the coil and closes the contacts of the Electronic EC power relay. Vehicle power (VPWR) is now sent to the PCM and the Electronic EC System as VPWR.

Vehicle Reference Voltage

The vehicle reference voltage (VREF) is a positive voltage (about 5.0 volts) that is output by the PCM. This is a consistent voltage that is used by the 3-wire sensors.

Mass Air Flow Return

The mass air flow return (MAF RTN) is a dedicated analog signal return from the mass air flow (MAF) sensor. It serves as a ground offset for the analog voltage differential input by the MAF sensor to the PCM.

Signal Return

The signal return (SIG RTN) is a dedicated ground circuit used by most Electronic EC sensors and some other inputs.

Power Ground

Power ground (PWR GND) is an electric current path return for VPWR voltage circuit. The purpose of the PWR GND is to maintain sufficient voltage at the PCM.

Gold Plated Pins

Note: Damaged gold terminals should only be replaced with new gold terminals.

Some engine control hardware has gold plated pins on the connectors and mating harness connectors to improve electrical stability for low current draw circuits and to enhance corrosion resistance. The electronic EC components equipped with gold terminals will vary by vehicle application.

PCM Inputs

Note: Transmission input, which are not described in this section are discussed in the respective transmission Workshop Manual.

Air Conditioning Cycling Switch

The air conditioning (A/C) cycling switch may be wired to either the ACCS or ACPSW PCM input. When the A/C cycling switch opens, the PCM will turn off the A/C clutch. For information on the specific function of the A/C cycling switch, refer to the Climate Control Group in the Workshop Manual.

The A/C cycling switch (ACCS) circuit to the PCM provides a voltage signal which indicates when the A/C is requested. When the A/C demand switch is turned on, and both the A/C cycling switch and the high pressure contacts of the A/C high pressure switch (if equipped and in circuit) are closed, voltage is supplied to the ACCS circuit at the PCM. Refer to the applicable Wiring Diagram Manual for vehicle specific wiring.

If the ACCS signal is not received by the PCM, the PCM circuit will not allow the A/C to operate. For additional information, refer to PCM outputs, wide open throttle air conditioning cutoff.

Note: Some applications do not have a dedicated (separate) input to the PCM indicating that A/C is requested. This information is received by the PCM through the BUS + and BUS - (SCP) communication.

Air Conditioning Pressure Sensor

The air conditioning pressure (A/C pressure) sensor (Figure 20) is located in the high pressure (discharge) side of the air conditioning A/C system. The A/C pressure sensor provides a voltage signal to the powertrain control module (PCM) that is proportional to the A/C pressure. The PCM uses this information for A/C clutch control, fan control and idle speed control.

Figure 20: Typical Air Conditioning Pressure Sensor

Air Conditioning High Pressure Switch

The A/C high pressure switch is used for additional A/C system pressure control. The A/C high pressure switch is either dual function for two-speed electric fan applications or single function for all others.

For refrigerant containment control, the normally closed high pressure contacts open at a predetermined A/C pressure. This will result in the A/C turning off, preventing the A/C pressure from rising to a level that would open the A/C high pressure relief valve.

For fan control, the normally open medium pressure contacts close at a predetermined A/C pressure. This grounds the ACPSW circuit input to the PCM. The PCM will then turn on the high speed fan to help reduce the pressure.

For additional information, refer to the Climate Control Group in the Workshop Manual or the Wiring Diagram Manual.

Brake Pedal Position Switch

The brake pedal position (BPP) switch (Figure 21) is used by the PCM to disengage the transmission torque converter clutch and on some applications as an input to the idle speed control for idle quality. On most applications the BPP switch is hard wired to the PCM and supplies battery positive voltage (B+) when the vehicle brake pedal is applied. On other applications the BPP switch signal is broadcast over the SCP link via another module to be received by the PCM.

On applications where the BPP switch is hard wired to the PCM and stoplamp circuit, if all stoplamp bulbs are burned out (open), high voltage is present at the PCM due to a pull-up resistor in the PCM. This provides fail-safe operation in the event the circuit to the stoplamp bulbs has failed.

Figure 21: Brake Pedal Position Switch

Camshaft Position Sensor

The camshaft position (CMP) sensor detects the position of the camshaft. The CMP sensor identifies when piston No. 1 is on its compression stroke. A signal is then sent to the powertrain control module (PCM) and used for synchronizing the firing of sequential fuel injectors. The Coil On Plug (COP) Ignition applications also use the CMP signal to select the proper ignition coil to fire. The input circuit to the PCM is referred to as the CMP input or circuit.

There are two types of CMP sensors: the three pin connector Hall-effect type sensor (Figure 22) and the two pin connector variable reluctance sensor (Figure 23).

Figure 22: Typical Hall-Effect Sensor

Figure 23: Typical Variable Reluctance Sensor

Clutch Pedal Position Switch

The clutch pedal position (CPP) switch (Figure 24) is an input to the PCM indicating the clutch pedal position and, in some manual transmission applications, both the clutch pedal engagement position and the gear shift position. The PCM provides a 5-volt reference (VREF) signal to the CPP switch and/or a park/neutral position (PNP) switch (on the CPP signal line). If the CPP switch (either or both CPP and PNP switches are closed) is closed, indicating the clutch pedal is engaged and the shift lever is in the NEUTRAL position, the output voltage (5 volts) from the PCM is grounded through the signal return line to the PCM, and there is 1 volt or less. One volt or less indicates there is a reduced load on the engine. If the CPP switch (or PNP switch on vehicle or both CPP and PNP switches open on the vehicle) is open, meaning the clutch pedal is disengaged (all systems) and the shift lever is not in NEUTRAL position (PNP switch systems), the input on the CPP signal to the PCM will be approximately 5 volts. Then, the 5-volt signal input at the PCM will indicate a load on the engine. The PCM uses the load information in mass air flow and fuel calculations.

Figure 24: Clutch Pedal Position (CPP) Switch

Crankshaft Position Sensor (Integrated Ignition Systems)

The crankshaft position (CKP) sensor is a magnetic transducer mounted on the engine block adjacent to a pulse wheel located on the crankshaft. By monitoring the crankshaft mounted pulse wheel, the CKP is the primary sensor for ignition information to the powertrain control module (PCM). The trigger wheel has a total of 35 teeth spaced 10 degrees apart with one empty space for a missing tooth. The 6.8L ten cylinder pulse wheel has 39 teeth spaced 9 degrees apart and one 9 degree empty space for a missing tooth. By monitoring the trigger wheel, the CKP indicates crankshaft position and speed information to the PCM. By monitoring the missing tooth, the CKP is also able to identify piston travel in order to synchronize the ignition system and provide a way of tracking the angular position of the crankshaft relative to fixed reference (Figure 25).

Figure 25: Three Different Types of Crankshaft Position (CKP) Sensors

Cylinder Head Temperature Sensor

The cylinder head temperature (CHT) sensor (Figure 26) is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as temperature increases, and increases as temperature decreases. The varying resistance affects the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow.

Voltage that is dropped across a fixed resistor in series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The cylinder head temperature (CHT) sensor is installed in the aluminum cylinder head and measures the metal temperature. The CHT sensor can provide complete engine temperature information and can be used to infer coolant temperature. If the CHT sensor conveys an overheating condition to the PCM,

the PCM would then initiate a fail-safe cooling strategy based on information from the CHT sensor. A cooling system failure such as low coolant or coolant loss could cause an overheating condition. As a result, damage to major engine components could occur. Using both the CHT sensor and fail-safe cooling strategy, the PCM prevents damage by allowing air cooling of the engine and limp home capability. For additional information, refer to Powertrain Control Software for Fail-Safe Cooling Strategy details.

Figure 26: Cylinder Head Temperature (CHT) Sensor

Differential Pressure Feedback EGR Sensor

For information on the differential pressure feedback EGR sensor, refer to the description of the Exhaust Gas Recirculation Systems.

Engine Coolant Temperature

The engine coolant temperature (ECT) sensor (Figure 27) is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases, and increases as the temperature decreases. The varying resistance affects the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow.

Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The ECT measures the temperature of the engine coolant. The sensor is threaded into an engine coolant passage. The ECT sensor is similar in construction to the IAT sensor.

Figure 27: Engine Coolant Temperature (ECT) Sensor

Engine Fuel Temperature Sensor

The engine fuel temperature (EFT) sensor (Figure 28) is a thermistor device in which resistance

changes with temperature. The electrical resistance of a thermistor decreases as temperature increases, and increases as temperature decreases. The varying resistance affects the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow.

Voltage that is dropped across a fixed resistor in series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The EFT sensor measures the temperature of the fuel near the fuel injectors. This signal is used by the PCM to adjust the fuel injector pulse width and meter fuel to each engine combustion cylinder.

Figure 28: Engine Fuel Temperature (EFT) Sensor used on the 4.6L NG Crown Victoria

Engine Oil Temperature

The engine oil temperature (EOT) sensor (Figure 29) is a thermistor device in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases and increases as the temperature decreases. The varying resistance affects the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow.

Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The EOT measures the temperature of the engine oil. The EOT sensor is similar in construction to the engine coolant temperature (ECT) sensor. On some applications, EOT input to the PCM is used to initiate a soft engine shutdown. This prevents engine damage from occurring as a result of high oil temperature.

Figure 29: Engine Oil Temperature (EOT) Sensor

Flexible Fuel Sensor

The flexible fuel (FF) sensor (Figure 30) is a capacitive device that detects the dielectric constant, conductivity and temperature of the fuel being fed to the engine. From this information, the FF sensor generates a duty cycle frequency that it supplies to the PCM telling it the percentage of ethanol in the fuel.

In general, as the percentage of ethanol in the fuel mixture increases, the output frequency of the FF sensor signal increases. The relationship between ethanol alcohol percentage and duty cycle frequency is as follows:

Ethanol Alcohol Percentage	Duty Cycle Frequency
0 %	50 Hz
25 %	75 Hz
50 %	100 Hz
75 %	125 Hz
100 %	150 Hz

All duty cycle frequency values are +/-5%. It is important to note that currently no fuel with greater than 85% ethanol alcohol content is being produced. The PCM uses the percent ethanol information to calculate the correct A/F (air/fuel) ratio and spark advance for the vehicle.

Beginning in the 2001 model year, not all vehicles are equipped with flexible fuel sensors. On vehicles without flexible fuel sensors, the PCM calculates the A/F ratio based upon HO2S input signals.

Figure 30: Flexible Fuel (FF) Sensor

Fuel Level Input

The fuel level input (FLI) is a hard wire signal input to the PCM from the fuel pump (FP) module. Refer to the description of the FLI in the On-Board Diagnostics II Monitors.

Fuel Pump Monitor

Applications Using a Fuel Pump Relay for Fuel Pump On/Off Control

The Fuel Pump Monitor (FPM) circuit is spliced into the fuel pump power (FP PWR) circuit and is used by the PCM for diagnostic purposes. The PCM sources a low current voltage down the FPM circuit. With the fuel pump off, this voltage is pulled low by the path to ground through the fuel pump. With the fuel pump off and the FPM circuit low, the PCM can verify that the FPM circuit and the FP PWR circuit are

complete from the FPM splice through the fuel pump to ground. This also confirms that the FP PWR or FPM circuits are not shorted to power. With the fuel pump on, voltage is now being supplied from the fuel pump relay to the FP PWR and FPM circuits. With the fuel pump on and the FPM circuit high, the PCM can verify that the FP PWR circuit from the fuel pump relay to the FPM splice is complete. It can also verify that the fuel pump relay contacts are closed and there is a B+ supply to the fuel pump relay.

Fuel Pump Driver Module Applications

The fuel pump driver module (FPDM) communicates diagnostic information to the powertrain control module (PCM) through the Fuel Pump Monitor (FPM) circuit. This information is sent by the FPDM as a duty cycle signal. The three duty cycle signals that may be sent are listed in the following table.

FUEL PUMP DRIVER MODULE DUTY CYCLE SIGNALS

Duty Cycle ^a	On Time (mSec)	Comments	FP_M PID (on some scan tools) ^b
50%	500	"All OK" output from FPDM. With this input, the PCM can verify that the FPDM is powered and able to communicate on the FPM circuit.	80-125%
25%	250	FPDM did not receive a Fuel Pump (FP) duty cycle command from the PCM, or the duty cycle that was received was invalid (refer to PCM Outputs, Fuel Pump).	15-60%
75%	750	The FPDM has detected a fault in the circuits between the fuel pump and FPDM.	250-400%

^a If a duty cycle meter and breakout box is used, be aware that these values may be reversed depending on the trigger setting of the specific meter (for example, 25% from FPDM may read as 75% on duty cycle meter depending on trigger setting).

^b Value will fluctuate randomly. It is ok for value to briefly go outside this range, then return.

Fuel Tank Pressure Sensor

For information on the fuel tank pressure (FTP) sensor, refer to the description of the Evaporative Emission Systems.

Fuel Rail Pressure Sensor

The fuel rail pressure (FRP) sensor (Figure 31) is a diaphragm strain gauge device in which resistance changes with pressure. The electrical resistance of a strain gauge increases as pressure increases, and decreases as pressure decreases. The varying resistance affects the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to pressure.

Strain gauge type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow.

Voltage that is dropped across a fixed resistor in series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The FRP sensor measures the pressure of the fuel near the fuel injectors. This signal is used by the PCM to adjust the fuel injector pulse width and meter fuel to each engine combustion cylinder.

Figure 31: Fuel Rail Pressure (FRP) Sensor on the 4.6L NG Crown Victoria

The fuel rail pressure (FRP) sensor (Figure 32) senses the pressure difference between the fuel rail and the intake manifold. The return fuel line to the fuel tank has been deleted in this type of fuel system. The differential fuel/intake manifold pressure together with measured fuel temperature provides an indication of the fuel vapors in the fuel rail. Both differential pressure and temperature feedback signals are used to control the speed of the fuel pump. The speed of the fuel pump sustains fuel rail pressure which preserve fuel in its liquid state. The dynamic range of the fuel injectors increase because of the higher rail pressure, which allows the injector pulse width to decrease.

Figure 32: Fuel Rail Pressure (FRP) Sensor

Generator Monitor (Gen Mon)

For information on the generator monitor, refer to the description of the PCM/Controlled Charging System.

Generator Load

The Generator Load Input (GLI) circuit is used by the PCM to determine generator load on the engine. As generator load increases the PCM will adjust idle speed accordingly. This strategy helps reduce idle surges due to switching high current loads. The GLI signal is sent to the PCM from the voltage regulator/generator. The signal is a variable frequency duty cycle. Normal operating frequency is 40 - 250 Hz. Normal signal DC voltage (referenced to ground) is between 1.5 V (low generator load) and 10.5 V (high generator load).

Heated Oxygen Sensor

The heated oxygen sensor (HO2S) (Figure 33) detects the presence of oxygen in the exhaust and produces a variable voltage according to the amount of oxygen detected. A high concentration of oxygen (lean air/fuel ratio) in the exhaust produces a low voltage signal less than 0.4 volt. A low concentration of oxygen (rich air/fuel ratio) produces a high voltage signal greater than 0.6 volt. The HO2S provides feedback to the PCM indicating air/fuel ratio in order to achieve a near stoichiometric air/fuel ratio of

14.7:1 during closed loop engine operation. The HO₂S generates a voltage between 0.0 and 1.1 volts.

Embedded with the sensing element is the HO₂S heater. The heating element heats the sensor to temperatures of 800°C (1400°F). At approximately 300°C (600 °F) the engine can enter closed loop operation. The VPWR circuit supplies voltage to the heater and the PCM will complete the ground when the proper conditions occur. For model year 1998 a new HO₂S heater and heater control system are installed on some vehicles. The high power heater reaches closed loop fuel control temperatures. The use of this heater requires that the HO₂S heater control be duty cycled, to prevent damage to the heater. The 6 ohm design is **not** interchangeable with new style 3.3 ohm heater.

Town Car and Crown Victoria/Grand Marquis

Figure 33: Heated Oxygen Sensor (HO₂S)

Intake Air Temperature Sensor

The intake air temperature (IAT) sensors (Figure 34) and integrated MAF type (Figure 37), are thermistor devices in which resistance changes with temperature. The electrical resistance of a thermistor decreases as the temperature increases, and increases as the temperature decreases. The varying resistance affects the voltage drop across the sensor terminals and provides electrical signals to the PCM corresponding to temperature.

Thermistor-type sensors are considered passive sensors. A passive sensor is connected to a voltage divider network so that varying the resistance of the passive sensor causes a variation in total current flow.

Voltage that is dropped across a fixed resistor in a series with the sensor resistor determines the voltage signal at the PCM. This voltage signal is equal to the reference voltage minus the voltage drop across the fixed resistor.

The IAT provides air temperature information to the PCM. The PCM uses the air temperature information as a correction factor in the calculation of fuel, spark and MAF.

The IAT sensor provides a quicker temperature change response time than the ECT or CHT sensor.

Supercharged 5.4L Lightning vehicles use (2) IAT sensors. Both sensors operate as described above. However, one is located before the supercharger at the air cleaner for standard OBD II/cold weather input, while a second sensor (IAT2) is located after the supercharger in the intake manifold. The IAT2 sensor located after the supercharger provides air temperature information to the PCM to control border-line spark and to help determine intercooler efficiency.

Figure 34: Intake Air Temperature (IAT)

Intake Manifold Runner Control

For information on the intake manifold runner control (IMRC), refer to the description of the Intake Air Systems.

Intake Manifold Swirl Control

For information on the intake manifold swirl control (IMSC), refer to the description of the Intake Air Systems.

Intake Manifold Tuning Valve

For information on the intake manifold tuning valve(IMTV), refer to the description of the Intake Air Systems.

Knock Sensor

The knock sensor (KS) (Figure 35) is a tuned accelerometer on the engine which converts engine vibration to an electrical signal. The PCM uses this signal to determine the presence of engine knock and to retard spark timing.

Figure 35: Two Types of Knock Sensor (KS)

Mass Air Flow Sensor

The mass air flow (MAF) sensor uses a hot wire sensing element to measure the amount of air entering the engine. Air passing over the hot wire causes it to cool. This hot wire is maintained at 200°C (392°F) above ambient temperature as measured by a constant cold wire (Figure 36). If the hot wire electronic sensing element must be replaced, then the entire assembly must be replaced. Replacing only the element may change the air flow calibration.

Figure 36: Typical Mass Air Flow (MAF) Sensor

The current required to maintain the temperature of the hot wire is proportional to the air mass flow. The MAF sensor then outputs an analog voltage signal to the PCM proportional to the intake air mass. The PCM calculates the required fuel injector pulse width in order to provide the desired air/fuel ratio (Figure 37). This input is also used in determining transmission electronic pressure control (EPC), shift and torque converter clutch scheduling.

Some MAF sensors have integrated bypass technology (IBT) with an integrated intake air temperature (IAT) sensor. The present applications with IBT are: Focus, Escort (4V), 2.0L Cougar, Escape, Taurus/Sable, Windstar, Explorer/Mountaineer and E-Series.

Figure 37: Diagram of Air Flow through Throttle Body contacting MAF sensor hot and cold wire (and IAT sensor wire where applicable) terminals.

The MAF sensor is located between the air cleaner and the throttle body or inside the air cleaner assembly.

Output Shaft Speed Sensor

The Output Shaft Speed Sensor (OSS), provides the Powertrain Control Module (PCM) with information about the rotational speed of an output shaft. The (PCM) uses the information to control and diagnose powertrain behavior. In some applications, the sensor is also used as the source of vehicle speed. The sensor may be physically located in different places on the vehicle, depending upon the specific application. The design of each speed sensor is unique and depends on which powertrain control feature uses the information generated.

Power Steering Pressure Switch

The power steering pressure (PSP) switch (Figure 38) monitors the hydraulic pressure within the power steering system. The PSP switch is a normally closed switch that opens as the hydraulic pressure increases. The PCM uses the input signal from the PSP switch to compensate for additional loads on the engine by adjusting the idle rpm and preventing engine stall during parking maneuvers. Also, the PSP switch signals the PCM to adjust transmission electronic pressure control (EPC) pressure during the increased engine load, for example during parking maneuvers.

Figure 38: Power Steering Pressure (PSP) Switch

Power Steering Pressure Sensor

The power steering pressure (PSP) sensor (Figure 39) monitors the hydraulic pressure within the power steering system. The PSP sensor voltage input to the PCM will change as the hydraulic pressure changes. The PCM uses the input signal from the PSP sensor to compensate for additional loads on the engine by adjusting the idle rpm and preventing engine stall during parking maneuvers. Also, the PSP sensor signals the PCM to adjust transmission electronic pressure control (EPC) pressure during the increased engine load, for example during parking maneuvers.

Figure 39: Power Steering Pressure (PSP) Sensor

Power Take-Off Switch and Circuit

The Power Take-Off (PTO) circuit (Figure 40) is used by the PCM to disable some of the OBD II Monitors during PTO operation. The PTO circuit normally carries low voltage. When the PTO switch is on/closed, B+ is supplied to the PTO input circuit indicating to the PCM that an additional load is being applied to the engine. If this action was not reported by the PTO circuit, a false Diagnostic Trouble Code may be stored.

Figure 40: Power Take-Off (PTO) Switch and Circuit to PCM

Purge Flow Sensor

For information on the purge flow (PF) sensor, refer to the description of the Evaporative Emission Systems.

Thermal Manifold Absolute Pressure Sensor

The Thermal Manifold Absolute Pressure Sensor (TMAP) (Figure 41) consists of a manifold absolute pressure (MAP) sensor and an integrated thermistor. The thermistor part of the sensor is currently not being used. The MAP part of the sensor measures intake manifold air absolute pressure. The PCM uses information from the MAP sensor, throttle position (TP) sensor, mass air flow (MAF) sensor, engine coolant temperature (ECT) or cylinder head temperature (CHT) sensor and crankshaft position (CKP) sensor to determine how much exhaust gas is introduced into the intake manifold.

Figure 41: Thermal Manifold Absolute Pressure (TMAP) Sensor

Throttle Position Sensor

The throttle position (TP) sensor (Figure 42) is a rotary potentiometer sensor that provides a signal to the PCM that is linearly proportional to the throttle plate/shaft position. The sensor housing has a three-blade electrical connector that may be gold plated. The gold plating increases corrosion resistance on terminals and increases connector durability. The TP sensor is mounted on the throttle body. As the TP sensor is rotated by the throttle shaft, four operating conditions are determined by the PCM from the TP. Those conditions are closed throttle (includes idle or deceleration), part throttle (includes cruise or moderate acceleration), wide open throttle (includes maximum acceleration or de-choke on crank), and throttle angle rate.

Figure 42: Typical Throttle Position (TP) Sensor

Transmission Control Switch

The transmission control switch (TCS) (Figures 43 and 44) signals the PCM with keypower whenever the TCS is pressed. On vehicles with this feature, the transmission control indicator lamp (TCIL) lights when the TCS is cycled to disengage overdrive. The operator of the vehicle controls the position of the TCS.

Figure 43: Transmission Control Switch (TCS)

Figure 44: Transmission Control Switch (TCS)

Solid State Relay

For information on the solid state relay, refer to the description of the Secondary Air Injection Systems.

Vehicle Speed Sensor

The vehicle speed sensor (VSS) (Figure 45) is a variable reluctance or Hall-effect sensor that generates a waveform with a frequency that is proportional to the speed of the vehicle. If the vehicle is moving at a relatively low velocity, the sensor produces a signal with a low frequency. As the vehicle velocity increases, the sensor generates a signal with a higher frequency. The PCM uses the frequency signal generated by the VSS (and other inputs) to control such parameters as fuel injection, ignition control, transmission/transaxle shift scheduling and torque converter clutch scheduling.

Figure 45: Typical Vehicle Speed Sensor (VSS)

4x4 Mode Switch

The generic electronic module (GEM) provides the PCM with an indication of 4x4L. This input is used to adjust the shift schedule. A 5.0 volt module pull-up indicates 4x4H or 2WD (Figure 44).

A0013922

Figure 46: Typical 4x4 Switch

PCM Outputs

Note: Transmission outputs which are not described in this section are discussed in the Transmission/Powertrain Group, transmission section in the Workshop Manual.

Canister Vent Solenoid

For information on the canister vent solenoid, refer to the description of the Evaporative Emission System.

Coil Pack

A coil in a coil pack (Figure 47) is turned on (for example is coil charging) by the PCM, and is turned off when firing two spark plugs at once. The spark plugs are paired so that as one spark plug fires on the compression stroke, the other spark plug fires on the exhaust stroke. The next time the coil is fired the order is reversed. The next pair of spark plugs fire according to the engine firing order.

Coil On Plug

The coil on plug (COP) (Figure 48) ignition operates similar to standard coil pack ignition except each plug has one coil per plug. COP has three different modes of operation: engine crank, engine running, and CMP Failure Mode Effects Management (FMEM).

Engine Crank/Engine Running

During engine crank the PCM will fire two spark plugs simultaneously. Of the two plugs simultaneously fired one will be under compression the other will be on the exhaust stroke. Both plugs will fire until camshaft position is identified by a successful camshaft position sensor signal. Once camshaft position is identified, only the cylinder under compression will be fired.

CMP FMEM

During CMP FMEM the COP ignition works the same as during engine crank. This allows the engine to operate without the PCM knowing if cylinder one is under compression or exhaust.

Figure 47: Six-Tower Coil Pack

Figure 48: Coil On Plug

Engine Cooling Fan Control

The PCM monitors certain parameters (such as engine coolant temperature, vehicle speed, A/C on/off status, A/C pressure, etc) to determine engine cooling fan needs. The PCM controls the fan operation through the Fan Control (FC) (single speed fan applications), Low Fan Control (LFC), Medium Fan Control (MFC) and/or High Fan Control (HFC) outputs.

EGR Vacuum Regulator Solenoid

For information on the EGR vacuum regulator (EVR) solenoid, refer to the description of the Exhaust Gas Recirculation Systems.

Electric Secondary Air Injection Pump

For information on the electric secondary air injection pump, refer to the description of the Secondary Air Injection Systems.

Evaporative Emission Canister Purge Valve

For information on the Evaporative Emission (EVAP) canister purge valve, refer to the description of the Evaporative Emission Systems.

Fuel Cap Off Indicator Lamp

The Fuel Cap Off Indicator Lamp (FCIL) is an output signal that is controlled by the PCM and will illuminate when the strategy determines that there is a failure in the vapor management system due to the fuel filler cap not being sealed properly. This would be detected by the inability to pull vacuum in the fuel tank, after a fueling event.

Note: The Escape, Windstar, Mustang, Continental, Town Car and Lincoln LS6/LS8 do not have a dedicated (separate) output wire from the PCM to the instrument cluster. The PCM commands the FCIL on and off through the BUS +/- circuits (SCP).

Fuel Pump

Applications Using a Fuel Pump Relay for Fuel Pump On/Off Control

The Fuel Pump (FP) is a PCM output signal that is used to control the electric fuel pump. With the electronic EC power relay contacts closed, vehicle power (VPWR) is sent to the coil of the fuel pump relay. For electric fuel pump operation, the PCM grounds the FP circuit, which is connected to the coil of the fuel pump relay. This energizes the coil and closes the contacts of the relay, sending B+ through the FP PWR circuit to the electric fuel pump. When the ignition key is turned on, the electric fuel pump runs for about one second, but is then turned off by the PCM if engine rotation is not detected.

For applications with two speed fuel pumps, a normally closed low speed fuel pump relay (Figure 49) is wired into the fuel pump ground circuit. With the low speed fuel pump relay contacts in the normally closed position, there is no extra resistance in the ground circuit for high speed operation. For low speed fuel pump operation, the PCM will ground the Low Fuel Pump (LFP) circuit, which opens the relay contacts. With the relay contacts open, the fuel pump ground circuit now passes through a resistor that is wired into the circuit.

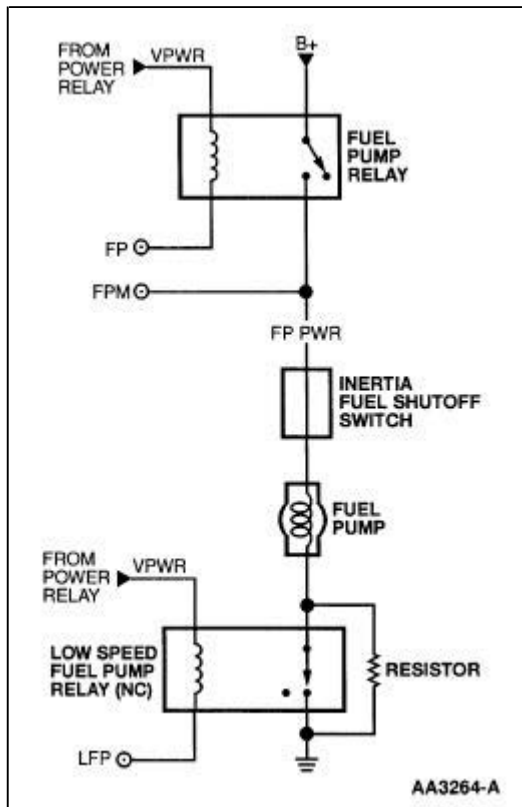

Figure 49: Low Speed Fuel Pump Relay Wiring

Fuel Pump Driver Module Applications (and Applications with Fuel Pump Functions Incorporated in Rear Electronic Module)

Note: For the LS6/LS8, the FPDM functions are incorporated in the Rear Electronic Module (REM). Fuel pump operation is the same as applications using the stand-alone FPDM. The REM will, however, communicate diagnostic information through the BUS +/- circuits (SCP) instead of using a fuel pump monitor (FPM) circuit.

The Fuel Pump (FP) signal is a duty cycle command sent from the powertrain control module (PCM) to the fuel pump driver module (FPDM) (Table 2). The FPDM uses the FP command to operate the fuel pump at the speed requested by the PCM or to turn the pump off.

TABLE 2—FUEL PUMP DUTY CYCLE OUTPUT FROM PCM

FP Duty Cycle Command	PCM Status	FPDM Actions
0-5%	PCM will not output this duty cycle.	Invalid FP duty cycle. FPDM will send 25% duty cycle signal on the fuel pump monitor (FPM) circuit. The fuel pump will be off.
5-51%	Normal operation.	FPDM will operate the fuel pump at the speed requested. "FP duty cycle" x 2 = pump speed % of full on. (for example FP duty cycle = 42%. 42x2=84. Pump is run at 84% of full on). FPDM will send 50% duty cycle signal on FPM circuit.
51-67.5%	PCM will not output this duty cycle.	Invalid FP duty cycle. FPDM will send 25% duty cycle signal on the fuel pump monitor (FPM) circuit. The fuel pump will be off.

67.5-82.5%	To request the fuel pump off, the PCM will output a 75% duty cycle.	Valid fuel pump off command from PCM. FPDM will not operate the fuel pump. FPDM will send a 50% duty cycle signal on the FPM circuit.
82.5-100%	PCM will not output this duty cycle.	Invalid FP duty cycle. FPDM will send 25% duty cycle signal on the FPM circuit. The fuel pump will be off.

NOTE: Also refer to PCM Inputs, Fuel Pump Monitor and Powertrain Control Hardware, Fuel Pump Driver Module.

Fuel Injectors

Fuel Pressure Regulator Control Solenoid

For information on the fuel pressure regulator control (FPRC) solenoid, refer to the description of the Fuel Systems.

Generator Communication (Gen Com)

For information on the generator (Gen Com), refer to the description of PCM/Controlled Charging System.

Hydraulic Cooling Fan Drive

The system consists of an engine-driven pump with an integral solenoid (Figure 50) on the pump that is triggered by the powertrain control module (PCM). Fan speed is controlled by adjusting current to the solenoid, which then changes the fluid flow to the hydraulic motor. More current means the solenoid opens up, allowing higher pressure to increase the fan speed. The fan always turns due to solenoid current leakage, even in cold engine cases. The motor is driven by the pump. It contains a shaft on which the fan mounts. The motor also contains quick connect fittings for the high pressure lines. The cooler is similar to the power steering cooler (same purpose and function, to keep the fluid cool).

Figure 50: Hydraulic Cooling Fan Pump with Integral Solenoid

Idle Air Control Solenoid

Secondary Air Injection Bypass Solenoid

For information on the secondary air injection bypass solenoid, refer to the description of the Secondary Air Injection Systems.

Solid State Relay

For information on the solid state relay, refer to the description of the Secondary Air Injection Systems.

Thermostat Heater Control

The primary objective for the thermostat heater control is for improvement in fuel economy and thermal

efficiency. The system consists of a high temperature (98°C/208°F in lieu of a 90°C/194°F) thermostat (Figure 51) that has a resistive heater within the wax element. The heater is controlled by the PCM dependent on engine speed, throttle position, engine load, vehicle speed, air charge temperature, transmission oil temperature and engine coolant temperature.

During low speed, low load and low air charge temperature conditions, the thermostat heater is OFF and the engine is allowed to operate at an elevated coolant temperature. This should result in lower internal friction and higher thermal efficiency, both leading to improved fuel economy.

During high speed, high load, high temperature conditions (air charge, transmission oil or engine coolant), the PCM output is energized with a duty cycle to the thermostat heater. This heats the wax and forces the thermostat to rapidly open wider allowing extra coolant to flow from the radiator. This will reduce the coolant temperature and improve with performance demand.

It should be noted that the heater is only capable of supplying a SMALL amount of additional heat to the wax element; it is NOT capable of opening the thermostat alone. The thermostat is 100% duty cycle for short calibrated time and then the duty cycle is reduced to a maximum of 70% on and 30% off.

Approximately, unheated, the thermostat will begin to open at a coolant temperature of 98°C (208°F) and will be fully open at 115°C (239°F). Energizing the heater will reduce the opening temperature to about 80°C (176°F) and the fully open temperature to 110°C (230°F).

Figure 51: Thermostat Assembly with Heater Control

Transmission Control Indicator Lamp

The transmission control indicator lamp (TCIL) is an output signal from the PCM that controls the lamp on/off function depending on the engagement or disengagement of overdrive. Refer to Transmission Control Switch in Hardware PCM Inputs.

Wide Open Throttle A/C Cut-Off

The wide open throttle A/C cutoff relay (may be referred to as the A/C clutch relay) is normally open. There is no direct electrical connection between the A/C switch or EATC Module and the A/C clutch. The PCM will receive a signal indicating that A/C is requested (for some applications, this message is sent through the BUS + and BUS - circuits). When A/C is requested, the PCM will check other A/C related inputs that are available (such as ACP (SW), ACCS). If these inputs indicate A/C operation is OK, and the engine conditions are OK (such as coolant temperature, engine rpm, throttle position), the PCM will ground the WAC output, closing the relay contacts and sending voltage to the A/C clutch.

Vapor Management Valve

For information on the vapor management valve (EVAP canister purge valve), refer to the description of the Evaporative Emission Systems.

Powertrain Control Module - Vehicle Speed Output (VSO)

The PCM-VSO (Powertrain Control Module - Vehicle Speed Output) speed signal subsystem generates vehicle speed information for distribution to the vehicle's electrical/electronic modules and subsystems that require vehicle speed data. This subsystem senses the transmission output shaft speed with a sensor. The data is processed by the PCM, and distributed as a hard-wired signal or as a multiplexed data message.

The key features of the PCM-VSO system are to:

- Infer vehicle movement from the output shaft sensor signal
- Convert transmission output shaft rotational information to vehicle speed information
- Compensate for tire size and axle ratio with a programmed calibration variable
- Utilize a transfer case sensor for four wheel drive applications
- Distribute vehicle speed information as a multiplexed message and/or an analog signal

The signal from a non-contact shaft sensor (Output Shaft Sensor--OSS or Transfer Case Shaft Sensor--TCSS) mounted on the transmission (automatics, manuals, or 4X4 transfer cases) is sensed directly by the PCM. The PCM converts the OSS or TCSS information to 8000 pulses per mile, based on a tire and axle ratio conversion factor. This conversion factor is programmed into the PCM at the time the vehicle is assembled and can be reprogrammed in the field for servicing changes in the tire size and axle ratio. The PCM transmits the computed vehicle speed and distance traveled information to all the vehicle speed signal users on the vehicle. VSO information can be transmitted by a hard-wired interface between the vehicle speed signal user and the PCM, or by Speed and Odometer SCP multiplexed data messages.

The VSO hard -wired signal wave form is a DC square wave with a voltage level of 0 to VBAT. Typical output operating range is 2.22Hz per MPH (1.3808 Hz pr 1 Km/h). Multiplexed data for speed and distance data are transmitted as separate SCP messages over the SCP multiplex link.

Ignition Systems

Overview

The Ignition System is designed to ignite the compressed air/fuel mixture in an internal combustion engine by a high voltage spark from an ignition coil. The ignition system also provides engine timing information to the powertrain control module (PCM) for proper vehicle operation and misfire detection.

Integrated Electronic Ignition System

The Integrated Electronic Ignition (EI) system consists of a crankshaft position (CKP) sensor, coil pack (s), connecting wiring, and PCM. The Coil On Plug (COP) Integrated EI System uses a separate coil per spark plug and each coil is mounted directly onto the plug. The COP Integrated EI System eliminates the need for spark plug wires but does require input from the camshaft position (CMP) sensor. Operation of the components are as follows (Figure 52):

1. **Note:** Electronic Ignition engine timing is entirely controlled by the PCM. Electronic Ignition engine timing is NOT adjustable. Do not attempt to check base timing. You will receive false readings.

The CKP sensor is used to indicate crankshaft position and speed by sensing a missing tooth on a pulse wheel mounted to the crankshaft. The CMP sensor is used by the COP Integrated EI System to identify top dead center of compression of cylinder 1 to synchronize the firing of the individual coils.

2. The PCM uses the CKP signal to calculate a spark target and then fires the coil pack(s) to that target shown (Figure 53). The PCM uses the CMP sensor not shown in Figure 53 on COP Integrated EI Systems to identify top dead center of compression of cylinder 1 to synchronize the firing of the individual coils.
3. The coils and coil packs receive their signal from the PCM to fire at a calculated spark target. Each coil within the pack fires two spark plugs at the same time. The plugs are paired so that as one fires during the compression stroke the other fires during the exhaust stroke. The next time the coil is fired the situation is reversed. The COP system fires only one spark plug per coil and only on the compression stroke.

The PCM acts as an electronic switch to ground in the coil primary circuit. When the switch is closed, battery positive voltage (B+) applied to the coil primary circuit builds a magnetic field around the primary coil. When the switch opens, the power is interrupted and the primary field collapses inducing the high voltage in the secondary coil windings and the spark plug is fired. A kickback voltage spike occurs when the primary field collapses. The PCM uses this voltage spike to generate an Ignition Diagnostic Monitor (IDM) signal. IDM communicates information by pulsewidth modulation in the PCM.

4. The PCM processes the CKP signal and uses it to drive the tachometer as the Clean Tach Out (CTO) signal.

Figure 52: Ignition Systems—Integrated Electronic Ignition (Refer to the On-Board Diagnostics II System Overview for icon definitions.)

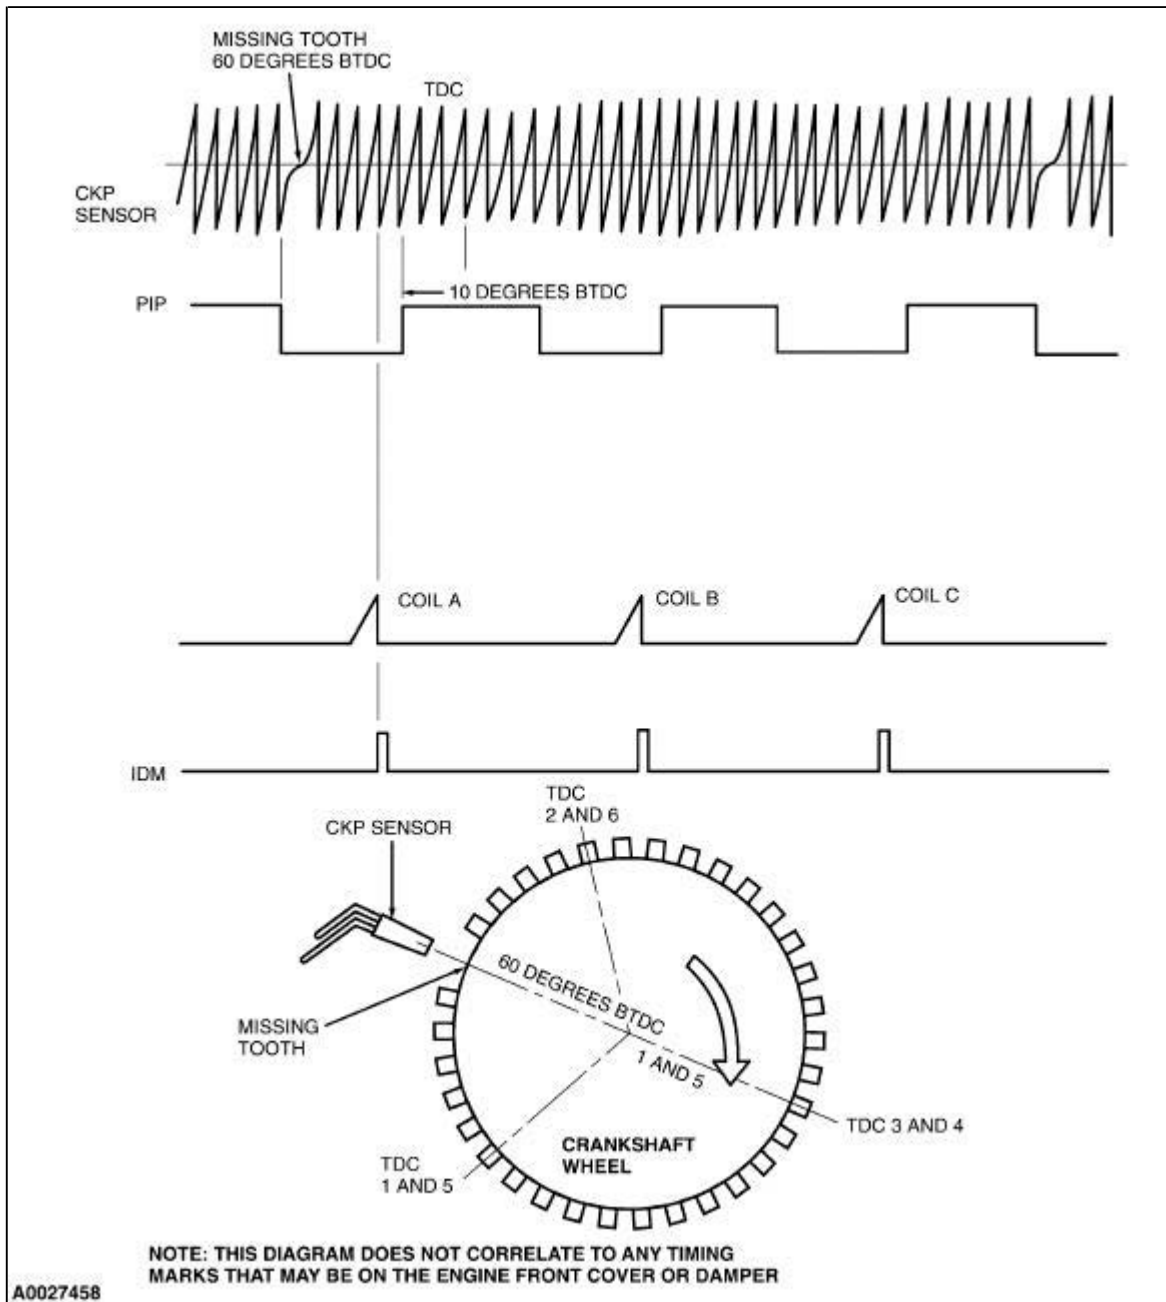

Figure 53: Six Cylinder Integrated Electronic (EI) Ignition Waveforms. Four, eight, and ten cylinder are similar.

Hardware

Crankshaft Position Sensor

The crankshaft position (CKP) sensor (Figure 54) is a magnetic transducer mounted on the engine block adjacent to a pulse wheel located on the crankshaft. By monitoring the crankshaft mounted pulse wheel, the CKP is the primary sensor for ignition information to the PCM. The pulse wheel has a total of 35 teeth spaced 10 degrees apart with one empty space for a missing tooth. The 6.8L ten cylinder pulse wheel has 39 teeth spaced 9 degrees apart and one 9 degree empty space for a missing tooth. By monitoring the pulse wheel, the CKP sensor signal indicates crankshaft position and speed information to the PCM. By monitoring the missing tooth, the CKP sensor is also able to identify piston travel in order to synchronize the ignition system and provide a way of tracking the angular position of the crankshaft relative to a fixed reference (Figure 51) for the CKP sensor configuration. The PCM also uses the CKP signal to determine if a misfire has occurred by measuring rapid decelerations between teeth.

Figure 54: Typical Crankshaft Position (CKP) Sensor Actual Sensor May Vary

Camshaft Position Sensor

The camshaft position sensor (Figure 55) used by COP Integrated EI system is a magnetic transducer mounted on the engine front cover adjacent to the camshaft. By monitoring a target on the camshaft sprocket, the CMP sensor identifies cylinder one to the PCM. The COP Integrated EI system uses this information to synchronize the firing of the individual coils.

Figure 55: Camshaft Position (CMP) Sensor

Coil Pack

Coil packs come in four tower, Series 5 four tower, six-tower horizontal connector and Series 5 Six tower models. Two adjacent coil towers share a common coil and are called a matched pair. For six-tower coil pack (six cylinder) applications the matched pairs are 1 and 5, 2 and 6, and 3 and 4 (Figure 56) and (Figure 57). For four-tower coil pack (four cylinder) applications the matched pairs are 1 and 4, and 2 and 3 (Figure 58) and (Figure 59).

When the coil is fired by the PCM, spark is delivered through the matched pair towers to their respective spark plugs. The spark plugs are fired simultaneously and are paired so that as one fires on the compression stroke, the other spark plug fires on the exhaust stroke. The next time the coil is fired the situation is reversed. The next pair of spark plugs fire according to the engine firing order.

Figure 58: Four-Tower Coil Packs for Escort, Focus, 2.0L Cougar, 2.3L Ranger, 2.5L Ranger

Figure 59: Series 5 Four Tower Coil Pack for 2.0L Escape

Coil On Plug

The coil on plug (COP) (Figure 60) ignition operates similar to standard coil pack ignition except each plug has one coil per plug. COP has three different modes of operation: engine crank, engine running, and CMP Failure Mode Effects Management (FMEM).

Engine Crank/Engine Running

During engine crank the PCM will fire two spark plugs simultaneously. Of the two plugs simultaneously fired one will be under compression the other will be on the exhaust stroke. Both plugs will fire until camshaft position is identified by a successful camshaft position sensor signal. Once camshaft position is identified only the cylinder under compression will be fired.

CMP FMEM

During CMP FMEM the COP ignition works the same as during engine crank. This allows the engine to operate without the PCM knowing if cylinder one is under compression or exhaust.

Fuel Systems

Overview

The fuel system supplies the Sequential Multiport Fuel Injection (SFI) fuel injectors with clean fuel at controlled pressure. The powertrain control module (PCM) controls the fuel pump and monitors the fuel pump circuit. The PCM also controls the duration of the on/off cycle providing correct timing of the fuel injectors. If the injectors have been replaced, it is necessary to clear learned values contained in the Keep Alive Random Access Memory (RAM) in the PCM. This can be done by disconnecting the battery or the PCM for five minutes. (Refer to Section 2, Powertrain Control Module (PCM) Reset, for more information.)

The three types of fuel systems used are:

- Returnable Fuel
- Mechanical Returnless Fuel
- Electronic Returnless Fuel

Returnable Fuel System

The fuel system consists of a fuel tank with a reservoir, fuel pump module, fuel supply lines, fuel filter(s), schrader/pressure test point, fuel rail, fuel injectors, and fuel pressure regulator. Operation of the system is as follows (refer to Figure 61 for all others):

1. The fuel delivery system uses the crankshaft position (CKP) sensor to signal the PCM that the engine is either cranking or running.
2. The fuel pump logic is defined in the Fuel System control strategy and is executed in the PCM. The PCM will ground the fuel pump relay for one second during key on and engine off. During crank the fuel pump relay is grounded as long as the PCM receives a CKP signal.
3. The fuel pump relay has a primary and a secondary circuit. The primary side is controlled by the PCM and the secondary side provides B+ to the fuel pump circuit when the relay is energized.
4. The inertia fuel shut-off (IFS) switch is used to de-energize the fuel delivery secondary circuit in the event of a collision. The IFS Switch is a safety device that should only be reset after a thorough inspection of the vehicle (following a collision).
5. The fuel injector is a solenoid-operated valve that meters fuel flow to each combustion cylinder. The fuel injector is opened and closed a constant number of times per crankshaft revolution. The amount of fuel is controlled by length of time the fuel injector is held open. The injector is normally closed and is operated by 12 volt VPWR from the power relay. The ground signal is controlled by the PCM.
6. A pressure test point valve (schrader valve) is located on the fuel rail. This is used to measure fuel injector supply pressure for service and diagnostic procedures. ON VEHICLES NOT EQUIPPED WITH A SCHRADER VALVE, USE ROTUNDA FUEL PRESSURE TEST KIT #134—R0087 OR EQUIVALENT.
7. The fuel pressure regulator is attached to the fuel rail downstream of the fuel injectors. It regulates fuel pressure supplied to the fuel injectors. The fuel pressure regulator is a diaphragm-operated relief valve. One side of the diaphragm senses fuel pressure and the other side is connected to the intake manifold vacuum. Fuel pressure is established by a spring preload applied to the diaphragm. Balancing one side of the diaphragm with manifold vacuum maintains a constant fuel pressure drop across the fuel injectors. Fuel pressure is high when engine vacuum is low. Excess fuel is bypassed through the fuel pressure regulator and returned through the fuel return line to the fuel tank.

8. There are four filtering or screening devices in the fuel delivery system. The fuel intake sock or screen is a fine, nylon mesh mounted on the intake side of the fuel pump. There is a fuel filter screen located at the fuel rail side of the fuel injector. A fuel filter/screen is located in the inlet side of the fuel pressure regulator. The fuel filter assembly is located between the fuel pump and the pressure test point/schrader valve.
9. The fuel pump (FP) module is a device that contains both fuel pump and fuel sender assembly. The fuel pump is located inside the reservoir and supplies fuel through the fuel pump module manifold to the engine and the fuel pump module jet pump.

Note: Some vehicles have the relay located in the Power Distribution Box.

Figure 61: Fuel System - All others

Mechanical Returnless Fuel System

The fuel system consists of a fuel tank with reservoir, fuel pump, fuel pressure regulator, fuel filter, fuel supply line, fuel rail, fuel rail pulse damper, fuel injectors, and schrader/pressure test point. Operation of the system is as follows (Figure 62):

1. The fuel delivery system is enabled during crank or running mode once the PCM receives a crankshaft position (CKP) sensor signal.
2. The fuel pump logic is defined in the fuel system control strategy and is executed by the PCM.
3. The PCM grounds the fuel pump relay, which provides VPWR to the fuel pump.
4. The inertia fuel shut-off (IFS) switch is used to de-energize the fuel delivery secondary circuit in the event of collision. The IFS switch is a safety device that should only be reset after a thorough inspection of the vehicle (following a collision).
5. A pressure test point valve (schrader valve) is located on the fuel rail. This is used to measure fuel injector supply pressure for diagnostic procedures and repairs. ON VEHICLES NOT EQUIPPED WITH A SCHRADER VALVE, USE ROTUNDA FUEL PRESSURE TEST KIT #134—R0087 OR EQUIVALENT.
6. Located on the fuel rail is a pulse damper. The pulse damper reduces fuel system noise caused by the pulsing of the fuel injectors. The vacuum port located on the damper is connected to manifold vacuum to avoid fuel spillage in the event the pulse damper diaphragm were to rupture

(the pulse damper should not be confused with a fuel pressure regulator).

7. The fuel injector is a solenoid-operated valve that meters the fuel flow to each combustion cylinder. The fuel injector is opened and closed a constant number of times per crankshaft revolution. The amount of fuel is controlled by the length of time the fuel injector is held open. The injector is normally closed and is operated by 12 volt VPWR from the power relay. The ground signal is controlled by the PCM.
8. There are three filtering or screening devices in the fuel delivery system. The intake sock is a fine, nylon mesh screen mounted on the intake side of the fuel pump. There is a fuel filter screen located at the fuel rail side of the fuel injector. The fuel filter assembly is located between the fuel pump and the pressure test point/schrader valve.
9. The fuel pump (FP) module contains the fuel pump, fuel pressure regulator and the fuel sender assembly. The fuel pressure regulator is attached to the fuel pump in the fuel pump module located in the fuel tank. It regulates fuel pressure supplied to the fuel injectors. The fuel pressure regulator is a diaphragm-operated relief valve. Fuel pressure is established by a spring preload applied to the diaphragm. Excess fuel is bypassed through the regulator and returned to the fuel tank.

Figure 62: Fuel System—Mechanical Returnless

Electronic Returnless Fuel System

The fuel system consists of a fuel tank with reservoir, fuel pump, fuel rail pressure sensor, fuel filter, fuel supply line, engine fuel temperature sensor, fuel rail, fuel injectors, and schrader/pressure test point. Operation of the system is as follows (Figure 63) and (Figure 64):

1. The fuel delivery system is enabled during crank or running mode once the PCM receives a crankshaft position (CKP) sensor signal.
2. The fuel pump logic is defined in the fuel system control strategy and is executed by the PCM.
3. The PCM commands a duty cycle to the fuel pump driver module (FPDM).
4. The fuel pump driver module modulates the voltage to the fuel pump (FP) to achieve the proper fuel pressure. Voltage for the fuel pump is supplied by the power relay or FPDM power supply relay. (For additional information on FPDM operation, refer to PCM Outputs—Fuel Pump and PCM Inputs—FPM.)
5. The fuel rail pressure (FRP) sensor provides the PCM with the current fuel rail pressure. The

PCM uses this information to vary the duty cycle output to the FPDM to compensate for varying loads.

6. The engine fuel temperature (EFT) sensor measures current fuel temperatures in the fuel rail. This information is used to vary the fuel pressure and avoid fuel system vaporization.
7. The fuel injector is a solenoid-operated valve that meters the fuel flow to each combustion cylinder. The fuel injector is opened and closed a constant number of times per crankshaft revolution. The amount of fuel is controlled by the length of time the fuel injector is held open. The injector is normally closed and is operated by 12 volt VPWR from the power relay. The ground signal is controlled by the PCM.
8. A pressure test point valve (schrader valve) is located on the fuel rail. This is used to measure fuel injector supply pressure for diagnostic procedures and repairs. ON VEHICLES NOT EQUIPPED WITH A SCHRADER VALVE, USE ROTUNDA FUEL PRESSURE TEST KIT #134—R0087 OR EQUIVALENT.
9. There are three filtering or screening devices in the fuel delivery system. The intake sock is a fine, nylon mesh screen mounted on the intake side of the fuel pump. There is a fuel filter screen located at the fuel rail side of the fuel injector. The fuel filter assembly is located between the fuel pump and the pressure test point/schrader valve.
10. The fuel pump (FP) module is a device that contains the fuel pump and the fuel sender assembly. The fuel pump is located inside the reservoir and supplies fuel through the fuel pump module manifold to the engine and the fuel pump module jet pump.
11. The inertia fuel shut-off (IFS) switch is used to de-energize the fuel delivery secondary circuit in the event of a collision. The IFS switch is a safety device that should only be reset after a thorough inspection of the vehicle (following a collision).

Figure 63: Fuel System—Electronic Returnless

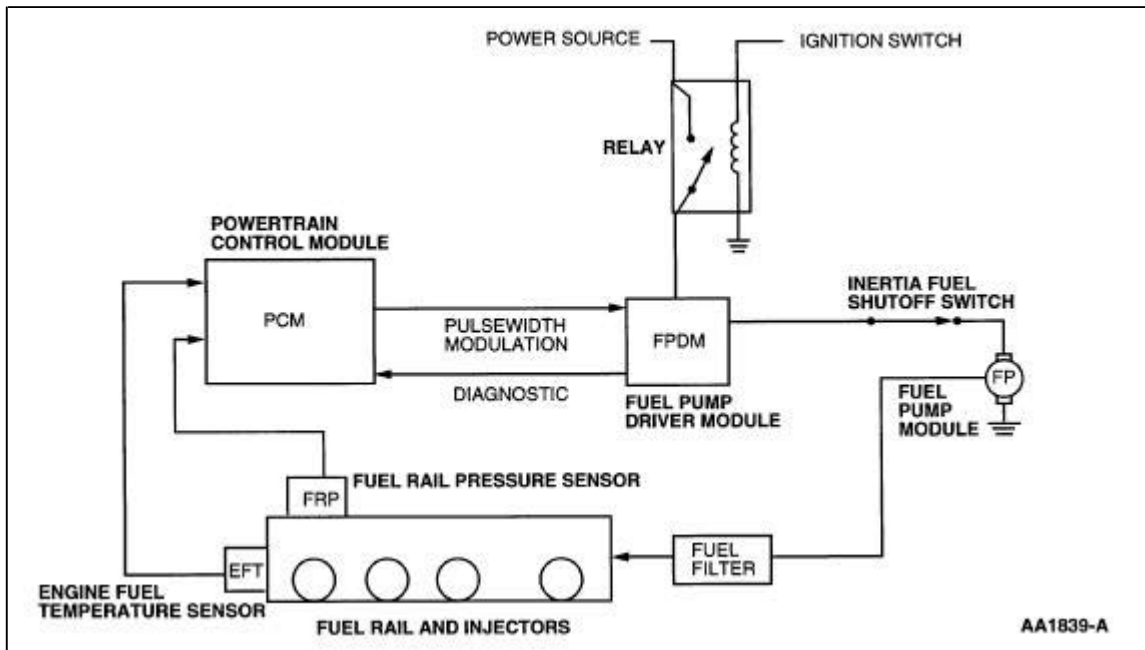

Figure 64: Typical Electronic Returnless Fuel System Schematic (NOTE: See wiring diagram for proper power source and relay usage.)

Fuel Pump and Reservoir

The fuel pump module (Figure 65) is mounted inside the fuel tank in a reservoir. The pump has a discharge check valve that maintains system pressure after the ignition key has been turned off to minimize starting concerns. The reservoir prevents fuel flow interruptions during extreme vehicle maneuvers with low tank fill levels.

Figure 65: Fuel Pump Module

Fuel Pump Module

The fuel pump (FP) module (Figure 66),(Figure 67) and(Figure 68) is a device that contains the fuel

pump and sender assembly. The fuel pump is located inside the FP module reservoir and supplies fuel through the FP module manifold to the engine and FP module jet pump. The jet pump continuously refills the reservoir with fuel, and a check valve located in the manifold outlet maintains system pressure when the fuel pump is not energized. A flapper valve located in the bottom of the reservoir allows fuel to enter the reservoir and prime the fuel pump during the initial fill.

Figure 66: Fuel Pump Module (For Returnable Fuel Systems)

Figure 67: Mechanical Returnless Fuel Pump Module (FPM)

Figure 68: Electronic Returnless Fuel Pump Module (FPM)

Fuel Filters

The system contains four filtering or screening devices. Refer to the individual component pictorial for location.

1. The fuel intake sock or screen is a fine nylon mesh sock mounted on the intake side of the fuel pump. It is part of the assembly and cannot be serviced separately.
2. The filter/screen at the fuel rail port of the Injectors is part of the fuel injector assembly and cannot be serviced separately.
3. The filter/screen at fuel inlet side of the fuel pressure regulator is part of the regulator assembly and cannot be serviced separately.
4. The fuel filter assembly is located between the fuel pump (tank) and the pressure test point (schrader valve) or Injectors. This filter may be serviced.

Pressure Test Point

There is a pressure test point with a schrader fitting in the fuel rail that relieves fuel pressure and measures the fuel injector supply pressure for service and diagnostic procedures. Before servicing or testing the fuel system, read any CAUTION, WARNING, and HANDLING information. ON VEHICLES NOT EQUIPPED WITH A SCHRADER VALVE, USE ROTUNDA FUEL PRESSURE TEST KIT #134—R0087 OR EQUIVALENT.

Fuel Injector

The fuel injector (Figure 69) is a solenoid-operated valve that meters fuel flow to the engine. The fuel injector is opened and closed a constant number of times per crankshaft revolution. The amount of fuel is controlled by the length of time the fuel injector is held open.

The fuel injector is normally closed and is operated by 12 volt VPWR from the electronic engine control power relay. The ground signal is controlled by the PCM.

CAUTION: Do not apply battery positive voltage (B+) directly to the fuel injector electrical connector terminals. The solenoids may be damaged internally in a matter of seconds.

The injector is the deposit resistant injection (DRI) type and does not have to be cleaned. However, it can be flow checked and, if found outside of specification, the fuel injector should be replaced.

A0013924

Figure 69: Fuel Injectors

Fuel Pressure Regulator

The fuel pressure regulator (Figure 70) is attached to the fuel rail downstream of the fuel injectors. It regulates fuel pressure supplied to the fuel injectors. The regulator is a diaphragm-operated relief valve. One side of the diaphragm senses fuel pressure and the other side is connected to the intake manifold vacuum. Fuel pressure is established by a spring preload applied to the diaphragm. Balancing one side of the diaphragm with manifold vacuum maintains a constant fuel pressure drop across the fuel injectors. Fuel pressure is high when engine vacuum is low. Excess fuel is bypassed through the fuel pressure regulator and returned through the fuel return line to the fuel tank.

Figure 70: Fuel Pressure Regulator

Fuel Rail Pulse Damper

The fuel rail pulse damper (Figure 71) located on the fuel rail reduces fuel system noise caused by the pulsing of the fuel injectors. The vacuum port located on the damper is connected to manifold vacuum to avoid fuel spillage in the event the pulse damper diaphragm were to rupture. **(The pulse damper should not be confused with a fuel pressure regulator, it does not regulate fuel rail pressure.)**

Figure 71: Pulse Damper

Inertia Fuel Shutoff (IFS) Switch

Inertia Fuel Shutoff (IFS) Switch

The inertia fuel shutoff (IFS) switch (Figure 72) is used in conjunction with the electric fuel pump. The purpose of the IFS switch is to shut off the fuel pump if a collision occurs. It consists of a steel ball held in place by a magnet. When a sharp impact occurs, the ball breaks loose from the magnet, rolls up a conical ramp and strikes a target plate which opens the electrical contacts of the switch and shuts off the electric fuel pump. **Once the switch is open , it must be manually reset before restarting the vehicle .** Refer to the Owner Guide for the location of the IFS.

Figure 72: Inertia Fuel Shutoff (IFS) Switch

Natural Gas Fuel System

Overview

The Fuel System provides a means of transporting clean fuel from the fuel tank to the fuel injectors under a controlled pressure.

Natural Gas Fuel System

The fuel system consists of a fuel tank, fuel shut-off valve assemblies, fuel supply lines, fuel filter, schrader/service valve, manual fuel shut-off valve, fuel rail, and fuel pressure regulator. Operation of the system is as follows (Figure 73),(Figure 74) and (Figure 75):

1. The fuel delivery system uses the crankshaft position (CKP) sensor to signal the PCM that the engine is either cranking or running.
2. The fuel shut-off valve logic is defined in the Fuel System control strategy and is executed in the PCM. The PCM will ground the fuel pump relay for one second during key on and engine off. During crank the fuel pump relay is grounded as long as the PCM receives a signal from the CKP.
3. The fuel pump relay has a primary and a secondary circuit. The primary side is controlled by the PCM and the secondary side provides B+ to the fuel shut-off valve circuit when the relay is energized.
4. The inertia fuel shut-off (IFS) switch is used to de-energize the fuel delivery circuit in the event of a collision. The IFS switch is a safety device that should only be reset after a thorough inspection of the vehicle (following a collision).
5. The fuel injector is used to meter natural gas to each combustion cylinder. Although the NG fuel injector appears very similar to some gasoline fuel injectors, it is unique. Flow capacity of this fuel injector is 6 to 12 times as large as various gasoline fuel injectors.
6. The fuel tank shut-off solenoid valve is located in the fuel tank. The solenoid valves are on the same circuit as the fuel pump and utilize the same inertia fuel shut-off (IFS) switch as gasoline.
7. The high pressure fuel filter is used to protect the engine fuel system components. A natural gas coalescing and particulate filter is positioned on the high pressure side of the fuel system just prior to the fuel pressure regulator.
8. The fuel pressure regulator used on the NG vehicle is a single-staged pressure reducing regulator which expands natural gas from storage pressures of 1,379 to 20,685 kPa (200 to 3,000 psig) to engine fuel pressures of 724 to 862 kPa (105 to 125 psig).
9. The fuel rail shut-off valve is a normally closed solenoid actuated valve that opens when grounded by the PCM. The valve isolates the fuel injectors from fuel line pressure when the engine is not operating. The fuel rail shut-off valve is wired in parallel with the fuel tank shut-off solenoid valves.

Figure 73: Natural Gas Fuel System

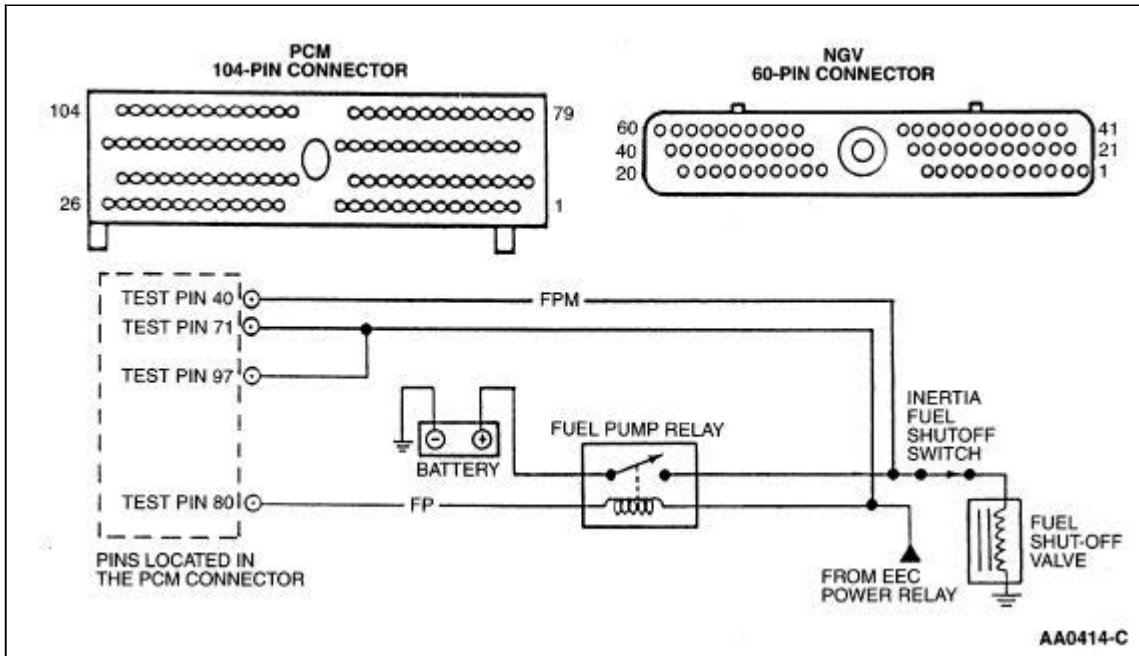

Figure 74: Natural Gas Fuel System Electrical Schematic—Typical

Figure 75: Natural Gas Fuel System

Hardware

Fuel Rail

The fuel rail (Figure 76) distributes low pressure fuel from the chassis supply line to each fuel injector. Fuel pressure at the top of each fuel injector is maintained within 1% of the other fuel injectors at all times; this is done with nearly symmetric flow paths. The fuel rail is also designed to have minimal flow restriction by increasing the cross-sectional flow area and reducing the flow path length. The fuel rail contains several other parts in assembly (PIA) components that perform crucial functions. These include:

- **Injection pressure sensor** which measures the pressure of the fuel near the fuel injectors. This signal is used by the PCM to adjust the fuel injector pulsewidth and meter fuel to each engine combustion cylinder.
- **Engine fuel temperature sensor** which measures the pressure of the fuel near the fuel injectors. This signal is used by the PCM to adjust the fuel injector pulsewidth and meter fuel to each engine combustion cylinder.
- **Low pressure solenoid shut-off valve** which isolates the fuel rail from the upstream fuel system when the engine is OFF. This minimizes the amount of fuel available to flow through the fuel injectors when the engine is off or leak from a damaged fuel rail during and after a crash. The valve is controlled by the PCM fuel shut-off valve circuit and contains an inertia switch. The valve is only on for one second after a key-on or whenever CKP signals are being received by the PCM.
- **Schrader/service valve** which provides a service port to the low pressure fuel system. This valve is needed to relieve the pressure in the system before and during service. This valve could also be used to monitor the pressure near the injectors during diagnostic procedures.

Figure 76: Fuel Rail Components

Fuel Injector(s)

The fuel injector (Figure 77) is a solenoid-operated valve that meters fuel flow to the engine. The fuel injector is opened and closed every other crankshaft revolution. The amount of fuel is controlled by the length of time the fuel injector is held open.

The fuel injector is normally closed and is operated by 12 volt VPWR from the power relay. The ground signal is controlled by the PCM.

The fuel injectors are used to meter natural gas to each combustion cylinder. Although the natural gas fuel injectors appear very similar to some gasoline fuel injectors, they are unique. Flow capacity of these fuel injectors is 6 to 12 times as large as various gasoline fuel injectors. Electrical resistance is much lower than typical gasoline fuel injectors (4.6 ohms as opposed to 14.5 ohms). To accommodate this lower resistance, a fuel injector driver module is used to convert the PCM fuel injector driver signal to the signal required by the fuel injector.

Figure 77: Fuel Injector

Fuel Pressure Regulator

The fuel pressure regulator (Figure 78) used in the Natural Gas fuel system is a single-stage pressure

reducing regulator which expands natural gas from storage pressures of 1,379 to 20,685 kPa (200 to 3,000 psig) to engine fuel injector pressures of 724 to 862 kPa (105 to 125 psig).

The regulator contains a pressure relief device, a 1,896 kPa (275 psig) check valve, which protects the low pressure fuel system. The low pressure fuel system no longer must fulfill the design requirements of the high pressure fuel system, therefore reducing cost, weight and complexity.

When gas expands, the fuel temperature drops significantly causing extreme cold temperatures (-177°C or -160°F) that may damage synthetic fuel system components as well as cause water vapor within the fuel to condense, freeze and plug the lines, valve and injectors. To prevent this, engine coolant is routed through the fuel pressure regulator to warm the fuel before it expands.

The regulator has an internal thermostat to control the flow of engine coolant. This prevents overheating and subsequent thinning of the fuel which may cause lean combustion. Outlet coolant flow is restricted by the thermostat when it rises above approximately 82°C (100°F).

Figure 78: Fuel Pressure Regulator

High Pressure Fuel Filter

The high pressure fuel filter (Figure 79) is used to protect the engine fuel system components. A natural gas coalescing and particulate filter is positioned on the high pressure side of the fuel system just prior to the pressure regulator. The filter is part of the regulator assembly. The filter can be disassembled to service the element. The drain plug on the bottom of the housing can be removed to drain any water that accumulates.

Figure 79: Fuel Filter

Fuel Lines and Fittings

A fuel line assembly (Figure 80) consists of flexible hose and/or stainless steel seamless tubing, end fittings and tube nuts. The hose is a conductive polytetrafluoroethylene (PTFE) liner reinforced with a stainless steel wire braided covering. The fittings are inserted into the hose ends and crimped into place. The stainless steel tubing contains end fittings which are brazed to the tube. There are high pressure fuel lines that are identified by either 1/4-inch or 3/8-inch outer diameter and a low pressure fuel line identified by a 1/2-inch outer diameter. The low pressure fuel line has a quick-connect at one end for connection to the fuel rail. The other fittings used on the natural gas vehicle to connect fuel components are SAE O-ring face seal tube fittings. There are two end types: an O-ring face seal end and a straight thread end. On tee and elbow fittings, a washer and a positionable nut are provided to aid in orientation of the fitting.

Figure 80: Fuel Line Assembly

Fueling Connector

Flange Assembly—Fuel Tank Fill

The flange assembly (Figure 81) is designed for 20,685 kPa (3,000 psi) service pressure and is the refueling connection to fill the vehicle. The assembly is mounted behind the fuel filler door and attached to the fuel filler housing, similar to a gasoline vehicle. This assembly consists of an NGVP1 type receptacle with a 150 micron filter (which can be serviced), a spring loaded check valve to allow filling of the vehicle and a manually opened bypass to provide safe venting of the fuel system. The vehicle is refueled by attaching the fuel station fill nozzle to the receptacle and locking into place.

Figure 81: Flange Assembly

Fuel Tank Shutoff Valve

The fuel tank shutoff solenoid valve (Figure 82) is located in the fuel tank. The solenoid valves are on the same circuit as the gasoline fuel pump and utilize the same Inertia fuel shutoff (IFS) switch as gasoline. When the key is in the off position, the shutoff valves are closed and fuel in the tanks is isolated. During refueling, the shutoff valve acts as a check valve and allows flow due to pressure differential between the fuel being added from the fill station and the fuel in the tank.

The internal solenoid valves also have the capability of being "manually locked down." If, while servicing the vehicle, it becomes necessary to remove the fuel tank, the lock down feature provides an added measure of safety. In addition, the valve has an internal Canadian Gas Association (CGA) type 9 fusible link pressure relief device (PRD) that senses the internal fuel tank gas temperature. The contents in the tank are vented when the internal fuel tank gas temperature reaches 199°C (217°F) and melts the fusible link. The escaping gas is vented through a vent line to the atmosphere.

Figure 82: Fuel Tank Shutoff Valve

Inertia Fuel Shutoff (IFS) Switch

The inertia fuel shutoff (IFS) switch (Figure 83) is used in conjunction with electric fuel close valves. The purpose of the IFS switch is to close the fuel shut-off valves if a crash occurs. It consists of a steel ball held in place by a magnet. When a sharp impact occurs, the ball breaks loose from the magnet, rolls up a conical ramp and strikes a target plate which opens the electrical contacts of the switch and closes the electric fuel shut-off valve. **Once the switch is open, it must be manually reset before restarting the vehicle.** On some vehicles a fuel reset light illuminates. Refer to the Owner Guide for the location of the IFS.

Figure 83: Inertia Fuel Shutoff (IFS) Switch

Reset Instructions

1. Turn key off.
2. Check for natural gas leaks in the engine compartment.
3. **Note:** In the closed position, the button can be depressed an additional 1.57 cm (1/16 inch) against a spring.

If no natural gas leak is apparent, reset the IFS by pushing the reset button on the top of the switch (refer to Owner Guide).

4. Turn key to on or start position for a few seconds, then off again.
5.  **WARNING: IF YOU SMELL NATURAL GAS AT ANY TIME OTHER THAN DURING FUELING, DO NOT RESET THE IFS SWITCH.**

Again, check for leaking natural gas.

Fuel Rail Shut-Off Valve

The fuel rail shut-off valve (Figure 84) is a normally closed solenoid actuated valve that opens when (along with all of the tank valves) Pin 80 is grounded by the PCM. The valve isolates the fuel injectors from fuel line pressure when the engine is off. Nominal resistance of the coil is 11 ohms. The fuel rail shut-off valve is wired in parallel with the four tank valves.

Fuel Rail Valve Circuit Operation

When the key is turned to the ON position, the power relay is turned on. The power relay provides power to the PCM and the control side of the fuel shut off valve relay. The relay provides voltage to the fuel rail valve. If the ignition switch is not turned to the START position, the PCM will shut off the fuel rail valve after one second. The PCM will open the valve (along with the four tank valves) to provide fuel while cranking. The valve will remain open when the engine is running unless the inertia fuel shut-off switch is "tripped."

Figure 84: Fuel Rail Shut-Off Valve

Exhaust Gas Recirculation Systems

Overview

The Exhaust Gas Recirculation (EGR) system controls the oxides of nitrogen (NO_x) emissions. Small amounts of exhaust gases are recirculated back into the combustion chamber to mix with the air/fuel charge. The combustion chamber temperature is reduced, lowering NO_x emissions.

Differential Pressure Feedback EGR System

The Differential Pressure Feedback EGR system consists of a differential pressure feedback EGR sensor, EGR vacuum regulator solenoid, EGR valve, orifice tube assembly, powertrain control module (PCM) and connecting wires and vacuum hoses. Operation of the system is as follows (Figure 85):

1. The Differential Pressure Feedback EGR system receives signals from the engine coolant temperature (ECT) sensor, intake air temperature (IAT) sensor, throttle position (TP) sensor, mass air flow (MAF) sensor and crankshaft position (CKP) sensor to provide information on engine operating conditions to the PCM. The engine must be warm, stable and running at a moderate load and rpm before the EGR system is activated. The PCM deactivates EGR during idle, extended wide open throttle or whenever a failure is detected in an EGR component or EGR required input.
2. The PCM calculates the desired amount of EGR flow for a given engine condition. It then determines the desired pressure drop across the metering orifice required to achieve that flow and outputs the corresponding signal to the EGR vacuum regulator solenoid.
3. The EGR vacuum regulator solenoid receives a variable duty cycle signal (0 to 100%). The higher the duty cycle the more vacuum the solenoid diverts to the EGR valve.
4. The increase in vacuum acting on the EGR valve diaphragm overcomes the valve spring and begins to lift the EGR valve pintle off its seat, causing exhaust gas to flow into the intake manifold.
5. Exhaust gas flowing through the EGR valve must first pass through the EGR metering orifice. With one side of the orifice exposed to exhaust backpressure and the other to the intake manifold, a pressure drop is created across the orifice whenever there is EGR flow. When the EGR valve closes, there is no longer flow across the metering orifice and pressure on both sides of the orifice is the same. The PCM constantly targets a desired pressure drop across the metering orifice to achieve the desired EGR flow.
6. The differential pressure feedback EGR sensor measures the actual pressure drop across the metering orifice and relays a proportional voltage signal (0 to 5 volts) to the PCM. The PCM uses this feedback signal to correct for any errors in achieving the desired EGR flow.

Figure 85: Differential Pressure Feedback EGR System Operation (Refer to the On-Board Diagnostics II System Overview for icon definitions.)

Hardware

Differential Pressure Feedback EGR Sensor

The differential pressure feedback EGR sensor (Figure 86) is a ceramic, capacitive-type pressure transducer that monitors the differential pressure across a metering orifice located in the orifice tube assembly. The differential pressure feedback sensor receives this signal through two hoses referred to as the downstream pressure hose (REF SIGNAL) and upstream pressure hose (HI SIGNAL). The HI and REF hose connections are marked on the aluminum differential pressure feedback EGR sensor housing for identification (note that the HI signal uses a larger diameter hose). The differential pressure feedback EGR sensor outputs a voltage proportional to the pressure drop across the metering orifice and supplies it to the PCM as EGR flow rate feedback.

Figure 86: Differential Pressure Feedback EGR Sensor

Tube Mounted Differential Pressure Feedback EGR Sensor

The tube mounted differential pressure feedback EGR sensor (Figure 87) is identical in operation as the larger metal or plastic DPFE sensors and uses a 1.0 volt offset. The HI and REF hose connections are marked on the underside of the sensor.

A0029812

Figure 87: Tube Mounted Differential Pressure Feedback EGR Sensor

EGR Vacuum Regulator Solenoid

The EGR vacuum regulator solenoid (Figure 88) is an electromagnetic device which is used to regulate the vacuum supply to the EGR valve. The solenoid contains a coil which magnetically controls the position of a disc to regulate the vacuum. As the duty cycle to the coil increases, the vacuum signal passed through the solenoid to the EGR valve also increases. Vacuum not directed to the EGR valve is vented through the solenoid vent to atmosphere. Note that at 0% duty cycle (no electrical signal applied), the EGR vacuum regulator solenoid allows some vacuum to pass, but not enough to open the EGR valve.

33	.55	1.86	1.3	4.39	2.05	6.9
90	5.69	19.2	6.32	21.3	6.95	23.47
EGR Vacuum Regulator Resistance: 26-40 Ohms						

Exhaust Gas Recirculation Valve

The EGR valve (Figure 89) in the Differential Pressure Feedback EGR system is a conventional, vacuum-actuated EGR valve. The valve increases or decreases the flow of exhaust gas recirculation. As vacuum applied to the EGR valve diaphragm overcomes the spring force, the valve begins to open. As the vacuum signal weakens, at 5.4 kPa (1.6 in-Hg) or less, the spring force closes the valve. The EGR valve is fully open at about 15 kPa (4.5 in-Hg).

Since EGR flow requirement varies greatly, providing service specifications on flow rate is impractical. The on-board diagnostic system monitors the EGR valve function and triggers a Diagnostic Trouble Code if the test criteria is not met. The EGR valve flow rate is not measured directly as part of the field diagnostic procedures.

Figure 89: EGR Valve

Orifice Tube Assembly

The orifice tube assembly (Figure 90) is a section of tubing connecting the exhaust system to the intake manifold. The assembly provides the flow path for the EGR to the intake manifold and also contains the metering orifice and two pressure pick-up tubes. The internal metering orifice creates a measurable pressure drop across it as the EGR valve opens and closes. This pressure differential across the orifice is picked up by the differential pressure feedback EGR sensor which provides feedback to the PCM.

Figure 90: Orifice Tube Assembly

Electric Motor EGR System (EEGR)

Highlights of the Electric System

- EEGR valve is activated by an electric stepper motor not a vacuum motor (Rear of engine block).
- No vacuum diaphragm is used.
- No DPFE sensor is used.
- No Orifice Tube/Assembly is used.
- No EGR vacuum regulator solenoid is used.
- A new MAP sensor is used (called TMAP but the temperature function is not used at this time) (located on top of the valve cover).
- Engine coolant is routed through the assembly extending durability of the electric motor.

Overview

The electric EGR system uses exhaust gas recirculation to control the oxides of nitrogen (NO_x) emissions just like vacuum operated systems. The only difference is the way in which the exhaust gas is controlled.

The Electric EGR system consists of an electric motor/EGR valve integrated assembly, a PCM, and connecting wiring. Additionally a MAP sensor is also required. Operation of the system is as follows (Figure 91):

1. The EEGR system receives signals from the engine coolant temperature (ECT) or cylinder head temperature (CHT) sensor, throttle position (TP) sensor, mass air flow (MAF) sensor, crankshaft position (CKP) sensor and the manifold absolute pressure (MAP) sensor to provide information on engine operating conditions to the PCM. The engine must be warm, stable and running at a moderate load and rpm before the EEGR system is activated. The PCM will deactivate EGR during idle, extended wide open throttle or whenever a failure is detected in an EEGR component or EGR required input.
2. The PCM calculates the desired amount of EGR for a given set of engine operating conditions.

3. The PCM in turn will output signals to the EGR motor to move (advance or retract) a certain number of discrete steps. The electric stepper motor will directly actuate the EGR valve, independent of engine vacuum. The EGR valve is commanded from 0 to 52 discrete increments or "steps" to get the EGR valve from a fully closed to full or partially open position. The position of the EGR valve determines the EGR flow.
4. A MAP sensor is used to measure variations in manifold pressure as exhaust gas recirculation is introduced into the intake manifold. Variations in EGR being used will correlate to the MAP signal (increasing EGR will increase manifold pressure values).

Figure 91: Electric EGR System

Hardware

The electric EGR valve (Figure 92) and (Figure 93) is a water cooled motor/valve assembly. The motor is commanded to move in 52 discrete steps as it acts directly on the the EGR valve. The position of the valve determines the rate of EGR. The built in spring works to close the valve (against the motor opening force).

Figure 92: Electric EGR Motor/Valve Assembly

Evaporative Emission Systems

Overview

The Evaporative Emission (EVAP) system prevents fuel vapor build-up in the sealed fuel tank. Fuel vapors trapped in the sealed tank are vented through the vapor valve assembly on top of the tank. The vapors leave the valve assembly through a single vapor line and continue to the EVAP canister (located in the engine compartment, in the rear of vehicle near luggage compartment area or along the frame rail) for storage until the vapors are purged to the engine for burning.

There are two types of Evaporative Emission (EVAP) systems:

- The Enhanced Evaporative Emission (EVAP) system.
- The On-Board Refueling Vapor Recovery (ORVR) Evaporative Emission (EVAP) system.

Enhanced Evaporative Emission (EVAP) System

The Enhanced EVAP system (Figure 94) consists of a fuel tank, fuel filler cap, fuel tank mounted or in-line fuel vapor control valve, fuel vapor vent valve, EVAP canister, fuel tank mounted or fuel pump mounted or in-line fuel tank pressure (FTP) sensor, EVAP canister purge valve, intake manifold hose assembly, canister vent (CV) solenoid, powertrain control module (PCM) and connecting wires and fuel vapor hoses.

1. The Enhanced EVAP system uses inputs from the engine coolant temperature (ECT) sensor, the intake air temperature (IAT) sensor, the mass air flow (MAF) sensor, the vehicle speed sensor (VSS) and the fuel tank pressure (FTP) sensor to provide information about engine operating conditions to the PCM. The fuel level input (FLI) and FTP sensor signals to the PCM are used by the PCM to determine activation of the EVAP Monitor based on presence of vapor generation or fuel sloshing.
2. The PCM calculates a variable duty cycle based on the desired amount of purge vapor flow to the intake manifold for a given engine condition. The PCM can then output the duty cycle to the solenoid on the EVAP canister purge valve. The PCM uses the Enhanced EVAP system inputs to evacuate the system using the EVAP canister purge valve, seals the Enhanced EVAP system from atmosphere using the CV solenoid, and uses the FTP sensor to observe total vacuum lost for a period of time.
3. The canister vent (CV) solenoid seals the Enhanced EVAP system to atmosphere during the EVAP leak check Monitor.
4. The PCM outputs a variable duty cycle signal (between 0% and 100%) to the solenoid on the EVAP canister purge valve.
5. The fuel tank pressure (FTP) sensor monitors the fuel tank pressure during engine operation and continuously transmits an input signal to the PCM. During the EVAP monitor testing, the FTP sensor monitors the fuel tank pressure or vacuum bleed-up.
6. The fuel tank mounted fuel vapor vent valve assembly, fuel tank mounted fuel vapor control valve (or remote fuel vapor control valve) are used in the Enhanced EVAP system to control the flow of fuel vapor entering the engine. All of these valves also prevent fuel tank overfilling during refueling operation and prevent liquid fuel from entering the EVAP canister and the EVAP canister purge valve under any vehicle altitude, handling or rollover condition. The liquid/vapor fuel discriminator is part of the fuel vapor control valve assembly on Escort and Focus applications.
7. The Enhanced EVAP system, including all the fuel vapor hoses, can be checked when a leak is detected by the PCM. This can be done by pressurizing the system using Rotunda Evaporative Emission Tester kit 134-00056 or equivalent and the leak (frequency) detector included with the

kit.

Figure 94: Enhanced Evaporative Emission System (Refer to the On-Board Diagnostics II System Overview for icon definitions.)

Hardware

EVAP Canister Purge Valve

The EVAP canister purge valve (Figure 95) and (Figure 96) is the part of the Enhanced EVAP system that is controlled by the PCM. This valve controls the flow of vapors (purging) from the EVAP canister to the intake manifold during various engine operating modes. The EVAP canister purge valve is normally closed valve.

Figure 95: EVAP Canister Purge Valve

Figure 96: EVAP Canister Purge Valve (used on Focus, Escort, Taurus/Sable, Mustang and LS6/LS8)

Fuel Tank Pressure Sensor

The fuel tank pressure (FTP) sensor (Figure 97) or inline fuel tank pressure (FTP) sensor (Figure 98) is used to measure the fuel tank pressure during the EVAP monitor test on vehicles equipped with the Running Loss-type system. Also, it is used to control excessive fuel tank pressure by forcing the system to purge.

Figure 97: Fuel Tank Pressure (FTP) Sensor

Figure 98: In-Line Fuel Tank Pressure (FTP) Sensor

Canister Vent Solenoid

During the Enhanced EVAP System test monitor, the canister vent (CV) solenoid (Figure 99) seals the EVAP canister from atmospheric pressure. This allows the EVAP canister purge valve to obtain the target vacuum in the fuel tank during the monitor run.

Figure 99: Typical Canister Vent (CV) Solenoid

Fuel Filler Cap

The fuel filler cap (Figure 100) is used to prevent fuel spill and close the evaporative emission/fuel system to atmosphere. Some vehicles may have a Fuel Cap Off Indicator Lamp (FCIL) in the instrument

cluster which will illuminate when there is a failure in the vapor management system that may be due to the fuel filler cap not being sealed.

Figure 100: Fuel Filler Cap

Refer to the appropriate Workshop Manual for information on the following Evaporative Emission System components: fuel vapor control valve, fuel vapor vent valve assembly and fuel vapor separator assembly.

On-Board Refueling Vapor Recovery (ORVR) Evaporative Emission (EVAP) System

The basic elements forming the ORVR system (Figure 101), (Figure 102) and (Figure 103) operation are as follows when fuel is dispensed:

1. The fuel filler pipe forms a seal to prevent vapors from escaping the fuel tank, while liquid is entering the fuel tank (liquid in the one inch diameter tube blocks vapors from rushing back up the fuel filler pipe).
2. A fuel vapor control valve controls the flow of vapors out of the fuel tank (valve closes when liquid level reaches a height associated with the fuel tank usable capacity). This valve accomplishes the following:
 - a. Limits the total amount of fuel that can be dispensed into the fuel tank.

- b. Prevents liquid gasoline from exiting the fuel tank when submerged (and also when tipped well beyond a horizontal plane as part of the vehicle roll-over protection in road accidents).
 - c. Minimizes vapor flow resistance during anticipated refueling conditions.
3. Fuel vapor tubing connects the fuel vapor control valve to the EVAP canister. This routes the fuel tank vapors (displaced by the incoming liquid) to the EVAP canister.
 4. A check valve in the bottom of the fuel filler pipe prevents liquid from rushing back up the fuel filler pipe during the liquid flow variations associated with the filler nozzle shut-off.

Between refueling events, the EVAP canister is purged with fresh air so that it may be used again to store vapors accumulated engine soaks or subsequent refueling events. The vapors drawn off of the carbon in the EVAP canister are consumed in the engine.

Figure 101: On-Board Refueling Vapor Recovery Evaporative Emission System Operation for Focus, Escort and Cougar

Figure 102: On-Board Refueling Vapor Recovery Evaporative Emission System Operation for LS6/LS8

Figure 103: On-Board Refueling Vapor Recovery Evaporative Emission System Operation

Refer to Section 303-13 in the Workshop Manual for information on the following Evaporative Emission System components: liquid/vapor fuel discriminator, fuel filler pipe check valve, fill limit valve assembly, fill limit vent valve assembly, fuel filler pipe flapper valve, fuel vapor control valve (fuel tank mounted), ORVR T-connector assembly and EVAP canister.

Intake Air System

Overview

The Intake Air system (Figure 104) provides clean air to the engine, optimizes air flow and reduces unwanted induction noise. The Intake Air System consists of an air cleaner assembly, resonator assemblies and hoses. The main component of the intake air system is the air cleaner assembly. The air cleaner assembly houses the air cleaner element that removes potential engine contaminants, particularly abrasive types. The mass air flow (MAF) sensor is attached internally or externally to the air cleaner assembly and measures the quantity of air delivered to the engine combustion chamber. The MAF sensor can be serviced or replaced as an individual component. The intake air system also contains a sensor that measures the intake air temperature which may also be integrated with the MAF sensor. (Refer to Electronic EC Hardware - PCM Inputs for additional information on the MAF and IAT sensors.) Air induction resonators can be separate components or part of the intake air housing (i.e., conical air cleaner). The function of a resonator is to reduce induction noise. The air induction components are connected to each other and to the throttle body assembly with hoses.

Figure 104: Intake Air System

Note: For additional illustrations, refer to the Workshop Manual.

There are three basic types of intake air sub-systems:

- Intake Manifold Runner Control (IMRC) electric actuated system
- Intake Manifold Swirl Control (IMSC) vacuum actuated system

- Intake Manifold Tuning Valve (IMTV)

These subsystems are used to provide increased intake airflow to improve torque, emissions and performance. The overall quantity of air metered to the engine is controlled by the throttle body.

Intake Manifold Runner Control (IMRC) Electric Actuated System

The Intake Manifold Runner Control (IMRC) Electric Actuated system (Figure 105) consists of a remote mounted motorized actuator with an attaching cable for each housing on each bank. Some applications will use one cable for both banks. The cable or linkage attaches to the housing butterfly plate levers. The 2.0L (2V) Focus/Escort IMRC uses a motorized actuator mounted directly to a single housing without the use of a cable. Each IMRC housing is an aluminum casting with two intake air passages for each cylinder. One passage is always open and the other is opened and closed with a butterfly valve plate. The housing uses a return spring to hold the butterfly valve plates closed. The motorized actuator houses an internal switch or switches, depending on the application, to provide feedback to the PCM indicating cable and butterfly valve plate position.

Below approximately 3000 rpm, the motorized actuator will not be energized. This will allow the cable to fully extend and the butterfly valve plates to remain closed. Above approximately 3000 rpm, the motorized actuator will be energized. The attaching cable will pull the butterfly valve plates into the open position. Some vehicles will activate the IMRC near 1500 rpm.

WARNING: SUBSTANTIAL OPENING AND CLOSING TORQUE IS APPLIED BY THIS SYSTEM. TO PREVENT INJURY, BE CAREFUL TO KEEP FINGERS AWAY FROM LEVER MECHANISMS WHEN ACTUATED.

1. The PCM uses the TP sensor and CKP signals to determine activation of the IMRC system. There must be a positive change in voltage from the TP sensor along with the increase in rpm to open the valve plates.
2. The PCM uses the information from the input signals to control the IMRC motorized actuator based upon rpm and changes in throttle position.
3. The PCM energizes the actuator to pull the butterfly plates open with the cable(s) or linkage.
4. The IMRC housing contain butterfly plates to allow increased air flow.

Figure 105: Intake Manifold Runner Control (IMRC) - Electric Actuated (Refer to the On Board Diagnostics II System Overview for Icon Definitions).

Intake Manifold Swirl Control (IMSC) Vacuum Actuated System

The Intake Manifold Swirl Control (IMSC) Vacuum Actuated system (Figure 106) consists of a manifold mounted vacuum actuator and a PCM controlled electric solenoid. The linkage from the actuator attaches to the manifold butterfly plate lever. The IMSC actuator and manifold are composite/plastic with a single intake air passage for each cylinder. The passage has a butterfly valve plate that blocks 60% of the opening when actuated, leaving the top of the passage open to generate turbulence. The housing uses a return spring to hold the butterfly valve plates open. The vacuum actuator houses an internal monitor circuit to provide feedback to the PCM indicating butterfly valve plate position.

Below approximately 3000 rpm, the vacuum solenoid will be energized. This will allow manifold vacuum to be applied and the butterfly valve plates to remain closed. Above approximately 3000 rpm, the vacuum solenoid will be de-energized. This will allow vacuum to vent from the actuator and the butterfly valve plates to open.

WARNING: SUBSTANTIAL OPENING AND CLOSING TORQUE IS APPLIED BY THIS SYSTEM. TO PREVENT INJURY, BE CAREFUL TO KEEP FINGERS AWAY FROM LEVER MECHANISMS WHEN ACTUATED.

1. The PCM monitors the TP sensor, CHT and CKP signals to determine activation of the IMSC system. There must be a positive change in voltage from the TP sensor along with the increase in rpm at the proper engine temperature to open the valve plates.
2. The PCM uses the information from the input signals to control the IMSC electric solenoid based upon changes in throttle position, engine temperature and rpm.
3. The PCM energizes the solenoid with the key on engine running, vacuum is then applied to the actuator to pull the butterfly plates closed.

Figure 106: Intake Manifold Swirl Control (IMSC) -Vacuum Actuated (Refer to the On Board Diagnostics II System Overview for Icon Definitions.

Intake Manifold Tuning Valve (IMTV)

The intake manifold tuning valve (IMTV) (Figure 107) is a motorized actuated unit mounted directly to the intake manifold. The IMTV actuator controls a shutter device attached to the actuator shaft. There is no monitor input to the PCM with this system to indicate shutter position.

The motorized IMTV unit will not be energized below approximately 2600 rpm or higher on some vehicles. The shutter will be in the closed position not allowing airflow blend to occur in the intake

manifold. Above approximately 2600 rpm or higher, the motorized unit will be energized. The motorized unit will be commanded on by the PCM initially at a 100 percent duty cycle to move the shutter to the open position and then falling to approximately 50 percent to continue to hold the shutter open.

1. The PCM uses the TP sensor and CKP signals to determine activation of the IMTV system. There must be a positive change in voltage from the TP sensor along with the increase in rpm to open the shutter.
2. The PCM uses the information from the input signals to control the IMTV.
3. When commanded on by the PCM, the motorized actuator shutter opens up the end of the vertical separating wall at high engine speeds to allow both sides of the manifold to blend together.

Throttle Body System Overview

The throttle body system meters air to the engine during idle, part throttle, and wide open throttle (WOT) conditions. The throttle body system consists of an Idle air control (IAC) valve assembly, idle air orifice, single or dual bores with butterfly valve throttle plates and a Throttle Position (TP) sensor. One other source of idle air flow is the Positive Crankcase Ventilation (PCV) system. The combined idle air flow (from idle air orifice IAC flow and PCV flow) is measured by the MAF sensor on all applications.

During idle, the throttle body assembly provides a set amount of air flow to the engine through the idle air passage and PCV valve. The IAC valve assembly provides additional air when commanded by the powertrain control module (PCM) to maintain the proper engine idle speed under varying conditions. The IAC valve assembly mounts directly to the throttle body assembly in most applications, but is remote-mounted to the intake manifold in some applications. Idle speed is controlled by the PCM and cannot be adjusted.

Note: The traditional idle air adjust procedure as well as throttle return screw are no longer used on OBD II applications.

Throttle rotation is controlled by a cam/cable linkage to slow the initial opening rate of the throttle plate. The TP sensor monitors throttle position and provides an electrical signal to the PCM. Some throttle body applications provide an air supply channel upstream of the throttle plate to provide fresh air to the Positive Crankcase Ventilation (PCV) or IAC systems. Other throttle body applications provide individual vacuum taps downstream of the throttle plate for PCV return, Exhaust Gas Recirculation (EGR), Evaporative Emission (EVAP), and miscellaneous control signals.

Throttle Body System Hardware

The major components of the throttle body assembly include the TP sensor, IAC valve assembly, and throttle body housing assembly.

Throttle Position Sensor

The TP sensor monitors throttle position and provides an electrical signal to the PCM. It is monitored by the OBD II system for component integrity, system functionality, and faults that can cause emissions levels to exceed standards set in government regulations. For additional information on the TP sensor, refer to Electronic EC System Hardware-PCM Inputs.

Idle Air Control Valve

The idle air control (IAC) valve assembly (Figure 117) and (Figure 118) controls engine idle speed and provides a dashpot function. The IAC valve assembly meters intake air around the throttle plate through a bypass within the IAC valve assembly and throttle body. The PCM determines the desired idle speed or bypass air and signals the IAC valve assembly through a specified duty cycle. The IAC valve responds by positioning the IAC valve to control the amount of bypassed air. The PCM monitors engine rpm and increases or decreases the IAC duty cycle in order to achieve the desired rpm.

On applications with air-assisted injectors, the IAC valve (Figure 119) also supplies a small amount of air into the path of the fuel injectors. The jet of air causes an increase in fuel atomization at low speed and light load conditions.

Note: The IAC Valve Assembly is NOT ADJUSTABLE and CANNOT BE CLEANED.

The IAC valve (part of throttle body assembly) has an internal diode on some applications. If the internal diode is measured in crossed terminal position with a digital multimeter, there will be an incorrect or negative reading. It is important that the mating component and harness connectors correctly oriented. Diagnostic procedures emphasize this importance.

The PCM uses the IAC valve assembly to control:

- No touch start
- Cold engine fast idle for rapid warm-up
- Idle (corrects for engine load)
- Stumble or stalling on deceleration (provides a dashpot function)
- Over-temperature idle boost.
- Air Assist to Injectors.

Throttle Body Housing

The throttle body housing assembly is a single piece of aluminum casting with an air passage and a butterfly throttle plate with linkage mechanisms. When the throttle plate is in the idle (or closed) position, the throttle lever arm should be in contact with the Throttle Return Stop. The throttle return stop prevents the throttle plate from contacting the bore and sticking closed. The setting also establishes the amount of air flow between the throttle plate and bore. To minimize the closed plate air flow, a special coating is applied to the throttle plate and bore to help seal this area. This sealant/coating also makes the throttle body resistant to engine intake sludge accumulation.

Features of the Throttle Body Assembly include:

1. Idle air control (IAC) valve assembly mounted directly to the throttle body assembly (some vehicles).
2. A pre-set stop to locate the WOT position.
3. An air supply channel upstream of the throttle plate to provide fresh air to the PCV system (some vehicles only).
4. Individual vacuum taps for PCV, EGR, EVAP and miscellaneous control signals (some vehicles only).
5. PCV air return (if applicable).
6. A throttle body-mounted throttle position (TP) sensor.
7. A sealant/coating on the throttle bore and throttle plate makes the throttle body air flow tolerant to engine intake sludge accumulation. These throttle body assemblies **MUST NOT BE CLEANED** and have a white/black attention decal (Figure 116) advising not to clean.

Secondary Air Injection (AIR) Systems

Overview

The Secondary Air Injection (AIR) system controls emissions during the first 20 to 120 seconds of engine operation by forcing air downstream into the exhaust manifolds to oxidize the hydrocarbons and carbon monoxide created by running rich at start up.

Electric Secondary Air Injection System

The Electric Secondary Air Injection (AIR) system consists of an electric AIR pump, single or dual combination check air injection diverter (AIR diverter) valve(s), an AIR bypass solenoid, a solid state relay, powertrain control module (PCM) and connecting wires and vacuum hoses (Figure 120).

1. The PCM requires ECT, IAT and CKP inputs to initiate Secondary Air Injection function.
2. When the engine is started, the strategy will determine when to enable the EAP. The PCM signals the solid state relay and the AIR bypass solenoid, after a (5 to 10) second delay, to begin system operation. Once the catalyst is lit-off, the PCM then signals the solid state relay to stop AIR system operation and to close the AIR bypass solenoid from supplying vacuum to the AIR diverter valve (s).
3. The solid state relay provides the start-up signal and will switch the high current required to operate the AIR pump.
4. The AIR bypass solenoid applies a vacuum to the AIR diverter valve(s) causing it to open and to allow air to flow into the exhaust manifolds.
5. The vacuum check valve controls vacuum bleed-off to solenoid.
6. The function of the splash cap if equipped is to provide the AIR pump with a source of dry air.
7. The electric AIR pump delivers the required amount of air to control emissions during engine operation. Air is forced into the exhaust manifolds to oxidize the hydrocarbons and carbon monoxide created by running rich at start up.

Figure 120: Dual or Single AIRD Valve Electric Secondary Air Injection (AIR) (Refer to the On-Board Diagnostics II System Overview for icon definitions.)

Hardware

Electric AIR Pump

The electric AIR pump (Figure 121) provides pressurized air to the Secondary Air Injection system. The electric AIR pump functions independently of rpm and is controlled by the PCM. The electric AIR pump is only used for short periods of time. Delivery of air is dependent on the amount of system backpressure and system voltage. The inlet system of the AIR pump incorporates a non-serviceable filter and splash cap which helps to guard against dirt and water.

Figure 121: Electric Air Pump

AIR Bypass Solenoid

The secondary air injection bypass (AIR bypass) solenoid (Figure 122) is used by the PCM to control vacuum to the secondary air injection diverter (AIR diverter) valve. The AIR bypass solenoid is a normally closed solenoid. The AIR bypass solenoid also has a filtered vent feature to permit vacuum release.

Figure 122: Secondary Air Injection Bypass Solenoid

AIR Diverter Valve

The secondary air injection diverter (AIR diverter) valve (Figure 123) is used with the electric AIR pump to provide on/off control of air to the exhaust manifold and catalytic converter. When the electric AIR pump is on and vacuum is supplied to the AIR diverter valve, the integral check valve disk passes the integral check valve disk. When the electric AIR pump is off, and vacuum is removed from the AIR diverter valve, the integral check valve disk is held on the seat and stops air from being drawn into the exhaust system and prevents the back flow of the exhaust into the Secondary Air Injection System.

Figure 123: Air Injection Diverter (AIR Diverter) Valve

Solid State Relay

The solid state relay (Figure 124) switches the high current required for operation of the electric AIR pump. Input control to the solid state relay comes from the powertrain control module (PCM).

Figure 124: Solid State Relay

Vacuum Check Valves

A vacuum check valve (Figure 125) blocks air flow in one direction. It allows free air flow in the other direction. The check side of this valve will hold the highest vacuum registered on the vacuum side.

Figure 125: Vacuum Check Valve

Figure 127: 3.8L Mustang (California)

Figure 128: 3.8L Mustang (California)

Variable Cam Timing System

Overview

The Variable Cam Timing System allows the exhaust cam to advance and retard at varying engine speeds. The purpose of this is to reduce exhaust emissions and increase fuel economy. As the exhaust cam retards in relation to the crankshaft position, residual exhaust gases are left in the combustion chamber. The residual gases cool the combustion chamber and are inert when mixed with the incoming fresh charge of fuel and air. This results in better fuel economy and lower nitrogen oxides (NOx) and hydrocarbons (HC) the engine produces. The Exhaust Gas Recalculation System (EGR) is unnecessary on the 2.0L (4V) engine due to this feature.

Variable Cam Timing

The Variable Cam Timing (VCT) System consists of the control solenoid, five-tooth pulse ring (4+1) on exhaust camshaft, intake air temperature (IAT) sensor, engine coolant temperature (ECT) sensor, camshaft position (CMP) sensor, mass air flow (MAF) sensor, crankshaft position (CKP) sensor, powertrain control module (PCM) (Figure 129).

1. The powertrain control module (PCM) receives input signals from the intake air temperature (IAT) sensor, engine coolant temperature (ECT) sensor, camshaft position (CMP) sensor, mass air flow (MAF) sensor and crankshaft position (CKP) sensor for determining the operating conditions of the engine.
2. The Variable Cam Timing (VCT) system is enabled by the PCM when the proper conditions are met. The PCM disables the VCT system if a fault is detected.
3. The PCM calculates relative cam position using the CMP sensor and data from the (4+1) pulse ring mounted on the exhaust camshaft. Relative cam position is calculated by measuring the time between the rising edge of profile ignition pickup (PIP) and the falling edge of VCT pulse.
4. The PCM continually calculates a cam position error value based on the difference between the desired and actual position and a duty cycle is commanded for the VCT solenoid valve. Engine oil is allowed to flow to the VCT unit.
5. Oil flows to either side of the piston chamber changing a linear motion from the piston to a rotation motion from the helical mechanism in the VCT unit. During closed loop the PCM outputs a revised duty cycle to the VCT solenoid valve to correct for cam position error.

Figure 129: Variable Cam Timing System (Refer to the On-Board Diagnostics II System Overview for icon definitions.)

Hardware

Variable Cam Timing (VCT) Solenoid Valve

The VCT solenoid valve (Figure 130) is an integral part of the VCT system. The solenoid valve controls the flow of engine oil to the variable cam timing unit assembly. As the PCM duty cycles the solenoid valve, oil is allowed to flow to the VCT unit assembly and advance or retard the cam timing.

Figure 130: Variable Cam Timing (VCT) Solenoid Valve

Variable Cam Timing (VCT) Unit Assembly

The variable cam timing unit assembly (Figure 131) is coupled to the camshaft through a helical spline in the VCT unit chamber. When the flow of oil is shifted from one side of the chamber to the other, the differential change in oil pressure forces the piston to move linearly along the axis of the camshaft. This linear motion is translated into rotational camshaft motion through the helical spline coupling. A spring installed in the chamber is designed to hold the camshaft in the minimum overlap position (5 degrees)

when oil pressure is too low to maintain adequate position control. The camshaft is allowed to rotate up to 30 degrees.

Figure 131: Variable Cam Timing Unit Assembly

Positive Crankcase Ventilation System

Overview

The Positive Crankcase Ventilation (PCV) System (Figure 132) cycles crankcase gases back through the engine where they are burned. The PCV valve regulates the amount of ventilating air and blow-by gas to the intake manifold and prevents backfire from traveling into the crankcase. The PCV valve should be mounted in a vertical position. On some applications, the PCV system is connected to the evaporative emission system (refer to the VECI decal).

CAUTION: Do not remove the PCV system from the engine. Removal of the PCV system will adversely affect the fuel economy and engine ventilation and result in shorter engine life.

Figure 132: PCV System

Hardware

Figure 133: PCV Internal Drawing

Figure 134: Typical PCV Vacuum Connector

Catalyst and Exhaust Systems

Overview

The Catalytic Converter and Exhaust systems (Figure 135) work together to control the release of harmful engine exhaust emissions into the atmosphere. The engine exhaust gas consists mainly of nitrogen (N), carbon dioxide (CO₂) and water vapor (H₂O). However, it also contains carbon monoxide (CO), oxides of nitrogen (NO_x), hydrogen (H), and various unburned hydrocarbons (HCs). CO, NO_x, and HCs are major air pollutants, and their emission into the atmosphere must be controlled.

The exhaust system generally consists of an exhaust manifold, front exhaust pipe, upstream heated oxygen sensor (HO₂S), rear exhaust pipe, downstream HO₂S, a muffler and an exhaust tailpipe. The catalytic converter is installed between the front and rear exhaust pipes. Catalytic converter efficiency is monitored by the On Board Diagnostic (OBD II) system. (Refer to OBD II Monitors to Catalyst Efficiency Monitor-Federal Test Procedure for specific information.)

Figure 135: Generic Catalyst and Exhaust System

Catalytic Converter

A catalyst is a material that remains unchanged when it initiates and increases the speed of a chemical reaction. A catalyst will also enable a chemical reaction to occur at a lower temperature. The concentration of exhaust gas products released to the atmosphere must be controlled. The catalytic converter assists in this task. It contains a catalyst in the form of a specially treated honeycomb structure saturated with catalytically active precious metals. As the exhaust gases come in contact with the catalyst, they are changed into mostly harmless products. The catalyst initiates and speeds up heat producing chemical reactions of the exhaust gas components so they are used up as much as possible.

Exhaust System

The purpose of the exhaust system is to convey engine emissions from the exhaust manifold to the atmosphere. Engine exhaust emissions are directed from the engine exhaust manifold to the catalytic converter through the front exhaust pipe. An HO₂S is mounted on the front exhaust pipe before the catalyst. The catalytic converter reduces the concentration of carbon monoxide (CO), unburned hydrocarbons (HCs) and oxides of nitrogen (NO_x) in the exhaust emissions to an acceptable level. The reduced exhaust emissions are directed from the catalytic converter to a muffler through the rear exhaust pipe. Another HO₂S is mounted on the rear exhaust pipe. Lastly, the exhaust emissions are directed to the atmosphere through an exhaust tailpipe.

Hardware

The downstream HO₂S may be located after the light off catalyst or underbody catalyst. The underbody catalyst may be in-line with the light off catalyst, or the underbody catalyst may be common to two light off catalysts, forming a "Y" pipe configuration. For an exact configuration of the catalyst and exhaust system, refer to Exhaust System Section 309-00 in the Workshop Manual.

Three Way Catalytic Converter

The three way catalytic (TWC) converter contains either platinum (Pt) and rhodium (Rh) or palladium (Pd) and rhodium (Rh). The TWC converter catalyzes the oxidation reactions of unburned HCs and CO and the reduction reaction of NO_x. The three-way conversion can be best accomplished by always operating the engine air fuel/ratio at or close to stoichiometry.

Exhaust Manifold/Runners

The exhaust manifold runners collect exhaust gases from engine cylinders. The number of exhaust manifolds and exhaust manifold runners depends on the engine configuration and number of cylinders.

Exhaust Pipes

Exhaust pipes are usually treated during manufacturing with an anti-corrosive coating agent to increase the life of the product. The pipes serve as guides for the flow of exhaust gases from the engine exhaust manifold through the catalytic converter and the muffler.

Upstream Heated and Downstream Heated Oxygen Sensors

The HO₂S provide the powertrain control module (PCM) with voltage and frequency information related to the oxygen content of the exhaust gas. (Refer to the PCM Inputs for a description of how the HO₂S operates.)

In addition to providing the PCM with indications of how rich/lean the engine is operating, the upstream HO₂S signal serves as an input to the HO₂S monitor. The downstream HO₂S signal is an input to the Catalyst Efficiency monitor. (Refer to the OBD II Monitors for specific information on these monitors.)

Muffler

Mufflers are usually treated during manufacturing with an anti-corrosive coating agent to increase the life of the product. The muffler reduces the level of noise produced by the engine, and it also reduces the noise produced by exhaust gases as they travel from the catalytic converter to the atmosphere.

Supercharger and Intercooler Systems

Supercharger Bypass System

The Supercharger Bypass (SCB) System (Figure 137) allows the high pressure air at the outlet of the supercharger to vent back in the inlet of the supercharger, equalizing the pressure. This eliminates the boost (increased pressure that a supercharger produces) for times when supercharger function is undesirable. The components in this system are the vacuum bypass actuator (Figure 141) (which controls the bypass valve inside the supercharger), a supercharger (boost) bypass (SCB) solenoid (Figure 138) and a vacuum reservoir (Figure 139). The system normally operates with engine vacuum applied to the upper port of the vacuum bypass actuator, while the lower port references the air pressure in the clean air tube to cancel out any pressure difference in the intake air system. The actuator is set to open (bypassing the supercharger) during high vacuum engine conditions. As the throttle is opened, and engine vacuum decreases, the actuator closes to allow the supercharger to pressurize the air in the manifold. If an undesirable condition occurs in the engine, such as overheating or a critical Electric Engine Control (Electronic EC) sensor failure, the powertrain control module (PCM) also has the ability to control the SCB solenoid and direct the vacuum bypass actuator to bypass the supercharger. Once the engine condition has been corrected, the PCM allows the engine vacuum to control the vacuum bypass actuator.

Supercharger Assembly

The supercharger assembly (Figure 136) is a positive displacement pump. Its purpose is to supply an excess volume of intake air to the engine by increasing air pressure and density in the intake manifold. The supercharger assembly incorporates the bypass system to reduce air handling losses when boost is not required, resulting in better fuel economy. When integrated on the engine, the supercharger will increase torque across the entire engine operating range from 25 to 50 percent without compromising driveability or emissions. The supercharger is matched to the engine by its displacement and belt ratio, and can provide excess airflow at any engine speed. It contains two three-lobed rotors. The helical shape and specialized porting provide a smooth discharge flow and low level of noise during operation. The rotors are supported by ball bearings in front and needle bearings at the rear. The drive gears are pressed into place, therefore the supercharger is replaced as a unit, and is not serviceable.

Supercharger (Boost) Bypass Solenoid/(Thermactor Air Control Solenoid/Vacuum Valve Assembly)

The supercharger (boost) (SCB) solenoid (Figure 138) is used to control intake manifold vacuum to the vacuum bypass actuator. This part is replaced in field service diagnostics under the part name of a thermactor air control solenoid/vacuum valve assembly (part number 9H465). The PCM transmits an output signal to the SCB solenoid, thereby activating the solenoid to apply stored vacuum from the reservoir to the actuator, when an undesirable condition occurs in the engine. Once the engine condition has been corrected, the solenoid will be de-activated by the PCM, allowing engine intake manifold vacuum to control the actuator. The SCB solenoid is normally de-energized.

Vacuum Reservoir Assembly

The vacuum reservoir assembly (Figure 139) stores vacuum that is applied to the vacuum actuator when a condition such as overheating or a critical sensor failure is generated. This allows the vacuum actuator to bypass the supercharger.

Figure 138: Supercharger (Boost) Bypass Solenoid (Thermactor Air Control Solenoid/Valve Assembly)

Figure 139: Vacuum Reservoir Assembly

Intercooler System

The Intercooler System (Figure 140 and Figure 141) is designed to cool the induction air, which has been heated by the supercharger. The removal of heat from the pressurized air going into the intercooler increases the air density, which improves combustion efficiency, engine horsepower and torque. The system consists of an additional radiator in the grille, a reservoir (independent from engine cooling system), an electric water pump, a heat exchanger (intercooler) located in the lower intake manifold and tubing to interconnect these components. The intercooler is positioned after the supercharger, directly in the flow of the intake air. As the heated air flows through the intercooler, heat is transferred to the coolant which is circulated back to the intercooler radiator to be cooled by the airflow through the grille. The intercooler pump is controlled by the powertrain control module (PCM) to maintain a desirable intake air temperature by a second intake air temperature (IAT2) sensor in the lower intake manifold.

PCM—Controlled Charging System

Overview

The PCM-Controlled charging system (Figure 142) provides many additional benefits over the current Integral Generator Regulator system. The first benefit is improved battery life. In an integral generator regulator system, the regulator set point is established by a temperature sensor in the regulator which estimates battery temperature. Field data has shown this approach lacks accuracy. With a PCM-controlled generator, the regulator voltage set point is determined by the PCM and communicated to the regulator via the generator communication line. The PCM will use a calibratable algorithm to estimate battery temperature. Improving battery temperature estimates will reduce battery damage caused by over- and undercharging.

The second benefit is improved engine performance. Whenever the PCM senses a wide-open throttle (WOT) condition, the PCM will momentarily lower the regulator voltage set point. This reduces the torque load of the generator on the engine and improves acceleration. The PCM has a calibratable time limit on this reduced voltage feature. This is to prevent the generator output from being cut back for an extended WOT period, which could cause battery discharge.

The third benefit is improved idle stability. In response to the PCM's generator communication signal, the regulator uses a generator monitor signal to provide feedback to the PCM. The generator monitor signal provides the PCM with charging system information. Specifically, it lets the PCM know when the charging system receives a transient electrical load which would normally affect idle stability. Because the PCM can anticipate additional loads, actions can be taken to minimize idle sag. The PCM can choose to either reduce the regulator set point or increase engine idle speed, both of which are calibratable features. In order to establish whether the regulator is accurately maintaining the desired voltage set point, the regulator uses a charging system voltage line to sense battery voltage at the rear power distribution box.

The fourth benefit is reduced cranking efforts. The PCM can reduce the mechanical load on the starter by initially commanding a low voltage set point. This may improve start times.

If the PCM detects a charging system error, it will broadcast a low voltage telltale (ON) command which tells the cluster to light the charge indicator. The charge indicator will be illuminated if the PCM fails to see a signal on the generator monitor line for a time period greater than 500 milliseconds. This telltale command will also be used to indicate over-voltage conditions detected by the PCM controlled generator.

Each time the ignition switch is cycled to the run position, the cluster will initiate a bulb check by illuminating the charge indicator. It is the PCM's responsibility to issue a low voltage telltale (OFF) command if the charging system is functioning properly. This message should be sent during Network Initialization in the voluntary phase (250 milliseconds to 450 milliseconds after the ignition switch is cycled to the run position). If a low voltage telltale (OFF) command is not received by the cluster, the cluster will continue to light the charge light indefinitely.

Powertrain Control/Emissions Diagnosis Manual

2001

On Board Diagnostics II

SECTION 2: Diagnostic Methods

Choose an item on the left side to display section contents.

Diagnostic Methods

Overview

The Diagnostic Methods Section provides information on routine diagnostic tasks.

When following powertrain diagnostics on OBD II vehicles, the system may be checked by an off-board tester referred to as a scan tool. This section contains information for performing diagnostics with a scan tool. A scan tool has certain generic capabilities that are standard across the automotive industry in the United States. All functions are selected from a menu. Refer to the instruction manual provided by the tool manufacturer.

Diagnostic Tools

Below is an equipment list with corresponding part numbers:

REQUIRED EQUIPMENT:

- Rotunda Worldwide Diagnostic System (WDS) 418-F224 or scan tool with functionality described under Scan Tool Set-up and Functionality.
- Rotunda EEC-IV 60-Pin Breakout Box 418-005 (014-00322) or equivalent.
- Rotunda Evaporative Emission System Tester 310-F007 (134-00056) or equivalent.

RECOMMENDED EQUIPMENT:

- Rotunda EEC-V 104-Pin Breakout Box 418-049 (014-00950) or equivalent.
- Rotunda Vacuum/Pressure Tester 164-R0253 or equivalent. Range 0-101.3 kPa (0-30 in-Hg.) Resolution 3.4 kPa (1 in-Hg.)
- Rotunda Vacuum Tester 014-R1054 or equivalent. Range 0-101.3 kPa (0-30 in-Hg.)
- Rotunda Engine EAR Amplifier 107-R2100 or equivalent.
- Rotunda 73 III Automotive Meter 105-R0057 or equivalent. Input impedance 10 Megaohm minimum.
- Rotunda Electronic Ignition (EI) System Tester (Distributor/less Ignition System Tester) 418-F024 (007-00075) or equivalent.
- Dist Integrated EDIS Cable Option 418-F039 (007-00110) or equivalent.
- Series 100 Engine/Ignition Analyzer 010-01060 or equivalent.
- Spark Tester D81P-6666-A or equivalent.
- Non-powered Test Lamp.

OPTIONAL EQUIPMENT:

- Rotunda Auxiliary Adapter 418-F007 (007-00023) or equivalent.
 - Rotunda Pressure/Vacuum Adapter 418-F006 (007-00022) or equivalent.
 - Rotunda Fuel (Gasoline) pressure test kit 134-R0087 or equivalent (Use tool manufacturer's instructions. For specific applications, refer to Workshop Manual Group 3).
 - Rotunda Fuel Composition Test Kit 014-00770.
 - Fuel Injector Tester/Cleaner 164-R3759 or equivalent.
 - Rotunda NG Tool Kit 134-00114 or equivalent.
-

Scan Tool Set-up and Functionality

The scan tool must be connected to the data link connector (DLC) for communication with the vehicle.

The DLC is located in the passenger compartment. It is attached to the instrument panel and accessible from the driver's seat.

The DLC is rectangular in design and capable of accommodating up to 16 terminals. The connector has keying features to allow easy connection. The vehicle connector and the test equipment connector have latching features that ensure the test equipment connector will remain mated when properly connected.

The required scan tool functions are described below:

- Monitor, record and playback of PIDs
- Freeze frame PID data
- Diagnostic test modes (self test)/clear diagnostic DTCs (PCM reset)
- Output Test Mode
- Reset Keep Alive Memory
- Digital measurement system (multimeter functionality)
- Diagnostic monitoring test results (for OBD II on-board monitors)
- On board system readiness (OBD II monitor completion status)

Some of these functions are described in this section. Refer to the scan tool manufacturer's manual for specific information on scan tool set-up and operation.

Vehicle Check/Preparation

Before using the scan tool to perform any test, refer to the important Safety Notice located at the beginning of this manual and the necessary visual checks listed below.

Visual Checks

- Inspect the air cleaner and inlet duct.
- Check all engine vacuum hoses for damage, leaks, cracks, kinks and proper routing.
- Check Electronic EC system wiring harness for proper connections, bent or broken pins, corrosion, loose wires and proper routing.
- Check the powertrain control module (PCM), sensors and actuators for physical damage.
- Check the engine coolant for proper level and mixture.
- Check the transmission fluid level and quality.
- Make all necessary repairs before continuing with Quick Test.

Vehicle Preparation

- Perform ALL safety steps required to start and run vehicle tests. Apply parking brake, place shift lever firmly into PARK position (NEUTRAL on manual transmission) and block drive wheels.
 - Turn off ALL electrical loads: radios, lamps, A/C, blower and fans.
 - Start engine and bring up to normal operating temperature before running Quick Test.
-

Quick Test

Quick Test

Quick Test is divided into three specialized tests:

1. Key On Engine Off (KOEO) On-Demand Self-Test
2. Key On Engine Running (KOER) On-Demand Self-Test
3. Continuous Memory Self-Test

Quick Test checks the integrity and function of the Electronic EC System and outputs the test results when requested by a scan tool. Quick Test also provides a quick end check of the powertrain control system and is usually performed at the start of each diagnostic procedure with all accessories off. Quick Test is also performed at the end of most pinpoint tests for verification of repair and to make sure no other faults were incurred while repairing a previous fault. A system pass will be displayed when no DTCs are output and a scan tool communication error does not exist. System pass means that hardware monitored by the PCM is functioning within normal operating limits. Only a system pass, DTC or an incomplete OBDII drive cycle (P1000) will be displayed.

Key On Engine Off (KOEO) On-Demand Self-Test

Key On Engine Off (KOEO) On-Demand Self-Test is a functional test of the powertrain control module performed on demand with the key on and the engine off. This test will perform checks on certain sensor and actuator circuits. A fault must be present at the time of testing for the KOEO Self-Test to detect the fault. When a fault is detected, a Diagnostic Trouble Code (DTC) will be output on the data link at the end of the test when requested by a scan tool.

Key On Engine Running (KOER) On-Demand Self-Test

Key On Engine Running (KOER) On-Demand Self-Test is a functional test of the powertrain control module performed on demand with the key on engine running and vehicle stopped. A check of certain inputs and outputs is made during operating conditions and at normal temperature. The brake pedal position, transmission control and power steering switch tests are part of KOER On-Demand Self-Test and MUST be performed during this operation if applicable. These are described below. A fault must be present at the time of testing KOER On-Demand Self-Test to detect the fault. When a fault is detected, a Diagnostic Trouble Code (DTC) will be output on the data link at the end of the test when requested by a scan tool.

Brake Pedal Position Test

This tests the ability of the Electronic EC system to detect a change of state in the stoplight switch. Brake pedal MUST briefly be applied and released on all vehicles equipped with Brake Pedal Position input. This is done during KOER On-Demand Self-Test.

Transmission Control Switch Test

This tests the ability of the Electronic EC system to detect a change of state in the transmission control switch (TCS). Switch MUST briefly be cycled on all vehicles equipped with TCS input. This is done during KOER On-Demand Self-Test.

Power Steering Pressure Test

This tests the ability of the Electronic EC system to detect a change in power steering system fluid pressure. The steering wheel MUST briefly be turned at least 1/4 of a revolution on vehicles equipped with a power steering pressure (PSP) switch or sensor. This is done during KOER On-Demand Self-Test.

Continuous Memory Self-Test

Testing for Continuous Memory DTC's is a functional test of the powertrain control module performed under any condition (engine running or off) with the key on. Unlike the KOEO and KOER self tests, which can only be activated on demand, the Continuous Self Test is always active. A fault does not need to be present at the time of testing for Continuous DTC's and is therefore, especially valuable when diagnosing intermittent faults. This test will detect failures contributing to driveability or emission concerns. The vehicle may need to be driven or the OBDII Drive Cycle completed to allow the PCM to detect a fault. Refer to [Drive Cycles](#) for more information. When a fault is stored in memory, a Diagnostic Trouble Code (DTC) will be output on the data link at the end of the test when requested by a scan tool.

There are two types of Continuous DTC's. The first type is an emission related malfunction indicator lamp (MIL) code which will illuminate the CHECK ENGINE or SERVICE ENGINE SOON indicator in the instrument cluster. The second is a non emission related non-MIL code which will never illuminate the cluster indicator.

For emission related MIL codes, the PCM will store the DTC in continuous memory when a fault is detected for the first time. At this point the DTC will not illuminate the MIL and is now considered a pending code. The purpose of pending codes is to assist in repair verification by reporting a pending DTC after one drive cycle. If the same fault is detected after the next ignition start-run cycle, the emission related MIL code will illuminate the MIL. The MIL will remain on even if the fault is intermittent. The MIL will be extinguished if the fault is not present through three consecutive drive cycles or a PCM reset is performed. Also, an emission related pending MIL and non emission related (non-MIL) code will be erased after approximately 40-80 vehicle warm up cycles or a PCM reset.

Any scan tool that meets OBDII requirements can access Continuous Memory to retrieve emission related MIL DTC's. However, not all scan tools access pending and non emission related (non-MIL) DTC's in the same way.

During most diagnostic procedures in this manual, it is required that all DTC's be retrieved and cleared. Consult the instruction manual from the tool manufacturer for specific instructions.

Parameter Identification (PID)

Description

The Parameter Identification (PID) mode allows access to powertrain control module (PCM) information. This includes analog and digital signal inputs and outputs along with calculated values and system status. There are two types of PID lists available and both are used throughout this manual. The first is the Generic (J1979) OBDII PID list. This is a standard set of PIDs for all manufacturers all scan tools must be able to access. The second is a Ford specific (J2190) list which can be accessed by an adequate scan tool. When accessing any of these PIDs, the values will be continuously updated. The Generic or Ford PID list provides definitions and values in appropriate units. For more information, refer to the Society of Automotive Engineers (SAE) J2205 document.

Generic OBD II PID List

"X" in the "Freeze Frame" column denotes both a mode 1 and mode 2 PID (real time and freeze frame).

Freeze Frame	Acronym	Description	Measurement Units
	AIR	Secondary Air Status	ON/OFF
	CCNT	Continuous DTC Counter	Unitless
X	ECT	Engine Coolant Temperature	DEGREES
X	FUEL SYS1	Fuel System Feedback Control Status-Bank 1	OL/CL/OL DRIVE ^a / OL FAULT/ CL FAULT
X	FUEL SYS2	Fuel System Feedback Control Status-Bank 2	OL/CL/OL DRIVE ^a / OL FAULT/ CL FAULT
	IAT	Intake Air Temp	DEGREES
X	LOAD ^b	Calculated Engine Load	Percent
X	LONG FT1	Current BANK 1 fuel trim adjustment (kamref1) from stoichiometry which is considered LONG TERM.	Percent
X	LONG FT2	Current BANK 2 fuel trim adjustment (kamref2) from stoichiometry which is considered LONG TERM.	Percent
	MAF	Mass Air Flow Rate	GM/SEC-LB/ MIN
	O2S11	Bank 1 Upstream Oxygen Sensor (11)	VOLTS
	O2S12	Bank 1 Downstream Oxygen Sensor (12)	VOLTS
	O2S21	Bank 2 Upstream Oxygen Sensor (21)	VOLTS
	O2S22	Bank 2 Downstream Oxygen Sensor (22)	VOLTS
	OBD SUP	On-Board Diagnostic System	Cal. OBD II 50 States OBD II OBD I and OBD II OBD I None
	PTO	Power Take-Off Status	ON/OFF
X	RPM	Revolutions Per Minute	RPM

X	SHRT FT1	Current BANK fuel trim adjustment (lambse1) from stoichiometry which is considered SHORT TERM.	Percent
	SHRT FT1 ¹	Current BANK fuel trim adjustment (lambse1) from stoichiometry which is considered SHORT TERM.	Percent
	SHRT FT12 ²	Current BANK 1 fuel trim adjustment (lambse1) from stoichiometry which is considered SHORT TERM.	Percent
X	SHRT FT2	Current BANK 2 fuel trim adjustment (lambse1) from stoichiometry which is considered SHORT TERM.	Percent
X	SHRT FT21 ³	Current BANK 2 fuel trim adjustment (lambse1) from stoichiometry which is considered SHORT TERM.	Percent
X	SHRT FT22 ⁴	Current BANK 2 fuel trim adjustment (lambse1) from stoichiometry which is considered SHORT TERM.	Percent
	SPARKADV	Spark Advance Cylinder No. 1	DEGREES
X	TP	Throttle Position	Percent
X	VSS	Vehicle Speed Sensor	MPH-KM/H

^a OL = Open loop, have not satisfied conditions for closed loop.

^b Percent engine load adjusted for atmospheric pressure.

¹ Individual oxygen sensor fuel trim adjustment is not supported.

² Individual oxygen sensor fuel trim adjustment is not supported.

³ Individual oxygen sensor fuel trim adjustment is not supported.

⁴ Individual oxygen sensor fuel trim adjustment is not supported.

CL = Closed loop using O2S(s) as feedback for fuel control.

OL DRIVE = Open loop due to driving conditions (heavy accel).

OL FAULT = Open loop due to fault with all upstream O2S sensors.

CL FAULT = Closed loop fuel control, but fault with one upstream O2S sensor on dual bank vehicles.

Note: PID MP LRN must be set to YES before the Misfire Monitor will be enabled.

On-Board System Readiness

Description

All OBD II scan tools display the On-Board System Readiness (OSR) Test. The OSR will display the supported monitors on the vehicle and the status of all monitors (complete or not complete) at that time. Fuel, misfire and comprehensive component monitors run continuously and will always display "YES" status. Only a PCM reset or a keep alive RAM reset will cause the non-continuous monitors to reinitialize to "NO" status.

Freeze Frame Data

Description

Freeze Frame Data allows access to emission-related values from specific generic PIDs. These values are stored when an emission-related DTC is stored in Continuous Memory. This provides a snapshot of the conditions that were present when the DTC was stored. Once one set of freeze frame data is stored, this data will remain in memory even if another emission-related DTC is stored, with the exception of Misfire or Fuel System DTCs. Once freeze frame data for Misfire or Fuel System DTC is stored, it will overwrite any previous data, and freeze frame will not be further overwritten. When a DTC associated with the freeze frame is erased or a PCM memory reset is performed, new freeze frame data can be stored again. In the event of multiple emission-related DTCs in memory, always note the DTC for the freeze frame data.

FREEZE FRAME DATA TABLE

Acronym	Description	Measurement Units
ECT	Engine Coolant	DEGREES

SHRTFT2	Short Term Fuel Bank2	PERCENT
VSS	Vehicle Speed	MPH-KMH

Some unique parameters (PIDs) are stored in the Keep Alive Memory of the PCM to help in diagnosing the root cause of misfires. These PIDs are collectively called misfire freeze-frame (MFF) data. These parameters are separate from the generic freeze-frame data that is stored for every MIL code. They are used for misfire diagnosis only. The MFF data is more useful for misfire diagnosis than the normal diagnosis only. It is captured at the time of the highest misfire rate and not when the DTC is stored at the end of a 1000 or 200 revolution block. (Generic freeze-frame data for misfire can be stored minutes after the misfire actually occurred.)

Note: MFF PIDs are supported on all vehicles but may not be available on all scan tools because enhanced PID access may vary by scan tool manufacturer.

MISFIRE FREEZE-FRAME PIDs

PID Name	Description	PID #	Measurement Units
MFF RPM	Engine RPM at the time of misfire	16D3	RPM
MFF LOAD	Engine load at the time of misfire	16D4	PERCENT
MFF VS	Vehicle speed at the time of misfire	16D5	MPH/KPH
MFF IAT	Intake air temperature at the time of misfire	16D6	DEGREES
MFF SOAK	Engine-off soak time at the time of misfire	16D7	MINUTES

MFF RNTM	Engine running time at the time of misfire	16D8	SECONDS
MFF EGR	EGR DPFE sensor at the time of misfire	16D9	VOLTAGE
MFF TP	Throttle Position at time of misfire	16DA	VOLTAGE
MFF T CNT	Number of driving cycles at the time of misfire (at least one 1,000 rev block)	16DC	# TRIPS
MFF PNP	1= in drive during the time of misfire	16DD b1	MODE
MP LRN	1= Misfire wheel profile learned in KAM	16DD b0	YES/NO

Output Test Mode

Description

The Output Test Mode (OTM) aids in servicing output actuators associated with the PCM. This mode allows the technician to energize and de-energize most of the system output actuators on command. When entering OTM, the outputs can be turned off and on without activating the fan control. The low and high speed fan control(s) may be turned on separately without energizing the other outputs. This function is supported by each vehicle strategy and may not be available on all scan tools.

As a safety precaution, Output Test Mode will default to the off state after 10 minutes and fuel pump off after approximately 7-10 seconds. OTM will also turn off after the vehicle is started or after cycling the key off then on.

WARNING: SAFETY MUST BE OBSERVED WHEN USING OUTPUT TEST MODE:

- **WHEN ALL OUTPUTS ARE ON, THE ELECTRIC FUEL PUMP IS BRIEFLY ENERGIZED, SO MAKE SURE FUEL SYSTEM IS INTACT AND IS NOT BEING SERVICED AT THIS TIME.**
 - **WHEN LOW SPEED OR HIGH SPEED FAN CONTROL(S) ARE TURNED ON, MAKE SURE FAN BLADES ARE CLEAR OF ANY OBSTRUCTION.**
-

Powertrain Control Module (PCM) Reset

Description

All OBDII scan tools support the powertrain control module (PCM) reset.

The PCM Reset allows the scan tool to command the PCM to clear all emission-related diagnostic information. When resetting the PCM, a DTC P1000 will be stored in the PCM until all the OBD II system monitors or components have been tested to satisfy a drive cycle, without any other faults occurring. For more information about a drive cycle, refer to [Drive Cycles](#).

The following events occur when a PCM reset is performed:

- Clears the number of Diagnostic Trouble Codes (DTCs).
- Clears the DTCs.
- Clears the freeze frame data.
- Clears diagnostic monitoring test results.
- Resets status of the OBD II system monitors.
- Sets DTC P1000.

Resetting Keep Alive Random Access Memory (RAM)

Resetting Keep Alive RAM will return PCM memory to its default setting. Adaptive learning contents such as idle and fuel trim are included. A PCM Reset (described above) is also part of a KAM Reset.

After Keep Alive RAM has been reset, the vehicle may exhibit certain driveability concerns. It will be necessary to drive the vehicle to allow the PCM to relearn values for optimum driveability and performance.

This function may not be supported by all scan tools. Refer to scan tool manufacturer's instruction manual.

If an error message is received or the scan tool does not support this function, disconnecting the battery ground cable for a minimum of 5 minutes may be used as an alternative procedure.

Flash Electrically Erasable Programmable Read Only Memory — Flash EEPROM

Description

Flash Electrically Erasable Programmable Read Only Memory (EEPROM) is contained in an Integrated Circuit (IC) internal to the PCM. The EEPROM contains the vehicle strategy including calibration information specific to the vehicle and is capable of being reprogrammed or reflashed repeatedly.

As part of the calibration there is an area referred to as the Vehicle Identification (VID) block. The VID block must be programmed when replacing the PCM as described under Programming the VID Block for a Replacement PCM. Failure to perform this procedure may generate fault code: P1639, VID Block not programmed or is corrupt. The VID block in an existing PCM can also be tailored to accommodate various hardware changes made to the vehicle since production. Failure to perform this procedure properly may generate fault code: P1635, Tire/Axle Ratio out of Acceptable Range. This is described under Making Changes to the VID Block and also under Making Changes to the PCM Calibration. The VID block contains many items used by the strategy for a variety of functions. Some of these items include the VIN number, octane adjust, fuel octane, fuel type, vehicle speed limit, tire size, axle ratio, the presence of speed control and four wheel drive electronic shift on the fly versus manual shift on the fly. Only items applicable to vehicle hardware and supported by the VID block will be displayed on the scan tool.

When changing items in the VID block, the strategy will place range limits on certain items such as tire and axle ratio. The VID block is also limited to the number of times to be reconfigured. When this limit is reached, the scan tool will display a message indicating the need to flash the PCM again to reset the VID block.

Each of the procedures described below use the Worldwide Diagnostic System (WDS). Reprogramming can be performed by a local Ford dealer for any non Ford facility. There are other Enhanced Scan Tools that may have reprogramming capabilities available. Refer to the manufacturers users manual for details.

Programming the VID Block for a Replacement PCM

A new PCM will contain the latest strategy and calibration level for a particular vehicle. However, the VID block will be blank and will need programming. There are two procedures available. The first is an automatic data transfer from the old PCM to the new PCM and the second is manual data entry into the new PCM.

Automatic data transfer will be performed if the old PCM is capable of communicating. This is done by the use of a scan tool to retrieve data from the old PCM before removing it from the vehicle. The stored data can now be downloaded to the new PCM after it has been replaced.

Manual data entry must be performed if the old module is damaged and is incapable of communicating. Remove and replace the old PCM. You may be instructed to contact the "AS BUILT" data center for the information needed to manually update the VID block with the scan tool. Contact the center ONLY if the old PCM cannot be used or the data is corrupt. For Ford L-M technician's, contact your National Hotline for "AS Built" data. Non Ford technicians, use the Fed World website at "fedworld.gov". Select Auto Service Information and search for "Calibrations" or "Vehicle Calibrations" then specify vehicle manufacturer, model name and model year as required.

Making Changes to the VID Block

A PCM which is programmed may require changes to be made to certain VID information to accommodate vehicle hardware. Refer to PCM/Module Reprogramming on the Scan Tool.

Making Changes to the PCM Calibration

At certain times, the entire EEPROM will need to be completely reprogrammed. This is due to changes made to the strategy or calibration after production or the need to reset the VID block because it has reached its limit. Refer to PCM/Module Reprogramming on the Scan Tool.

Diagnostic Monitoring Test Results

The purpose of this test mode is to allow access to the results of OBD II monitor diagnostic test results. The test values that are stored at the time of the particular monitor completion are displayed when the particular test identification is requested. Refer to the following table for test information.

DIAGNOSTIC MONITORING TEST RESULTS TABLE

Module ID h ^a	Test ID h ^a	Component ID h ^a	Test Description
			Oxygen Sensor Monitor (01-0F)
10	01	11	Sensor Voltage Amplitude - Bank 1, Sensor 1
10	01	21	Sensor Voltage Amplitude - Bank 2, Sensor 1
10	02	11	Upstream Static Shift, Lean Shift on EGO11
10	02	11	Upstream Static Shift, Rich Shift on EGO11
10	02	21	Upstream Static Shift, Lean Shift on EGO21
10	02	21	Upstream Static Shift, Rich Shift on EGO21
10	03	01	Upstream Switchpoint
10	03	02	Downstream Switchpoint
			Catalyst Monitor (10-1F)
10	10	11	Rear to Front Switch Ratio Test - Bank 1 test
10	10	21	Rear to Front Switch Ratio Test - Bank 2 test
			Evaporative Monitor (21-2F)
10	21 ^b	00	Fuel Tank Pressure test - Low
10	21 ^b	00	Fuel Tank Pressure test - High
10	22 ^b	00	Evap-Phase 2 change in pressure test
10	23 ^b	00	Evap-Phase 4 change in pressure too large
10	24 ^b	00	Evap-Phase 4 change in pressure too small
10	25 ^b	00	Evap-Phase 4 pressure build test-upper limit
10	26	00	Phase 0 initial tank vacuum and minimum limit
10	26	00	Phase 0 initial tank vacuum and maximum limit
10	27	00	Phase 2 0.040" cruise leak check vacuum bleed-up and max 0.04" leak threshold
10	28	00	Phase 2 0.020" cruise leak check vacuum bleed-up and max leak threshold
10	29	00	EVAP-Phase 4 change in pressure too small
10	2A	00	Phase 4 vapor generation maximum change in pressure and maximum threshold
10	2B	00	Phase 4 vapor generation maximum absolute pressure rise and maximum threshold
10	2C	00	Phase 2 0.020" idle leak check vac bleed-up and max leak threshold
10	2D	00	Phase 2 0.020" idle leak check vacuum bleed-up and max no-leak threshold

			Secondary Air Monitor (30-3F)
10	30	11	O2S11 rich during flow test
10	30	21	O2S21 rich during flow test
10	30	12	O2S12 rich during flow test
10	31	00	O2Ss lean timer test
10	31	01	O2Ss lean timer test
			EGR System Monitor (41-4F)
10	41 ^b	11	Upstream hose disconnected test
10	41 ^b	12	Downstream hose disconnected test
10	45	20	Stuck Open Valve Test
10	49	30	EGR Flow Test
10	4B	30	Flow test
			Misfire Monitor (51-5F)
10	50	00	Total Misfires that exceeded threshold
10	53	01	Misfire rate per 200 revs for Cylinder 1/Type A
10	53	02	Misfire rate per 200 revs for Cylinder 2/Type A
10	53	03	Misfire rate per 200 revs for Cylinder 3/Type A
10	53	04	Misfire rate per 200 revs for Cylinder 4/Type A
10	53	05	Misfire rate per 200 revs for Cylinder 5/Type A
10	53	06	Misfire rate per 200 revs for Cylinder 6/Type A
10	53	07	Misfire rate per 200 revs for Cylinder 7/Type A
10	53	08	Misfire rate per 200 revs for Cylinder 8/Type A
10	53	09	Misfire rate per 200 revs for Cylinder 9/Type A
10	53	0A	Misfire rate per 200 revs for Cylinder 10/Type A
10	54	00	Highest misfire rate in 200 rev test/Type A
10	55	00	Highest misfire rate in 1000 rev test/Type B
10	56	00	Misfire monitor trip complete test

a = hexadecimal

b = These test IDs are signed values. Scan tool may display them as unsigned.

The conversion is done as follows:

If the value is > 32767 then complement (change 0's to 1's and 1's to 0's), add 1 and a negative sign.

Example:

50000 =	1100001101010000
Complement of 50000 =	0011110010101111
	+1
	0011110010110000

Signed Value =	-15536
----------------	--------

Drive Cycles

Description of OBD II Drive Cycle

The following procedure is designed to execute and complete the OBDII monitors and to clear the Ford P1000, I/M readiness code. To complete a specific monitor for repair verification, follow steps 1 through 4, then continue with the step described by the appropriate monitor found under the "OBDII Monitor Exercised" column. When the ambient air temperature is outside 4.4 to 37.8°C (40 to 100 °F), or the altitude is above 2438 meters (8000 feet), the EVAP monitor will not run. If the P1000 code must be cleared in these conditions, the PCM must detect them once (twice on some applications) before the EVAP monitor can be "bypassed" and the P1000 cleared. The EVAP "bypassing" procedure is described in the following drive cycle.

The OBDII Drive Cycle will be performed using a scan tool. Consult the instruction manual for each described function.

Note: A detailed description of a Powertrain Control Module (PCM) Reset is found in this section, refer to the table of contents.

Drive Cycle Recommendations

1. Most OBDII monitors will complete more readily using a "steady foot" driving style during cruise or acceleration modes. Operating the throttle in a "smooth" fashion will minimize the time required for monitor completion.
2. Fuel tank level should be between 1/2 and 3/4 fill with 3/4 fill being the most desirable.
3. The Evaporative Monitor can only operate during the first 30 minutes of engine operation. When executing the procedure for this monitor, stay in part throttle mode and drive in a smooth fashion to minimize "fuel slosh".

WARNING: STRICT OBSERVANCE OF POSTED SPEED LIMITS AND ATTENTION TO DRIVING CONDITIONS ARE MANDATORY WHEN PROCEEDING THROUGH THE FOLLOWING DRIVE CYCLES.

For best result, follow each of the following steps as accurately as possible:

OBDII Monitor Exercised	Drive Cycle Procedure	Purpose of Drive Cycle Procedure
Drive Cycle Preparation	1. Install scan tool. Turn key on with the engine off. Cycle key off, then on. Select appropriate Vehicle & Engine qualifier. Clear all DTC's/Perform a PCM reset.	Bypass engine soak timer. Resets OBDII Monitor status.
	2. Begin to monitor the following PIDs: ECT, EVAPDC, FLI (if available) and TP MODE. Start vehicle WITHOUT returning to Key Off.	
Prep for Monitor Entry	3. Idle vehicle for 15 seconds. Drive at 64 Km/h (40 MPH) until ECT is at least 76.7°C (170°F). 4. Is IAT within 4.4 to 37.8°C (40 to 100°F)? If not, complete the following steps, but note that step 14 will be required to "bypass" the EVAP monitor and clear the P1000.	Engine warm-up and provide IAT input to the PCM.
HEGO	5. Cruise at 64 Km/h (40 MPH) for at least 5 minutes.	Executes the

		HEGO monitor.
EVAP	6. Cruise at 72 to 104 Km/h (45 to 65 MPH) for 10 minutes (avoid sharp turns and hills). NOTE: To initiate the monitor TP MODE should = PT, EVAPDC must be > 75%, and FLI must be between 15 and 85%.	Executes the EVAP monitor (If IAT is within 4.4 to 37.8°C (40 to 100° F).
Catalyst	7. Drive in stop-and-go traffic conditions. Include five different constant cruise speeds, ranging from 40 to 72 Km/h (25 to 45 MPH) over a 10 minute period.	Executes the Catalyst Monitor.
EGR	8. From a stop, accelerate to 72 Km/h (45 MPH) at 1/2 to 3/4 throttle. Repeat 3 times.	Executes the EGR Monitor.
SEC AIR/CCM (Engine)	9. Bring the vehicle to a stop. Idle with transmission in drive (neutral for M/T) for 2 minutes.	Executes the ISC portion of the CCM.
CCM (Trans)	10. For M/T, accelerate from 0 to 80 Km/h (0 to 50 MPH), continue to step 11. For A/T, from a stop and in overdrive, moderately accelerate to 80 Km/h (50 MPH) and cruise for at least 15 seconds. Stop vehicle and repeat without overdrive to 64 Km/h (40 MPH) cruising for at least 30 seconds. While at 64 Km/h (40 MPH), activate overdrive and accelerate to 80 Km/h (50 MPH) and cruise for at least 15 seconds. Stop for at least 20 seconds and repeat step 10 five times.	Executes the transmission portion of the CCM.
Misfire & Fuel Monitors	11. From a stop, accelerate to 104 Km/h (65 MPH). Decelerate at closed throttle until 64 Km/h (40 MPH) (no brakes). Repeat this 3 times.	Allows learning for the misfire monitor.
Readiness Check	12. Access the On-Board System Readiness (OBDII monitor status) function on the scan tool. Determine whether all non-continuous monitors have completed. If not, go to step 13.	Determines if any monitor has not completed.
Pending Code Check and EVAP Monitor "Bypass" Check	13. With the scan tool, check for pending codes. Conduct normal repair procedures for any pending code concern. Otherwise, rerun any incomplete monitor. If the EVAP monitor is not complete AND IAT was out of the 4.4 to 37.8 °C (40 to 100 ° F) temperature range in step #4, or the altitude is over 2438 m. (8000 ft.), the EVAP "bypass" procedure must be followed. Proceed to Step 14.	Determines if a pending code is preventing the clearing of P1000.
EVAP Monitor "Bypass"	14. Park vehicle for a minimum of 8 hours. Repeat steps 2 through 12. DO NOT REPEAT STEP 1.	Allow the "bypass" counter to increment to two.

Intermittent Diagnostic Techniques

Intermittent diagnostic techniques help find and isolate the root cause of intermittent faults associated with the Electronic Engine Control System. The information is organized to help find the fault and perform the repair. The process of finding and isolating an intermittent starts with recreating a fault symptom, accumulating PCM data and comparing that data to typical values, then analyzing the results. Refer to the scan tool users manual for functions described below.

Before proceeding, be sure that:

- Customary mechanical system tests and inspections do not reveal a concern. (Remember, mechanical component conditions can make a PCM system react abnormally.)
- Technical Service Bulletins (TSBs) and OASIS messages, if available, are reviewed.
- Quick Test and associated Diagnostic Subroutines have been completed without finding a fault, and the symptom is still present.

Recreating the Fault

Recreating the fault is the first step in isolating the cause of the intermittent symptom. A thorough investigation should start with the customer information worksheet located in the back of the book. If Freeze Frame Data is available, it may help in recreating the conditions at the time of a Malfunction Indicator Lamp Diagnostic Trouble Code (MIL DTC). Listed below are some of the conditions for recreating the fault:

CONDITIONS TO RECREATE FAULT

Engine Type Conditions	Non-Engine Type Conditions
Engine Temperature	Ambient Temperature
Engine rpm	Moisture Conditions
Engine Load	Road Conditions (smooth-bumpy)
Engine idle/accel/decel	

Accumulating PCM Data

PCM data can be accumulated in a number of ways. This includes circuit measurements with a DVOM or scan tool PID data. Acquisition of PCM PID data using a scan tool is one of the easiest ways to gather information. Gather as much data as possible when the fault is occurring to prevent improper diagnosis. Data should be accumulated during different operating conditions and based on the customer description of the intermittent fault. Compare this data with the known good data values located in Section 6 in the [Typical Diagnostic Reference Values](#). This will require recording data in four conditions for comparison: 1) KOEO, 2) HOT IDLE, 3) 48 km/h (30 mph) and 4) 89 km/h (55 mph).

Analyzing Data From Playback of Stored PIDs

Look for abnormal events or values that are clearly incorrect. Inspect the signals for abrupt or unexpected changes. For example, during a steady cruise most of the sensor values should be relatively stable. Sensors such as TP, MAF and RPM that change abruptly when the vehicle is traveling at a constant speed are clues to a possible fault area.

Look for agreement in related signals. For example, if TP is changed during acceleration, a corresponding change should occur in IAC, RPM and SPARK ADV PID.

Make sure the signals act in proper sequence. An increase in rpm after the TP is increased is expected. However, if rpm increases without a TP change, then a fault may exist.

Table Format (Figure 1): Scroll through the PID data while analyzing the information. Look for sudden drops or spikes in the values. (Refer to the following TP example). Notice the major jump in the TP voltage while scrolling through the information. This example would require a smooth and progressive accelerator pedal travel during a key on and engine off mode.

Graph Format (Figure 2): Scroll through the PID data while analyzing the information. Look for sudden drops or spikes in the linear lines showing the transformation of values to the line graph. (Refer to the following TP example.) This example would require a smooth and progressive accelerator pedal with the key on and the engine off.

Figure 1: Table Format

Figure 2: Graph Format

Peripheral Inputs

Some signals may require certain peripherals or auxiliary tools for diagnosis. These tools include the Auxiliary Adapter and Pressure/Vacuum Adapter. In some cases, these devices can be inserted into the measurement jacks of the scan tool or multimeter. For example, connecting an electronic fuel pressure gauge to monitor and record the fuel pressure voltage reading and capturing the data would help find the fault.

Comparing PCM Data

After the PCM values have been acquired, it is necessary to determine the fault area. Typically, it will require the comparison of the actual values from the vehicle to the typical values from the Typical Diagnostic Reference Values in Section 6. The charts apply to different vehicle applications (i.e., model, engine, transmission, etc.).

Basic Circuit Checks

Description

Basic circuit checks help to minimize pinpoint test steps by providing a procedure to diagnose harness faults associated with the Electronic Engine Control (EC) System. The following techniques provide helpful reminders for diagnosing open circuits (continuity), shorts to ground and shorts to power.

NOTE:

- The suspect circuit must be isolated before testing.
- When disconnecting any harness connector, always inspect for damaged or pushed out pins, corrosion and loose wires. Repair as necessary.
- The digital multimeter must be set to the correct scale.
- The techniques do not apply in all situations, therefore, it is necessary to follow each pinpoint test step accurately and completely.
- General resistance and voltage values are specified below. Always use the pinpoint test values if they differ.
- Always turn the key to the OFF position unless directed otherwise by the pinpoint test.

Each of the following procedures will require the powertrain control module (PCM) and component to be disconnected to isolate the harness.

Open Circuit (Continuity)

Disconnect PCM. Measure the harness resistance between the suspect circuit at the harness connector and the appropriate PCM harness connector pin or PCM breakout box (if available). The resistance must be less than 5.0 ohms.

Shorts to Ground

Measure the harness resistance between the suspect circuit at the harness connector and a reliable ground (B-, chassis gnd or PWR GND at the PCM breakout box, if available). The resistance must be greater than 10,000 ohms.

Shorts to Power

Key ON to power up circuit. Measure voltage between the suspect circuit at the harness connector and a reliable ground. The voltage must be less than 1.0 volt.

On Board Diagnostics II

SECTION 3: Symptom Charts

Choose an item on the left side to display section contents.

QT: Step 1: PCM Quick Test

QT1 PERFORM PCM QUICK TEST

Note: If the vehicle was brought in with an emission compliance failure symptom, GO directly to Section 5; GO to [EM1](#).

- Complete preliminary checks looking for obvious concerns that may relate to the symptom. Check items such as those listed:
 - Related electrical connectors or fuses
 - Vacuum lines (leaks, routing)
 - Air intake system (leaks, restrictions)
 - Fuel quality (octane, contamination, winter/summer blend)
 - Cooling system (engine operating at proper temperature)
- Access any related OASIS or TSB information (if available).
- Complete PCM Quick Test to access any DTCs. Note any Key On Engine Off, Key On Engine Running (if engine runs) and Continuous Memory (MIL and non-MIL) DTCs.

Note: If unable to access DTCs, or any scan tool communication concern exists, GO to [QA1](#) in Section 5. For additional information on retrieving MIL and non-MIL DTCs, refer to Section 2, [Diagnostic Methods](#) (Continuous Memory Self-Test).

Were any DTCs present?

Yes	No
<p>If engine runs rough at idle and Key On Engine Running or Continuous Memory DTC(s) are present:</p> <p>GO to Quick Test QT2 to check injector fault PIDS.</p> <p>All Others:</p> <p>GO to Section 4 (Diagnostic Trouble Code (DTC) Charts) for direction to service DTC(s) after noting the following:</p> <p>Service DTCs in the following order (for each mode, begin diagnosis with the first DTC output).</p> <ol style="list-style-type: none"> 1. Any KOEO DTC(s) 2. Any KOER DTC(s) 3. Any Continuous Memory DTC(s) (retrieve any available Freeze Frame Data)(disregard any identical/related Continuous DTC(s) of DTC(s) already serviced). 	<p>GO to Step 2: NO DTC(s) PRESENT SYMPTOM CHART INDEX for direction to proper STEP 3 Chart.</p> <p>Note: If symptom is not listed, REFER to applicable Workshop Manual or GO to Z1 in Section 5 (for intermittent PCM system diagnostics).</p>

QT2 ENGINE RUNS ROUGH AT IDLE WITH KEY ON ENGINE RUNNING OR

CONTINUOUS MEMORY DTC(s): CHECK INJECTOR FAULT (INJxF) PID(s)

Note: An injector circuit fault could result in unrelated DTC(s) being received from the PCM.

- Key on, engine off.
- Access the INJxF PIDs (the "x" indicates the injector number). There will be one INJxF PID for each engine cylinder.

Do any of the INJxF PIDs indicate "Yes"?

Yes	No
<p>An injector circuit fault exists. KEY OFF. Disregard DTC(s).</p> <p>For Natural Gas applications: GO to HA60.</p> <p>All Others: GO to H56.</p>	<p>No fault detected by injector fault PIDs. KEY OFF. GO to Quick Test QT1 and follow the YES Action To Take for all others.</p>

Step 2: No DTC(s) Present Symptom Chart Index

	Engagement concern	503000	<u>Chart Number: 13</u>

Step 3: No DTC(s) Present Symptom Charts

Chart 1

- Starting Concerns: Stalls After Start
- Stalls/Quits: Idle, Acceleration, Cruise
- Runs Rough
- Misses
- Buck/Jerk
- Hesitation/Stumble
- Surge
- Unique Idle concerns: Rolling Idle

Note: For stalls on passenger car applications, engine may stall if left running while refueling. Advise customer to turn engine off while refueling to avoid contamination or damage to the EVAP system.

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
<p>Check The Following PIDs:</p> <ul style="list-style-type: none"> ■ DPFEGR (if equipped) (hot idle value within 0.15V of KOEO value) ■ LONGFT1 / LONGFT2 (value between -20 and +20) ■ VPWR (value between 10.5 and 17.0 volts, and within 0.5 volts of battery voltage) 	<p>DPFEGR PID value not within 0.15V of KOEO value: GO to HE100</p> <p>LONGFT1 / LONGFT2 value low (-): Continue diagnosis. Concentrate checks in areas that would cause the engine to run rich.</p> <p>LONGFT1 / LONGFT2 value high (+): Continue diagnosis. Concentrate checks in areas that would cause the engine to run lean.</p> <p>VPWR not between 10.5 and 17.0 volts: Go to the Charging System - General Information Section 414-00 of the Workshop Manual.</p> <p>VPWR between 10.5 and 17.0 volts, but not within 0.5 of battery voltage: CHECK B(+) supply to power relay (or CCRM). CHECK VPWR circuit between PCM and power relay or CCRM. CHECK PWR GND circuits.</p>
<p>For vehicles that run rough at idle: With the key on, engine off, check the INJxF PIDs (the "x" indicates the injector number, there will be one INJxF PID for each engine cylinder). All INJxF PIDs must indicate "NO".</p>	<p>INJxF PID(s) indicate "yes" (an injector circuit fault is indicated): Natural Gas applications: GO to HA60 All others: GO to H56</p>
<p>For engine now starts but stalls in PARK or NEUTRAL: If engine will start and run normally at part throttle, check Idle Air Control (IAC) System.</p>	<p>Engine will start and run normally, instead of stalling, at part throttle: GO to KE2</p>
<p>Mass Air Flow (MAF) Sensor</p>	<p>GO to DC25</p>

Secondary Ignition System	GO to JB1
Fuel Delivery System	For Natural Gas Applications: GO to HB1 All Others: GO to HC1
Exhaust System	GO to HF1
PCV System	GO to HG1
Natural Gas applications with rough idle: Injector circuits between NG module and injectors.	GO to HA57
EVAP System	Check for EVAP system blockages (engine stalls) or leaks (other symptoms). REFER to Evaporative Emissions, Section 303-13 in the Workshop Manual.
Automatic Transmission	Automatic Transaxle/Transmission - Section 307-01 of the Workshop Manual
Base Engine	Engine System - General Information, Section 303-00 of the Workshop Manual
Intake Air System	GO to HU1
Continental, LS6/LS8, Windstar: A/C pressure sensor input to PCM	GO to DS22
Additional Testing	GO to Z1
Additional Checks: NOTE: Some applications have a PID that will indicate whether the PCM is reducing torque (095E b0), and if so, why the torque is being reduced (095Eb1-13). <ul style="list-style-type: none"> ■ Correct PCM vehicle identification (VID) block information (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)) ■ Be aware of engine RPM/speed limiting functions of the PCM (look for incorrect high vehicle speed signal from ABS, VSS or OSS) ■ Verify fuel cap is properly tightened, and not physically damaged. ■ Drivelines ■ Manual transmission/clutch ■ Charging System ■ Traction control system (if equipped) ■ A/C system (for surge with A/C on) ■ Speed control system (for surge with speed control on) ■ A/C compressor diode, if equipped (for rolling idle) 	Applicable section in Workshop Manual.

Chart 2

Starting Concerns:

- Hard Start/Long Crank

- Erratic Start/Erratic Crank

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Battery Condition and Current Draw	Visual, Charging System - General Information Section 414-00 in the Workshop Manual.
Secondary Ignition System	GO to JB1
Fuel Delivery System	For Natural Gas Applications: GO to HB1 All Others: GO to HC1
Exhaust System	GO to HF1
PCV System	GO to HG1
EVAP System	Check for EVAP system blockages (engine stalls) or leaks (other symptoms). REFER to the Evaporative Emissions, Section 303-13 in the Workshop Manual.
Intake Air System	GO to HU1
Starting System	Starting System, Section 303-06 in the Workshop Manual.
Contaminated MAF Sensor	Visual Check
F-150 Lightning (5.4L SC) only: Check high speed fuel pump secondary circuits.	GO to KA70
Additional Testing	GO to Z1

Chart 3

Starting Concerns:

- No Start, Normal Crank

Note: Extended cranking because of a no start can load the exhaust system with raw fuel, damaging the catalytic converter after the engine starts. For applications with Secondary Air Injection (AIR) Systems, perform the following after the no start has been repaired: Disconnect the electric secondary air injection (AIR) solid state relay, run the engine until the surplus fuel is used up, and reconnect the relay (disconnecting the relay may set a Continuous Memory PCM DTC that will need to be cleared).

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Add-on Anti-Theft Devices	Visual, check with customer.
Fuel/Ignition	For LS6/LS8: GO to KB85 . All others: GO to A1 .
If engine will not start now: If engine will not start at closed throttle, but will start and run normally at part throttle, check Idle Air	Engine will now start and run normally at part throttle: GO to KE2

Control (IAC) System.	
Exhaust System (restrictions)	GO to <u>HF1</u>
Base Engine	Engine System - General Information Section 303-00 of the Workshop Manual.
Additional Testing	GO to <u>Z1</u>

Chart 4

Unique Idle Concerns:

- Slow Return To Idle

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Vacuum Leaks, Throttle Body	Visual
PCV System	GO to <u>HG1</u>
Intake Air System (air leaks)	GO to <u>HU1</u>

Chart 5

Unique Idle Concerns:

- Fast Idle

Additional Driveability Concerns:

- Diesels/Runs On

Note: If vehicle runs normally after the ignition key is turned OFF, check for damaged ignition switch, IGN RUN circuit short to power, VPWR circuit short to power, etc. Refer to applicable Wiring Diagram and/or Workshop Manual.

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Base engine air leaks, including proper sealing of intake manifold and components attached to intake air (such as the EGR valve or IAC valve).	Visual, Engine System - General Information Section 303-00 of the Workshop Manual.
Verify engine operates at normal temperature.	Visual (refer to Symptom Index, or Engine Cooling, Section 303-03 of Workshop Manual to diagnose any cooling system concerns that are present).
Fast idle concerns: Key on, engine off, monitor TP MODE PID while wiggling TP sensor circuits. TP MODE PID can also be monitored during vehicle drive. With	TP Mode PID is not C/T with throttle closed: NOTE: At vehicle start, the TP REL will begin at about 1.25 volts, and count down to the lowest TP V value seen since engine start. If the TP V value

throttle closed, TP MODE PID must be C/T (closed throttle).	<p>goes below the "normal" range, then increases again, TPREL will set to the lower voltage. If TP V is about 0.04 volts greater than the TPREL value at closed throttle, the PCM will go into part throttle mode.</p> <p>Monitor TP V and TPREL PIDs for sudden changes while checking for intermittent TP circuit/connector concerns. Also check for loose/worn throttle plates. If no concern is found, GO to <u>Z1</u> in Section 5.</p>
Intake Air System (air leaks)	GO to <u>HU1</u>
Additional Testing	GO to <u>Z1</u>

Chart 6

Unique Idle Concerns:

- Low/Slow Idle

Stalls/Quits

- Deceleration

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Verify fuel filler cap is properly tightened	Visual
For A/T with Stalls/Quits on deceleration: Transmission	Automatic Transaxle/Transmission, Section 307-01 of the Workshop Manual (Diagnosis By Symptom: Torque Converter Concerns)
For Low idle with A/C on (4.6/5.4L/6.8L E-Series): Check ACCS PID with A/C on and engine running (PID should indicate ON when A/C clutch is engaged). (On applications where the PCM cannot control the A/C clutch on and off, the PCM uses the ACCS circuit to determine additional load on the engine.)	ACCS PID does not indicate ON with A/C clutch engaged: GO to <u>KM10</u>
Fuel Delivery System	Natural Gas Applications: GO to <u>HB1</u> All Others: GO to <u>HC1</u>
Intake Air System	GO to <u>HU1</u>
Base Engine	Engine System - General Information, Section 303-00.
Additional Testing	GO to <u>Z1</u>

Chart 7

Backfires

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Secondary Ignition	GO to JB1
Fuel Delivery System	Natural Gas Applications: GO to HB1 All Others: GO to HC1
Base Engine	Engine System - General Information, Section 303-00 of the Workshop Manual.
Exhaust System	GO to HF1
Additional Testing	GO to Z1

Chart 8

Lack/Loss of Power

Note: Verify symptom is reported under normal driving conditions without excessive engine/vehicle load. Also, be aware of the engine rpm/speed limiting functions of the PCM.

Note: For applications with knock sensor, a lack of power may result when the vehicle is operated with a breakout box installed at the PCM. The KS circuits are not shielded in the breakout box, and KS signal noise may be noticed by the PCM. If this happens, spark timing will be retarded and a lack of power may result.

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
<ul style="list-style-type: none"> ■ Automatic Transmission Fluid ■ Throttle Linkage ■ Air cleaner element 	Visual
Check the Following PIDS: <ul style="list-style-type: none"> ■ DPFEGR (if equipped) (hot idle value within 0.15V of KOEO value) ■ LONGFT1 / LONGFT2 (value between -20 and +20) ■ For 4.6L E/F Series, 5.4L 4V Navigator/Blackwood: IMTVF with both Key On Engine Off, and with transmission in PARK/NEUTRAL and engine rpm greater than 3000 rpm (PID should indicate NO in both situations). 	DPFEGR PID value not within 0.15V of KOEO value: GO to HE100 LONGFT1 / LONGFT2 value low (-): Continue diagnosis. Concentrate checks in areas that would cause the engine to run rich. LONGFT1 / LONGFT2 value high (+): Continue diagnosis. Concentrate checks in areas that would cause the engine to run lean. IMTVF PID indicates YES: GO to HU65
Fuel Delivery System	Natural Gas Applications: GO to HB1

	All others: GO to HC1
Secondary Ignition	GO to JB1
Mass Air Flow (MAF) Sensor	GO to DC25
Exhaust System	GO to HF1
Base Engine	Engine System - General Information, Section 303-00 of the Workshop Manual
Automatic Transmission	Automatic Transaxle/Transmission, Section 307-01 of the Workshop Manual (Diagnosis by Symptom - Poor Performance)
Brake System (brake drag or binding)	Brake System - General Information, Section 206-00 of the Workshop Manual
Mustang only: Check for lack of A/C cutoff under wide open throttle conditions.	Audible (listen for A/C clutch to disengage during a brief wide open throttle, then re-engage a few seconds after returning to idle). Follow Symptom Chart 21 if A/C does not cutoff.
F-150 Lightning (5.4 SC): Supercharger bypass system	GO to KJ13
F-150 Lightning (5.4L SC): Check high speed fuel pump secondary circuits	GO to KA70
Additional Testing	GO to Z1
Additional Checks: NOTE: Some applications have a PID that will indicate whether the PCM is reducing torque (095E b0), and if so, why the torque is being reduced (095E b1-13). <ul style="list-style-type: none"> ■ Customer driving habits ■ Correct PCM vehicle identification (VID) block information (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)) ■ IMRC linkage (if equipped) ■ Clutch (M/T) ■ Charging System ■ Engine RPM/speed limiting functions of the PCM (look for incorrect high vehicle speed signal from ABS, VSS or OSS) 	Visual. Appropriate Group of the Workshop Manual.

Chart 9

Spark Knock

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)

Verify engine operates at normal temperature	Visual (refer to Symptom Index or Engine Cooling Section 303-03 of the Workshop Manual, to diagnose any cooling system concerns that are present).
Verify correct coolant level and coolant concentration	Refer to Engine Cooling Section 303-03 for proper fill concentrations and fill procedures.
Mass Air Flow (MAF) Sensor	GO to DC25
Base Engine	Engine System - General Information Section 303-00 of the Workshop Manual
Fuel Delivery System	For Natural Gas Applications: GO to HB1 All Others: GO to HC1
Secondary Ignition System	GO to JB1
PCV System	GO to HG1
Knock Sensor (if equipped)	GO to DG15
Engine Oil Quality	Visual
Additional Testing	GO to Z1

Chart 10

Poor Fuel Economy

Note: Since driving styles can have a significant influence on fuel economy, verify the concern before starting an in-depth diagnosis. Also, the following external factors could contribute to "poor fuel economy" conditions:

- Stop/go driving
- Improper tire pressure/size
- Vehicle loads (such as trailer towing)
- Extended winter warm-up conditions
- High speed driving

- Improper axle ratio
- Road/weather conditions
- Aftermarket add-ons
- Short run operations
- Customer expectations

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Transmission Fluid Level	Visual
Check The Following PIDs: <ul style="list-style-type: none"> ■ DPFEGR (if equipped) (hot idle value within 0.15V of KOEO value) ■ LONGFT1 / LONGFT2 (value between -20 and +20) ■ VPWR (value between 10.5 and 17.0 volts, and within 0.5 volts of 	DPFEGR PID value not within 0.15V of KOEO value: GO to HE100 LONGFT1 / LONGFT2 value low (-): Continue diagnosis. Concentrate checks in areas that would cause the engine to run rich.

battery voltage)	<p>LONGFT1 / LONGFT2 value high (+): Continue diagnosis. Concentrate checks in areas that would cause the engine to run lean.</p> <p>VPWR not between 10.5 and 17.0 volts: Go to the Charging System - General Information Section 414-00 of the Workshop Manual.</p> <p>VPWR between 10.5 and 17.0 volts, but not within 0.5 of battery voltage: CHECK B(+) supply to power relay (or CCRM). CHECK VPWR circuit between PCM and power relay or CCRM. CHECK PWR GND circuits.</p>
Verify engine operates at normal temperature	Visual (refer to Symptom Index, or Engine Cooling Section 303-03 of the Workshop Manual, to diagnose any cooling system concerns that are present).
Secondary Ignition System	GO to JB1
Fuel System	<p>For Natural Gas Applications: GO to HB1</p> <p>All Others: GO to HC1</p>
Exhaust System	GO to HF1
Automatic Transmission	Automatic Transaxle/Transmission Section 307-01 of the Workshop Manual (Diagnosis by Symptom - Poor Performance)
PCV System	GO to HG1
<p>Additional Checks:</p> <ul style="list-style-type: none"> ■ Correct PCM vehicle identification (VID) block information (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)) ■ Brake drag ■ Base engine concerns ■ Incorrect PCV valve ■ Contaminated MAF sensor ■ Intake air system 	Appropriate section in Workshop Manual
Additional Testing	GO to Z1

Chart 11

Emissions Compliance

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Emissions Related Systems	GO to EM1

Chart 12

Warning Indicators:

- MIL
- TCIL
- SIL
- Temperature Warning Indicator Lamp or Gauge (applications with CHT sensor)
- Check Fuel Cap Indicator Lamp

Note:

- If the symptom is both "MIL on" AND "exhaust emission test failure", GO directly to Chart 11.
- If engine is a no start, GO directly to Chart 3.
- If engine runs rough at idle, GO directly to Chart 1.

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Verify fuel filler cap is properly tightened	Visual
Trucks with Power Takeoff (PTO) and MIL concern: PTO input to PCM	GO to FB3
MIL always on when engine is running (no DTCs): MIL circuits	For Focus, Mustang, Town Car, Continental, LS6/LS8, Escape, Windstar, F-150, Expedition and Navigator/Blackwood: Instrument Cluster, Section 413-01 of the Workshop Manual. All Others: GO to NB1
TCIL always on when engine is running (no DTCs): TCIL circuits	For Focus, Mustang, Town Car, Continental, LS6/LS8, and Windstar: Instrument Cluster, Section 413-01 of the Workshop Manual. All Others: GO to TB6
MIL never on (including the bulb check when the engine is first started): MIL circuits	For Focus, Mustang, Town Car, Continental, LS6/LS8, Escape, Windstar, F-150, Expedition and Navigator/Blackwood: Instrument Cluster, Section 413-01 of the Workshop Manual. All others: GO to NB2
TCIL never on: TCIL circuits	For Focus, Mustang, Town Car, Continental, LS6/LS8 and Windstar: Instrument Cluster, Section 413-01 of the Workshop Manual. All others: GO to TB8
Temperature Warning Indicator Lamp or Gauge concerns (applications with CHT sensor only): Engine cooling system or lamp circuits	If engine is overheating: Engine Cooling, Section 303-03 of the Workshop Manual. Be aware that since a PCM DTC was not received, the PCM has not attempted to turn the lamp on. If engine operates at normal temperature: GO to DL40

SIL always on or off: SIL circuits	GO to KL1
Check Fuel Cap Indicator Lamp Always on or off: Check fuel indicator lamp circuits	For Mustang, Town Car, Continental, LS6/LS8, Escape, Windstar and Explorer/Mountaineer (w/150 pin PCM): Instrument Cluster, Section 413-01 of the Workshop Manual. All others: Indicator Lamp Always On: GO to HX88 Indicator Lamp Always Off: GO to HX89
Additional Testing	GO to Z1

Chart 13

Automatic Transmission Concerns:

- Upshift
- Downshift
- Engagement

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Transmission	Automatic Transaxle/Transmission Section 307-01 of the Workshop Manual
Additional Tests	GO to Z1

Chart 14

Instrumentation:

- Tachometer Inoperative
- Speedometer Inoperative

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Tachometer Inoperative Applications with CTO circuit from PCM pin 48: CTO circuit from PCM	GO to JH1
Speedometer/odometer Inoperative Applications with Manual Shift On The Fly (MSOF) transfer case using a Transfer Case Speed Sensor (TCSS):	GO to DP30
Instrumentation	Instrument Cluster, Section

Chart 15

Oil System Concerns:

- High Oil Consumption
- Leaks

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
PCV System	GO to HG1
Base Engine	Engine System - General Information Section 303-00 of the Workshop Manual
Additional Checks <ul style="list-style-type: none"> ■ External leaks ■ Proper dipstick ■ Proper oil viscosity 	Visual

Chart 16

Cooling System Concerns:

- Electric Cooling Fan(s) Does Not Operate (Low, Medium and/or High Speed)
- Hydraulic Cooling Fan Does Not Operate (LS6/8)

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Electric or Hydraulic Cooling Fan Components	<p>For Escort and Mustang: GO to X40</p> <p>For LS6/LS8: GO to KH1</p> <p>All Others: GO to KF25</p>
Cooling System	Engine Cooling, Section 303-03 of the Workshop Manual

Chart 17

Cooling System Concerns:

- Electric or Hydraulic Cooling Fan(s) Always Runs

Note: This chart is intended to only diagnose an electric or hydraulic cooling fan that always runs with a

"cool" engine and the A/C and defroster off.

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Cooling fan circuits and ACPSW or ACP circuits	For Escort and 4.6L Mustang: GO to X80 For 3.8L Mustang: GO to X82 For Continental and Windstar: GO to KF63 For LS6/LS8: GO to KH1 All Others: GO to KF60
Cooling System	Engine Cooling, Section 303-03 of the Workshop Manual

Chart 18

Exhaust System Concerns:

- Smoke

Note: Black smoke indicates a rich fuel mixture, blue smoke indicates burning oil, and white smoke indicates water in the combustion chamber.

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Base Engine	Engine System - General Information Section 303-00 of the Workshop Manual
Black Smoke: Fuel Delivery System	For Natural Gas Applications: GO to HB1 All Others: GO to HC1
Black Smoke: Ignition System	GO to JB1
Blue Smoke: PCV System	GO to HG1

Chart 19

Fuel System Concerns:

- Odor, Engine Compartment

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)

Natural Gas Applications: Fuel Delivery System	GO to HB16
EVAP System	Check for EVAP system leaks. REFER to Evaporative Emissions, Section 303-13 in the Workshop Manual.
Fuel System	Visual (refer to Fuel Tank and Lines, section 310-01 of the Workshop Manual for system description)

Chart 20

Engine Noise (under hood)

Note: Attempt to identify source of noise. If noise is from source other than those listed below, refer to Symptom Index (for noise such as spark knock) or applicable Workshop Manual section.

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Snap noise that may be due to secondary ignition arcing: Secondary Ignition System	For Coil On Plug Ignition Systems: Check condition of spark plug boots. All Others: GO to JB1

Chart 21

Climate Control:

- Lack of Cooling (A/C)/ A/C Not Functioning
- A/C Always On
- A/C Compressor Runs Continuously
- A/C Does Not CUT-OFF Under WOT Conditions (Mustang only)

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Mustang only: A/C electrical circuits	For lack of A/C cooling or A/C not functioning: GO to X98 (Mustang) For A/C always on: GO to X140 (Mustang) For A/C does not CUT-OFF under WOT conditions: GO to X130 (Mustang)
A/C System	If sent here from Workshop Manual with WACF PID displaying YES (fault indicated): GO to Section 4 , Powertrain Diagnostic Trouble Code (DTC) Charts and follow direction for KOEO DTC P1460. All others: Climate Control System, General Information section 412-00 of the Workshop Manual

Chart 22

Exhaust System Concerns

- Odor (Sulfur, Rotten Egg Smell)

Note: A slight sulfur smell may be normal. Catalysts with less than 8,000-16,000 kilometers (5,000-10,000 miles)(new vehicle or replaced catalyst) are likely to have a sulfur smell due to the highly active state of new catalysts. Replacing the catalyst can actually make the symptom worse.

SYSTEM/COMPONENT	REFERENCE (Section 5 Pinpoint Test unless noted)
Check for any driveability or exhaust smoke symptoms	Refer to STEP 2: NO DTC(s) PRESENT SYMPTOM Chart INDEX for direction to repair other symptoms.
Fuel Delivery System	For Natural Gas Applications: GO to HB1 All others: GO to HC1
EVAP System	Check for EVAP system leaks. REFER to the Evaporative Emissions, Section 303-13 in the Workshop Manual.
Fuel Source	Talk with customer. Since sulfur content can vary in different fuels, suggest trying a different fuel source.

Uxxxx	All	—	—	See Network DTC's Chart

Note: "x" = any number 0 thru 9

Note 1: DTC P1000 is ignored in KOEO AND KOER Self-Test. Disregard the DTC P1000 and continue as directed.

Note 2: For "P" DTCs not listed in this chart; refer to the customer's symptom to determine applicable Workshop Manual section for diagnosis.

Note 3: Go to the Workshop Manual Powertrain Group, Transmission Section to perform complete diagnosis.

Note 8: Go to the applicable Section of the Workshop Manual to diagnose the Chassis DTC.

Note 9: Go to the Vehicle Speed Control Section 310-03 of the Workshop Manual.

Note 10: Go to the Workshop Manual for REM (REAR ELECTRONICS MODULE) self-test/diagnostics.

Note 11: The vehicle ID block (VID) needs to be reprogrammed. For instructions refer to [Section 2](#), Flash VID Block Procedure.

Note 12: Vehicle speed information is provided by the anti-lock brake system. Go to Workshop Manual Section 206-09 Anti-Lock Control to perform complete diagnosis.

Note 13: See BI-Fuel Service Manual for instruction on how to retrieve DTCs from secondary module. (See P1640 Diagnostic Trouble Code (DTC) Descriptions for additional information.)

Note 14: Be sure to check for aftermarket performance products before replacing PCM. (If replacement is necessary refer to Section 2, [Flash Electrically Erasable Programmable Read Only Memory \(EEPROM\)](#).)

Note 15: Go to the Evaporative Emissions, Section 303-13 of the Workshop Manual.

Note 16: Go to the applicable Section of the Workshop Manual to diagnose the Body DTC. For LS6/LS8 with B2172, begin diagnosis in [Section 3](#).

Note 17: Go to the Transfer Case, Section 308-07 of the Workshop Manual.

Note 18: DTC P1636 indicates the PCM has lost communication with the Inductive Signature Chip.

Replace PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM))

Network DTCs Chart

DTC	Description	Action

UXXXX	"U" DTCs received during Self-test of another module.	GO to PC/ED <u>Section 3</u> , QT1 PCM Quick Test

^a PERFORM On-Board Diagnostics for the associated SCP module.

Diagnostic Trouble Code (DTC) Descriptions

DTC	Description	Possible Causes	Diagnostic Aides
P0102 - Mass Air Flow (MAF) Circuit Low Input	The MAF sensor circuit is monitored by the PCM for low air flow (or voltage) input through the comprehensive component monitor (CCM). If during key ON engine running the air flow (or voltage) changes below a minimum calibrated limit, the test fails.	<ul style="list-style-type: none"> • MAF sensor disconnected • MAF circuit open to PCM • VPWR open to MAF sensor • PWR GND open to MAF sensor • MAF RTN circuit open to PCM • MAF circuit shorted to GND • Intake air leak (near MAF sensor) • A closed throttle indication [throttle position (TP) sensor system] • Damaged MAF sensor • Damaged PCM 	A MAF V PID (MAF PID) reading less than 0.23 volts (Refer to equivalent grams/second chart in GO to Pinpoint Test DC) in continuous memory or key ON and engine running indicates a hard fault.
P0103 - Mass Air Flow (MAF) Circuit High Input	The MAF sensor circuit is monitored by the PCM for high air flow (or voltage) input through the comprehensive component monitor (CCM). If during key ON engine OFF or key ON engine running the air flow (or voltage) changes above a maximum calibrated limit, the test fails.	<ul style="list-style-type: none"> • MAF sensor screen is blocked • MAF circuit shorted to VPWR • Damaged MAF sensor • Damaged PCM 	A MAF V PID (MAF PID) reading less than 4.6 volts (Refer to equivalent grams/second chart in GO to Pinpoint Test DC) in continuous memory or key ON and engine running indicates a hard fault.
P0106 - Barometric (BARO) Pressure Sensor Circuit Performance	Baro sensor input to the PCM is monitored and is not within the calibrated value.	<ul style="list-style-type: none"> • Slow responding BARO sensor • Electrical circuit failure • Damaged BARO sensor • Damaged PCM 	<ul style="list-style-type: none"> • VREF voltage should be between 4.0 and 6.0 volts • PID reading is in frequency
P0107 - BARO/MAP Sensor Low Voltage Detected	Sensor operating voltage is less than 0.25 volts (VREF), as a result it failed below the minimum allowable calibrated parameter.	<ul style="list-style-type: none"> • Open in the circuit, or short to ground • VREF circuit open, or short to ground • Damaged BARO/MAP sensor • Damaged PCM 	<ul style="list-style-type: none"> • VREF should be greater than 4.0 volts • PID reading is in frequency/volts
P0108 - BARO/MAP Sensor High Voltage Detected	Sensor operating voltage is greater than 5.0 volts (VREF), as a result it failed above maximum allowable calibrated parameter.	<ul style="list-style-type: none"> • VREF shorted to VWPR • BARO/MAP signal shorted to VPWR • Damaged BARO/MAP sensor • Damaged PCM 	VREF should be less than 6.0 volts. PID reading is in frequency/Volts

P0109 - BARO/MAP Sensor Circuit Intermittent	The sensor signal to the PCM is failing intermittently.	<ul style="list-style-type: none"> • Loose electrical connection • Damaged BARO/MAP sensor 	Check harness and connection.
P0112 - Intake Air Temperature (IAT) Circuit Low Input	Indicates the sensor signal is less than Self-Test minimum. The IAT sensor minimum is 0.2 volts or 121°C (250°F).	<ul style="list-style-type: none"> • Grounded circuit in harness • Damaged sensor • Improper harness connection • Damaged PCM 	IAT V PID reading less than 0.2 volts with key ON and engine OFF or during any engine operating mode indicates a hard fault.
P0113 - Intake Air Temperature (IAT) Circuit High Input	Indicates the sensor signal is greater than Self-Test maximum. The IAT sensor maximum is 4.6 volts or -50°C (-58°F).	<ul style="list-style-type: none"> • Open circuit in harness • Sensor signal short to power • Damaged sensor • Improper harness connection • Damaged PCM 	IAT V PID reading greater than 4.6 volts with key ON and engine OFF or during any engine operating mode indicates a hard fault.
P0116 - Engine Coolant Temperature Circuit Range/Performance Failure	<p>Indicates the engine coolant temperature rationality test has failed. The PCM logic that sets this DTC indicates that engine coolant temperature sensor (ECT or CHT) drifted higher than the nominal sensor calibration curve and could prevent one or more OBD II monitors from executing. The PCM runs this logic after an engine off "calibrated soak period (typically 6 hours). This soak period allows the Intake Air Temperature (IAT) and engine coolant temperature (CHT or ECT) to stabilize and not differ by more than a calibrated value. DTC P0116 is set when all of the following conditions are met:</p> <ul style="list-style-type: none"> • Engine coolant temperature at engine start 	<ul style="list-style-type: none"> • Engine Coolant Temperature (ECT) or Cylinder Head Temperature (CHT) sensor • Coolant System Concern 	Ensure IAT and engine coolant temperature are similar when engine is cold. Also ensure engine coolant temperature sensor (ECT or CHT) and actual engine operating temperature are the same.

	<p>exceeds IAT at engine start by more than a calibrated value, typically 30° F (1°C).</p> <ul style="list-style-type: none"> • Engine coolant temperature exceeds a calibrated value, typically 225F (107C). • The Fuel, Heated Oxygen Sensor, Catalyst and Misfire monitors have not completed. • Calibrated timer to set DTC P0116 has expired. 		
P0117 - Engine Coolant Temperature (ECT) Circuit Low Input	<p>Indicates the sensor signal is less than Self-Test minimum. The ECT sensor minimum is 0.2 volts or 121°C (250°F). Note on some vehicles that are not equipped with an ECT sensor, CHT can be used and can set this DTC.</p>	<ul style="list-style-type: none"> • Grounded circuit in harness • Damaged sensor • Improper harness connection • Damaged PCM 	<p>ECT V PID reading less than 0.2 volts with key ON and engine OFF or during any engine operating mode indicates a hard fault.</p>
P0118 - Engine Coolant Temperature (ECT) Circuit High Input	<p>Indicates the sensor signal is greater than Self-Test maximum. The ECT sensor maximum is 4.6 volts or -50°C (-58° F). Note on some vehicles that are not equipped with an ECT sensor, CHT can be used and can set this DTC.</p>	<ul style="list-style-type: none"> • Open circuit in harness • Sensor signal short to power • Damaged PCM • Improper harness connection • Damaged sensor 	<p>ECT V PID reading greater than 4.6 volts with key ON and engine OFF or during any engine operating mode indicates a hard fault.</p>
P0121 - Throttle Position (TP) Circuit Performance Problem	<p>The TP sensor circuit is monitored by the PCM for a non closed throttle position at idle. If</p>	<ul style="list-style-type: none"> • Binding throttle linkage • Damaged throttle body • TP circuit open to PCM • Damaged TP sensor • SIG RTN circuit open to TP 	<p>Drive vehicle, bring to a stop, turn key OFF. Start vehicle, run key ON engine running self-test at idle. Access KOER</p>

	key ON engine running self-test terminates upon placing the transmission range selector in gear (DRIVE or REVERSE) or when closing the throttle (idle) after opening it (in PARK or NEUTRAL) the TP closed throttle position is not attained, the test fails.	sensor	diagnostic trouble codes on scan tool.
P0122 - Throttle Position (TP) Circuit Low Input	The TP sensor circuit is monitored by the PCM for a low TP rotation angle (or voltage) input through the comprehensive component monitor (CCM). If during key ON engine OFF or key ON engine running the TP rotation angle (or voltage) changes below a minimum calibrated limit, the test fails.	<ul style="list-style-type: none"> • TP sensor not seated properly • TP circuit open to PCM • VREF open to TP sensor • TP circuit short to GND • Damaged TP sensor • Damaged PCM 	A TP PID (TP V PID) reading less than 3.42% (0.17 volt) in key ON engine OFF, continuous memory or key ON engine running indicates a hard fault.
P0123 - Throttle Position (TP) Circuit High Input	The TP sensor circuit is monitored by the PCM for a high TP rotation angle (or voltage) input through the comprehensive component monitor (CCM). If during key ON engine OFF or key ON engine running the TP rotation angle (or voltage) changes above maximum calibrated limit, the test fails.	<ul style="list-style-type: none"> • TP sensor not seated properly • TP circuit short to PWR • VREF short to PWR • SIG RTN circuit open to TP sensor • Damaged TP sensor • Damaged PCM 	A TP PID (TP V PID) reading greater than 93% (4.65 volts) in key ON engine OFF, continuous memory or key ON engine running indicates a hard fault.
P0125 - Insufficient Coolant Temperature For Closed Loop Fuel Control	Indicates the ECT or CHT sensor has not achieved the required temperature level to enter closed loop operating conditions within a specified amount	<ul style="list-style-type: none"> • Insufficient warm up time • Low engine coolant level • Leaking or stuck open thermostat • Malfunctioning ECT sensor • Malfunctioning CHT sensor 	Refer to Thermostat Monitor in Section 1, Description and Operation, for system information.

	of time after starting engine.		
P0127 - Intake Air Temperature Too High	Indicates that IAT2 sensor has detected a potential abnormality in the intercooler system. This condition will cause the boost from the supercharger to be bypassed to avoid potential engine damage.	<ul style="list-style-type: none"> • Blockage of heat exchangers • Low fluid level • Fluid leakage • Intercooler pump or relay failure • Crossed intercooler coolant lines 	Monitor IAT2 PID. Typical IAT2 temperature should be greater than IAT1. Refer to Section 6 : Reference Values for ranges.
P0131 - HO2S Sensor Circuit Out of Range Low Voltage (HO2S-11)	The HO2S sensor is monitored for a negative voltage known as characteristic shift downward (CSD). If the sensor is thought to be switching from 0 volts to -1 volts during testing, the PCM will use this input and remain in fuel control.	<ul style="list-style-type: none"> • Contaminated HO2S (water, fuel, etc) • Crossed HO2S signal/signal return wiring 	
P0133 - HO2S Sensor Circuit Slow Response (HO2S-11)	The HEGO Monitor checks the HO2S Sensor frequency and amplitude. If during testing the frequency and amplitude were to fall below a calibrated limit, the test will fail.	<ul style="list-style-type: none"> • Contaminated HO2S sensor. • Exhaust leaks. • Shorted /open wiring. • Improper fueling. • MAF sensor. • Deteriorating HO2S sensor. • Inlet air leaks. 	Access HO2S test results from the Generic OBD-II menu to verify DTC.
P0135 - HO2S Sensor Circuit Malfunction (HO2S-11)	During testing the HO2S Heaters are checked for opens/shorts and excessive current draw. The test fails when current draw exceeds a calibrated limit and/or an open or short is detected.	<ul style="list-style-type: none"> • Short to VPWR in harness or HO2S. • Water in harness connector. • Open VPWR circuit. • Open GND circuit. • Low battery voltage. • Corrosion or poor mating terminals and wiring • Damaged HO2S heater. • Damaged PCM. 	<ul style="list-style-type: none"> ■ Wiring. ■ Damaged HO2S heater. ■ Damaged PCM.
P0136 - HO2S Sensor Circuit Malfunction (HO2S-12)	The downstream HO2S sensor(s) are continuously checked for maximum and minimum voltages. The test fails when the voltages fail to meet the calibrated limits.	<ul style="list-style-type: none"> • Pinched, shorted, and corroded wiring and pins. • Crossed sensor wires. • Exhaust leaks. • Contaminated or damaged sensor. 	

P0141 - HO2S Sensor Circuit Malfunction (HO2S-125)	See DTC P0135		
P0148 - Fuel Delivery Error	At least one bank lean at wide open throttle.	<ul style="list-style-type: none"> • Severely restricted fuel filter. • Severely restricted fuel supply line. 	
P0151 - HO2S Sensor Circuit Out of Range Low Voltage (HO2S-21)	See DTC P0131		
P0153 - HO2S Sensor Circuit Slow Response (HO2S-21)	See DTC P0133		
P0155 - HO2S Sensor Circuit Malfunction (HO2S-21)	See DTC P0135		
P0156 - HO2S Sensor Circuit Malfunction (HO2S-22)	See DTC P0136		
P0161 - HO2S Sensor Circuit Malfunction (HO2S-22)	See DTC P0135		
P0171 - System to Lean (Bank 1)	The Adaptive Fuel Strategy continuously monitors fuel delivery hardware. The test fails when the adaptive fuel tables reach a rich calibrated limit.	<p>For lean and rich DTCs:</p> <ul style="list-style-type: none"> • Fuel system • Excessive fuel pressure. • Leaking/contaminated fuel injectors. • Leaking fuel pressure regulator. • Low fuel pressure or running out of fuel. • Vapor recovery system. • Induction system: <ul style="list-style-type: none"> ■ Air leaks after the MAF. ■ Vacuum Leaks. ■ PCV system. ■ Improperly seated engine oil dipstick. • EGR system: <ul style="list-style-type: none"> ■ Leaking gasket. ■ Stuck EGR valve. ■ Leaking diaphragm or EVR. • Base Engine: <ul style="list-style-type: none"> ■ Oil overfill. ■ Cam timing. ■ Cylinder compression. ■ Exhaust leaks before or near the HO2Ss. 	A SHRTFT-1,2 PID value between -25% to +35% and a LONGFT-1,2 PID value between -35% to +35% is acceptable. Reading beyond these values indicate a failure.
P0172 - System to Rich (Bank 1)	The Adaptive Fuel Strategy	See Possible Causes for DTC P0171	See Diagnostic Aides for DTC P0171

	continuously monitors the fuel delivery hardware. The test fails when the adaptive fuel tables reach a lean calibrated limit.		
P0174 - System to Lean (Bank 2)	The Adaptive Fuel Strategy continuously monitors the fuel delivery hardware. The test fails when the adaptive fuel tables reach a rich calibrated limit.	See Possible Causes for DTC P0171.	See Diagnostic Aides for DTC P0171
P0175 - System to Rich (Bank 2)	The Adaptive Fuel Strategy continuously monitors the fuel delivery hardware. The test fails when the adaptive fuel tables reach a lean calibrated limit.	See Possible Causes for DTC P0171.	See Diagnostic Aides for DTC P0171
P0176 - Flexible Fuel (FF) Sensor Circuit Malfunction	The FF sensor input signal to PCM is continuously monitored. The test fails when the signal falls out of a maximum or minimum calibrated range.	<ul style="list-style-type: none"> • Open or short in FF sensor VPWR circuit • Open in battery ground to FF sensor circuit • Open in FF sensor signal circuit • Short to ground in FF sensor signal circuit • Fuel contamination • Short to VPWR in FF sensor battery ground circuit • Short to VPWR in FF sensor signal circuit • Fuel separation • Damaged FF sensor • Damaged PCM 	A flex fuel (FF) PID reading of 0 Hz with the key ON and engine OFF or with engine at idle indicates a hard fault.
P0180 - Engine Fuel Temperature Sensor A Circuit Low Input (EFT)	The comprehensive component monitor (CCM) monitors the EFT sensor circuit to the PCM for low and high voltage. If voltage were to fall below or exceed a calibrated limit and amount of time during testing, the test will fail.	<ul style="list-style-type: none"> • Open or short in harness. • Low ambient temperature operation. • Improper harness connection. • Damaged EFT sensor. • Damaged PCM. 	Verify EFT-PID value to determine open or short.
P0181 - Engine Fuel Temperature Sensor A Circuit Range/ Performance (EFT)	The comprehensive component monitor (CCM) monitors the EFT Temperature for	<ul style="list-style-type: none"> • Open or short in harness. • Low ambient temperature operation. • Improper harness connection. • Damaged EFT sensor. 	Verify EFT-PID value to determine open or short.

	acceptable operating temperature. If during testing voltage were to fall below or exceed a calibrated limit, a calibrated amount of time the test will fail.	<ul style="list-style-type: none"> • Damaged PCM. 	
P0182 - Engine Fuel Temperature Sensor A Circuit Low Input (EFT)	The comprehensive component monitor (CCM) monitors the EFT sensor circuit to the PCM for low voltage. If voltage were to fall below a calibrated limit and amount of time during testing, the test will fail.	<ul style="list-style-type: none"> • Short in harness. • VREF open or shorted. • Low ambient temperature operation. • Improper harness connection. • Damaged EFT sensor. • Damaged PCM. 	Verify EFT-PID and VREF values to determine open or short.
P0183 - Engine Fuel Temperature Sensor A Circuit High Input (EFT)	The comprehensive component monitor (CCM) monitors the EFT sensor circuit to the PCM for high voltage. If voltage were to exceed a calibrated limit and a calibrated amount of time during testing, the test will fail.	<ul style="list-style-type: none"> • Open or short to PWR in harness. • Damaged EFT sensor. • Improper harness connection. • Damaged PCM. 	Verify EFT-PID value to determine open or short.
P0186 - Engine Fuel Temperature Sensor B Circuit Range/Performance (EFT)	See DTC P0181.		
P0187 - Engine Fuel Temperature Sensor B Circuit Low Input (EFT).	See DTC P0182.		
P0188 - Engine Fuel Temperature Sensor B Circuit High Input (EFT)	See DTC P0183.		
P0190 - Fuel Rail Pressure Sensor Circuit Malfunction (FRP)	The comprehensive component monitor (CCM) monitors the FRP sensor to the PCM for VREF voltage. The test fails when the VREF voltage from the PCM drops to a voltage less than a	<ul style="list-style-type: none"> • VREF open in harness. • VREF open in sensor. • VREF open in PCM. 	Verify VREF voltage between 4.0 and 6.0V.

	minimum calibrated value.		
P0191 - Fuel Rail Pressure Sensor Circuit Performance (FRP)	The comprehensive component monitor (CCM) monitors the FRP pressure for acceptable fuel pressure. The test fails when the fuel pressure falls below or exceeds a minimum/maximum calibrated value for a calibrated period of time.	<ul style="list-style-type: none"> • High fuel pressure. • Low fuel pressure. • Damaged FRP sensor. • Excessive resistance in circuit. • Low or no fuel. 	A FRP PID value during KOER of 138 kpa (20 psi) and 413 kpa (60 psi) for gasoline or 586 kpa (85 psi) and 725 kpa (105 psi) for natural gas vehicles (NG) is acceptable.
P0192 - Fuel Rail Pressure Sensor Circuit Low Input (FRP)	The comprehensive component monitor (CCM) monitors the FRP sensor circuit to the PCM for low voltage. If voltage were to fall below a calibrated limit and amount of time during testing, the test will fail.	<ul style="list-style-type: none"> • FRP signal shorted to SIG RTN or PWR GND. • FRP signal open (NG only) • Low fuel pressure (NG only) • Damaged FRP sensor. • Damaged PCM. 	A FRP PID value during KOER or KOEO less than 0.3 volts for gasoline or 0.5 volts for natural gas vehicles (NG) would indicate a hard fault.
P0193 - Fuel Rail Pressure Sensor Circuit High Input (FRP)	The comprehensive component monitor (CCM) monitors the FRP sensor circuit to the PCM for high voltage. If voltage were to fall below a calibrated limit and a calibrated amount of time during testing, the test will fail.	<ul style="list-style-type: none"> • FRP signal shorted to VREF or VPWR. • FRP signal open (gasoline only) • Low fuel pressure (NG only) • Damaged FRP sensor. • Damaged PCM. • High fuel pressure (caused by damaged fuel pressure regulator) NG. 	A FRP PID value during KOER or KOEO less than 0.3 volts for gasoline or 0.5 volts for natural gas vehicles (NG) would indicate a hard fault.
P0201 through P0212 - Cylinder #1 through Cylinder #12 Injector Circuits	The comprehensive component monitor (CCM) monitors the operation of the fuel injector drivers in the PCM. The test fails when the fuel injector does not operate electrically even though the harness assembly and fuel injectors test satisfactorily.	<ul style="list-style-type: none"> • Faulty fuel injector driver within the PCM. 	PID Data Monitor INJ1F-INJ12F fault flags = YES.
P0217 - Engine Coolant Over-Temperature Condition	Indicates an engine overheat condition was detected by the	<ul style="list-style-type: none"> • Engine cooling system concerns. • Low engine coolant level. • Base engine concerns. 	Monitor CHT PID for overheat condition. Typical CHT temperature should be close to cooling

	<p>cylinder head temperature (CHT) sensor. This condition will cause the boost from the supercharger to be bypassed to avoid potential engine damage.</p>		<p>system thermostat opening specification.</p>
<p>P0230 - Fuel Pump Primary Circuit Malfunction</p>	<p>NOTE: For natural gas applications, the following description applies to the fuel shutoff valve (FSV) circuit.</p> <p>The PCM monitors the fuel pump (FP) circuit output from the PCM. The test fails if: With the FP output commanded ON (grounded), excessive current draw is detected on the FP circuit; or with the FP output commanded OFF, voltage is not detected on the FP circuit (the PCM expects to detect VPWR voltage coming through the fuel pump relay coil to the FP circuit).</p>	<ul style="list-style-type: none"> • Open or shorted fuel pump (FP) circuit • Open VPWR circuit to fuel pump relay • Damaged fuel pump relay • Damaged PCM 	<ul style="list-style-type: none"> • When the FPF PID reads YES, a fault is currently present. • An open circuit or short to ground can only be detected with the fuel pump commanded OFF. • A short to power can only be detected with the fuel pump commanded ON. • During KOEO and KOER self-test, the fuel pump output command will be cycled ON and OFF.
<p>P0231 - Fuel Pump Secondary Circuit Low</p>	<p>NOTE: For natural gas applications, the following description applies to the fuel shutoff valve monitor (FSVM) and the fuel shutoff valve power (FSV PWR) circuits.</p> <p>The PCM monitors the fuel pump monitor (FPM) circuit. The test fails if the PCM commands the fuel pump ON and B+ voltage is not detected on the FPM circuit.</p>	<ul style="list-style-type: none"> • Open B+ circuit to the fuel pump relay • Open FP PWR circuit between the fuel pump relay and its connection to the FPM circuit • Damaged fuel pump relay • Damaged PCM (engine will start) • For 4.6L Mustang, open FP PWR circuit from low speed fuel pump relay, through resistor to FPM splice (engine will start) • For 5.4L SC Lightning, damaged IFS switch, IFS switch relay, or concern with related circuits. 	<p>During KOEO self-test, the PCM will command the fuel pump ON so this test can be performed.</p>
<p>P0232 - Fuel Pump Secondary Circuit High</p>	<p>NOTE: For natural gas applications, the following description applies to</p>	<ul style="list-style-type: none"> • Inertia fuel shutoff (IFS) switch not reset or electrically open • Open circuit between the fuel pump and the FPM connection to the FP PWR 	<p>Continuous memory P0232 can be set if the IFS switch was tripped, then reset, or if the fuel pump circuit is activated when the PCM expected</p>

	<p>the fuel shutoff valve monitor (FSVM) and the fuel shutoff valve power (FSV PWR) circuits. The PCM monitors the fuel pump monitor (FPM) circuit. This test fails when the PCM detects voltage on the FPM circuit while the fuel pump is commanded OFF. The FPM circuit is wired to a pull-up voltage inside the PCM. The FPM circuit will go high if, with the key ON and the fuel pump commanded OFF, the FPM/FP PWR circuit loses its path to ground through the fuel pump. The FPM circuit will also go high if the FPM/FP PWR circuit is shorted to power.</p>	<p>circuit</p> <ul style="list-style-type: none"> • Poor fuel pump ground • Fuel pump electrically open • Fuel pump secondary circuits short to power • Fuel pump relay contacts always closed • Open FPM circuit between PCM and connection to FP PWR circuit • Damaged low speed fuel pump relay or concern with related circuits (if equipped). • Damaged PCM 	<p>the circuit to be off (i.e. fuel system test or prime procedure).</p>
<p>P0234 - Supercharger Overboost Condition</p>	<p>The PCM disables (bypasses) the supercharger boost and sets a diagnostic trouble code (DTC) to keep from damaging the</p>	<ul style="list-style-type: none"> • Brake torque (brake on and throttle at wide open) • Transmission oil temperature (TOT) exceeds calibrated threshold • Engine over temperature • Ignition misfire exceeds calibrated threshold 	<p>Check for other diagnostic trouble codes accompanying the P0234 or check appropriate and available PIDs related to above possible causes.</p>

	powertrain (engine or transmission) during potential harmful operating conditions.	<ul style="list-style-type: none"> • Knock sensor (KS) failure or knock detected • Low speed fuel pump relay not switching 	
P0243 - Supercharger (Boost) Bypass Solenoid Circuit Malfunction	The PCM monitors the supercharger (boost) bypass (SCB) solenoid circuit for an electrical failure. The test fails when the signal moves outside the minimum or maximum allowable calibrated parameters for a specified SCB solenoid duty cycle (100% or 0%) by PCM command.	<ul style="list-style-type: none"> • VPWR circuit open to SCB solenoid • SCB solenoid circuit shorted to PWR GND or CHASSIS GND • Damaged SCB solenoid • SCB solenoid circuit open • SCB solenoid circuit shorted to VPWR • Damaged PCM 	Disconnect SCB solenoid. Connect test lamp to SCB solenoid harness connector. Cycle SCB driver in PCM by Output Test Mode. Test lamp cycle on and off - SCB solenoid is suspect. Test lamp always on - SCB signal short in harness or PCM. Test always off - SCB signal or VPWR open in harness or PCM.
P0298 - Engine Oil Over Temperature Condition	Indicates the Engine Oil Temperature Protection strategy in the PCM has been activated. This will temporarily prohibit high engine speed operation by disabling injectors, therefore reducing the risk of engine damage from high engine oil temperature. Note: On engines which are equipped with an oil temperature sensor, the PCM reads oil temperature to determine if it is excessive. When an oil temperature sensor is not present, the PCM uses an oil algorithm to infer actual temperature. Engine shutdown strategy function is the same on vehicles with and without oil temperature sensors.	<ul style="list-style-type: none"> • Very high engine rpm for extended period of time. • Over-heating condition. • Malfunction EOT sensor or circuit (vehicles w/EOT sensor). • Base engine concerns. 	Engine operating in high rpm range, due to improper gear selection. May cause Lack/Loss of Power or Surge customer concern.
P0300 - Random Misfire	The random misfire DTC indicates	<ul style="list-style-type: none"> • Camshaft position sensor (CMP) 	One or more EGR passages may be

	multiple cylinders are misfiring or the PCM cannot identify which cylinder is misfiring.	<ul style="list-style-type: none"> • Low fuel: less than 1/8 tank • Stuck open EGR valve • Blocked EGR passages 	blocked or partially blocked. If this is the case the Misfire Detection Monitor will indicate the EGR port to check for possible blockage.
P0301 through P0310 - Misfire Detection Monitor	The misfire detection monitor is designed to monitor engine misfire and identify the specific cylinder in which the misfire has occurred. Misfire is defined as lack of combustion in a cylinder due to absence of spark, poor fuel metering, poor compression, or any other cause.	<ul style="list-style-type: none"> • Ignition system • Fuel injectors • Running out of fuel • EVAP canister purge valve • Fuel pressure • Evaporative emission system • Base engine 	The MIL will blink once per second when a misfire is detected severe enough to cause catalyst damage. If the MIL is on steady state, due to a misfire, this will indicate the threshold for emissions was exceeded and cause the vehicle to fail an inspection and maintenance tailpipe test.
P0320 - Ignition Engine Speed Input Circuit Malfunction	The ignition engine speed sensor input signal to PCM is continuously monitored. The test fails when the signal indicates that two successive erratic profile ignition pickup (PIP) pulses have occurred.	<ul style="list-style-type: none"> • Loose wires/connectors. • Arcing secondary ignition components (coil, wires and plugs) • On board transmitter (2-way radio) 	The DTC indicates that two successive erratic PIP pulses occurred.
P0325 - Knock Sensor 1 Circuit Malfunction (Bank 1)	See DTC P0326		
P0326 - Knock Sensor 1 Circuit Range/Performance (Bank 1)	The knock sensor detects vibrations upon increase and decrease in engine rpm. The knock sensor generates a voltage based on this vibration. Should this voltage go outside a calibrated level a DTC will set.	<ul style="list-style-type: none"> • Knock sensor circuit short to GND • Knock sensor circuit short to PWR • Knock sensor circuit open • Damaged knock sensor • Damaged PCM 	A knock sensor voltage greater than 0.5V with the key ON and engine OFF indicates a hard fault.
P0330 - Knock Sensor 2 Circuit Malfunction (Bank 2)	See DTC P0331		
P0331 - Knock Sensor 2 Circuit Range/performance (Bank 2)	The knock sensor detects vibration upon increase and decrease in engine rpm. The knock sensor generates a	<ul style="list-style-type: none"> • Knock sensor circuit short to GND • Knock sensor circuit short to PWR • Damaged knock sensor • Damaged PCM 	A knock sensor voltage greater than 0.5V with the key ON and engine OFF indicates a hard fault.

	voltage based on this vibration. Should this voltage go outside a calibrated level a DTC will set.	<ul style="list-style-type: none"> • Knock sensor circuit open 	
P0340 - Camshaft Position (CMP) Sensor Circuit Malfunction	The test fails when the PCM can no longer detect the signal from the CMP sensor.	<ul style="list-style-type: none"> • CMP circuit open • CMP circuit short to GND • CMP circuit short to PWR • SIG RTN open (VR sensor) • CMP GND open (Hall effect sensor) • CMP misinstalled (Hall effect sensor) • Damaged CMP sensor shielding • Damaged CMP sensor • Damaged PCM 	Harness routing, harness alterations, improper shielding, or electrical interference from other improperly functioning systems may have intermittent impact on the CMP signal.
P0350 - Ignition Coil (Undetermined) Primary/ Secondary Circuit Malfunction	Each ignition primary circuit is continuously monitored. The test fails when the PCM does not receive a valid IDM pulse signal from the ignition module (integrated in PCM).	<ul style="list-style-type: none"> • Open or short in Ignition START/RUN circuit • Open coil driver circuit • Coil driver circuit shorted to ground • Damaged coil • Damaged PCM • Coil driver circuit shorted to VPWR 	
P0351 Through P0360 - Ignition Coil A through J Primary/ Secondary Circuit Malfunction	Each ignition primary circuit is continuously monitored. The test fails when the PCM does not receive a valid IDM pulse signal from the ignition module (integrated in PCM).	<ul style="list-style-type: none"> • Open or short in Ignition START/RUN circuit • Open coil driver circuit in harness • Coil driver circuit shorted to ground • Damaged coil • Damaged PCM • Coil driver circuit shorted to PWR 	
P0400 EGR Flow Failure (outside the minimum or maximum limits)	The EEGR system is monitored once per drive cycle during steady state conditions above 48 mph . The test will fail when a malfunction is detected by PCM calculations indicating the EGR flow is less or greater than expected.	<ul style="list-style-type: none"> • EEGR valve stuck open or closed • Connector to EEGR not seated • EEGR motor windings shorted or open circuited • No power to EEGR • Harness open or shorted to power or ground • Vacuum signal to MAP restricted or leaking • MAF sensor signal erroneous • Damaged PCM • Carbon build up in EEGR valve seat area • One or more sensor not responding or out of range 	All of the following sensors input data to the PCM for proper operation of the EEGR system: ECT, CPS, IAT, MAF, TP, MAP. Any DTC relating to these sensors must be resolved prior to addressing P0400 code.
P0401 - EGR Flow Insufficient Detected	The EGR system is monitored during steady state driving	<ul style="list-style-type: none"> • Vacuum supply • EGR valve stuck closed • EGR valve leaks vacuum 	Perform KOER self-test and look for DTC P1408 as an indication of a hard

	<p>conditions while the EGR is commanded on. The test fails when the signal from the DPF EGR sensor indicates that EGR flow is less than the desired minimum.</p>	<ul style="list-style-type: none"> • EGR flow path restricted • EGRVR circuit shorted to PWR • VREF open to D.P.F. EGR sensor • D.P.F. EGR sensor downstream hose off or plugged • EGRVR circuit open to PCM • VPWR open to EGRVR solenoid • D.P.F. EGR sensor hoses both off • D.P.F. EGR sensor hoses reversed • Damaged EGR orifice tube • Damaged EGRVR solenoid • Damaged PCM 	<p>fault. If P1408 is not present, look for contamination, restrictions, leaks, and intermittents.</p>
<p>P0402 - EGR Flow Excessive Detected</p>	<p>The EGR system is monitored for undesired EGR flow during idle. The EGR monitor looks at the DPF EGR signal at idle and compares it to the stored signal measured during key ON and engine OFF. The test fails when the signal at idle is greater than at key ON engine OFF by a calibrated amount.</p>	<ul style="list-style-type: none"> • EGR valve stuck open • Plugged EGR vacuum regulator solenoid vent • Plugged EGR tube • Slow responding D.P.F. EGR sensor • Damaged DPF EGR sensor • Improper vacuum hose connection • Plugged vacuum hoses • EGRVR circuit shorted to ground • Damaged EGR vacuum regulator solenoid • Damaged PCM 	<p>A DPFEGR PID reading that is greater at idle than during key ON and engine OFF by 0.5 volt or a rough engine idle, may indicate a hard fault.</p>
<p>P0403 EEGR Electric Motor Windings Or Circuits To The PCM Shorted Or Open</p>	<p>The EEGR system is continuously monitored to check the 4 EEGR motor coils, circuits, and the PCM for opens, shorts to power and ground. If a malfunction is detected the EEGR system will be disabled and additional monitoring will be suspended for the remainder of the drive until the next drive cycle.</p>	<ul style="list-style-type: none"> • EEGR motor windings open • Connector to EEGR not seated • Open circuit in harness from PCM to EEGR • Open circuit in PCM • Short circuit in EEGR motor • Short circuit in harness from PCM to EEGR • Short circuit in PCM 	<p>If an intermittent condition is suspected the most effective method of wiring fault isolation is to use the wiggle test method while measuring for shorts and open circuits.</p>
<p>P0411 - Secondary Air Injection (AIR) system upstream flow</p>	<p>See DTC P1411</p>		
<p>P0412 - Secondary Air Injection System (AIR) circuit malfunction</p>	<p>The PCM attempts to control when air is injected in the exhaust. The DTC</p>	<ul style="list-style-type: none"> • AIR circuit open • AIR bypass solenoid fault • Damaged PCM • AIR circuit short to power 	<p>The AIR circuit is normally held high through the AIR bypass solenoid and SSR when</p>

	indicates a Secondary Air injection system AIR circuit fault.	<ul style="list-style-type: none"> • Solid state relay fault • Damaged AIR pump 	the output driver is off. Therefore, a low AIR circuit indicates a driver is always on and a high circuit indicates an open in the PCM.
P0420 - Catalyst System Efficiency Below Threshold (Bank 1)	Indicates Bank 1 catalyst system efficiency is below the acceptable threshold	<ul style="list-style-type: none"> • Use of leaded fuel • Damaged HO2S • Malfunctioning ECT • High fuel pressure • Damaged exhaust manifold • Damaged catalytic converter • Oil contamination • Cylinder misfiring • Downstream HO2S wires improperly connected • Damaged exhaust system pipe • Damaged muffler/tailpipe assembly • Retarded spark timing 	Compare HO2S upstream and downstream switch rate and amplitude. Under normal closed loop fuel conditions, high efficiency catalysts have oxygen storage which makes the switching frequency of the downstream HO2S very slow and reduces the amplitude of those switches as compared to the upstream HO2S. As catalyst efficiency deteriorates, its ability to store oxygen declines and the downstream HO2S signal begins to switch more rapidly with increase amplitude, approaching the switching rate and amplitude of the upstream HO2S. Once beyond an acceptable limit the DTC is set.
P0430 - Catalyst System Efficiency Below Threshold (Bank 2)	Indicates Bank 2 catalyst system efficiency is below the acceptable threshold.	<ul style="list-style-type: none"> • Use of leaded fuel • Damaged HO2S • Malfunctioning ECT • High fuel pressure • Damaged exhaust manifold • Damaged catalytic converter • Oil contamination • Cylinder misfiring • Downstream HO2S wires improperly connected • Damaged exhaust system pipe • Damaged muffler/tailpipe assembly • Retarded spark timing 	Compare HO2S upstream and downstream switch rate and amplitude. Under normal closed loop fuel conditions, high efficiency catalysts have oxygen storage which makes the switching frequency of the downstream HO2S very slow and reduces the amplitude of those switches as compared to the upstream HO2S. As catalyst efficiency deteriorates, its ability to store oxygen declines and the downstream HO2S signal begins to switch more rapidly with increase amplitude, approaching the switching rate and amplitude of the upstream HO2S. Once beyond an acceptable limit the DTC is set.
P0442 - EVAP Control System	The PCM monitors the complete	<ul style="list-style-type: none"> • After-market EVAP hardware (such as fuel filler 	

Leak Detected (Small Leak)	EVAP control system for presence of a small fuel vapor leak. The system failure occurs when a fuel vapor leak from an opening as small as 1.016 mm (0.04 inch) is detected by the EVAP running loss monitor test.	cap) non-conforming to required specifications <ul style="list-style-type: none"> • Small holes or cuts in fuel vapor hoses/tubes • Canister vent solenoid stays partially open on closed command • Damaged, cross-threaded or loosely installed fuel filler cap • Loose fuel vapor hose/tube connections to EVAP system components • EVAP system component seals leaking (EVAP canister purge valve, fuel tank pressure sensor, canister vent solenoid, fuel vapor control valve tube assembly or fuel vapor vent valve assembly) 	
P0443 - EVAP Control System Canister Purge Valve Circuit Malfunction	The PCM monitors the EVAP canister purge valve circuit for an electrical failure. The test fails when the signal moves outside the minimum or maximum allowable calibrated parameters for a specified purge duty cycle by PCM command.	<ul style="list-style-type: none"> • VPWR circuit open • EVAP canister purge valve circuit shorted to GND • Damaged EVAP canister purge valve • EVAP canister purge valve circuit open • EVAP canister purge valve circuit shorted to VPWR • Damaged PCM 	Monitor EVAPPDC PID and voltage between EVAP canister valve signal and PWR GND in output test mode with key ON engine OFF (or in key ON engine RUNNING mode). EVAPPDC PID at 0% and voltage less than 1.0 volts (or EVAPPDC PID at 100% and voltage less than 0.5 volts) indicates a hard fault.
P0451 - FTP Sensor Circuit Noisy	The fuel tank pressure changes greater than 14 inches of H ₂ O in 0.10 seconds.	<ul style="list-style-type: none"> • Intermittent open or short in the FTP sensor or the FTP sensor signal. 	Monitor FTP PID and does it change from above 15 inches of H ₂ O to below a minus (-) 15 inches of H ₂ O often in 1.0 minute.
P0452 - FTP Sensor Circuit Low Voltage Detected	The PCM monitors the EVAP control system FTP sensor input signal to the PCM. The test fails when the signal average drops below a minimum allowable calibrated parameter.	<ul style="list-style-type: none"> • Contamination internal to FTP sensor connector • Damaged PCM • FTP circuit shorted to GND or SIG RTN • Damaged FTP sensor 	FTP V PID reading less than 0.22 volt with key ON and engine OFF or during any engine operating mode indicates a hard fault.
P0453 - FTP Sensor Circuit High Voltage Detected	The PCM monitors the EVAP control system FTP sensor input signal to the PCM. The test fails when the signal average jumps	<ul style="list-style-type: none"> • FTP circuit open • VREF shorted to VPWR • Damaged PCM • FTP circuit shorted to VREF or VPWR • SIG RTN circuit open • Damaged FTP sensor 	FTP V PID reading greater than 4.50 volts with key ON and engine OFF or during any engine operating mode indicates a hard fault.

	above a minimum allowable calibrated parameter.		
P0455 - EVAP Control System Leak Detected (No Purge Flow or Large Leak)	The PCM monitors the complete EVAP control system for no purge flow, the presence of a large fuel vapor leak or multiple small fuel vapor leaks. The system failure occurs when no purge flow (attributed to fuel vapor blockages or restrictions), a large fuel vapor leak or multiple fuel vapor leaks are detected by the EVAP running loss monitor test with the engine running (but not at idle).	<ul style="list-style-type: none"> • After-market EVAP hardware (such as fuel filler cap) non-conforming to required specifications • Disconnected or cracked fuel EVAP canister tube, EVAP canister purge outlet tube or EVAP return tube • EVAP canister purge valve stuck closed • Damaged EVAP canister • Damaged or missing fuel filler cap • Insufficient fuel filler cap installation • Loose fuel vapor hose/tube connections to EVAP system components • Blockages or restrictions in fuel vapor hoses/tubes (items also listed under disconnections or cracks) • Fuel vapor control valve tube assembly or fuel vapor vent valve assembly blocked • Canister vent (CV) solenoid stuck open • Mechanically inoperative fuel tank pressure (FTP) sensor 	Check for audible vacuum noise or significant fuel odor in the engine compartment or near the EVAP canister and fuel tank.
P0456 - EVAP Control System Leak Detected (Very Small Leak)	The PCM monitors the complete EVAP control system for the presence of a very small fuel vapor leak. The system failure occurs when a fuel vapor leak from an opening as small as 0.508 mm (0.020 inch) is detected by the EVAP running loss monitor test.	<ul style="list-style-type: none"> • Very small holes or cuts in fuel vapor hoses/tubes. • Loose fuel vapor hose/tube connections to EVAP system components. • EVAP system component seals leaking (refer to Possible Causes under DTC P0442). 	
P0457 - EVAP Control System Leak Detected (Fuel Filler Cap Loose/Off)	A fuel tank pressure change of lesser than a minus (-) 7 inches of H ₂ O in 30 seconds has occurred after refueling; or there is excessive purge (fuel vapor) flow greater than 0.06 pounds per minute.	<ul style="list-style-type: none"> • Fuel filler cap not installed on refueling (storing continuous memory DTC) and "check Fuel Cap" light may also be illuminated. • Fuel filler cap missing, loose or cross-threaded. 	Check for missing fuel filler cap or integrity of the cap. If OK, clear continuous memory DTCs and re-initiate EVAP Emission Running Loss Monitor Drive Cycle.

P0460 - Fuel Level Sensor Circuit Malfunction	<p>The PCM monitors the fuel level input (FLI) circuit for electrical failure. The test fails when the signal moves outside the minimum or maximum allowable calibrated parameters for a specified fuel fill percentage in the fuel tank.</p>	<ul style="list-style-type: none"> • Empty fuel tank • Fuel pump (FP) module stuck open • Incorrectly installed fuel gauge • Damaged instrument cluster • CASE GND circuit open • FLI shorted to VPWR • Damaged PCM • Overfilled fuel tank • Fuel pump (FP) module stuck closed • Damaged fuel gauge • FLI circuit open • FLI circuit shorted to CASE GND or PWR GND • CSE GND shorted to VPWR 	<p>Monitor FLI PID and FLI V PID in key ON engine RUNNING. FLI PID at 25% fill (with non matching fuel gauge) and FLI V PID less than 0.90 volts [for FLI PID at 75% fill (with non matching fuel gauge) and FLI V PID greater than 2.45 volts] indicates a hard fault.</p>
P0500 - Vehicle Speed Sensor (VSS) Malfunction	<p>Indicates the powertrain control module (PCM) detected an error in the vehicle speed information. Vehicle speed data is received from either the vehicle speed sensor (VSS), transfer case speed sensor (TCSS), anti-lock brake system (ABS) control module, generic electronic module (GEM), or central timer module (CTM). If the engine rpm is above the torque converter stall speed (automatic transmission) and engine load is high, it can be inferred that the vehicle must be moving. If there is insufficient vehicle speed data input, a malfunction is indicated and a DTC is set. On most vehicle applications the malfunction indicator lamp (MIL) will be triggered when this DTC is set.</p>	<ul style="list-style-type: none"> • Open in VSS+/VSS- harness circuit. • Open in TCSS signal or TCSS signal return harness circuit. • Short to GND in VSS harness circuit. • Short to GND in TCSS harness circuit. • Short to PWR in VSS harness circuit. • Short to PWR in TCSS harness circuit. • Open or short in the vehicle speed circuit(s) (VSC) between the PCM and appropriate control module. • Damaged VSS or TCSS. • Damaged wheel speed sensors. • Damaged wheel speed sensor harness circuits. • Damage in module(s) connected to VSC/VSS circuit. • Damage drive mechanism for VSS or TCSS. 	<p>Monitor VSS PID while driving vehicle. This DTC is set when the PCM detects a sudden loss of vehicle speed signal over a period of time. If vehicle speed data is lost, check the source of where the vehicle speed input originates from: VSS, TCSS, ABS, GEM or CTM. Note: On some MSOF applications, VSS and TCSS PID can be monitor. However if no TCSS PID is available and VSS PID is zero, TCSS circuitry frequency must be checked for loss of sensor signal. If another vehicle electronic module has generated the P0500 and the vehicle does not receive its vehicle speed input from one of the above mention sources (VSS, TCSS, ABS, GEM or CTM). Check the PCM for Output Shaft Speed Sensor (OSS) DTCs. On OSS applications the PCM uses the OSS to calculated the vehicle speed. If no OSS DTCs are found check for correct PCM configuration. Check PCM configuration for correct tire size and axle ratio.</p>
P0501 - Vehicle Speed Sensor (VSS) Range/	<p>Indicates the powertrain control module (PCM)</p>	<ul style="list-style-type: none"> • Refer to possible causes for P0500. 	<p>Refer to diagnostic aids for P0500.</p>

Performance	detected an error in the vehicle speed information. This DTC is set the same way as P0500, however the malfunction indicator lamp (MIL) is not triggered.		
P0503 - Vehicle Speed Sensor (VSS) Intermittent	Indicates poor or noisy VSS performance. Vehicle speed data is received from either the vehicle speed sensor (VSS), transfer case speed sensor (TCSS), anti-lock brake system (ABS) control module, generic electronic module (GEM), or central timer module (CTM).	<ul style="list-style-type: none"> Noisy VSS/TCSS input signal from Radio Frequency Interference/ Electro-Magnetic Interference (RFI/EMI) external sources such as ignition components or charging circuit. Damaged VSS or driven gears. Damaged TCSS. Damaged wiring harness or connectors. Malfunction in module(s) or circuit connected to VSS/TCSS circuit. After market add-on. 	Monitor VSS PID while driving vehicle, check for intermittent vehicle speed indication. Verify ignition and charging system are functioning correctly.
P0505 - Idle Air Control System Malfunction	The PCM attempts to control engine speed during KOER self-test. The test fails when the desired rpm could not be reached or controlled during the self-test.	<ul style="list-style-type: none"> IAC circuit open VPWR to IAC solenoid open IAC circuit shorted to PWR Air inlet is plugged Damaged IAC valve Damaged PCM 	The IAC solenoid resistance is from 6 to 13 ohms.
P0552 - Power Steering Pressure (PSP) Sensor Circuit Malfunction	The PSP sensor input signal to the PCM is continuously monitored. The test fails when the signal is open or shorted to ground.	<ul style="list-style-type: none"> PSP sensor damaged SIG RTN circuit open or shorted VREF circuit open or shorted PSP sensor signal circuit open or shorted Damaged PCM 	The DTC indicates the PSP sensor circuit is open or shorted to ground.
P0553 - Power Steering Pressure (PSP) Sensor Circuit Malfunction	The PSP sensor input signal to PCM is continuously monitored. The test fails when the signal is shorted to power.	<ul style="list-style-type: none"> PSP sensor damaged SIG RTN circuit shorted to power VREF circuit shorted to power PSP sensor signal circuit shorted to power Damaged PCM 	The code indicates the PSP sensor circuit is shorted to power.
P0602 - Control Module Programming Error	This Diagnostic Trouble Code (DTC) indicates programming error within Vehicle ID block (VID).	<ul style="list-style-type: none"> VID data corrupted by the scan tool during VID reprogramming 	Using the scan tool, reprogram the VID block. If PCM does not allow reprogramming of the VID block, reflashing PCM will be required.
P0603 - Powertrain	Indicates the PCM	<ul style="list-style-type: none"> Reprogramming 	If KAPWR is interrupted

Control Module KAM Test Error	has experienced an internal memory fault. However there are external items that can cause this DTC.	<ul style="list-style-type: none"> • Battery terminal corrosion • KAPWR to PCM interrupt/open • Loose battery connection • Damaged PCM 	to the PCM because of a battery or PCM disconnect, DTC can be generated on the first power-up.
P0605 - PCM read only memory (ROM) error	Indicates the PCM ROM has been corrupted.	<ul style="list-style-type: none"> • An attempt was made to change the calibration. • Module programming error. • Damaged PCM 	<ul style="list-style-type: none"> ■ Reprogram or update calibration. ■ Reprogram VID block (use as built data). ■ Check for other DTC's or drive symptoms for further action.
P0703 - Brake Switch Circuit Input Malfunction	Indicates PCM did not receive a brake pedal position (BPP) input.	<ul style="list-style-type: none"> • Open or short in BPP circuit • Open or short in stoplamp circuits • Damaged PCM • Malfunction in module(s) connected to BPP circuit. (Rear Electronic Module [REM] Windstar and LS6/LS8 or Lighting Control Module (LCM) Continental and Town Car. • Damaged brake switch • Misadjusted brake switch 	Check for proper function of stoplamps. Follow correct Self-Test procedures, refer to Section 2 of Quick Test.
P0704 - Clutch Pedal Position Switch Malfunction	When the clutch pedal is depressed the voltage goes to low. If the PCM does not see this change from high to low the DTC is set.	<ul style="list-style-type: none"> • CPP circuit short to PWR • Damaged CPP switch • CPP circuit open in the SIGRTN • Damaged PCM 	When depressing the CPP switch the voltage should cycle from 5.0V down.
P0720 - Insufficient input from Output Shaft Speed sensor	The output shaft speed sensor inputs a signal to the PCM, based on the speed of the output shaft of the transmission. The PCM compares this signal with the signal of the VSS or TCSS and determines correct tire size and axle gear ratio.	<ul style="list-style-type: none"> • OSS sensor circuit short to GND • OSS sensor circuit short to PWR • OSS sensor circuit open • Damaged OSS sensor • Damaged PCM 	Verify sensor signal output varies with vehicle speed.
P0721 - Noise interference on Output Shaft Speed sensor signal	The output shaft speed sensor signal is very sensitive to noise. This noise distorts the input to the PCM.	<ul style="list-style-type: none"> • Wiring misrouted • After market add-on • Wiring damaged • Wiring insulation wear 	<ul style="list-style-type: none"> ■ Check routing of harness. ■ Check wiring and connector for damage.
P0722 - No signal from Output Shaft Speed sensor	The output shaft speed sensor failed to provide a	<ul style="list-style-type: none"> • Damaged OSS connector • Damaged OSS sensor, or not installed properly 	

	signal to the PCM upon initial movement of vehicle.	<ul style="list-style-type: none"> • Harness intermittently shorted or open 	
P0723 - Output Shaft Speed sensor circuit intermittent failure	The output shaft speed sensor signal to the PCM is irregular or interrupted.	<ul style="list-style-type: none"> • Harness connector not properly seated • Harness intermittently shorted, or open • Harness connector damaged • OSS sensor damaged, or not installed properly 	<ul style="list-style-type: none"> ■ Verify harness and connector integrity ■ Verify OSS sensor proper installation
P0812 - Reverse Switch (RS) input circuit malfunction	The DTC indicates that the voltage is high when it should be low.	<ul style="list-style-type: none"> • Transmission shift not indicating neutral while in KOEO Self-Test • RS circuit short to PWR • Damaged reverse switch • RS circuit open or short to SIGRTN • Damaged PCM 	Check RS PID while exercising shift lever in and out of reverse.
P1000 - Monitor Testing Not Complete	The on board diagnostic II (OBD II) monitors are performed during the OBD II Drive Cycle. The DTC will be stored in continuous memory if any of the OBD II monitors do not complete.	<ul style="list-style-type: none"> • Vehicle is new from the factory • Battery or PCM had recently been disconnected • An OBD II monitor failure had occurred before completion of an OBD II drive cycle • PCM DTCs have recently been cleared with a scan tool • PTO circuit is shorted to VPWR or B+ or PTO is on during testing 	The DTC does not need to be cleared from the PCM except to pass an inspection/maintenance test.
P1001 - KOER Not Able To Complete, KOER Aborted	This Non-MIL (Malfunction Indicator Lamp) code will be set when Key On Engine Running (KOER) Self-Test does not complete in the time intended.	<ul style="list-style-type: none"> • Incorrect Self-Test Procedure. • Unexpected response from Self-Test monitors. • rpm out of specification. 	Rerun Self-Test following QT1 in Section 3 , Symptom Charts, STEP 1: PCM Quick Test.
P1100 - Mass Air Flow (MAF) Sensor Intermittent	The MAF sensor circuit is monitored by the PCM for sudden voltage (or air flow) input change through the comprehensive component monitor (CCM). If during the last 40 warm-up cycles in key ON engine running the PCM detects a voltage (or air flow) change beyond the minimum or maximum	<ul style="list-style-type: none"> • Poor continuity through the MAF sensor connectors • Poor continuity through the MAF sensor harness • Intermittent open or short inside the MAF sensor. 	While accessing the MAF V PID on the scan tool, lightly tap on the MAF sensor or wiggle the MAF sensor connector and harness. If the MAF V PID suddenly changes below 0.23 volt or above 4.60 volts, an intermittent fault is indicated.

	calibrated limit, a continuous memory diagnostic trouble code (DTC) is stored.		
P1101 - Mass Air Flow (MAF) Sensor Out of Self-Test Range	The MAF sensor circuit is monitored by the PCM for an out of range air flow (or voltage) input. If during key ON engine OFF the air flow voltage signal is greater than 0.27 volts the test fails. Likewise, if during key ON engine running, an air flow voltage signal is not within 0.46 volt to 2.44 volts, the test fails. For voltage to air flow gm/sec conversion, GO to Pinpoint Test DC and refer to Voltage To Mass Air Flow Conversion Table.	<ul style="list-style-type: none"> • Low battery charge • MAF sensor partially connected • MAF sensor contamination • PWR GND open to MAF sensor • MAF RTN circuit open to PCM • Damaged MAF sensor • Damaged PCM 	A MAF V PID reading greater than 0.27 volts (KOEO) or a MAF V PID reading outside the 0.46 volt to 2.44 volts range (KOER) indicates a hard fault.
P1112 - Intake Air Temperature (IAT) Sensor Intermittent	Indicates IAT sensor signal was intermittent during the comprehensive component monitor.	<ul style="list-style-type: none"> • Damaged harness • Damaged sensor • Damaged harness connector • Damaged PCM 	Monitor IAT on scan tool, look for sudden changes in reading when harness is wiggled or sensor is tapped.
P1114 - Intake Air Temperature 2 Circuit Low Input	Indicates the sensor signal is less than Self-Test minimum. The IAT2 sensor minimum is 0.2 volts.	<ul style="list-style-type: none"> • Grounded circuit in harness • Improper harness connection • Damaged sensor • Damaged PCM 	Monitor IAT2 PID. Typical IAT2 temperature should be greater than IAT1. Refer to Section 6 : Reference Values for ranges.
P1115 - Intake Air Temperature 2 Circuit High Input	Indicates the sensor signal is greater than Self-Test maximum. The IAT2 sensor maximum is 4.6 volts.	<ul style="list-style-type: none"> • Open circuit in harness • Sensor signal short to power • Improper harness connection • Damaged sensor • Damaged PCM 	Monitor IAT2 PID. Typical IAT2 temperature should be greater than IAT1. Refer to Section 6 : Reference Values for ranges.
P1116 - Engine Coolant Temperature (ECT) Sensor Out of Self-Test Range	Indicates the ECT sensor is out of Self-Test range. Correct range is 0.3 to 3.7 volts.	<ul style="list-style-type: none"> • Overheating condition • Malfunctioning thermostat • Damaged ECT sensor • Low engine coolant • Damaged harness connector • Damaged PCM 	Engine coolant temperature must be greater than 10°C (50°F) to pass the KOEO Self-Test and greater than 82° C (180°F) to pass the KOER Self-Test.
P1117 - Engine Coolant Temperature (ECT)	Indicates ECT circuit became intermittently open	<ul style="list-style-type: none"> • Damaged harness • Damaged sensor • Damaged PCM 	Monitor ECT on scan tool, look for sudden changes in reading when

Sensor Intermittent	or shorted while engine was running.	<ul style="list-style-type: none"> • Damaged harness connector • Low engine coolant 	harness is wiggled or sensor is tapped.
P1120 - Throttle Position (TP) Sensor Out of Range Low (RATCH too Low)	The TP sensor circuit is monitored by the PCM for a low TP rotation angle (or voltage) input below the closed throttle position through the comprehensive component monitor (CCM). If during key ON engine OFF or key ON engine running the TP rotation angle (or voltage) remains within the calibrated self-test range but falls between 3.42 and 9.85% (0.17 and 0.49 volt), the test fails.	<ul style="list-style-type: none"> • TP circuit with frayed wires • Corrosion on TP circuit connectors • VREF open to TP sensor • VREF short to SIG RTN • TP sensor loose pins 	A TP PID (TP V PID) between 3.42 and 9.85% (0.17 and 0.49 volt) in key ON engine OFF, continuous memory or key ON engine running indicates a hard fault.
P1121 - Throttle Position (TP) Sensor Inconsistent with MAF Sensor	The PCM monitors a vehicle operation rationality check by comparing sensed throttle position to mass air flow readings. If during key ON engine running self-test the comparison of the TP sensor and MAF sensor readings are not consistent with calibrated load values, the test fails and a diagnostic trouble code is stored in continuous memory.	<ul style="list-style-type: none"> • Air leak between MAF sensor and throttle body • TP sensor not seated properly • Damaged TP sensor • Damaged MAF sensor 	Drive vehicle and exercise throttle and TP sensor in all gears. A TP PID (TP V PID) less than 4.82 % (0.24 volt) with a LOAD PID greater than 55% or a TP V PID greater than 49.05% (2.44 volts) with a LOAD PID less than 30% indicates a hard fault.
P1124 - Throttle Position (TP) Sensor Out of Self-Test Range	The TP sensor circuit is monitored by the PCM for an out of range TP rotation angle (or voltage) input. If during key ON engine OFF or key ON engine running the TP rotation angle (or voltage) reading is less than 13.27% (0.66 volt) or greater than 23.52% (1.17	<ul style="list-style-type: none"> • Binding or bent throttle linkage • TP sensor not seated properly • Throttle plate below closed throttle position • Throttle plate/screw misadjusted • Damaged TP sensor • Damaged PCM 	A TP PID (TP V PID) reading not between 13.27 and 23.52% (0.66 and 1.17 volts) in key ON engine OFF or key ON engine running indicates a hard fault.

	volts), the test fails.		
P1125 - Throttle Position (TP) Sensor Intermittent	The TP sensor circuit is monitored by the PCM for sudden TP rotation angle (or voltage) input change through the comprehensive component monitor (CCM). If during the last 80 warm-up cycles in key ON engine running the PCM detects a TP rotation angle (or voltage) changes beyond the minimum or maximum calibrated limit, a continuous diagnostic trouble code (DTC) is stored.	<ul style="list-style-type: none"> • Poor continuity through the TP sensor connectors • Poor continuity through the TP harness • Intermittent open or short inside the TP sensor 	While accessing the TP V PID on the scan tool, lightly tap on the TP sensor or wiggle the TP sensor connector and harness. If the TP V PID suddenly changes below 0.49 volt or above 4.65 volts, an intermittent fault is indicated.
P1127 - Exhaust Not Warm Enough, Downstream Sensor Not Tested	The HEGO monitor uses an exhaust temperature model to determine when the HO2S heaters are cycled ON. The test fails when the inferred exhaust temperature is below a minimum calibrated value.	<ul style="list-style-type: none"> • Engine not operating long enough prior to performing KOER self-test. • Exhaust system too cool. 	Monitor HO2S Heater PIDs to determine their ON/OFF state. DTC P1127 will be present if the exhaust is not hot.
P1128 - Upstream Oxygen Sensors Swapped from Bank to Bank (HO2S-11-21)	The HEGO monitor checks and determines if the HO2S signal response for a fuel shift corresponds to the correct engine bank. The test fails when a response from the HO2S(s) being tested is not indicated.	<ul style="list-style-type: none"> • Crossed HO2S harness connectors (upstream). • Crossed HO2S wiring at the harness connectors (upstream). • Crossed HO2S wiring at the 104-pin harness connectors (upstream). 	
P1129 - Downstream Oxygen Sensors Swapped from Bank to Bank (HO2S-12-22)	The HEGO monitor checks and determines if the HO2S signal response for a fuel shift corresponds to the correct engine bank. The test fails when a response from the HO2S(s) being tested is not	<ul style="list-style-type: none"> • Crossed HO2S harness connectors (downstream). • Crossed HO2S wiring at the harness connectors (downstream). • Crossed HO2S wiring at the 104-pin harness connectors (downstream). 	

	indicated.		
P1130 - Lack of HO2S-11 Switch, Fuel Trim at Limit	The HEGO Sensor is monitored for switching. The test fails when the HO2S fails to switch due to circuit or fuel at or exceeding a calibrated limit.	<p>Electrical:</p> <ul style="list-style-type: none"> • Short to VPWR in harness or HO2S • Water in harness connector • Open/Shorted HO2S circuit • Corrosion or poor mating terminals and wiring • Damaged HO2S • Damaged PCM <p>Fuel System:</p> <ul style="list-style-type: none"> • Excessive fuel pressure • Leaking/contaminated fuel injectors • Leaking fuel pressure regulator • Low fuel pressure or running out of fuel • Vapor recovery system <p>Induction System:</p> <ul style="list-style-type: none"> • Air leaks after the MAF • Vacuum Leaks • PCV system • Improperly seated engine oil dipstick <p>EGR System:</p> <ul style="list-style-type: none"> • Leaking gasket • Stuck EGR valve • Leaking diaphragm or EVR <p>Base Engine:</p> <ul style="list-style-type: none"> • Oil overfill • Cam timing • Cylinder compression • Exhaust leaks before or near the HO2S(s) 	A fuel control HO2S PID switching across 0.45 volt from 0.2 to 0.9 volt indicates a normal switching HO2S.
P1131 - Lack of HO2S-11 Switch, Sensor Indicates Lean	A HEGO sensor indicating lean at the end of a test is trying to correct for an over-rich condition. The test fails when the fuel control system no longer detects switching for a calibrated amount of time.	See Possible Causes for DTC P1130	
P1132 - Lack of HO2S-11 Switch, Sensor Indicates Rich	A HEGO sensor indicating rich at the end of a test is trying to correct for an over-lean condition. The test fails when the fuel control system no	See Possible Causes for DTC P1130	

	longer detects switching for a calibrated amount of time.		
P1137 - Lack of HO2S-12 Switch, Sensor Indicates Lean	The downstream HO2S sensors are forced rich and lean and monitored by the PCM. The test fails if the PCM does not detect the output of the HO2S in a calibrated amount of time.	<ul style="list-style-type: none"> • Pinched, shorted, and corroded wiring and pins • Crossed sensor wires • Exhaust leaks • Contaminated or damaged sensor 	
P1138 - Lack of HO2S-12 Switch, Sensor Indicates Rich	See DTC P1137		
P1150 - Lack of HO2S-21 Switch, Fuel Trim at Limit	See DTC P1130		
P1151 - Lack of HO2S-21 Switch, Sensor Indicates Lean	A HEGO sensor indicating lean at the end of a test is trying to correct for an over-rich condition. The test fails when fuel control system no longer detects switching for a calibrated amount of time.	See Possible Causes for DTC P1130	
P1152 - Lack of HO2S-21 Switch, Sensor Indicates Rich	A HEGO sensor indicating rich at the end of a test is trying to correct for an over-lean condition. The test fails when the fuel control system no longer detects switching for a calibrated amount of time.	See Possible Causes for DTC P1130	
P1157 - Lack of HO2S-22 Switch, Sensor Indicates Lean	See DTC P1137		
P1158 - Lack of HO2S-22 Switch, Sensor Indicates Rich	See DTC P1137		
P1168 - Fuel Rail Pressure Sensor in Range But Low	The comprehensive component monitor (CCM) monitors the FRP pressure for acceptable fuel	<ul style="list-style-type: none"> • Low fuel pressure • Damaged FRP sensor • Excessive resistance in circuit • Low or no fuel 	<p>A FRP PID value below 551 kpa (80 psi) indicates a failure</p> <ul style="list-style-type: none"> • Low or no fuel

	pressure. The test fails when the fuel pressure falls below a calibrated value.		A FRP PID value greater than 896 kpa (130 psi) indicates a failure
P1169 - Fuel Rail Pressure (FRP) Sensor in Range But High	The comprehensive component monitor (CCM) monitors the FRP pressure for acceptable fuel pressure. The test fails when the fuel pressure falls below or exceeds a minimum/maximum calibrated value for a calibrated period of time.	<ul style="list-style-type: none"> • High fuel pressure • Low fuel pressure • Damaged FRP sensor • Excessive resistance in circuit 	
P1180 - Fuel Delivery System - Low	The PCM receives fuel tank pressure (FTP) information from the natural gas module (NG), which uses the information to infer fuel rail pressure (FRP). The test fails when the inferred pressure is less than a minimum calibrated value.	<ul style="list-style-type: none"> • Restriction in the fuel line • Plugged fuel filter 	
P1181 - Fuel Delivery System - High	The PCM receives fuel tank pressure (FTP) information from the natural gas module (NG), which uses the information to infer fuel rail pressure (FRP). The test fails when the inferred pressure is higher than a maximum calibrated value.	<ul style="list-style-type: none"> • Fuel pressure regulator 	
P1183 - Engine Oil Temperature (EOT) Sensor Circuit Malfunction	Indicates EOT circuit became intermittently open or shorted while engine was running.	<ul style="list-style-type: none"> • Damaged harness • Damaged sensor • Damaged harness connector • Damaged PCM 	EOT V PID reading less than 0.2 volts with key ON and engine OFF or during any engine operating mode indicates a hard fault short to ground. EOT V PID reading greater than 4.5 volts with key ON and engine OFF or during any engine operating mode indicates an open circuit hard fault.
P1184 - Engine Oil	Indicates EOT	<ul style="list-style-type: none"> • Damaged harness 	Engine should be at

Temperature (EOT) Sensor Out of Self-Test Range	signal was out of Self-Test range. Correct range for KOER is 0.3-1.2 volts.	<ul style="list-style-type: none"> • Damaged sensor • Damaged harness connector • Damaged PCM 	operating temperature before running self-test.
P1229 - Supercharger Intercooler Pump (ICP) Pump Not Operating	The ICP DTC will be set when the PCM is calling for the pump to be operating but no current is being detected.	<ul style="list-style-type: none"> • Pump motor open circuited • Pump relay coil open • Open circuit between relay and pump • Damaged PCM • Pump motor shorted • Open circuit between PCM and relay • Poor pump ground connection 	Check for voltage at relay, check fuse in power feed, check ground connection of pump motor, PID reading is on/off.
P1232 - Low Speed Fuel Pump Primary Circuit Malfunction	The PCM monitors the low speed fuel pump (LFP) primary circuit output from the PCM. The test fails if: When the LFP circuit is commanded on (grounded), excessive current draw is detected on the LFP circuit; or when the LFP circuit is commanded off, voltage is not detected on the LFP circuit (the PCM expects to detect VPWR voltage coming through the low speed fuel pump relay coil to the LFP circuit).	<ul style="list-style-type: none"> • Open or shorted low fuel pump (LFP) circuit • Open VPWR to low speed fuel pump relay • Damaged low speed fuel pump relay • Damaged PCM 	<ul style="list-style-type: none"> ■ An open circuit or short to ground can only be detected with the low speed fuel pump. ■ A short to power can only be detected with the low speed fuel pump commanded on. ■ During KOEO and KOER Self-Test, the low speed fuel pump output command will be cycled on and off.
P1233 - Fuel System Disabled or Offline	<p>LS6/LS8: For LS6/LS8, P1233 indicates the PCM is not receiving the fuel level information on SCP from the rear electronics module (REM). Refer to the Workshop Manual Section 413-01 for diagnostics.</p> <p>All Others: The PCM monitors the fuel pump monitor (FPM) circuit from the fuel pump driver module (FPDM). With the key on,</p>	<ul style="list-style-type: none"> • Inertia fuel shutoff (IFS) switch needs to be reset • Open FPDM ground circuit • Open or shorted FPM circuit • Damaged IFS switch • Damaged FPDM • Damaged PCM • Also for Escort/Tracer and Mustang: <ul style="list-style-type: none"> ■ Open FPDM PWR circuit ■ Open B+ circuit to constant control relay module (CCRM) pin 11 ■ Open ground to CCRM pin 18 (Mustang) ■ Damaged CCRM • Also for Continental: <ul style="list-style-type: none"> ■ Open VPWR circuit to 	The PCM expects to see one of the following duty cycle signals from the FPDM on the FPM circuit: 1) 50% (500 msec on, 500 msec off), all OK. 2) 25% (250 msec on, 750 msec off), FPDM did not receive a fuel pump (FP) duty cycle command from the PCM, or the duty cycle that was received was invalid. 3) 75% (750 msec ON, 250 OFF), the FPDM has detected a fault in the circuits between the FPDM and the fuel pump.

	the FPDM continuously sends a duty cycle signal to the PCM through the FPM circuit. The test fails if the PCM stops receiving the duty cycle signal.	FPDM	
P1234 - Fuel System Disabled or Offline	See DTC P1233. P1234 is identical to P1233 except P1234 will not illuminate the MIL.		
P1235 - Fuel Pump Control Out Of Range	Note: For LS6/LS8, the FPDM functions are incorporated in the Rear Electronics Module (REM). Also, the REM does not use a FPM circuit. Diagnostic information will be sent through SCP. Indicates that the FPDM has detected an invalid or missing FP circuit signal from the PCM. The FPDM will send a message to the PCM through the FPM circuit, indicating that this failure has been detected. The PCM will set the DTC when the message is received.	<ul style="list-style-type: none"> ● FP circuit open or shorted ● Damaged FPDM. ● Damaged PCM 	The FPDM sends a 25% duty cycle (250 msec ON, 750 msec OFF) through the FPM circuit to the PCM while the fault is being detected by the FPDM. If the fault is no longer detected, the PDM will return to sending an "all OK" (50% duty cycle) message to the PCM. The PCM will keep P1235 stored in Continuous Memory.
P1236 - Fuel Pump Control Out Of Range	See DTC P1235. P1236 is identical to P1235 except P1236 will not illuminate the MIL.		
P1237 - Fuel Pump Secondary Circuit Malfunction	Note: For LS6/LS8, the FPDM functions are incorporated in the rear electronics module (REM). Also, the REM does not use a FPM circuit. Diagnostic information will be set through SCP. Indicates that the FPDM has	<ul style="list-style-type: none"> ● Open or shorted FP PWR circuit ● Open FP RTN circuit to FPDM ● Open or shorted circuit in the fuel pump ● Locked fuel pump rotor ● Damaged FPDM ● For LS6/LS8, circuits associated with the Fuel Pump relay 	<ul style="list-style-type: none"> ■ The FPDM sends a 75% duty cycle (750 msec ON, 250 msec OFF) through the FPM circuit to the PCM while the fault is being detected by the FPDM. If the fault is no longer detected, the PCM will return to sending an "all OK" (50% duty

	detected a fuel pump secondary circuit fault. The FPDM will send a message to the PCM through the FPM circuit, indicating that this failure has been detected. The PCM will set the DTC when the message is received.		cycle) message to the PCM. The PCM will keep P1237 stored in Continuous Memory. <ul style="list-style-type: none"> ■ The FPDM controls pump speed by supplying a "variable" ground on the RTN circuit.
P1238 - Fuel Pump Secondary Circuit Malfunction	See DTC P1237. P1238 is identical to P1237 except P1238 will not illuminate the MIL.		
P1244 - Generator Load Input Low	The PCM monitors the GLI circuit, and will set the DTC when the input is below calibrated limit for a calibrated amount of time.	<ul style="list-style-type: none"> ● GLI circuit open or short ● Damaged voltage regulator/generator ● Damaged PCM 	Verify operation of charging system.
P1245 - Generator Load Input High	The PCM monitors the GLI circuit, and will set the DTC when the input is above a calibrated limit for a calibrated amount of time.	<ul style="list-style-type: none"> ● GLI circuit open or short ● Damaged voltage regulator/generator ● Damaged PCM 	Verify operation of charging system.
P1246 - Generator Load Input (2.0L Cougar)	The PCM monitors the GLI circuit, and will set the DTC when the input is not within a calibrated limit for a calibrated amount of time.	<ul style="list-style-type: none"> ● GLI circuit concern. ● Damaged voltage regulator/generator ● Damaged PCM. 	<ul style="list-style-type: none"> ● Verify operation of charging system. ● Verify battery is at proper charge.
P1246 - Generator Load Input Failed (All Others)	The PCM monitors generator load from the generator/regulator in the form of frequency. The frequency range is determined by the temperature of the voltage regulator where 97% represents full load, below 6% means no load.	<ul style="list-style-type: none"> ● Generator circuit short to GND ● Generator circuit short to PWR ● Generator circuit open ● Generator drive mechanism ● Damaged generator/regulator assembly ● Damaged PCM 	<ul style="list-style-type: none"> ■ Verify battery voltage is 14.5V. ■ Verify generator/regulator has the correct part number.
P1260 - Theft Detected - Vehicle Immobilized	Indicates that the passive anti-theft system (PATS) has determined a theft	<ul style="list-style-type: none"> ● Previous theft condition ● Anti-Theft System failure 	Theft indicator flashing rapidly or on solid when ignition switch is in the ON position. Check anti-

	condition existed and the engine is disabled. This DTC is a good indicator to check the PATS for DTCs.		theft system for DTCs. Typical vehicle symptoms are: Start/Stall or Crank/No Start. NOTE: No crank symptom only on vehicles equipped with PATS starter disable feature.
P1270 - Engine RPM/Vehicle Speed Limiter	Indicates the vehicle has been operated in a manner which caused the engine or vehicle to exceed a calibration limit. The engine rpm and vehicle speed are continuously monitored by the PCM. The DTC is set when the rpm or speed fall out of calibrated range. For additional information on the engine rpm/vehicle speed limiter, refer to Section 1, <u>Electronic Engine Control (EC) System</u> , Powertrain Control Software.	<ul style="list-style-type: none"> • Wheel slippage (water, ice, mud and snow) • Excessive engine rpm in Neutral • Vehicle drive at a high rate of speed 	The DTC indicates the vehicle has been operated in a manner which caused the engine or vehicle speed to exceed a calibrated limit.
P1285 - Cylinder Head Over Temperature Sensed	Indicates an engine overheat condition was sensed by the cylinder head temperature sensor.	<ul style="list-style-type: none"> • Low engine coolant level • Base engine concerns • Engine cooling system concerns • CHT sensor concern 	On some applications when this fault occurs the Engine Temperature warning indicator will illuminate and/or force the temperature gauge to full H (Hot) zone by grounding the engine temperature warning circuit.
P1288 - Cylinder Head Temperature (CHT) Sensor Circuit Out of Self-Test Range	Indicates the CHT sensor is out of Self-Test range. Engine not at operating temperature.	<ul style="list-style-type: none"> • Cold engine • Engine overheating • Damaged harness connector • Damaged PCM • Low engine coolant level • Damaged CHT sensor 	Bring engine to operating temperature. If cold, re-run self-test. If engine over-heats check cooling system.
P1289 - Cylinder Head Temperature (CHT) Sensor Circuit High Input (PCM STRATEGIES UP TO AND INCLUDING 1998)	Indicates a CHT sensor circuit malfunction (shorted).	<ul style="list-style-type: none"> • Grounded circuit in CHT harness • Damaged CHT sensor • Improper harness connection • Damaged PCM 	CHT V PID reading less than 0.2 volts with key ON and engine OFF or during any engine operating mode indicates a hard fault. Note: DTC P0117 may also be reported when this DTC is set, either of these DTC's will activate the

			MIL light.
P1289 - Cylinder Head Temperature (CHT) Sensor Circuit High Input (PCM STRATEGIES 1999 AND BEYOND)	Indicates a CHT sensor circuit malfunction (open).	<ul style="list-style-type: none"> • Open circuit in CHT harness • Damaged CHT sensor • Improper harness connection • Damaged PCM 	CHT V PID reading greater than 4.6 volts with key ON and engine OFF or during any engine operating mode indicates a hard fault. Note: DTC P0118 may also be reported when this DTC is set, either of these DTC's will activate the MIL light.
P1290 - Cylinder Head Temperature (CHT) Sensor Circuit Low Input (PCM STRATEGIES UP TO AND INCLUDING 1998)	Indicates a CHT sensor circuit malfunction (open).	<ul style="list-style-type: none"> • Open circuit in CHT harness • Damaged CHT sensor • Improper harness connection • Damaged PCM 	CHT V PID reading greater than 4.6 volts with key ON and engine OFF or during any engine operating mode indicates a hard fault. Note: DTC P0118 may also be reported when this DTC is set, either of these DTC's will activate the MIL light.
P1290 - Cylinder Head Temperature (CHT) Sensor Circuit Low Input (PCM STRATEGIES 1999 AND BEYOND)	Indicates a CHT sensor circuit malfunction (shorted).	<ul style="list-style-type: none"> • Grounded circuit in CHT harness • Damaged CHT sensor • Improper harness connection • Damaged PCM 	CHT V PID reading greater than 4.6 volts with key ON and engine OFF or during any engine operating mode indicates a hard fault. Note: DTC P0118 may also be reported when this DTC is set, either of these DTC's will activate the MIL light.
P1299 - Cylinder Head Over Temperature Protection Active	Indicates an engine overheat condition was detected by the cylinder head temperature (CHT) sensor. An FMEM Strategy called Fail-safe Cooling was activated to cool the engine.	<ul style="list-style-type: none"> • Engine cooling system concerns • Low engine coolant level • Base engine concerns 	Refer to Section 1, Powertrain Control Software , for more information on Fail-safe Cooling Strategy and cylinder head temperature sensor.
P1309 - Misfire Monitor Disabled	When the misfire monitor is disabled, usually due to the input signal generated by the camshaft position (CMP) sensor, by sensing the passage of teeth from the CMP wheel.	<ul style="list-style-type: none"> • Camshaft position sensor • Powertrain control module • ECT, MAF, and CKP sensors 	Verify the CMP is installed correctly and not out of synchronization.
P1380 - Variable Cam Timing Solenoid A Circuit Malfunction	The comprehensive component monitor (CCM) monitors	<ul style="list-style-type: none"> • Open or short VCT circuit • Open VPWR circuit • Damaged PCM • Open or short VCT solenoid 	DTC P1380 is a VCT circuit check. Testing should include wires, solenoid coil and PCM.

	the VCT circuit to the PCM for high and low voltage. If during testing voltage was to fall below a calibrated limit a calibrated amount of time the test will fail.	valve	
P1381 - Variable Cam Timing Over-advanced (Bank 1)	The comprehensive component monitor (CCM) monitors the VCT position for an over-advanced camshaft timing. The test fails when the camshaft timing exceeds a maximum calibrated value or remains in an advanced position.	<ul style="list-style-type: none"> • Cam timing improperly set • No oil flow to the VCT piston chamber • Low oil pressure • VCT solenoid valve stuck closed • Camshaft advance mechanism binding (VCT unit) 	P1381 DTC is a check of the VCT unit. Testing should not include electrical checks. Diagnostics and repair for the VCT unit are located in the Workshop Manual.
P1383 - Variable Cam Timing Over-retarded (Bank 1)	The comprehensive component monitor (CCM) monitors the VCT position for over-retarded camshaft timing. The test fails when the camshaft timing exceeds a maximum calibrated value or remains in an retarded position.	<ul style="list-style-type: none"> • Cam timing improperly set • Continuous oil flow to the VCT piston chamber • VCT solenoid valve stuck open • Camshaft advance mechanism binding (VCT unit) 	DTC P1383 is a check of the VCT unit. Testing should not include electrical checks. Engine will idle rough, hard starting and may stall. Diagnostics and repair for the VCT unit are located in the Workshop Manual.
P1400 - DPF EGR Sensor Circuit Low Voltage Detected	The EGR monitor checks the DPF EGR sensor signal to the PCM for low voltage. The test fails when the average voltage to the PCM drops to a voltage less than the minimum calibrated value.	<ul style="list-style-type: none"> • DPF EGR circuit short to GND • Damaged DPF EGR sensor • VREF short to GND • Damaged PCM 	A DPF EGR PID reading less than 0.2 volt with the key ON and engine OFF or running, indicates a hard fault.
P1401 - DPF EGR Sensor Circuit High Voltage Detected	The EGR monitor checks the DPF EGR sensor signal to the PCM for high voltage. The test fails when the average voltage to the PCM goes to a voltage greater than the maximum calibrated value.	<ul style="list-style-type: none"> • DPF EGR circuit open • VREF short to PWR • Damaged DPF EGR sensor • DPF EGR circuit short to PWR • SIG RTN circuit open • Damaged PCM 	A DPF EGR PID reading greater than 4.5 volts with the key ON and engine OFF or running, indicates a hard fault.
P1405 - DPF EGR	While driving, the	<ul style="list-style-type: none"> • Upstream hose is 	<ul style="list-style-type: none"> ■ Look for signs of

Sensor Upstream Hose Off or Plugged	<p>EGR monitor commands the EGR valve closed and checks the differential pressure across the EGR orifice. The test fails when the signal from the DPF EGR sensor indicates EGR flow is in the negative direction.</p>	<p>disconnected</p> <ul style="list-style-type: none"> ● Upstream hose is plugged (ice) ● Plugged or damaged EGR tube 	<p>water or icing in hose</p> <ul style="list-style-type: none"> ■ Verify hose connection and routing (no excessive dips) ■ Verify DPF EGR sensor proper mounting and function (view DPF EGR PID while applying and releasing vacuum directly to sensor with a hand pump)
P1406 - DPF EGR Sensor Downstream Hose Off or Plugged	<p>While driving, the EGR monitor commands the EGR valve closed and checks the differential pressure across the EGR orifice. The test fails when the signal from the DPF EGR sensor continues to indicate EGR flow even after the EGR valve is commanded closed.</p>	<ul style="list-style-type: none"> ● Downstream hose is disconnected ● Downstream hose is plugged (ice) ● Plugged or damaged EGR tube 	<ul style="list-style-type: none"> ■ Look for signs of water or icing in hose ■ Verify connection and routing (no excessive dips) ■ Verify DPF EGR sensor proper mounting and function (view DPF EGR PID while applying and releasing vacuum directly to sensor with a hand pump)
P1408 - EGR Flow Out of Self-Test Range (Non MIL)	<p>This test is performed during the KOER on demand self-test only. The EGR system is commanded ON at a fixed engine speed. The test fails and the DTC is output when the measured EGR flow falls above or below the required calibration .</p>	<p>For vacuum activated systems see Possible Causes for DTC P0401. For electric motor system see Possible Causes DTC P0400.</p>	<p>For Electric EGR, use the output state control function of the scan tool and monitor the MAP PID (MAP) and the EEGR PID (EGRMDS) while commanding the EEGR on. If EGR is introduced into the engine at idle, the rpm will drop or stall out. For vacuum systems see Diagnostic Aids for P0401.</p>
P1409 - EGR Vacuum Regulator Solenoid Circuit Malfunction	<p>This test checks the electrical function of the EGRVR solenoid. The test fails when the EGRVR circuit voltage is either too high or too low when compared to the expected voltage range. The EGR system must be enabled for the test to be completed.</p>	<ul style="list-style-type: none"> ● EGRVR circuit open ● VPWR open to EGRVR solenoid ● EGRVR circuit short to VPWR or GND ● Damaged EGRVR solenoid ● Damaged PCM 	<p>The EGR vacuum regulator solenoid resistance is from 26 to 40 ohms.</p>

P1411 - Secondary Air Injection (AIR) system downstream flow	The secondary air injection system does not detect the presence of air in the exhaust when introduced by the secondary air injection system	<ul style="list-style-type: none"> • Electric AIR Pump • Hose from AIR pump leak • AIR bypass solenoid leak/blocked • Hose from AIR pump blocked • AIR bypass solenoid stuck open/closed 	In order to test the AIR pump, it must be capable of driving the HO2S lean.
P1413 Secondary Air Injection System Monitor Circuit Low	The secondary air injection system monitor circuit is low, indicating the electrical AIR pump is off although the electrical AIR pump was commanded on by the PCM.	<ul style="list-style-type: none"> • Open B+ circuit • Open AIR circuit • Damaged PCM • Air circuit short to ground • Damaged AIR pump • Damaged solid state relay 	The AIR monitor circuit is held low by the resistance path through the AIR pump when the pump is off. Also, look for open circuit from SSR to AIR pump.
P1414 Secondary Air Injection System Monitor Circuit High	The secondary air injection system monitor circuit is high, indicating the electrical AIR pump is on although the electrical AIR pump was commanded off by the PCM.	<ul style="list-style-type: none"> • Open AIR monitor circuit from the pump • AIR circuit short to power • Damaged solid state relay • Open AIR pump ground • Damaged AIR pump • Damaged PCM 	
P1432 - Thermostat Heater Control (THTRC) Circuit Failure	The Comprehensive component monitor (CCM) monitors the THTRC circuit to the PCM for high and low voltage. If during testing; voltage was to fall below a calibrated limit for a calibrated amount of time the test will fail and set the DTC and MIL.	<ul style="list-style-type: none"> • Open or shorted THTRC circuit • Open VPWR • Open or shorted thermostat assembly • Damaged PCM 	DTC P1432 is a THTRC circuit check. Testing should include wire harness, thermostat heater and PCM.
P1443 - Very Small Or No Purge Flow Condition	A fuel tank pressure change greater than a minus (-) 7 inches of H ₂ O in 30 seconds has occurred with purge (fuel vapor) flow less than 0.02 pounds per minute.	<ul style="list-style-type: none"> • Blocked fuel vapor hose between EVAP canister purge valve and FTP sensor. • Blocked fuel vapor hose between EVAP canister purge valve and engine intake manifold. • Blocked vacuum hose between EVAP canister purge valve-solenoid and engine intake manifold. • EVAP canister purge valve stuck closed (mechanically). 	Check for blockages between the fuel tank, EVAP canister purge valve and engine intake manifold. Check obstructions in the EVAP canister purge valve diaphragm and ports.
P1450 - Unable to Bleed Up Fuel Tank	Monitors the fuel vapor vacuum and	<ul style="list-style-type: none"> • Blockages or kinks in EVAP canister tube or EVAP 	

Vacuum	<p>pressure in the fuel tank. The system failure occurs when the EVAP running loss monitor detects excessive fuel tank vacuum with the engine running (but not at idle).</p>	<p>canister purge outlet tube (between fuel tank, EVAP canister purge valve and EVAP canister)</p> <ul style="list-style-type: none"> ● Fuel filler cap stuck closed (no vacuum relief) ● Contaminated fuel vapor elbow on EVAP canister ● Restricted EVAP canister ● CV solenoid stuck open (partially or fully) ● Plugged CV solenoid filter ● EVAP canister purge valve stuck open ● VREF circuit open (harness near FTP sensor, FTP sensor or PCM) ● Damaged FTP sensor 	
P1451 - EVAP Control System Canister Vent Solenoid Circuit Malfunction	<p>Monitors the canister vent (CV) solenoid circuit for an electrical failure. The test fails when the signal moves outside the minimum or maximum allowable calibrated parameters for a specified canister vent duty cycle by PCM command.</p>	<ul style="list-style-type: none"> ● VPWR circuit open ● CV solenoid circuit shorted to PWR GND or CHASSIS GND ● Damaged CV solenoid ● CV solenoid circuit open ● CV solenoid circuit shorted to VPWR ● Damaged PCM 	<ul style="list-style-type: none"> ■ Monitor EVAPCV PID and voltage between canister vent solenoid signal and PWR GND in output test mode with key ON engine OFF (or in key ON engine RUNNING mode) ■ EVAPCV PID at 0% and voltage less than 1.0 volt (or EVAPCV PID at 100% and voltage greater than 0.5 volt) indicates a hard fault
P1460 - Wide Open Throttle A/C Cutout Primary Circuit Malfunction	<p>NOTE: For applications that use a normally open relay to control the A/C clutch, the following description applies to the A/C clutch relay control circuit. Monitors the wide open throttle A/C cutoff (WAC) circuit output from the PCM. The test fails if: When the PCM grounds the WAC circuit, excessive current draw is detected on the WAC circuit; or with the WAC circuit not grounded by the PCM, voltage is</p>	<ul style="list-style-type: none"> ● Open or shorted WAC circuit ● Damaged WAC relay (or CCRM) ● Open VPWR circuit to WAC relay ● Damaged PCM 	<ul style="list-style-type: none"> ■ When the WACF PID reads YES, a fault is currently present ■ An open circuit or short to ground can only be detected when the PCM is not grounding the circuit ■ A short to power can only be detected when the PCM is grounding the circuit ■ During KOEO and KOER self-test, the WAC circuit will be cycled ON and OFF ■ Verify A/C and defrost were OFF during KOEO and KOER self-test

	not detected on the WAC circuit (the PCM expects to detect VPWR voltage coming through the WAC relay coil to the WAC circuit).		(Check ACCS PID to verify) <ul style="list-style-type: none"> ■ If vehicle is not equipped with A/C, DTC P1460 can be ignored
P1461 - Air Conditioning Pressure Sensor (ACP) Sensor High Voltage Detected	ACP inputs a voltage to the PCM. If the voltage is above a calibrated level the DTC will set.	<ul style="list-style-type: none"> ● ACP sensor circuit short to PWR ● ACP circuit open ● Damaged PCM ● ACP circuit short to VREF ● ACP circuit short to SIGRTN ● Damaged ACP sensor 	Verify VREF voltage between 4.0 and 6.0V.
P1462 - Air Conditioning Pressure Sensor (ACP) Sensor Low Voltage Detected	ACP inputs a voltage to the PCM. If the voltage is below the calibrated level the DTC will set.	<ul style="list-style-type: none"> ● ACP circuit short to GND or SIGRTN ● VREF circuit open ● Damaged PCM ● Open ACP circuit ● Damaged ACP sensor 	Verify VREF voltage between 4.0 and 6.0V.
P1463 - Air Conditioning Pressure Sensor (ACP) Insufficient Pressure Change	Each time the A/C clutch engages, the PCM is looking for a pressure change in the refrigerant. If the change in pressure is outside of the calibration the DTC will set.	<ul style="list-style-type: none"> ● A/C system mechanical failure ● Open ACP or VREF circuit ● A/C sensor damaged ● A/C system electrical failure ● A/C clutch always engaged 	Verify A/C system function, including refrigerant charge.
P1464 - A/C Demand Out Of Self-Test Range	Indicates the ACCS input to the PCM was high during Self-Test.	<ul style="list-style-type: none"> ● A/C was on during self-test ● A/C Clutch PWR circuit short to power (applications with N/C WAC relay contacts) ● ACCS circuit short to power ● Damaged A/C demand switch ● Damaged WAC relay (or CCRM) ● Damaged PCM 	If A/C or defrost were on during self-test, turn off and rerun test.
P1469 - Low A/C Cycling Period	Indicates frequent A/C compressor clutch cycling.	<ul style="list-style-type: none"> ● Mechanical A/C system concern (such as low refrigerant charge, damaged A/C cycling switch) ● Intermittent open between the cycling pressure switch and pin 41 (ACCS) to the PCM ● Intermittent open in IGN RUN circuit to cycling pressure switch (if applicable) 	<ul style="list-style-type: none"> ■ An intermittent open circuit, although possible, is unlikely ■ This test was designed to protect the transmission. In some strategies, the PCM will unlock the torque converter during A/C clutch engagement. If a concern is present that results in frequent A/C clutch cycling, damage could occur if the torque converter was cycled at

			these intervals. This test will detect this condition, set the DTC and prevent the torque converter from excessive cycling.
P1474 - Low Fan Control (LFC) Primary Circuit Failure	Monitors the low fan control (LFC) (fan control [FC] for one speed fan application) primary circuit output from the PCM. The test fails if: When the PCM grounds the LFC/FC circuit, excessive current draw is detected on the LFC/FC circuit; or with the LFC/FC circuit not grounded by the PCM, voltage is not detected on the LFC/FC circuit (the PCM expects to detect VPWR voltage coming through the low speed FC relay [or CCRM] coil to the LFC/FC circuit).	<ul style="list-style-type: none"> ● Open or shorted LFC/FC circuit ● Open VPWR circuit to low speed FC relay ● Damaged low speed FC relay (or CCRM) ● Damaged PCM 	<ul style="list-style-type: none"> ■ When the LFCF PID reads YES, a fault is currently present ■ An open circuit or short to ground can only be detected when the PCM is not grounding the LFC/FC circuit ■ A short to power can only be detected when the PCM is grounding the LFC/FC circuit. ■ During KOEO and KOER Self-Test, the LFC/FC circuit will be cycled on and off
P1474 - Hydraulic Cooling Fan Primary Circuit Failure (HCF)	This test checks the electrical function of the (HCF) primary circuit. The test fails if: the PCM detects voltage either too high or too low when compared to the expected voltage range on the (HCF) primary circuit.	<ul style="list-style-type: none"> ● HCF circuit open ● HCF circuit short to power ● HCF circuit short to ground ● Damaged HCF solenoid ● Damaged PCM 	The HCF solenoid is integrated in the HCF pump which looks like a power steering pump. The electrical resistance of the solenoid windings is nominally 10 ohms.
P1477 - Medium Fan Control (MFC) Primary Circuit Failure	Monitors the medium fan control (MFC) primary circuit output from the PCM. The test fails if: With the MFC output commanded on (grounded), excessive current draw is detected on the MFC circuit; or with the MFC circuit commanded off, voltage is not	<ul style="list-style-type: none"> ● Open or shorted MFC circuit ● Open IGN START/RUN circuit to medium speed FC relay ● Damaged medium speed FC relay ● Damaged PCM 	<ul style="list-style-type: none"> ■ Same as P1479, except with MFC circuit and MFCF PID (for early build Escape, MFCF and MFC PIDs may not be available) ■ Using Output Test Mode on scan tool, when commanding the low speed fan on, the PCM will also activate the medium speed fan

	detected on the MFC circuit (the PCM expects to detect IGN START/RUN voltage coming through the medium speed FC relay coil to the MFC circuit).		output.
P1479 - High Fan Control (HFC) Primary Circuit Failure	Monitors the high fan control (HFC) primary circuit output from the PCM. The test fails if: With the HFC output commanded on (grounded), excessive current draw is detected on the HFC circuit; or with the HFC circuit commanded off, voltage is not detected on the HFC circuit (the PCM expects to detect VPWR voltage coming through the high speed FC relay [or CCRM] coil to the HFC circuit).	<ul style="list-style-type: none"> • Open or shorted HFC circuit • Open VPWR circuit to high speed FC relay • Damaged high speed FC relay (or CCRM) • Damaged PCM 	<ul style="list-style-type: none"> ■ When the HFCF PID reads YES, a fault is currently present ■ An open circuit or short to ground can only be detected when the PCM is not grounding the HFC circuit ■ A short to power can only be detected when the PCM is grounding the HFC circuit ■ During KOEO and KOER self-test, the HFC circuit will be cycled on and off
P1500 - Vehicle Speed Sensor (VSS) Intermittent	Indicates the VSS input signal was intermittent. This DTC is set when a VSS fault interferes with other OBDII tests, such as Catalyst efficiency monitor, EVAP monitor, HO2S monitor, etc.	<ul style="list-style-type: none"> • Intermittent VSS connections • Intermittent open in VSS harness circuit(s) • Intermittent short in VSS harness circuit(s) • Damaged VSS • Damaged PCM 	
P1501 - Vehicle Speed Sensor (VSS) Out of Self Test Range	Indicates the VSS input signal is out of Self Test range. If the PCM detects a VSS input signal any time during Self Test, a DTC P1501 will be set and the test will abort.	<ul style="list-style-type: none"> • Noisy VSS input signal from Radio Frequency Interference/ Electro-Magnetic Interference (RFI/EMI) external sources such as ignition wires, charging circuit or after market equipment. 	Check for VSS input to be 0 mph when vehicle transmission is in Park.
P1502 - Vehicle Speed Sensor (VSS) Intermittent	Indicates the powertrain control module (PCM) detected an error in the vehicle speed information. Vehicle speed data	<ul style="list-style-type: none"> • Refer to possible causes for P0500. 	Refer to diagnostic aids for P0500.

	<p>is received from either the vehicle speed sensor (VSS), transfer case speed sensor (TCSS), anti-lock brake system (ABS) control module, generic electronic module (GEM), or central timer module (CTM). This DTC is set the same way as P0500. However, it is intended to flash the transmission control indicator lamp (TCIL) for first time VSS circuit error/malfunctions.</p>		
<p>P1502 - Vehicle Speed Sensor (VSS) Intermittent (TCIL illuminates)</p>	<p>Indicates the powertrain control module (PCM) detected an error in the vehicle speed information. Vehicle speed data is received from either the vehicle speed sensor (VSS), anti-lock brake system (ABS) control module, generic electronic module (GEM), or central timer module (CTM). This DTC is set the same way as P0500. However, it is intended to flash the transmission control indicator lamp (TCIL) for first time VSS circuit error/malfunctions.</p>	<p>Refer to possible causes for P0500</p>	<p>Refer to diagnostic aides for P0500</p>
<p>P1504 - Idle Air Control (IAC) Circuit Malfunction</p>	<p>This DTC is set when the PCM detects an electrical load failure on the IAC output circuit.</p>	<ul style="list-style-type: none"> ● IAC circuit open ● VPWR to IAC solenoid open ● IAC circuit short to PWR ● IAC circuit short to GND ● Damaged IAC valve ● Damaged PCM 	<ul style="list-style-type: none"> ■ The IAC solenoid resistance is from 6 to 13 ohms.
<p>P1506 - Idle Air Control (IAC) Overspeed Error</p>	<p>This DTC is set when the PCM detects engine idle speed that is greater than the desired rpm.</p>	<ul style="list-style-type: none"> ● IAC circuit short to GND ● Damaged IAC valve ● IAC valve stuck open ● Vacuum leaks ● Failed EVAP system ● Damaged PCM 	<p>Disconnect IAC valve and look for little or no change in engine rpm as an indication of a stuck or damaged valve.</p>

P1507 - Idle Air Control (IAC) Underspeed Error	<p>This DTC is set when the PCM detects engine idle speed that is less than the desired rpm.</p>	<ul style="list-style-type: none"> ● IAC circuit open ● IAC circuit short to PWR ● VPWR to IAC solenoid open ● Air inlet is plugged ● Damaged IAC solenoid ● Damaged PCM 	<ul style="list-style-type: none"> ■ The IAC solenoid resistance is from 6 to 13 ohms ■ Disconnect IAC valve and look for no change in engine rpm as an indication of a stuck or damaged valve
P1516 - Intake Manifold Runner Control Input Error (Bank 1)			
P1517 - Intake Manifold Runner Control Input Error (Bank 2)	<p>The IMRC system is monitored for failure during continuous or key ON engine OFF self-test. Each DTC will distinguish the corresponding failed bank for IMRC actuator assemblies with dual monitor switches. The test fails when the signal on the monitor pin is outside an expected calibrated range.</p>	<ul style="list-style-type: none"> ● Mechanical concern - bind, seize, damage or obstruction of IMRC hardware 	<ul style="list-style-type: none"> ■ An IMRCM PID reading at closed throttle that is less than VREF may indicate a fault ■ An IMRCM PID reading near 1 volt or greater with engine rpm of at least 3000 may indicate a fault
P1518 - Intake Manifold Runner Control Malfunction (Stuck Open)	<p>The IMRC system is monitored for failure during continuous, key ON engine OFF or key ON engine running self-test. The test fails when the signal on the monitor pin is less than an expected calibrated range at closed throttle.</p>	<ul style="list-style-type: none"> ● IMRC monitor signal circuit shorted to PWR GND or SIG RTN ● Damaged IMRC actuator ● Damaged PCM 	<p>An IMRCM PID reading approximately near 1 volt at closed throttle may indicate a fault</p>
P1519 - Inlet Manifold Runner Control Malfunction (Stuck Closed)	<p>The IMRC system is monitored for failure during continuous, key ON engine OFF or key ON engine running self-test. The test fails when the signal on the monitor pin is more than an expected calibrated range with IMRC activated.</p>	<ul style="list-style-type: none"> ● IMRC monitor circuit open ● IMRC control circuit open ● IMRC monitor circuit short to VREF ● IMRC monitor return circuit open ● Damaged IMRC actuator ● IMRC VPWR circuit open ● Damaged PCM 	<p>An IMRCM PID reading at VREF with engine rpm of at least 3000 may indicate a fault.</p>

P1549 - Intake Manifold Communication Control Circuit Malfunction	The IMCC or intake manifold tuning (IMT) valve system is monitored for failure during continuous or key ON engine OFF self-test. The test fails when the PCM detects a concern with IMT valve output circuit.	<ul style="list-style-type: none"> • Open IMT valve circuit • Open VPWR circuit • Shorted IMT valve circuit • Damaged IMT valve • Damaged PCM 	<ul style="list-style-type: none"> ■ An IMT valve fault PID (IMTVF) displaying YES status may indicate a fault
P1550 - Power Steering Pressure (PSP) Sensor Malfunction	The PSP sensor input signal to PCM is continuously monitored. The test fails when the signal falls out of a maximum or minimum calibrated range.	<ul style="list-style-type: none"> • PSP sensor damaged • Damaged PCM 	<ul style="list-style-type: none"> ■ The DTC indicates the PSP sensor is out of Self-Test range.
P1572 - Brake Pedal Switch Circuit	Indicates that the brake input rationality test for brake pedal position (BPP) and brake pressure applied (BPA) switches has failed. One or both inputs to the PCM did not change when it was expected to.	<ul style="list-style-type: none"> • Misadjusted brake switch • Blown fuse • Damaged BPP switch • Damaged BPA switch • Open or short in BPP circuit • Open or short in BPA circuit • Damaged PCM 	Check for proper function of stoplamps and speed control operation. Follow correct Self-Test procedures, refer to Section 2 Quick Test.
P1605 - Keep Alive Memory Test Failure	Indicates the PCM has experienced an internal memory test failure. However there are external items that can cause this DTC.	<ul style="list-style-type: none"> • Reprogramming • Battery terminal corrosion • Damaged PCM • KAPWR to PCM interrupt/open • Loose battery connection 	If KAPWR is interrupted to the PCM, because of a battery or PCM disconnect, DTC can be generated on the first power-up.
P1633 - Keep Alive Power Voltage Too Low	Indicates that the Keep Alive Power (KAPWR) circuit has experienced a power interrupt.	<ul style="list-style-type: none"> • Open KAPWR circuit • Damaged PCM • Intermittent KAPWR Circuit 	
P1635 - Tire/Axle Ratio Out Of Acceptable Range	This Diagnostic Trouble Code (DTC) indicates the tire and axle information contained in Vehicle ID block (VID) does not match vehicle hardware.	<ul style="list-style-type: none"> • Incorrect tire size • Incorrect axle ratio • Incorrect VID configuration parameters 	Using the scan tool, view the tire and axle parameters within the VID. They must match vehicle hardware.
P1636 - Inductive	Indicates the PCM	<ul style="list-style-type: none"> • PCM Damaged 	

Signature Chip Communication Error	has lost communication with the Inductive Signature Chip.		
P1639 - Vehicle ID Block Not Programed Or Is Corrupt	This diagnostic trouble code (DTC) indicates that the vehicle ID (VID) block is not programed or the information within is corrupt.	<ul style="list-style-type: none"> • New PCM • Incorrect PCM • Incorrect VID configuration 	Using an enhanced scan tool, reprogram the PCM to the most recent calibration available.
P1640 - Powertrain DTC's Available in Another Module	Vehicles using a secondary Engine Control Module can request that the Powertrain Control Module illuminate the Check Engine Light when a failure occurs which affect emission.	<ul style="list-style-type: none"> • DTCs stored in a secondary module, which requested the MIL to be turned on. 	Call-up PID address 0946 to determine secondary module requesting MIL illumination. Once secondary module is determined request DTCs from module.
P1650 - Power Steering Pressure (PSP) Switch Malfunction	In Key On, Engine Off Self-Test, this DTC indicates the PSP input to the PCM is high. In Key On, Engine Running Self-Test, this DTC indicates that the PSP input did not change state.	<ul style="list-style-type: none"> • Steering wheel must be turned during Key On, Engine Running Self-Test • PSP switch/shorting bar damaged • SIG RTN circuit open • PSP circuit open or shorted to SIGRTN • PCM damaged 	
P1651 - Power Steering Pressure (PSP) Switch Signal Malfunction	The PCM counts the number of times vehicle speed transitions from 0 to a calibratable speed. After a calibratable number of speed transitions the PCM expects that the PSP input should have changed. This DTC is set if the transition is not detected.	<ul style="list-style-type: none"> • Vehicle towed with engine running • Power steering hydraulic concern was repaired but DTC was not erased • PSP switch/shorting bar damaged • SIG RTN circuit open • PSP circuit open or shorted to SIGRTN • PCM damaged 	<ul style="list-style-type: none"> ■ Check, if possible, if vehicle was towed or power steering service was performed. ■ Observe PSP V PID while checking wires for intermittents.
P1703 - Brake Switch Out of Self-Test Range	Indicates that during Key On Engine Off (KOEO) Self-Test, BPP signal was high. Or during Key On Engine Running (KOER) Self -Test, the BPP signal did not cycle high and	<ul style="list-style-type: none"> • Open or short in (BPP) circuit • Open or short in stoplamp circuits • Damaged PCM • Malfunction in module(s) connected to BPP circuit (Rear Electronic Module [REM] Windstar and LS6/LS8 and Lighting 	Check for proper function of stoplamps. Follow correct Self-Test procedures, refer to Section 2, <u>Quick Test</u> .

	low.	Control Module (LCM) Continental and Town Car	
P1705 - Transmission Range Sensor Out of Self-Test Range		<ul style="list-style-type: none"> • Damaged Brake Switch • Misadjusted Brake Switch 	
P1709 - Park/Neutral Position Switch Out of Self-Test Range	The DTCs indicate that the voltage is high when it should be low.	<ul style="list-style-type: none"> • PNP/ CPP circuit short to PWR • Damaged PNP or CPP switch • PNP/ CPP circuit open in the SIGRTN • Damaged PCM 	When exercising either the PNP or CPP switch the voltage should cycle from 5.0V to low
P1729 - 4x4L Switch Malfunction	The 4x4L switch is an ON/OFF. If the PCM does not see low voltage when the switch is ON a DTC will set.	<ul style="list-style-type: none"> • 4x4L harness open or shorted • Damaged electronic shift module • Damaged PCM 	Verify the 4x4L switch cycles ON/OFF.
P1780 - Transmission Control Switch Out of Self-Test Range	During KOER self-test the TCS has to be cycled, if not cycled a DTC is set.	<ul style="list-style-type: none"> • TCS circuit short or open • Damaged TCS switch • Damaged PCM 	Verify the TCS switch cycles ON/OFF
P1781 - 4x4L Switch Out of Self-Test Range	The 4x4L switch is an ON/OFF. If the PCM does not see low voltage when the switch is on a DTC will set.	<ul style="list-style-type: none"> • 4x4L harness open or shorted • Damaged electronic shift module • Damaged PCM 	Verify the 4x4L switch cycles ON/OFF
P1900 - Output Shaft Speed sensor circuit intermittent failure	See DTC P0723

On Board Diagnostics II

SECTION 5: Pinpoint Tests

Choose an item on the left side to display section contents.

A: No Start Introduction

A: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Spark (as related to Electronic Engine Control)
- Powertrain Control Module (PCM) (12A650)

WARNING: STOP THIS TEST AT THE FIRST SIGN OF A FUEL LEAK AND SERVICE AS REQUIRED.

No open flame — No smoking during fuel delivery checks.

A: Pinpoint Tests →

A: No Start

← A: Introduction

A1 CHECK PASSIVE ANTI-THEFT SYSTEM (SECURILOCK)

Note: This vehicle may have an anti-theft system, which may be activated, causing the no start condition. Verify by viewing anti-theft indicator light on instrument panel or a Diagnostic Trouble Code (DTC P1260) may be present.

- Verify anti-theft system.

Is the system activated?

Yes	No
REFER to Electrical Anti-Theft, Section 419-01 in the Workshop Manual for diagnosis and testing.	GO to <u>A2</u> .

A2 ATTEMPT TO CRANK ENGINE

Note: Verify inertia fuel shutoff (IFS) switch is set (button pushed in). Refer to Owner Guide for location.

Does engine crank?

Yes	No
GO to <u>A3</u> .	REFER to the Starting Systems, Section 303-06 in the Workshop Manual.

A3 IDENTIFY TYPE OF NO START

Note: The purpose of this Test Step is to identify intermittent No Starts in order to guide the technician to the proper repair procedure.

Does the vehicle start now?

Yes	No
Vehicle is an intermittent No Start. GO to <u>Z2</u> .	Natural gas vehicles: KEY OFF. GO to <u>HA47</u> . All others: KEY OFF. GO to <u>A4</u> .

A4 CHECK VREF VOLTAGE TO THROTTLE POSITION (TP) SENSOR

- Disconnect TP sensor.
- Key on, engine off.
- Measure voltage between VREF and SIG RTN circuit at the TP sensor harness connector. GO to Pinpoint Test DH to refer to the schematic.

Is voltage between 4.0 and 6.0 volts?

Yes	No
KEY OFF. RECONNECT TP sensor. GO to <u>A5</u> .	KEY OFF. GO to <u>C1</u> .

A5 CHECK FLASH EPROM POWER SUPPLY (FEPS) CIRCUIT FOR SHORT TO POWER IN HARNESS

- Key on, engine off.
- Measure voltage between Pin 13 at the data link connector and battery negative post.
- (Refer to the Wiring Diagrams for connector location.)

Is voltage greater than 9.0 volts?

Yes	No
REPAIR short to power.	For coil-on-plug vehicles: KEY OFF. GO to <u>A17</u> . All others: KEY OFF. GO to <u>A6</u> .

A6 CHECK RPM IN THE PCM

Note: The scan tool must be connected to a reliable power source that is powered with the key in the START position (such as directly to the vehicle battery). Also verify that the vehicle battery is fully charged.

- Access RPM PID.
- While viewing the RPM PID, crank engine.

Does the RPM PID indicate cranking speed?

Yes	No
KEY OFF. GO to <u>JB1</u> . To check ignition. If OK: Natural Gas Vehicles : GO to <u>A9</u> . All others: GO to <u>A7</u> .	KEY OFF. GO to <u>JD1</u> .

A7 CHECK FUEL PRESSURE

WARNING: BEFORE SERVICING OR REPLACING ANY COMPONENTS IN THE FUEL SYSTEM, REDUCE THE POSSIBILITY OF INJURY OR FIRE BY FOLLOWING DIRECTIONS IN PINPOINT TEST HC WARNING, CAUTION, AND HANDLING.

- Release the fuel pressure.
- Install fuel pressure tester.
- Scan Tool connected.
- Key on, engine off.
- Enter Output Test Mode (refer to [Section 2](#)) and run the fuel pump to obtain maximum fuel pressure.

Is fuel pressure at the specified pressure (use the fuel pressure chart in Pinpoint Test HC)?

Yes	No
GO to A8 .	KEY OFF. GO to HC1 .

A8 CHECK FUEL PRESSURE LEAKDOWN

- GO to Pinpoint Test [HC](#) and observe WARNING, CAUTION AND HANDLING.
- Fuel pressure tester installed.
- Scan Tool connected.
- Key on, engine off.
- Access Output Test Mode and run fuel pump to obtain maximum fuel pressure.
- Exit Output Test Mode.
- Verify fuel pressure remains within 34 kPa (5 psi) of the maximum pressure for 1 minute after turning pump off.

Does fuel pressure remain within 34 kPa (5 psi)?

Yes	No
KEY OFF. GO to A9 .	KEY OFF. GO to HC1 .

A9 CHECK FUEL INJECTORS FOR VPWR

Note: Check at least two fuel injectors, one on each bank. A no start condition can exist only if greater than 50% of the fuel injectors are without VPWR.

- Disconnect any two fuel injectors.
- Key on.
- Measure VPWR circuit voltage at fuel injector harness connectors.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. Natural Gas Vehicles: GO to A15 . All Others: GO to A10 .	REPAIR VPWR circuit.

A10 CHECK FUEL INJECTORS ABILITY TO DELIVER FUEL

- Connect fuel pressure gauge to Schrader valve.
- Cycle key several times.
- Locate and disconnect the inertia fuel shutoff (IFS) switch.
- Monitor pressure gauge while cranking the engine for at least five seconds.

Is there a pressure drop greater than 34 kPa (5 psi) while cranking the engine?

Yes	No
The electronic engine control system is not the cause of the no start. RETURN to Section 3 , Symptom Chart for further diagnosis.	REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).

A15 CHECK FUEL PRESSURE ON NATURAL GAS VEHICLES

- Connect scan tool to DLC.
- Access FRP PID (fuel pressure).
- Record fuel pressure.
- Connect fuel pressure gauge to Schrader valve.
- Key on, engine off.
- Record fuel pressure.

Is fuel pressure between 552 and 827 kPa (80 and 120 psi) on the Scan Tool and fuel pressure gauge?

Yes	No
KEY OFF. GO to A16 .	KEY OFF. GO to HB1 .

A16 CHECK INJECTOR SIGNAL FROM NGV MODULE

Note: This test requires a standard 12 volt test lamp. A properly operating system will show a dim glow.

- Connect test lamp between the injector signal circuit and VPWR circuit pin at the injector harness.
- Crank engine.

Does test lamp have a dim glow while cranking?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)). GO to A6 .	No light or continuously bright light. GO to HA47 .

A17 CHECK PCM DRIVER TO COILS

- Connect incandescent test lamp between B+ and each coil driver circuit at the harness connector.
- Crank engine.

Does lamp blink consistently and brightly (one blink per engine revolution)?

Yes	No
KEY OFF. GO to <u>A7</u> .	KEY OFF. GO to <u>JD1</u> .

B: Electronic Engine Control (EC) Power Relay Introduction

B: Pinpoint Tests →

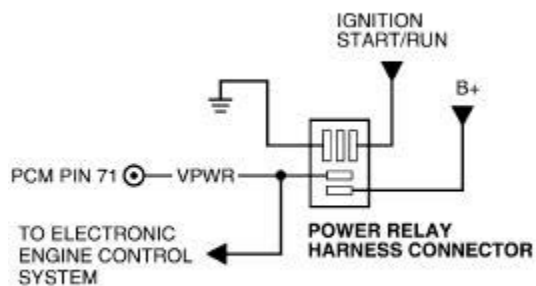

Note

This Pinpoint Test is intended to diagnose the following:

- Harness Circuits: Vehicle Power (VPWR), Ignition Start/Run, Power Relay Ground, Battery Positive Voltage (B+)
- Power Relay (12A646)

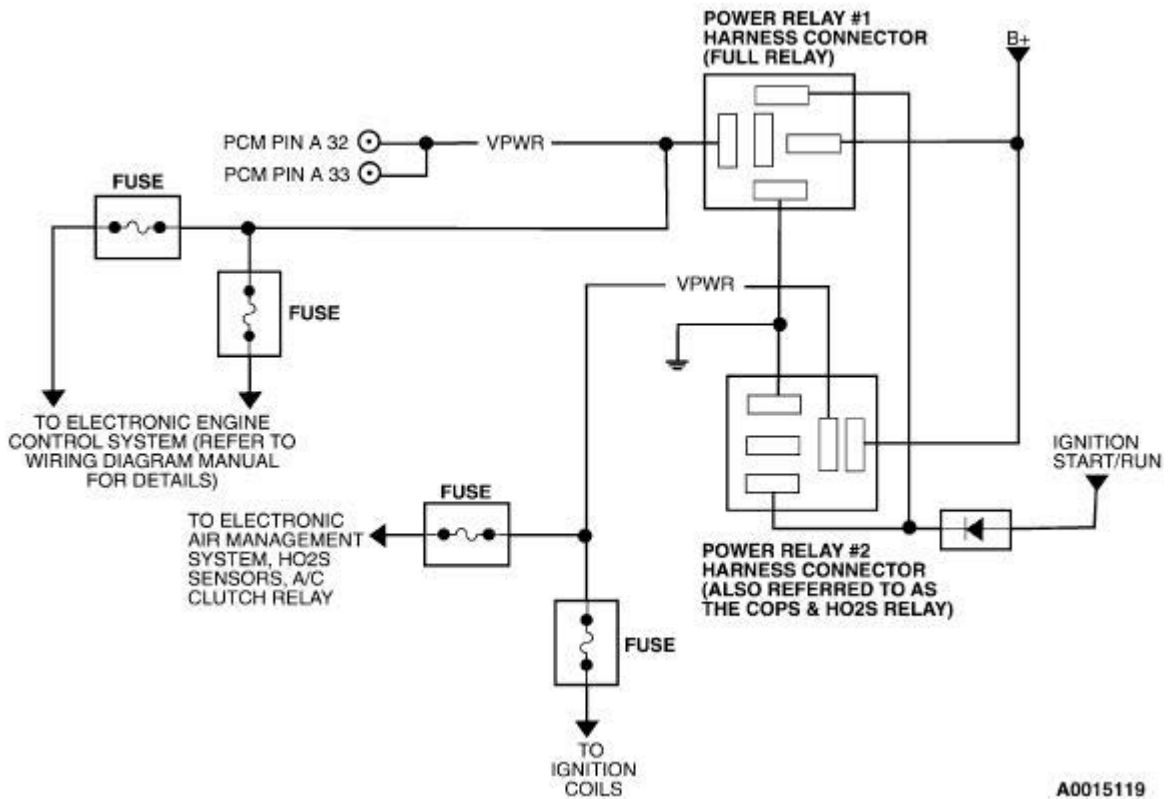

Pinpoint Test Schematics and Connectors

Focus, Cougar, Taurus/Sable, Escape

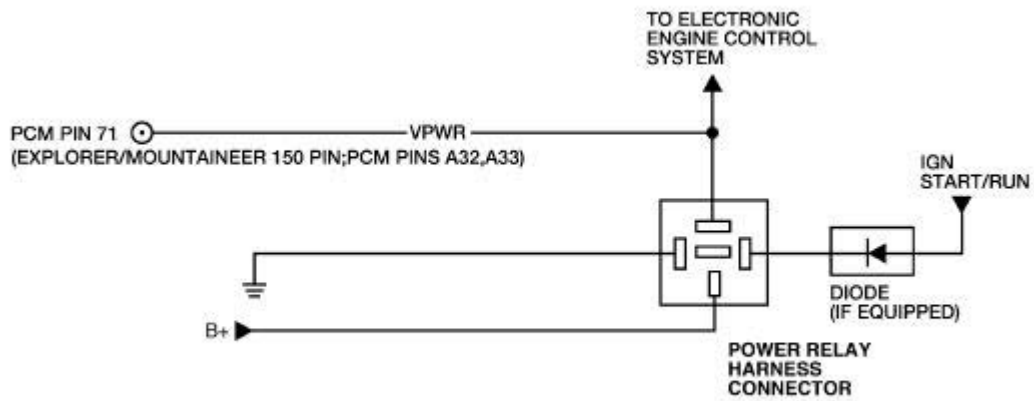

A0013926

LS6/LS8

All Others

A0027463

Note: The IGN START/RUN and GROUND circuits, and/or the B+ and VPWR circuits may be reversed in the harness connector. Refer to the Wiring Diagram Manual for more information.

B: Electronic Engine Control (EC) Power Relay

← B: Introduction

B1 VPWR CHECK AT IAC VALVE FAILED IN PINPOINT TEST C: CHECK FOR OPEN VPWR CIRCUIT

- Idle air control (IAC) valve disconnected.
- Disconnect scan tool from DLC.
- Disconnect electronic engine control power relay (referred to here as "power relay").
- Measure resistance of VPWR circuit between IAC valve harness connector and power relay harness connector.

Is resistance less than 5.0 ohms?

Yes	No
RECONNECT IAC valve. GO to B2 .	REPAIR open VPWR circuit between the power relay and the splice to the IAC valve.

B2 CHECK B+ AND IGN START/RUN VOLTAGE TO POWER RELAY

- Measure B+ circuit voltage at the power relay harness connector.
- Key on.
- Measure IGN START/RUN circuit voltage at power relay harness connector.

Are both voltages greater than 10.5 volts?

Yes	No
GO to B3 .	KEY OFF. B+ or IGN START/RUN circuit fault. CHECK condition of related fuse (s)/diode. If OK, REPAIR open circuit. If fuse is damaged, check IGN START/RUN or B+ and VPWR circuits for short to ground before replacing.

B3 CHECK GROUND CIRCUIT TO POWER RELAY

- Measure voltage between B+ and the ground circuits at the power relay harness connector.

Is voltage greater than 10.5 volts?

Yes	No
REPLACE power relay.	REPAIR open ground circuit.

B5 LS6/LS8 VPWR CHECK FAILED: CHECK FUSE

Note: The electronic engine control power relay #2 supplies VPWR to two separately fused circuits. Refer to the applicable Wiring Diagrams to determine fuse locations.

- Remove and inspect VPWR circuit fuse that goes to the component where VPWR check failed.

Is the fuse OK?

AA3310-A

Yes	No
GO to <u>B6</u> .	CHECK VPWR circuit for short to ground between fuse and applicable component. REPAIR as necessary. REPLACE fuse.

B6 CHECK FOR POWER TO OTHER VPWR CIRCUIT FUSE CONNECTED TO POWER RELAY #2

- Remove and inspect other VPWR circuit fuse that goes to the components supplied by the power relay #2. Service as necessary.
- Key on, engine off.
- Measure voltage to both VPWR circuit fuse harness connectors supplied by the power relay #2.

Are both voltages greater than 10.5 volts?

Yes	No
REPAIR open circuit between fuse and component where VPWR check failed.	<p>If both voltages were less than 10.5 volts:</p> <p>KEY OFF. GO to <u>B7</u>.</p> <p>If only one voltage was less than 10.5 volts:</p> <p>REPAIR open circuit between fuse and splice.</p>

B7 CHECK VPWR CIRCUIT CONTINUITY BETWEEN FUSE AND POWER RELAY #2

- Disconnect power relay #2.
- Measure resistance of the VPWR circuit between the power relay #2 harness connector and the harness connector either fuse.

Is resistance less than 5.0 ohms?

Yes	No
GO to <u>B2</u> . Make all indicated checks at power relay #2.	REPAIR open VPWR circuit between splice and power relay #2.

C: Reference Voltage Introduction

C: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Sensor harness circuits: SIG RTN, VREF
- 3-wire sensors: throttle position (TP) sensor, differential pressure feedback EGR sensor, A/C pressure (ACP) sensor, fuel tank pressure (FTP) sensor, power steering pressure (PSP) sensor, fuel rail pressure (FRP) sensor and barometric (BARO) pressure sensor.
- Powertrain control module (PCM) (12A650)

C: Pinpoint Tests →

C: Reference Voltage

← C: Introduction

C1 CHECK VREF CIRCUIT FOR SHORT TO PWR IN HARNESS

- Disconnect TP sensor.
- Key on.
- Measure voltage between VREF and SIG RTN circuits at the TP sensor harness connector.

Is VREF greater than 6.0 volts?

Yes	No
KEY OFF. GO to C35 (to check VREF for short to power).	GO to C2 .

C2 CHECK VOLTAGE ON BATTERY

- Measure voltage across battery terminals.

Is voltage greater than 10.5 volts?

Yes	No
GO to C3 .	Key off. REFER to Battery and Charging, Section 414-00 in the Workshop Manual to service discharged battery.

C3 CHECK VOLTAGE BETWEEN B+ AND SIG RTN

- Disconnect sensor where VREF check failed.
- Measure voltage between SIG RTN circuit and battery positive post at the appropriate sensor harness connector.

Is voltage greater than 10.5 volts and within 1.0 volt of battery voltage?

Yes	No
GO to C4 .	SIG RTN/PWR GND fault present. GO to C25 .

C4 CHECK VREF VOLTAGE THROUGH PCM ON TP PID

Note: Vehicles with 150 pin processor and multiple DTCs output, GO to [C5](#) for VREF concerns.

- Attempt to access the TP PID.

Can the PID be accessed?

--	--

Yes	No
KEY OFF. GO to <u>C20</u> (to check VREF for opens).	GO to <u>C5</u> (to check for VPWR, and VREF for shorts).

C5 CHECK VPWR VOLTAGE TO IAC VALVE

- Disconnect TP sensor.
- Disconnect idle air control (IAC) valve.
- Key on.
- Measure voltage between the VPWR circuit at the IAC valve harness connector and the battery negative post.

Is voltage greater than 10.5 volts?

Yes	No
RECONNECT IAC valve. For 2.0L Escort, Cougar, 5.4L E/F-Series with NGV: GO to <u>C7</u> . All Others: GO to <u>C6</u> .	VPWR is not present. RECONNECT TP sensor. For application with Power Relay inside CCRM: GO to <u>X1</u> . All others: GO to <u>B1</u> .

C6 CHECK VREF CIRCUIT SHORT TO SIG RTN IN THE D.P.F. EGR OR EGR VALVE POSITION SENSOR

- TP sensor disconnected.
- Disconnect D.P.F. EGR or EGR valve position sensor.
- Key on.
- Measure voltage between VREF and SIG RTN circuits at the TP sensor harness connector.

Is voltage between 4.0 and 6.0 volts?

Yes	No
KEY OFF. REPLACE D.P.F. EGR sensor or EGR valve position sensor.	For 3.0L FFV Taurus: GO to <u>C12</u> . For all others: GO to <u>C7</u> .

C7 CHECK VREF CIRCUIT SHORT TO SIG RTN IN FTP SENSOR

- TP and D.P.F. EGR sensors disconnected.
- Disconnect FTP sensor.
- Key on.

- Measure voltage between the VREF and SIG RTN circuits at the TP sensor harness connector.

Is voltage between 4.0 and 6.0 volts?

Yes	No
KEY OFF. REPLACE the FTP sensor.	<p>For applications with an A/C Pressure (ACP) sensor:</p> <p>GO to <u>C8</u>.</p> <p>For applications with PSP:</p> <p>GO to <u>C9</u>.</p> <p>For applications with FRP only:</p> <p>GO to <u>C10</u>.</p> <p>All Others:</p> <p>GO to <u>C12</u>.</p>

C8 CHECK VREF CIRCUIT SHORT TO SIG RTN IN ACP SENSOR

- TP (FTP where applicable) and D.P.F. EGR sensor disconnected.
- Disconnect ACP sensor.
- Key on.
- Measure voltage between the VREF and SIG RTN circuits at the TP sensor harness connector.
- Key off.

Is voltage between 4.0 and 6.0 volts?

Yes	No
KEY OFF. REPLACE the ACP sensor.	<p>For application with FRP:</p> <p>GO to <u>C10</u>.</p> <p>All others:</p> <p>GO to <u>C12</u>.</p>

C9 CHECK VREF CIRCUIT SHORT TO SIG RTN IN PSP SENSOR

- TP, FTP, ACP where applicable and D.P.F. EGR sensors disconnected.
- Disconnect PSP sensor.
- Key on.
- Measure voltage between the VREF and SIG RTN circuits at the TP sensor harness connector.

Is voltage between 4.0 and 6.0 volts?

Yes	No
	<p>For applications with FRP:</p> <p>GO to <u>C10</u>.</p>

KEY OFF. REPLACE the PSP sensor.

All others:

GO to C12.

C10 CHECK VREF CIRCUIT SHORT TO SIG RTN IN FRP SENSOR

- TP, FTP, ACP and PSP where applicable and D.P.F. EGR sensors disconnected.
- Disconnect fuel rail pressure (FRP) sensor.
- Measure voltage between the VREF and SIG RTN circuits at the TP sensor harness connector.

Is voltage between 4.0 and 6.0 volts?

Yes	No
KEY OFF. REPLACE the FRP sensor.	KEY OFF. For applications with BARO: GO to <u>C11</u> . All others: GO to <u>C12</u> .

C11 CHECK VREF CIRCUIT SHORT TO SIG RTN IN BARO SENSOR

- TP, D.P.F. EGR, FTP, and FRP disconnected.
- Disconnect barometric (BARO) pressure sensor.
- Measure voltage between VREF and SIG RTN circuits at the TP sensor harness connector.

Is voltage between 4.0 and 6.0 volts?

Yes	No
KEY OFF. REPLACE BARO sensor.	KEY OFF. GO to <u>C12</u> .

C12 CHECK VPWR VOLTAGE TO PCM

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- TP sensor disconnected.
- All other sensors wired to VREF disconnected from previous test steps (if necessary, refer to Sensors Connected To VREF chart at the beginning of this pinpoint test).
- PCM disconnected.
- Key on.
- Measure voltage between VPWR and PWR GND circuits at the PCM harness connector.

Is voltage greater than 10.5 volts?

Yes	No
GO to <u>C13</u> .	KEY OFF. REPAIR open VPWR circuit between PCM and splice to IAC valve.

C13 CHECK VREF VOLTAGE FOR SHORT TO GROUND OR SIG RTN

- TP sensor disconnected.
- All other sensors wired to VREF disconnected.
- Disconnect PCM.
- Disconnect Scan Tool from DLC.
- Measure resistance between VREF and SIG RTN, PWR GND circuits at the PCM harness connector. (Vehicles with 150 pin processor, measure to both VREF pins.)

Is each resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR VREF short to ground.

C20 CHECK VREF CIRCUIT FOR OPEN IN HARNESS

- Sensor where VREF check failed disconnected.
- Disconnect PCM.
- Measure resistance of VREF circuit between PCM harness connector pin and appropriate sensor harness connector.

Is resistance less than 5.0 ohms?

Yes	No
KEY OFF. REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR open VREF circuit. REFER to the EVTM and DTCs received to help pinpoint the location of the open.

C25 CHECK SIG RTN/PWR GND THROUGH PCM ON TP PID

- Key on.
- Attempt to access the TP PID.

Can the PID be accessed?

Yes	No
GO to C26 .	GO to C28 .

C26 ARE KOEO DTCs PRESENT FOR TWO OR MORE SENSORS/SWITCHES CONNECTED TO THE SIG RTN CIRCUIT?

Are KOEO DTCs present for two or more sensors/switches connected to the SIG RTN circuit? (Refer to the Electrical and Vacuum Troubleshooting Manual, Engine Controls.)

Yes	No
KEY OFF. GO to C27 .	KEY OFF. REPAIR open SIG RTN circuit to the sensor where the VREF check failed.

C27 CHECK SIG RTN CIRCUIT FOR OPEN IN HARNESS

- Scan Tool disconnected.
- Sensor where VREF check failed disconnected.
- Disconnect PCM.
- Measure resistance of SIG RTN circuit between PCM harness connector pin and appropriate sensor harness connector.

Is resistance less than 5.0 ohms?

Yes	No
RECONNECT sensor. GO to C28 .	REPAIR open SIG RTN circuit. REFER to the EVTM and DTCs received to help pinpoint the location of the open.

C28 CHECK PWR GND CIRCUITS FOR OPEN IN HARNESS

- Disconnect scan tool from DLC.
- Measure resistance of PWR GND circuits between the PCM harness connector pin and the battery negative post.

Is each resistance less than 5.0 ohms?

Yes	No
GO to C29 .	REPAIR open circuit.

C29 CHECK GROUND CIRCUITS FOR OPEN IN HARNESS

- Measure resistance of ground circuits between SIG RTN and PWR GND circuits at the PCM harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	Repair SIG RTN/PWR GND circuits in harness.

C35 CHECK VREF CIRCUIT FOR SHORT TO PWR

- Sensor where VREF check failed disconnected.
- Disconnect all other sensors connected to VREF (refer to Sensors Connected to VREF chart at beginning of this pinpoint test).
- Disconnect PCM.
- Key on.
- Measure voltage between the VREF circuit at the TP sensor harness connector and the battery negative post.

Is voltage less than 0.5 volts?

Yes	No
KEY OFF. REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	KEY OFF. REPAIR VREF short to power in harness.

DA: Intake Air Temperature (IAT)/Engine Coolant Temperature (ECT)/Engine Oil Temperature (EOT) Sensors

Introduction

DA: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Intake air temperature (IAT) sensor (12A697)
- Integrated intake air temperature (IAT) sensor (12B579)
- Engine coolant temperature (ECT) sensor (12A648)
- Engine oil temperature (EOT) sensor (12A648)
- Harness circuits: IAT, ECT, EOT and SIG RTN
- Powertrain control module (PCM) (12A650)

The term "applicable" is used in this pinpoint test and refers to the temperature sensor indicated by the DTC. Example: ECTV, IATV, EOTV.

Tables and Graphs

Note: Engine coolant temperature must be greater than 10°C (50°F) to pass the KOEO Self-Test and greater than 82°C (180°F) to pass the KOER Self-Test. To accomplish this, the engine must be at normal operating temperature.

Ambient temperature must be above 10°C (50°F) to receive acceptable input from the intake air temperature (IAT) sensor.

Engine oil temperature must be greater than 10°C (50°F) to pass the KOEO Self-Test and greater than 66°C (150°F) to pass the KOER Self-Test.

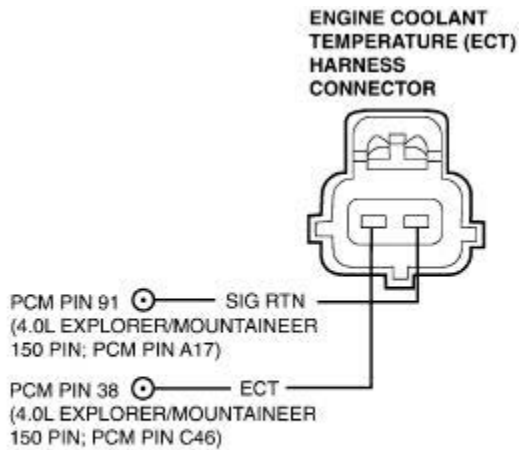

Voltage values were calculated for VREF = 5.0 volts. These values can vary 15 percent due to sensor and VREF variations.

TEMPERATURE SENSOR VOLTAGE AND RESISTANCE SPECIFICATIONS

Temperature		Temperature Sensor Values		
°C	°F	Voltage (volts)		Resistance
		Focus	All Others	K ohms
120	248	0.28	0.27	1.18
110	230	0.36	0.35	1.55
100	212	0.47	0.46	2.07
90	194	0.61	0.60	2.80
80	176	0.80	0.78	3.84
70	158	1.05	1.02	5.37
60	140	1.37	1.33	7.70
50	122	1.77	1.70	10.97
40	104	2.23	2.13	16.15
30	86	2.74	2.60	24.27
20	68	3.26	3.07	37.30
10	50	3.73	3.51	58.75
0	32	4.14	3.91	95.85
-10	14	4.45	4.15	160.31

DA: Intake Air Temperature (IAT)/Engine Coolant Temperature (ECT)/Engine Oil Temperature (EOT) Sensors

← DA: Introduction

DA1 DTC P1116: CHECK OPERATION OF ECT SENSOR

- Run engine at 2000 rpm until engine temperature becomes stabilized.
- **No Starts:**
 - GO to [DA3](#).
- **Vehicles that stall:**
 - Return to [Section 3](#), Symptom Charts.
- Check that upper radiator hose is hot and pressurized.
- Rerun Key On Engine Running (KOER) Self-Test.

Is DTC P1116 present?

Yes	No
KEY OFF. GO to DA2 .	Engine was not at closed loop operating conditions. REPAIR any other DTCs as necessary.

DA2 CHECK VREF VOLTAGE TO TP SENSOR

- Disconnect throttle position (TP) sensor.

Note: GO to Pinpoint Test [DH](#) and refer to **Pinpoint Test Schematics and Connectors** for TP harness connector pin-out information.

- Key on, engine off.
- Measure the voltage between VREF and SIG RTN circuits at the TP sensor harness connector.

Is voltage between 4.0 volts and 6.0 volts?

Yes	No
There is sufficient VREF voltage. RECONNECT TP sensor. GO to DA3 .	GO to C1 .

DA3 CHECK TEMPERATURE SENSOR RESISTANCE WITH ENGINE OFF

- Disconnect ECT sensor.
- Measure ECT sensor resistance. Refer to the chart at the beginning of this Pinpoint Test for resistance specifications.

Is resistance within specification?

Yes	No

<p>For ECT sensor with a No Start:</p> <p>Do not repair DTC P1116 at this time. RETURN to <u>Section 3</u>, Symptom Charts.</p> <p>For symptoms of cooling fan concerns, overheating and lack of heat, do not repair DTC P1116. REPAIR next DTC. If no other DTC exists, RETURN to <u>Section 3</u>, Symptom Charts.</p> <p>All others:</p> <p>GO to <u>DA4</u>.</p>	<p>REPLACE suspect sensor.</p>
--	--------------------------------

DA4 CHECK TEMPERATURE SENSOR RESISTANCE WITH ENGINE RUNNING

Note: Verify that engine is at operating temperature before taking ECT readings.

- Run engine for two minutes at 2000 rpm.
- Measure temperature sensor resistance. Refer to the chart at the beginning of this Pinpoint Test for resistance specifications.

Is resistance within specification?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>). RESTORE vehicle.	REPLACE suspect sensor.

DA10 DTC P0118 OR P0113: CHECK VOLTAGE BETWEEN VREF AND SIG RTN

- Disconnect throttle position (TP) sensor.

Note: GO to Pinpoint Test DH and refer to **Pinpoint Teat Schematics and Connectors** for TP harness connector pin-out information.

- Key on, engine off.
- Measure the voltage between VREF and SIG RTN circuits at the TP sensor harness connector.

Is voltage between 4.0 volts and 6.0 volts?

Yes	No
GO to <u>DA11</u> .	GO to <u>C1</u> .

DA11 SIMULATE OPPOSITE SIGNAL TO PCM

- With applicable temperature sensor disconnected, connect a jumper wire between the sensor signal and SIG RTN circuits at the temperature sensor harness connector.
- Key on.

Note: If a scan tool communication concern exists, remove jumper wire immediately and GO to [DA13](#).

- Access applicable temperature sensor voltage PID.

Is the applicable temperature sensor voltage PID less than 0.2 volts (greater than 120°C/248°F)?

Yes	No
REPLACE suspect sensor.	REMOVE jumper wire. GO to DA12 . KEY OFF.

DA12 CHECK TEMPERATURE SENSOR SIGNAL AND SIG RTN CIRCUITS FOR OPEN IN HARNESS

Note: Refer to the PCM connector pin numbers on this pinpoint test cover page.

- Disconnect PCM.
- Measure resistance of sensor signal circuit between PCM harness connector pin and applicable sensor harness connector.
- Measure resistance of SIG RTN circuit between PCM harness connector pin and applicable temperature sensor harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
REPLACE PCM.	REPAIR open circuits.

DA13 CHECK TEMPERATURE SENSOR SIGNAL FOR SHORT TO VREF IN HARNESS

- Key off.
- Disconnect PCM.
- Measure resistance between applicable temperature sensor signal and VREF circuits at the PCM harness connector.

Is resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR short to VREF.

DA20 DTC P0112 OR P0117: SIMULATE OPPOSITE SIGNAL TO PCM

- Disconnect harness from applicable temperature sensor.
- Connect scan tool.
- Key on.
- Access applicable temperature sensor voltage PID.

Is the applicable temperature sensor voltage PID greater than 4.2 volts (less than -40°C/-40°F)?

Yes	No
REPLACE sensor.	GO to DA21 .

DA21 CHECK VREF VOLTAGE TO TP SENSOR

- Disconnect throttle position (TP) sensor.

Note: GO to Pinpoint Test [DH](#) and refer to **Pinpoint Test Schematics and Connectors** for TP harness connector pin-out information.

- Key on, engine off.
- Measure the voltage between VREF and SIG RTN circuits at the TP sensor harness connector.

Is voltage between 4.0 and 6.0 volts?

Yes	No
There is sufficient VREF voltage. RECONNECT TP sensor. GO to DA22 . KEY OFF.	GO to C1 .

DA22 CHECK TEMPERATURE SIGNAL CIRCUIT FOR SHORT TO GROUND IN HARNESS

Note: Refer to the PCM connector pin numbers on this pinpoint test cover page.

- Disconnect PCM.
- Measure resistance between sensor signal and SIG RTN circuits and then between sensor signal and PWR GND circuits at the PCM harness connector.

Is each resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR short circuit.

DA80 P0116: CHECK TEMPERATURE SENSOR RESISTANCE WITH ENGINE OFF

Note: Verify that engine temperature is at ambient room temperature before continuing with this test. A soak period of 6 hours may be required. Refer to [Diagnostic Trouble Code \(DTC\) Descriptions](#), in Section 4 for information concerning P0116.

- Key on, engine off.
- Disconnect ECT sensor.
- Measure ECT sensor resistance. Refer to the chart at the beginning of this Pinpoint Test for resistance specifications.

Is resistance within specification?

Yes	No

GO to [DA81](#).

REPLACE suspect sensor.

DA81 P0116: CHECK TEMPERATURE SENSOR RESISTANCE WITH ENGINE RUNNING

Note: Verify that engine is at operating temperature before taking ECT readings.

- Run engine for two minutes at 2000 rpm.
- Measure temperature sensor resistance. Refer to the chart at the beginning of this Pinpoint Test for resistance specifications.

Is resistance within specification?

Yes	No
Fault is not present at this time. COMPLETE OBDII Drive Cycle to determine if Fuel, HEGO, Catalyst and Misfire monitors can be executed (REFER to Section 2, Drive Cycles). Retest if necessary.	REPLACE suspect sensor.

DA90 DTCS P0112, P1112, P0113, P0117, P1117 OR P0118: INTERMITTENT CHECK

- Connect scan tool.
- Key on.
- Monitor the applicable temperature sensor voltage PID.
- While observing the PID, complete the following:
 - Tap on the sensor to simulate road shock.
 - Wiggle the sensor connector.

Is there any large change in the voltage reading?

Yes	No
Key OFF. DISCONNECT and INSPECT connectors. If OK, REPLACE the sensor. For Continuous DTCs P1112 and P1117, COMPLETE OBDII Drive Cycle to verify repair (REFER to Section 2, Drive Cycles).	GO to DA91 .

DA91 CHECK ELECTRONIC ENGINE CONTROL (EC) WIRING HARNESS

- Still monitoring PID.
- While observing the appropriate PID, complete the following:
 - Hold the sensor harness close to the sensor connector. Wiggle, shake and bend small sections of wiring harness while working toward the PCM.

Is there any change in the voltage reading?

Yes	No
ISOLATE fault. REPAIR as necessary. For	

Continuous DTCs P1112 and P1117, COMPLETE OBDII Drive Cycle to verify repair (REFER to Section 2, Drive Cycles).	GO to DA92 .
---	------------------------------

DA92 CHECK PCM AND VEHICLE HARNESS CONNECTOR

- Disconnect PCM.
- Disconnect sensor connector.

Are connectors and terminals OK?

Yes	No
Fault is not present at this time. For Continuous Memory DTCs P1112 and P1117, COMPLETE OBDII Drive Cycle (REFER to Section 2, Drive Cycles).	REPAIR as necessary. For Continuous Memory DTCs P1112 or P1117, COMPLETE OBDII Drive Cycle to verify repair (REFER to Section 2, Drive Cycles).

DA100 DTC P0125: CHECK ENGINE COOLANT LEVEL

Diagnostic Trouble Code (DTC) P0125 indicates the ECT sensor has not achieved the required temperature level to enter closed loop operating conditions within a specified amount of time after starting engine. This DTC will light the MIL.

Possible causes:

- Insufficient warm up time.
- Leaky or stuck open thermostat.
- Low engine coolant level.
- Malfunctioning ECT sensor.

WARNING: TO AVOID PERSONAL INJURY, DO NOT UNSCREW THE COOLANT PRESSURE RELIEF CAP WHILE THE ENGINE IS OPERATING OR HOT. THE COOLING SYSTEM IS UNDER PRESSURE; STREAM AND HOT LIQUID CAN COME OUT FORCEFULLY WHEN THE CAP IS LOOSENDED SLIGHTLY.

- Check engine coolant level.

Is the engine coolant level fill correct?

Yes	No
REFER to Engine Cooling, Section 303-03 in the Workshop Manual for further diagnostics.	FILL engine coolant to proper level. COMPLETE OBDII Drive Cycle to verify repair (REFER to Section 2, Drive Cycles).

DA110 DTC P1184: CHECK OPERATION OF EOT TEMP SENSOR

- Connect scan tool.
- Run engine at 2000 rpm until engine temperature becomes stabilized.
- Run Key On Engine Running (KOER) Self-Test.

Is DTC P1184 present?

Yes	No
GO to DA111 .	Engine oil temperature was not at operating temperature. REPAIR any other DTCs as necessary.

DA111 DTC P1183, P1184 OR P0298: CHECK TEMPERATURE SENSOR SIGNAL

- Connect scan tool.
- Key on.
- Access EOTV PID.

Is EOTV PID less than 0.3 volts?

Yes	No
GO to DA112 .	GO to DA115 .

DA112 SIMULATE OPPOSITE EOT SIGNAL TO PCM

- Still monitoring PID.
- Disconnect EOT sensor.

Is EOTV PID greater than 4.2 volts?

Yes	No
REPLACE suspect sensor.	GO to DA113 .

DA113 CHECK EOT SIGNAL CIRCUIT FOR SHORT TO GROUND IN HARNESS

Note: Refer to the PCM connector pins numbers on this pinpoint test cover page.

- Disconnect PCM.
- Measure resistance between EOT and SIG RTN circuits and then between EOT and PWR GND circuits at the PCM harness connector.

Is each resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR short circuit.

DA115 CHECK FOR HIGH EOT SIGNAL

- Still monitoring PID.

Is EOTV PID greater than 4.2 volts?

Yes	No
GO to DA116.	GO to DA120.

DA116 SIMULATE LOW SIGNAL TO PCM

- Disconnect EOT temperature sensor.
- Connect a jumper wire between the sensor signal and SIG RTN circuits at the temperature sensor harness connector.
- Key on.
- Access EOTV PID.

Is EOTV PID less than 0.3 volts?

Yes	No
REPLACE suspect sensor.	KEY OFF. GO to DA117.

DA117 CHECK TEMPERATURE SENSOR SIGNAL AND SIG RTN CIRCUIT FOR OPEN IN HARNESS

Note: Refer to the PCM connector pins numbers on this pinpoint test cover page.

- Disconnect PCM.
- Measure resistance of EOT circuit between PCM harness connector pin and EOT sensor harness connector.
- Measure resistance of SIG RTN circuit between PCM harness connector pin and EOT sensor harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR open circuits.

DA120 INTERMITTENT EOT SENSOR CHECK

- Still monitoring PID, complete the following:
 - Tap on sensor to simulate road shock.
 - Wiggle the sensor connector.

Is there any large change in the PID reading?

Yes	No
KEY OFF. DISCONNECT and INSPECT connector. If OK, REPLACE the sensor.	GO to DA121.

DA121 CHECK EOT ELECTRONIC ENGINE CONTROL (EC) WIRING HARNESS

- Still monitoring PID, complete the following:
 - Wiggle, shake and bend small sections of wiring harness while working from the sensor to the PCM.

Is there any large change in the PID reading?

Yes	No
ISOLATE fault. REPAIR as necessary.	Fault is not present at this time. For Continuous Memory DTCs, COMPLETE OBDII Drive Cycle (REFER to Section 2, Drive Cycles).

DA130 DTC P0298: ENGINE OIL OVER TEMPERATURE CONDITION

- Engine oil temperature protection strategy in the PCM has been activated.
 - Check for overheating condition and base engine concerns.

Is there any overheating or base engine concerns?

Yes	No
ISOLATE fault. REPAIR as necessary. REFER to Engine System — General Information, Section 303-00 in the Workshop Manual.	GO to DA131 .

DA131 CHECK FOR EOT SENSOR HARDWARE

- Engine oil temperature protection strategy in the PCM can be activated with or without an EOT sensor.

Does vehicle have an EOT sensor?

Yes	No
GO to DA111 .	IDENTIFY customer driving habits. Advise customer improper transmission gear selection and high rpm for extended period will initialize engine protection strategy.

DB: Engine Fuel Temperature (EFT) Sensor Introduction

DB: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Engine Fuel Temperature (EFT) Sensor (9F951)
- Harness Circuits: EFT and SIG RTN
- Powertrain Control Module (PCM) (12A650)

Tables and Graphs

Note: The engine fuel temperature (EFT) sensor will operate within the range of -40°C to 135°C (-40°F to 275°F).

Table and Graph voltage values are calculated for VREF=5.0 volts. These values may vary up to 15% due to sensor and VREF variations.

ENGINE FUEL TEMPERATURE SENSOR VOLTAGE AND RESISTANCE SPECIFICATIONS

Temperature		Engine Fuel Temperature (EFT) Sensor Values	
°C	°F	Voltage (volts)	Resistance (K ohms)
150	302	0.13	0.56
135	275	0.19	0.81
120	248	0.27	1.18
110	230	0.35	1.55
100	212	0.46	2.07
90	194	0.60	2.80
80	176	0.78	3.84
70	158	1.02	5.37

60	140	1.33	7.70
50	122	1.70	10.97
40	104	2.13	16.15
30	86	2.60	24.27
20	68	3.07	37.30
10	50	3.51	58.75
-40	-40	4.54	92.5

DB: Pinpoint Tests ➔

DB: Engine Fuel Temperature (EFT) Sensor

← DB: Introduction

DB1 DTC P0181 CHECK FOR KOER DTCS

- Start engine and bring up to operating temperature.
- Check for KOER DTCs.

Is DTC P0182 or P0183 present during KOER?

Yes	No
For DTC P0181 with DTC P0182 or P0183. GO to <u>DB2</u> .	For DTC P0181 only. COMPLETE an OBD-II Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>). GO to <u>DB2</u> .

DB2 DTC P0180, P0181, P0182 and P0183: VERIFY ELECTRICAL FAULT CONDITION BY SIMULATING OPPOSITE SIGNAL TO PCM

- Disconnect engine fuel temperature sensor.
- Access EFTA-V PID value.
- Install jumper across terminals at the vehicle harness connector.

Note: If a scan tool communication concern exists, remove jumper wire immediately and GO to DB5.

- Record new reading.

Is the original reading of the EFTA-V PID with the harness disconnected greater than 4.5 volts or (-40°C/-40°F) and less than 0.21 volt or (135°C/275 °F) with the jumper installed?

Yes	No
KEY OFF. REPLACE EFTA sensor. REFER to Electronic Engine Controls, Section 303-14 in the Workshop Manual.	KEY OFF. FOR EFTA-V reading less than 4.54 volts with harness disconnected and jumper removed: GO to <u>DB3</u> . FOR DTC P0182: GO to <u>DB3</u> . FOR EFTA-V reading greater than 0.2 volt with harness disconnected and jumper installed: GO to <u>DB5</u> . FOR DTC P0183: GO to <u>DB5</u> .

DB3 CHECK VREF CIRCUIT VOLTAGE AT FRP SENSOR

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect fuel rail pressure (FRP) sensor.
- Key on, engine off.

- Measure voltage between VREF and SIG RTN at the fuel rail pressure (FRP) sensor harness connector.

Is voltage between 4.0 and 6.0 volts?

Yes	No
GO to <u>DB4</u> .	GO to <u>C1</u> .

DB4 CHECK EFT CIRCUIT FOR SHORT TO SIG RTN IN HARNESS

- Disconnect PCM.
- Measure resistance between EFT and SIG RTN circuits at the PCM harness connector.

Is each resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPAIR short circuit.

DB5 CHECK EFT SIGNAL FOR SHORT TO VREF

- Temperature sensor disconnected.
- PCM disconnected.
- Measure resistance between EFT and VREF circuits at the PCM harness connector.

Is each resistance greater than 10,000 ohms?

Yes	No
GO to <u>DB6</u> .	LOCATE and REPAIR short to VREF.

DB6 CHECK EFT SIGNAL AND SIG RTN CIRCUITS FOR OPEN IN HARNESS

- Measure resistance of EFT circuit between PCM harness connector pin and EFT sensor harness connector.
- Measure resistance of SIG RTN circuit between PCM harness connector pin and EFT sensor harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPAIR open circuits.

DB7 DTCS P0180, P0181, P0182 and P0183: INTERMITTENT CHECK

- Key on.

- Access EFT-A PID.
- While monitoring EFT-A PID, perform the following: Tap on the sensor to simulate road shock. Wiggle the sensor connector.

Was there any change in the temperature reading?

Yes	No
DISCONNECT and INSPECT connectors. If OK, REPLACE the sensor.	GO to <u>DB8</u> .

DB8 WIGGLE TEST OF SENSOR WIRING HARNESS

- While monitoring EFT-A PID, hold the vehicle harness close to the sensor connector. Wiggle, shake and bend small sections of wiring harness while working toward the PCM.

Was there any change in the temperature reading?

Yes	No
REPAIR as necessary.	Fault is not present at this time.

DC: Pinpoint Tests →

DC: Mass Air Flow (MAF) Sensor

← DC: Introduction

DC1 DTC P1101: CHECK FOR MAF SENSOR CONTINUOUS MEMORY DTCs

- Drive vehicle for 6 to 10 minutes.
- Rerun KOER, KOEO Self-Test and retrieve Continuous Memory DTCs.

Is a Continuous Memory DTC present with the KOER DTC P1101?

Yes	No
For Continuous Memory DTC P0102: GO to DC2 . For Continuous Memory DTC P0103: GO to DC20 . All other Continuous Memory DTCs: GO to Section 4, Powertrain Diagnostic Trouble Code (DTC) Charts .	KEY OFF. GO to DC3 .

DC2 DTC P0102: CHECK MAF SENSOR SIGNAL LOW INPUT TO PCM

- Check for broken/loose air outlet tube clamps (throttle body and air cleaner assembly ends), cracks/holes in air outlet tube, worn gaskets between MAF sensor and air cleaner assembly. Repair as necessary.
- Start engine and bring to idle.
- If a KOER DTC P0505 is present, go to Section 4, Powertrain [Diagnostic Trouble Code \(DTC\) Charts](#). For A/T vehicles, if the engine stalls and cannot maintain an idle, GO to [DC7](#).
- Run engine up 1500 rpm for 5 seconds, then bring it back to idle.
- Access MAF V PID.

Is MAF V PID less than 0.23 volt?

Yes	No
KEY OFF. GO to DC4 .	KEY OFF. GO to DC3 .

DC3 DTC P1101: CHECK FOR MAF SENSOR SIGNAL OUT OF SELF-TEST RANGE

Note: DTC P1101 can be generated by a low charged vehicle battery or the garage exhaust ventilation system. Repair battery as necessary. Then remove ventilation system and properly vent to outside atmosphere. Rerun KOEO Self-Test.

- Verify MAF sensor is connected. If not, repair as necessary.
- Key on, engine running.

- Access MAF V PID.

Is MAF V PID between 0.46-2.44 volts?

Yes	No
Unable to identify fault at this time. GO to <u>Z1</u> .	KEY OFF. GO to <u>DC4</u> .

DC4 CHECK VPWR VOLTAGE TO MAF SENSOR

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect MAF sensor.
- Key on, engine off.
- Measure voltage between VPWR circuit at the MAF sensor harness connector and battery negative post.

Is voltage greater than 10.5 volts?

Yes	No
GO to <u>DC5</u> .	REPAIR open circuit. RESET Keep Alive Random Access Memory (RAM) (REFER to Section 2, <u>Powertrain Control Module (PCM) Reset</u>).

DC5 CHECK PWR GND CIRCUIT BETWEEN MAF SENSOR AND POWER RELAY

- Measure voltage between PWR GND circuit at the MAF sensor harness connector and battery positive post.

Is voltage greater than 10.0 volts?

Yes	No
KEY OFF. GO to <u>DC6</u> .	REPAIR open circuit. RESET Keep Alive Random Access Memory (RAM) (REFER to Section 2, <u>Powertrain Control Module (PCM) Reset</u>).

DC6 CHECK VPWR CIRCUIT FOR OPEN IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Measure resistance of VPWR circuit between PCM harness connector pin (or on 150PIN PCM, the VPWR fuse to the power relay) and MAF sensor harness connector.

Is resistance less than 5.0 ohms?

Yes	No
GO to <u>DC7</u> .	REPAIR open circuit. RESET Keep Alive Random Access Memory (RAM) (REFER to Section 2, <u>Powertrain Control Module (PCM)</u>

Reset).

DC7 CHECK MAF CIRCUIT SHORT TO PWR GND OR MAF RTN IN THE HARNESS

- PCM disconnected.
- Disconnect scan tool from DLC.
- Measure resistance between MAF and PWR GND circuits at the MAF sensor harness connector.
- Measure resistance between MAF and MAF RTN circuits at the MAF sensor harness connector.

Is each resistance greater than 10,000 ohms?

Yes	No
GO to <u>DC8</u> .	REPAIR short circuit. RESET Keep Alive Random Access Memory (RAM) (REFER to Section 2, <u>Powertrain Control Module (PCM) Reset</u>).

DC8 CHECK MAF RTN CIRCUIT SHORT TO PWR GND IN THE HARNESS

- Measure resistance between MAF RTN and PWR GND circuits at the MAF sensor harness connector.

Is the resistance greater than 10,000 ohms?

Yes	No
RECONNECT scan tool to DLC. GO to <u>DC9</u> .	REPAIR short circuit. RESET Keep Alive Random Access Memory (RAM) (REFER to Section 2, <u>Powertrain Control Module (PCM) Reset</u>).

DC9 CHECK MAF CIRCUIT VOLTAGE CYCLING INTEGRITY

- Reconnect PCM.
- Key on, engine off.
- Access MAF V PID.
- Record the MAF V PID reading.
- Jumper MAF RTN and PWR GND circuits at the MAF sensor harness connector.
- Jumper MAF and VPWR circuits at the MAF sensor harness connector.

Does the MAF V PID change from less than 0.23 volt (closer to zero volts) to greater than 4.50 volts?

Yes	No
REPLACE MAF sensor. RESET Keep Alive Random Access Memory (RAM)(REFER to Section 2, <u>Powertrain Control Module (PCM) Reset</u>).	For DTC P1101 without P0102 present: KEY OFF. GO to <u>DC11</u> . For DTC P0102: KEY OFF. GO to <u>DC10</u> .

DC10 CHECK MAF CIRCUIT FOR OPEN IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Measure resistance of MAF circuit between PCM harness connector pin and MAF sensor harness connector.

Is resistance less than 5.0 ohms?

Yes	No
GO to DC11 .	REPAIR open circuit. RESET Keep Alive Random Access Memory (RAM) (REFER to Section 2, Powertrain Control Module (PCM) Reset).

DC11 CHECK PWR GND CIRCUIT FOR OPEN IN HARNESS

- PCM disconnected.
- Disconnect scan tool from DLC.
- Measure resistance of PWR GND circuit between MAF sensor harness connector and battery negative post.

Is resistance less than 10 ohms?

Yes	No
RECONNECT scan tool. GO to DC12 .	REPAIR open circuit. RESET Keep Alive Random Access Memory (RAM) (REFER to Section 2, Powertrain Control Module (PCM) Reset).

DC12 CHECK MAF RTN FOR OPEN IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Measure resistance of MAF RTN circuit between PCM harness connector pin and MAF sensor harness connector.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR open circuit. RESET Keep Alive Random Access Memory (RAM) (REFER to Section 2, Powertrain Control Module (PCM) Reset).

DC16 DTC P1100: CHECK MAF CIRCUIT FOR INTERMITTENT VOLTAGE TO PCM

- Start engine and bring it to idle.
- If a stable idle is not at least 700 rpm, GO to [Section 3](#) , Symptom Charts.

- Run throttle up to 1500 rpm for 5 seconds, and bring back to idle.
- Access MAF V PID while completing the following:
 - Lightly tap on MAF sensor and wiggle harness connector to simulate road shock.

Is MAF V PID changing below the minimum 0.23 volt or above a maximum 4.60 volts?

Yes	No
INSPECT MAF sensor connector. If OK, REPLACE the MAF sensor. RESET Keep Alive Random Access Memory (RAM) (REFER to Section 2, Powertrain Control Module (PCM) Reset).	GO to DC17 .

DC17 CHECK FOR MAF SENSOR CIRCUIT FOR INTERMITTENT OPENS OR SHORTS

- Again access the MAF V PID.
- Key on, engine off.
- Complete the following:
 - Grasp the MAF sensor harness and MAF sensor harness connector.
 - Shake and bend a small section of the harness all the way to the dash panel.
 - Wiggle, shake and bend the harness from the dash panel to the PCM.

Is the MAF V PID reading changing below the minimum 0.23 volt or above the maximum 4.60 volts?

Yes	No
REPAIR as necessary. RESET Keep Alive Random Access Memory (RAM) (REFER to Section 2, Powertrain Control Module (PCM) Reset).	Unable to duplicate or identify fault at this time. GO to Z1 .

DC20 DTC P0103: CHECK MAF SENSOR SIGNAL HIGH INPUT TO PCM

Note: DTC P0103 can be generated by foreign material blocking the MAF sensor screen causing an air flow restriction. If contaminants are found on the screen, check air cleaner element installation in air cleaner housing and proper sealing of air cleaner and air tubes before proceeding. Rerun Quick Test after service.

- Start engine and bring to idle.
- If a KOER DTC P0505 is present, GO to Section 4, Powertrain [Diagnostic Trouble Code \(DTC\) Charts](#). For 2.5L A/T Ranger that stalls and cannot maintain an idle, REPLACE PCM (refer to Section 2, [Flash Electrically Erasable Programmable Read Only Memory \(EEPROM\)](#)).
- Run throttle up to 1500 rpm for 5 seconds, and bring it back to idle.

Note: MAF V PID is greater than 4.60 volts.

- Access MAF V PID.
- Key off.
- Disconnect MAF sensor.
- Jumper PWR GND and MAF RTN circuits at the MAF sensor harness connector.
- Key on, engine running.
- Again access MAF V PID.

Did MAF V PID drop from the previous reading to below 0.23 volt?

Yes	No
REMOVE jumper. REPLACE MAF sensor. RESET Keep Alive Random Access Memory (RAM) (REFER to Section 2, <u>Powertrain Control Module (PCM) Reset</u>).	KEY OFF. REMOVE jumper. GO to <u>DC21</u> .

DC21 CHECK MAF CIRCUIT FOR SHORT TO VPWR IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Key on, engine off.
- Measure voltage between MAF and PWR GND circuits at the PCM harness connector.

Is voltage less than 1.0 volt?

Yes	No
<p>If an idle concern is not present:</p> <p>REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).</p> <p>If a fault was not detected and an idle concern is still present:</p> <p>Disregard DTC P0102 at this time. RETURN to <u>Section 3</u> , Symptom Charts.</p>	REPAIR short circuit.

DC25 DTC P0171, P0172, P0174, P0175, P1131, P1132, P1151, P1152, P1130, P1150 OR LEAN DRIVEABILITY CONCERNS: CHECK CONDITIONS RELATED TO MAF SENSOR

Note: Most weather service reports are a local barometric pressure that has been corrected to sea level. However, the BARO PID reports the actual barometric pressure for the altitude the vehicle is being diagnosed in. Local weather conditions (high or low pressure areas) will change the local barometric pressure by several inches of mercury [+/- 3 Hz. (+/- 1 in.Hg.)].

- Verify the MAF sensor is connected. If not, repair as necessary.
- Key on, engine running.
- Access the BARO, LONGFT1, LONGFT2 and MAF V PIDs on fully warmed-up engine.
- Check that the BARO PID is approximately the same as the barometric pressure reading for the location, day and altitude the vehicle is being diagnosed at.
 - BARO PID values in Keep Alive Memory require updating at high throttle openings. If vehicle is driven down from higher altitudes for diagnosing, complete three or four heavy accelerations at greater than half-throttle to allow BARO PID to update.
 - BARO PID must be within +/- 6 Hz. (+/- 2 in.Hg.) of the altitude value in Barometric Pressure Reference Chart (at the beginning of this pinpoint test).
 - Make BARO PID comparisons to Barometric Pressure Reference Chart or daily airport barometric pressure reports, if available.
- Check that the LONGFT1 and LONGFT2 PIDS for all injector banks at idle is not more negative than -12%.

- Check that the MAF V PID at idle and neutral is not greater than 30% of the normal MAF V listed in [Section 6](#), Reference Values (or not greater than 1.1 volts).

Are two of the above three checks OK?

Yes	No
<p>For DTC P0171, P0172, P0174, P0175, P1131, P1132, P1151, P1152, P1130 or P1150 : GO to H42 (or GO to HA42 for natural gas vehicles only). For driveability symptoms without DTCs : RETURN to Section 3, Symptom Charts for further diagnosis.</p>	<p>KEY OFF. GO to DC26.</p>

DC26 CHECK TO ISOLATE MAF SENSOR FROM LEAN DRIVEABILITY OCCURENCE

Note: Due to increasingly stringent emission/OBD II requirements, a fuel system DTC on some vehicles will be generated without a noticeable driveability concern with or without the MAF sensor disconnected. Under these conditions, if the BARO, LONGFT1, LONGFT2 and MAF V PID indicates a MAF sensor concern, replace the MAF sensor.

- Disconnect the MAF sensor.
- Key on, engine running.
- Drive the vehicle.

Is the lean driveability symptom (lack of power, spark knock/detonation, buck/jerk or hesitation/surge on acceleration) gone?

Yes	No
<p>REPLACE MAF sensor.</p> <p>RESET Keep Alive random Access Memory (RAM) (REFER to Section 2, Powertrain Control Module (PCM) Reset).</p> <p>VERIFY a symptom no longer exists.</p>	<p>For DTC P0171, P0172, P0174, P0175, P1131, P1132, P1151, P1152, P1130 or P1150 : GO to H42 (or GO to HA42 for natural gas vehicles only).</p> <p>For lean driveability symptoms listed without DTCs : RETURN to Section 3, Symptom Charts for further diagnosis.</p>

DD: Fuel Rail Pressure (FRP) Sensor Introduction

DD: Pinpoint Tests →

Note

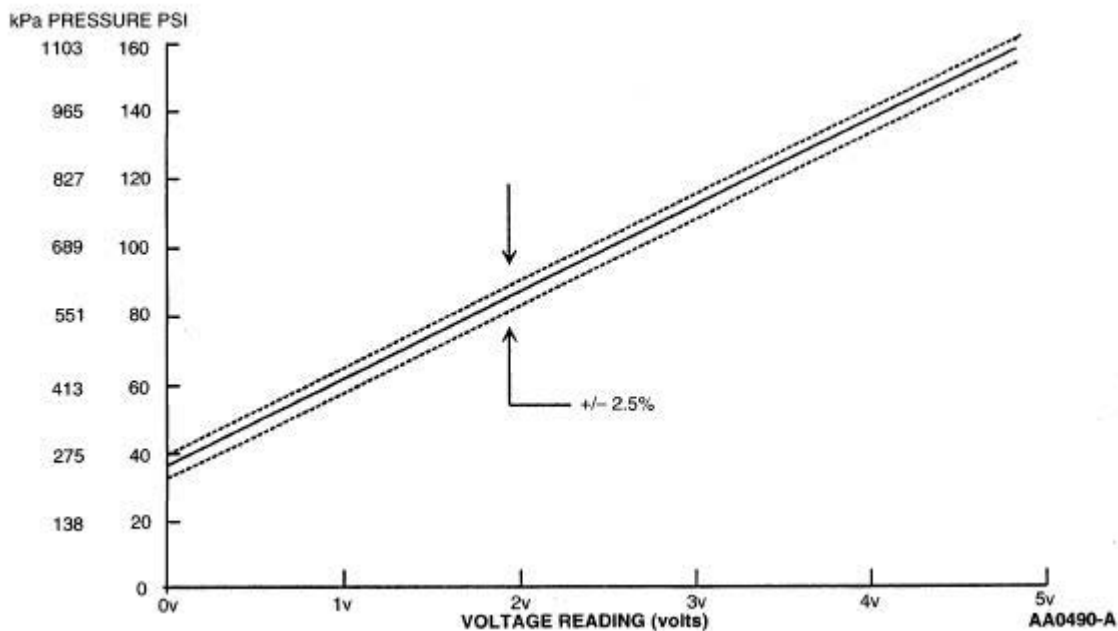

This Pinpoint Test is intended to diagnose the following:

- Fuel Rail Pressure (FRP) Sensor (9F972)
- Harness Circuits: FRP and SIG RTN
- Powertrain Control Module (PCM) (12A650)

Tables and Graphs

Voltage values were calculated for VREF = 5.0 volts. These values may vary 15 percent due to sensor and VREF variations.

Natural Gas Vehicles

Natural Gas Vehicles — FUEL RAIL PRESSURE SENSOR VOLTAGE AND PRESSURE SPECIFICATIONS

Fuel Rail Pressure (FRP) Sensor		
Voltage (dcv)	Pressure (psi)	Pressure (kPa)
4.5	150	1034
4.1	140	965

3.7	130	896
3.3	120	827
2.9	110	758
2.5	100	689
2.1	90	620
1.7	80	551
1.3	70	482
0.9	60	413
0.5	50	344
0.1	40	275
0	37.6	259

Gasoline Vehicles

Gasoline Vehicles — FUEL RAIL PRESSURE SENSOR EXPECTED VOLTAGE

Voltage (dcv)	Pressure (kPa)	Pressure (psi)
4.5	482	70
3.9	413	60
3.4	344	50
2.8	275	40
2.2	207	30
1.6	138	20

DD: Fuel Rail Pressure (FRP) Sensor

← DD: Introduction

DD1 DTC P0192: VERIFY DTC WITH FRP PID

- Key on, engine off.
- Verify there is sufficient fuel (NG only).
- Access FRP PID.

Is the FRP PID voltage less than 0.2 volt?

Yes	No
KEY OFF. For NG vehicles: GO to DD2 . All others: Fault is present, GO to DD3 .	Fault is intermittent. GO to DD13 .

DD2 CHECK FUEL PRESSURE (NATURAL GAS)

- Install fuel pressure gauge.
- Key on engine running.
- Obtain a pressure reading.

Is the fuel pressure reading greater than 345 kPa (50 psi)?

Yes	No
KEY OFF. GO to DD3 .	GO to HB1 .

DD3 GENERATE OPPOSITE SIGNAL

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect FRP harness connector.
- Natural Gas Vehicles: Jumper FRP SIG pin to VREF pin at the FRP sensor harness connector.

Note: If any scan tool communication concern exists, remove jumper and GO to [DD24](#).

- Key on, engine off.
- Access FRP V PID.

Is the FRP V PID voltage greater than 4.6 volts?

Yes	No
REPLACE FRP sensor. REFER to Electronic	

Engine Controls, Section 303-14 in the Workshop Manual.

GO to DD4.

DD4 CHECK VREF VOLTAGE TO FRP SENSOR

- Measure voltage between VREF and SIG RTN circuits at the FRP sensor harness connector.

Is the voltage between 4.0 and 6.0 volts?

Yes	No
KEY OFF. GO to <u>DD5</u> .	GO to <u>C1</u> .

DD5 CHECK FRP CIRCUIT FOR OPEN IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Measure resistance of FRP circuit between PCM harness connector pin and FRP sensor harness connector.

Is the resistance less than 5.0 ohms?

Yes	No
GO to <u>DD6</u> .	REPAIR open circuit.

DD6 CHECK FRP CIRCUIT FOR SHORTS TO SIG RTN AND PWR GND IN HARNESS

- Measure resistance between FRP and SIG RTN circuits at the PCM harness connector.
- Measure resistance of FRP circuit at the PCM harness connector and battery negative post.

Are both resistances greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPAIR short circuit.

DD7 DTC P0193: CHECK FUEL PRESSURE PID VALUE

- Key on.
- Access and monitor FRP V PID.

Is the FRP V PID voltage greater than 4.5 for NG and 4.8 for all others?

Yes	No
KEY OFF.	

For gasoline vehicles: GO to <u>DD8</u> . For NG vehicles: GO to <u>DD9</u> .	Fault is intermittent. GO to <u>DD14</u> .
--	--

DD8 CHECK FUEL RAIL PRESSURE SENSOR FOR FUEL LEAKS

- Remove vacuum hose from fuel rail pressure sensor.
- Inspect sensor and hose for fuel.

Is fuel present?

Yes	No
REPLACE fuel rail pressure sensor.	GO to <u>DD10</u> .

DD9 CHECK FUEL PRESSURE (NATURAL GAS)

- Install fuel pressure gauge.
- Key on, engine running.
- Obtain a pressure reading.

Is the fuel pressure reading greater than 1034 kPa (150 psi)?

Yes	No
KEY OFF. GO to <u>HB1</u> .	KEY OFF. GO to <u>DD10</u> .

DD10 ATTEMPT TO INDUCE OPPOSITE FRP SIGNAL

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect FRP sensor.
- Jumper FRP pin to SIG RTN pin at the FRP sensor harness connector.
- Key on, engine off.
- Access FRP V PID.

Note: If any scan tool communication concern exists, remove jumper and GO to DD24.

Is the FRP V PID voltage less than 0.2 volt?

Yes	No
KEY OFF. REPLACE fuel rail pressure (FRP) sensor. REFER to the Electronic Engine Controls, Section 303-14 in the Workshop Manual.	KEY OFF. GO to <u>DD12</u> .

DD11 DTC P0190: CHECK VREF TO FRP SENSOR

Note: Before proceeding to the following test step, a complete inspection of the fuel system for external leaks must be completed. Repair any leaks before continuing. Verify fuel level before beginning test steps.

- Key on, engine off.
- Measure voltage between VREF and SIG RTN circuits at the FRP sensor harness connector.

Is the voltage between 4.0 and 6.0 volts?

Yes	No
KEY OFF. GO to DD13 .	KEY OFF. GO to DD12 .

DD12 CHECK FRP, SIG RTN AND VREF CIRCUITS FOR OPEN IN HARNESS

- Disconnect PCM.
- Measure resistance of FRP circuit between PCM pin and FRP sensor harness connector.
- Measure resistance of SIG RTN circuit between PCM harness connector pin and FRP sensor harness connector.
- Measure resistance of VREF circuit between PCM harness connector pin and FRP sensor harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
GO to DD13 .	REPAIR open circuit.

DD13 CHECK FRP SENSOR RESISTANCE

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Measure resistance between FRP pin and VREF pin at the FRP sensor.
- Measure resistance between FRP pin and SIG RTN pin at the sensor.

Is each resistance between 30K - 40K ohms?

Yes	No
<p>For continuous memory DTC P0190 only:</p> <p>GO to DD15.</p> <p>For DTC P0192:</p> <p>REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).</p> <p>DTC P0193:</p> <p>GO to DD14.</p>	REPLACE FRP sensor.

DD14 CHECK FRP CIRCUIT FOR SHORT TO VREF AND VPWR IN HARNESS

- Disconnect PCM.
- Measure resistance between FRP and VPWR circuits at the PCM harness connector.
- Measure resistance between FRP and VREF circuits at the PCM harness connector.

Are both resistances greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR short circuit.

DD15 WIGGLE TEST THE FRP SENSOR CIRCUIT WHILE MONITORING FRP PID FOR SUDDEN VALUE CHANGE

- Access FRP V PID.
- While monitoring FRP V PID, tap on the FRP sensor; then wiggle the wiring while looking for sudden changes in the PID voltage as an indication of an intermittent fault.

Is a fault indicated?

Yes	No
REPAIR as necessary.	Unable to duplicate/identify fault at this time. GO to Z1 .

DD16 KOEO, KOER DTC P0191 AND CONTINUOUS DTCS P0191 P1168 P1169: CHECK FUEL PRESSURE

Note: For Natural Gas Vehicles, if vehicle is a no-start, GO to [HB1](#).

- Key on.
- Verify there is sufficient fuel (one eighth tank or greater).
- Key off.
- Fuel pressure gauge connected.
- Key on engine off.

Note: for fuel pressure specifications, refer to the **Fuel Delivery System Test Information Chart** in the beginning of **HC**.

Is the fuel pressure within range for the vehicle being diagnosed?

Yes	No
GO to DD17 .	REMOVE pressure gauge. GO to HC1 for gasoline or GO to HB1 for NG vehicles.

DD17 CHECK FUEL PRESSURE WITH FRP PID

- Connect scan tool.

- Install fuel pressure gauge.
- Key on.
- Access and monitor FRP PID.

Is the FRP pressure reading within 10 psig of the fuel pressure gauge reading?

Yes	No
<p>For DTCS P1168 or P1169: Complete PCM Reset to clear DTCS (REFER to Section 2, Powertrain Control Module (PCM) Reset). DRIVE vehicle 3-5 minutes at a steady speed state. CHECK for Continuous Memory DTC P1168 or P1169. If P1168 or P1169 is displayed, GO to DD18.</p> <p>For DTC P0191 in Continuous Memory only: GO to DD15.</p> <p>All others: RERUN Quick Test.</p>	<p>For NG vehicle: GO to DD18.</p> <p>All others: GO to DD19.</p>

DD18 VERIFY FUEL RAIL SOLENOID SHUT-OFF VALVE OPERATES

- Key on.
- Access and enter the Output Test Mode.
- Cycle output ON and then OFF several times.

Is a click felt or heard from the fuel rail solenoid shut-off valve?

Yes	No
<p>KEY OFF. EXIT Output Test Mode. RECONNECT solenoid valve. GO to DD19.</p>	<p>KEY OFF. GO to DD22.</p>

DD19 CHECK VREF VOLTAGE TO FRP SENSOR

- Disconnect FRP sensor.
- Key on, engine off.
- Measure voltage between VREF and SIG RTN circuits at the FRP sensor harness connector.

Is the voltage reading between 4.0 and 6.0 volts?

Yes	No
<p>KEY OFF. GO to DD20.</p>	<p>GO to C1.</p>

DD20 CHECK FRP CIRCUIT RESISTANCE

Note: Refer to the PCM connector pin numbers at the beginning of this pinpoint test.

- Disconnect PCM.
- Measure resistance of FRP circuit between PCM harness connector pin and the FRP sensor harness connector.
- Measure resistance of SIG RTN circuit between PCM harness connector pin and FRP sensor

harness connector.

- Measure resistance of VREF circuit between PCM harness connector pin and FRP sensor harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
GO to DD21 .	REPAIR as necessary.

DD21 MONITOR FRP V PID WITH SCAN TOOL

- Key on, engine off.
- Access FRP V PID.

Is the FRP V PID value less than 0.2 volt for NG, and greater than 4.8 volts for all others?

Yes	No
REPLACE FRP sensor.	REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).

DD22 CHECK FSV PWR VOLTAGE TO FUEL RAIL SOLENOID SHUT-OFF VALVE HARNESS CONNECTOR

- Disconnect the fuel rail solenoid shut-off valve at the harness connector.
- Key on.
- Access and enter Output Test Mode on the scan tool.
- Select: ALL ON.

Note: Measurement must be made within 7 seconds of activating test mode.

- Measure voltage between the FSV PWR circuit at the fuel rail solenoid shut-off valve harness connector and battery negative post.

Is the voltage reading greater than 10.5 volts?

Yes	No
GO to DD23 .	KEY OFF. REPAIR open circuit.

DD23 CHECK GROUND CIRCUIT FOR OPEN IN HARNESS

- Measure resistance between the ground circuit at the fuel rail solenoid shut-off valve harness connector and battery negative post.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE fuel rail solenoid shut-off valve.	REPAIR open circuit.

DD24 CHECK VREF VOLTAGE TO FRP SENSOR

- Disconnect FRP sensor.
- Key on, engine off.
- Measure voltage between VREF and SIG RTN circuits at the FRP harness connector.

Is the voltage between 4.0 and 6.0 volts?

Yes	No
KEY OFF. GO to DD25 .	VREF is out of range. GO to C1 .

DD25 CHECK FOR FRP SIGNAL CIRCUIT SHORTED TO SIG RTN VREF OR PWR GND IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Disconnect scan tool from DLC.
- FRP disconnected.
- Measure resistance between FRP and SIG RTN circuits at the PCM harness connector.
- Measure resistance between FRP and VREF circuits at the PCM harness connector.
- Measure resistance between FRP circuit at the PCM harness connector and battery negative post.

Is the resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR short.

DE: Flexible Fuel (FF) Sensor Introduction

DE: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Flexible Fuel (FF) sensor (9C044)
- Harness circuits: FF SIG, Vehicle Power (VPWR) and Power Ground (PWR GND)
- Powertrain Control Module (PCM) (12A650)

Warning

THE FUEL SYSTEM IS PRESSURIZED WHEN THE ENGINE IS NOT RUNNING. TO PREVENT INJURY OR FIRE, USE CAUTION WHEN WORKING ON THE FUEL SYSTEM. BECOME FAMILIAR WITH THE WARNING AND SAFE FUEL HANDLING PRACTICES IN PINPOINT TEST HB BEFORE SERVICING.

Pinpoint Test Schematics and Connectors

All with Flex Fuel Sensor Hardware(not sensorless application)

DE: Pinpoint Tests →

DE: Flexible Fuel (FF) Sensor

← DE: Introduction

DE1 DTC P0176: CHECK VPWR VOLTAGE TO FF SENSOR

Note: To determine whether the vehicle being serviced is an ethanol or methanol application, look at the calibration sticker on the door jamb. A prefix of 610 C indicates an ethanol vehicle. A prefix of 610 G indicates a methanol vehicle. Another method is to refer to the fuel filler door; it will read either METHANOL or ETHANOL.

- Disconnect FF sensor.
- Key on.
- Measure VPWR circuit voltage between the VPWR circuit at the FF sensor harness connector and battery negative post.

Is the voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to DE2 .	VPWR circuit fault. KEY OFF. CHECK condition of related fuses/fuse links. If OK, REPAIR open circuit. If fuse/fuse link is damaged, CHECK VPWR circuit for short to ground. REPAIR as necessary.

DE2 CHECK BATTERY GROUND CIRCUIT FOR OPEN IN HARNESS

- Measure resistance between battery ground circuit at the FF sensor harness connector and battery negative post.

Is resistance less than 10,000 ohms?

Yes	No
GO to DE3 .	REPAIR open circuit.

DE3 CHECK FF SENSOR SIGNAL CIRCUIT FOR OPEN IN HARNESS

- Measure resistance between FF sensor signal circuit at PCM harness connector and FF sensor signal circuit at the FF sensor harness connector.

Is resistance less than 5 ohms?

Yes	No
GO to DE4 .	REPAIR open circuit.

DE4 CHECK FF SENSOR SIGNAL CIRCUIT FOR SHORT TO POWER

- Disconnect scan tool.
- Disconnect PCM.
- Measure resistance between FF sensor signal and VPWR circuits at PCM harness connector.

Is resistance greater than 10,000 ohms?

Yes	No
GO to <u>DE5</u> .	REPAIR short circuit.

DE5 CHECK FF SENSOR SIGNAL CIRCUIT FOR SHORT TO GROUND

- Measure resistance between FF sensor signal and PWR GND circuits at PCM harness connector.

Is each resistance greater than 10,000 ohms?

Yes	No
GO to <u>DE6</u> .	REPAIR short circuit.

DE6 CHECK FF SENSOR DEDICATED FAILURE MODE PID

- Flex fuel sensor connected.
- Connect scan tool.
- Connect PCM.
- Key on, engine running.

Is the FFFM PID indicating an ON condition?

Yes	No
Possible FF sensor damage. GO to <u>DE7</u> .	<p>KEY OFF. For Ethanol Vehicles:</p> <p>If you know the percentage of ethanol in the fuel of the vehicle, GO to <u>DE10</u>.</p> <p>For Methanol Vehicles:</p> <p>If you know the percentage of methanol in the fuel of the vehicle, GO to <u>DE11</u>.</p> <p>If you do not know the percentage of ethanol or methanol in the fuel, GO to <u>DE8</u>.</p>

DE7 CHECK FF SENSOR FREQUENCY

- Access the FF PID and record the PID frequency value.

Is the FF PID indicating a value within 40-160 Hz?

Yes	No
KEY OFF. The FF sensor output does not indicate a failure.	

For Ethanol Vehicles:

If you know the percentage of ethanol in the fuel of the vehicle, GO to DE10.

For Methanol Vehicles:

If you know the percentage of methanol in the fuel of the vehicle, GO to DE11.

If you do not know the percentage of ethanol or methanol in the fuel, GO to DE8.

KEY OFF. GO to DE12.

DE8 DETERMINE SEPARATION POINT OF WATER/METHANOL (OR WATER/ETHANOL) AND GASOLINE IN THE FUEL

Note: This step requires the Rotunda Fuel Composition Test Kit 014-00770 or equivalent.

- Fill beaker with 5 ml of clean water.
- Place the hose end of the fuel drain hose assembly in gas can.
- Connect fuel drain hose assembly to fuel pressure relief valve. Turn connector clockwise to tighten. Turn ON/OFF valve clockwise to open.
- Key on.
- Allow 22 ml of fuel to drain into the gas can.
- Pour 20 ml of the fuel into 25 ml graduated cylinder.
- Pour enough water from the beaker into the 25 ml graduated cylinder to bring total volume to 24 ml.
- Insert stopper plug in opening of 25 ml graduated cylinder. Hold it in place as you shake cylinder to mix water and fuel. Allow liquid to stand and separate.

Note: After about three minutes, the methanol and water (or ethanol and water) will mix together and settle to the bottom of the cylinder. The gasoline will rise to the top.

- Record the level on the graduated cylinder where the methanol/water (or ethanol/water) mixture and gasoline meet.

Have all of the steps been completed?

Yes	No
KEY OFF. RECONNECT fuel pressure relief valve. GO to <u>DE9</u> .	KEY OFF. COMPLETE all steps before continuing. Gasoline and water will separate. However, if the fuel does not appear to separate, then the fuel is either 100% methanol or a mixture of methanol and water.

DE9 CALCULATE PERCENTAGE OF METHANOL (OR ETHANOL) IN THE FUEL

- Use the following equation to calculate and record the percentage of methanol (or ethanol) in the fuel sample collected in step **DE8** :

$$\text{Percent methanol (or ethanol)} = (A - 4) \times 5$$

Note: The letter A in the above equation equals the level on the graduated cylinder recorded from step **DE8** where the methanol/water (or ethanol/water) mixture and gasoline meet; see illustration

below.

- EXAMPLE: If the reading from step **DE8** is 14 ml then the percentage of methanol (or ethanol) in the fuel mixture is $(14 - 4) \times 5$, which equals 50. Therefore, the percentage of methanol (or ethanol) in the fuel mixture is 50.

Has the percentage of methanol (or ethanol) in the fuel mixture been determined?

Yes	No
<p>The results are accurate to +/- 10%. POUR any remaining fuel back into the vehicle via the fuel filler.</p> <p>For ethanol vehicles: GO to <u>DE10</u>.</p> <p>For methanol vehicles: GO to <u>DE11</u>.</p>	<p>COMPLETE the determination of the methanol (or ethanol) percentage before continuing.</p>

DE10 CHECK FF SENSOR OPERATION: ETHANOL BLEND FUEL

- Key on, engine running.
- Access the FF PID and record frequency.
- Using chart below, determine the corresponding frequency range for the known percentage of ethanol.

A24584-A

Is the FF PID value within the frequency range shown on the chart?

Yes	No
KEY OFF. REPLACE the PCM.	KEY OFF. Either the FF sensor is not operating properly or the fuel is contaminated. LOWER and DRAIN the fuel tank and refill with known ethanol blend. START and RUN engine to purge the old fuel from the fuel rails, then GO to <u>DE10</u> . If output frequency still does not match the known ethanol fuel blend, REPLACE the FF sensor.

DE11 CHECK FF SENSOR OPERATION: METHANOL FUEL BLEND

- Key on, engine running.
- Access the FF PID and record frequency.
- Using the chart below, determine the corresponding frequency range for the known percentage of methanol.

Is the FF PID value within the frequency range shown on the chart?

Yes	No
KEY OFF. REPLACE the PCM.	KEY OFF. Either the FF sensor is not operating properly or the fuel is contaminated. LOWER and DRAIN the fuel tank and refill with known methanol blend. START and RUN engine to purge the old fuel from the fuel rails, then GO to <u>DE11</u> . If output frequency still does not match the known methanol fuel blend, REPLACE the FF sensor.

DE12 CHECK PCM FUNCTION

- Disconnect FF sensor.
- Connect scan tool.
- Access the FF PID.
- Using the NGS signal simulator, or equivalent tool, feed a 100 Hz signal into the FFS signal circuit at the FF sensor harness connector.
- Key on.

Is the FF PID reflecting the frequency input signal?

Yes	No
KEY OFF. REPLACE FF sensor.	KEY OFF. REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).

DE20 DTC P0176: COMPLETE KOER SELF-TEST

- Output all KOER self-test DTCs.

Note: Ignore all other DTCs output at this time.

Is P0176 output in KOER?

Yes	No
KEY OFF. GO to <u>DE1</u> and ADDRESS the KOER DTC.	KEY OFF. The FF sensor circuit fault is intermittent. GO to <u>Z1</u> .

DF: Vehicle Speed Circuit Check Introduction

DF: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Harness circuits: vehicle speed circuit signal (VSC SIG), vehicle speed circuit ground (VSC GND)
- Powertrain control module (PCM) (12A650)

For additional information on the Anti-Lock Brake System and its circuits, refer to **Brake System, Anti-Lock** in the Workshop Manual and Wiring Diagram Manual.

Pinpoint Test Schematic and Connectors

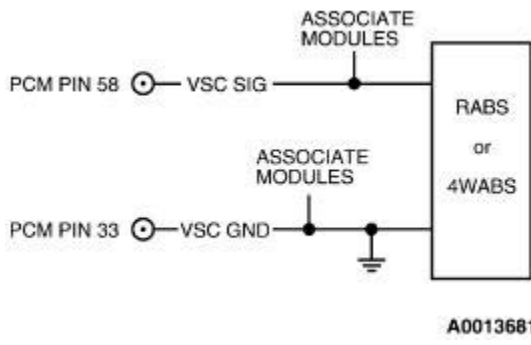

2.5L Ranger

Explorer/Mountaineer (104 PIN PCM ONLY)

5.4L, 6.8L Excursion, 5.4L, 6.8L F-Series 0/8500 GVW

DF: Pinpoint Tests →

DF: Vehicle Speed Circuit Check

← DF: Introduction

DF1 DTC P0500/P0501/P1502: CHECK VEHICLE SPEED PID

- Powertrain control module (PCM) detected an error in the vehicle speed information received from the anti-lock brake system (ABS) control module, generic electronic module (GEM) or central timer module (CTM).

Note: When diagnosing the VSC signal to the PCM refer to the chart below to determine which module sends the VSC signal to the PCM.

Vehicle Applications	Module Application(s)
2.5L Ranger	GEM or CTM
4.0L/5.0L Explorer/ Mountaineer	4WABS (w/ 4 wheel Anti-Lock Brake System)
5.4L/6.8L F-Series	4WABS (w/ 4 wheel Anti-Lock Brake System) or RABS (w/ rear wheel only Anti-Lock Brake System)
5.4L/6.8L Excursion	4WABS (w/ 4 wheel Anti-Lock Brake System)

- Key on.
- Connect scan tool.
- Access VSS PID.
- Obeying all local traffic laws, complete the following:
 - Take the vehicle to a suitable location and gradually increase the vehicle speed to 80 km/h (50 mph), while observing the VSS PID mph values.

Did the VSS PID value match the speed at which you were traveling?

Yes	No
KEY OFF. The VSS PID value was as expected. The fault that produced DTC is intermittent. GO to <u>DF5</u> .	KEY OFF. The VSS PID value was not as expected. GO to <u>DF2</u> .

DF2 CHECK VSC FOR SHORT TO POWER IN HARNESS

- Disconnect PCM.
- Disconnect appropriate control module (ABS, GEM, or CTM).
- Key on.
- Measure voltage between VSC SIG circuit at PCM harness connector and ground.
- **For Excursion and F-Series:**
 - Also measure voltage between VSC GND circuit at PCM harness connector and ground.
- Key off.

Was voltage(s) less than 1.0 volt?

--	--

Yes	No
GO to DF3 .	GO to DF6 .

DF3 CHECK FOR OPEN VSC BETWEEN PCM AND CTM, GEM, OR ABS CONTROL MODULE

- Measure resistance of VSC circuit between PCM harness connector pin and the appropriate control module connector.
- For Excursion and F-Series:
 - Also measure resistance of VSC GND circuit between PCM harness connector pin and ground.

Is (each) resistance less than 5.0 ohms?

Yes	No
GO to DF4 .	REPAIR open circuit(s). GO to DF7 and COMPLETE VSC Repair Verification Drive Cycle.

DF4 CHECK VSC FOR SHORTS TO GROUND IN HARNESS

- Disconnect scan tool from DLC.
- Measure resistance between ground and VSC SIG circuit at the PCM harness connector.
- For Excursion and F-Series:
 - Also measure resistance between VSC SIG and VSC GND circuits at the PCM harness connector.

Is (each) resistance greater than 10,000 ohms?

Yes	No
RESTORE vehicle. REFER to Anti-Lock Control, Section 206-09 in the Workshop Manual, for further diagnosis of the ABS control module, its speed sensors and its wheel speed sensor harness circuits. If those components are working properly, REPLACE the PCM (refer to)Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u> .GO to DF7 and COMPLETE VSC Repair Verification Drive Cycle.	GO to DF6 .

DF5 VISUAL INSPECTION

- Visually inspect the vehicle speed circuit harness circuits for any potential failures. Use the following check list for reference:
 - Loose harness connection of vehicle speed circuits at the appropriate control module.
 - Loose harness connection of vehicle speed circuits at the PCM.
 - Incorrect harness routing of vehicle speed circuits.

Note: Refer to Wiring Diagrams Manual for harness, module and connector location.

Did the visual inspection reveal any potential failure?

Yes	No
REPAIR fault as necessary. GO to <u>DF7</u> and COMPLETE VSC Repair Verification Drive Cycle.	Unable to duplicate or identify fault at this time. REFER to Anti-Lock Control, Section 206-09 in the Workshop Manual, for diagnosis of intermittent control module and wheel speed sensor concern.

DF6 VERIFY IF VSC IS SHORTED IN HARNESS OR ANOTHER MODULE

- Determine which, if any, modules are connected to the VSC (Refer to Wiring Diagrams Manual). If no other modules are connected to the VSC, GO to the "YES" Action To Take.
- One at a time, disconnect the modules associated with the VSC. After disconnecting each module, again test for short circuit (Refer to test step that sent you here). Repeat until each associated module has been disconnected or the short circuit has been eliminated.

Did the short circuit remain after all associated modules were disconnected?

Yes	No
REPAIR short circuit. GO to <u>DF7</u> and COMPLETE VSC Repair Verification Drive Cycle.	REFER to the Workshop Manual for further diagnosis of appropriate module. After repair, RESTORE vehicle. GO to <u>DF7</u> and COMPLETE VSC Repair Verification Drive Cycle.

DF7 VSC REPAIR VERIFICATION DRIVE CYCLE

Warm engine to operating temperature. Complete the VSC Repair Verification Drive Cycle at least three times as described below:

AUTOMATIC TRANSMISSIONS:

- Place transmission range selector lever in DRIVE range.
- Obey all local traffic laws.
- Accelerate heavily to 56 km/h (35 mph).
- Coast down to an idle and stop the vehicle.
- Shut the engine off.
- After the drive cycle is completed, retrieve any Continuous Memory DTCs.

MANUAL TRANSMISSIONS:

- Shift to second from first gear.
- Obey all local traffic laws.
- Accelerate moderately to 64 km/h (40 mph).
- Coast down to an idle and stop the vehicle.
- After the drive cycle is completed, retrieve any Continuous Memory DTCs.

Were any Continuous Memory DTCs generated during the drive cycle?

Yes	No
Testing is not complete. The repair has not been verified. REPAIR DTC(s). REFER to	Testing is complete. The repair has been

Section 4, Powertrain Diagnostic Trouble
Code (DTC) Charts.

verified.

DG: Knock Sensor (KS)

← DG: Introduction

DG1 DTC P0330, P0331 (KS2), DTC P0325, P0326 (KS1): CHECK VOLTAGE BETWEEN SENSOR AND SIG RTN

- Verify that KS is connected and installed properly. Then complete comprehensive repair verification drive cycle. Refer to Section 2, [Drive Cycles](#).
- Key on, engine off.
- Access KS PID.
- Read dc voltage.

Is the KS PID less than 0.5 volts?

Yes	No
KEY OFF. GO to DG2 .	GO to DG5 .

DG2 CHECK KS SENSOR RESISTANCE

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect KS, measure resistance through the KS harness connector pins
- **For 4.2L:** Measure resistance between (KS+) and (KS-) at the knock sensor.

Is resistance between 4.39 and 5.35 megaohms?

Yes	No
For Town Car, 5.4L E/F-Series (HD), and 6.8L E/F-Series: GO to DG6 .	For resistance greater than 5.35 megaohms: GO to DG3 .
All others: GO to DG7 .	For resistance less than 4.39 megohm: GO to DG4 .

DG3 CHECK FOR OPEN OF KS CIRCUIT BETWEEN KS SIGRTN AND SHIELD IN HARNESS

- Disconnect PCM.
- Measure resistance of the KS+ circuit between the PCM harness connector pin and the KS harness connector.
- **For 4.2L:**
- Measure resistance of KS- circuit between the PCM harness connector pin and the KS connector.
- Where applicable, measure resistance of shield between the PCM harness connector and the shield pin at the KS connector.

Is each resistance less than 5.0 ohms?

Yes	No
REPLACE KS.	REPAIR open circuit. COMPLETE Comprehensive Component Repair Verification Drive Cycle. (REFER to Section 2, Drive Cycles .)

DG4 CHECK KS CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect PCM.
- Measure resistance between the KS- circuit at the PCM harness connector and chassis GND.
- Measure resistance between the KS+ circuit at the PCM harness connector and chassis GND.
- **For 4.2L Only:**
- Measure resistance between the KS- and KS+ at the PCM harness connector.

Is each resistance greater than 10,000 ohms?

Yes	No
GO to DG7 .	SERVICE short circuit. COMPLETE Comprehensive Component Repair Verification Drive Cycle. (REFER to Section 2, Drive Cycles .)

DG5 CHECK KS CIRCUITS FOR SHORT TO POWER IN HARNESS

- Disconnect PCM.
- Key on.
- Measure voltage between the KS+ circuit at the PCM harness connector and battery negative post.
- **For 4.2L Only:**
- Measure voltage between the KS- circuit at the PCM harness connector and battery negative post.

Is each voltage less than 0.5 volt?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)). COMPLETE Comprehensive Component Repair Verification Drive Cycle. (REFER to Section 2, Drive Cycles .)	SERVICE short circuit. COMPLETE Comprehensive Component Repair Verification Drive Cycle. (Refer to Section 2, Drive Cycles .)

DG6 CHECK SHIELD CIRCUIT RESISTANCE

- Disconnect PCM.
- Measure resistance of the KS shield between the PCM harness connector pin and the KS harness connector.

Is resistance less than 5.0 ohms?

Yes	No

GO to [DG7](#). COMPLETE Comprehensive Component Repair Verification Drive Cycle. (REFER to Section 2, [Drive Cycles](#).)

REPAIR open circuit. COMPLETE Comprehensive Component Repair Verification Drive Cycle. (REFER to Section 2, [Drive Cycles](#).)

DG7 CHECK PCM FOR SHORT TO GROUND

- Measure resistance between KS+ and SIG RTN circuits at the KS harness connector.
- **For 4.2L Only:**
- Measure resistance between KS+ and KS- circuits at the PCM harness connector.

Is resistance greater than 10,000 ohms?

Yes	No
REPLACE KS. If concern is still present, REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)). COMPLETE Comprehensive Component Repair Verification Drive Cycle. (REFER to Section 2, Drive Cycles .)	REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)). COMPLETE Comprehensive Component Repair Verification Drive Cycle. (REFER to Section 2, Drive Cycles .)

DG15 DTC P0325, P0326 (KS1), DTC P0330, P0331 (KS2): CHECK KS SENSOR VOLTAGE

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Access KS PID.
- Key on, engine off.

Is the KS PID between 2.2 and 2.6 volts?

Yes	No
KEY OFF. GO to DG16 .	GO to DG18 .

DG16 CHECK KS CIRCUIT FOR INTERMITTENT FAULT

- Key on.
- While viewing the voltmeter, grasp the vehicle harness as close to the knock sensor(s) as possible. Shake and bend a small section of the harness from the KS sensor to the PCM.
- Tap the PCM and KS connectors if possible.

Is KS reading changing?

Yes	No
ISOLATE fault and SERVICE as required. COMPLETE Comprehensive Component Repair Verification Drive Cycle. (REFER to Section 2, Drive Cycles .)	GO to DG17 .

DG17 CHECK FOR KS VOLTAGE INCREASE

- Start and run engine.
- Monitor voltage at the knock sensor at idle and at 3000 rpm.

Does the AC voltage reading increase?

Yes	No
For symptom only: RETURN to Section 3 . All others with DTC: REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)). COMPLETE Comprehensive Component Repair Verification Drive Cycle. (REFER to Section 2, Drive Cycles .)	GO to DG18 .

DG18 CHECK KS CIRCUIT FOR OPEN IN HARNESS

- PCM disconnected.
- Disconnect suspect KS.
- Measure resistance of the KS+ signal circuit between the PCM harness connector pin and the KS harness connector.
- Measure resistance of the SIG RTN circuit between the PCM harness connector and the KS harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
GO to DG19 .	REPAIR open circuit. COMPLETE Comprehensive Component Repair Verification Drive Cycle. (REFER to Section 2, Drive Cycles .)

DG19 CHECK KS CIRCUIT FOR SHORT TO GROUND

- Measure resistance of the KS+ circuit between the PCM harness connector pin and chassis GND.

Is resistance greater than 10,000 ohms?

Yes	No
REPLACE suspect KS. COMPLETE Comprehensive Component Repair Verification Drive Cycle. (REFER to Section 2, Drive Cycles .)	REPAIR short circuit. COMPLETE Comprehensive Component Repair Verification Drive Cycle. (REFER to Section 2, Drive Cycles .)

DH: Throttle Position (TP) Sensor Introduction

DH: Pinpoint Tests →

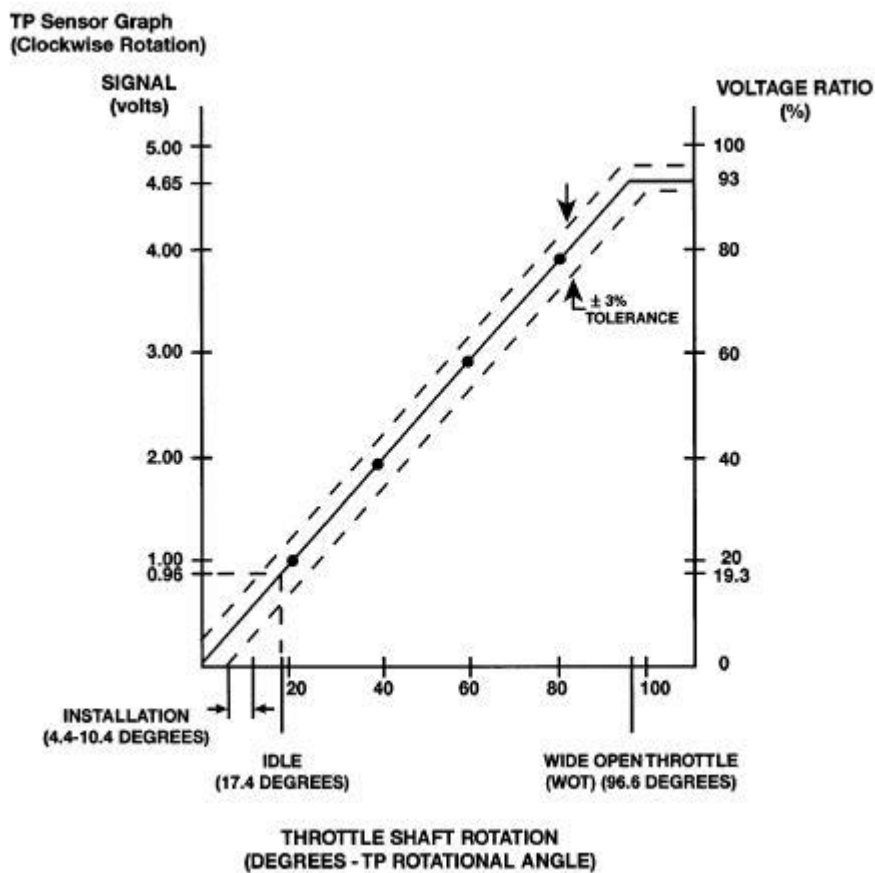

Note

This Pinpoint Test is intended to diagnose the following:

- Throttle Position (TP) Sensor (9B989)
- Binding and sticking Throttle Linkage
- Harness Circuits: TP, SIG RTN, VREF, Vehicle Power (VPWR), Power Ground (PWR GND)
- Powertrain Control Module (PCM) (12A650)

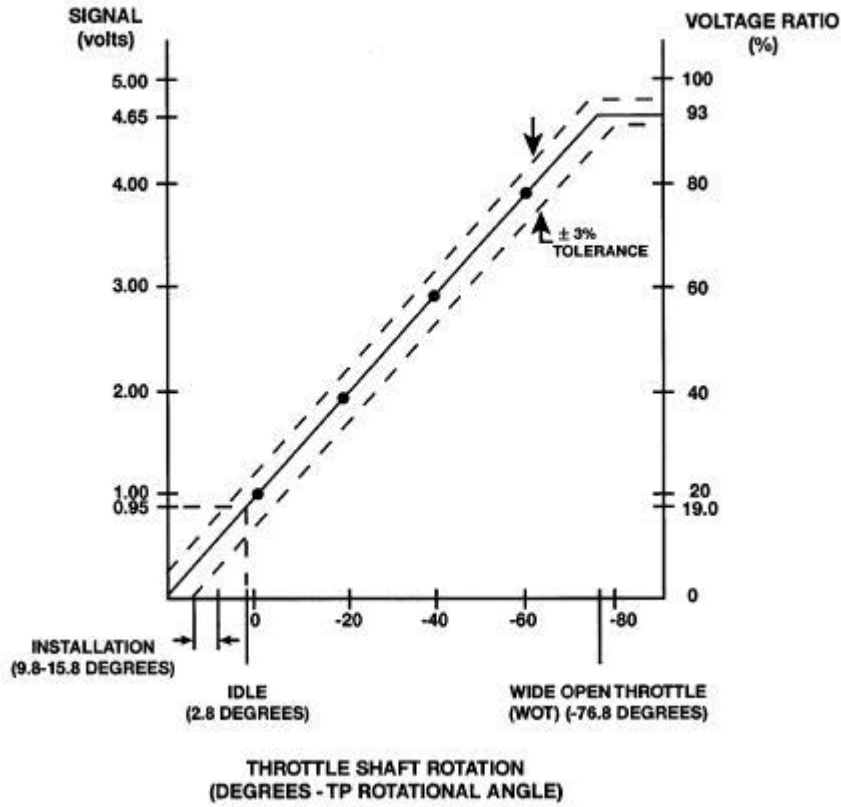

Graphs

Note: The normal range of the throttle angle measurement for the throttle position (TP) sensor is 0 to 96.6 degrees.

DH: Throttle Position (TP) Sensor

← DH: Introduction

DH1 KOEO AND KOER DTC P1124: CHECK FOR OTHER DTCS

- Check for DTC P1400 in KOEO or KOER Self-Test.

Is KOEO or KOER DTC P1400 present with KOEO DTC P1124?

Yes	No
RETURN to Section 4, Powertrain Diagnostic Trouble Code (DTC) Charts for DTC P1400.	KEY OFF. GO to DH2 .

DH2 CHECK FOR STUCK THROTTLE PLATE OR LINKAGE

- Visually inspect the throttle linkage and throttle plate for binding or sticking.
- Verify the throttle plate and linkage is at closed throttle position.

Does the throttle move freely and return to closed throttle position?

Yes	No
Throttle plate and linkage are OK. GO to DH8 .	REPAIR as necessary.

DH3 DTC P1120: CHECK TP CIRCUIT FOR FRAYED WIRES OR CORROSION ON CONNECTORS

- Key off.
- Complete a visual inspection of pins on harness connector at the TP sensor for corrosion.
- Complete a visual inspection of the harness wires between the TP sensor and the PCM for insulation fraying and corrosion.

Is a fault present?

Yes	No
REPAIR as necessary.	GO to DH4 .

DH4 CHECK FOR STUCK TP SENSOR

- Key on, engine off.
- Access TP PID (TP V PID).
- Slowly move throttle from closed throttle position to wide open throttle position and observe the TP PID (TP V PID).

While opening the throttle, is the TP PID (TPV PID) reading below 9.85% (0.49 volt)?

Yes	No
KEY OFF. GO to DH5 .	GO to DH20 .

DH5 CHECK VOLTAGE BETWEEN VREF AND SIG RTN CIRCUITS TO TP SENSOR

- Disconnect TP sensor.
- Key on, engine off.
- Measure voltage between VREF and SIG RTN circuits at the TP sensor harness connector.

Is voltage between 4.0 and 6.0 volts?

Yes	No
KEY OFF. GO to DH6 .	GO to C1 .

DH6 CHECK TP CIRCUIT FOR OPEN IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Measure resistance of TP circuit between PCM harness connector pin and TP harness connector.

Is resistance less than 5.0 ohms?

Yes	No
GO to DH7 .	REPAIR open circuit.

DH7 CHECK TP SENSOR VOLTAGE TO PCM

- Reconnect PCM and TP sensor.
- Start engine and idle for 2 minutes.
- Access TP PID (TP V PID).
- Slowly open the throttle from closed position and observe PID(s).

Is TP PID (TP V PID) reading at any time between 3.42-9.85% (0.17-0.49 volt)?

Yes	No
REPLACE TP sensor.	If DTC P1120 is still present, GO to DH20 .

DH8 DTC P0123 OR P1124: ATTEMPT TO GENERATE THE OPPOSITE THROTTLE POSITION ANGLE (VOLTAGE) PID READING

- Disconnect TP sensor.
- Key on, engine off.
- Access TP PID (TP V PID).

Is TP PID (TP V PID) less than 3.42% (0.17 volt)?

Yes	No
GO to <u>DH9</u> .	KEY OFF. GO to <u>DH10</u> .

DH9 CHECK VOLTAGE BETWEEN VREF AND SIG RTN CIRCUITS TO TP SENSOR

- Key on, engine off.
- Measure voltage between VREF and SIG RTN circuits at the TP sensor harness connector.

Is voltage between 4.0 and 6.0 volts?

Yes	No
REPLACE TP sensor.	GO to <u>C1</u> .

DH10 CHECK TP CIRCUIT FOR SHORT TO VREF OR VPWR IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Measure resistance between TP and VPWR circuits at the PCM harness connector.
- Measure resistance between TP and VREF circuits at the PCM harness connector. (For 150PIN PCM, measure to both VREF pins.)

Is each resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPAIR short circuit.

DH11 DTC P0122: ATTEMPT TO GENERATE THE OPPOSITE THROTTLE POSITION ANGLE (VOLTAGE) PID READING

Note: An intermittent fault can cause a Continuous Memory DTC P0122. If a Continuous Memory DTC P0122 is still present after DH11 through DH14, GO to DH20.

- Disconnect TP sensor.
- Jumper VREF circuit to TP circuit at the TP sensor harness connector.
- Key on, engine off.

Note: If any scan tool communication concern exists, remove jumper and GO to DH14.

- Access TP PID (TP V PID).

Is TP PID (TP V PID) greater than 93% (4.65 volts)?

Yes	No
REPLACE TP sensor.	REMOVE jumper. GO to <u>DH12</u> .

DH12 CHECK VOLTAGE BETWEEN VREF AND SIG RTN CIRCUITS

- Key on, engine off.
- Measure voltage between VREF and SIG RTN circuits at the TP sensor harness connector.

Is voltage between 4.0 and 6.0 volts?

Yes	No
KEY OFF. GO to DH13 .	GO to C1 .

DH13 CHECK TP SENSOR CIRCUIT FOR OPEN IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Measure resistance of TP circuit between PCM harness connector pin and TP sensor harness connector.

Is resistance less than 5.0 ohms?

Yes	No
GO to DH14 .	REPAIR open circuit.

DH14 CHECK TP CIRCUIT FOR SHORT TO PWR GND OR SIG RTN IN HARNESS

- Disconnect PCM.
- Disconnect scan tool from DLC.
- Measure resistance between TP and PWR GND circuits at the PCM harness connector.
- Measure resistance between TP and SIG RTN circuits at the PCM harness connector.

Are both resistances greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR short circuit.

DH15 DTC P1121: CHECK RATIONALITY OPERATION BETWEEN TP AND MAF SENSORS

- Attempt to start engine.

Does the engine run?

Yes	No
GO to DH16 .	CHECK for major leaks, cracks, and openings between MAF sensor and throttle body. If OK,

GO to A1.

DH16 CHECK MECHANICAL OPERATION OF TP SENSOR

- Key on, engine off.
- Access TP PID (TP V PID).
- Slowly move throttle from closed throttle position to wide open throttle position.
- Observe and record the TP PID (TP V PID).

While opening and closing the throttle, is there a change in the TP PID (TP V PID) between 9.85% and 93% (0.49 and 4.65 volts)?

Yes	No
GO to <u>DH17</u> .	REPLACE TP sensor. VERIFY a symptom no longer exists.

DH17 CHECK TP SENSOR SIGNAL HIGH VERSUS THE ENGINE LOAD WHILE DRIVING VEHICLE

- Key on, engine running.
- Drive vehicle, exercising the throttle and TP sensor while accessing PIDS.
- Access TP PID (TP V PID) and LOAD PID and record readings.

Is TP PID (TP V PID) greater than 49.02% (2.44 volts) and the LOAD PID reading less than 30%?

Yes	No
LISTEN for air noise around MAF sensor and throttle body while engine is running. REPAIR if necessary. Otherwise, GO to <u>HU1</u> for air restriction. If OK, REPLACE the TP sensor.	GO to <u>DH18</u> .

DH18 CHECK TP SENSOR SIGNAL LOW VERSUS THE ENGINE LOAD WHILE DRIVING VEHICLE

Note: If the vehicle is a no start, GO to A1.

- Drive vehicle exercising the throttle and TP sensor near higher gears (preferably overdrive) while accessing PIDS.
- Access TP PID (TP V PID) and LOAD PID.

Is TP PID (TP V PID) reading less than 4.82% (0.24 volts) and the LOAD PID reading greater than 55%?

Yes	No
TIGHTEN TP sensor to throttle body if necessary. CLEAR Continuous Memory DTCs. DRIVE vehicle exercising the throttle. If Continuous Memory P1121 is now present, REPLACE MAF sensor.	Unable to identify the fault at this time. If vehicle is still a No Start, GO to <u>A1</u> .

DH20 CONTINUOUS MEMORY DTCS P1120 OR P1125: CHECK FOR TP CIRCUIT INTERMITTENT SIGNAL

- Start engine and bring to idle.
- Run throttle up to 1500 rpm for 5 seconds.
- Access TP PID (TP V PID) for a fault indication while completing the following:
 - Lightly tap on TP sensor and wiggle harness connector to simulate road shock.

Is TP PID (TP V PID) changing below the minimum 9.85% (0.49 volt) or above the maximum 93% (4.65 volts)?

Yes	No
INSPECT the TP sensor connector. If OK, REPLACE the TP sensor.	KEY OFF. GO to <u>DH21</u> .

DH21 CHECK TP SENSOR HARNESS FOR INTERMITTENT OPENS OR SHORTS

- Again access the TP PID (TP V PID).
- Key on, engine off.
- Complete the following:
 - Grasp the vehicle harness closest to the TP sensor connector.
 - Shake and bend a small section of the harness all the way to the dash panel.
 - Wiggle, shake and bend the harness from the dash panel to the PCM.

Is TP PID (TP V PID) reading changing below the minimum 9.85% (0.49 volt) or above the maximum 93% (4.65 volts)?

Yes	No
ISOLATE and REPAIR as necessary.	Unable to duplicate or identify fault at this time. GO to <u>Z1</u> .

DH22 DTC P0121: CHECK FOR KOER SELF-TEST COMPLETION

Note: If KOER Self-Test terminates when placing the transmission range selector lever in gear (DRIVE or REVERSE), GO to DH25 directly.

- Start engine, bring to idle (throttle closed).
- Activate Key On Engine Running (KOER) Self-Test.
- Attempt to drive vehicle, while still in Key On Engine Running Self-Test.
- Key off, wait 15 seconds.
- Start engine again.
- Activate KOER Self-Test.

Is DTC P0121 still present or does KOER Self-Test again fail to terminate?

Yes	No
KEY OFF. GO to <u>DH23</u> .	VERIFY a symptom no longer exists.

DH23 ISOLATE BINDING OR STICKING CONCERN

- Disconnect accelerator cable and speed control cable from throttle body linkage.

CAUTION: Do not attempt to clean the throttle bore and plate area. Cleaning will damage the throttle body assembly.

Note: Sticking or binding condition can either appear within cables or throttle body assembly.

- Rotate throttle body linkage.

Does the throttle body rotate freely without a sticking, binding or grabbing condition?

Yes	No
REPAIR cable(s) causing concern. RERUN Quick Test. If the DTC P0121 is still present, GO to <u>DH24</u> .	REPLACE throttle body assembly.

DH24 CHECK FUNCTIONALITY OF THE THROTTLE POSITION SENSOR

- Key on.
- Access TP V PID with the scan tool.
- From closed throttle, slowly begin to press accelerator to wide open throttle.

Did the TP V PID display a smooth reading during accelerator movement?

Yes	No
VERIFY a symptom no longer exists.	KEY OFF. REPLACE TP sensor.

DH25 CHECK TP AND SIG RTN CIRCUITS FOR OPEN IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM and TP sensor.
- Key off.
- Measure resistance of TP circuit between PCM harness connector and TP sensor harness connector.
- Measure resistance of SIG RTN circuit between PCM harness connector and TP sensor harness connector.

Is each resistance less than 0.5 ohms?

Yes	No
REPLACE TP sensor. VERIFY a symptom no longer exists.	REPAIR open circuit. VERIFY a symptom no longer exists.

DL: Cylinder Head Temperature (CHT) Sensor

DL: Pinpoint Tests →

Introduction

Note

This Pinpoint Test is intended to diagnose the following:

- Cylinder head temperature (CHT) sensor (6G004)
- Harness circuits: CHT, VREF, and SIG RTN
- Powertrain control module (PCM) (12A650)

Tables and Graphs

On applications that do not use a ECT sensor, the CHT sensor is used to determine the engine coolant temperature in place of the ECT sensor. In this case the PCM may store both CHT and ECT Diagnostic Trouble Codes (DTCs). To cover the entire temperature range of both the CHT and ECT sensors, the PCM has a dual switching resistor circuit on the CHT input. A graph showing the temperature switching from the COLD END line to the HOT END line with increasing temperature and back with decreasing temperature is included. Note the temperature to voltage overlap zone. Within this zone it is possible to have either a COLD END or HOT END voltage at the same temperature. For example, at 90°C (194 °F) the voltage could read either 0.60 volt or 3.71 volts. Refer to the table for the temperature to voltage expected values.

Voltage values were calculated for VREF = 5.0 volts. These values can vary 15 percent due to sensor and VREF variations.

AA0885-B

CYLINDER HEAD TEMPERATURE SENSOR EXPECTED VALUES

Temperature		CHT Sensor Values		
°C	°F	COLD END	HOT END	Resistance (K ohms)
-40	-40	4.89	—	965.808
-30	-22	4.81	—	513.019
-20	-4	4.67	—	283.664
-10	14	4.45	—	162.584
0	32	4.14	—	96.255
10	50	3.73	—	59.175

DL: Pinpoint Tests →

DL: Cylinder Head Temperature (CHT) Sensor ← DL: Introduction

DL1 DTC P1288 OR P1116: CHECK OPERATION OF CYLINDER HEAD TEMPERATURE SENSOR

- Run engine at 2000 rpm until engine temperature becomes stabilized.
- **No Starts or Vehicle that Stalls:**
 - GO to [DL3](#).
- Check that upper radiator hose is hot and pressurized.
- Rerun Key On Engine Running (KOER) Self-Test.

Is DTC P1288 or P1116 present?

Yes	No
GO to DL2 .	Engine temperature was not stabilized. REPAIR any other DTCs as necessary.

DL2 CHECK VREF CIRCUIT VOLTAGE AT TP SENSOR

- Disconnect throttle position (TP) sensor.

Note: GO to Pinpoint Test [DH](#) and refer to **Pinpoint Test Schematics and Connectors** for TP harness connector pin-out information.

- Key on, engine off.
- Measure the voltage between VREF and SIG RTN circuits at the TP sensor harness connector.

Is voltage between 4.0 volts and 6.0 volts?

Yes	No
There is sufficient VREF voltage. RECONNECT TP sensor. GO to DL3 .	GO to C1 .

DL3 CHECK RESISTANCE OF CYLINDER HEAD TEMPERATURE SENSOR WITH ENGINE OFF

- Disconnect CHT sensor.
- Measure resistance between CHT signal and SIG RTN pins at the CHT sensor. Refer to the table at the beginning of this pinpoint test for resistance specifications.

Is resistance within specification?

Yes	No
For No Starts or Stalls, RETURN to Section 3 , Symptom Charts.	REPLACE CHT sensor.

All others, GO to [DL4](#).

DL4 CHECK RESISTANCE OF CHT SENSOR WITH ENGINE RUNNING

Note: Verify that engine is at operating temperature before taking CHT readings.

- Run engine for two minutes at 2000 rpm.
- Measure resistance between CHT signal and SIG RTN pins at the CHT sensor. Refer to the table at the beginning of this Pinpoint Test for resistance specifications.
- Key off.

Is resistance within specification?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPLACE CHT sensor.

DL5 DTC P1289 OR P1290: ACCESS CHT PID AND CHECK VOLTAGE

- Connect scan tool.
- Key on, engine off.
- Access CHT V PID.

Is the CHT V PID less than 0.2 volt?

Yes	No
GO to DL6 .	GO to DL7 .

DL6 CHECK FOR GROUNDED CIRCUIT

- Disconnect CHT sensor.
- Key on.
- Access CHT V PID.

Is the CHT V PID more than 4.6 volts?

Yes	No
REPLACE CHT sensor.	GO to DL21 .

DL7 CHECK FOR OPEN HARNESS

- Disconnect CHT sensor.
- Connect a jumper wire between the CHT signal and SIG RTN circuits at the CHT sensor vehicle harness connector.
- Key on.
- **Note:** If a Scan Tool communication concern exists, remove jumper wire immediately and GO to

DL12.

- Access CHT V PID.

Is the CHT V PID less than 0.2 volt?

Yes	No
REPLACE CHT sensor.	REMOVE jumper wire. GO to <u>DL11.</u> KEY OFF.

DL10 DTC P0118: SIMULATE OPPOSITE SIGNAL TO PCM

- Disconnect CHT sensor.
- Connect a jumper wire between the CHT signal circuit and SIG RTN circuit at the CHT sensor vehicle harness connector.
- Connect scan tool.
- Key on.
- **Note:** If a Scan Tool communication concern exists, remove jumper wire immediately and GO to DL12.

- Access CHT V PID.

Is the CHT V PID less than 0.2 volt?

Yes	No
REPLACE CHT sensor.	REMOVE jumper wire. GO to <u>DL11.</u>

DL11 CHECK CHT SENSOR SIGNAL AND SIG RTN CIRCUITS FOR OPEN IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Measure resistance of CHT circuit between PCM harness connector pin and CHT sensor harness connector.
- Measure resistance of SIG RTN circuit between PCM harness connector pin and CHT sensor harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPAIR open circuits.

DL12 CHECK CHT SENSOR SIGNAL FOR SHORT TO VREF IN HARNESS

- Key off.
- Disconnect PCM.
- Measure resistance between CHT and VREF circuits at the PCM harness connector.

Is resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPAIR short to VREF.

DL20 DTC P0117: SIMULATE OPPOSITE SIGNAL TO PCM

- Disconnect CHT sensor.
- Connect scan tool.
- Key on.
- Access CHT V PID.

Is the CHT V PID more than 4.6 volts?

Yes	No
REPLACE CHT sensor.	GO to <u>DL21</u> .

DL21 CHECK VREF CIRCUIT VOLTAGE AT TP SENSOR

- Disconnect throttle position (TP) sensor.

Note: GO to Pinpoint Test DH and refer to **Pinpoint Test Schematics and Connectors** for TP harness connector pin-out information.

- Key on, engine off.
- Measure voltage between VREF and SIG RTN circuits at the TP sensor harness connector.

Is voltage between 4.0 and 6.0 volts?

Yes	No
There is sufficient VREF voltage. RECONNECT TP sensor. GO to <u>DL22</u> . KEY OFF.	GO to <u>C1</u> .

DL22 CHECK CHT SIGNAL CIRCUIT FOR SHORT TO GROUND

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Measure resistance between CHT signal and SIG RTN circuits and then between CHT signal and PWR GND circuits at the PCM harness connector.

Is each resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPAIR short circuit.

DL30 DTC P1285: EARLY WARNING OF ENGINE OVERHEAT CONDITION

An engine overheat condition was sensed by the CHT sensor.

- Check cooling system for:
 - Correct coolant level.
 - Internal or external coolant leaks.
 - Blockage of radiator.
 - Cooling fan operation.

Note: If electric cooling fan does not operate, return to [Section 3](#) for electric cooling fan DTC or symptom diagnosis.

Is cooling system OK?

Yes	No
CHECK CHT sensor operation. GO to DL3 .	REPAIR as necessary. REFER to Engine Cooling, Section 303-03 in the Workshop Manual for symptom diagnosis of Engine Overheats or Loss of Coolant.

DL40 ENGINE TEMPERATURE WARNING INDICATOR LAMP ON OR TEMPERATURE GAUGE INDICATES HOT, BUT ENGINE IS NOT OVERHEATING

Note: PCM Quick Test must be performed prior to entering this Pinpoint Test.

Was PCM Quick Test performed prior to entering this Pinpoint Test?

Yes	No
No Diagnostic Trouble Codes (DTCs) received during PCM Quick Test. GO to DL41 .	GO to Section 3 and RERUN Quick Test. REPAIR any DTCs as necessary.

DL41 ENGINE TEMPERATURE INDICATOR LAMP ON OR TEMPERATURE GAUGE INDICATES HOT, WITH NO DIAGNOSTIC TROUBLE CODE (DTC)

The Engine Temperature Warning Indicator (gauge or lamp) is a warning of an engine overheating condition. The PCM monitors the cylinder head temperature (CHT) sensor and grounds the engine temperature warning circuit when the engine is overheating. This causes the instrument cluster indicator to illuminate and/or forces the temperature gauge to H (hot) zone. A DTC P1285 will also be stored in the PCM.

This test diagnoses Engine Temperature Warning Lamp ON and/or temperature gauge in the H (hot) zone with no PCM DTCs.

Possible causes:

- Damaged engine coolant temperature sensor.
- Instrument cluster concern.
- Wiring harness fault between PCM and Instrument cluster. (PCM output pins: 19, 42 or 45 depending on vehicle application.)

- Damaged PCM.
- Disconnect PCM.
- Key on.

Is the engine temperature warning indicator lamp OFF and the temperature gauge in the normal zone with the PCM disconnected?

Yes	No
Key off. REPLACE the PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	The PCM has not attempted to ground the Engine Temperature Warning circuit and turn the engine temperature indicator lamp ON or force the temperature gauge to the H (hot) zone. REFER to Instrument Cluster, Section 413-01 in the Workshop Manual for further diagnosis.

DL80 P0116: CHECK TEMPERATURE SENSOR RESISTANCE WITH ENGINE OFF

Note: Verify that engine temperature is at ambient room temperature before continuing with this test. A soak period of 6 hours may be required. Refer to Diagnostic Trouble Code (DTC) Descriptions, in Section 4 for information concerning P0116.

- Key on, engine off.
- Disconnect CHT sensor.
- Measure CHT sensor resistance. Refer to the chart at the beginning of this Pinpoint Test for resistance specifications.

Is resistance within specification?

Yes	No
GO to <u>DL81</u> .	REPLACE suspect sensor.

DL81 P0116: CHECK TEMPERATURE SENSOR RESISTANCE WITH ENGINE RUNNING

Note: Verify that engine is at operating temperature before taking CHT readings.

- Run engine for two minutes at 2000 rpm.
- Measure temperature sensor resistance. Refer to the chart at the beginning of this Pinpoint Test for resistance specifications.

Is resistance within specification?

Yes	No
Fault is not present at this time. COMPLETE OBDII Drive Cycle to determine if Fuel, HEGO, Catalyst and Misfire monitors can be executed (REFER to Section 2, <u>Drive Cycles</u>). Retest if necessary.	REPLACE suspect sensor.

DL90 DTCS P0117, P0118, P1117, P1289 OR P1290: INTERMITTENT CHECK

- Connect scan tool.
- Key on.
- Monitor the CHT PID.
- While observing the PID, complete the following:
 - Tap on the sensor to simulate road shock.
 - Wiggle the sensor connector.

Is there any large change in the temperature reading?

Yes	No
Key off. DISCONNECT and INSPECT connectors. If OK, REPLACE CHT sensor. COMPLETE OBDII Drive Cycle to verify repair (REFER to Section 2, Drive Cycles).	GO to DL91 .

DL91 CHECK ELECTRONIC ENGINE CONTROL (EC) WIRING HARNESS

- Still monitoring PID.
- While observing the appropriate PID, complete the following:
 - Hold the vehicle harness close to the sensor connector. Wiggle, shake and bend small sections of wiring harness while working toward the PCM.

Is there any change in the temperature reading?

Yes	No
ISOLATE fault. REPAIR as necessary. COMPLETE OBDII Drive Cycle to verify repair (REFER to Section 2, Drive Cycles).	GO to DL92 .

DL92 CHECK PCM AND VEHICLE HARNESS CONNECTOR

- Disconnect PCM.
- Disconnect CHT sensor.

Are connectors and terminals OK?

Yes	No
Fault is not present at this time. COMPLETE OBDII Drive Cycle (REFER to Section 2, Drive Cycles).	REPAIR as necessary. COMPLETE OBDII Drive Cycle to verify repair (REFER to Section 2, Drive Cycles).

DL100 DTC P1299 OR P0217 INDICATES AN ENGINE OVERHEAT CONDITION OCCURRED

Note: Refer to [Section 4](#) for possible causes and additional DTC description information.

WARNING: TO AVOID PERSONAL INJURY, DO NOT UNSCREW THE COOLANT PRESSURE RELIEF CAP WHILE THE ENGINE IS OPERATING OR HOT. THE COOLING SYSTEM IS UNDER PRESSURE; STREAM AND HOT LIQUID CAN COME OUT FORCEFULLY WHEN THE CAP IS LOOSENED SLIGHTLY.

- Check engine coolant level.

Is the engine coolant level fill correct?

Yes	No
REFER to Engine Cooling, Section 303-03 in the Workshop Manual for symptom, Engine Overheats.	REFER to Engine Cooling, Section 303-03 in the Workshop Manual for symptom, Loss of Engine Coolant.

DL110 DTC P0125: CHECK ENGINE COOLANT LEVEL

Diagnostic Trouble Code (DTC) P0125 indicates the CHT sensor has not achieved the required temperature level to enter closed loop operating conditions within a specified amount of time after starting engine. This DTC will light the MIL.

Possible causes:

- Insufficient warm up time.
- Leaky or stuck open thermostat.
- Low engine coolant level.
- Malfunctioning CHT sensor.

WARNING: TO AVOID PERSONAL INJURY, DO NOT UNSCREW THE COOLANT PRESSURE RELIEF CAP WHILE THE ENGINE IS OPERATING OR HOT. THE COOLING SYSTEM IS UNDER PRESSURE; STREAM AND HOT LIQUID CAN COME OUT FORCEFULLY WHEN THE CAP IS LOOSENDED SLIGHTLY.

- Check engine coolant level.

Is the engine coolant level fill correct?

Yes	No
Go to Engine Cooling, Section 303-03 in the Workshop Manual for further diagnostics.	FILL engine coolant to proper level. Complete Comprehensive Component Monitor Repair Verification Drive Cycle (Refer to <u>Section 2</u> , Drive Cycles).

DM: Thermal Manifold Absolute Pressure (TMAP) Sensor Introduction

DM: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- TMAP sensor (9F479)
- Harness circuits: MAP SIG, SIG RTN, and VREF
- Powertrain control module (PCM) (12A650)

Pinpoint Test Schematics and Connectors

2.3L (4V) Ranger

DM: Pinpoint Tests →

DM: Thermal Manifold Absolute Pressure (TMAP) Sensor

← DM: Introduction

DM1 DTC P0107 AND P0108: CHECK VOLTAGE BETWEEN VREF AND SIG RTN AT TMAP SENSOR

- Disconnect TMAP connector.
- Measure voltage between VREF and SIG RTN circuits at the TMAP sensor harness connector.

Is VREF voltage between 4.0 and 6.0 volts?

Yes	No
GO to <u>DM2</u>	GO to <u>C1</u> .

DM2 CHECK TMAP SENSOR OPERATION

- Connect a jumper wire for the VREF circuit between the TMAP sensor harness connector and sensor connector.
- Connect jumper wire for the SIG RTN circuit between the TMAP sensor harness connector and sensor connector
- Start engine and let idle.
- Measure voltage between MAP circuit at the MAP sensor connector and chassis ground.
- Observe voltage while rapidly increasing rpm to 3000 by depressing the accelerator pedal and then release.

Did the voltage reading rapidly increase to approximately 4.0 volts and then decrease to approximately 0.7 volts?

NOTE: ALL HARNESS CONNECTORS ARE VIEWED INTO MATING SURFACE
A0038681

Yes	No

GO to DM3

Replace TMAP sensor.

DM3 CHECK TMAP CIRCUIT FOR SHORT TO VREF AND SIG RTN IN HARNESS

- Disconnect PCM.
- Measure resistance between the TMAP circuit and both the VREF and SIG RTN circuits at the TMAP sensor harness connector

Is each resistance greater than 10,000 ohms?

Yes	No
GO to <u>DM4</u>	REPAIR short circuit.

DM4 CHECK TMAP SENSOR CIRCUIT FOR OPEN IN HARNESS

- Disconnect PCM.
- Measure resistance of MAP circuit between PCM harness connector pin 63 and MAP sensor harness connector.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPAIR open circuit.

DM6 CONTINUOUS MEMORY DTC P0107, P0108: CHECK FOR INTERMITTENT CIRCUITS TO TMAP SENSOR

- Key on, engine off.
- Access MAP V PID
- Observe MAP V PID for an indication of a fault while performing the following (a fault will be indicated in a sudden change in the MAP V PID voltage):
 - Shake, wiggle, bend the MAP, SIG RTN and VREF circuits between the MAP sensor and the PCM.
 - Lightly tap on the MAP sensor to simulate road shock.

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary.	KEY OFF. Unable to duplicate or identify fault at this time. GO to <u>Z1</u>

DP: Vehicle Speed Sensor (VSS)/Transfer Case Speed Sensor (TCSS) Introduction

DP: Pinpoint Tests →

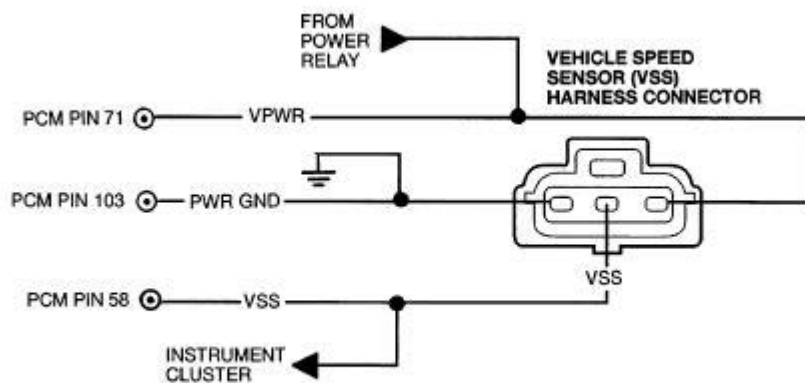

Note

This Pinpoint Test is intended to diagnose the following:

- Vehicle speed sensor (VSS) (9E731)
- Transfer case speed sensor (TCSS) (7H103)
- Harness circuits: VSS + and VSS -
- Harness circuits: TCSS and SIGRTN
- Powertrain control module (PCM) (12A650)

DP: Vehicle Speed Sensor (VSS)/Transfer Case Speed Sensor (TCSS)

← DP: Introduction

DP1 DTC P0500/P0501/P1502: CHECK VSS CIRCUITS FOR OPEN IN HARNESS (VRS TYPE)

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Disconnect VSS.
- Measure resistance of VSS+ circuit between PCM harness connector pin and VSS+ sensor harness connector.
- Measure resistance of VSS- circuit between PCM harness connector pin and VSS- sensor harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
GO to DP2 .	REPAIR open circuit. COMPLETE an OBD II Drive Cycle (REFER to Section 2, Drive Cycles).

DP2 CHECK VSS CIRCUITS FOR SHORT TO GROUND AND POWER IN HARNESS

- Measure resistance between VSS+ and PWR GND circuits at PCM harness connector.
- Measure resistance between VSS+ and VSS- circuits at PCM harness connector.
- Measure resistance between VSS+ and VPWR circuits at PCM harness connector.

Is each resistance greater than 5.0 ohms?

Yes	No
GO to DP3 .	GO to DP12 .

DP3 CHECK VSS RESISTANCE

- Measure VSS resistance.

Is resistance between 170 and 270 ohms?

Yes	No
REPLACE the PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)). COMPLETE an OBD II Drive Cycle (REFER to Section 2, Drive Cycles).	REPLACE the VSS. COMPLETE an OBD II Drive Cycle (REFER to Section 2 , Drive Cycles).

DP5 DTC P0500/P0501/P1502: CHECK VSS SIGNAL OUTPUT TO (PCM) POWERTRAIN CONTROL MODULE (HALL TYPE)

- Disconnect PCM.
- Raise the vehicle to allow rotation of the front drive wheel.
- Key on, transmission in NEUTRAL.

Note: The opposite wheel must be held stationary.

- Measure voltage between VSS+ and PWR GND circuits at the PCM harness connector, while slowly rotating the drive wheel.
- The voltage should rise above 5.0 volts and fall below 1.0 volt in a regular cycle. Observe several cycles.
- Key off.

Does the VSS output voltage rise and fall as specified while slowly rotating the drive wheel?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)). COMPLETE an OBD II Drive Cycle (REFER to Section 2, Drive Cycles).	GO to DP6 .

DP6 CHECK VOLTAGE BETWEEN VPWR AND PWR GND CIRCUITS AT VSS

- Disconnect VSS.
- Key on.
- Measure voltage between VPWR and PWR GND circuits at the VSS harness connector.

Is the voltage greater than 10.5 volts?

Yes	No
GO to DP7 .	KEY OFF. GO to DP10 .

DP7 CHECK VSS CIRCUIT FOR SHORT TO POWER IN HARNESS

- Key on.
- Measure voltage between VSS+ and PWR GND circuits at the PCM harness connector.
- Key off.

Is voltage less than 1.0 volt?

Yes	No
GO to DP8 .	GO to DP12 .

DP8 CHECK VSS CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Measure resistance between VSS+ and PWR GND circuits at the PCM harness connector.

Is resistance greater than 3,000 ohms?

Yes	No
GO to <u>DP9</u> .	GO to <u>DP12</u> .

DP9 CHECK VSS SIGNAL CIRCUIT FOR OPEN IN HARNESS

- Measure resistance of VSS+ signal circuit between PCM harness connector pin and VSS+ sensor harness connector.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE VSS. COMPLETE an OBD II Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>).	REPAIR open circuit. COMPLETE an OBD II Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>).

DP10 CHECK VSS GROUND CIRCUIT FOR OPEN IN HARNESS

- Measure resistance of PWR GND circuit between VSS harness connector and chassis ground.

Is resistance less than 5.0 ohms?

Yes	No
REPAIR open VPWR to VSS. COMPLETE an OBD II Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>).	REPAIR open VSS PWR GND circuit. COMPLETE an OBD II Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>).

DP12 VERIFY IF VSS CIRCUIT IS SHORTED IN HARNESS OR ANOTHER MODULE

- Determine which, if any, modules are connected to the VSS circuit (Refer to Wiring Diagrams Manual). If no other modules are connected to the VSS circuit, GO to the "YES" Action To Take.
- One at a time, disconnect the modules associated with the VSS circuit. After disconnecting each module, again test for short circuit (Refer to test step that sent you here). Repeat until each associated module has been disconnected or the short circuit has been eliminated.

Does the short circuit remain after all associated modules were disconnected?

Yes	No
REPAIR short circuit. COMPLETE an OBD II Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>).	REFER to the Workshop Manual for further diagnosis of appropriate module.

DP15 KOER DTC P1501: CHECK PCM VSS PID FOR INPUT SIGNAL

- Start the engine and idle in NEUTRAL.
- Access the VSS PID with a scan tool and observe for vehicle speed input to the PCM.
- Increase the engine speed, not greater than 2000 rpm, several times while observing the VSS

PID.

Is the reading on the VSS PID less than 5 km/h (3 mph)?

Yes	No
Unable to duplicate or identify fault at this time. If DTC P1501 still exists. GO to <u>Z1</u> . (REFER to Section 4, <u>Diagnostic Trouble Code (DTC) Descriptions</u> for a list of possible causes.)	GO to <u>DP22</u> .

DP20 DTC P0503: INSPECT VSS AND CIRCUIT FOR AN INTERMITTENT

- Check for harness intermittents by verifying that Pins are properly seated in connector shell, wiring is properly crimped, no corrosion exists in the harness and sensor is securely mounted.

Are there any indications of harness intermittents?

Yes	No
REPAIR as necessary. COMPLETE an OBDII Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>).	GO to <u>DP21</u> .

DP21 CHECK PCM VSS PID FOR INPUT SIGNAL

- Access the VSS PID with a scan tool.
- Drive the vehicle at several steady state speeds above and below 50 km/h (30 mph).

Note: For Scan Tools which have Data Record feature, record data for playback to help identify variations.

- During each steady state speed observe the VSS PID for variations of (+) or (-) 8 km/h (5 mph) for greater than 10 seconds.

Is there any indications of a noisy or intermittent signal with the VSS PID?

Yes	No
GO to <u>DP22</u> .	Unable to duplicate or identify fault at this time. REPAIR any other DTCs.

DP22 CHECK VSS HARNESS ROUTING

- Check VSS harness routing:
 - Verify that the harness is not routed adjacent to high current wires such as ignition wires or generator wiring.
 - Verify VSS harness is shielded and grounded, if applicable.
 - Check resistance of the VSS harness; refer to Pinpoint Test Schematic and Connectors at beginning of pinpoint test.

Are any concerns evident?

--	--

Yes	No
REPAIR as necessary. COMPLETE an OBDII Drive Cycle (REFER to Section 2, Drive Cycles).	Unable to duplicate or identify a fault at this time. GO to Z1 . (REFER to Section 4, Diagnostic Trouble Code (DTC) Descriptions for a list of possible causes.)

DP25 DTC P1500: VISUAL INSPECTION

- Visually inspect the VSS and VSS harness circuits for any potential failures. Use the following check list for reference:
 - Loose VSS connector.
 - Pushed out VSS connector pins.
 - Damaged VSS wiring harness insulation.
 - Incorrect harness routing.
 - Incorrect VSS mounting.

Did the visual inspection reveal a potential failure?

Yes	No
REPAIR fault as necessary. COMPLETE an OBD II Drive Cycle (REFER to Section 2, Drive Cycles).	RESTORE vehicle. Unable to duplicate or identify fault at this time. GO to Z1 . (REFER to Section 4, Diagnostic Trouble Code (DTC) Descriptions for a list of possible causes.)

DP30 DTC P0500, P1502 VISUAL INSPECTION

Note: The transfer case speed sensor (TCSS) provides rotational speed of output shaft of the transfer case. The PCM use this information to control powertrain behavior and on some applications is used as the source of vehicle speed information.

- Disconnect TCSS sensor.
- Inspect TCSS vehicle harness connector for damage and proper seating.

Have any problems been found?

Yes	No
REPAIR as necessary.	GO to DP31 .

DP31 CHECK RESISTANCE OF TCSS SENSOR

- Measure resistance between TCSS signal and TCSS SIGTRN circuits at the TCSS sensor.

Is resistance between 1,000 and 1,250 ohms?

Yes	No
GO to DP32 .	REPLACE TCSS sensor.

DP32 TCSS OUTPUT CHECK

- Measure frequency between TCSS signal and TCSS SIGRTN circuits at the TCSS sensor.
- Drive vehicle between 0 and 48 km/h (0 and 30 mph).
- Refer to [Section 6](#), Reference Values for frequency ranges.

Does frequency reading increase and decrease with vehicle speed?

Yes	No
GO to DP33 .	REMOVE the TCSS and inspect target wheel. REPAIR as necessary. IF OK REPLACE TCSS.

DP33 CHECK HARNESS FOR SHORT TO PWR

- Key on.
- TCSS sensor disconnected.
- Measure voltage between the TCSS signal circuit at the TCSS harness connector and ground.

If voltage less than 1.0 volt?

Yes	No
KEY OFF. GO to DP34 .	REPAIR short circuit.

DP34 CHECK HARNESS FOR OPEN

- Disconnect PCM.
- Measure resistance of TCSS signal circuit between PCM harness connector pin and TCSS sensor harness connector.
- Measure resistance of TCSS SIGRTN circuit between PCM harness connector pin and TCSS sensor harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
GO to DP35 .	REPAIR open circuit.

DP35 CHECK HARNESS FOR SHORT TO GROUND

- Measure resistance between TCSS signal and SIGRTN circuits at the TCSS harness connector.
- Measure resistance between TCSS signal and GND circuits at the TCSS harness connector.

Is each resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR short circuit.

DQ: Barometric Pressure (BARO) Sensor Introduction

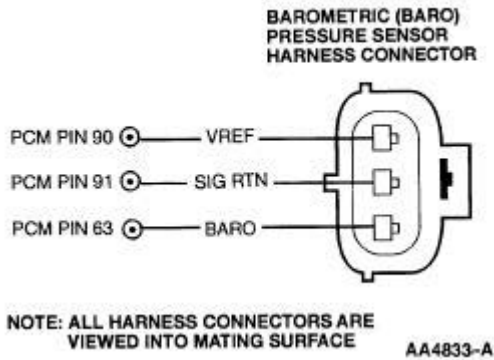

DQ: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- BARO sensor (9F479)
- Harness circuits: BARO SIG, SIG RTN, and VREF
- Powertrain control module (PCM) (12A650)

Pinpoint Test Schematics and Connectors

BARO SENSOR DATA

Barometric Pressure		Frequency
in-Hg	kPa	Hz
17.1	58	122.4
18.3	62	125.5
19.5	66	128.7
20.7	70	131.9
21.8	74	135.1
23.0	78	138.3
24.2	82	141.8
25.4	86	145.4
26.6	90	148.9
27.7	94	152.5
28.9	98	156.1
30.1	102	159.6
31.0	105	162.4

DQ: Pinpoint Tests →

DQ: Barometric Pressure (BARO) Sensor

← DQ: Introduction

DQ1 DTC P0106, P0107, P0108 AND P0109: CHECK BARO PID

- Obtain local barometric pressure reading.
- Access BARO PID.
- Compare PID readings with chart.

Does PID reading compare with that of chart?

Yes	No
Unable to duplicate or identify fault at this time. GO to <u>Z1</u> .	GO to <u>DQ2</u> .

DQ2 CHECK BARO SIGNAL AND SIG RTN CIRCUIT FOR OPEN

- Measure resistance of the BARO circuit between PCM harness connector pin and BARO sensor harness connector.
- Measure resistance of the SIG RTN circuit between PCM harness connector pin and SIG RTN at the BARO sensor harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
GO to <u>DQ3</u> . For DTC P0108: GO to <u>DQ7</u> .	REPAIR open circuit.

DQ3 CHECK VREF VOLTAGE TO BARO SENSOR

- Disconnect BARO connector.
- Measure voltage between VREF and SIG RTN circuits at the BARO harness connector.

Is VREF voltage between 4.0 and 6.0 volts?

Yes	No
KEY OFF. GO to <u>DQ5</u> .	KEY OFF. GO to <u>DQ4</u> .

DQ4 CHECK VREF CIRCUIT FOR OPEN

- Measure resistance of the VREF circuit between PCM harness connector pin and VREF at the BARO sensor harness connector.

Is resistance less than 5.0 ohms?

--	--

Yes	No
GO to DQ5 .	REPAIR open circuit.

DQ5 CHECK BARO CIRCUIT FOR SHORT TO GROUND

- Measure resistance between the BARO and SIG RTN circuits at the PCM harness connector.
- Measure resistance between the BARO circuit at the PCM harness connector and the battery negative post.

Is each resistance greater than 10,000 ohms?

Yes	No
GO to DQ6 .	REPAIR short circuit.

DQ6 CHECK FOR VREF CIRCUIT SHORT TO GROUND

- Measure resistance between the VREF circuit and SIG RTN circuits at the PCM harness connector.
- Measure resistance between the VREF circuit at the PCM harness connector and the battery negative post.

Is each resistance greater than 10,000 ohms?

Yes	No
REPLACE BARO . If concern is still present, REPLACE PCM. (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR short circuit.

DQ7 DTC P0108: INDUCE OPPOSITE CODE

- Disconnect BARO sensor.
- Key on.
- Check DTCs.

Is DTC P0107 present?

Yes	No
KEY OFF. REPLACE BARO sensor.	KEY OFF. GO to DQ8 .

DQ8 CHECK BARO SIGNAL FOR SHORT TO POWER

- Measure resistance between BARO and VPWR circuits at the PCM harness connector.

Is each resistance greater than 10,000 ohms?

Yes	No

REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).

REPAIR short circuit.

DR: Camshaft Position (CMP) Sensor Introduction

DR: Pinpoint Tests →

Note

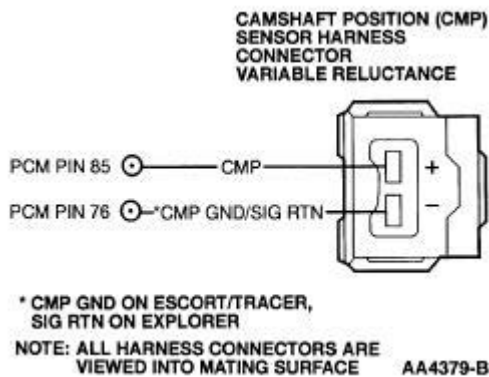

This Pinpoint Test is intended to diagnose the following:

- Camshaft Position (CMP) Sensor (6B288) (12A112)
- Harness Circuits: CMP, VPWR, SIG RTN, PWR GND, CMP/TSS GND
- Powertrain Control Module (PCM) (12A650)

DR: Camshaft Position (CMP) Sensor

← DR: Introduction

DR1 DTC P0340: CHECK IF ENGINE WILL START

Note: Refer to the Pinpoint Test Schematic to determine the type of CMP sensor.

- Start engine.

Will the engine start?

Yes	No
GO to DR2 .	DTC P0340 is not the cause of the No Start. GO to Section 3 to diagnose the No Start symptom.

DR2 CLEAR AND ATTEMPT TO RE-GENERATE DTC P0340

- Complete PCM Reset to clear DTCs.
- Increase rpm to greater than 1500 rpm for 10 seconds. Repeat two times.
- Retrieve all Continuous Memory DTCs.

Is DTC P0340 present?

Yes	No
<p>For VR type CMP: KEY OFF. GO to DR5</p> <p>For Hall Effect type CMP: KEY OFF. GO to DR3</p>	The fault that produced DTC P0340 is intermittent. GO to Z1 .

DR3 CHECK VPWR VOLTAGE TO CMP SENSOR

- Disconnect CMP sensor.
- Key on, engine off.
- Measure VPWR circuit voltage between CMP sensor harness connector and battery negative post.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to DR4 .	REPAIR open circuit.

DR4 CHECK PWR GND TO CMP SENSOR

- Measure resistance of PWR GND circuit between CMP sensor harness connector and battery negative post.

Is resistance less than 5.0 ohms?

Yes	No
GO to DR5 .	REPAIR open circuit.

DR5 CHECK FOR OPEN CMP, SIG RTN/CMP GND AND PWR GND CIRCUITS BETWEEN PCM AND CMP SENSOR

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM and CMP sensor.
- If VR type CMP: Measure resistance of CMP, CMP GND/SIG RTN circuits between PCM harness connector pin and CMP sensor harness connector.
- If Hall type CMP: Measure resistance of CMP, VPWR and PWR GND circuits between PCM harness connector and CMP sensor harness connector.

Are resistance measurements less than 5.0 ohms?

Yes	No
GO to DR6 .	REPAIR open circuit.

DR6 CHECK CMP CIRCUIT FOR SHORT TO POWER IN HARNESS

- Reconnect CMP sensor.
- Key on, engine off.
- If Hall type CMP: Measure voltage between CMP and VPWR circuits at the PCM harness connector.
- If VR type CMP: Measure voltage between CMP and CMP GND/SIG RTN circuits at the PCM connector.

Is voltage less than 1.0 volt?

Yes	No
KEY OFF. GO to DR7 .	REPAIR short circuit.

DR7 CHECK CMP CIRCUIT FOR SHORT TO GND AND SIG RTN IN HARNESS

- Disconnect CMP sensor.
- If VR type CMP: Measure resistance between CMP and CMP GND/SIG RTN at the PCM harness connector.
- If Hall type CMP: Measure resistance between CMP and PWR GND at the PCM harness connector.

Is each resistance greater than 10,000 ohms?

Yes	No
GO to DR8 .	REPAIR short circuit.

DR8 CHECK FOR SHORTS IN PCM

- Reconnect PCM.
- For VR type CMP: Measure resistance between CMP and CMP GND/SIG RTN circuits at the CMP harness connector.
- For Hall Effect type CMP: Measure resistance between CMP and VPWR and CMP and PWR GND circuits at the CMP harness connector.

Is each resistance greater than 500 ohms?

Yes	No
<p>For VR type CMP: GO to DR9.</p> <p>For Hall Effect type CMP: GO to DR10.</p>	<p>REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).</p>

DR9 CHECK CMP SENSOR OUTPUT

- Reconnect CMP sensor.
- Digital multimeter on ac scale (to monitor less than 5.0 volts).
- Measure voltage between CMP and CMP GND/SIG RTN circuits while running engine at varying rpm.

Does AC voltage vary greater than 0.1 volt AC?

Yes	No
<p>REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).</p>	<p>REPLACE CMP sensor.</p>

DR10 CHECK CMP SENSOR OUTPUT DURING CRANK MODE

- Disconnect PCM.
- Reconnect CMP sensor.
- Connect digital multimeter between CMP and the CMP sensor GND circuit.
- Bump engine in short bursts with the starter without starting engine for at least 10 engine revolutions.

Does voltage reading switch between low (less than 2.0 volts dc) and high (greater than 8.0 volts dc)?

Yes	No
<p>A Hall effect type CMP sensor that is installed out of synchronization will produce a DTC. VERIFY the correct installation by referring to Electronic Engine Controls, Section 303-14 in the Workshop Manual. If CMP is installed properly, REPLACE PCM (refer to Section 2,</p>	

Flash Electrically Erasable Programmable
Read Only Memory (EEPROM).

Note: If vehicle has a miss with the P0340
code, ignition/ alternator noise, RFI, and CKP
concerns should be considered.

REPLACE CMP sensor.

DS: Air Conditioning Pressure (ACP) Sensor Introduction

DS: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Harness circuits: ACP, VREF, SIG RTN
- Air Conditioning Pressure (ACP) Sensor (19D594)
- Powertrain Control Module (PCM) (12A650)

Pinpoint Test Schematics and Connector

DS: Pinpoint Tests →

DS: Air Conditioning Pressure (ACP) Sensor

← DS: Introduction

DS1 DTC P1461: CHECK ACP V PID

- Connect scan tool.
- Key on, engine off.
- Access ACP V PID.

Is ACP V PID less than 4.9 volts?

Yes	No
The ACP circuit voltage is now below the maximum. GO to <u>DS18</u> to determine if an intermittent condition exists.	KEY OFF. A hard fault is present. GO to <u>DS2</u> .

DS2 CHECK VOLTAGE BETWEEN VREF AND SIG RTN CIRCUITS TO ACP SENSOR

- Disconnect ACP sensor.
- Key on, engine off.
- Measure voltage between VREF and SIG RTN circuits at the ACP sensor harness connector.

Is voltage between 4.0 and 6.0 volts?

Yes	No
GO to <u>DS3</u> .	VREF is out of range, or SIG RTN circuit to ACP sensor is open. KEY OFF. GO to <u>C1</u> .

DS3 INDUCE OPPOSITE ACP SIGNAL

- Key on, engine off.
- Again access ACP V PID.

Is ACP V PID now less than 4.9 volts?

Yes	No
KEY OFF. REPLACE ACP sensor. REFER to the Climate Control System General Information, Section 412-03 in the Workshop Manual. START engine. TURN A/C on, WAIT 15 seconds then TURN A/C off. RERUN Quick Test.	KEY OFF. GO to <u>DS4</u> .

DS4 CHECK ACP CIRCUIT FOR SHORT TO VREF IN HARNESS

- Disconnect scan tool from DLC.
- Disconnect PCM.
- Measure resistance between ACP and VREF circuits at the ACP sensor harness connector.

Is resistance greater than 10,000 ohms?

Yes	No
GO to DS5 .	REPAIR short circuit. START engine. TURN A/C on, WAIT 15 seconds then TURN A/C off. RERUN Quick Test.

DS5 CHECK ACP CIRCUIT FOR SHORT TO POWER IN HARNESS

- Key on, engine off.
- Measure voltage between ACP circuit at the ACP sensor vehicle harness connector and chassis ground.

Is voltage less than 1.0 volt?

Yes	No
<p>For Escort, LS6/LS8:</p> <p>KEY OFF. GO to DS6.</p> <p>All others:</p> <p>REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)). START engine. TURN A/C on, WAIT 15 seconds then TURN A/C off. RERUN Quick Test.</p>	<p>REPAIR short circuit. START engine. TURN A/C on, WAIT 15 seconds then TURN A/C off. RERUN Quick Test.</p>

DS6 CHECK FOR OPEN ACP CIRCUIT IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Measure resistance of ACP circuit between PCM harness connector pin and the ACP sensor harness connector.

Is resistance less than 5.0 ohms?

Yes	No
GO to DS7 .	REPAIR open circuit. START engine. TURN A/C on, WAIT 15 seconds then TURN A/C off. RERUN Quick Test.

DS7 CHECK PCM

- Reconnect PCM.
- Connect a jumper wire between the ACP and SIG RTN Circuits at the ACP sensor harness connector.
- Key on, engine off.

- Access ACP V PID.

Note: If the scan tool is now unable to communicate, follow NO Action to Take.

Is ACP V PID now less than 4.9 volts?

Yes	No
REPLACE ACP sensor. REFER to the Climate Control System General Information, Section 412-00 in the Workshop Manual. START engine. TURN A/C on, WAIT 15 seconds then TURN A/C off. RERUN Quick Test.	REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)). START engine. TURN A/C on, WAIT 15 seconds then TURN A/C off. RERUN Quick Test.

DS10 DTC P1462: CHECK ACP V PID

- Connect scan tool.
- Key on, engine off.
- Access ACP V PID.

Is ACP V PID greater than 0.15 volt?

Yes	No
The ACP circuit voltage is now above the minimum. GO to DS18 to determine if an intermittent condition exists.	KEY OFF. A hard fault is present. GO to DS11 .

DS11 CHECK VOLTAGE BETWEEN VREF AND SIG RTN TO ACP SENSOR

- Disconnect ACP sensor.
- Key on, engine off.
- Measure voltage between VREF and SIG RTN circuits at the ACP sensor harness connector.

Is voltage between 4.0 and 6.0 volts?

Yes	No
GO to DS12 .	VREF is out of range. KEY OFF. GO to C1 .

DS12 INDUCE OPPOSITE ACP SIGNAL

- Connect a jumper wire between ACP and VREF circuits at the ACP sensor harness connector.
- Key on, engine off.
- Access ACP V PID.

Note: If any scan tool communication concern occurs, remove jumper immediately and GO to [DS13](#).

Is ACP V PID greater than 4.0 volts?

Yes	No

REPLACE ACP sensor. REFER to the Climate Control System General Information, Section 412-03 in the Workshop Manual. START engine. TURN A/C on, WAIT 15 seconds then TURN A/C off. RERUN Quick Test.

GO to [DS13](#).

DS13 CHECK ACP CIRCUIT FOR SHORT TO PWR GND OR SIG RTN IN HARNESS

- Key off.
- Disconnect scan tool from DLC.
- Disconnect PCM.
- Measure resistance between ACP and SIG RTN circuits at the ACP sensor harness connector.
- Measure resistance between the ACP circuit at the ACP sensor harness connector and the battery negative post.

Are both resistances greater than 10,000 ohms?

Yes	No
GO to DS14 .	REPAIR short circuit. START engine. TURN A/C on, WAIT 15 seconds then TURN A/C off. RERUN Quick Test.

DS14 CHECK ACP CIRCUIT FOR OPEN IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this Pinpoint Test.

- Measure resistance of ACP circuit between PCM harness connector pin and the ACP sensor harness connector.

Is resistance less than 5.0 ohms?

Yes	No
GO to DS15 .	REPAIR open ACP circuit. START engine. TURN A/C on, WAIT 15 seconds then TURN A/C off. RERUN Quick Test.

DS15 CHECK FOR THE A/C CLUTCH TO ENGAGE

- Reconnect ACP sensor.
- Key on, engine off.
- While listening for the A/C clutch to engage, turn the A/C on. Repeat if necessary.
- Key off.

Did the A/C clutch engage when the A/C was turned on?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)). START engine. TURN A/C on, WAIT 15 seconds then TURN	GO to DS16 .

A/C off. RERUN Quick Test.	
----------------------------	--

DS16 VERIFY A/C SYSTEM HAS A REFRIGERANT CHARGE

- Restore vehicle.
- Verify that the A/C system has a refrigerant charge. (Refer to the Electrical/Climate Control Systems Group in the Workshop Manual).

Does the A/C system have a refrigerant charge?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>). START engine. TURN A/C on, WAIT 15 seconds then TURN A/C off. RERUN Quick Test.	REPAIR A/C system. REFER to Climate Control System General Information, Section 412-00. START engine. TURN A/C on, WAIT 15 seconds then TURN A/C off. RERUN Quick Test.

DS18 CHECK FOR INTERMITTENT ACP CIRCUIT FAULT

- Key on, engine off.
- Access ACP V PID.
- Observe ACP V PID for an indication of a fault while completing the following (a fault will be indicated by a sudden change in ACP V PID voltage):
 - Shake, wiggle, bend the ACP, SIG RTN and VREF circuits between the ACP sensor and the PCM.
 - Lightly tap on the ACP sensor (to simulate road shock).

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary. PERFORM PCM Reset to clear DTC(s). START engine. TURN A/C on, WAIT 15 seconds then TURN A/C off. RERUN Quick Test.	Unable to duplicate or identify fault at this time. GO to <u>Z1</u> .

DS20 DTC P1463: VERIFY A/C CLUTCH CAN DISENGAGE

- A/C and defroster off.
- Start engine.
- Verify that the A/C clutch disengages.

Is the A/C clutch disengaged?

Yes	No
KEY OFF. GO to <u>DS21</u> .	GO to <u>Section 3</u> , Symptom Chart 24 (A/C Compressor Runs Continuously, A/C Always On) to diagnose the always engaged A/C clutch.

DS21 CHECK FOR VOLTAGE AND GROUND TO A/C CLUTCH (USING NON POWERED TEST LAMP)

Note: If voltage and ground to A/C clutch has already been checked in the [Section 3](#), Symptom Charts, or the A/C clutch can be heard clicking on when the A/C is turned on, go to the question at the end of this test step.

- Disconnect A/C cycling switch. Install a jumper wire in the A/C cycling switch vehicle harness connector (to complete the circuit).
- Disconnect the A/C clutch.
- Connect a non-powered test lamp between the power pin and ground pin at the A/C clutch vehicle harness connector.
- Start engine.
- Turn A/C on, wait 15 seconds.
- Monitor test lamp.
- After testing turn key off, remove jumper and reconnect A/C clutch and A/C cycling switch.

Does test lamp light (or can A/C clutch be heard clicking on)?

Yes	No
GO to DS22 .	REFER to the Climate Control System, General Information, Section 412-00 in the Workshop Manual.

DS22 CHECK IF A SUFFICIENT A/C PRESSURE CHANGE CAN BE DETECTED BY THE ACP PID

- Start engine.
- A/C off.
- Access ACP V PID.
- Note ACP V PID voltage.
- While monitoring ACP V PID voltage, turn A/C on. Five seconds after A/C clutch engagement, note voltage (if clutch does not engage, follow NO Action To Take).

Did the ACP V PID voltage change more than 0.3 volt within five seconds of clutch engagement?

Yes	No
<p>The ACP Sensor and PCM can detect a sufficient change in A/C system pressure.</p> <p>For Symptom without DTC P1463:</p> <p>RETURN to Section 3.</p> <p>All others:</p> <p>REFER to the Climate Control System General Information, Section 412-00 in the Workshop Manual to check for proper operation of the A/C system. After any service. START engine. TURN A/C on, WAIT 15 seconds then TURN A/C off. RERUN Quick Test.</p>	<p>KEY OFF, A/C off. GO to DS23.</p>

DS23 CHECK A/C SYSTEM PRESSURE AND PRESSURE CHANGE

- Install an A/C System Manifold Gauge Set and check the A/C system high pressure readings.
- Start engine.
- A/C off.
- Note the A/C high pressure reading.
- While monitoring the A/C system high pressure reading, turn the A/C on. Five seconds after clutch engagement, note the pressure (the pressure should increase).
- A/C off.

Did the A/C high pressure reading change more than 207 kPa (30 psi) within five seconds of clutch engagement?

Yes	No
KEY OFF. GO to DS24 .	A/C system pressure did not change as expected. REFER to the Climate Control System General Information, Section 412-00 in the Workshop Manual to check for proper mechanical operation of the A/C system. START engine. TURN A/C on, WAIT 15 seconds then TURN A/C off. RERUN Quick Test.

DS24 CHECK VOLTAGE BETWEEN VREF AND SIG RTN TO ACP SENSOR

- Disconnect ACP sensor.
- Key on, engine off.
- Measure voltage between VREF and SIG RTN circuits at the ACP sensor harness connector.

Is voltage between 4.0 and 6.0 volts?

Yes	No
KEY OFF. GO to DS25 .	VREF is out of range. KEY OFF. GO to C1 .

DS25 CHECK ACP CIRCUIT FOR OPEN IN SENSOR

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Key off.
- ACP sensor disconnected.
- Disconnect PCM.
- Measure resistance of ACP circuit between PCM harness connector pin and the ACP sensor harness connector.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE ACP sensor. REFER to the Climate Control System General Information, Section 412-03 in the Workshop Manual. START engine. TURN A/C on, WAIT 15 seconds then TURN A/C off. RERUN Quick	REPAIR open circuit. START engine. TURN A/C on, WAIT 15 seconds then TURN A/C off. RERUN Quick Test.

Test.

DT: Power Steering Pressure (PSP) Sensor Introduction

DT: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- PSP sensor (3K215)
- Harness circuits: PSP signal, SIG RTN, VREF
- Powertrain Control Module (PCM) (12A650)

Pinpoint Test Schematics and Connectors

NOTE: ALL HARNESS CONNECTORS ARE VIEWED INTO MATING SURFACE

Graph

Power Steering Pressure (PSP) Sensor Transfer Function

AA0930-C

DT: Pinpoint Tests →

DT: Power Steering Pressure (PSP) Sensor

← DT: Introduction

DT1 DTC P1550: VERIFY OPERATOR INTERACTION

Did you turn the steering wheel at least one-half turn within 20 seconds of starting KOER self-test?

Yes	No
KEY OFF. If there are any symptoms with the power steering system (for example, lack of power assist), go to Workshop Manual Section 211-00, Steering Systems - General Information. If no symptoms are present with the power steering system, GO to DT2 .	RERUN Quick Test.

DT2 DTC P0552, P0553: CHECK VOLTAGE BETWEEN VREF AND SIG RTN AT PSP SENSOR

- Disconnect PSP sensor.
- Key on, engine off.
- Measure voltage between VREF and SIG RTN circuits at the PSP sensor harness connector.

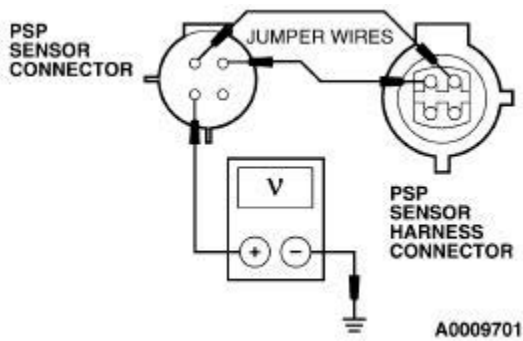

Is voltage between 4.0 and 6.0 volts?

Yes	No
KEY OFF. GO to DT3 .	KEY OFF. GO to C1 .

DT3 CHECK PSP SENSOR OPERATION

- Connect a jumper wire for the VREF circuit between the PSP sensor harness connector and sensor connector.
- Connect jumper wire for the SIG RTN circuit between the PSP sensor harness connector and sensor connector.
- Start engine and let idle.
- Measure voltage between PSP circuit at the PSP sensor connector and chassis ground.
- Observe voltage while turning the steering wheel at least one half turn right and left.

Is voltage reading between 0.3 and 4.7 volts, and does the voltage change when the steering wheel is turned?

Yes	No
KEY OFF. GO to DT4 .	REPLACE PSP sensor.

DT4 CHECK PSP SENSOR CIRCUIT FOR OPEN IN HARNESS

- Disconnect PCM.
- Measure resistance of PSP circuit between PCM harness connector pin 31 and PSP sensor harness connector.

Is resistance less than 5.0 ohms?

Yes	No
GO to DT5 .	REPAIR open circuit.

DT5 CHECK PSP CIRCUIT FOR SHORT TO POWER IN HARNESS

- Key on, engine off.
- Measure voltage between PSP circuit at the PSP sensor harness connector and chassis ground.

Is voltage less than 1.0 volt?

Yes	No
KEY OFF. GO to DT6 .	REPAIR short circuit.

DT6 CHECK PSP CIRCUIT FOR SHORT TO VREF, SIG RTN AND GROUND IN HARNESS

- Measure resistance between the PSP circuit and both the VREF and SIG RTN circuits at the PSP sensor harness connector.
- Measure resistance between the PSP circuit at the PSP sensor harness connector and chassis ground.

Is each resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (REFER to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR short circuit.

DT10 CONTINUOUS MEMORY DTC P0552, P0553: CHECK FOR INTERMITTENT CIRCUITS TO PSP SENSOR

- Key on, engine off.
- Access PSP V PID.
- Observe PSP V PID for an indication of a fault while performing the following (a fault will be indicated by a sudden change in the PSP V PID voltage):
 - Shake, wiggle, bend the PSP, SIG RTN and VREF circuits between the PSP sensor and the PCM.
 - Lightly tap on the PSP sensor to simulate road shock.

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary.	KEY OFF. Unable to duplicate or identify fault at this time. GO to <u>Z1</u> .

DU: Intake Air Temperature 2 (IAT2) Introduction

DU: Pinpoint Tests →

DU: Intake Air Temperature 2 (IAT2)

← DU: Introduction

DU10 DTC P1115: SIMULATE OPPOSITE SIGNAL TO PCM

- With IAT2 temperature sensor disconnected, connect a jumper wire between the sensor signal and SIG RTN circuits at the temperature sensor harness connector.
- Key on.

Note: If a scan tool communication concern exists, remove jumper wire immediately and GO to [DU12](#).

- Access IAT2 temperature sensor voltage PID.

Is the IAT2 temperature sensor voltage PID less than 0.2 volts?

Yes	No
REPLACE suspect sensor.	KEY OFF. REMOVE jumper wire. GO to DU11 .

DU11 CHECK TEMPERATURE SENSOR SIGNAL AND SIG RTN CIRCUITS FOR OPEN IN HARNESS

Note: Refer to the PCM connector pin numbers on this pinpoint test cover page.

- Disconnect PCM.
- Measure resistance of sensor signal circuit between PCM harness connector pin and IAT2 sensor harness connector.
- Measure resistance of SIG RTN circuit between PCM harness connector pin and IAT2 temperature sensor harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR open circuits.

DU12 CHECK TEMPERATURE SIGNAL FOR SHORT TO VREF IN HARNESS

- Key off.
- Disconnect PCM.
- Measure resistance between IAT2 temperature signal circuit at the sensor harness connector and VREF circuits at the PCM harness connector.

Is the resistance greater than 10,000 ohms?

Yes	No

REPLACE PCM (refer to Section 2, [Flash Electrically Erasable Programmable Read Only Memory \(EEPROM\)](#)).

REPAIR short to VREF.

DU20 P1114: SIMULATE OPPOSITE SIGNAL TO PCM

- Disconnect harness from IAT2 temperature sensor.
- Connect scan tool.
- Key on.
- Access IAT2 temperature sensor voltage PID.
- Key off.

Is the IAT2 temperature sensor voltage PID greater than 4.2 volts?

Yes	No
REPLACE sensor.	GO to DU21 .

DU21 CHECK VREF VOLTAGE TO TP SENSOR

- Refer to schematic at the beginning of the pinpoint test.
- Disconnect TP sensor.
- Key on, engine off.
- Measure the voltage between VREF and SIG RTN circuits at the TP sensor harness connector.

Is voltage between 4.0 and 6.0 volts?

Yes	No
There is sufficient VREF voltage. RECONNECT TP sensor. GO to DU22 . KEY OFF.	GO to C1 .

DU22 CHECK TEMPERATURE SIGNAL CIRCUIT FOR SHORT TO GROUND IN HARNESS

Note: Refer to the PCM connector pin numbers on this pinpoint test cover page.

- Disconnect PCM.
- Measure resistance between sensor signal and SIG RTN circuits and then between sensor signal and PWR GND circuits at the PCM harness connector.

Is each resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR short circuit.

DU30 P0127 IAT2 TOO HIGH. CHECK SUPERCHARGER INTERCOOLER PUMP

OPERATION

- Connect scan tool.
- Access Output Test Mode.
- Select Mode: ALL ON.
- Command pump to run.

Does supercharger intercooler pump run?

Yes	No
GO to <u>DU31</u> .	KEY OFF. GO to <u>KP1</u> (Charge Air Cooler Pump).

DU31 CHECK INTERCOOLER SYSTEM

- Check intercooler system for:
 - low fluid level.
 - cracked coolant lines.
 - blocked heat exchanger or coolant lines.
 - crossed coolant lines.

Is intercooler system OK?

Yes	No
KEY OFF. GO to <u>DU32</u> .	REPAIR as necessary.

DU32 SIMULATE HIGH IAT2 VOLTAGE SIGNAL

- Connect scan tool.
- Key on.
- Access IAT2 VPID.
- Observe PID while disconnecting IAT2 sensor.

Is PID greater than 4.0V?

Yes	No
GO to <u>DU33</u> .	REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).

DU33 SIMULATE LOW IAT2 VOLTAGE SIGNAL

- Access IAT2 VPID.
- Observe PID while connecting a jumper wire between the sensor signal and SIG RTN circuit at the temperature sensor harness connector.

Is PID less than 1.0V?

Yes	No

RECONNECT sensor and GO to [Section 6](#), Reference Values. COMPARE IAT2 PID to reference values under the given road test conditions. If sensor is not in range, REPLACE IAT2 sensor.

REPLACE PCM (refer to Section 2, [Flash Electrically Erasable Programmable Read Only Memory \(EEPROM\)](#)).

EM: Emissions Compliance Introduction

EM: Pinpoint Tests →

Note

Canada and some states or metropolitan areas in the United States require periodic Emission, or Inspection and Maintenance (I/M) Tests. All Ford products have been designed to pass these tests. If a Ford product fails an I/M Test, it is probable that 1) the engine or catalyst temperature was not warm and stabilized before the test, or 2) the vehicle had idled excessively before the test.

- If any emission components are replaced, perform the following before repeating the I/M Test procedure:
 1. Clear Keep Alive Random Access Memory (RAM)—Refer to Section 2, [Powertrain Control Module \(PCM\) Reset](#).
 2. To relearn some basic Adaptive Learning (trim) values, run engine at 2500 rpm for one minute and idle engine for two minutes.

Exhaust Gas Analysis Chart

* EXACT AIR FUEL RATIO VARIES DEPENDING ON ENGINE

Verifying an Excessive Grams Per Mile (GPM) Indication Using a Parts Per Million (PPM) Reading

For the vehicle's gas reading(s) that is excessive, compare the actual GPM reading to the gas cutpoint level needed to pass testing. Determine how much the actual GPM reading is over the cutpoint. This will give an indication of how much the PPM reading will have to be reduced (if the actual reading is twice the cutpoint, the baseline reading will have to be cut in half or more). See following example.

Example:

- The actual HC produced by a vehicle was 1.6 GPM. The cutpoint for HC in this example is 0.8 GPM. The actual reading is twice the cutpoint.
- The HC reading obtained for the same vehicle during the baseline drive averages 440 PPM. In order for this vehicle to pass the I/M test, the HC reading from the verification trip must be at least half of the baseline reading, or an average of 220 PPM or less.
- This method only gives a general idea of how much the PPM reading needs to be reduced in order for the vehicle to pass an I/M test that calculates GPM. This test is not exact. Experience will still have to be used to determine if the emission readings have been reduced enough for the vehicle to pass the I/M test.

EM: Emissions Compliance

← EM: Introduction

EM1 ANALYZE VEHICLE'S INSPECTION AND MAINTENANCE (I/M) TEST REPORT

- Analyze I/M test report for data entry errors:
 - Correct model and year.
 - Correct test weight, if included on report (this number will be less than the vehicle's GVW).
 - Correct calibration, if included on report (such as Calif. or Federal).
- Analyze I/M test report results:
 - Identify which gas readings are high AND which readings are low.
 - For reports that include a drive trace, identify during which mode the gas(es) failed. Be aware that if all gases were high early then decreased, the catalyst may have been cool when testing began.

Has the I/M test report been analyzed?

Yes	No
GO to EM2 .	REPEAT this test step.

EM2 DID THE VEHICLE FAIL ONLY AN EVAP SYSTEM LEAK TEST OR A PURGE FLOW TEST (if these tests were performed)?

Did the vehicle fail only an EVAP system leak test or purge flow test (all gases OK)?

Yes	No
EVAP concern only. GO to EM35 .	GO to EM3 .

EM3 BASELINE VEHICLE

Note: Baselining the vehicle's exhaust gas readings is important so the baseline readings can be used for comparison after any repair is made.

- Baseline vehicle using an exhaust gas analyzer. If the vehicle must be driven, be certain any baseline drive used is repeatable. The same drive cycle will be used to verify any repair.
- During the baseline, check for any related symptoms that may be present (such as driveability, transmission shifting or exhaust smoke concerns).

Has the vehicle been baselined?

Yes	No
GO to EM4 .	REPEAT this test step.

EM4 CHECK IF ANY OTHER SYMPTOMS ARE PRESENT

Are any of the following symptoms present?

- Driveability Concerns (including Idle or Transmission Concerns).
- Exhaust smoke.
- Cooling System Concerns (engine not operating at proper temperature).

Yes	No
GO to Section 3 (begin at Step 1: PCM Quick Test) for direction to repair the additional symptom. Also REFER to the Exhaust Gas Analysis Chart at the beginning of this pinpoint test for additional information. After any repair, GO to EM40 to verify repair.	No other concerns present. GO to EM5 .

EM5 PRELIMINARY CHECKS

- Perform the following preliminary checks:
 - Vacuum lines (leaks/blockage).
 - Electrical connections.
 - Proper scheduled maintenance.
 - Intake air tube and air cleaner concerns (such as obstructions, leaks or dirty air cleaner element).
 - Ford authorized emission controls and components installed on vehicle.

Are all checks OK?

Yes	No
GO to EM6 .	REPAIR as necessary. After repair, GO to EM40 to VERIFY repair.

EM6 PERFORM PCM QUICK TEST

- Complete PCM Quick Test to access any PCM DTCs (Refer to [Section 3](#), Step 1: PCM Quick Test (for Test Step procedure only)).

Is a fault indicated?

Yes	No
FOLLOW Section 3 Quick Test direction. After repair, GO to EM40 to verify repair.	GO to EM7 .

EM7 CHECK CARBON MONOXIDE (CO) LEVELS

Did the vehicle have excessive CO levels?

Yes	No
Excessive CO levels indicate that the engine is running rich. GO to EM15 .	GO to EM8 .

EM8 CHECK HYDROCARBON (HC) LEVELS

Did the vehicle have excessive HC levels?

Yes	No
Excessive HC levels with low to normal CO levels indicate that the engine is running lean. GO to EM25 .	GO to EM9 .

EM9 CHECK OXIDES OF NITROGEN (NO_x) LEVELS

Did the vehicle have excessive NO_x levels?

Yes	No
GO to EM30 .	VERIFY all previous testing.

EM15 HIGH CO LEVELS: CHECK HC LEVELS

Did the vehicle have excessive HC levels?

Yes	No
GO to EM16 (to check for incomplete combustion/running rich).	GO to EM17 (to check for running rich).

EM16 CHECK SECONDARY IGNITION SYSTEM

- GO to [JB1](#) to check the secondary ignition system.

Is a fault indicated?

Yes	No
FOLLOW Pinpoint Test direction. After repair, GO to EM40 to verify repair.	GO to EM17 .

EM17 CHECK FUEL DELIVERY SYSTEM FOR CONCERNS SUCH AS HIGH FUEL PRESSURE AND ABILITY TO HOLD PRESSURE

- For Natural Gas applications:
 - GO to [HB1](#).
- All others:
 - GO to [HC1](#).

Is a fault indicated?

Yes	No
FOLLOW Pinpoint Test direction. After repair, GO to EM40 to verify repair.	GO to EM18 .

EM18 CHECK PCV SYSTEM FOR LEAKS, STUCK VALVE, ETC.

- GO to HG1 to check the PCV System.

Is a fault indicated?

Yes	No
FOLLOW Pinpoint Test direction. After repair, GO to <u>EM40</u> to verify repair.	GO to <u>EM19</u> .

EM19 CHECK EXHAUST SYSTEM

- GO to HF1 to check the exhaust system.

Is a fault indicated?

Yes	No
FOLLOW Pinpoint Test direction. After repair is performed, GO to <u>EM40</u> to verify repair.	GO to <u>EM20</u> .

EM20 CHECK BASE ENGINE

- Go to Engine System—General Information Section 303-00 in the Workshop Manual to check for proper compression, valvetrain, camshaft, etc.

Is a fault indicated?

Yes	No
REPAIR as required according to Workshop Manual direction. After repair, GO to <u>EM40</u> to verify repair.	GO to <u>EM21</u> .

EM21 ADDITIONAL CHECKS

- Additional checks:
 - Incorrect PCV valve.

Are all checks OK?

Yes	No
GO to <u>EM45</u> .	REPAIR as necessary. After repair, GO to <u>EM40</u> to verify repair.

EM25 HIGH HC WITH NORMAL TO LOW CO LEVEL: CHECK FUEL DELIVERY SYSTEM FOR CONCERNS SUCH AS LOW FUEL PRESSURE

- For Natural Gas applications:
 - GO to HB1.
- All others:
 - GO to HC1.

Is a fault indicated?

Yes	No
FOLLOW Pinpoint Test direction. After repair, GO to <u>EM40</u> to verify repair.	GO to <u>EM26</u> .

EM26 CHECK SECONDARY IGNITION SYSTEM

- GO to JB1 to check the secondary ignition system.

Is a fault indicated?

Yes	No
FOLLOW Pinpoint Test direction. After repair, GO to <u>EM40</u> to verify repair.	GO to <u>EM27</u> .

EM27 CHECK PCV SYSTEM

- GO to HG1 to check the PCV system.

Is a fault indicated?

Yes	No
FOLLOW Pinpoint Test direction. After repair, GO to <u>EM40</u> to verify repair.	GO to <u>EM28</u> .

EM28 CHECK BASE ENGINE

- Go to Engine System—General Information Section 303-00 in the Workshop Manual to check base engine for concerns such as intake manifold leaks, improper compression, valvetrain or camshaft damage.

Is a fault indicated?

Yes	No
REPAIR as required according to Workshop Manual direction. After repair, GO to <u>EM40</u> to verify repair.	GO to <u>EM29</u> .

EM29 ADDITIONAL CHECKS

- Additional checks:
 - Incorrect PCV valve.

Are all checks OK?

Yes	No
GO to EM45 .	REPAIR as necessary. After repair, GO to EM40 to verify repair.

EM30 HIGH NO_x WITH NORMAL TO LOW HC AND CO LEVELS: CHECK BASE ENGINE FOR CONCERNS SUCH AS EXCESSIVE CARBON BUILD UP IN COMBUSTION CHAMBER

- Go to the Engine System—General Information Section 303-00 in the Workshop Manual to check for base engine concerns such as excessive carbon build up in the combustion chamber.

Is a fault indicated?

Yes	No
REPAIR as required according to Workshop Manual direction. After repair, GO to EM40 to verify repair.	GO to EM31 .

EM31 ADDITIONAL CHECKS

- Additional checks:
 - Transmission torque converter clutch operation.
 - Cooling System concerns (such as aftermarket front fascia covering intake air, intake air system modifications).
 - Engine running lean (concerns such as vacuum leaks, low fuel pressure (refer to steps starting at **EM25**)).

Are all checks OK?

Yes	No
GO to EM45 .	REPAIR as necessary. After repair, GO to EM40 to verify repair.

EM35 EVAP SYSTEM CONCERN: PRELIMINARY CHECKS

- Analyze I/M Test Report to determine when concern is present. Attempt to verify concern.
- Make the following preliminary checks:
 - Fuel filler cap (check for proper installation, physical damage or contamination).
 - EVAP system lines/hoses (check for proper connections, damage or blockage).
 - Fuel vapor storage canister damage.

Are all checks OK?

Yes	No
GO to EM36 .	REPAIR as necessary. After repair, GO to EM38 to verify repair.

EM36 PERFORM PCM QUICK TEST

- Complete PCM Quick Test to access any PCM DTCs (Refer to [Section 3](#), Step 1: Quick Test (for Test Step procedure only)).

Is a fault indicated?

Yes	No
FOLLOW Section 3 Quick Test direction. After repair, GO to EM38 to verify repair.	GO to EM37 .

EM37 CHECK EVAP SYSTEM

- Go to Evaporative Emissions, Section 303-13, in the Workshop Manual to check for system leaks.

Is a fault indicated?

Yes	No
FOLLOW Pinpoint Test direction. After repair, GO to EM38 to verify repair.	VERIFY test results. If OK, GO to Z1 , or RETURN to Section 3 to repair any additional symptoms. After any repair, GO to EM38 to verify repair.

EM38 EVAP SYSTEM REPAIR VERIFICATION

- Vehicle repair performed.
- Reset the PCM Keep Alive Random Access Memory (RAM). Be aware that this will set DTC P1000 (and reset the On-Board System Readiness Test).
- To relearn some basic Adaptive Learning (trim) values, run the engine at 2500 rpm for one minute and idle engine for two minutes.
- Rerun PCM Quick Test (refer to [Section 3](#), Step 1: Quick Test). REPAIR any DTCs as directed.
- Perform the EVAP system leak test and flow check.

Does the vehicle pass the EVAP system leak test and flow check?

Yes	No
Save any repair documentation that may be required by local/federal laws. RETURN vehicle to customer.	Original concern not repaired, or another concern exists. GO to EM1 and proceed as directed.

EM40 REPAIR VERIFICATION

- Vehicle repair completed.
- Reset the PCM Keep Alive Random Access Memory (RAM). Be aware that this will set DTC P1000 (and reset the On-Board System Readiness Test).
- To relearn some basic Adaptive Learning (Trim) values, run the engine at 2500 rpm for one minute and idle engine for two minutes.
- Rerun PCM Quick Test (refer to [Section 3](#), Step 1: Quick Test). REPAIR any DTCs as directed.
- Again perform the baseline test using the exhaust gas analyzer.

Note: If vehicle needs to be driven for the baseline, it may be necessary to drive the vehicle first for up to 8 km (5 miles) to relearn some additional Adaptive Learning (trim) values. Also, during the baseline be certain to use the same drive mode that was used for the original baseline test (refer to **EM3**).

- For I/M 240 Emission Testing areas (original gas concentrations reported in Grams Per Mile):
 - Refer to the beginning of this pinpoint test for information on verifying an excessive Grams Per Mile indication using a Parts Per Million (PPM) reading.
- All others (original gas concentrations reported in Parts Per Million):
 - Verify gas levels are within acceptable range.

Are all gases within the acceptable range?

Yes	No
SAVE any repair documentation that may be required by local/federal laws. RETURN vehicle to customer.	Gas level is still high, or another gas level is above the acceptable range: GO to <u>EM1</u> and proceed as directed.

EM45 CATALYST DELTA TEMPERATURE TEST

- All previous testing as indicated completed.
- Disable the AIR system, if equipped.
- Run the engine for two minutes at 2500 rpm to heat the exhaust system.
- Key OFF.
- Disconnect and ground one spark plug wire from each cylinder bank (for Coil On Plug applications, disconnect coil connector).
- Start engine and run at 1000 rpm.
- Disconnect IAC valve (maintain 1000 rpm).
- Measure the surface temperature of both the inlet and outlet of each under-body catalytic converter using an infrared temperature probe.
- Compare the difference in temperature between the inlet and outlet readings of each under-body catalytic converter.

Does each catalytic converter have a difference of more than 28°C (50°F) between its inlet and outlet reading?

Yes	No
The catalytic converter(s) is operating correctly. RECONNECT spark plug wire(s), IAC valve and AIR system (if equipped). COMPLETE PCM Reset to clear any DTC(s) set during testing. VERIFY previous test results. If OK, GO to <u>Z1</u> , or RETURN to <u>Section 3</u> to repair any additional symptoms. After any repair is completed, GO to <u>EM40</u> to verify repair.	For the catalytic converter(s), that had less than 28°C (50 °F) difference, testing indicates the catalytic converter is not working. REPEAT test step to verify results. If the temperature difference is still less than required, REPLACE the catalytic converter. RESTORE vehicle. GO to <u>EM40</u> to verify repair.

FB: Power Take Off (PTO) Introduction

FB: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- PTO Harness circuit
- Powertrain Control Module (PCM) (12A650)

Pinpoint Test Schematic

FB: Pinpoint Tests →

FB: Power Take Off (PTO)

← FB: Introduction

FB1 PTO PID DOES NOT CYCLE: CHECK FOR DEFECTIVE PTO SWITCH

Note: Causes of concern:

- PTO circuit short to power in aftermarket switch/input to the PTO harness connector.
 - PTO circuit short to VPWR.
 - Damaged PCM.
- Disconnect PTO switch harness connector.
 - Measure resistance across PTO switch while in on then off position.

Is resistance less than 5.0 ohms then greater than 10,000 ohms when cycling switch?

Yes	No
GO to FB2 .	REPAIR or REPLACE PTO switch. REFER to aftermarket component manufacturer for service information. RECONNECT PTO switch harness connector. COMPLETE an OBD II Drive Cycle (REFER to Section 2, Drive Cycles).

FB2 CHECK PTO CIRCUIT FOR SHORT TO VPWR

- Disconnect PCM.
- Key on, engine off.
- Measure voltage of PTO circuit between PCM harness connector pin 4 and battery negative post.

Is voltage less than 1.0 volt?

Yes	No
RECONNECT PCM and PTO switch harness connector. GO to FB4 .	REPAIR short circuit.

FB3 MIL ON: CHECK PTO PID

Note: Causes of concern:

- Open in PTO circuit.
 - Short to chassis ground in PTO circuit.
- Connect scan tool to DLC.
 - Key on, engine off.
 - Access the PTO PID.

Is the PTO PID available and displaying on or off?

Yes	No

GO to [FB1](#).

GO to [FB9](#).

FB4 CHECK PTO CIRCUIT WITH SCAN TOOL

Note: This step requires operating the PTO component. Refer to aftermarket manufacturer for PTO operating instructions. Follow all safety precautions.

- Key on (may need to start engine to engage PTO).
- Cycle PTO switch/handle while viewing PTO PID.

Does PTO PID cycle ON, delay, then turn OFF?

Yes	No
RETURN to Section 3 , Symptom Charts.	KEY OFF. GO to FB5 .

FB5 CHECK PTO CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect PCM.
- Disconnect scan tool from DLC.
- Disconnect PTO switch harness connector.
- Measure resistance of PTO circuit between PCM harness connector pin 4 and battery negative post.

Is resistance greater than 10,000 ohms?

Yes	No
RECONNECT PCM. GO to FB7 .	REPAIR short circuit.

FB7 CHECK PTO CIRCUIT FROM PTO SWITCH HARNESS CONNECTOR TO PCM

- Connect scan tool.
- Connect Jumper wire between B+ and PTO circuit at the PTO switch harness connector.
- Key on, engine off.
- Access PTO PID.

Is PTO PID on with jumper inserted and off with jumper removed?

Yes	No
RETURN to Section 3 , Symptom Charts.	KEY OFF. GO to FB8 .

FB8 CHECK PTO CIRCUIT RESISTANCE

- Disconnect PCM.
- Measure resistance of PTO circuit between PCM harness connector pin 4 and PTO switch harness connector.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR open PTO circuit.

FB9 COMPLETE KOEO AND KOER QUICK TESTS

The following steps are used for PTO diagnostics when the vehicle does not support the PTO circuit or PID.

- Complete KOEO and KOER Quick Tests. Refer to [Section 3](#), Symptom Charts, GO to Quick Test [QT1](#).

Are any KOEO or KOER DTCs present?

Yes	No
FOLLOW direction in GO to Quick Test QT1 to REPAIR the KOEO or KOER DTCs.	GO to FB10 .

FB10 COMPLETE OBD II DRIVE CYCLE WITH PTO DISENGAGED

Note: This test step will determine if the PTO operation resulted in any Continuous Memory DTCs stored due to the extra load of the PTO component on the engine.

- Complete PCM Reset.

Note: Make sure the PTO is disengaged.

- Complete OBD II Drive Cycle (refer to Section 2, [Drive Cycles](#)).
- Retrieve all Continuous Memory DTCs (refer to [Section 2](#), Accessing All Continuous Memory DTCs).

Are any Continuous Memory DTCs stored?

Yes	No
GO to Section 4, Powertrain Diagnostic Trouble Code (DTC) Charts , to ADDRESS the first Continuous Memory DTC.	MIL can be caused by engaging the PTO, creating a load on the engine, while the OBD II Monitors were running. If the symptom persists, GO to Z1 .

FD: Brake Pedal Position (BPP) Switch Introduction

FD: Pinpoint Tests →

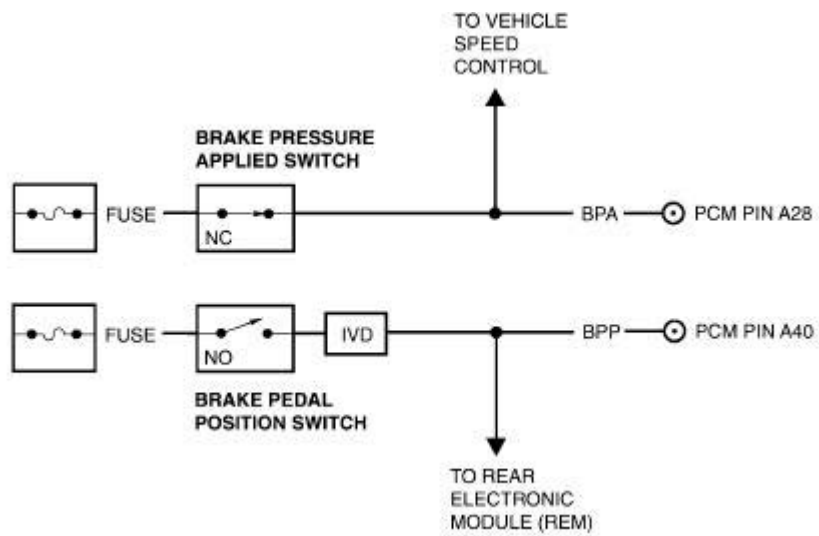

Note

This Pinpoint Test is intended to diagnose the following:

- Brake pedal position (BPP) switch
- Brake pressure applied (BPA) deactivator switch
- Harness circuits: B+, BPA, BPP, GND and stoplamp PWR
- Powertrain control module (PCM) (12A650)

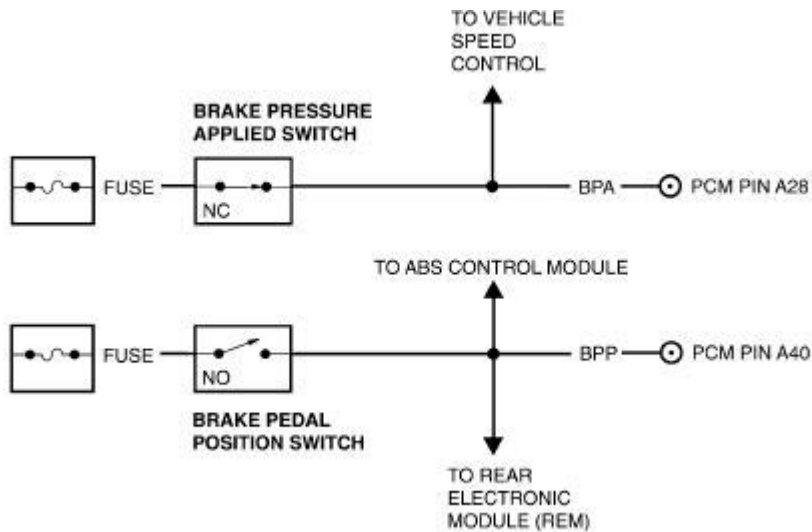

Pinpoint Test Schematics and Connectors

LS6/LS8 (with IVD)

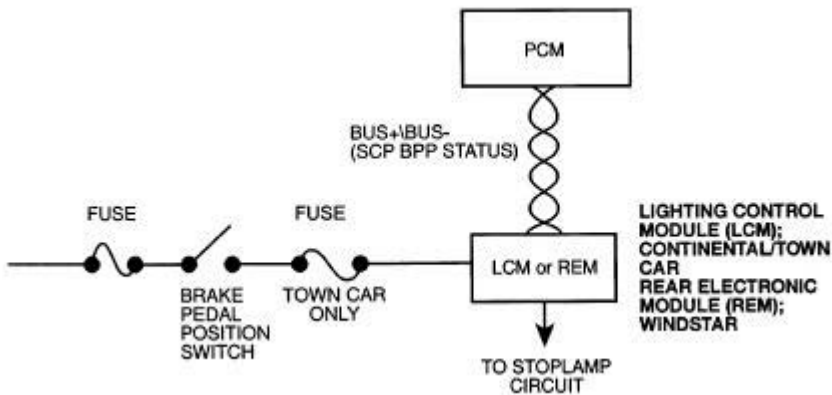

A0027482

LS6/LS8 (without IVD)

A0027483

Continental, Town Car and Windstar

AA4387-A

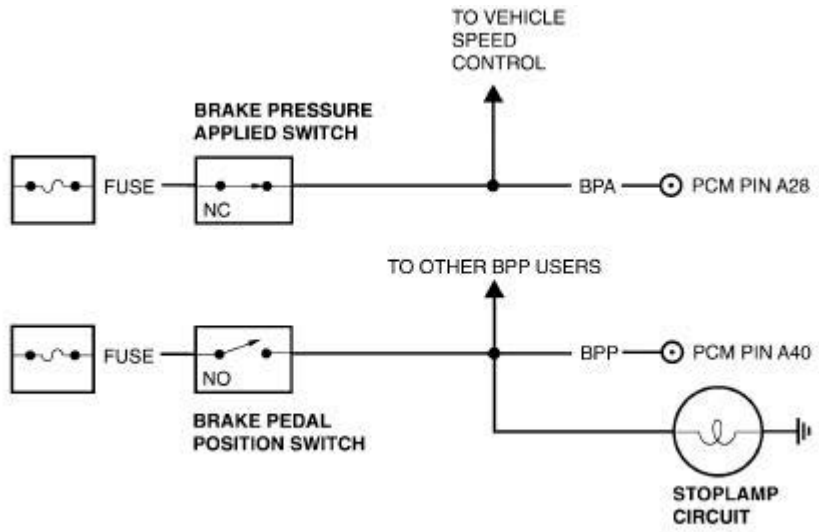

The PCM receives BPP information through the SCP link. This pinpoint test will only verify Self-Test was performed correctly. For detail wiring information, refer to the Workshop Manual or Wiring Diagrams Manual.

Explorer/Mountaineer, Explorer Sport/Sport Trac, Ranger, F-Series, Blackwood, Expedition/Navigator, Excursion

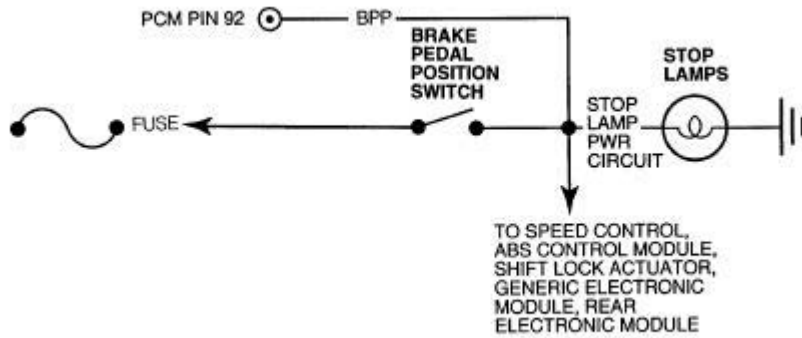

A0009690

Explorer/Mountaineer (150 PIN PCM ONLY)

A0027484

All Others

NOTE: ALL HARNESS CONNECTORS ARE VIEWED INTO MATING SURFACE

AA0841-E

FD: Brake Pedal Position (BPP) Switch

← FD: Introduction

FD1 KOER DTC P0703 OR P1703: VERIFY BRAKE PEDAL WAS APPLIED

Was the brake pedal applied and released during KOER Self-Test?

Yes	No
<p>For Continental and Town Car:</p> <p>REFER to Exterior Lighting, Section 417-01 in the Workshop Manual for further diagnosis of the lighting control module (LCM) system.</p> <p>For Windstar:</p> <p>REFER to Exterior Lighting, Section 417-01 in the Workshop Manual for further diagnosis of the Rear Electronic Module (REM).</p> <p>All Others:</p> <p>KEY ON. GO to FD3.</p>	<p>RERUN KOER Self-Test. APPLY and RELEASE brake pedal.</p>

FD2 KOEO DTC P0703 OR P1703: VERIFY BRAKE PEDAL WAS NOT APPLIED

Was the brake pedal applied during KOEO Self-Test?

Yes	No
<p>RERUN KOEO Self-Test. Avoid applying brake pedal during test.</p>	<p>For Continental and Town Car:</p> <p>REFER to Exterior Lighting, Section 417-01 in the Workshop Manual for further diagnosis of the lighting control module (LCM) system.</p> <p>For Windstar:</p> <p>REFER to Exterior Lighting, Section 417-01 in the Workshop manual for further diagnosis of the Rear Electronic Module (REM).</p> <p>All others:</p> <p>KEY ON. GO to FD3.</p>

FD3 DTCS P0703, P1572 AND P1703: CHECK OPERATION OF STOPLAMPS

- Apply and release the brake pedal several times and observe stoplamp operation.

Do the stoplamps operate normally?

--	--

Yes	No
GO to FD4 .	For LS6/LS8: REFER to Exterior Lighting, Section 417-01 in the Workshop Manual for further diagnosis of the rear electrical module (REM). For all others: GO to FD5 for stoplamps never on. GO to FD7 for stoplamps always on.

FD4 CHECK FOR PCM BPP PID CYCLING

- Key on, engine off.
- Access BPP PID.

Note: If BPP PID is not accessible, GO to [FD10](#).

- Apply and release the brake pedal several times while viewing the BPP PID.

Does the BPP PID cycle ON/OFF?

Yes	No
KEY OFF. Unable to duplicate or identify fault at this time. GO to Z1 .	KEY OFF. GO to FD10 .

FD5 CHECK B+ VOLTAGE TO BRAKE PEDAL POSITION SWITCH

Note: Check the condition of the stoplamp bulbs before starting this test.

- Disconnect BPP switch.
- Measure B+ input voltage between BPP switch harness connector and chassis ground.

Is voltage greater than 10 volts?

Yes	No
GO to FD6 .	VERIFY integrity of fuse for B+ to brake pedal position switch. If OK, REPAIR open in B+ circuit. If fuse is damaged, check B+ circuit, BPP circuit, stop lamp PWR circuit and any other associated circuits (REFER to Wiring Diagrams) for short to ground. REPAIR as necessary.

FD6 VERIFY INTEGRITY OF BRAKE PEDAL POSITION SWITCH

- Connect digital multimeter test probes to BPP switch terminals at the BPP switch.
- Apply brake pedal while monitoring reading.

Is the resistance less than 5.0 ohms?

Yes	No
REPAIR open circuit between BPP switch and stoplamp ground.	REPLACE BPP switch.

FD7 VERIFY BRAKE PEDAL POSITION SWITCH IS NOT ALWAYS CLOSED

- Disconnect BPP switch.
- Key on, engine off.

Are stoplamps still on?

Yes	No
KEY OFF. GO to <u>FD8</u> .	VERIFY proper installation of BPP switch. If OK, REPLACE switch.

FD8 CHECK FOR SHORT TO POWER IN PCM

- Disconnect PCM.
- Key on.

Are stoplamps still on?

Yes	No
KEY OFF. GO to <u>FD9</u> .	KEY OFF. REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).

FD9 CHECK STOPLAMP CIRCUIT FOR SHORT TO POWER IN HARNESS

- One at a time, disconnect all modules associated with the stoplamp circuit (Refer to Wiring Diagram Manual). After disconnecting each module, turn key on and observe stoplamps. Turn key off. Repeat until each associated module has been disconnected or stoplamps turn off.

Did stoplamps turn off when any of the modules were disconnected?

Yes	No
REFER to the Workshop Manual for further diagnosis of appropriate module.	REPAIR short to power in stoplamp circuit.

FD10 CHECK FOR BPP CIRCUIT CYCLING

Note: Refer to the PCM connector pin numbers in the beginning of this Pinpoint Test.

- KEY OFF.
- Disconnect PCM.
- Measure voltage between BPP circuit at the PCM harness connector and ground while applying

and releasing the brake.

Does the voltage cycle?

Yes	No
<p>For LS6/LS8, Explorer/Mountaineer (150 PIN PCM): GO to FD11.</p> <p>For all others:</p> <p>REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).</p>	REPAIR open in BPP circuit to PCM.

FD11 CHECK FOR BPA CIRCUIT CYCLING

Note: Refer to the PCM connector pin numbers in the beginning of this Pinpoint Test.

- Disconnect PCM.
- Measure voltage between BPA circuit at the PCM harness connector and ground while applying and releasing the brake.

Does the voltage cycle?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	GO to FD12 .

FD12 CHECK BPA CIRCUIT FOR OPEN IN HARNESS

- Disconnect BPA deactivator switch.
- Measure resistance of BPA circuit between PCM harness connector pin and BPA deactivator switch harness connector.

Is the resistance less than 5 ohms?

Yes	No
GO to FD13 .	REPAIR open in BPA circuit to PCM.

FD13 CHECK BPA DEACTIVATOR SWITCH

- Connect digital multimeter test probes to BPA switch terminals at the BPA switch.
- Apply brake pedal while monitoring reading.

Is the resistance less than 5 ohms with the brake pedal released and greater than 10,000 ohms with the brake pedal depressed?

Yes	No
REPAIR VPWR circuit to BPA switch.	REPLACE BPA deactivator switch.

FF: Power Steering Pressure (PSP) Switch Introduction

FF: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Power steering pressure (PSP) switch (3N824)
- Harness circuits: PSP and SIG RTN
- Powertrain control module (PCM) (12A650)

Pinpoint Test Schematics and Connectors

Focus, Escape

All Others

NOTE: THE PSP AND SIG RTN CIRCUITS MAY BE REVERSED IN THE HARNESS CONNECTOR. REFER TO THE WIRING DIAGRAM MANUAL FOR MORE INFORMATION.

A0009699

Shorting Bar for Harness Circuit without PSP Switch

A24595-A

FF: Pinpoint Tests →

FF: Power Steering Pressure (PSP) Switch

← FF: Introduction

FF1 DTC P1650: VERIFY ELECTRICAL FUNCTION

Note: If P1650 was received in Key On Engine Running Self-Test, verify that the steering wheel was turned at least one half turn within 20 seconds of starting test.

- Connect scan tool.
- Key on, engine running.
- Access PSP PID (PSP V PID for Taurus/Sable).
- Turn the steering wheel back and forth.

Does the PSP PID (or PSP V PID) indicate a change?

Yes	No
GO to <u>FF10</u> .	KEY OFF. GO to <u>FF2</u> .

FF2 CHECK FOR PSP SWITCH CYCLING

- Disconnect PSP switch or remove the shorting bar.
- Install a jumper wire across the PSP switch harness connector.
- Key on, engine off.
- Record the PID reading.
- Remove the jumper wire and record the PID reading.

Does the PSP PID change from high to low (or PSP V PID change from less than 1.0 volt to greater than 8 volts)?

Yes	No
REPLACE the PSP switch or shorting bar.	KEY OFF. GO to <u>FF3</u> .

FF3 CHECK PSP CIRCUIT FOR OPEN IN HARNESS

Note: Refer to the PCM connector pin numbers at the beginning of the pinpoint test.

- Disconnect PCM.
- Measure resistance of PSP circuit between PCM harness connector pin and PSP switch harness connector.
- Measure resistance of SIG RTN circuit between PCM harness connector pin and PSP switch harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
GO to <u>FF4</u> .	REPAIR open circuit.

FF4 CHECK PSP CIRCUIT FOR SHORT TO SIG RTN OR GROUND IN HARNESS

- Measure resistance between PSP signal and SIG RTN at PSP switch harness connector.
- Measure resistance between PSP signal at PSP switch harness connector and chassis ground.

Is either resistance less than 10,000 ohms?

Yes	No
REPAIR short circuit.	REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).

FF10 DTC P1651: CHECK PSP CIRCUITS FOR INTERMITTENT CONCERNS

Note: Be aware that P1651 could be set if the vehicle is towed with the engine running, or if a power steering hydraulic concern was present.

- Key on, engine off.
- Access PSP V PID.
- Check for open circuits while performing the following (a fault will be indicated by a sudden change in the PSP V PID):
 - Shake, wiggle, bend the PSP and SIG RTN circuits between the PSP switch and the PCM.
 - Lightly tap on the PSP switch (to simulate road shock).
- Disconnect PSP switch.
- Check PSP circuit for short to ground while performing the following (a fault will be indicated by a sudden change in the PSP V PID voltage):
 - Shake, wiggle, bend the PSP circuit between the PSP switch and the PCM.

Is a fault indicated?

Yes	No
KEY OFF. ISOLATE fault and REPAIR as necessary.	KEY OFF. RECONNECT PSP switch. Unable to duplicate or identify fault at this time. GO to <u>Z1</u> .

FH: Generator Load Input (GLI) Introduction

FH: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- GLI circuit
- Powertrain control module (PCM) (12A650)

Pinpoint Test Schematic

FH: Pinpoint Tests →

FH: Generator Load Input (GLI)

← FH: Introduction

FH1 P1244, P1245 OR P1246: CHECK IF ANY BATTERY OR CHARGING SYSTEM CONCERNS ARE PRESENT

- Check generator drive belt condition and tension.
- Verify that the battery is at proper charge.
- Verify that there are no symptoms associated with the charging system.

Does the battery and charging system appear OK?

Yes	No
GO to FH2 .	REFER to Battery and Charging, Section 414-00 in the Workshop Manual.

FH2 CHECK GENERATOR LOAD INPUT (GLI) CIRCUIT FOR SHORT TO POWER IN HARNESS

- Disconnect voltage regulator.
- Disconnect PCM.
- Key on.
- Measure voltage between PCM harness connector Pin 59 and ground.

Is voltage less than 1.0 volts?

Yes	No
KEY OFF. GO to FH3 .	REPAIR short circuit.

FH3 CHECK GLI CIRCUIT FOR SHORT TO GROUND

- Disconnect scan tool from DLC.
- Measure resistance between PCM harness connector Pin 59 and ground.

Is resistance greater than 10,000 ohms?

Yes	No
GO to FH4 .	REPAIR short circuit.

FH4 CHECK FOR OPEN GLI CIRCUIT

- Measure resistance of the GLI circuit between PCM harness connector Pin 59 and the voltage regulator harness connector.

Is resistance less than 5.0 ohms?

Yes	No
GO to <u>FH5</u> .	REPAIR open circuit.

FH5 CHECK PCM

- Reconnect PCM.
- Key on, engine off.
- Measure voltage between the GLI circuit at the voltage regulator harness connector and ground.

Is voltage greater than 2.0 volts?

Yes	No
REFER to Charging System-General Information, Section 414-00 in the Workshop Manual to verify operation of voltage regulator and generator.	REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).

H: Fuel Control Introduction

H: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- HO2S/Heater (9F472)
- Fuel Injector(s) (9F593)
- Vacuum Systems

- Harness Circuits: HO2S GND, HO2S, INJ 1-10, VPWR and SIG RTN
- Powertrain Control Module (PCM) (12A650)

H: Fuel Control

← H: Introduction

H20 PERFORM KOER SELF-TEST

- Key on, engine running and engine at operating temperature.
- Activate Key On, Engine Running (KOER) Self-Test.

Is DTC P1127, P1128 or P1129 present during KOER Self-Test?

Yes	No
GO to Section 4, Powertrain <u>Diagnostic Trouble Code (DTC) Charts</u> and SERVICE DTC P1127, P1128 or P1129.	GO to <u>H21</u> .

H21 DIAGNOSTIC TROUBLE CODE (DTC) P0133 AND P0153: HO2S RESPONSE TEST

DTC/HO2S Reference List:

DTC P0133 = HO2S-11

DTC P0153 = HO2S-21

- Key on, engine off.
- Select Generic OBD II Function from the menu and trigger.
- Press Continue.
- Select Diagnostic Monitoring Test Results from the menu and trigger.
- Scroll to Test ID: 01 trigger and press start.
- Key off. (REFER to Section 2 Diagnostic Monitoring Test Results.)

Is the indicated value greater than the minimum threshold?

Yes	No
COMPLETE PCM Reset to clear DTCs. COMPLETE HO2S Monitor Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>). GO to <u>H20</u> . If test results indicate a pass, testing is complete.	GO to <u>H23</u> .

H23 CHECK FOR UNMETERED AIR LEAKS

Fuel calculations can be affected by unmetered air leaks.

- Carefully inspect the following areas for potential air leaks:
 - Hoses connecting to MAF sensor assembly.
 - Hoses connecting to throttle body.
 - Intake manifold gasket leaks.
 - PCV disconnected.

- Vacuum lines disconnected.
- Improperly seated engine oil dipstick, tube, and oil fill cap.
- Exhaust leaks at flanges and gaskets.

Are any air leaks present?

Yes	No
REPAIR source of air leak. COMPLETE PCM Reset to clear DTCs. COMPLETE HO2S Monitor Drive Cycle (REFER to Section 2, Drive Cycles).	GO to H24 .

H24 CHECK HO2S CIRCUIT WIRING

Note: Refer to the PCM connector pin number in the beginning of this pinpoint test.

- Disconnect suspect HO2S.
- Check for water contamination.
- Jumper HO2S signal to VPWR at the HO2S harness connector.
- Key on, engine off.

Note: HO2S displayed as O2S on Scan Tool.

- Access the correct HO2S PID.

Is the voltage greater than 1.50 volts?

Yes	No
KEY OFF. REPLACE HO2S. CHANGE oil/filter. COMPLETE PCM Reset to clear DTCs. COMPLETE HO2S Monitor Drive Cycle (REFER to Section 2, Drive Cycles).	KEY OFF. REMOVE jumper wire. GO to H25 .

H25 DTCS P0141 AND P0161: HO2S HEATER CIRCUIT IS OPEN, CHECK HO2S SIGNAL AND SIGNAL RETURN CIRCUITS FOR OPEN IN HARNESS

Note: Refer to the PCM harness connector pin numbers in the beginning of this pinpoint test.

DTC/HO2S Reference List:

- DTC P0141 = HO2S HTR-12
- DTC P0161 = HO2S HTR-22

Note: On some applications, a vehicle hoist is required to access the HO2S harness.

- Visually inspect the HO2S circuit for exposed wiring, water contamination, corrosion and proper assembly.
- Measure resistance of HO2S SIG circuit between PCM harness connector pin and HO2S harness connector.
- Measure resistance of HO2S SIG RTN circuit between PCM harness connector pin and HO2S harness connector.

Is the resistance less than 5.0 ohms?

Yes	No
GO to H26 .	REPAIR open circuit. COMPLETE HO2S Monitor Drive Cycle (REFER to Section 2, Drive Cycles).

H26 CHECK HO2S CIRCUIT FOR SHORT TO VPWR IN HARNESS

- Measure resistance between the HO2S SIG and VPWR circuit at the PCM harness connector pin.

Is the resistance greater than 10,000 ohms?

Yes	No
GO to H27 .	GO to H28 .

H27 CHECK FOR SOURCE OF POTENTIAL HO2S CONTAMINATION

- Investigate the following items as potential sources of HO2S contamination:
 - Use of unapproved silicon sealers.
 - Fuel contaminated by silicon additives.
 - Excessive oil burning (i.e. rings, valve seals and oil overfill).
 - Glycol (antifreeze) leaking internally in the engine.
 - Lead contaminated fuel.
 - Short drive cycles in cold weather.
 - Use of unapproved cleaning agents.

Were any of the above conditions or concerns found during inspection?

Yes	No
REPAIR source of contamination. REPLACE HO2S and oil/filter. COMPLETE PCM Reset to clear DTCs. COMPLETE HO2S Monitor Drive Cycle (REFER to Section 2, Drive Cycles).	If diagnosing DTC P0141 or P0161, GO to H30 . All others: REPLACE PCM.

H28 VERIFY WIRING IS IN PROPER PIN LOCATION

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Measure resistance of the HO2S SIG circuit and HO2S Signal Return circuit between the PCM harness connector pin and the HO2S harness connector.

Is the resistance less than 5.0 ohms?

Yes	No
REPLACE HO2S.	REPAIR as necessary.

H30 DTCS P0135 AND P0155: HO2S HEATER CIRCUIT IS SHORTED TO GROUND, SHORTED TO VPWR OR EXCESSIVE CURRENT DRAW, LOW CURRENT DRAW

Note: Refer to the PCM harness connector pin numbers in the beginning of this pinpoint test.

DTC/HO2S Reference List:

- DTC P0135 = HO2S HTR-11
- DTC P0155 = HO2S HTR-21

Note: On some applications, a vehicle hoist is required to access the HO2S harness.

- Visually inspect the HO2S circuit for exposed wiring, water contamination, corrosion and proper assembly.

Were any concerns found during inspection?

Yes	No
REPAIR any concerns found during inspection.	GO to <u>H31</u> .

H31 PERFORM KEY ON ENGINE OFF (KOEO) SELF-TEST

- Key on, engine off.
- Perform KOEO Self-Test.

Is DTCs P0135, P0141, P0155 or P0161 present?

Yes	No
KEY OFF. GO to <u>H32</u> .	KEY OFF. GO to <u>H33</u> .

H32 CHECK VPWR VOLTAGE TO H02S HARNESS CONNECTOR

Note: If DTCs P0135 and P0155 or P0141 and P0161 are displayed, both heater circuits will require testing. DTCs displayed separately are to be tested individually.

- Disconnect the appropriate HO2S(s).
- Key on, engine off.
- Measure voltage between VPWR and SIG RTN circuits at the HO2S harness connector.

Is the voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to <u>H33</u> .	CHECK fuse in circuit. If fuse is OK, REPAIR open circuit. For no VPWR on vehicles equipped with 150 Pin PCM: GO to <u>B5</u> .

H33 CHECK HO2S HEATER CIRCUIT FOR SHORT TO VPWR AND GND

- Disconnect PCM.
- Measure resistance between the suspect HO2S HTR circuit and PWR GND circuit.
- Measure resistance between the suspect HO2S HTR circuit and SIG RTN circuit at the HO2S harness connector.
- Measure resistance between the suspect HO2S HTR circuit and VPWR circuit at the HO2S harness connector.

Is each resistance greater than 10,000 ohms?

Yes	No
GO to <u>H34</u> .	REPAIR shorted circuit.

H34 CHECK HO2S HTR CIRCUIT FOR OPEN IN HARNESS

- Measure resistance of the suspect HO2S HTR circuit between PCM harness connector pin and HO2S harness connector.

Is the resistance less than 5.0 ohms?

Yes	No
GO to <u>H35</u> .	REPAIR open or excessive resistance in the heater circuit in harness.

H35 CHECK HO2S HTR RESISTANCE

- Measure the resistance of the HO2S HTR to VPWR (refer to schematic at the beginning of this Pinpoint Test).

Is the resistance between 3 and 30 ohms?

Yes	No
GO to <u>H36</u> .	REPLACE HO2S.

H36 CHECK HO2S CASE FOR SHORT TO VPWR, HTR AND SIG RTN

- Measure resistance between HO2S HTR pin at HO2S connector and the HO2S case.
- Measure resistance between the HO2S HTR pin and the SIG RTN Pin at the HO2S sensor.
- Measure the resistance between the HO2S VPWR pin at the HO2S connector and the HO2S case.

Is the resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM.	REPLACE HO2S.

H40 DTCs P1131, P1132, P1151 AND P1152: UPSTREAM HO2S NOT SWITCHING. DTCs P1130 and P1150: FUEL SYSTEM NOT SWITCHING AT FUEL TRIM (RICH OR LEAN)

Note: It is necessary to address all Continuous Memory Ignition and Misfire DTCs, if received during Continuous Memory testing, before addressing any KOER HO2S DTCs.

DTC/HO2S Reference List:

- HO2S-11 = DTCs P1131, P1132 and P1130
- HO2S-21 = DTCs P1151, P1152 and P1150
- Check intake air system for leaks, obstructions and damage.
- Check air cleaner element, air cleaner housing for blockage.
- Verify integrity of the PCV system.
- Check for vacuum leaks.

Were any concerns found during inspection?

Yes	No
REPAIR as necessary.	GO to <u>DC25</u> .

H41 DTCs P0171, P0172, P0174 AND P0175: FUEL SYSTEM AT THE CORRECTED FUEL TRIM

Note: It is necessary to address all Continuous Memory Ignition and Misfire DTCs, if received during Continuous Memory testing, before addressing any Fuel Trim DTCs.

Fuel System DTC Reference List:

- Bank 1 = DTCs P0171 (lean) and P0172 (rich)
- Bank 2 = DTCs P0174 (lean) and P0175 (rich)
- Check intake air system for leaks, obstructions and damage.
- Check air cleaner element, air cleaner housing for blockage.
- Verify integrity of the PCV system.
- Check fuel delivery system and filter for restriction.
- Check for vacuum leaks.

Were any concerns found during inspection?

Yes	No
REPAIR as necessary. COMPLETE KAM Reset.	GO to <u>DC25</u> .

H42 PERFORM KOER SELF-TEST

- Disconnect fuel vapor hose from intake manifold and plug fitting at intake manifold.
- Start engine and run at 2000 rpm for 5 minutes and return to idle.
- Complete Key On Engine Running (KOER) Self-Test.

Are any HO2S DTCs P1127, P1128, P1129, P1131, P1132, P1151 or P1152 present?

Yes	No
<p>KEY OFF. If DTC P1127, P1128 or P1129 is present, GO to Section 4, Powertrain <u>Diagnostic Trouble Code (DTC) Charts</u> and REPAIR those DTCs first.</p> <p>DTCs (P1131, P1130) or (P1151, P1150):</p> <p>GO to <u>H43</u>.</p> <p>DTCs (P1132, P1130) or (P1152, P1150):</p> <p>GO to <u>H49</u>.</p>	<p>KEY OFF. For Continuous Memory DTCs Only P1130, P1150, P0171, P0174, P0172 and P0175:</p> <p>GO to <u>H52</u>.</p> <p>If DTC(s) P1132 and/or P1152 are no longer present, RECONNECT fuel vapor line.</p> <p>Vehicles experiencing KOER DTC 1131, 1132, 1151 or 1152: REFER to Evaporative Emissions, Section 303-13 in the Workshop Manual for system leakage.</p> <p>All others without recurring DTCs:</p> <p>Unable to duplicate or identify fault at this time. GO to <u>Z1</u>.</p>

H43 HO2S CIRCUIT TEST (WITH LEAN DTCs)

- Disconnect the HO2S related to the DTC.
- Key on, engine off.
- Access the correct HO2S PID.

Note: If arcing occurs (indicating a short), remove jumper and GO to H47 (check fuse in the heater circuit).

- Jumper the HO2S SIG circuit to the VPWR circuit at the HO2S vehicle harness connector.

Is the reading 1.30 volts or greater?

Yes	No
KEY OFF. CHECK SIG RTN circuit. GO to <u>H44</u> .	KEY OFF. GO to <u>H46</u> .

H44 CHECK SIGNAL RETURN CIRCUIT FOR OPEN

- Measure resistance of HO2S SIG RTN circuit between the HO2S harness connector and the battery negative post.

Is the resistance reading less than 5.0 ohms?

Yes	No
GO to <u>H52</u> .	GO to <u>H45</u> .

H45 CHECK HO2S SIGNAL RETURN CIRCUIT FOR OPEN IN HARNESS

- Disconnect PCM.
- Measure resistance of HO2S SIG RTN circuit between the PCM harness connector pin and

HO2S harness connector.

Is the resistance reading less than 5.0 ohms?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPAIR open circuit.

H46 CHECK HO2S SIGNAL AND HO2S GND CIRCUITS FOR OPEN IN HARNESS

- Disconnect PCM.
- Measure resistance of HO2S SIG circuit between PCM harness connector pin and the HO2S harness connector.

Is the resistance reading less than 5.0 ohms?

Yes	No
GO to <u>H47</u> .	REPAIR open circuit.

H47 CHECK HO2S SIGNAL CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect PCM.
- Measure resistance between the HO2S SIG and PWR GND circuits; and the HO2S SIG and SIG RTN circuits at the PCM harness connector.

Is each resistance greater than 10,000 ohms?

Yes	No
GO to <u>H48</u> .	REPAIR short circuit.

H48 CHECK HO2S SIGNAL CIRCUIT FOR SHORT TO GROUND

- Disconnect PCM.
- Reconnect HO2S.
- Measure resistance between HO2S SIG and PWR GND circuits and HO2S SIG and SIG RTN circuits at the PCM harness connector.

Is each resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPLACE HO2S.

H49 HO2S CIRCUIT CHECK (FOR RICH DTCS)

- Disconnect the HO2S related to the DTC received.

- Key on.
- Access the correct HO2S PID(s).

Is the reading 0.2 volt or less?

Yes	No
KEY OFF. GO to <u>H51</u> .	KEY OFF. GO to <u>H50</u> .

H50 CHECK HO2S CIRCUIT FOR SHORT TO VPWR AND HO2S HEATER GROUND IN HARNESS

- Disconnect PCM.
- Measure resistance between the HO2S SIG and VPWR circuits; and HO2S Signal and HO2S HTR circuits at the PCM harness connector.

Is each resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPAIR short circuit.

H51 CHECK HO2S SIGNAL FOR SHORT TO HO2S HEATER CIRCUIT IN THE SENSOR

- Suspect HO2S sensor disconnected.
- Measure resistance between the HO2S SIG and HO2S HTR circuits at the HO2S connector.

Is the resistance greater than 10,000 ohms?

Yes	No
KEY OFF. GO to <u>H52</u> .	KEY OFF. REPLACE HO2S.

H52 CHECK FUEL PRESSURE

WARNING: THE FUEL SYSTEM IS PRESSURIZED WHEN THE ENGINE IS NOT RUNNING. TO PREVENT INJURY OR FIRE, USE CAUTION WHEN WORKING ON THE FUEL SYSTEM. BECOME FAMILIAR WITH THE WARNING CAUTION AND NOTE IN PINPOINT TEST HC BEFORE SERVICING.

- Connect battery charger.
- Install fuel pressure gauge.
- Key on, engine off.
- Access Output Test Mode and run the fuel pump to obtain maximum fuel pressure.
- NOTE: The fuel pump will only operate for approximately 8 seconds when Output Test Mode is selected and activated. (GO to Pinpoint Test HC to refer to the Fuel Delivery System Test Information Chart.)

Is the fuel pressure within range for the vehicle being diagnosed?

--	--

Yes	No
KEY OFF. GO to <u>H53</u> .	KEY OFF. GO to <u>HC1</u> .

H53 CHECK FUEL SYSTEM FOR PRESSURE STABILITY – FAST LEAKDOWN

- Cycle key on and off several times.
- Key on and Engine off, monitor fuel pressure gauge.

Does the fuel pressure remain within 34 kPa (5 psi) of the highest reading after 10 seconds?

Yes	No
GO to <u>H54</u> .	Check fuel system for external leaks. If external leak is detected: GO to <u>HC1</u> . If no external leak is detected: GO to <u>H55</u> .

H54 CHECK FUEL SYSTEM FOR PRESSURE STABILITY – SLOW LEAKDOWN

- Cycle key on then off several times.
- Key on and engine off, monitor fuel pressure gauge.

Does the fuel pressure remain within 34 kPa (5 psi) of the highest reading after one minute?

Yes	No
For HO2S DTCs displayed with Misfire DTCs: GO to <u>H56</u> . All other DTCs: GO to <u>H59</u>	GO to <u>HC6</u>

H55 CHECK INJECTOR FAULT PIDS AND ASSOCIATED DTCS

- Access INJ1F-INJ10F PIDs.

Note: If misfire DTCs are present, access only injector fault PIDs corresponding to misfire DTCs.

Is DTC P0201 through P0212 or an injector(s) fault present?

Yes	No
GO to <u>H56</u> .	For DTCs P0300 through P0310: GO to <u>HD12</u> . For all other DTCs: GO to <u>H59</u> .

H56 CHECK FUEL INJECTOR(S) AND HARNESS RESISTANCE

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

Note: This erases Continuous Memory DTCs.

- Disconnected PCM.

Note: Use the injector fault PID to determine the fuel injector circuit(s) requiring testing.

- Measure resistance between suspect fuel injector and VPWR circuits at the PCM harness connector.

Is the resistance between 11.0-18.0 ohms?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	GO to <u>H57</u> .

H57 CHECK FUEL INJECTOR HARNESS RESISTANCE

- Disconnect fuel injector harness connector at the suspect fuel injector.
- Measure resistance of VPWR circuit between PCM harness connector pin and the fuel injector harness connector.
- Measure resistance of fuel injector circuit between PCM harness connector pin and the fuel injector harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
GO to <u>H58</u> .	REPAIR open harness circuit.

H58 CHECK FUEL INJECTOR HARNESS CIRCUIT FOR SHORT TO POWER AND GROUND

- Disconnect PCM.
- Suspect fuel injector disconnected.
- Measure resistance between fuel injector SIG and VPWR circuits; and between fuel injector SIG and PWR GND circuits at the PCM harness connector.

Is each resistance greater than 10,000 ohms?

Yes	No
GO to <u>H59</u> .	REPAIR short circuit.

H59 FLOW TEST FUEL INJECTOR(S)

- Use the Rotunda Injector Tester or equivalent to flow test the fuel injectors according to the

instructions for the fuel injector tester.

Is the leakage and flow within specification?

Yes	No
<p>DTC P0171 and P0174: GO to <u>H61</u> .</p> <p>DTC P0172 and P0175: Unable to duplicate or identify fault at this time. GO to <u>Z1</u> .</p> <p>For DTC P1130 and P1150: GO to <u>H61</u> .</p> <p>For DTC P1131 and P1151: GO to <u>H60</u> .</p> <p>For DTC P1132 and P1152: GO to <u>H64</u> .</p>	<p>REPLACE fuel injector.</p>

H60 CHECK FOR SECONDARY AIR INTRUSION

Note: If the vehicle is not equipped with Secondary Air Injection System,GO to H61 .

An HO2S always lean condition can be caused by:

- Leak in hoses from secondary air injection pump to engine.
- Secondary Air diverted upstream of HO2S.
- Disconnect secondary air injection hose(s) from engine and plug engine side of secondary air injection system.
- Key on, engine running and at operating temperature.
- Activate Key On, Engine Running (KOER) Self-Test.

Is DTC P1131 or P1151 present?

Yes	No
<p>GO to <u>H61</u> .</p>	<p>Cause of DTC(s) is in the Secondary Air Injection System. GO to <u>HM7</u> for Secondary Air Injection System diagnostics.</p>

H61 INSPECT INDUCTION SYSTEM FOR AIR LEAKS

- Inspect the following areas for signs of air leaks:
 - Inlet tube(s) from air cleaner to the throttle body.
 - Gaskets which seal the upper and lower intake manifold.
 - Vacuum hoses and lines for cracks and proper connections.
 - PCV system.

Are there any signs of leaks or damage?

Yes	No
REPAIR as necessary.	<p>CONTINUOUS DTCs P0171, P0174, P1130 or P1150:</p> <p>Unable to duplicate or identify fault at this time. GO to <u>Z1</u>.</p> <p>DTCs P1131 and P1130 or P1151 and P1150:</p> <p>GO to <u>H62</u>.</p>

H62 CHECK CYLINDER COMPRESSION

Note: Use the Misfire DTC(s) displayed on prior DTC retrieval to determine which cylinder's compression to check.

- Check cylinder compression. Refer to Engine, Section 303-00, 303-01 in the Workshop Manual.

Are cylinder compression readings within specification?

Yes	No
<p>For DTCs P1131, P1130, P1151 and P1150:</p> <p>GO to <u>H63</u>.</p> <p>For DTCs P1132 and P1152:</p> <p>GO to <u>H64</u>.</p> <p>Misfire DTCs displayed with fuel control DTCs:</p> <p>GO to <u>HD20</u>.</p>	REPAIR as necessary.

H63 CHECK HO2S'S ABILITY TO GENERATE A VOLTAGE GREATER THAN 0.5 VOLT

Any vacuum or air leaks can cause DTCs P1131, P1130, P1151 and P1150.

Possible causes:

- Water contamination in connector.
 - Leaking vacuum actuators.
 - Engine sealing (Intake and IAC).
 - EGR system (valve).
 - PCV system (hose and valve).
 - Unmetered air leaks between throttle body and mass air flow (MAF) sensor assembly.
- Inspect HO2S harness for chafing, burned wires or other damage and repair as necessary.
- Unplug the suspect HO2S.
- Connect digital multimeter to the HO2S Signal and HO2S SIG RTN or HO2S GND at the HO2S sensor connector.

- Run engine at 2000 rpm for three minutes.
- Rerun KOER Self-Test and monitor HO2S voltage.

Is the voltage greater than 0.5 volt during or at the end of Self-Test?

Yes	No
KEY OFF. GO to H70 .	KEY OFF. REPLACE HO2S.

H64 ATTEMPT TO GENERATE DTC P1131 OR P1151

- HO2S disconnected.
- Jumper HO2S Signal at the HO2S harness vehicle connector to the battery negative post.
- Activate Key On Engine Running (KOER) Self-Test.

Is DTC P1131 or P1151 present?

Yes	No
KEY OFF. REMOVE jumper. GO to H65 .	KEY OFF. REMOVE jumper. RECONNECT HO2S. DISCONNECT PCM. INSPECT both ends of connector for damaged or pushed out pins, moisture, corrosion, loose pins and REPAIR as necessary. If OK, REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).

H65 HO2S SENSOR VOLTAGE CHECK

- HO2S disconnected.
- Connect digital multimeter to HO2S SIG circuit and HO2S SIG RTN at the HO2S sensor connector.
- Disconnect vacuum hose from vacuum tree.
- Start engine and run at 2000 rpm.

Does the voltage reading indicate less than 0.4 volt within 30 seconds?

Yes	No
KEY OFF. RECONNECT vacuum hose and HO2S. GO to H70 .	KEY OFF. REPLACE HO2S. PERFORM KOER SELF-TEST. If DTCs P1132 or P1152 still exist, REPLACE PCM (refer to Section 2, Flash EEPROM).

H70 MONITOR HO2S (PID) FOR PROPER SWITCHING WHILE PERFORMING WIGGLE TEST

- Key on, engine running.
- Engine at operating temperature.

Note: HO2S displayed as O2S on Scan Tool.

- Monitor suspect HO2S PID.
- Wiggle, bend and shake small sections of the Electronic Engine Control harness from the PCM to the HO2S.

Did the HO2S voltage stay high (greater than 0.45 volt) or low (less than 0.45 volt)?

Yes	No
KEY OFF. ISOLATE area of harness concern causing lack of HO2S switches and repair.	KEY OFF. GO to <u>H71</u> .

H71 TEST DRIVE WHILE MONITORING HO2S PID FOR SWITCHING

Note: This test step requires an observer to monitor HO2S PID.

- Access HO2S PID.
- While observer views PID, test drive vehicle under different road conditions in an attempt to simulate the original fault.

Does the HO2S switch?

Yes	No
KEY OFF. UNABLE to duplicate fault. Testing complete at this time.	KEY OFF. REPLACE HO2S.

H80 DTC P0136 AND P0156 MONITOR DOWNSTREAM HO2S OUTPUT VOLTAGE FOR ACTIVITY. DTCs P1137, P1138, P1157 AND/OR P1158 INDICATE LACK OF HO2S SWITCHING

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

Note: It is necessary to address all Continuous Memory Ignition and Misfire DTCs, if received during Continuous Memory testing, before addressing any KOER HO2S DTCs.

- DTC P0136, P1137 and P1138=HO2S-12
- DTC P0156, P1157 and P1158=HO2S-22
- Visually inspect for:
 - pinched, shorted and corroded wiring and pins
 - crossed sensor wires
 - exhaust leaks
 - contaminated or damaged sensor

Were any concerns found during inspection?

Yes	No
REPAIR as necessary.	<p>Continuous Memory DTC P0136 and P0156:</p> <p>GO to <u>H81</u>.</p> <p>All others:</p> <p>GO to <u>H82</u>.</p>

H81 CHECK FOR KOER DTCS P1137, P1157, P1138 AND P1158

- Key on.
- Engine at 2000 rpm for 3 minutes.
- Activate KOER Self-Test.
- Check for DTCs.

Is DTC P1137, P1138, P1157 or P1158 present?

Yes	No
KEY OFF. GO to H82 .	KEY OFF. For DTC P0136 and P0156: Unable to duplicate or identify at this time. GO to Z1 .

H82 CHECK EXHAUST SYSTEM FOR LEAKS

Note: Any exhaust leaks between the engine and the end of the catalyst can cause DTC P0136 and P0156.

- Place vehicle on a hoist, transmission in PARK, emergency brake applied, raise vehicle.
- Inspect the following:
 - Exhaust flanges for leaks.
 - HO2S torque.
 - Check for punctures and cracks in catalyst and pipes leading to them.

Is an exhaust leak present?

Yes	No
REPAIR as necessary.	GO to H83 .

H83 CHECK HO2S HARNESS CIRCUIT FOR SHORT TO VPWR AND GROUND

- Disconnect PCM.
- Disconnect suspect HO2S.
- Measure resistance between HO2S SIG and SIG RTN circuits at the PCM harness connector.
- Measure resistance between HO2S SIG circuit and VPWR and VREF circuits at the PCM harness connector.
- Measure resistance between HO2S SIG circuit and PWR GND circuit at the PCM harness connector.

Is the resistance greater than 10,000 ohms?

Yes	No
GO to H84 .	REPAIR short in harness.

H84 CHECK HO2S SIGNAL CIRCUIT AND HO2S SIGNAL RETURN CIRCUITS FOR OPEN IN HARNESS

- Measure resistance of VPWR circuit between the PCM harness connector pin and the HO2S harness connector.
- Measure resistance of HO2S SIG circuit between the PCM harness connector pin and the HO2S harness connector.
- Measure resistance of SIG RTN circuit between the PCM harness connector pin and HO2S SIG RTN vehicle harness connector.

Is the resistance reading less than 5.0 ohms?

Yes	No
GO to H85 .	REPAIR open circuit.

H85 CHECK HO2S CIRCUIT VOLTAGE

- Connect PCM.
- Suspect HO2S connected to harness.
- Key on, engine off.

Note: HO2S displayed as O2S on Scan Tool.

- Access the correct HO2S PID.

Is the voltage greater than 1.5 volts?

Yes	No
KEY OFF. GO to H88 .	KEY OFF. GO to H86 .

H86 CHECK HO2S GROUND CIRCUIT IN THE PCM

- Disconnect PCM.
- Measure resistance between SIG RTN and PWR GND circuits at the PCM connector.

Is the resistance reading less than 5.0 ohms?

Yes	No
GO to H87 .	REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).

H87 HO2S CIRCUIT CHECK

- PCM connected.
- Suspect HO2S disconnected.
- Jumper VPWR to HO2S SIG circuit at the HO2S harness connector.
- Key on.
- Access HO2S PID.

Is the PID value greater than 1.5 volts?

Yes	No

REPLACE HO2S.

REPLACE PCM (refer to Section 2, [Flash Electrically Erasable Programmable Read Only Memory \(EEPROM\)](#)).

H88 CHECK FOR OVER VOLTAGE ON THE HO2S CIRCUIT IN THE PCM

- Key on.
- HO2S disconnected.
- Measure voltage between SIG RTN circuit at the HO2S harness connector and battery negative post.
- Measure voltage between HO2S SIG circuit at the HO2S harness connector and battery negative post.

Are either voltage readings greater than 1.5 volts?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPLACE HO2S.

H100 KOER DTC P1127

- Key on, engine on.
- Access all HO2S heaters and HO2S heater monitor PIDs.

Do all PIDs switch or indicate ON?

Yes	No
Engine still operating. PERFORM KOER Self-Test.	Operate the engine until all PIDs indicate on. PERFORM KOER Self-Test.

H110 DTCS P1128 AND P1129 KOER

Note: Refer to the PCM harness connector pin numbers in the beginning of this pinpoint test.

- P1128 refer to the upstream HO2S.
- P1129 refer to the downstream HO2S.
- Visually inspect vehicle HO2S harness connector(s) for any indication of being crossed (stretched wires, wire harnesses not mounted properly).

Are there crossed connections or wires?

Yes	No
REPAIR as necessary.	GO to H111 .

H111 VERIFY PROPER HO2S SIGNAL PIN LOCATION

- PCM disconnected.

- Disconnect both of the suspect HO2S sensors from the vehicle harness connector.
 - P1128 = HO2S 11/21 Upstream
 - P1129 = HO2S 12/22 Downstream
- Measure resistance of HO2S signal circuits between PCM harness connector pins and HO2S harness connector.

Is the resistance less than 5.0 ohms?

Yes	No
Unable to duplicate or identify at this time. GO to <u>Z1</u> .	CONNECT HO2S connector to proper HO2S signal pins in the PCM harness connector or HO2S harness connectors. RERUN Quick Test.

HA: Natural Gas Fuel Control Introduction

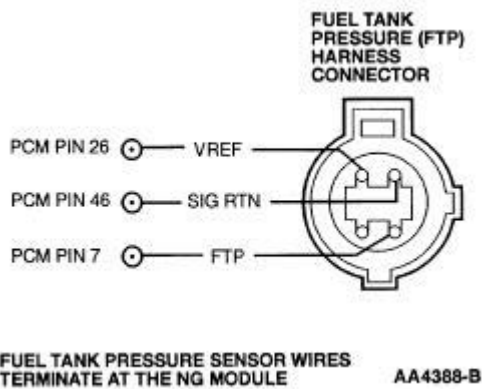

HA: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- HO2S/HTR (Heater) (9F472)
- HO2S Connections
- Vacuum Systems
- Fuel Injector(s) (9F593)
- Harness Circuits: HO2S GND, HO2S, INJ 1-8, VPWR and SIG RTN
- Powertrain Control Module (PCM) (12A650)
- Natural Gas Module (NG) (9F954)

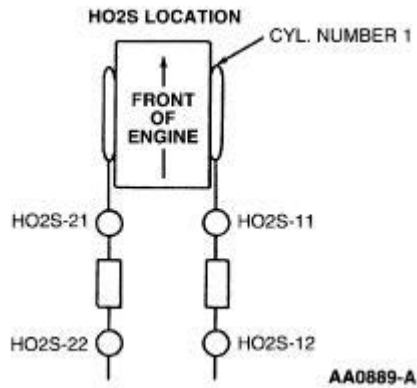

Pinpoint Test Schematic and Connectors

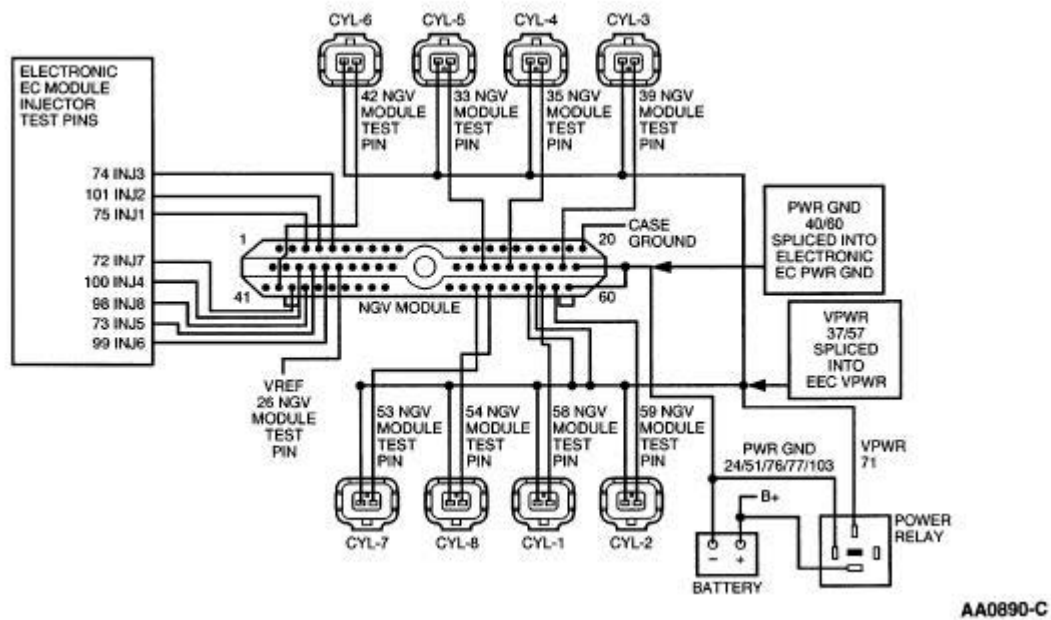

HO2S CONNECTOR PIN ASSIGNMENT

Signal	Pin	HO2S HTR Ground	Pin	HTR VPWR	Pin	HO2S SIG RTN	Pin
HO2S-11	60	HO2S HTR-11 (GND)	93	VPWR	71	SIG RTN	91

HO2S-12	35	HO2S HTR-12 (GND)	95	VPWR	71	SIG RTN	91
HO2S-21	87	HO2S HTR-21 (GND)	94	VPWR	71	SIG RTN	91
HO2S-22	61	HO2S HTR-22 (GND)	96	VPWR	71	SIG RTN	91

NGV Module 60 Pin Connector

HA: Pinpoint Tests →

HA: Natural Gas Fuel Control

← HA: Introduction

HA30 DTCS P0135, P0141, P0155 AND P0161: HO2S HTR SIGNAL CIRCUIT IS OPEN, SHORTED TO GROUND, SHORTED TO VPWR OR EXCESSIVE CURRENT DRAW

DTC/HO2S Reference List

DTC P0135 = HO2S HTR-11

DTC P0141 = HO2S HTR-12

DTC P0155 = HO2S HTR-21

DTC P0161 = HO2S HTR-22

Note: On some applications, a vehicle hoist is required to access the HO2S harness.

- Visually inspect the HO2S circuit for exposed wiring, contamination, corrosion and proper installation.

Were any concerns found during the visual inspection?

Yes	No
REPAIR any concerns found in the visual inspection.	GO to HA31 .

HA31 PERFORM KEY ON ENGINE OFF (KOEO) SELF-TEST

- Key on.
- Engine at 2000 rpm for 1 minute.
- Key off.
- Key on, engine off.
- Perform KOEO Self-Test.

Are DTCS P0135, P0141, P0155 and/or P0161 present?

Yes	No
KEY OFF. GO to HA32 .	KEY OFF. Unable to duplicate or identify fault at this time. GO to Z1 .

HA32 CHECK VPWR VOLTAGE TO HO2S HARNESS CONNECTOR

Note: If DTCS P0135 and P0155 or P0141 and P0161 are displayed, both heater circuits will require testing. DTCS displayed separately are tested individually.

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect the appropriate HO2S(s).

- Key on, engine off.
- Measure voltage between VPWR and SIG RTN circuits at the HO2S harness connector.

Is the voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to HA34 .	KEY OFF. GO to HA33 .

HA33 CHECK VPWR CIRCUIT FOR OPEN IN HARNESS

- Disconnect PCM.
- Measure resistance of VPWR circuit between PCM harness connector pin and HO2S harness connector.

Is the resistance less than 5.0 ohms?

Yes	No
GO to HA34 .	CHECK fuse in circuit. If fuse is OK, REPAIR open circuit.

HA34 CHECK HO2S HEATER RESISTANCE

- Measure the resistance of the HO2S HTR.

Is the resistance between 3 and 30 ohms?

Yes	No
GO to HA35 .	REPLACE HO2S.

HA35 CHECK HO2S CASE FOR SHORT TO VPWR AND HTR GND

- Measure resistance between the HO2S HTR GND at the HO2S sensor connector and the HO2S sensor case.
- Measure resistance between the HO2S VPWR at the HO2S sensor connector and the HO2S sensor case.

Is the resistance greater than 10,000 ohms?

Yes	No
GO to HA36 .	REPLACE HO2S.

HA36 CHECK FOR SHORTS TO OTHER GROUNDS AND VPWR IN THE HO2S HTR GROUND HARNESS CIRCUITS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Measure resistance between the suspect HO2S HTR circuit and PWR GND, SIG RTN and VPWR circuits at the HO2S harness connector.

Is the resistance greater than 10,000 ohms?

Yes	No
GO to HA37 .	REPAIR shorted circuit.

HA37 CHECK HO2S HTR GROUND FOR OPEN IN HARNESS

- Measure resistance of the suspect HO2S HTR circuit between PCM harness connector pin and HO2S harness connector.

Is the resistance less than 5.0 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR open or excessive resistance in the heater circuit in harness.

HA40 DTC P1131, P1151, P1132 AND P1152: UPSTREAM HO2S(S) NOT SWITCHING. DTCs P1130 AND P1150: FUEL SYSTEM NOT SWITCHING AT THE FUEL TRIM (RICH OR LEAN)

HO2S DTCs Reference list

- HO2S-11 = DTCs P1131, P1132 and P1130
- HO2S-21 = DTCs P1151, P1152 and P1150
- Check intake air system for leaks, obstructions, damage and blockage.
- Verify integrity of the PCV system.
- Check for disconnected spark plug wires.
- Check for vacuum leaks.

Are any of the above concerns present?

Yes	No
REPAIR as necessary.	GO to DC25 .

HA41 DTCs P0171, P0172, P0174 AND P0175: FUEL SYSTEM AT THE CORRECTED FUEL TRIM

Fuel System DTC Reference list:

- BANK 1 = DTCs P0171 (lean) and P0172 (rich)
- BANK 2 = DTCs P0174 (lean) and P0175 (rich)
- Check intake air system for leaks, obstructions and damage.
- Check air cleaner element, air cleaner housing for blockage.
- Verify fuel level.
- Verify integrity of the PCV system.
- Check for disconnected spark plug wires.
- Check for vacuum leaks.
- Verify customer did not run out of fuel.

Are any of the above concerns present?

Yes	No
REPAIR as necessary.	GO to <u>DC25</u> .

HA42 PERFORM KOER SELF-TEST

- Enter Key On Engine Running (KOER) Self-Test.

Are HO2S DTCs P1131, P1132, P1151 or P1152 present?

Yes	No
KEY OFF. GO to <u>HA43</u> .	<p>KEY OFF. For continuous DTCs P1130, P1150 P0171, P0174, P0172 and P0175:</p> <p>GO to <u>HA43</u>.</p> <p>All others:</p> <p>Unable to duplicate or identify fault at this time. GO to <u>Z1</u>.</p>

HA43 CHECK FUEL PRESSURE

WARNING: THE FUEL SYSTEM IS PRESSURIZED WHEN THE ENGINE IS NOT RUNNING. TO PREVENT INJURY OR FIRE, USE CAUTION WHEN WORKING ON THE FUEL SYSTEM. BECOME FAMILIAR WITH THE WARNING, CAUTION AND NOTE IN PINPOINT TEST HB BEFORE SERVICING.

Note: Fuel rail pressure gauge is part of the NG Special Rotunda Tool Kit 134-00114. Not all Natural Gas vehicles are equipped with a FRP sensor. On vehicles without a FRP sensor, use the values supplied by the fuel rail pressure gauge.

- NG fuel pressure gauge connected at the fuel rail Schrader valve.
- Access FRP PID (if available) and monitor the fuel pressure.
- Key on, engine off. Record pressure readings.
- Key on, engine on. Record pressure readings.
- Increase engine speed to 2500 rpm and maintain for one minute. Record pressure reading.

Are the fuel pressure readings between 552 or 827 kPa (80-120 psi)?

Yes	No
KEY OFF. GO to <u>HA44</u> .	KEY OFF. GO to <u>HB1</u> .

HA44 CHECK FUEL SYSTEM FOR PRESSURE STABILITY

- Cycle key on and off twice.
- Verify there are no external leaks (service as necessary).

Does the fuel pressure remain within 69 kPa (10 psi) of the highest reading after two minutes?

--	--

Yes	No
For DTCs P1130, P1150, P0171, P0172, P0174 and P0175: GO to HA45 . For No Starts: GO to HA45 . All other DTCs: GO to HA62 .	GO to HB1 .

HA45 CHECK FUEL SYSTEM FOR PRESSURE STABILITY WITH KEY ON

- Access FRP PID, if available, to monitor the fuel pressure. If FRP PID is not available, connect NG Special Rotunda Tool Kit 134-00114, or equivalent to monitor fuel pressure.
- Key On, Engine Off. Monitor the fuel pressure.

Does the fuel pressure remain within 69 kPa (10 psi) of the highest reading after 10 seconds?

Yes	No
For No Starts: GO to HA46 . For DTCs P1130, P1150, P0171 and P0174: GO to HA55 .	For DTCs P0172 and P0175: GO to HA56 .

HA46 CHECK FUEL INJECTOR(S) ABILITY TO DELIVER FUEL

- Access FRP PID, if available, to monitor the fuel pressure. If FRP PID is not available, connect NG Special Rotunda Tool Kit 134-00114, or equivalent to monitor fuel pressure.
- Cycle key twice.
- Locate and disconnect the inertia fuel shutoff (IFS) switch.
- Crank the engine for ten seconds and monitor the fuel pressure reading.

Was there a pressure drop greater than 34 kPa (20 psi)?

Yes	No
The Electronic Engine Control System is not the cause of the no start. GO to Section 3 , Symptom Chart, for further diagnosis.	GO to HA47 .

HA47 CHECK VREF VOLTAGE AT NATURAL GAS (NG) VEHICLE MODULE

- Disconnect PCM.
- NG Module connected.
- Key on, engine off.

- Measure the voltage between VREF and SIG RTN circuits at the NG module harness connector.

Is the voltage reading between 4.0 and 6.0 volts?

Yes	No
KEY OFF. For NO START: GO to HA48 . All others: GO to HA57 .	KEY OFF. GO to HA50 .

HA48 CHECK FOR OPEN IN POWER GROUND CIRCUITS

- NG Module disconnected.
- Measure resistance of PWR GND circuit between NG module harness connector pin and battery negative post.

Is the resistance less than 5.0 ohms?

Yes	No
GO to HA49 .	REPAIR open circuit.

HA49 CHECK FOR OPEN IN POWER GROUND CIRCUIT IN NG MODULE

- NG Module disconnected.
- Measure the resistance between PWR GND and SIG RTN circuits at the NG Module connector.

Is the resistance less than 5.0 ohms?

Yes	No
For NO START: GO to HA57 . All others: RECONNECT PCM, NG Module, and GO to A6 .	REPLACE NG Module.

HA50 IS VREF GREATER THAN 6.0 VOLTS

Is the VREF reading greater than 6.0 volts from the previous test step?

Yes	No
GO to HA55 .	GO to HA51 .

HA51 CHECK BATTERY VOLTAGE

- Measure the voltage across the battery terminals.

Is the voltage reading greater than 10.5 volts?

Yes	No
GO to HA52 .	REFER to the Charging System—General Information Section 414-00 in the Workshop Manual.

HA52 CHECK VPWR AT NG MODULE

- Key on.
- Measure the voltage between VPWR and PWR GND circuits at the NG module harness connector.

Is the voltage reading greater than 10.5 volts?

Yes	No
GO to HA54 .	GO to HA53 .

HA53 CHECK VOLTAGE BETWEEN VPWR AT THE NG MODULE AND BATTERY GROUND

- Key on.
- Measure the voltage between VPWR circuit at the NG module harness connector and battery ground.

Is the voltage reading greater than 10.5 volts?

Yes	No
REPAIR open ground.	REPAIR open power circuit.

HA54 CHECK VREF VOLTAGE TO THE FUEL TANK PRESSURE SENSOR

- Locate fuel tank pressure sensor at the rear of the vehicle and disconnect (On the Crown Victoria, the fuel tank pressure sensor is located under the vent box cover of the upper tank assembly).
- Key on, engine off.
- Measure voltage between the VREF circuit and SIG RTN circuit at the fuel tank pressure sensor harness connector (refer to schematic at the beginning of this Pinpoint Test for pin location).

Is the voltage reading between 4.0 and 6.0 volts?

Yes	No
KEY OFF. REPLACE Fuel Tank Pressure sensor. REFER to Fuel Tank and Lines—Natural Gas, Section 310-01B in the Workshop Manual.	KEY OFF. GO to HA56 .

HA55 CHECK VREF CIRCUIT FOR SHORT TO POWER IN HARNESS

- Fuel tank pressure sensor disconnected.
- Disconnect NG module.
- Key on.
- Measure voltage between the VREF and PWR GND circuits at the NG module harness connector.

Is the voltage reading less than 1.0 volt?

Yes	No
REPLACE NG module.	REPAIR short to power.

HA56 CHECK VREF CIRCUIT FOR SHORTED TO PWR GND

Note: Refer to the NG module pin numbers at the beginning of this pinpoint test.

- NG module disconnected.
- Measure resistance between VREF circuit and the SIG RTN, PWR GND and CASE GND circuits at the NG module harness connector.

Is the resistance greater than 10,000 ohms?

Yes	No
REPLACE NG module.	REPAIR short to ground.

HA57 CHECK FUEL INJECTOR(S) AND HARNESS RESISTANCE FROM THE NATURAL GAS (NG) MODULE TO THE FUEL INJECTOR(S)

- NG module disconnected.
- Measure resistance between suspect fuel injector circuit Pin(s) and VPWR pins 37/57 at the NG module harness connector (use chart for injector pin location).

Cylinder Number	NG Module	Cylinder Number	NG Module
1	58	5	33
2	59	6	42
3	39	7	53
4	35	8	54

Is the resistance between 3.0 and 6.0 ohms?

Yes	No
For No Start and DTCs: GO to HA60 .	GO to HA58 .

HA58 CHECK FUEL INJECTOR(S) HARNESS RESISTANCE BETWEEN NG MODULE AND FUEL INJECTOR

- Measure resistance of injector circuits between the NG module harness connector Pins and the

fuel injector(s) harness connector (use chart from Test Step **HA57** for fuel injector pin location).

- Measure resistance between the NG module harness connector VPWR Pins 37/57 and VPWR circuit at the fuel injector harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
GO to HA59 .	REPAIR open circuit.

HA59 CHECK FUEL INJECTOR HARNESS CIRCUIT FOR SHORTS TO POWER AND GROUND BETWEEN THE NG MODULE AND INJECTORS

- Measure resistance between the NG module fuel injector Pin(s) and NG module Pins 37/57 and 40/60.

Cylinder Number	NG MODULE	Cylinder Number	NG Module
1	58	5	33
2	59	6	42
3	39	7	53
4	35	8	54

Is each resistance greater than 10,000 ohms?

Yes	No
For DTCs P0172 and P0175, GO to HA61 . All Others : REPLACE only damaged fuel injector(s).	REPAIR short circuit.

HA60 CHECK FUEL INJECTOR DRIVER SIGNAL

This test requires a standard 12 volt test lamp.

- NG module connected.

Note: A properly operating system will show a dim glow at idle on the test lamp.

- Connect test lamp between the fuel injector signal circuit pin and VPWR circuit pin at the fuel injector harness connector.
- Crank or start the engine.

Does the test lamp have a dim glow while cranking or running the engine?

Yes	No
PCM and NG circuits are OK. For runs rough condition, RETURN to Section 3 , Symptom Charts. For No Start condition, GO to A4 .	No light/continuous bright light, GO to HA61 .

All others:

GO to [HA64](#).

HA61 CHECK PCM FUEL INJECTOR HARNESS CIRCUIT RESISTANCE

Note: Refer to the PCM and NG module pin numbers at the beginning of this pinpoint test.

- PCM and NG module disconnected.
- Measure resistance of VPWR circuit between PCM harness connector pins and NG module harness connector pins.
- Measure resistance of the Fuel Injector Pin(s) between the PCM and NG module. (Refer to chart for PCM and NG module pin location.)

Cylinder Number	PCM Output to 60-Pin NG Input	
	PCM Pin	NG Module Pin
1	75	3
2	101	4
3	74	5
4	100	23
5	73	24
6	99	25
7	72	43
8	98	44

Is each resistance less than 5.0 ohms?

Yes	No
GO to HA62 .	REPAIR open harness circuit.

HA62 CHECK PCM FUEL INJECTOR CIRCUIT FOR SHORT TO POWER AND GROUND IN HARNESS

- Measure resistance between the Fuel Injector circuit pin(s) and VPWR and PWR GND circuits at the PCM harness connector (GO to [HA61](#) and refer to the chart).
- Measure the resistance between the Fuel Injector circuit pin(s) and VPWR, CASE GND and PWR GND circuits at the NG module harness connector (GO to [HA61](#) and refer to the chart).

Is each resistance greater than 10,000 ohms?

Yes	No
For DTCs P0172 and P0175: GO to HA64 . All others: GO to HA63 .	REPAIR short circuit.

HA63 CHECK FUEL INJECTOR DRIVER SIGNAL FROM PCM

This test requires a standard 12 volt test lamp.

- PCM connected, NG module disconnected.

Note: A properly operating system will show a dim glow or flicker at idle on the test lamp.

- Connect a test lamp between the VPWR circuit and each from PCM Fuel Injector Signal circuit at the NG module harness connector.
- Crank or start the engine.

Does the test lamp have a dim glow or flicker while cranking or starting the engine?

Yes	No
<p>For no starts: REPLACE NG module.</p> <p>For runs rough: Return to symptom chart.</p> <p>For DTCs: GO to HA64.</p>	<p>REPLACE PCM.</p>

HA64 FLOW TEST FUEL INJECTOR(S)

Use Rotunda Natural Gas (NG) Injector Tester found in the Special NG Tool Kit 113-00114 or equivalent to flow test NG fuel injectors. Follow the Rotunda Natural Gas (NG) Injector Tester test steps indicated below, or follow the specific instructions included with the injector tester you are using.

- Observe WARNING, CAUTION and NOTE.
- Key off.
- Key on, engine off.
- Note initial FRP sensor pressure using the scan tool.
- Electronic fuel injector tester installed to suspect fuel injector.
- Select pulse width of 200 m sec.
- Activate the fuel injector tester.
- Note final FRP sensor pressure using scan tool.
- Subtract final pressure from initial pressure to find pressure drop.
- Repeat above test procedures for all remaining fuel injectors.

Is the leakage and flow within specification?

Yes	No
<p>DTCs P0171, P0172, P0174 and P0175: Unable to duplicate or identify fault at this time. GO to Z1.</p> <p>DTCs P1130 and P1150:</p>	<p>REPLACE fuel injector.</p>

GO to [HA66](#).

All others:

GO to [HA65](#).

HA65 CHECK CYLINDER COMPRESSION

- Check cylinder compression. Refer to Powertrain/Engine Group Base Engine/Engine—Service Section of the Workshop Manual.

Are cylinder compression readings within specification?

Yes	No
For DTCs P1131, P1130, P1151 and P1150: GO to HA66 .	REPAIR as necessary.
For DTCs P1132 and P1152: GO to HA71 .	

HA66 CHECK HO2S INTEGRITY

- Inspect HO2S harness for chafing, burned out wires or other damage and service.
- Inspect HO2S and connector for indications of submersions in water, oil and coolant. Repair as necessary.
- Run engine at 2000 rpm for two minutes.
- Perform Key On Engine Running (KOER) Self-Test.
- Key off.

Are DTCs P1131 and/or P1151 present?

Yes	No
GO to HA67 .	Unable to duplicate or identify fault at this time. GO to Z1 .

HA67 CHECK HO2S's ABILITY TO GENERATE A VOLTAGE GREATER THAN 0.5 VOLT

Note: Refer to the PCM pin numbers at the beginning of this pinpoint test.

Any vacuum or air leaks can cause DTCs P1131, P1151, P1130 and P1150.

- Disconnect the suspect HO2S from vehicle harness.
- Connect digital multimeter to the HO2S Signal circuit and HO2S SIG RTN circuit or HO2S GND circuit at the HO2S sensor connector.
- Run engine at 2000 rpm for two minutes.
- Rerun KOER Self-Test and monitor HO2S voltage.

Does voltage reading indicate greater than 0.5 volt during or at the end of Self-Test?

Yes	No
GO to HA68 .	REPLACE HO2S.

HA68 CHECK HO2S SIGNAL AND HO2S GROUND CIRCUITS FOR OPEN IN HARNESS

- Disconnect PCM.
- Disconnect suspect HO2S from harness.
- Measure the resistance of HO2S Signal circuit between PCM harness connector and the HO2S harness connector.
- Measure resistance of SIG RTN circuit between PCM harness connector and HO2S SIG RTN harness connector.

Is the resistance reading less than 5.0 ohms?

Yes	No
GO to HA69 .	REPAIR open circuit.

HA69 CHECK HO2S CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Measure resistance of HO2S Signal circuit between the PCM harness connector and battery negative post.

Is the resistance greater than 10,000 ohms?

Yes	No
GO to HA70 .	REPAIR short circuit.

HA70 CHECK HO2S FOR SHORT TO GROUND

- Measure resistance between HO2S Signal and PWR GND/SIG RTN circuits at the PCM harness connector.

Is the resistance greater than 10,000 ohms?

Yes	No
<p>For DTCs P1130 and P1150: GO to HA71.</p> <p>For DTCs P1131C and P1151C: GO to HA76.</p> <p>For KOER DTCs P1131 and P1151: REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).</p>	REPLACE HO2S.

HA71 CHECK FOR DTCS P1132 AND P1152 WITH P1130 AND P1150

- Activate Key On Engine Running (KOER) Self-Test.

Are DTCS P1132 or P1152 present?

Yes	No
GO to HA72 .	Unable to duplicate or identify fault at this time. GO to Z1 .

HA72 CHECK HO2S SIGNAL FOR SHORT TO VPWR and VREF

DTC P1130, P1132=HO2S-11

DTC P1150, P1152=HO2S-21

- Key on, engine off.

Note: HO2S displayed as O2S on Scan Tool.

- Access the HO2S PID for the DTC generated.

Is the voltage greater than 1.0 volt and less than 4.0 volts?

Yes	No
GO to HA73 .	GO to HA75 .

HA73 CHECK HO2S CIRCUIT FOR SHORT TO VPWR

- Disconnect sensor.
- Disconnect PCM.

Note: Refer to the PCM pin numbers at the beginning of this pinpoint test.

- Measure the resistance between the HO2S signal circuit pin(s) and VPWR circuit at the HO2S harness connector.

Is the resistance greater than 10,000 ohms?

Yes	No
GO to HA74 .	REPAIR short to power.

HA74 CHECK HO2S SIGNAL FOR SHORT TO HO2S HTR CIRCUIT IN THE SENSOR

- HO2S sensor disconnected.
- Key on, engine off.

Note: HO2S displayed as O2S on Scan Tool.

- Access HO2S PID for DTC(s) received.

Is the HO2S voltage less than 0.2 volt?

Yes	No
REPLACE HO2S.	REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).

HA75 ATTEMPT TO GENERATE DTCS P1131 AND P1151

- Disconnect HO2S.
- Connect jumper between HO2S Signal at the HO2S harness connector and battery negative post.
- Activate Key On Engine Running (KOER) Self-Test.

Is DTC P1131 or P1151 present?

Yes	No
GO to HA76 .	DISCONNECT PCM. INSPECT both ends of connector for damaged or pushed out pins, moisture, corrosion, loose pins. REPAIR as necessary. If OK, REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).

HA76 HO2S SENSOR VOLTAGE CHECK

Note: Refer to the PCM pin numbers at the beginning of this pinpoint test.

- Disconnect HO2S.
- Connect digital multimeter to HO2S SIG circuit and HO2S SIG RTN circuit at the HO2S sensor connector.
- Disconnect vacuum hose from vacuum tree.
- Start engine and run at 2000 rpm.

Does the voltage reading indicate less than 0.4 volt within 30 seconds?

Yes	No
GO to HA77 .	REPLACE HO2S.

HA77 MONITOR HO2S PID FOR PROPER SWITCHING

- Key on, engine running.
- Engine at operating temperature.

Note: HO2S displayed as O2S on Scan Tool.

- Access HO2S PID for DTC received.
- Wiggle, bend and shake small sections of the Electronic Engine Control harness from the PCM to

the HO2S harness connector.

Did the HO2S voltage stay high (greater than 0.45 volt) or low (less than 0.45 volt)?

Yes	No
ISOLATE cause of lack of HO2S switches and repair.	GO to HA78 .

HA78 TEST DRIVE WHILE MONITORING HO2S PID FOR PROPER SWITCHING

Note: This test step requires an observer to monitor PID for proper operation.

- Access HO2S PID.
- While observer views HO2S PID, test drive vehicle under different road conditions in an attempt to simulate the original fault.

Does HO2S appear to switch properly?

Yes	No
UNABLE to duplicate fault. Testing complete at this time.	REPLACE HO2S.

HA90 DTC P1127 KOER

Possible causes:

- Engine not operating long enough prior to performing KOER Self-Test.
- Exhaust system too cool.
- Key on, engine running.
- Access HTR11, 21 PIDs.

Do all PIDs indicate ON?

Yes	No
With engine still running, COMPLETE a KOER Self-Test to verify P1127 is no longer present.	OPERATE engine until all PIDs indicate ON. COMPLETE a KOER Self-Test.

HA100 DTC P1128 KOER

- P1128 refers to the upstream HO2S.

Possible causes:

- Crossed HO2S harness connectors.
- Crossed wiring at HO2S harness connectors.
- Crossed HO2S wiring at PCM 104-pin harness connector.
- Key off.
- Visually inspect HO2S harness connector(s) for any crossed or stretched wires or wire harnesses not mounted properly.

Are there any indications of crossed connectors or wires?

Yes	No
REPAIR as necessary.	GO to <u>HA101</u> .

HA101 VERIFY PROPER HO2S SIGNAL PIN LOCATION

- Disconnect PCM.
- Disconnect both of the suspect HO2S sensors at the HO2S harness connector.
P1128 = HO2S 11/21 Upstream
- Measure resistance of HO2S SIG circuits between the PCM harness connector and the HO2S harness connectors.
HO2S-11-Test Pin 60
HO2S-21-Test Pin 87

Is the resistance less than 5.0 ohms?

Yes	No
HO2S SIG circuit is OK.	CONNECT HO2S connector to proper HO2S or RELOCATE HO2S signal pins in the PCM 104-pin harness connector or HO2S harness connector.

HB: Natural Gas Fuel Delivery System Introduction

HB: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Fuel Pressure
- Fuel Supply Lines
- Fuel Filter (9155)
- Fuel Injectors (9F593)
- Fuel Pressure Regulator (9C968)
- Fuel Injection Supply Manifold (Fuel Rail) (9F792)
- Fuel Rail Solenoid Shut-Off Valves (9D278)

Fuel Delivery System Special Tool Kit		
Tool Kit 134-00114 Contains		
Fuel Pressure Gauge	Filler Connector Venting Tool	Injector Flow Tester

Note: For specific fuel delivery system specifications, refer to the Fuel Delivery System Test Information Chart located at the beginning of section HC.

4.6L Crown Victoria NGV

5.4L E/F-Series (NGV)

AA0892-E

WARNING

NATURAL GAS IN THE FUEL SYSTEM IS AT HIGH PRESSURE AT ALL TIMES. TO AVOID INJURY OR FIRE, RELEASE THE FUEL PRESSURE FROM THE FUEL SYSTEM BEFORE DISASSEMBLING ANY FUEL SYSTEM COMPONENT. TO RELEASE THE PRESSURE FROM THE SYSTEM FOLLOW THE PRESSURE RELIEF PROCEDURE:

PRESSURE RELIEF PROCEDURE

- THUMP INERTIA FUEL SHUTOFF (IFS) SWITCH AND VERIFY THE BUTTON HAS BEEN UPSET (DO NOT RESET).
- CONNECT NATURAL GAS FUEL PRESSURE TESTING KIT 134-00114 AT THE SCHRADER VALVE LOCATED ON THE FUEL INJECTION SUPPLY MANIFOLD (FUEL RAIL). TESTING KIT VALVE MUST BE CLOSED.
- POSITION THE TESTING KIT VENTING HOSE TO A WELL-VENTILATED LOCATION, PREFERABLY OUTSIDE OR INTO VENT STACK.
- GRADUALLY OPEN THE TESTING KIT VALVE TO RELIEVE THE FUEL PRESSURE AND ALLOW IT TO ESCAPE (TAKES APPROXIMATELY ONE TO TWO MINUTES.).

USE CARE TO PREVENT COMBUSTION FROM ESCAPING FUEL. NO SMOKING, OPEN FLAMES OR ANY KIND OF ARCING.

SAFE FUEL HANDLING PRACTICES: NATURAL GAS—FIRE

- REPORT ALL FIRES TO THE APPROPRIATE AUTHORITIES.
- FLAMES FROM NATURAL GAS HAVE A YELLOW AND/OR BLUE COLOR.

- **KNOW THE LOCATIONS OF PORTABLE FIRE EXTINGUISHER, FIRE BLANKETS, AND FIRE ALARMS. LEARN HOW TO USE THEM.**
- **USE AN ABC RATED/CERTIFIED FIRE EXTINGUISHER OR FIRE BLANKET TO FIGHT FLAMMABLE GAS FIRES.**

FIRST AID

- **WHEN OVERCOME BY VAPORS, IF SAFE, MOVE VICTIM TO FRESH AIR. IF NOT BREATHING, GIVE ARTIFICIAL RESPIRATION OR CPR (CARDIOPULMONARY RESUSCITATION) AS APPROPRIATE. SEEK MEDICAL ATTENTION IMMEDIATELY.**
- **FOR IRRITATED EYES, FLUSH WITH LARGE AMOUNTS OF WATER FOR 15 MINUTES. REMOVE CONTACT LENSES, IF WORN. SEEK MEDICAL ATTENTION.**

HEALTH

- **NATURAL GAS (AND ALL OTHER FUEL VAPORS) CAN BE HARMFUL BY INHALATION.**
- **ALL FUELS CAN BE HARMFUL OR FATAL IF SWALLOWED.**
- **FUELS AND PRODUCTS CONTAINING METHANOL (E.G. WINDSHIELD WASHER FLUID) CAN CAUSE BLINDNESS IF SWALLOWED.**
- **ALL FUELS ARE IRRITATING TO THE EYES AND RESPIRATORY SYSTEM.**

HANDLING

- **BE AWARE OF THE MERCUROUS MERCAPTAN "ROTTEN EGG" SMELL OF NATURAL GAS.**
- **USE FLAMMABLE GAS HANDLING PRECAUTIONS.**
- **KEEP FLAMMABLE GASES IN APPROVED, LABELED CONTAINERS.**
- **USE IN WELL-VENTILATED AREAS AND CONTROL VAPORS. BE AWARE THAT NATURAL GAS IS NOT VISIBLE, IS LIGHTER THAN AIR, CAN TRAVEL ALONG THE CEILING, AND MAY COLLECT IN HIGH HOLLOWES.**
- **WHEN TRANSFERRING FLAMMABLE GASES, CONNECT THE VENT STACK TO THE SOURCE, AND GROUND THE SOURCE TO THE EARTH.**
- **DO NOT SMOKE, OR USE HEAT/SPARK PRODUCING EQUIPMENT NEAR NATURAL GAS.**
- **DO NOT EAT, DRINK OR SMOKE WHERE FUELS ARE HANDLED, PROCESSED OR STORED.**
- **WASH HANDS THOROUGHLY AFTER HANDLING ANY FUEL.**

LEAKAGE

- **NOTIFY THE PROPER AUTHORITIES IN THE EVENT OF ANY LEAKAGE YOU HAVE NOT BEEN TRAINED TO ADDRESS.**
- **STOP, AND ALLOW FUEL TO VENTILATE TO OUTSIDE ATMOSPHERE AFTER ANY FUEL ESCAPE.**

NOTE

A small amount of pressure 21 kPa (3 psig) will remain in the fuel rail.

High pressure still exists in the fuel tanks.

HB: Natural Gas Fuel Delivery System

← HB: Introduction

HB1 CHECK SYSTEM INTEGRITY

 **WARNING: BEFORE SERVICING OR REPLACING ANY COMPONENTS IN THE FUEL SYSTEM, REDUCE THE POSSIBILITY OF INJURY OR FIRE BY FOLLOWING DIRECTIONS IN FUEL SYSTEM WARNING, CAUTION AND NOTE AT THE BEGINNING OF THIS PINPOINT TEST.**

- Key on, engine off for 5 seconds.
- Key off.
- Visually inspect the complete fuel delivery system, including fuel lines, connections, fuel rail, pressure regulator and fuel injector areas for leaks (hissing noise), looseness, cracks, kinks, pinching, or abrasion caused by a collision or mishandling.
- Visually inspect electrical harness and connectors for loose pins, corrosion, abrasion or other damage from collision or mishandling.
- Verify vehicle has followed maintenance schedule.
- Inspect fuel filter element for contamination and service as necessary.
- Verify Inertia Fuel Shutoff (IFS) switch is set.
- Verify vehicle battery is fully charged.
- Verify electrical/fuse integrity.

Have any concerns been identified?

Yes	No
REPAIR as necessary. VERIFY symptom no longer exists.	<p>For symptom of poor fuel range:</p> <p>GO to NG fuel tank venting procedures located in Section 310-00 in the Workshop Manual.</p> <p>For symptom of fuel smell:</p> <p>GO to HB16.</p> <p>All other symptoms:</p> <p>GO to HB2.</p>

HB2 CHECK FUEL TANK PRESSURE

- Install fuel tank venting tool (supplied in Tool Kit 134-00114) to vehicle fueling connector.
- Open bypass on fill valve (refer to Powertrain/Fuel Systems Group in the Workshop Manual for this procedure).
- Key on.
- Record fuel tank pressure reading and fuel gauge reading.

Is the fuel pressure reading greater than 3,448 kPa (500 psi)?

Yes	No

KEY OFF. CLOSE bypass and REMOVE tool.
GO to [HB5](#).

VERIFY fuel level. If OK, CHECK for power at
tank solenoid valve. GO to [HB3](#).

HB3 CHECK FSV PWR AND GND CIRCUITS TO THE FUEL TANK SOLENOID SHUT-OFF VALVE

- Key on.
- Access Output Test Mode.
- Select ALL ON.

Note: Measurement must be made within 7 seconds of activating test mode

- Measure voltage between the FSV PWR and GND circuits at the fuel tank solenoid shut-off valve harness connector (refer to the Electrical and Vacuum Troubleshooting Manual for location).

Is the voltage reading greater than 10.5 volts?

Yes	No
GO to NG fuel tank venting procedures located in Section 310-00 in the Workshop Manual for fuel tank solenoid shut-off valve diagnostics.	GO to HB4 .

HB4 CHECK FOR OPEN GND CIRCUIT TO FUEL TANK SOLENOID SHUT-OFF VALVE

- Measure resistance between the ground circuit at the fuel tank solenoid shut-off valve harness connector and battery negative post.

Is resistance less than 5 ohms?

Yes	No
REPAIR open FSV PWR circuit. VERIFY symptom no longer exists.	REPAIR open GND circuit. VERIFY symptom no longer exists.

HB5 CHECK FUEL PRESSURE

- Observe WARNING, CAUTION AND NOTE.
- Connect Fuel Pressure Tester to schrader valve.
- Release fuel pressure in fuel injection supply manifold (fuel rail) and supply lines.
- Key on, engine on (if possible, start engine).
- Key off.
- After two minutes, obtain pressure reading from pressure tester.

Is fuel pressure within 552 to 827 kPa (80 to 120 psi)?

Yes	No
For no starts: GO to HB6 .	REPLACE fuel pressure regulator. VERIFY symptom no longer exists.

HB6 CHECK FUEL RAIL PRESSURE SENSOR ACCURACY

- Observe WARNING, CAUTION and NOTE.
- Fuel pressure tester connected with vent hose.
- Connect scan tool.
- Key on, engine off.
- Note pressure of FRP sensor with scan tool.
- Note pressure at schrader valve with fuel pressure tester.
- Key off.
- Slowly open the one quarter turn shut off valve on the fuel pressure tester and vent fuel pressure to 345-485 kPa (50-70 psi).
- Remove the fuel pump relay.
- Key on, engine off.
- Note pressure of FRP sensor with scan tool.
- Note pressure at schrader valve with pressure tester.
- Key off.

Is the FRP sensor pressure constant and within 70 kPa (10 psi) of the pressure at the Schrader valve?

Yes	No
<p>For no starts: GO to HB10 .</p> <p>For all others: Return to symptom chart.</p>	<p>GO to HB7 .</p>

HB7 VERIFY FUEL RAIL SOLENOID SHUT-OFF VALVE OPENS

- Observe WARNING, CAUTION and NOTE.
- Fuel pressure tester connected with vent hose.
- Key on, engine off.
- Access Output Test Mode.
- Select ALL ON and then START and STOP several times by toggling the START and STOP button on the scan tool and listening or feeling for a click at the fuel rail solenoid shut-off valve.
- Key off.

Was a click of the solenoid valve felt or heard?

Yes	No
<p>REPLACE fuel rail pressure sensor. VERIFY symptom no longer exists.</p>	<p>GO to HB8 .</p>

HB8 CHECK FSV PWR AND GND CIRCUITS TO THE FUEL RAIL SOLENOID SHUT-OFF VALVE

- Key on, engine off.

- Access Output Test Mode.
- Select ALL ON, and START.
- Measure the voltage between the FSV PWR and GND circuit at the fuel rail solenoid shut-off valve harness connector.

Note: This circuit remains on for only 7 seconds.

Is the voltage reading greater than 10.5 volts?

Yes	No
REPLACE fuel rail solenoid valve. VERIFY symptom no longer exists.	GO to HB9 .

HB9 CHECK FOR OPEN GND CIRCUIT TO FUEL RAIL SOLENOID SHUT-OFF VALVE

- Measure the resistance between the GND circuit at the fuel rail solenoid shut-off valve harness connector and battery negative post.

Is resistance less than 5 ohms?

Yes	No
REPAIR open FSV PWR circuit. VERIFY symptom no longer exists.	REPAIR open GND circuit. VERIFY symptom no longer exists.

HB10 VERIFY FUEL RAIL SOLENOID SHUT-OFF VALVE SEALS

- Observe WARNING, CAUTION and NOTE.
- Fuel pressure tester connected with vent hose.
- Vent fuel pressure in the fuel injection supply manifold (fuel rail) and supply lines.
- Disconnect the fuel rail solenoid shut-off valve at the fuel injection supply manifold (fuel rail) harness connector.
- Crank the engine for 3 seconds.
- After two minutes, turn key on and access FRP PID and note pressure.

Is pressure at FRP sensor less than 70 kPa (10 psi)?

Yes	No
GO to HB11 .	REPLACE solenoid valve. VERIFY symptom no longer exists.

HB11 VERIFY FUEL RAIL SOLENOID SHUT-OFF VALVE PARTIALLY OPENS

- Observe WARNING, CAUTION and NOTE.
- Key off.
- Fuel pressure tester connected with vent hose.
- Vent pressure in the fuel injection supply manifold (fuel rail) and supply lines.
- Disconnect the fuel rail solenoid shut-off valve on the fuel injection supply manifold (fuel rail) at the harness connector.
- Key on, engine off.

- Key off.
- Reconnect the fuel rail solenoid shut-off valve.
- Key on, engine off.
- Access the FRP PID.
- Note the pressure on the pressure gauge.

Is the FRP sensor pressure within 70 kPa (10 psi) of the fuel pressure gauge after turning key on with the engine off?

Yes	No
KEY OFF. GO to HB12 .	REPLACE fuel rail solenoid shut-off valve. VERIFY symptom no longer exists.

HB12 VERIFY FUEL RAIL SOLENOID SHUT-OFF VALVE FULLY OPENS

- Observe WARNING, CAUTION and NOTE.
- Fuel pressure tester connected with vent hose.
- Vent pressure in the fuel injection supply manifold (fuel rail) and supply lines.
- Disconnect the fuel rail solenoid shut-off valve on the fuel injection supply manifold (fuel rail) at the harness connector.
- Key on, engine off.
- Key off.
- Reconnect the fuel rail solenoid shut-off valve.
- Snap start the engine (Key on and immediately start the engine).
- Immediately increase the engine speed to approximately 2500 rpm while monitoring the FRP PID.
- Note the pressure on the pressure gauge.
- Note the FRP pressure.

Is the FRP sensor pressure within 70 kPa (10 psi) of the pressure at the schrader valve?

Yes	No
KEY OFF. GO to HB13 .	REPLACE fuel rail solenoid shut-off valve. VERIFY symptom no longer exists.

HB13 VERIFY FUEL PRESSURE WITH ENGINE ON

- Observe WARNING, CAUTION and NOTE.
- Key on, engine running.
- Note FRP sensor pressure at idle with scan tool.
- Increase engine speed to approximately 2500 rpm.
- Note FRP sensor pressure at 2500 rpm with scan tool.

Is idle fuel pressure between 552 and 827 kPa (80 and 120 psi) and is pressure at 2500 rpm greater than 552 kPa (80 psi)?

Yes	No
KEY OFF. GO to HB14 .	VERIFY a blockage does not exist in fuel lines. REPLACE fuel pressure regulator. VERIFY symptom no longer exists.

HB14 VERIFY REGULATOR THERMOSTAT

- Observe WARNING, CAUTION and NOTE.
- Key on, engine on.
- Allow engine coolant to reach normal operating temperature.
- Measure the temperature of fuel pressure regulator coolant bowl or coolant outlet with a thermometer or temperature probe.

Is the regulator temperature within 15° to 60°C (59° to 140°F)?

Yes	No
KEY OFF. GO to HB15 .	<p>If fuel regulator coolant bowl is less than 15°C (59°F):</p> <p>KEY OFF. CHECK coolant lines and coolant system for proper operation.</p> <p>If OK, REPLACE fuel pressure regulator.</p> <p>If fuel regulator coolant bowl is greater than 60°C (140°F):</p> <p>KEY OFF. REPLACE pressure regulator. VERIFY symptom no longer exists.</p>

HB15 VERIFY FUEL INJECTOR FLOW

- Observe WARNING, CAUTION and NOTE.
- Key off.
- Key on, engine off.
- Note initial FRP sensor pressure using the scan tool.
- Electronic fuel injector tester installed to suspect fuel injector.
- Select pulse width of 200 m sec.
- Activate the fuel injector tester.
- Note final FRP sensor pressure using scan tool.
- Subtract final pressure from initial pressure to find pressure drop.
- Repeat above test procedures for all remaining fuel injectors.

Is the pressure drop within 241 to 345 kPa (35 to 50 psi) and all fuel injectors within 20 kPa (3 psi) of each other?

Yes	No
RETURN to Section 3 , Symptom Charts, for additional symptom diagnostics.	KEY OFF. REPLACE fuel injector(s) that does not meet pressure specification. VERIFY symptom no longer exists.

HB16 FUEL LEAK CHECK

Possible causes:

- Loose fitting connectors.
- Damaged or worn seals or fittings.

- Damaged fuel lines or fuel system components.

Note: After the vehicle has soaked for several hours (has not run), a slight natural gas smell may emanate from within the intake manifold and intake air system. This is normal, as the fuel injectors leak down from the fuel rail to the intake manifold over several hours.

- Key off.
- Install fuel rail pressure gauge.
- Key on, engine off (verify pressure is greater than 586 kPa (85 psi)). If the fuel system does have a fuel leak, it will be necessary to repeat this step to maintain pressure.
- Check for leaks with the natural gas sniffer provided in Rotunda tool kit 134-00114 or a soapy water solution such as Snoop. Cover the complete joint with this solution. Examine the components or joints for 60 seconds for signs of bubbles.

Are any leaks indicated?

Yes	No
VERIFY proper torque on suspect fuel system components. RECHECK for leaks. If leaks still exist, REPAIR or REPLACE as necessary.	No leaks detected. No further diagnostics are required.

HB17 DTC P1180 AND P1181: CHECK FUEL PRESSURE

- Inspect the fuel lines, regulator and fuel filter for restrictions or leaks.

Are there any concerns?

Yes	No
REPAIR as necessary.	GO to HB18 .

HB18 CHECK FUEL TANK PRESSURE

- Key on, engine running and vehicle in park.
- Scan tool connected.
- Access and monitor the TANKPR PID from the NGVM menu and record the value.
- Access and monitor the FRP PID from the PCM menu and record the value.
- Locate the approximate TANKPR value on the chart below, from this value determine the PCM inferred pressure.

Is the PCM inferred pressure ± 22 psi of the fuel rail pressure (FRP) recorded?

Fuel Tank Pressure in kPa	PCM Inferred Pressure (psi)
30000	94
28000	95.5
26000	96
24000	96
23000	96.31
22000	97.25

21000	97.5
20000	98.5
19000	99
18000	99.31
17000	99.75
16000	100.75
14000	101.75
13000	102.25
12000	102.5
11000	103
10000	103.38
9000	104.5
8000	105
7000	105.56
6000	106
5000	106.5
4000	106.88
3000	108.44
2000	109
0	0

Yes	No
ADDRESS other Continuous Memory DTCs if present.	For DTC P1180: GO to HB19 . For DTC P1181: REPLACE fuel pressure regulator.

HB19 CHECK FUEL FILTER FOR WATER OR OTHER CONTAMINATION

- Disassemble fuel filter and check for water and other contamination.

Is there any contamination present?

Yes	No
CLEAN contaminants from filter housing. REPLACE filter element.	GO to HB20 .

HB20 CHECK FUEL LINE FOR RESTRICTION

- Visually inspect all fuel lines for damage which may cause the fuel to be restricted or leaking.

Are there any restrictions?

Yes	No

REPAIR fuel line(s) as required.

REPLACE fuel pressure regulator.

HC: Fuel Delivery System Introduction

HC: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Chassis Components
- Engine Vacuum
- Fuel Pressure
- Fuel Filter

- Fuel Return
- Fuel Supply
- Fuel Injector (9F593)

1. Return Fuel Systems (RFS) return fuel to the fuel tank by means of a return line from the fuel rail.
2. Mechanical Returnless Fuel Systems (MRFS) do not return fuel to the fuel tank by means of a fuel return line. The fuel pressure regulator is mounted on the Fuel Pump Module located in the fuel tank. Excess fuel is returned from this point.
3. Electronic Returnless Fuel Systems (ERFS) do not return fuel to the fuel tank by means of a fuel return line. There is no fuel pressure regulator and pressure is controlled by continuously varying the fuel pump speed through the Fuel Pump Driver Module (FPDM).
4. Service replacement fuel injectors may not be the same color as the injectors in the vehicle. Verify replacement injector is correct for the application by part number.

Injector supplier key:

B=Bosch

D=Denso

S=Siemens

V=Visteon

Description

For additional information on the Fuel Delivery System, refer to [Section 1](#).

WARNING: FUEL IN THE FUEL SYSTEM REMAINS UNDER HIGH PRESSURE EVEN WHEN THE ENGINE IS NOT RUNNING. TO AVOID INJURY OR FIRE, RELEASE THE FUEL PRESSURE FROM THE FUEL SYSTEM BEFORE DISCONNECTING ANY FUEL LINE. TO RELEASE THE PRESSURE FROM THE SYSTEM PERFORM THE FOLLOWING:

- CONNECT THE ROTUNDA FUEL PRESSURE GAUGE T80L-9974-B OR EQUIVALENT AT THE SCHRADER VALVE LOCATED ON THE FUEL RAIL. TESTING KIT VALVE MUST BE CLOSED. ON VEHICLES NOT EQUIPPED WITH A SCHRADER VALVE, USE ROTUNDA FUEL PRESSURE TEST KIT #134—R0087 OR EQUIVALENT.
- GRADUALLY OPEN THE TESTING KIT VALVE TO RELIEVE FUEL PRESSURE IN THE VEHICLE FUEL SYSTEM AND DRAIN THE FUEL INTO A SUITABLE CONTAINER OR RETURN IT TO THE FUEL TANK.
- TO AVOID UNNECESSARY FUEL SPILLAGE AND FIRE HAZARD, ANY TIME FUEL LINES ARE DISCONNECTED, THE IGNITION SWITCH MUST BE IN THE OFF POSITION UNLESS FUEL PUMP OPERATION IS REQUIRED FOR TEST PURPOSES.

CAUTION: Use care to prevent combustion from fuel spillage. No smoking, open flames or any kind of arcing.

SAFE FUEL HANDLING PRACTICES

Gasoline, Methanol and Methanol Blends

FIRE

- Report all fires to the appropriate authorities.
- Flames from methanol or methanol-gasoline blends can be invisible.
- Know the locations of portable fire extinguishers, fire blankets, fire alarms and eye/wash shower facilities. Learn how to use them.
- Use a B or AFFF (light water) type fire extinguisher to fight flammable liquid fires.

FIRST AID

- If swallowed:
 - If gasoline has been swallowed, do not induce vomiting. Seek medical attention immediately!
 - If methanol or a methanol/gasoline blend has been swallowed, induce vomiting under the direction of a physician or Poison Control Center. Seek medical attention immediately!
- When overcome by vapors, if safe, move victim to fresh air. If not breathing, give artificial respiration or CPR (Cardiopulmonary Resuscitation) as appropriate. Seek medical attention immediately!
- If splashed in eyes, flush with large amounts of water for 15 minutes. Remove contact lenses, if worn. Seek medical attention.
- If splashed on skin, remove contaminated clothing. Wash skin thoroughly with soap and water.

HEALTH

- All fuels can be harmful or fatal if swallowed.
- Be aware, if fuel is swallowed, onset of serious health effects can be delayed 12 to 24 hours.
- Fuels and products containing methanol (e.g. windshield washer fluid) can cause blindness if swallowed.
- All fuel vapors can be harmful if inhaled.
- All fuels can be harmful if absorbed through the skin.
- All fuels are irritating to the eyes and respiratory system.
- Some fuels made with gasoline contain benzene which is a cancer-causing agent.

HANDLING

- Use flammable liquid handling precautions.
- Wear chemical goggles and nitrile gloves (additional protective clothing and equipment may be necessary in some instances).
- Keep flammable liquids in approved, labeled, closed containers.
- Use in well-ventilated areas and control vapors. Be aware that vapors are not visible, are heavier than air, can travel along the floor, and will settle in lower areas.
- When transferring flammable liquids, bond the receiving container to the source and ground the source to the earth.
- Do not smoke or use heat/spark producing equipment near vapors.
- Do not eat, smoke or drink where these products are handled, processed or stored.
- Never siphon by mouth.
- Wash hands thoroughly after handling any fuel .

SPILLS

- Notify the proper authorities in the event of any spill you have not been trained to clean up.
- Stop, contain, and clean up small spills with an absorbent material.

Inertia Fuel Shutoff (IFS) Switch — Reset Instructions

-  **WARNING: IF YOU SEE OR SMELL GASOLINE AT ANY TIME OTHER THAN DURING FUELING, DO NOT RESET THE INERTIA FUEL SHUTOFF (IFS) SWITCH.**
- Turn key off.
- Check for fuel leaks in the engine compartment.
- If no leak is present, reset the IFS switch by pushing the reset button on the top of the switch (refer to Owner Guide for switch location). NOTE: In the closed position, the button can be depressed an additional 1.57 mm (1/16 inch) against a spring.
- Turn key to on or start position for a few seconds, then off again.
- Again, check for leaking fuel.

HC: Pinpoint Tests →

HC: Fuel Delivery System

← HC: Introduction

HC1 CHECK SYSTEM INTEGRITY

- Visually inspect the complete fuel delivery system for damage; including fuel lines, connections, relays, fuel tank, fuel pump, fuel pressure regulator, fuel pulse damper and fuel injector areas for leaks, looseness, cracks, kinks, pinching, or abrasion caused by a collision or mishandling.
- Visually inspect electrical harness and connectors for loose pins, corrosion, abrasion, or other damage from collision or mishandling.
- Check electrical connectors for proper mating.
- Verify vehicle has followed maintenance schedule.
- Verify inertia fuel shutoff (IFS) switch is set.
- Verify battery is fully charged (12.5 volts or greater).
- Verify electrical/fuse integrity.
- Verify fuel level in the tank is sufficient.

Are any concerns present?

Yes	No
REPAIR as necessary.	GO to HC2 .

HC2 CHECK VOLTAGE AT FUEL PUMP HARNESS CONNECTOR

- Connect battery charger.
- Verify IFS switch state. Follow the IFS switch reset procedure at the beginning of this pinpoint test.
- Disconnect the fuel pump harness connector at the fuel pump.
- Key on, engine off.
- Connect a digital multimeter between the fuel pump power circuit and fuel pump ground circuit at the fuel pump harness connector (refer to the Wiring Diagram Manual for correct pin location).
- Access Output Test Mode (refer to [Section 2](#)) and turn on the fuel pump circuit and monitor the voltage reading.

Was the voltage greater than 12.5 volts?

Yes	No
KEY OFF. EXIT Output Test Mode. GO to HC3 .	KEY OFF. FOR vehicles with electronic returnless fuel systems: GO to KB70 . ALL others: CHECK for opens and shorts in the fuel pump power and ground circuits.

HC3 CHECK FUEL FILTER FOR PROPER MAINTENANCE

- Locate and inspect the vehicle maintenance schedule and fuel filter. Check for last repair date.

Was the fuel filter replaced within the last 48,280 km/30,000 miles?

Yes	No
GO to HC4 .	REPLACE fuel filter. GO to HC4 .

HC4 CHECK FUEL PRESSURE

WARNING: BEFORE SERVICING OR REPLACING ANY COMPONENTS IN THE FUEL SYSTEM, REDUCE THE POSSIBILITY OF INJURY OR FIRE BY FOLLOWING DIRECTIONS IN FUEL SYSTEM CAUTION, HANDLING AND WARNING AT THE BEGINNING OF THIS PINPOINT TEST.

- Install fuel pressure tester.
- Release fuel pressure.
- Key on, engine off.
- Access Output Test Mode and run the fuel pump to obtain maximum fuel pressure. (GO to Pinpoint Test [HC](#) to refer to the Fuel Delivery System Test Information / Specification Chart.)

Note: The fuel pump will only operate for approximately 8 seconds when Output Test Mode is selected and activated.

Is the fuel pressure within the specified pressure range as stated in the Fuel Delivery System Test Information / Specification Chart?

Yes	No
<p>KEY OFF. For Electronic Returnless Fuel Systems : GO to HC6.</p> <p>KEY OFF. For Mechanical Returnless Fuel Systems : GO to HC12.</p> <p>All others: GO to HC5.</p>	<p>KEY OFF. For Mechanical Returnless Fuel System with fuel pressure greater than 448 kPa (65 psi). REPLACE fuel pressure regulator in fuel tank.</p> <p>For Mechanical Returnless Fuel System with fuel pressure less than 310 kPa (45 psi): GO to HC6.</p> <p>For Electronic Returnless Fuel Systems with fuel pressure less than 207 kPa (30 psi). GO to HC13.</p> <p>For Electronic Returnless Fuel Systems with fuel pressure greater than 448 kPa (65 psi). RERUN Quick Test. Other DTC's should be present if fuel pressure is out of range.</p> <p>All others:</p> <p>Fuel pressure greater than 280 kPa (40 psi) (Cougar 415 kPa, 60 psi) on returnable fuel systems , GO to HC10.</p> <p>Fuel pressure less than 240 kPa (35 psi) (Cougar 310 kPa, 45 psi) on returnable fuel systems , GO to HC13.</p>

HC5 CHECK FUEL PRESSURE LEAKDOWN

- Observe Warning, Caution and Notes.

- Fuel pressure tester installed.
- Key on, engine off.
- Access Output Test Mode and run the fuel pump to obtain maximum fuel pressure.
- Key off.
- Verify fuel pressure remains within 34 kPa (5 psi) of the maximum fuel pressure for 1 minute after the fuel pump is turned off.

Does the fuel pressure remain within 34 kPa (5 psi)?

Yes	No
GO to HC7.	GO to HC6.

HC6 CHECK PRESSURE REGULATOR AND PULSE DAMPER DIAPHRAGM

- Fuel pressure tester installed.
- Start engine and run engine for 10 seconds.
- Key off, wait 10 seconds.
- Start engine and run engine for 10 seconds.
- Key off, remove vacuum hose from fuel pressure regulator or pulse damper port.
- Inspect for fuel in the vacuum hose or regulator port or pulse damper.

Is fuel present in the vacuum hose, regulator or pulse damper port?

Yes	No
REPLACE fuel pressure regulator. For Mechanical Returnless Fuel System: Replace pulse damper.	GO to HC12.

HC7 CHECK FUEL PRESSURE, ENGINE RUNNING

- Fuel pressure tester installed.
- Disconnect vacuum hose at the fuel pressure regulator and plug it.
- Drive vehicle with heavy accelerations while observing fuel pressure gauge reading.

Does fuel pressure reading hold steady within 21 kPa (3 psi) during test?

Yes	No
GO to HC8.	GO to HC13.

HC8 CHECK FUEL PRESSURE REGULATOR RESPONSE

- Fuel pressure tester installed.
- Install vacuum gauge to intake manifold.
- Start engine and observe both gauges.
- Accelerate and decelerate engine speed to vary vacuum gauge reading.

Does the fuel pressure gauge reading increase as vacuum gauge reading decreases or decrease as vacuum gauge reading increases?

Yes	No
Concern is elsewhere. RETURN to Section 3 , Symptom Charts for further direction.	GO to HC9 .

HC9 CHECK VACUUM SUPPLY

- Fuel pressure tester installed.
- Vacuum hose disconnected and plugged at the fuel pressure regulator.
- Install a hand held vacuum pump to the fuel pressure regulator.
- Start engine, remain at idle.
- Observe fuel pressure while applying vacuum.

Does the fuel pressure change as the vacuum changes?

Yes	No
REPAIR vacuum source.	REPLACE fuel pressure regulator.

HC10 CHECK FOR RESTRICTED FUEL RETURN LINE

- Fuel pressure tester installed.
- Remove fuel return line at the fuel rail and connect a short hose from the fuel rail to a measure container of at least 1.1 liter (1.0 quart) capacity.
- Key on, engine off.
- Access Output Test Mode and run the fuel pump to obtain maximum fuel flow (one cycle of the fuel pump is all that is required).
- Record fuel pressure and observe if fuel is being returned to the measuring container.

Is fuel pressure within specification and is fuel returning to the container?

Yes	No
KEY OFF. GO to HC11 .	KEY OFF. Fuel pressure out of specification. REPLACE fuel pressure regulator.

HC11 CHECK FUEL RETURN SYSTEM

- Observe Warning, Caution and Handling at the beginning of this pinpoint test.
- Disconnect fuel return line at the fuel rail.
- Disconnect fuel return line at the fuel pump.
- Check the fuel return line for restrictions due to blockage, kinking or pinching.
- Apply 21 to 34 kPa (3 to 5 psi) regulated shop air to the return line pressure.

Does air flow freely through the line?

Yes	No
REPLACE the fuel pump module.	REPAIR the fuel return line.

HC12 CHECK FUEL INJECTOR FLOW AND LEAKAGE

- Observe Warning, Caution and Handling at the beginning of this pinpoint test.
- Check injectors for leakage and flow rate using Injector Flow Tester.

Are test results satisfactory?

Yes	No
<p>For symptoms without DTCs and Electronic/Mechanical Returnless Fuel Systems: RETURN to Section 3, Symptom Charts for further direction.</p> <p>All others: VERIFY no other leak exists. REPLACE fuel pump module.</p>	<p>REPLACE faulty fuel injector(s).</p>

HC13 CHECK FUEL SUPPLY LINE FOR RESTRICTION

- Observe Warning, Cautions and Handling at the beginning of this pinpoint test.
- Disconnect fuel supply line at the fuel rail.
- Disconnect fuel supply line at the fuel pump.
- Check the fuel supply line for restrictions due to blockage, kinking, or pinching.
- Apply 21 to 34 kPa (3 to 5 psi) regulated shop air pressure to the supply line.

Does air flow freely through the line?

Yes	No
<p>Air flows freely. REPLACE fuel pump module.</p>	<p>REPAIR cause of restriction.</p>

HD: Misfire Detection Monitor Introduction

HD: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Ignition System
- Fuel injectors (9F593)
- Fuel pressure
- Vacuum system
- Evaporative emission system
- Fuel vapor storage canister
- EVAP canister purge valve (9C915)
- Base engine
- Crankshaft position (CKP) sensor (6C315)
- Powertrain control module (PCM) (12A650)

Pinpoint Test Schematics and Connectors

Misfire Detection Monitor

HD: Pinpoint Tests →

HD: Misfire Detection Monitor

← HD: Introduction

HD1 CHECK FOR ADAPTIVE FUEL MONITOR AND HO2S CONTINUOUS MEMORY DTCS

Note: The following is a list of non-misfire DTCS to look for in the Continuous Memory.

P0136, P0156
 P0171, P0172, P0175
 P1130, P1150

Are any of the DTCS listed above present?

Yes	No
GO to HD3 .	GO to HD2 .

HD2 CHECK FOR OTHER NON-MISFIRE CONTINUOUS MEMORY DTCS

Note: Check for other non-misfire Continuous Memory DTCS, which could cause the misfire DTC.

Are other non-misfire Continuous Memory DTCS present?

Yes	No
ADDRESS the next Continuous Memory DTC. DISREGARD Misfire DTC at this time. GO to Section 4 for Powertrain Diagnostic Trouble Code (DTC) Charts .	GO to HD3 .

HD3 CHECK FOR KEY ON ENGINE OFF (KOEO) DTCS

- Check for any key on, engine off DTCS which could cause the Misfire DTC.

Are any key on, engine off DTCS displayed on the Scan Tool?

Yes	No
GO to Section 4, Powertrain Diagnostic Trouble Code (DTC) Charts , and PROCEED as required.	GO to JB1 to evaluate spark plugs and secondary wires. If OK, GO to HD4 .

HD4 CHECK FOR OTHER KEY ON ENGINE RUNNING DTCS

Note: Check for any other key on, engine running DTCS, which can cause the Misfire DTC.

Are any additional key on, engine running DTCS displayed on the Scan Tool?

--	--

Yes	No
<p>If DTCs P1132, P1138, P1152, P1158, P1131, P1137, P1151 or P1157 are present, GO to HD8.</p> <p>All others: GO to Section 4, Powertrain Diagnostic Trouble Code (DTC) Charts, and PROCEED as required.</p>	<p>If Misfire is present: Those with DPFEGR Systems, GO to HD6.</p> <p>All others: GO to HD7.</p> <p>If Intermittent: GO to Section 2, Diagnostic Methods for Freeze Frame Data and GO to Z1 for Intermittent Diagnosis.</p> <p>If OK, GO to HD7.</p>

HD6 CHECK/COMPARE PID VALUES

- Start engine and warm to normal operating temperature.
- Access DPFEGR PID.
- Record DPFEGR PID value.
- Key off.
- Key on, engine off.
- Access DPFEGR.
- Compare key on, engine off and engine running PID values.

Was engine running PID value within 0.15 volt of key on, engine off value?

Yes	No
KEY OFF. GO to HD7 .	KEY OFF. GO to HE100 .

HD7 EGR RESTRICTION/FLOW TEST

Note: DTCs may be induced and will need to be cleared at end of testing.

- Record and clear codes.
- Disconnect vacuum line at EGR valve and plug the vacuum line.
- Complete Misfire Monitor Drive Cycle.

Is Misfire code still present?

Yes	No
GO to HD8 .	REFER to Workshop Manual Section 303-00, Engine, for EGR and intake port inspection.

HD8 CHECK INJECTOR DRIVER PIDS INJ1F THRU INJ10F

- Key on, engine off.
- Access appropriate INJxF PID(s) for the suspect fuel injector.

Is the PID status Yes?

Yes	No
GO to HD9 .	GO to HD10 .

HD9 CHECK FUEL INJECTOR(S) AND HARNESS FOR OPEN

- Disconnect PCM.
- Measure resistance of fuel injector and harness circuit between the fuel injector and VPWR circuits at the fuel injector harness connector (GO to Pinpoint Test H to refer to the injector connector chart).
- GO to Pinpoint Test HC Refer to the Fuel Delivery System Test Information Chart (at the beginning of the pinpoint test) for injector resistance values.

Is the resistance value(s) within specification?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	GO to <u>H57</u> to diagnose fuel injectors.

HD10 CHECK FUEL PRESSURE

WARNING: THE FUEL SYSTEM WILL REMAIN PRESSURIZED WHEN ENGINE IS NOT RUNNING. TO PREVENT INJURY OR FIRE, USE CAUTION WHILE WORKING ON THE FUEL SYSTEM.

- Install fuel pressure gauge.
- Start and run engine at idle. Record fuel pressure.
- Increase engine speed to 2500 rpm and maintain for one minute. Note and compare fuel pressure.

Is the fuel pressure at the specified pressure(GO to Pinpoint Test HC to use the fuel pressure chart)?

Yes	No
KEY OFF. GO to <u>HD11</u> .	REFER to Fuel System General Information, Section 310-00 in the Workshop Manual.

HD11 CHECK ABILITY OF FUEL SYSTEM TO HOLD FUEL PRESSURE

- Start and run engine at idle. Note fuel pressure.
- Increase engine speed to 2500 rpm and maintain for one minute.
- Look for fuel leaking at the fuel injector O-ring, fuel pressure regulator, and the fuel lines to the fuel charging assembly.

Did fuel pressure remain at specification within 34 kPa (5 psi) for 60 seconds?

Yes	No
KEY OFF. GO to <u>HD12</u> .	REFER to Fuel System General Information, Section 310-00 in the Workshop Manual to determine which area within the Fuel Delivery System is at fault.

HD12 CHECK FUEL INJECTOR FOR FLOW AND LEAKAGE

- GO to Pinpoint Test [HC](#) to refer to the Warning, Caution, and Handling, to avoid fuel spillage and injury.
- Verify that the flow rate for each fuel injector is within specification, using Injector Flow Tester.

Is flow rate for each fuel injector within specification?

Yes	No
Fuel delivery system is not likely to have caused the Misfire DTC. GO to HD20 to diagnose the vacuum system.	REPLACE or CLEAN the inoperative fuel injector(s) as required. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).

HD20 CHECK VACUUM SYSTEM

Note: Some vacuum leaks can be heard.

- Inspect all vacuum lines for damage, such as pinched lines, cracks, proper routing, and assembly.

Is the vehicle vacuum system OK?

Yes	No
GO to HD21 .	REPAIR the vacuum system. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).

HD21 CHECK DAMPER AND PULLEY ASSEMBLY

Note: This Pinpoint Test Step is for engines that have damper-mounted pulse rings. Remove the front cover if necessary to observe the crank pulley.

- Observe the crank pulley for wobble.
- Examine the EI pulse ring fastened to the harmonic fastener.

Does the crank pulley wobble or is the pulse ring loose or damaged?

Yes	No
DISCONNECT battery for 5 minutes to allow PCM to learn new data, due to the old pulse ring. REPLACE the pulley or damper assembly. COMPLETE Misfire Monitor Repair Verification Drive Cycle(REFER to Section 2, Drive Cycles).	GO to HD22 .

HD22 CHECK EVAPORATIVE EMISSION SYSTEM

The Misfire Monitor can be influenced by Evaporative Emission System. The next five Pinpoint Test steps will diagnose the Evaporative Emission System.

- Check the EVAP canister for fuel saturation.

Is there an excess amount of liquid fuel present in the fuel vapor storage canister?

Yes	No
REPLACE EVAP. COMPLETE Misfire Monitor Repair Verification Drive Cycle(REFER to Section 2, Drive Cycles).	CHECK fuel tank vent system. GO to HD23 .

HD23 PRESSURE TEST EVAPORATIVE EMISSION SYSTEM

- Pressure test EVAP emission system.
- Install Rotunda Evaporative Emission System Tester 134-00056 or equivalent first at the EVAP SERVICE port, if equipped, then at the fuel filler cap.
- Follow test instructions from the Tester Kit.

Is evaporative emission system holding pressure?

Yes	No
GO to HD24 .	REPAIR as necessary. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).

HD24 CHECK VACUUM IN EVAPORATIVE EMISSION SYSTEM

- Check for blockage/restrictions or cut hoses between engine vacuum port and EVAP canister.
- Check for blockage in fuel tank vent system.

Is there a fault indicated?

Yes	No
REPLACE damaged vacuum hoses, or REMOVE blockage/restrictions. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).	GO to HD26 .

HD26 CHECK OF EVAP CANISTER PURGE VALVE HOUSING LEAKS

- EVAP canister purge valve electrically connected.
- Install a hand vacuum pump to the fuel vapor port from EVAP canister on the EVAP canister purge valve vacuum at line.
- Apply 53 kPa (16 in-Hg) of vacuum with the vacuum pump.

Does the EVAP canister purge valve hold vacuum at room temperature?

Yes	No
GO to HD27 .	REMOVE vacuum pump. REPLACE damaged EVAP canister purge valve. COMPLETE PCM Reset to clear DTCs.

HD27 CHECK FOR FILTER CONTAMINATION ON DAMAGE EVAP CANISTER PURGE VALVE

- Vacuum line from input vacuum port to intake manifold on the EVAP canister purge valve (control vacuum solenoid part of valve) is removed.
- Install a hand held vacuum pump to the open input vacuum port on the EVAP canister purge valve.
- Apply 48-52 kPa (10-15 in-Hg) of vacuum to the EVAP canister purge valve.

Does the EVAP canister purge valve hold vacuum, or is the valve very slow to release vacuum to atmosphere?

Yes	No
REPAIR EVAP canister purge valve filter. If unable to clean filter or REMOVE blockage to filter, REPLACE EVAP canister purge valve. COMPLETE Misfire Monitor Repair Verification Drive Cycle.	REMOVE vacuum pump. RECONNECT all components. GO to HD29 .

HD29 CHECK FOR BASE ENGINE CONCERNS

This Pinpoint Test step will determine if there are any base engine concerns that may have caused the Misfire DTC or drive concern.

Note: Engine temperature may affect results.

Perform the following tests in order to evaluate base engine integrity:

- Perform Engine Compression and leakdown tests.
- Perform Valve Train analysis.
- Check Positive Crankcase Ventilation System.
- Check possible leakage points.
- Refer to Engine System-General Information, Section 303-00 in the Workshop Manual for all of the above.

Is any service required?

Yes	No
REFER to Engine System, General Information, Section 303-00 in the Workshop Manual, Diagnosis and Testing, to make repairs.	The cause of the Misfire DTC is intermittent. To diagnose the Ignition System, GO to Z1 . If OK, GO to HD30 .

HD30 CHECK FOR ADDITIONAL MISFIRE DTCS

Diagnostic Trouble Code P0300 indicates multiple cylinders are misfiring or PCM cannot identify which cylinder is misfiring.

Are any other misfire DTCs present?

Yes	No
GO to HD1 .	GO to HD31 .

HD31 CHECK FOR OTHER CONTINUOUS MEMORY DTCS

Are other Continuous Memory DTCS present?

Yes	No
GO to Section 4 for Powertrain Diagnostic Trouble Code (DTC) Charts . PROCEED as required.	GO to HD32 .

HD32 CHECK/COMPARE PID VALUES

- Start engine and warm to normal operating temperature.
- Access DPFEGR PID.
- Record PID value.
- Key off.
- Key on, engine off.
- Access DPFEGR.
- Compare key on, engine off and engine running PID values.

Is engine running DPFEGR PID value within 0.15 volt of key on, engine off value?

Yes	No
KEY OFF. Vehicles with VRS type CMP, GO to HD41 . KEY OFF. Vehicles with hall effect type CMP, GO to HD40 .	KEY OFF. GO to HE100 .

HD40 CHECK CMP SENSOR OUTPUT — PCM DISCONNECTED

Diagnostic Trouble Code (DTC) P1309 indicates Misfire Detection Monitor is not enabled.

- Disconnect PCM.
- Connect digital multimeter.
- Measure voltage between CMP and PWR GND circuits at the PCM harness connector.
- Bump engine in short burst with the starter, without starting engine for at least 10 engine revolutions.

Does digital multimeter reading switch between low (less than 2.0 volts DC) and high (greater than 8.0 volts DC)?

Yes	No
Note: A Hall effect type CMP sensor that is installed out of synchronization will produce a DTC. VERIFY the correct installation by referring to the Electronic Engine Controls, Section 303-14 in the Workshop Manual. If the CMP is installed properly, REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory	REPLACE CMP sensor. RESTORE vehicle. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles). RERUN Quick Test.

(EEPROM). RESTORE vehicle. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles). RERUN Quick Test.

HD41 CHECK CMP SENSOR OUTPUT — PCM CONNECTED

- Connect PCM.
- Connect digital multimeter.
- Start engine and vary engine RPM.
- Measure voltage between CMP and PWR GND circuits at the PCM harness connector.

Does AC voltage vary greater than 0.1 volt AC?

Yes	No
VERIFY the correct installation by referring to the Electronic Engine Controls, Section 303-14 in the Workshop Manual. If CMP is installed properly, REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>). COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>). RERUN Quick Test.	REPLACE CMP sensor. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>).

HE: Exhaust Gas Recirculation (EGR) Systems Introduction

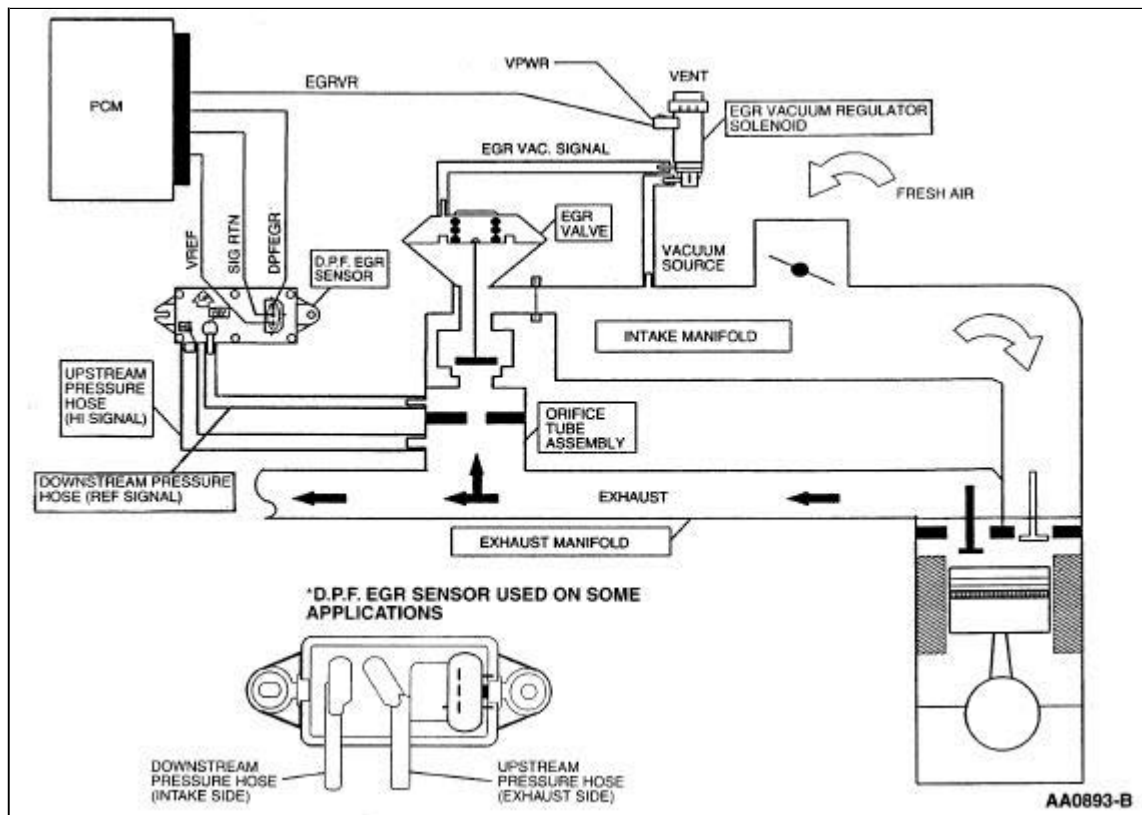

HE: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Differential pressure feedback EGR sensor (9J460)
- Exhaust gas recirculation (EGR) valve (9D460) (9D475)
- EGR vacuum regulator solenoid (9J459)
- Orifice tube assembly (9D477)
- Differential pressure feedback EGR sensor pressure hoses
- Vacuum lines
- Harness circuits: VREF, DPFE, SIG, SIG RTN, EVR, EVR PWR
- Powertrain control module (PCM) (12A650)

HE: Exhaust Gas Recirculation (EGR) Systems

← HE: Introduction

HE1 DTC P1400: DETERMINE PRESENT DPFEGR PID VOLTAGE

- Key on, engine off.
- Access DPFEGR PID.

Is DPFEGR PID voltage less than 0.2 volt?

Yes	No
Fault is currently present. KEY OFF. GO to HE2 .	Fault is intermittent. GO to HE5 .

HE2 ATTEMPT TO INDUCE OPPOSITE D.P.F. EGR SENSOR VOLTAGE

- Disconnect D.P.F. EGR sensor.
- Key on, engine off.

Is DPFEGR PID value between 4.0 and 6.0 volts?

Yes	No
REPLACE D.P.F. EGR sensor.	GO to HE3 .

HE3 CHECK VREF AND SIG RTN CIRCUITS FOR OPEN IN HARNESS TO D.P.F. EGR SENSOR

- Measure voltage between VREF and SIG RTN circuits at the D.P.F. EGR sensor harness connector.

Is VREF voltage between 4.0 and 6.0 volts?

Yes	No
KEY OFF. GO to HE4 .	GO to C1 .

HE4 CHECK DPFEGR CIRCUIT FOR SHORT TO GROUND AND SIG RTN IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect scan tool from DLC.
- Disconnect PCM.
- Measure resistance between DPFEGR and SIG. RTN circuits at the PCM harness connector.
- Measure resistance between DPFEGR circuit at the PCM harness connector and battery negative

post.

Is each resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPAIR short circuit.

HE5 PERFORM WIGGLE TEST ON D.P.F. EGR SENSOR AND CIRCUIT WHILE MONITORING DPFEGR PID FOR A SUDDEN CHANGE

- While monitoring DPFEGR PID, tap on the D.P.F. EGR sensor and wiggle the wiring while looking for a sudden change in value as an indication of an intermittent.

Is intermittent fault found?

Yes	No
REPAIR as necessary.	Unable to duplicate or identify fault at this time. GO to <u>Z1</u> .

HE10 DTC P1401: DETERMINE PRESENT DPFEGR PID VOLTAGE

- Key on, engine off.
- Access DPFEGR PID with a scan tool.

Is DPFEGR PID voltage greater than 4.0 volts?

Yes	No
Fault is currently present. KEY OFF. GO to <u>HE11</u> .	Fault is intermittent. GO to <u>HE19</u> .

HE11 CHECK DPFEGR CIRCUIT FOR SHORT TO PWR

- Disconnect D.P.F. EGR sensor.
- Key on, engine off.
- Measure voltage between DPFEGR circuit at the D.P.F. EGR sensor harness connector and chassis ground.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to <u>HE12</u> .	GO to <u>HE13</u> .

HE12 CHECK DPFEGR CIRCUIT FOR SHORT TO PWR IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Key on, engine off.
- Measure voltage between DPFEGR circuit at the PCM harness connector and the battery negative post.

Is voltage greater than 10.5 volts?

Yes	No
REPAIR short circuit.	REPLACE damaged PCM.

HE13 INDUCE OPPOSITE D.P.F. EGR SENSOR VOLTAGE

- Connect a jumper wire between DPFEGR and SIG RTN circuits at the D.P.F. EGR sensor harness connector.
- **Note:** If a scan tool communication concern exists, key off, remove jumper immediately and GO to [HE18](#).
- Access DPFEGR PID.

Is DPFEGR PID voltage less than 0.05 volt?

Yes	No
REMOVE jumper. GO to HE14 .	Unable to induce opposite signal. KEY OFF. GO to HE16 .

HE14 CHECK VREF VOLTAGE TO D.P.F. EGR SENSOR

- Measure voltage between VREF and SIG RTN circuits at the D.P.F. EGR sensor harness connector.

Is VREF voltage between 4.0 and 6.0 volts?

Yes	No
GO to HE15 .	GO to C1 .

HE15 CHECK DPFEGR CIRCUIT FOR SHORT TO VREF IN HARNESS

- Disconnect PCM.
- Measure resistance between DPFEGR and VREF circuits at the PCM harness connector. (For LS6/LS8 measure to both VREF pins.)

Is resistance greater than 10 K ohms?

Yes	No
REPLACE D.P.F. EGR sensor.	REPAIR short circuit.

HE16 CHECK DPFEGR CIRCUIT FOR OPEN IN HARNESS

- Disconnect PCM.
- Measure resistance of DPFEGR circuit between PCM harness connector pin and D.P.F. EGR sensor harness connector.

Is resistance less than 5.0 ohms?

Yes	No
GO to <u>HE17</u> .	REPAIR open circuit.

HE17 CHECK SIG RTN CIRCUIT FOR OPEN IN HARNESS

- Measure resistance of SIG RTN circuit between PCM harness connector pin and D.P.F. EGR sensor harness connector.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPAIR open circuit.

HE18 CHECK DPFEGR CIRCUIT FOR SHORT TO VREF IN HARNESS

- Disconnect PCM.
- Measure resistance between DPFEGR and VREF circuits at the PCM harness connector. (For LS6/LS8 measure to both VREF pins.)

Is resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPAIR short circuit.

HE19 COMPLETE A WIGGLE TEST ON D.P.F. EGR SENSOR AND CIRCUIT WHILE MONITORING DPFEGR PID FOR A SUDDEN CHANGE

- While monitoring DPFEGR PID, tap on the D.P.F. EGR sensor and wiggle the wiring while looking for a sudden change in value as an indication of an intermittent.

Is intermittent fault found?

Yes	No
REPAIR as necessary.	Unable to duplicate or identify fault at this time. GO to <u>Z1</u> .

HE20 DTC P0402: CHECK FOR EGR FLOW AT IDLE WITH EGR VACUUM HOSE DISCONNECTED

Note: If DTC P1405 is in continuous memory, diagnose that first starting with HE50.

- Disconnect vacuum hose at EGR valve and plug hose.
- Run Key On Engine Running (KOER) Self-Test.

Is KOER DTC P0402 output or unable to run KOER Self-Test due to engine stall or no start?

Yes	No
KEY OFF. INSPECT pressure hoses first for pinching and icing. If OK, REMOVE and INSPECT the EGR valve and EGR tube for signs of contamination, unusual wear, carbon deposits, binding and other damage. REPAIR as necessary.	RECONNECT vacuum hose to EGR valve. GO to HE21 .

HE21 CHECK FOR EGR FLOW AT IDLE WITH EGR VACUUM HOSE CONNECTED

- EGR vacuum hose connected.
- Run KOER Self-Test.

Is KOER DTC P0402 output or unable to run KOER Self-Test due to engine stall or no start?

Yes	No
There is possible EGR flow at idle. GO to HE22 .	Fault is intermittent. INSPECT pressure hoses for pinching and icing. REPAIR as necessary. If OK, GO to HE30 .

HE22 CHECK EGR SYSTEM VACUUM HOSES FOR INTEGRITY AND CONNECTION

Note: A pinched or plugged EGR vacuum hose can trap vacuum between the EGR vacuum regulator solenoid and EGR valve not allowing the EGR valve to close.

- Trace each vacuum hose from EGR vacuum regulator solenoid and verify that each hose is connected correctly. (Refer to vehicle vacuum diagram label.)
- Verify that the EGR valve vacuum hose is not pinched or plugged and routed properly.

Are vacuum hoses OK?

Yes	No
RECONNECT vacuum hoses. GO to HE23 .	REPAIR vacuum hoses as necessary.

HE23 CHECK D.P.F. EGR SENSOR OUTPUT BY APPLYING VACUUM WITH HAND PUMP

- Disconnect pressure hoses at D.P.F. EGR sensor.
- Connect a hand vacuum pump to the downstream connection at sensor (intake manifold side of sensor or the smaller diameter pickup tube).
- Key on, engine off.
- Access DPFEGR PID and note PID value.

- Apply 27 to 30 kPa (8 to 9 in-Hg) vacuum to the D.P.F. EGR sensor and hold for a few seconds.
- Quickly release vacuum.
 - The DPFEGR PID voltage must be between 0.2 and 1.3 volt with the key on and no vacuum applied.
 - The DPFEGR PID voltage must increase to greater than 4.0 volts with the vacuum applied.
 - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when vacuum is released.

Does the DPFEGR PID voltage indicate a fault in the D.P.F. EGR sensor?

Yes	No
REPLACE D.P.F. EGR sensor.	RECONNECT D.P.F. EGR sensor. GO to HE24 .

HE24 CHECK FOR EGR FLOW AT IDLE WITH EGR VACUUM REGULATOR SOLENOID CONNECTOR OFF

- Disconnect vacuum hose at EGR valve and connect hose to vacuum gauge.
- Start engine and bring to an idle.
- While monitoring vacuum gauge, disconnect the EGR vacuum regulator solenoid harness connector.
 - The EGR valve requires vacuum greater than 5.4 kPa (1.6 in-Hg) to begin to open. If the vacuum reading remains greater than 5.4 kPa (1.6 in-Hg) after the EGR vacuum regulator solenoid is electrically disconnected, this would indicate a mechanical fault in the EGR vacuum regulator solenoid.

Does the EGR vacuum remain greater than 5.4 kPa (1.6 in-Hg) at idle even after EGR vacuum regulator solenoid is electrically disconnected?

Yes	No
This indicates a fault in the EGR vacuum regulator solenoid. KEY OFF. GO to HE25 .	KEY OFF. GO to HE26 .

HE25 INSPECT EGR VACUUM REGULATOR SOLENOID VENT FOR PLUGGING

Note: A plugged EGR vacuum regulator solenoid vent will not allow EGR vacuum to vent to atmosphere.

- Disconnect EGR vacuum regulator solenoid vacuum hoses.
- Remove EGR vacuum regulator solenoid vent cap (if removable).
- Remove filter and inspect for blockage or icing in some cases.
- With the EGR vacuum supply port plugged, apply 34 to 51 kPa (10 to 15 in-Hg) of vacuum directly to EGR vacuum regulator solenoid vacuum source port with a hand vacuum pump. If the vacuum holds or is slow to release to atmosphere, the EGR vacuum regulator solenoid vent could be plugged or restricted.

AA0897-A

Is the EGR vacuum regulator solenoid vent or vent filter plugged or restricted?

Yes	No
REPAIR EGR vacuum regulator solenoid as necessary. If unable to repair, REPLACE EGR vacuum regulator solenoid.	REPLACE EGR vacuum regulator solenoid.

HE26 MEASURE EGR VACUUM REGULATOR SOLENOID COIL RESISTANCE

- Measure resistance across EGR vacuum regulator solenoid.

Is resistance between 26 and 40 ohms?

Yes	No
GO to HE27 .	REPLACE EGR vacuum regulator solenoid.

HE27 CHECK EGRVR CIRCUIT FOR SHORT TO GROUND IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect scan tool from DLC.
- Disconnect PCM.
- Measure resistance between EGRVR circuit at the PCM harness connector and battery negative post.

Is resistance greater than 10,000 ohms?

Yes	No
GO to HE28 .	REPAIR short circuit.

HE28 CHECK EGRVR CIRCUIT FOR SHORT TO VREF

- Measure resistance between EGRVR and VREF circuits at the PCM harness connector. (For LS6/LS8 measure to both VREF pins.)

Is resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash	

Electrically Erasable Programmable Read Only Memory (EEPROM).

REPAIR short circuit.

HE30 CHECK D.P.F. EGR SENSOR OUTPUT BY APPLYING VACUUM WITH HAND PUMP

- Disconnect pressure hoses at D.P.F. EGR sensor.
- Connect a hand vacuum pump to the downstream connection at sensor (intake manifold side of sensor or the smaller diameter pickup tube).
- Key on, engine off.
- Access DPFEGR PID and note PID value.
- Apply 27 to 30 kPa (8 to 9 in-Hg) vacuum to the D.P.F. EGR sensor and hold for a few seconds
- Quickly release vacuum.
 - The DPFEGR PID voltage must be between 0.2 and 1.3 volt with the key on and no vacuum applied.
 - The DPFEGR PID voltage must increase to greater than 4.0 volts with the vacuum applied.
 - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when vacuum is released.

Does the DPFEGR PID voltage indicate a fault in the D.P.F. EGR sensor?

Yes	No
REPLACE D.P.F. EGR sensor.	RECONNECT D.P.F. EGR sensor. GO to HE31 .

HE31 CHECK D.P.F. EGR SENSOR VOLTAGE WHILE EXERCISING EGR VALVE

- Key on, engine off.
- View DPFEGR PID and make note of voltage.
 - Typical D.P.F. EGR sensor voltage with no EGR flow is between 0.2 and 1.3 volt.
- Disconnect vacuum hose at EGR valve and plug hose.
- Connect a hand vacuum pump to EGR valve.
- Start engine and bring to idle.
- Observe DPFEGR PID at idle and compare to the key on engine off voltage. (A higher voltage at idle could be due to a non-seating EGR valve.)
- Apply just enough vacuum to EGR valve to open it 7-10 kPa (2-3 in-Hg) without stalling engine and release vacuum. Repeat several times while observing DPFEGR PID. (DPFEGR PID voltage must increase as valve begins to open and return to initial value as vacuum is released. A slow to return voltage could be an indication of a binding or a slow-closing EGR valve.)

Does the DPFEGR PID voltage indicate an open, binding or slow-closing EGR valve?

Yes	No
REMOVE and INSPECT the EGR valve for signs of contamination, unusual wear, carbon deposits, binding and other damage. REPAIR as necessary.	KEY OFF. GO to HE32 .

HE32 MONITOR EGR VALVE VACUUM WHILE WIGGLING EGRVR CIRCUIT

Note: An intermittent short to GND in the EGRVR circuit will cause the vacuum applied to the EGR valve to be higher than normal while the short is present. The vacuum available at the EGR valve at idle is normally below 3.4 kPa (1.0 in-Hg) and it takes about 5.4 kPa (1.6 in-Hg) for the valve to begin to open.

- Remove hand vacuum pump.
- Connect vacuum gauge to EGR valve vacuum hose.
- Key on, engine running.
- Observe vacuum gauge for an indication of a fault while performing the following:
 - Lightly tap on the EGR vacuum regulator solenoid; wiggle the EGR vacuum regulator solenoid connector and vehicle harness between solenoid and PCM. A fault is indicated by a sudden jump in vacuum reading.

Is intermittent fault found?

Yes	No
ISOLATE fault and REPAIR as necessary.	RECONNECT vacuum hose. KEY OFF. GO to <u>HE33</u> .

HE33 INSPECT EGR VACUUM REGULATOR SOLENOID AND VACUUM HOSES FOR POTENTIAL PLUGGING

- Remove EGR vacuum regulator solenoid vent filter and inspect for contamination and excessive water absorption. (In cold climate, excessive water in filter could freeze and plug the EGR vacuum regulator solenoid vent.)
- Inspect EGR vacuum hose for possible blockage or pinching.

Is EGR vacuum regulator solenoid vent or filter contaminated or vacuum hose plugged?

Yes	No
REPAIR EGR vacuum regulator solenoid or EGR vacuum hose as necessary.	Unable to duplicate or identify fault at this time. GO to <u>Z1</u> .

HE50 DTC P1405: INSPECT UPSTREAM PRESSURE HOSE CONNECTIONS

- Inspect upstream hose at D.P.F. EGR sensor and orifice tube assembly for disconnect or poor connection.

Is hose off or poorly connected?

A21168-B

Yes	No
REPAIR as necessary. COMPLETE EGR Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).	GO to HE51 .

HE51 INSPECT UPSTREAM PRESSURE HOSE FOR PLUGGING

Note: It is essential that the D.P.F. EGR pressure hose used is the correct repair part and not a substitute.

- Visually inspect upstream pressure hose routing. Hose must not be pinched or have dips in it where water could settle or freeze.
- Remove upstream pressure hose and carefully inspect for plugging, water or leaks.

Is there a fault detected in the hose?

Yes	No
REPAIR or REPLACE upstream pressure hose as necessary. COMPLETE EGR Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).	GO to HE52 .

HE52 CHECK ORIFICE TUBE ASSEMBLY AND D.P.F. EGR SENSOR

- Inspect the upstream connection on the D.P.F. EGR sensor for plugging or damage at the sensor.
- Inspect the exhaust manifold side pressure pickup tube at the orifice tube assembly for plugging or damage.

Is the D.P.F. EGR sensor or orifice tube assembly plugged or damaged?

Yes	No
REPAIR or REPLACE D.P.F. EGR sensor or orifice tube assembly as necessary. COMPLETE EGR Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).	GO to HE53 .

HE53 CHECK D.P.F. EGR SENSOR OUTPUT BY APPLYING VACUUM WITH HAND

PUMP

- Disconnect pressure hoses at D.P.F. EGR sensor.
- Connect a hand vacuum pump to the downstream connection at sensor (intake manifold side of sensor or the smaller diameter pickup tube).
- Key on, engine off.
- Access DPFEGR PID and note PID value.
- Apply 27 to 30 kPa (8 to 9 in-Hg) vacuum to the D.P.F. EGR sensor and hold for a few seconds.
- Quickly release vacuum.
 - The DPFEGR PID voltage must be between 0.2 and 1.3 volt with the key on and no vacuum applied.
 - The DPFEGR PID voltage must increase to greater than 4.0 volts with the vacuum applied.
 - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when vacuum is released.

Does the DPFEGR PID voltage indicate a fault in the D.P.F. EGR sensor?

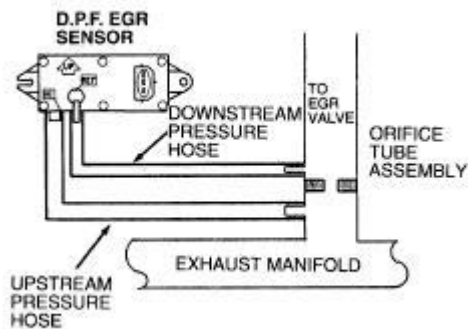

Yes	No
REPLACE D.P.F. EGR sensor. COMPLETE an EGR Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).	Unable to duplicate or identify fault at this time. GO to Z1 .

HE60 DTC P1406: INSPECT DOWNSTREAM PRESSURE HOSE CONNECTIONS

Note: If the fault is currently present, DTC P1408 will be output in Key On Engine Running (KOER) Self-Test.

- Inspect downstream hose at D.P.F. EGR sensor and orifice tube assembly for disconnect or poor connection.

Is hose OFF or poorly connected?

Yes	No
REPAIR as necessary.	GO to HE61 .

HE61 INSPECT DOWNSTREAM PRESSURE HOSE FOR PLUGGING

Note: It is essential that the D.P.F. EGR sensor pressure hose is the correct repair part and not a substitute.

- Visually inspect downstream pressure hose routing. Hose must not be pinched or have dips in it where water can settle or freeze.
- Remove downstream pressure hose and carefully inspect for plugging, water or leaks.

Is there a fault detected in the hose?

Yes	No
REPAIR or REPLACE as necessary.	GO to HE62 .

HE62 CHECK ORIFICE TUBE ASSEMBLY AND D.P.F. EGR SENSOR

- Inspect the connections at the D.P.F. EGR sensor for plugging or damage.
- Inspect the intake manifold side pressure pickup tube and orifice tube assembly for plugging, loose connection or damage.

Is the D.P.F. EGR sensor or orifice tube assembly plugged, loose or damaged?

Yes	No
REPAIR or REPLACE D.P.F. EGR sensor or orifice tube assembly as necessary.	GO to HE63 .

HE63 CHECK EGR SENSOR OUTPUT BY APPLYING VACUUM WITH HAND PUMP

- Disconnect pressure hoses at D.P.F. EGR sensor.
- Connect a hand vacuum pump to the downstream connection at sensor (intake manifold side of sensor or the smaller diameter pickup tube).
- Key on, engine off.
- Access DPFEGR PID and note PID value.
- Apply 27 to 30 kPa (8 to 9 in-Hg) vacuum to the D.P.F. EGR sensor and hold for a few seconds.
- Quickly release vacuum.
 - The DPFEGR PID voltage must be between 0.2 and 1.3 volt with the key on and no vacuum applied.
 - The DPFEGR PID voltage must increase to greater than 4.0 volts with the vacuum applied.
 - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when vacuum is released.

Does the DPFEGR PID voltage indicate a fault in the D.P.F. EGR sensor?

Yes	No
REPLACE D.P.F. EGR sensor.	Unable to duplicate or identify fault at this time. GO to Z1 .

HE70 DTC P0401: RUN KOER SELF-TEST

- Run KOER Self-Test.

Is KOER DTC P1408 output?

Yes	No
Fault is currently present. GO to HE71 .	GO to HE90 .

HE71 DTC P1408: RETRIEVE CONTINUOUS MEMORY DTCS

Note: If any DTC other than DTC P1406 is output, record DTC and refer to [Diagnostic Trouble Code \(DTC\) Charts](#) in Section 4 after completing this Pinpoint Test.

- Retrieve all Continuous Memory DTCs.

Is DTC P1406 output?

Yes	No
GO to HE60 .	GO to HE72 .

HE72 RUN KOER SELF-TEST WHILE MONITORING EGR VACUUM

- Disconnect vacuum hose at EGR valve and connect hose to a vacuum gauge.

Note: Since the EGR vacuum hose is disconnected, ignore DTCs during this KOER Self-Test.

- Run Key On Engine Running (KOER) Self-Test while monitoring gauge. Approximately 30 seconds into test, EGR flow will be requested for a few seconds. The vacuum at this time should increase above 5.4 kPa (1.6 in-Hg) to open the valve.

Does the vacuum increase to 10 kPa (3.0 in-Hg) or greater at any time during KOER Self-Test?

Yes	No
The vacuum indicated is sufficient to open the EGR valve. Fault is unlikely to be in EGR vacuum control system. KEY OFF. GO to HE73 .	The vacuum indicated is insufficient to open the EGR valve. KEY OFF. GO to HE80 .

HE73 INSPECT D.P.F. EGR SENSOR PRESSURE HOSES

- Visually inspect both pressure hoses for reversed connection at D.P.F. EGR sensor or at orifice tube assembly.
- Inspect both hoses for improper routing. Hoses should not be pinched or have dips where water could settle or freeze.
- Inspect both hoses for leaks and blockage.
- Inspect D.P.F. EGR sensor and orifice tube assembly for blockage or damage at the pickup tubes.

Is a fault detected?

A21169-B

Yes	No
REPAIR pressure hoses as necessary.	GO to HE74 .

HE74 CHECK D.P.F. EGR SENSOR OUTPUT BY APPLYING VACUUM WITH HAND PUMP

- Disconnect pressure hoses at D.P.F. EGR sensor.
- Connect a hand vacuum pump to the downstream connection at sensor (intake manifold side of sensor or the smaller diameter pickup tube.)
- Key on, engine off.
- Access DPFEGR PID and note PID value.
- Apply 27-30 kPa (8-9 in-Hg) vacuum to the D.P.F. EGR sensor and hold for a few seconds.
- Quickly release vacuum.
 - The DPFEGR PID voltage must be between 0.2 and 1.3 volt with the key on and no vacuum applied.
 - The DPFEGR PID voltage must increase to greater than 4.0 volts with the vacuum applied.
 - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when vacuum is released.

Does the DPFEGR PID voltage indicate a fault in the D.P.F. EGR sensor?

Yes	No
REPLACE D.P.F. EGR sensor.	RECONNECT pressure hoses. GO to HE76 .

HE76 CHECK EGR VALVE FUNCTION BY APPLYING VACUUM WITH HAND PUMP

- Disconnect vacuum hose at EGR valve and plug hose.
- Connect a hand vacuum pump to EGR valve.
- Start engine and bring to idle.
- Access DPFEGR and rpm PIDs.
- Slowly apply 27 to 34 kPa (8 to 10 in-Hg) of vacuum to the EGR valve and hold it for 10 seconds. If engine wants to stall, increase rpm with throttle to maintain a minimum of 1000 rpm.
- Look for the following:
 - EGR valve starts opening at about 5.4 kPa (1.6 in-Hg) vacuum indicated by increasing DPFEGR PID voltage.
 - DPFEGR PID voltage increasing until EGR valve is fully open. DPFEGR PID must read 2.5 volts minimum with full vacuum applied.

- DPFEGR PID voltage steady when vacuum is held. If voltage drops within a few seconds, the EGR valve or vacuum source can be leaking.

Does the DPFEGR PID voltage indicate that the EGR valve is operating as described in this test?

Yes	No
GO to HE85 .	REMOVE and INSPECT the EGR valve for signs of contamination, unusual wear, carbon deposits, binding, leaking diaphragm and other damage. If EGR valve is OK, look for an obstructed EGR port in the intake manifold or plugged orifice tube assembly. REPAIR as necessary.

HE80 CHECK VACUUM SOURCE AND VACUUM HOSES TO AND FROM EGR VACUUM REGULATOR SOLENOID

- Inspect vacuum lines between vacuum source and EGR vacuum regulator solenoid and between EGR vacuum regulator solenoid and EGR valve for leaks, kinks, disconnects, blockage, routing or any damage.
- Disconnect vacuum hoses at EGR vacuum regulator solenoid.
- Connect EGR vacuum regulator solenoid vacuum source hose to a vacuum gauge.
- With engine warm and at idle, take vacuum gauge reading.

Is the vacuum gauge reading a minimum of 51 kPa (15 in-Hg) at idle and vacuum lines OK?

Yes	No
KEY OFF. GO to HE81 .	ISOLATE fault and REPAIR as necessary.

HE81 CHECK VPWR VOLTAGE TO EGR VACUUM REGULATOR SOLENOID

- Disconnect EGR vacuum regulator solenoid.
- Key on, engine off.
- Measure VPWR circuit voltage at EGR vacuum regulator solenoid harness connector.

Is EGR vacuum regulator solenoid VPWR voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to HE82 .	REPAIR open circuit.

HE82 CHECK EGR VACUUM REGULATOR SOLENOID RESISTANCE

- Measure EGR vacuum regulator solenoid resistance.

Is solenoid resistance between 26 and 40 ohms?

Yes	No
GO to HE83 .	REPLACE EGR vacuum regulator solenoid.

HE83 CHECK EGRVR CIRCUIT FOR SHORT TO PWR IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Key on, engine off.
- Measure voltage between EGRVR circuit at the PCM harness connector and battery negative post.

Is voltage greater than 1.0 volt?

Yes	No
REPAIR short circuit.	KEY OFF. GO to HE84 .

HE84 CHECK EGRVR CIRCUIT FOR OPEN IN HARNESS

- Measure resistance of EGRVR circuit between PCM harness connector pin and EGR vacuum regulator solenoid harness connector.

Is resistance less than 5.0 ohms?

Yes	No
RECONNECT PCM and EGR vacuum regulator solenoid. GO to HE85 .	REPAIR open in EGRVR circuit.

HE85 CHECK EGR VACUUM REGULATOR SOLENOID VACUUM OUTPUT CAPABILITY BY GROUNDING EGRVR CIRCUIT

- Disconnect vacuum hose at the EGR valve and connect to a vacuum gauge.
- Key on, engine running.
- With engine at idle, jumper PCM EGRVR circuit to chassis ground.

Is vacuum gauge reading 13.5 kPa (4.0 in-Hg) or greater?

Yes	No
REPLACE PCM (refer to section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPLACE EGR vacuum regulator solenoid.

HE90 INSPECT EGR SYSTEM FOR AN INTERMITTENT FAILURE

- Visually inspect the EGR system for signs of intermittent failure.

Is a fault found?

Yes	No
REPAIR fault as necessary.	GO to HE91 .

HE91 INSPECT D.P.F. EGR SENSOR PRESSURE HOSES

- Visually inspect both pressure hoses for reversed connection at D.P.F. EGR sensor or at orifice tube assembly.
- Inspect both hoses for improper routing. Hoses should not be pinched or have dips where water could settle or freeze.
- Inspect both hoses for leaks and blockage.
- Inspect D.P.F. EGR sensor and orifice tube assembly for blockage or damage at the pickup tubes.

Is a fault detected?

A21169-B

Yes	No
REPAIR pressure hoses as necessary.	GO to <u>HE92</u> .

HE92 CHECK D.P.F. EGR SENSOR OUTPUT BY APPLYING VACUUM WITH HAND PUMP

- Disconnect pressure hoses at D.P.F. EGR sensor.
- Connect a hand vacuum pump to the downstream connection at sensor (intake manifold side of sensor or the smaller diameter pickup tube.)
- Key on, engine off.
- Access DPFEGR PID and note PID value.
- Apply 27-30 kPa (8-9 in-Hg) vacuum to the D.P.F. EGR sensor and hold for a few seconds.
- Quickly release vacuum.
 - The DPFEGR PID voltage must be between 0.2 and 1.3 volt with the key on and no vacuum applied.
 - The DPFEGR PID voltage must increase to greater than 4.0 volts with the vacuum applied.
 - The DPFEGR PID must drop to less than 1.5 volts in less than 3 seconds when vacuum is released.

Does the DPFEGR PID voltage indicate a fault in the D.P.F. EGR sensor?

Yes	No
REPLACE D.P.F. EGR sensor.	RECONNECT pressure hoses. GO to <u>HE93</u> .

HE93 CHECK EGR VALVE FUNCTION BY APPLYING VACUUM WITH HAND PUMP

- Disconnect vacuum hose at EGR valve and plug hose.
- Connect a hand vacuum pump to EGR valve.
- Start engine and bring to idle.
- Access DPFEGR and RPM PIDs.
- Slowly apply 17 to 34 kPa (5 to 10 in-Hg) of vacuum to the EGR valve and hold it for 10 seconds. If engine wants to stall, increase rpm with throttle to maintain a minimum of 800 rpm.
- Look for the following:
 - EGR valve starts opening at about 5.4 kPa (1.6 in-Hg) vacuum indicated by increasing DPFEGR PID voltage.
 - DPFEGR PID voltage increasing until EGR valve is fully open. DPFEGR PID should read 2.5 volts minimum with full vacuum applied.
 - DPFEGR PID voltage steady when vacuum is held. If voltage drops within a few seconds, the EGR valve or vacuum source could be leaking.

Does the DPFEGR PID voltage indicate that the EGR valve is operating as described in this test?

Yes	No
GO to HE94 .	REMOVE and INSPECT the EGR valve for signs of contamination, unusual wear, carbon deposits, binding, leaking diaphragm and other damage. If EGR valve is OK, look for an obstructed EGR port in the intake manifold. REPAIR as necessary.

HE94 INSPECT EGR VACUUM SIGNAL SUPPLY FOR INTERMITTENT FAILURE

- Disconnect plugged hose at EGR valve and connect to a vacuum gauge.
- Key on, engine running.
- Connect a jumper wire between EGRVR circuit and ground to activate the solenoid to full on. At idle, the vacuum gauge should read above 13.5 kPa (4.0 in-Hg).
- Observe vacuum gauge for an indication of a fault while performing the following:
 - Lightly tap on the EGR vacuum regulator solenoid and wiggle the EGR vacuum regulator solenoid connector, vacuum lines and vehicle harness between the solenoid and PCM. A fault is indicated by a sudden drop in vacuum reading.

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary.	Unable to duplicate or identify fault at this time. (In cold climates, the EGR valve may temporarily freeze shut and thaw when the engine warms up causing the intermittent DTC.) GO to Z1 .

HE100 EGR DIAGNOSIS BY SYMPTOM: CHECK FOR EGR FLOW WITH EGR VACUUM HOSE DISCONNECTED AND PLUGGED

Note: Perform KOER Self-Test and repair any DTCs before proceeding with this test.

The symptom charts have indicated possible EGR flow at idle with no EGR diagnostic trouble codes output.

Possible causes:

- EGR valve not fully seating.
- EGR vacuum regulator solenoid vent restricted.
- Damaged EGR vacuum regulator solenoid.
- Disconnect vacuum hose at EGR valve and plug hose.
- Key on, engine off.
- Access DPFEGR PID and note voltage.
- Start engine and bring to idle.
- With engine at idle, look at the DPFEGR PID voltage and compare to the engine off reading. An increase in the voltage at idle indicates that the differential pressure feedback EGR sensor is sensing EGR flow.

Is the DPFEGR PID voltage greater at idle by a minimum of 0.15 volt than with the engine off?

Yes	No
The DPFEGR PID voltage is indicating EGR flow at idle. Since the EGR vacuum hose is disconnected and plugged, the fault is most likely in the EGR valve. REMOVE and INSPECT the EGR valve for signs of contamination, unusual wear, carbon deposits, binding and other damage. REPAIR as necessary.	This indicates a fault in the EGR valve vacuum supply. INSPECT the EGR vacuum regulator solenoid vent and vent filter for restrictions. REPAIR as necessary. If OK, REPLACE EGR vacuum regulator solenoid.

HE110 DTC P1409: CHECK EGR VACUUM REGULATOR SOLENOID RESISTANCE

- Disconnect EGR vacuum regulator solenoid.
- Measure EGR vacuum regulator solenoid resistance.

Is solenoid resistance between 26 and 40 ohms?

Yes	No
GO to <u>HE111</u> .	REPLACE EGR vacuum regulator solenoid.

HE111 CHECK VPWR VOLTAGE TO EGR VACUUM REGULATOR SOLENOID

- Key on, engine off.
- Measure VPWR circuit voltage at EGR vacuum regulator solenoid harness connector.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to <u>HE112</u> .	REPAIR open in VPWR circuit.

HE112 CHECK EGRVR CIRCUIT FOR OPEN IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Measure resistance of EGRVR circuit between PCM Pin and EGR vacuum regulator solenoid harness connector.

Is resistance less than 5.0 ohms?

Yes	No
GO to HE113 .	REPAIR open in EGRVR circuit.

HE113 CHECK EGRVR CIRCUIT FOR SHORT TO POWER IN HARNESS

- Key on, engine off.
- Measure voltage between EGRVR at the PCM harness connector and battery negative post.

Is voltage less than 1.0 volt?

Yes	No
KEY OFF. GO to HE114 .	REPAIR short circuit.

HE114 CHECK EGRVR CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Measure resistance between EGRVR and PWR GND circuits at the PCM harness connector.

Is each resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR short circuit.

HE120 CONTINUOUS MEMORY DTC P1409: WIGGLE EGR VACUUM REGULATOR SOLENOID WHILE MONITORING VPWR

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

Note: If DTC P1409 was output in Key On Engine Off (KOEO) or Key On Engine Running (KOER) Self-Test, GO to [HE110](#) to diagnose present fault.

- Disconnect PCM.
- Key on.
- Measure voltage between EGRVR and PWR GND circuits at the PCM harness connector.
- Voltage must read greater than 10.5 volts. For an indication of a fault, look for this voltage to drop while performing the following:
 - Lightly tap on the EGR vacuum regulator solenoid.
 - Wiggle the EGR vacuum regulator solenoid connector.
 - Grasp the EGR vacuum regulator solenoid harness connector and wiggle wires between solenoid and PCM.

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary.	Unable to duplicate or identify fault at this time. GO to <u>Z1</u> .

HF: Catalyst Efficiency Monitor and Exhaust Systems Introduction

HF: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Exhaust system pipes (front and rear)
- Exhaust system muffler and tailpipe assembly
- Catalytic converter
- Exhaust manifold
- Harness circuits: Downstream heated oxygen sensors (HO2S)

HF: Pinpoint Tests →

HF: Catalyst Efficiency Monitor and Exhaust Systems

← HF: Introduction

HF1 DTCs P0420 OR P0430: CHECK FOR MISFIRE DETECTION MONITOR DTCS

NOTE 1: Be sure customer has not:

1. Refueled vehicle with leaded gasoline.
2. Noticed high vehicle oil consumption.

NOTE 2: If entering this Pinpoint Test for symptoms only, immediately GO to [HF5](#).

NOTE 3: Internal deterioration of a catalytic converter is usually caused by abnormal engine operation upstream of the catalyst. Events that can produce higher than normal temperatures in the catalyst are particularly suspect. For example, misfiring can cause higher than normal catalyst operating temperatures.

- Retrieve and record all Continuous Memory DTCs (MIL and non-MIL).

Were any of the following Misfire Detection Monitor DTCs recorded: P0300, P0301, P0302, P0303, P0304, P0305, P0306, P0307, P0308, P0309 and P0310?

Yes	No
GO to Section 4, Powertrain Diagnostic Trouble Code (DTC) Charts , to address the Misfire Detection Monitor DTCs.	GO to HF2 .

HF2 CHECK FOR HO2S MONITOR DTCS

NOTE: Incorrect HO2S signal input (such as rich/lean input signal when the engine is operating under lean/rich conditions) can cause an abnormal temperature increase in the catalyst.

Were any of the following HO2S monitor DTCs recorded in HF1: P0136, P0138 and P0141 (Bank 1, rear HO2S) or P0156, P0158 and P0161 (Bank 2, rear HO2S)?

Yes	No
GO to, Section 4, Powertrain Diagnostic Trouble Code (DTC) Charts , to address the HO2S Monitor DTCs.	GO to HF3 .

HF3 CHECK FOR ECT OR CHT SENSOR DTCS

Note: ECT or CHT sensor DTCs can indicate that the thermostat is not operating correctly or that the engine coolant level is not filled to specification, producing above normal operating temperatures.

Were any of the following ECT or CHT sensor DTCs recorded in HF1: P0117, P0118, P0125, P1117, P1285, P1288, P1289, P1290 and P1299?

Yes	No
GO to Section 4, Powertrain Diagnostic Trouble Code (DTC) Charts , to address the ECT or CHT sensor DTCs.	GO to HF4 .

HF4 CHECK FOR ANY OTHER DTCS

Were any other DTCs recorded in HF1 (not including the initial P0420 or P0430 DTCs)?

Yes	No
GO to Section 4, Powertrain Diagnostic Trouble Code (DTC) Charts , to address the DTCs.	GO to HF5 .

HF5 CHECK REAR HO2S WIRING AND PCM CONNECTIONS

Note: If the electrical connections of the rear HO2S are interchanged/crossed, the Catalyst Efficiency Monitor Test will fail.

- Inspect the wiring of each rear HO2S for proper routing and connection.
- Disconnect the PCM, inspect for damaged or pushed out pins, corrosion and loose wires.

Are there any concerns with the HO2S wiring or the PCM connection?

Yes	No
REPAIR any wiring or connection concerns. For PCM pin concerns, REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)). COMPLETE Catalyst Monitor OBD II Drive Cycle to verify repair (Refer to Section 2, Drive Cycles).	No Electronic EC root causes related to the DTCs or symptoms. GO to HF6 .

HF6 CHECK FUEL PRESSURE

WARNING: THE FUEL SYSTEM WILL REMAIN PRESSURIZED WHEN THE ENGINE IS NOT RUNNING. TO PREVENT INJURY OR FIRE, USE CAUTION WHEN WORKING ON THE FUEL SYSTEM.

Note: Fuel pressures above specification can produce an abnormally rich air/fuel mixture. The rich air/fuel mixture can cause higher than normal catalyst operating temperatures.

- RETURN FUEL SYSTEM
 - Inspect the vacuum hose going to the fuel pressure regulator for proper installation and cracks. Repair as necessary.
 - Verify vacuum source to fuel pressure regulator.
- MECHANICAL RETURNLESS FUEL SYSTEM
 - If applicable, inspect the vacuum hose going to the fuel rail pulse damper for proper installation and cracks. Repair as necessary.
- Install fuel pressure gauge. NOTE: On Electronic Returnless Fuel System, the fuel pressure can

be monitored by scan tool using the Fuel Rail Pressure (FRP) sensor PID.

- Start and run the engine at idle. Record the fuel pressure.
- Increase engine speed to 2500 rpm and maintain for one minute. Record the fuel pressure. GO to Pinpoint Test [HC](#) and compare fuel pressure to the Fuel Pressure Delivery System Test Information Chart at the beginning of the pinpoint.
- Key off.

Was the fuel pressure within specifications?

Yes	No
Fuel pressure is OK. If applicable, REMOVE the fuel pressure gauge. GO to HF7 .	Fuel pressure is out of specification. GO to HC4 , Fuel Delivery Systems in Section 5 for diagnosis.

HF7 CHECK FOR OBVIOUS LEAK SOURCES IN THE EXHAUST SYSTEM

Note: If a catalyst is in series with a leaking exhaust system, it can fail the Catalyst Efficiency Monitor test.

- Inspect the following for leaks, cracks, loose connections or punctures:
 - Exhaust manifold.
 - Front exhaust pipe.
 - Rear exhaust pipe.
 - Muffler/tailpipe assembly.

Are the above components free of cracks and punctures, etc.?

Yes	No
GO to HF8 .	REPAIR the leak source(s). COMPLETE Catalyst Monitor OBD II Drive Cycle to verify repair (Refer to Section 2, Drive Cycles).

HF8 CHECK FOR OBVIOUS RESTRICTIONS IN THE EXHAUST SYSTEM

- Inspect the following for dents, areas of collapsed material and unusual bending:
 - Front exhaust pipe.
 - Rear exhaust pipe.
 - Muffler/tailpipe assembly.

Are the components free of dents and areas of collapsed material or unusual bending, etc.?

Yes	No
GO to HF9 .	REPAIR the restricted component(s) as necessary. COMPLETE Catalyst Monitor OBD II Drive Cycle to verify repair (Refer to Section 2, Drive Cycles).

HF9 CHECK MANIFOLD VACUUM FOR INDICATION OF EXCESSIVE EXHAUST SYSTEM RESTRICTION

- Attach a vacuum gauge to the intake manifold vacuum source.
- Monitor RPM with scan tool or tachometer.
- Observe the vacuum gauge needle while completing the following:

Note: The vacuum gauge reading may be normal when the engine is first started and idling. However, excessive restriction in the exhaust system will cause intake manifold vacuum to decrease with the engine at a steady/constant idle speed.

- Start the engine and gradually increase the engine speed to 2000 rpm with the transmission in NEUTRAL.
- Decrease engine speed to base idle rpm.
- Key off.

Did manifold vacuum rise above 54 kPa (16 inches-Hg) with the engine speed at 2000 rpm?

Yes	No
GO to HF10 .	Manifold vacuum did not reach an acceptable level. GO to HF11 to check for excessive restriction in the exhaust system.

HF10 CHECK MANIFOLD VACUUM FOR INDICATION OF MODERATE EXHAUST SYSTEM RESTRICTION

- Key on, engine idling.
- Increase the engine speed gradually from base idle rpm to 2000 rpm with the transmission in NEUTRAL.
- Observe the speed the vacuum gauge needle rises, while maintaining the increased engine rpm.
- NOTE 1: On a non-restricted exhaust system, the vacuum gauge needle will rise quickly to the normal range as the increased rpm is maintained.
- NOTE 2: On a restricted exhaust system, the vacuum gauge needle will rise slowly to the normal range as the increased rpm is maintained.
- NOTE 3: The rate of speed the vacuum gauge needle rises to the normal range is slower on a restricted system than on a non-restricted system as the increased rpm is maintained.
- Decrease engine speed to base idle rpm.
- Key off.

Is the rate of speed that the vacuum gauge needle rises back to the normal range (above 54 kPa (16 inches-Hg)) much slower than that of a non-restricted system?

Yes	No
A moderate restriction may be present. GO to HF11 .	No indications of restrictions or leaks have been detected in the exhaust system. If here because of DTCs P0420 or P0430, the catalytic converter is chemically inactive. REPLACE the catalytic converter. COMPLETE Catalyst Monitor OBD II Drive Cycle to verify repair (Refer to Section 2, Drive Cycles). For further diagnosis of symptom (e.g. Lack of Power, Loss of Power, or No Start) REFER to Section 3 , Symptom Charts.

HF11 CHECK MANIFOLD VACUUM WITH EXHAUST MANIFOLD DISCONNECTED FOR INDICATION OF A RESTRICTION

Note: An intake manifold gasket leak can also cause the vacuum gauge needle to remain well below the normal range.

- Disconnect exhaust system immediately after the exhaust manifold.
- GO to [HF10](#) and repeat the vacuum measurement.

Did the vacuum needle QUICKLY rise above 54 kPa (16 inches-Hg) with the engine speed at 2000 rpm?

Yes	No
<p>The exhaust system restriction is downstream of the exhaust manifold. RECONNECT exhaust system at exhaust manifold. GO to HF12.</p>	<p>A restriction is present in the exhaust manifold. INSPECT each exhaust port for casting flash/restrictions by dropping a length of chain into it (NOTE: Do not use a wire or lamp to check the ports. The restriction can be small enough for both to pass through, but large enough to cause excessive back-pressure at high engine rpm.). REPLACE the exhaust manifold if unable to remove the casting flash/restriction. COMPLETE Catalyst Monitor OBD II Drive Cycle to verify repair (Refer to Section 2, Drive Cycles).</p>

HF12 CHECK MANIFOLD VACUUM WITH MUFFLER/TAILOPIPE ASSEMBLY DISCONNECTED FOR INDICATION OF A RESTRICTION

- Disconnect muffler/tailpipe assembly from the catalytic converter.
- GO to [HF10](#) to repeat the vacuum measurement.

Did the vacuum needle QUICKLY rise above 54 kPa (16 inches-Hg) with the engine speed at 2000 rpm?

Yes	No
<p>There is a restriction in the muffler/tailpipe assembly. REPLACE the muffler/tailpipe assembly. COMPLETE Catalyst Monitor OBD II Drive Cycle to verify repair (Refer to Section 2, Drive Cycles).</p>	<p>There is a restriction in the catalytic converter. REPLACE the catalytic converter. INSPECT the muffler to be certain converter debris has not entered. COMPLETE Catalyst Monitor OBD II Drive Cycle to verify repair (Refer to Section 2, Drive Cycles).</p>

HG: Positive Crankcase Ventilation (PCV) System Introduction

HG: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose only the following:

- Positive Crankcase Ventilation (PCV) valve (6A666) and related vacuum lines

HG: Pinpoint Tests →

HG: Positive Crankcase Ventilation (PCV) System

← HG: Introduction

HG1 STUCK PCV VALVE CHECK

- Verify PCV valve maintenance schedule has been followed.
- Verify proper PCV valve part number.
- Verify clean PCV valve.
- Shake the PCV valve.

Does PCV valve rattle when shaken?

Yes	No
REINSTALL PCV valve. GO to HG2 .	PCV valve is sticking. REPLACE PCV valve. VERIFY a symptom no longer exists.

HG2 PCV SYSTEM CHECK

- Start engine and bring to normal operating temperature.
- Disconnect closure (fresh air) hose from remote air cleaner or air outlet tube (tube connecting mass air flow sensor and throttle body).
- Place a stiff piece of paper over the hose end. Wait one minute.

Does vacuum hold the paper in place?

Yes	No
PCV System is OK. RETURN to Section 3 for other possible causes of vehicle symptoms.	System is leaking/plugged or Evaporative Emission System is leaking. GO to HG3 .

HG3 EVAPORATIVE EMISSION SYSTEM CHECK

Note: If the evaporative emission hose is not connected to the PCV hose, follow the No Action to Take (refer to VECI decal).

- Disconnect evaporative emission hose at connection to PCV hose (if equipped). Cap the connector.
- Again place a stiff piece of paper over the closure (fresh air) hose end, as in **HG2**. Wait one minute.

Does vacuum now hold the paper in place?

Yes	No
PCV system is OK. REFER to Evaporative Emission Section 303-13 in the Workshop	CHECK for vacuum leaks/obstruction in the PCV system (such as oil cap, PCV valve, hoses, cut grommets, valve cover bolt

Manual.

torque/gasket leak). REPAIR as necessary.

HK: Variable Cam Timing (VCT) Introduction

HK: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Powertrain Control Module (PCM) (12A650)
- Harness circuits: VCT and VPWR
- VCT Solenoid (6L713)

Pinpoint Test Schematic

PCM CONNECTOR PINOUT

Application	VPWR	SIG RTN	PWR GND	VCT
2.0L Contour/Mystique/ Cougar (with returnless fuel system)	71	91	51/77/103	45
All others	71	91	51/77/103	44

HK: Pinpoint Tests →

HK: Variable Cam Timing (VCT)

← HK: Introduction

HK1 DTC P1380: CHECK FOR KOEO OR KOER DTC

- Start engine and bring up to operating temperature.
- Check for DTC P1380 during KOEO or KOER Self-Test.

Is DTC P1380 present during KOEO or KOER Self-Test?

Yes	No
KEY OFF. GO to <u>HK2</u> .	Unable to duplicate or identify fault at this time. GO to <u>Z1</u> .

HK2 CHECK VPWR VOLTAGE AT VCT SOLENOID VALVE HARNESS CONNECTOR

- Disconnect the VCT solenoid valve harness connector.
- Key on.
- Measure VCT circuit voltage at the VCT solenoid valve harness connector.

Is the voltage reading greater than 10.5 volts?

Yes	No
KEY OFF. GO to <u>HK3</u> .	KEY OFF. REPAIR VPWR circuit.

HK3 CHECK VCT CIRCUIT FOR OPEN IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Measure resistance of VCT circuit between PCM harness connector pin and the VCT solenoid valve harness connector.

Is the resistance less than 5.0 ohms?

Yes	No
GO to <u>HK4</u> .	REPAIR open circuit.

HK4 CHECK VCT CIRCUIT FOR SHORT TO GROUND AND VPWR IN HARNESS

- Measure resistance between VCT PCM Pin and PCM Pins VPWR, SIG RTN and PWR GND.

Is each resistance greater than 10,000 ohms?

--	--

Yes	No
GO to HK5 .	REPAIR short to GND or PWR.

HK5 CHECK VCT SOLENOID VALVE COIL RESISTANCE

- Measure resistance of the VCT solenoid valve coil at the two connector terminals.

Is the resistance between 3.0 and 6.0 ohms?

Yes	No
GO to HK6 .	REPLACE VCT solenoid valve assembly.

HK6 CHECK VCT SOLENOID VALVE FOR SHORT TO CASE

- Measure resistance between each connector terminal of the VCT solenoid valve and the solenoid body.

Is each resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPLACE VCT solenoid valve.

HK11 DTC P1381 AND P1383: CHECK VCT FOR PROPER OPERATION

- Key on.
- Check for DTC P1381 or P1383 in KOER Self-Test.

Are P1381 or P1383 present during KOER Self-Test?

Yes	No
KEY OFF. DTC P1381 or P1383 present. GO to HK12 .	KEY OFF. Unable to duplicate or identify fault at this time. GO to Z1 .

HK12 CHECK CAMSHAFT TIMING

- Verify camshaft timing. Refer to Engine, Section 303-01 in the Workshop Manual.

Is the camshaft timing within specification?

Yes	No
Camshaft advance mechanism is seized. REPLACE camshaft advance mechanism. REFER to Engine, Section 303-01B in the Workshop Manual for proper repair direction. COMPLETE PCM Reset to clear DTCs. RERUN Quick Test.	REFER to Powertrain/Engine, Section 303-01 in the Workshop Manual for proper direction in setting cam timing. RERUN Quick Test.

HM: Secondary Air Injection (AIR) System Introduction

HM: Pinpoint Tests →

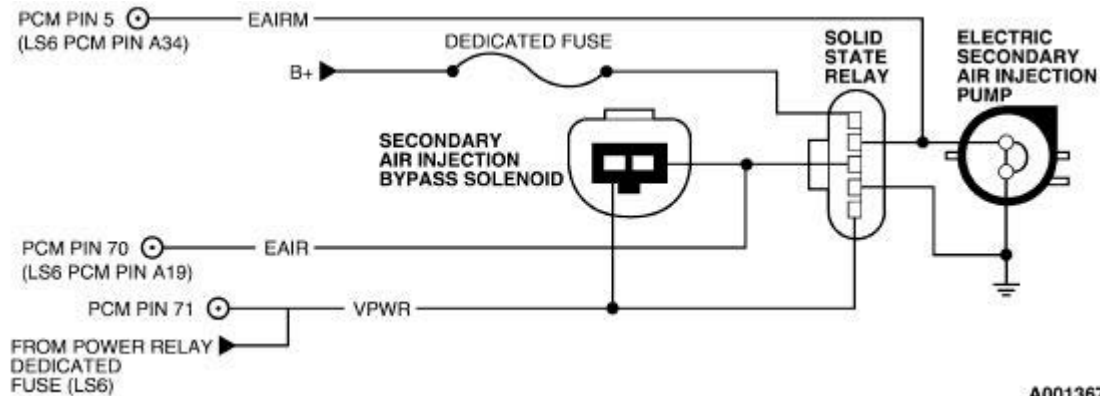

Note

This Pinpoint Test is intended to diagnose the following:

- Harness circuits: B+, EAIR, EAIR Monitor, Ground, AIRB
 - Solid state relay (SSR) (2C013)
 - Electric secondary air injection (AIR) pump (9A486)
 - Secondary air injection (AIR) bypass solenoid (9H465)
 - Powertrain control module (PCM) (12A650)
-
- Secondary air injection (AIR) diverter valve (9F491)
 - Vacuum supply
 - Air silencer (9H467)
 - Secondary air injection (AIR) check valve (12A197)
 - Hoses (9B460)
 - Partial restricted exhaust

Pinpoint Test Schematics and Connectors

Secondary Air Injection System Connectors

Electric AIR Pump

AA0919-B

HM: Pinpoint Tests →

HM: Secondary Air Injection (AIR) System

← HM: Introduction

HM1 DTC P0412: CHECK B+ VOLTAGE TO SOLID STATE RELAY

- Disconnect SSR.
- Key on, engine off.
- Measure voltage of B+ circuit at SSR harness connector and battery negative post.

Is voltage greater than 10.5 volts?

Yes	No
Supplied voltage is OK, GO to HM2 .	GO to HM6 .

HM2 CHECK EAIR CIRCUIT FOR OPEN IN HARNESS

- Key off.
- Disconnect AIR bypass solenoid.
- Remove Secondary Air Injection System dedicated fuse temporarily.
- Disconnect PCM.
- Measure resistance of EAIR circuit between PCM harness connector pin and SSR harness connector and AIR bypass harness connector.

Is resistance less than 5.0 ohms?

Yes	No
GO to HM3 .	REPAIR open circuit.

HM3 CHECK EAIR CIRCUIT FOR SHORT TO POWER AND GROUND WITH DISCONNECTED AIR BYPASS SOLENOID

- Measure resistance between EAIR and VPWR circuits at the PCM harness connector.
- Measure resistance between EAIR at the PCM harness connector and battery negative post.

Is each resistance greater than 10,000 ohms?

Yes	No
The EAIR harness is OK. GO to HM4 .	REPAIR short circuit.

HM4 CHECK AIR BYPASS SOLENOID RESISTANCE

- Disconnect AIR bypass solenoid harness connector.
- Measure AIR bypass solenoid resistance.

Is resistance between 50 and 100 ohms?

Yes	No
GO to HM5 .	REPLACE AIR bypass solenoid.

HM5 CHECK EAIR CIRCUIT FOR SHORT TO POWER AND GROUND WITH SOLID STATE RELAY RECONNECTED

- AIR bypass solenoid disconnected.
- Reconnect solid state relay.
- Measure resistance of EAIR circuit between VPWR and PWR GND circuits at the PCM harness connector.

Is each resistance greater than 10,000 ohms?

Yes	No
<p>If DTC P0411 is present:</p> <p>GO to HM9.</p> <p>All others:</p> <p>GO to HM16.</p>	REPLACE solid state relay.

HM6 CHECK B+ CIRCUIT FOR OPEN IN HARNESS

- Measure resistance of B+ circuit between solid state relay harness connector and Secondary Air Injection System dedicated fuse.

Is resistance less than 5.0 ohms?

Yes	No
CHECK VPWR circuit for short to ground. REPLACE fuse. GO to HM8 to check electric AIR pump. RECONNECT solid state relay.	REPAIR open circuit. RECONNECT solid state relay and fuse.

HM7 DTC P0411: VISUALLY INSPECT ELECTRIC AIR PUMP HOSES AND AIR SILENCER (9H467)

- Visually inspect electric AIR pump hoses from the electric AIR pump to the AIR diverter valves.
- Visually inspect for damaged exhaust system.
- Inspect air hose for cracks, binding, obstructions, water or ice.
- Inspect Air silencer (9H467) for obstructions.

Are electric AIR pump hoses and Air silencer (9H467)OK?

Yes	No
GO to HM8 .	DRAIN all water from hoses or REPLACE damaged parts.

HM8 CHECK ELECTRIC AIR PUMP OPERATION

- Key on, engine off.
- Enter output test mode

Does the pump run?

Yes	No
KEY OFF. GO to <u>HM17</u> to check electric AIR pump for water contamination.	KEY OFF. Possible intermittent concern. GO to <u>Z2</u> . If OK, GO to <u>HM13</u> .  CAUTION: RUNNING OUTPUT TEST MODE LONGER THAN TWO MINUTES MAY OVERHEAT/DAMAGE AIR PUMP.

HM9 CHECK FOR VACUUM AT AIR DIVERTER VALVES

- Connect a vacuum gauge to the control vacuum hose at the AIR diverter valve(s).
- Apply 53kPa (16in-HG) of vacuum at the intake manifold side of the AIR bypass solenoid vacuum supply hose.
- Key on, engine off.
- Enter output test mode

Is vacuum present at the AIR Diverter valve(s)?

Yes	No
GO to <u>HM10</u> .	GO to <u>HM32</u> .

HM10 CHECK AIR DIVERTER VALVE(S) INTEGRITY

 **CAUTION: Caution must be observed while performing this test.**

Note: On a two valve system make sure that air is flowing from both valves.

- Disconnect air tube from AIR diverter valve(s) outlet side.
- Inspect AIR diverter valve(s) outlets for damage from hot exhaust gases. Repair as necessary.
- Apply 53kPa (16in-HG) of vacuum to the AIR diverter valve(s).
- Key on, engine off.
- Enter output test mode.

Is air present from the AIR diverter valve(s)?

Yes	No
KEY OFF. INSPECT the exhaust tubes from the AIR diverter valve to the exhaust manifold (s). If OK, GO to <u>HM11</u> .	KEY OFF. INSPECT hose from electric AIR pump to AIR diverter valve(s). If OK, REPLACE the appropriate AIR diverter valve (s).

HM11 CHECK MANIFOLD VACUUM WITH EXHAUST MANIFOLD DISCONNECTED FOR INDICATION OF A RESTRICTION

Note: An intake manifold gasket leak can also cause the vacuum gauge needle to remain well below the normal range.

- Disconnect exhaust system immediately after the exhaust manifold.
- Observe the rate of speed the vacuum gauge needle rises, while maintaining 2000 rpm.

Note: The rate of speed the vacuum gauge needle rises to the normal range is slower on a restricted system than on a non-restricted system as the increased rpm is maintained.

Did the vacuum needle QUICKLY rise above 54 kPa (16 inches-Hg) with the engine speed at 2000 rpm?

Yes	No
<p>The exhaust system restriction is downstream of the exhaust manifold. RECONNECT exhaust system at exhaust manifold. GO to HM12.</p>	<p>A restriction is present in the exhaust manifold. INSPECT each exhaust port for casting flash/restrictions by dropping a length of chain into it (NOTE: Do not use a wire or lamp to check the ports. The restriction can be small enough for both to pass through, but large enough to cause excessive back-pressure at high engine rpm.). REPLACE the exhaust manifold if unable to remove the casting flash/restriction.</p>

HM12 CHECK MANIFOLD VACUUM WITH MUFFLER/TAILOPIPE ASSEMBLY DISCONNECTED FOR INDICATION OF A RESTRICTION

- Disconnect muffler/tailpipe assembly from the catalytic converter.
- GO to [HM11](#) to repeat the vacuum measurement.

Did the vacuum needle QUICKLY rise above 54 kPa (16 inches-Hg) with the engine speed at 2000 rpm?

Yes	No
<p>There is a restriction in the muffler/tailpipe assembly. REPLACE the muffler/tailpipe assembly.</p>	<p>There is a restriction in the catalytic converter. REPLACE the catalytic converter. INSPECT the muffler to be certain converter debris has not entered.</p>

HM13 CHECK VOLTAGE ON EAIR MONITOR CIRCUIT

- Disconnect electric AIR pump.
- Key on, engine off.
- Enter output test mode.
- Measure voltage of EAIR monitor circuit between electric AIR pump harness connector and battery negative post.

Is voltage greater than 10.5 volts?

Yes	No

GO to [HM15](#).

GO to [HM14](#).

HM14 CHECK ELECTRIC AIR PUMP GROUND FOR OPEN IN HARNESS

- Measure resistance of EAP ground circuit between electric AIR pump harness connector and battery negative post.

Is resistance less than 5 ohms?

Yes	No
GO to HM21 .	REPAIR open circuit.

HM15 CHECK AIR HOSE TO ELECTRIC AIR PUMP

- Disconnect inlet air hose.
- Visually inspect inlet air hose for binding, obstructions, water or ice to the electric AIR pump.

Is the hose integrity or orientation OK?

Yes	No
GO to HM17 .	DRAIN all water from air hose. REPLACE or RE-ORIENT hose as appropriate. GO to HM17 .

HM16 CHECK SOLID STATE RELAY OUTPUT

- Reconnect AIR bypass solenoid.
- Connect PCM.
- Key on, engine off.
- Enter output test mode.
- Access AIR PID.
- Access AIRM PID.
- Compare AIR and AIRM PIDs.

Were both PIDs on?

Yes	No
REPLACE solid state relay.	Possible intermittent concern. GO to Z2 . If no problem is found, REPLACE PCM (REFER to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).

HM17 CHECK AIR PUMP FOR WATER

Note: Water ingested in the electric AIR pump will reduce the life of the pump.

- Disconnect electric AIR pump connector and air hoses.

- Carefully tilt electric AIR pump in various positions to verify if any water is present.

Is any water present?

Yes	No
REPLACE electric AIR pump.	If fuse was replaced, GO to <u>HM6</u> , Testing is complete. All others, GO to <u>HM9</u> .

HM19 DTC P1413: CHECK B+ CIRCUIT VOLTAGE TO SOLID STATE RELAY

- Disconnect solid state relay.
- Key on.
- Measure voltage of B+ circuit between solid state relay harness connector and chassis ground.

Is voltage greater than 10.5 volts?

Yes	No
GO to <u>HM20</u> .	GO to <u>HM26</u> .

HM20 CHECK FOR VPWR TO SOLID STATE RELAY

- Key on, engine off.
- Measure VPWR circuit voltage at the solid state relay harness connector.

Is voltage greater than 10.5 volts?

Yes	No
GO to <u>HM21</u> .	For LS6 : GO to <u>B5</u> . All others : REPAIR open VPWR circuit between the solid state relay and Electronic Engine Control power relay.

HM21 CHECK VOLTAGE ON EAIR MONITOR CIRCUIT

- Reconnect solid state relay.
- Disconnect electric AIR pump.
- Key on, engine off.
- Enter output test mode.
- Access AIRM PID.

Is PID on?

Yes	No

GO to [HM25](#). REMAIN in output test mode.

If DTC P0411 is present, REPLACE electric AIR pump. GO to [HM22](#). REMAIN in output test mode.

HM22 CHECK EAIR MONITOR VOLTAGE TO PCM

- Key on, engine off.
- Access AIRM PID.

Is PID on?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	GO to HM23 .

HM23 CHECK EAIR DRIVER AND EAIR MONITOR CIRCUIT FOR OPEN IN HARNESS

- Disconnect solid state relay.
- Measure resistance of EAIR driver circuit between PCM harness connector and solid state relay harness connector.
- Measure resistance of EAIR monitor circuit between PCM harness connector and solid state relay harness connector.
- Measure resistance of EAIR monitor circuit between the solid state relay harness connector and the electric AIR pump harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
GO to HM24 .	REPAIR open circuit.

HM24 CHECK EAIR MONITOR CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Measure resistance between EAIR monitor and PWR GND circuit at the PCM harness connector.

Is resistance greater than 10,000 ohms?

Yes	No
REPLACE solid state relay.	REPAIR short circuit.

HM25 CHECK EAIR MONITOR VOLTAGE TO PCM

- Reconnect electric AIR pump.
- Reconnect PCM.
- Key on, engine off.
- Access AIRM PID.

Is PID on?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPAIR open EAIR circuit.

HM26 CHECK B+ CIRCUIT FOR OPEN IN HARNESS

- Measure resistance of B+ circuit between solid state relay harness connector and dedicated fuse B+ circuit.

Is resistance less than 5 ohms?

Yes	No
REPLACE solid state relay dedicated fuse.	REPAIR open circuit.

HM27 DTC P1414: CHECK EAIR MONITOR CIRCUIT FOR OPEN IN HARNESS

- Disconnect solid state relay.
- Disconnect PCM.
- Disconnect electric AIR pump.
- Measure resistance of EAIR monitor circuit between PCM harness connector and electric AIR pump harness connector.

Is resistance less than 5 ohms?

Yes	No
GO to <u>HM28</u> .	REPAIR open circuit.

HM28 CHECK ELECTRIC AIR PUMP FOR OPEN

- Measure electric AIR pump resistance.

Is resistance between 0.5-5.0 ohms?

Yes	No
GO to <u>HM29</u> .	REPLACE electric AIR pump.

HM29 CHECK EAIR MONITOR CIRCUIT FOR SHORT TO POWER IN HARNESS

- Key on.
- Measure voltage between PCM harness connector and chassis ground.

Is voltage greater than 10.5 volts?

Yes	No
REPAIR short circuit.	EAIR Monitor circuit is OK. GO to <u>HM30</u> .

HM30 CHECK SOLID STATE RELAY OUTPUT

- Reconnect AIR bypass solenoid.
- Connect PCM.
- Key on, engine off.
- Enter output test mode.
- Access AIR PID.
- Access AIRM PID.
- Compare AIR and AIRM PIDs.

Were both PIDs on?

Yes	No
REPLACE solid state relay.	REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).

HM32 CHECK VACUUM HOSE INTEGRITY

- Key off.
- Check vacuum hose between Intake manifold and AIR diverter valve(s).
- Check for blockage and restrictions.
- Check for leaks and cracks.
- Check for kinks or disconnects.

Are the above checks OK?

Yes	No
GO to <u>HM33</u> .	REPLACE damaged vacuum hose.

HM33 CHECK AIR BYPASS SOLENOID ELECTRICAL OPERATION

- Key on, engine off.
- Access Output Test Mode.
- Disconnect AIR bypass solenoid.
- Connect digital multimeter to AIR bypass solenoid vehicle harness connector.
- Turn the outputs on, then turn outputs off while observing digital multimeter.

Does EAIR circuit voltage cycle greater than 0.5 volt?

Yes	No
REMAIN in Output Test Mode. GO to <u>HM34</u> .	Key off. GO to <u>HM35</u> .

HM34 CHECK AIR BYPASS SOLENOID FOR MECHANICAL OPERATION

- Reconnect AIR bypass solenoid.

- Disconnect source vacuum hose from AIR bypass solenoid.
- Apply 53 kPa (16 in-Hg) of vacuum to source side of AIR bypass solenoid.
- Turn the outputs on, then turn outputs off.

Was vacuum released?

Yes	No
REPAIR vacuum hose from manifold vacuum tree to AIR bypass solenoid. If OK, GO to <u>Z2</u> .	REPLACE AIR bypass solenoid.

HM35 CHECK AIR BYPASS SOLENOID RESISTANCE

- Disconnect AIR bypass solenoid harness connector.
- Measure AIR bypass solenoid resistance.

Is resistance between 50 and 100 ohms?

Yes	No
GO to <u>HM36</u> .	REPLACE AIR bypass solenoid.

HM36 CHECK VPWR CIRCUIT FOR OPEN IN HARNESS

- Key on, engine off.
- Measure VPWR circuit voltage at the AIR bypass solenoid harness connector.

Is voltage greater than 10.5 volts?

Yes	No
GO to <u>HM37</u> .	REPAIR open VPWR circuit (and dedicated fuse on LS6).

HM37 CHECK EAIR CIRCUIT FOR OPEN IN HARNESS

- Disconnect solid state relay.
- Disconnect PCM.
- Measure resistance of EAIR circuit between PCM harness connector and the AIR bypass solenoid harness connector and at the solid state relay harness connector.

Is resistance less than 5.0 ohms?

Yes	No
GO to <u>HM38</u> .	REPAIR open EAIR circuit.

HM38 CHECK EAIR CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Measure resistance between EAIR and PWR GND circuits at the PCM harness connector.

Is resistance greater than 10,000 ohms?

Yes	No
GO to <u>HM39</u> .	REPAIR short to ground.

HM39 CHECK EAIR CIRCUIT FOR SHORT TO POWER IN HARNESS

- Measure resistance between EAIR and PWR GND circuits at the PCM harness connector.

Is each resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPAIR short to power.

HU: Intake Air Systems Introduction

HU: Pinpoint
Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Throttle body assembly (9E926)
- Speed control cable (9A825)
- Accelerator cable linkage to throttle body (9C799)
- Air cleaner assembly (including air cleaner element)
- Air inlet tube
- Clean air tube hose and resonator (9R504)(9F593)
- Intake manifold runner control housing assembly (IMRC) (9U531) (9U524) and (9J447)
- IMRC actuator assembly (9J559)
- IMSC actuator assembly (9L492)
- Harness circuits: IMRC/IMSC, IMRC/IMSC Monitor, SIG RTN, PWR GND, VREF, VPWR
- Intake manifold tuning valve (IMT Valve) electric (9L490)
- Powertrain control module (PCM) (12A650)

HU: Intake Air Systems

← HU: Introduction

HU1 CHECK FOR INCORRECT IDLE SPEED

Note: Vehicle must be at operating temperature and at idle for a minimum of one minute. If here for a part throttle symptom, GO to HU4.

- Key on, engine running.
- Determine if idle speed is incorrect. Refer to the Typical Reference Value Charts in Section 6, if necessary.
- Read the vehicle tachometer (if equipped) or connect the scan tool to the data link connector (DLC) and view the rpm PID.

Is vehicle idle speed incorrect?

Yes	No
For a high idle concern, be sure throttle arm contacts return stop, then GO to <u>HU6</u> . For other idle speed concerns, GO to <u>HU7</u> .	KEY OFF. GO to <u>HU2</u> .

HU2 CHECK FOR STICKING/BINDING CONDITION

- Gently cycle throttle from fully closed to fully open and back to fully closed. Check for binding/sticking in travel.

Is a stick or bind condition present?

Yes	No
GO to <u>HU3</u> .	GO to <u>HU4</u> .

HU3 ISOLATE BINDING/STICKING CONCERN

- Disconnect accelerator cable and speed control cable from throttle body linkage.

CAUTION: Do not attempt to clean the throttle bore and plate area. Cleaning will damage the throttle body assembly.

Note: Sticking or binding condition can either be within cables or throttle body assembly.

- Rotate throttle body linkage.

Does the throttle body rotate freely without a sticking, binding or grabbing condition?

Yes	No
REPAIR cable(s) causing the concern.	REPLACE throttle body assembly.

HU4 CHECK FUNCTIONALITY OF THE THROTTLE POSITION SENSOR

- Key on.
- View TP V PID with the scan tool.
- From closed throttle, slowly begin to press accelerator to wide open throttle.

Did the TP V PID display a smooth reading during accelerator movement?

Yes	No
KEY OFF. GO to HU5 .	REPLACE throttle position sensor.

HU5 CHECK FOR AIR CLEANER ELEMENT AND INLET FOR RESTRICTIONS

- Remove air cleaner element. Check for a plugged or dirty element.
- Check for any restrictions along the air inlet path from the air inlet back to the throttle body.

Are any restrictions present?

Yes	No
REPLACE air cleaner element or clear any restrictions.	REINSERT original air cleaner element. GO to HU6 .

HU6 CHECK FOR A POSITIVE CRANK VENTILATION CONCERN

Note: A high idle may indicate incorrect PCV valve size or vacuum leak.

- Inspect PCV valve connections for leaks or cracks.
- Remove PCV valve and inspect for plugging or an incorrect valve.

Is a PCV concern present?

Yes	No
REPLACE PCV valve or REPAIR leak or crack.	For high idle, GO to HU9 , otherwise, RECONNECT PCV valve. GO to HU7 .

HU7 CHECK FOR IDLE AIR CONTROL VALVE RESPONSE

- Key on, engine running.
- With vehicle at operating temperature and at idle for a minimum of one minute, disconnect the IAC valve harness connector.

Did engine idle speed drop or nearly stall?

Yes	No
GO to HU8 .	For a high idle with no idle speed drop when disconnecting IAC, GO to HU9 . For a low idle with no idle speed drop when disconnecting IAC, REPLACE the IAC valve.

HU8 INSPECT THROTTLE BODY PLATE HOLE FOR PLUGGING

Note: Only some applications have a throttle plate hole. If not equipped, return to symptom charts.

- Detach resonator from throttle body assembly.
- Inspect throttle plate hole for any restrictions.

Is the throttle plate hole restricted?

Yes	No
CLEAR throttle plate hole.	Return to Symptom Charts.

HU9 CHECK FOR VACUUM LEAKS

- Listen for vacuum leaks.
- Inspect entire air intake system from the mass air flow (MAF) sensor to the intake manifold for leaks such as:
 - cracked or punctured inlet air tube.
 - loose connections on the inlet air tube at the air cleaner housing or throttle body.
 - idle air control (IAC) valve assembly or gasket seal.
 - EGR valve gasket seal leak to intake manifold.
 - intake manifold assembly or gasket seal.
 - EGR valve diaphragm or control solenoid.
 - vacuum supply connectors and hose.

Are any leaks detected?

Yes	No
KEY OFF. REPAIR any leaks.	REPLACE IAC valve if idle speed does not drop when disconnecting harness connector otherwise, KEY OFF. GO to HU10 .

HU10 CHECK THROTTLE BODY FOR EXCESSIVE WEAR

- Remove throttle body assembly (refer to Intake Air Distribution and Filtering, Section 303-12 in the Workshop Manual).
- Hold throttle body up to a light source.
- Rotate the throttle lever to wide open throttle and inspect bore for excessive wear or grooving.
- Rotate the throttle lever to closed throttle position while inspecting for misaligned or worn plate. Look for excessive gap between bore and plate area.

Is a concern detected?

Yes	No
REPLACE throttle body.	RETURN to Symptom Charts.

HU15 DTCS P1516, P1517, P1518, P1519, P1520, P1537, P1538 VISUAL INSPECTION

Note: Refer to the PCM connector pin numbers in the beginning of the pinpoint test.

- View linkage or cable routing. Check for any binding or improper routing. Cable core wire (if applicable) at IMRC/IMSC housing attachment must have slack and lever must contact close plate stop screw. For Focus/Escort and 2.3L Ranger, a visual inspection may not be appropriate. GO to [HU17](#). Refer to the IMRC/IMSC system description in [Section 1](#), Intake Air and Throttle Body, for illustrations.

Note: The IMRC/IMSC return springs are strong. Make sure the return springs operate properly and plates open and close fully. On vacuum operated systems engine must run for 20 seconds then return to KOEO for testing.

- Manually open and close IMRC/IMSC plates at intake manifold and feel for sticking/binding.

Is concern indicated?

Yes	No
GO to HU16 .	GO to HU17 .

HU16 PERFORM IMRC/IMSC PHYSICAL TEST

- Disconnect IMRC/IMSC linkage or cables(s) from runner(s) or remove actuator assembly for Focus/Escort.

Note: IMRC/IMSC return springs are strong.

- Rotate IMRC/IMSC lever(s) fully open to fully closed without obstruction and contacting closed stop screw.
- Feel for sticking or binding during rotation and spring tension of approximately .34 to .45 Nm (3 to 4 lb-in).

Is concern indicated?

Yes	No
CLEAN or REPAIR runners. REFER to Intake Air Distribution and Filtering, Section 303-12 in the Workshop Manual. GO to HU38 .	REPLACE IMRC/IMSC actuator. GO to HU38 .

HU17 PERFORM IMRC/IMSC FUNCTIONAL TEST

- Connect scan tool to data link connector (DLC).
- Key on, engine off.

Note: All except Focus and 2.3L Ranger, if the IMRC/IMSC plates open immediately when the key is turned on with engine off, GO to [HU23](#).

For Focus and 2.3L Ranger, monitor IMRCM/SCVM PID or voltage. GO to [HU23](#) if PID displays less than 1 volt.

- Access Output Test Mode (OTM) (refer to [Section 2](#)).

WARNING: KEEP FINGERS CLEAR OF IMRC/IMSC LEVER/CABLE MECHANISM.

- Turn all outputs on.
- When IMRC/IMSC is commanded on, lever(s) should rotate to full-open position. At least one of the levers should contact the wide open stop, the other may be slightly off the wide open stop. For Focus/Escort and 2.3L Ranger, listen for IMRC/IMSC to actuate.

Did the IMRC/IMSC lever(s) cycle from fully closed and remain fully open while all outputs were on?

Yes	No
GO to HU25 .	GO to HU18 .

HU18 CHECK IMRC/IMSC ACTUATOR VPWR CIRCUIT FOR AN OPEN IN HARNESS

- Disconnect IMRC/IMSC actuator harness connector.
- Measure VPWR circuit voltage at the IMRC/IMSC actuator harness connector.

Is IMRC/IMSC VPWR voltage greater than 10.5 volts?

Yes	No
GO to HU19 . For Focus/Escort, GO to HU20 .	KEY OFF. REPAIR open circuit. GO to HU38 .

HU19 CHECK IMRC/IMSC GROUND CIRCUIT FOR OPEN IN HARNESS

- Measure voltage between ground and VPWR circuits at the IMRC/IMSC actuator harness connector.

Is voltage greater than 10.5 volts?

Yes	No
GO to HU20 .	REPAIR open circuit. GO to HU38 .

HU20 VERIFY DRIVER CIRCUIT FUNCTION

- Access Output Test Mode (OTM) (refer to [Section 2](#)).
- Place a test lamp between VPWR and the IMRC/IMSC signal circuit at the IMRC/IMSC actuator harness connector.
- Turn all outputs on.

Did the test lamp cycle from off to on?

Yes	No
KEY OFF. GO to HU32 .	KEY OFF. GO to HU21 .

HU21 CHECK IMRC/IMSC DRIVER CIRCUIT FOR OPEN IN HARNESS

- Disconnect PCM.
- Measure resistance of IMRC/IMSC signal circuit between PCM harness connector and the IMRC/IMSC actuator harness connector.

Is resistance less than 5 ohms?

Yes	No
GO to HU22 .	REPAIR open circuit. GO to HU38 .

HU22 CHECK IMRC/IMSC DRIVER CIRCUIT FOR SHORT TO VPWR IN HARNESS

- Key on, engine off.
- Measure voltage between IMRC/IMSC signal circuit at the IMRC/IMSC actuator harness connector and ground.

Is voltage less than 10.5 volts?

Yes	No
Possible intermittent concern. GO to Z1 . REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)) after determining concern is not intermittent. GO to HU38 .	REPAIR short circuit. GO to HU38 .

HU23 CHECK IMRC/IMSC DRIVER CIRCUIT FOR SHORT TO GROUND OR SHORT TO MONITOR CIRCUIT WITH PCM CONNECTED

- Key off.
- Measure resistance between the IMRC/IMSC driver circuit to PWR GND and then to SIG RTN and then to the monitor circuit at the IMRC/IMSC harness connector.

Are all resistances greater than 10,000 ohms?

Yes	No
REPLACE IMRC/IMSC. GO to HU38 .	GO to HU24 .

HU24 CHECK IMRC/IMSC DRIVER CIRCUIT FOR SHORT TO GROUND OR SHORT TO MONITOR CIRCUIT WITH PCM DISCONNECTED

- Disconnect PCM harness connector.
- Measure the resistance between the IMRC/IMSC driver circuit to PWR GND and then to SIG RTN and then to the monitor circuit at the IMRC/IMSC harness connector.

Are all resistances greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash	REPAIR the appropriate circuit for short. GO

Electrically Erasable Programmable Read Only Memory (EEPROM). GO to HU38.

to HU38.

HU25 VIEW IMRC/IMSC MONITOR PID TO DETERMINE PATH FOR POSSIBLE SHORT

Note: All vehicles will display VREF for IMRCM/SCVM PID except 3.8L and 4.2L which will display approximately 2.5 volts.

- With the scan tool, monitor the IMRCM/SCVM PID or voltage.

Is the IMRCM/SCVM PID displaying either VREF or approximately 2.5 volts?

Yes	No
GO to HU26.	GO to HU30.

HU26 CHECK IMRC/IMSC MONITOR PID TO DETERMINE A SHORT TO VPWR

- With the scan tool, monitor the IMRC/IMSCM PID or voltage while in Output Test Mode.
- Turn all output on.

Is the IMRC/IMSCM PID displaying less than 1 volt with all outputs on?

Yes	No
GO to HU27.	GO to HU32.

HU27 CHECK IMRC/IMSC MONITOR CIRCUIT FOR SHORT TO VPWR AT IMRC/IMSC HARNESS CONNECTOR

- Disconnect IMRC/IMSC actuator harness connector.
- Key on, engine off.
- Measure voltage between monitor circuit at the IMRC/IMSC actuator harness connector and ground.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to HU28.	KEY OFF. GO to HU29.

HU28 DETERMINE SHORT TO POWER WITH PCM DISCONNECTED

- Key on, engine off.
- Disconnect PCM.
- Measure voltage between monitor circuit at the IMRC/SCVM harness connector and ground.

Is voltage greater than 10.5 volts?

--	--

Yes	No
KEY OFF. REPAIR short circuit. GO to HU38 .	KEY OFF. REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)). GO to HU38 .

HU29 CHECK MONITOR FOR SHORT TO VPWR AT IMRC/IMSC ACTUATOR

- Measure actuator resistance between the monitor circuit and VPWR.

Is resistance greater than 10,000 ohms?

Yes	No
Possible intermittent concern. GO to Z1 . REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)) after determining fault is not intermittent. GO to HU38 .	REPLACE IMRC/IMSC actuator. GO to HU38 .

HU30 DETERMINE IMRC/IMSC MONITOR CIRCUIT SHORT TO GROUND

- With the scan tool, monitor the IMRCM/SCVM PID or voltage.
- While viewing PID, disconnect the IMRC/SCVM harness connector.

Did voltage change from less than 1 volt to VREF when disconnecting the IMRC/SCVM harness connector?

Yes	No
KEY OFF. REPLACE IMRC/IMSC actuator. GO to HU38 .	KEY OFF. GO to HU31 .

HU31 CHECK IMRC/IMSC MONITOR HARNESS FOR SHORT TO GROUND

- Disconnect PCM.
- Measure resistance between IMRC/IMSC monitor and ground (if applicable) and SIG RTN pins at the IMRC actuator harness or SCVM harness connector.

Is resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)). GO to HU38 .	REPAIR short circuit. GO to HU38 .

HU32 CHECK MONITOR CIRCUIT RESPONSE

- Disconnect IMRC actuator or SCVM harness connector.
- With the scan tool, monitor the IMRCM/SCVM PID or voltage.

- Connect a jumper lead from the IMRC/IMSC monitor pin to ground at the harness connector.

Did the IMRCM/SCVM PID voltage cycle from VREF to less than 1 volt when inserting the jumper?

Yes	No
KEY OFF. GO to HU33 .	KEY OFF. GO to HU36 .

HU33 CHECK SIG RTN OR CHASSIS GROUND CIRCUIT CONTINUITY WITH PCM CONNECTED

- Measure resistance of SIG RTN or chassis ground circuit between IMRC/IMSC actuator harness or SCVM harness connector and B-.

Is resistance less than 5 ohms?

Yes	No
GO to HU34 .	GO to HU35 .

HU34 CHECK MONITOR LINE FOR INTERMITTENT OPEN

- Measure resistance of monitor line while wiggling and bending harness from IMRC/SCVM harness connector to PCM harness connector.

Is the resistance fluctuating while checking the harness?

Yes	No
REPAIR intermittent open circuit. GO to HU38 .	REPLACE IMRC actuator or IMSC actuator. GO to HU38 .

HU35 CHECK SIG RTN OR CHASSIS GROUND CIRCUIT CONTINUITY WITH PCM DISCONNECTED

- Disconnect PCM from harness connector.
- Measure resistance of SIG RTN or chassis ground circuit between PCM harness connector and IMRC/IMSC actuator harness connector.

Is resistance less than 5 ohms?

Yes	No
Possible intermittent concern. GO to Z1 . REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)) after determining concern is not intermittent. GO to HU38 .	REPAIR open circuit. GO to HU38 .

HU36 CHECK MONITOR LINE CONTINUITY

- Disconnect PCM from harness connector.

- Measure resistance of IMRC/IMSC monitor circuit between PCM harness connector and IMRC actuator or SCVM harness connector.

Is resistance less than 5 ohms?

Yes	No
GO to HU37 .	REPAIR open circuit. GO to HU38 .

HU37 CHECK MONITOR CIRCUIT FOR INTERMITTENT OPEN

- Measure resistance of monitor line while wiggling and bending harness from IMRC/SCVM harness connector to PCM harness connector.

Is the resistance fluctuating while checking the harness?

Yes	No
REPAIR intermittent open. GO to HU38 .	REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)). GO to HU38 .

HU38 IMRC/IMSC REPAIR VERIFICATION DRIVE CYCLE

- Key on, engine off.
- Connect scan tool to data link connector (DLC)
- Complete PCM reset.
- Access IMRC/IMSC and IMRCM/SCVM PIDs or voltage.
- Drive vehicle, obeying all traffic and safety laws.
- Safely perform three accelerations from stop to more than 3500 rpm.
- Watch for PIDs or voltage to change.
- Perform Quick Test (refer to Section 4, Powertrain [Diagnostic Trouble Code \(DTC\) Charts](#)).

Are any DTCs received?

Yes	No
GO to Section 4, Powertrain Diagnostic Trouble Code (DTC) Charts .	PASSED IMRC/IMSC Drive cycle. No IMRC/IMSC concern is present at this time.

HU65 DTC P1549: PERFORM VISUAL INSPECTION

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Inspect IMT Valve System. Check to be sure the harness is intact and the connector is firmly in place.

Is fault indicated?

Yes	No
REPAIR as necessary. REFER to the Intake Air Distribution and Filtering, Section 303-12 in the Workshop Manual for component removal	Passed visual inspection. GO to HU66 .

procedure. VERIFY a symptom no longer exists.	
---	--

HU66 CHECK PCM DRIVER COMMAND

Note: Vehicle must be driven if rev limiter does not allow 3500 rpm in the bay.

- Connect scan tool to data link connector (DLC).
- Key on, engine running.
- Access IMTV PID.
- Increase engine speed slowly to about 4000 rpm while observing IMTV PID.

Does PID read 100% then drop to 50% while rpm was above 3500?

Yes	No
KEY OFF. Passed test. GO to HU67 .	REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)). VERIFY a symptom no longer exists.

HU67 CHECK IMT VALVE ACTUATOR VPWR CIRCUIT FOR OPEN IN HARNESS

- Disconnect harness connector from the actuator.
- Key on, engine off.
- Measure VPWR circuit voltage at the harness connector.

Was the voltage greater than 10.5 volts?

Yes	No
KEY OFF. Passed check. GO to HU69 .	REPAIR IMT valve actuator VPWR circuit for open. VERIFY a symptom no longer exists.

HU69 CHECK FOR OPEN SIGNAL CIRCUIT BETWEEN PCM AND IMT VALVE ACTUATOR

- Disconnect PCM.
- Measure resistance of Circuit between PCM test pin 46 and actuator harness connector.

Is the resistance less than 5.0 ohms?

Yes	No
Passed test. GO to HU70 .	REPAIR IMT Valve Actuator Signal Circuit open. VERIFY a symptom no longer exists.

HU70 CHECK IMT VALVE ACTUATOR FOR SHORT TO PWR GND

- Measure resistance between PCM test pin 46 and test pin 77 or 103.

Is resistance greater than 10,000 ohms?

Yes	No
Passed check. GO to HU71 .	REPAIR IMT Valve actuator signal circuit for short to PWR GND. VERIFY a symptom no longer exists.

HU71 CHECK IMT VALVE ACTUATOR SIGNAL CIRCUIT FOR SHORT TO VPWR

- Key on, engine off.
- Measure voltage between PCM test pin 46 and 77 or 103.

Is the voltage less than 1 volt?

Yes	No
KEY OFF. Passed check. GO to HU72 .	REPAIR IMT Valve actuator signal circuit for short to VPWR. VERIFY a symptom no longer exists.

HU72 CHECK PCM DRIVER FOR IMT VALVE ACTUATOR

- Reconnect PCM.
- Connect test lamp to VPWR and signal at the harness connector.
- Connect scan tool to data link connector (DLC).
- Key on, engine off.
- Access Output Test Mode (OTM) (Refer to scan tool instruction manual).
- Command all outputs on.

Was the test lamp off before commanding all outputs on and on with all outputs on?

Yes	No
KEY OFF. Passed test. GO to HU73 .	REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)). VERIFY a symptom no longer exists.

HU73 CHECK IMT VALVE SHUTTER FOR DAMAGE

- Remove IMT Valve (Refer to the Powertrain/Engine Group of the Workshop Manual).
- Visually inspect IMT valve shutter for damage.
- Rotate shutter by hand.

Does the shutter bind or appear damaged?

Yes	No
Damaged shutter. REPLACE IMT valve. VERIFY a symptom no longer exists.	Passed test. Leave IMT Valve disassembled. GO to HU74 .

HU74 CHECK IMT VALVE ACTUATOR FOR COIL DAMAGE

- Reconnect IMT valve harness connector.
- Key on, engine off.
- Access Output Test Mode (OTM) (Refer to scan tool instruction manual).
- Command all outputs on.

Did the IMT valve shutter rotate when commanding all outputs on?

Yes	No
Passed check. Fault is intermittent. GO to <u>Z1</u> .	REPLACE IMT valve actuator. VERIFY a symptom no longer exists.

HX: Evaporative Emission (EVAP) Monitor and System Introduction

HX: Pinpoint Tests →

Note

Enter this Pinpoint Test only when directed here.

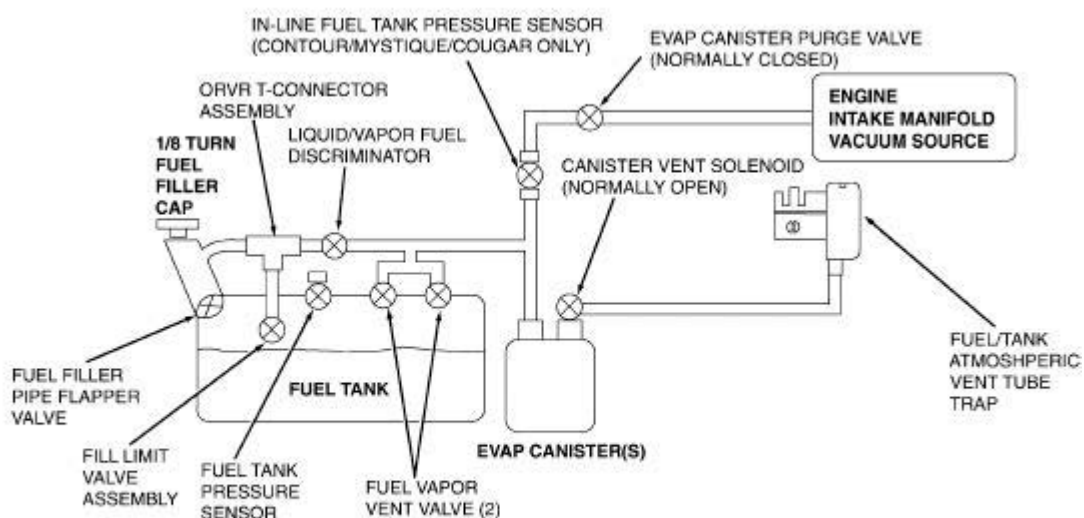

The use of a soap solution, such as SNOOP, around the fuel filler cap or the use of the hydrocarbon emission analyzer to determine an evaporative emission system leak is not recommended. The mandatory Rotunda Evaporative Emission System Leak Tester for OBD II (including the ultra-sonic tester) is the only device to be used at this time for evaporative emission system leak detection.

This Pinpoint Test is intended to diagnose the following:

- Canister vent (CV) solenoid (9F945)
- Fuel filler cap (9030)
- Fuel tank pressure (FTP) sensor (9C052)
- In-line fuel tank pressure (FTP) sensor (9C052)
- EVAP canister purge valve (9C915)
- Harness circuits: CV, FLI, FTP, EVAP Canister Purge Valve, SIG RTN, vehicle power (VPWR), reference voltage (VREF) and power ground (PWR GND)
- Powertrain control module (PCM) (12A650)

HX: Pinpoint Tests →

HX: Evaporative Emission (EVAP) Monitor and System

← HX: Introduction

HX1 DTC P0443: INSPECT EVAP CANISTER PURGE VALVE CIRCUIT FOR INTERMITTENT FAILURE

- Rerun KOEO, KOER Self-Tests and retrieve Continuous Memory DTCs.

Is DTC P0443 present in Continuous Memory Self-Test only?

Yes	No
The fault that produced Continuous Memory DTC P0443 can be intermittent. GO to <u>Z1</u> . If OK REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	GO to <u>HX2</u> .

HX2 DTC P0443: CHECK VPWR VOLTAGE TO EVAP CANISTER PURGE VALVE

- Key off.
- Disconnect EVAP canister purge valve.
- Key on, engine off.
- Measure voltage between VPWR circuit at the EVAP canister purge valve harness connector and battery negative post.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to <u>HX3</u> .	REPAIR open circuit.

HX3 CHECK EVAP CANISTER PURGE VALVE RESISTANCE

Note: EVAP canister purge valve resistance reading must be taken with engine cooled down.

- Disconnect EVAP canister purge valve.
- Measure EVAP canister purge valve resistance.

Is resistance between 30 and 38 ohms?

Yes	No
GO to <u>HX4</u> .	REPLACE damaged EVAP canister purge valve. COMPLETE an Evaporative Emission Leak Check Monitor Repair Verification Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>).

HX4 CHECK EVAP CANISTER PURGE VALVE CIRCUIT FOR OPEN IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Measure resistance of EVAP canister purge valve circuit between PCM harness connector pin and EVAP canister purge valve harness connector.

Is resistance less than 5.0 ohms?

Yes	No
GO to HX5 .	REPAIR open circuit.

HX5 CHECK EVAP CANISTER PURGE VALVE CIRCUIT FOR SHORT TO PWR GND IN HARNESS

- Disconnect scan tool from DLC.
- Measure resistance between EVAP canister purge valve circuit at the EVAP canister purge valve harness connector and battery negative post.

Is resistance greater than 10,000 ohms?

Yes	No
GO to HX6 .	REPAIR short circuit.

HX6 CHECK EVAP CANISTER PURGE VALVE CIRCUIT FOR SHORT TO VPWR IN HARNESS

- Key on, engine off.
- Measure voltage between EVAP canister purge valve circuit at the EVAP canister purge valve harness connector and battery negative post.

Is voltage greater than 10.5 volts?

Yes	No
REPAIR short circuit.	REPLACE PCM. (Refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).

HX18 DTC P1450: CHECK FOR VISUAL CAUSES OF EXCESSIVE FUEL TANK VACUUM

Note: If the EVAP canister-CV solenoid and fuel tank assemblies are not accessible during this pinpoint test step, GO to Evaporative Emissions, Section 303-13 in the Workshop Manual for removal instructions.

- Check for kinks or bends in the fuel vapor hoses/tubes (EVAP canister purge outlet tube and EVAP canister tube).
- Visually inspect EVAP canister inlet port, CV solenoid filter and canister vent hose assembly for

contamination or debris.

- Check CV solenoid filter for blockage or contamination.

Is a fault indicated?

Yes	No
REMOVE any contamination or debris around fuel vapor hoses/tubes and EVAP canister-CV solenoid assembly. REMOVE kinks or bends in EVAP canister purge outlet tube, EVAP canister tube and canister vent hose assembly. GO to <u>HX19</u> .	GO to <u>HX19</u> .

HX19 CHECK FUEL TANK PRESSURE SENSOR VOLTAGE

- Connect scan tool.
- Key on, engine off.
- Access the FTP V PID.

Is the FTP V PID between 2.40 to 2.80 volts with the fuel filler cap on?

Yes	No
A possible intermittent condition on the FTP sensor circuit can cause the DTC P1450. GO to <u>Z1</u> . If circuit is OK, REFER to Evaporative Emissions, Section 303-13, Diagnostic Trouble Code/Symptom Chart in the Workshop Manual for a blocked (plugged) EVAP system condition.	KEY OFF. GO to <u>HX20</u> .

HX20 CHECK FUEL TANK PRESSURE SENSOR VOLTAGE WITH FUEL FILLER CAP REMOVED

- Remove the fuel filler cap.
- Key on, engine off.
- Access the FTP V PID.

Is the FTP V PID between 2.40 to 2.80 volts with fuel filler cap off?

Yes	No
REFER to Evaporative Emissions, Section 303-13, in the Workshop Manual for a blocked (plugged) EVAP system condition.	KEY OFF. GO to <u>HX21</u> .

HX21 CHECK FOR OTHER DTCS PRESENT

- Check for other three wire sensor DTCs (KOEO, KOER or Continuous Memory) present with the DTC P1450.

Are other DTCS present?

--	--

Yes	No
RETURN to Diagnostic Subroutines, Section 4 , for direction in addressing the other DTCs.	KEY OFF. GO to HX22 .

HX22 CHECK VREF FROM PCM TO FTP SENSOR

- Disconnect FTP sensor.
- Key on, engine off.
- Measure voltage between VREF and SIG RTN circuits at the FTP sensor harness connector.

Is voltage between 4.0 and 6.0 volts?

Yes	No
KEY OFF. REPLACE damaged FTP sensor. CLEAR Continuous Memory DTCs. FOLLOW the Vehicle Preparation for Monitor Repair Verification Drive Cycle and COMPLETE an Evaporative Emission Leak Check Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles). RETRIEVE Continuous Memory DTCs. If DTC P1450 is still present, REFER to Evaporative Emissions, Section 303-13, Diagnostic Trouble Code/Symptom Chart, in the Workshop Manual.	KEY OFF. GO to HX23 .

HX23 CHECK FOR OPEN VREF AND SIG RTN CIRCUITS BETWEEN PCM AND FTP SENSOR

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Measure resistance of VREF circuit between PCM harness connector pin and FTP sensor harness connector.
- Measure resistance of SIG RTN circuit between PCM harness connector pin and FTP sensor harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
REPLACE PCM (REFER to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR open circuit.

HX26 DTC P0452: CHECK FOR FTP SENSOR CONNECTOR CONTAMINATION

- Key off.
- Visually check for contamination of the FTP sensor electrical connector.
- Check for completely submerged FTP sensor (tank mounted type only) in liquid fuel (can affect correct FTP voltage reading).

Does FTP sensor and its electrical connector show signs of contamination?

Yes	No
REPAIR FTP sensor electrical connector as necessary.	GO to HX27 .

HX27 CHECK FOR LOW FTP SENSOR VOLTAGE

Note: FTP sensor input with no pressure/vacuum on the fuel tank (filler cap open or not open to atmosphere) is between 2.37 and 2.97 volts.

- Connect scan tool.
- Key on, engine off.
- Access FTP V PID.
- If FTP V PID is not present on the scan tool, measure voltage between FTP and SIG RTN circuits at the PCM harness connector with PCM connected.

Is measured voltage or FTP V PID reading less than 0.22 volt?

Yes	No
KEY OFF. GO to HX28 .	The fault that produced the DTC P0452 is intermittent. GO to Z1 .

HX28 CHECK OPPOSITE INDUCED HIGH FTP SIGNAL

- Disconnect FTP sensor.
- Connect a jumper wire between VREF circuit and FTP circuits at the FTP sensor harness connector.
- Key on, engine off.
- If a scan tool communication concern exists, remove jumper immediately and GO to [HX29](#).
- Access FTP V PID.
- If FTP V PID is not present on the scan tool, measure voltage between FTP and SIG RTN circuits at the PCM harness connector with PCM connected.

Is measured voltage or FTP V PID reading between 4.0 and 6.0 volts?

Yes	No
REPLACE FTP sensor. REFER to Evaporative Emissions, Section 303-13 in the Workshop Manual for component removal and installation. RESTORE vehicle. FOLLOW the Vehicle Preparation for Monitor Repair Verification Drive Cycle and COMPLETE an Evaporative Emission Leak Check Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).	REMOVE jumper. GO to HX29 .

HX29 CHECK VOLTAGE BETWEEN VREF AND SIG RTN CIRCUITS AT FTP SENSOR

- Key on, engine off.

- Measure voltage between VREF and SIG RTN circuits at the FTP sensor harness connector.

Is voltage between 4.0 and 6.0 volts?

Yes	No
KEY OFF. GO to <u>HX30</u> .	VREF voltage is out of range. GO to <u>C1</u> .

HX30 CHECK FTP CIRCUIT FOR SHORT TO SIG RTN OR PWR GND IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Disconnect scan tool from DLC.
- Measure resistance between FTP and SIG RTN circuits at the PCM harness connector.
- Measure resistance between FTP circuit at the PCM harness connector and battery negative post.

Is each resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (REFER to Section 2, <u>Drive Cycles</u>).	REPAIR short circuit.

HX33 DTC P0453: CHECK FOR HIGH FTP SENSOR VOLTAGE

Note: FTP sensor input with no pressure/vacuum on the fuel tank (fuel filler cap open or not open to atmosphere) is 2.37 to 2.97 volts.

- Connect scan tool.
- Key on, engine off.
- Access FTP V PID.
- If FTP V PID is not present on the scan tool, measure voltage between FTP and SIG RTN circuits at the PCM harness connector with PCM connected.

Is measured voltage or FTP V PID reading greater than 4.50 volts?

Yes	No
KEY OFF. GO to <u>HX34</u> .	The fault that produced DTC P0453 is intermittent. GO to <u>Z1</u> .

HX34 CHECK FTP CIRCUIT FOR SHORT TO POWER

- Disconnect FTP sensor.
- Key on, engine off.
- Measure voltage between FTP circuit at the FTP sensor harness connector and battery negative post.

Is the voltage greater than 10.5 volts?

Yes	No

KEY OFF. The FTP is indicating a short to VPWR. GO to [HX35](#).

KEY OFF. GO to [HX36](#).

HX35 CHECK FTP CIRCUIT FOR SHORT TO VPWR IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Key on, engine off.
- Measure the voltage between FTP circuit at the PCM harness connector and battery negative post.

Is voltage greater than 10.5 volts?

Yes	No
REPAIR short circuit.	REPLACE PCM. (REFER to Section 2 , Flash EEPROM.)

HX36 CHECK OPPOSITE INDUCED LOW FTP SIGNAL

- Connect a jumper wire between SIG RTN and FTP circuits at the FTP sensor harness connector.
- Key on, engine off.
- If a scan tool communication concern exists, turn the key off, remove jumper immediately and GO to [HX41](#).
- Access FTP V PID.
- If FTP V PID is not present on the scan tool, measure voltage between FTP and SIG RTN circuits at the PCM harness connector with PCM connected.

Is measured voltage or FTP V PID reading less than 0.10 volt?

Yes	No
REMOVE jumper. GO to HX37 .	Unable to induce opposite signal. KEY OFF. GO to HX39 .

HX37 CHECK FOR IN RANGE VOLTAGE BETWEEN VREF AND SIG RTN CIRCUITS AT FTP SENSOR

- Key on, engine off.
- Measure voltage between VREF and SIG RTN circuits at the FTP sensor vehicle harness connector.

Is voltage between 4.0 and 6.0 volts?

Yes	No
KEY OFF. GO to HX38 .	VREF voltage is out of range. GO to C1 .

HX38 CHECK FTP CIRCUIT FOR SHORT TO VREF IN SENSOR OR HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Measure resistance between FTP and VREF circuits at the PCM harness connector. (For 150PIN PCM, measure to both VREF pins.)

Is the resistance greater than 10,000 ohms?

Yes	No
REPLACE FTP sensor. REFER to Evaporative Emissions, Section 303-13 in the Workshop Manual for component removal and installation. RESTORE vehicle. FOLLOW the Vehicle Preparation for Monitor Repair Verification Drive Cycle and COMPLETE an Evaporative Emission Leak Check Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).	REPAIR short circuit.

HX39 CHECK FTP CIRCUIT FOR OPEN IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Measure resistance of FTP circuit between PCM harness connector pin and FTP sensor harness connector.

Is resistance less than 5.0 ohms?

Yes	No
GO to HX40 .	REPAIR open circuit.

HX40 CHECK FOR OPEN SIG RTN CIRCUIT BETWEEN PCM AND FTP SENSOR

- Measure resistance of SIG RTN circuit between PCM harness connector pin and FTP sensor harness connector.

Is resistance less than 5.0 ohms?

Yes	No
GO to HX41 .	REPAIR open circuit.

HX41 CHECK FTP CIRCUIT FOR SHORT TO VREF IN PCM

- PCM disconnected.
- Measure resistance between FTP and VREF circuits at the PCM harness connector. (For 150 PIN PCM, measure to both VREF pins.)

Is the resistance greater than 10,000?

Yes	No
-----	----

REPLACE PCM (refer to Section 2, [Flash Electrically Erasable Programmable Read Only Memory \(EEPROM\)](#)).

REPAIR short circuit.

HX43 DTC P0457: CHECK FOR MISSING OR LEAKING FUEL FILLER CAP

- Check for missing fuel filler cap.
- Check for a loose fuel filler cap.
- Check for possible cross-thread fuel filler cap condition.

Is a concern present with the proper installation of the fuel filler cap?

Yes	No
<p>REPLACE cross-threaded or damaged fuel filler cap. RECONNECT and TIGHTEN the fuel filler cap only one-eighth turn so that the cap initially clicks by sound or touch. COMPLETE PCM KAM Reset to clear DTCs and adaptive memory. (REFER to Section 2, Diagnostic Methods). COMPLETE an Evaporative Emission Leak Check Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles). RERUN Quick Test. If DTC P0455 is present, REFER to Evaporative Emissions, Section 303-13, Diagnostic Trouble Code/Symptom Chart in the Workshop Manual.</p>	<p>COMPLETE PCM KAM Reset to clear DTCs and adaptive memory. (REFER to Section 2, Diagnostic Methods). COMPLETE an Evaporative Emission Leak Check Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles). RERUN Quick Test. If DTC P0455 is present, REFER to Evaporative Emissions, Section 303-13, Diagnostic Trouble Code/Symptom Chart in the Workshop Manual. Otherwise, INFORM the vehicle owner that it is important and necessary to immediately install the fuel filler cap after every refueling event.</p>

HX65 DTC P1451: CHECK VPWR VOLTAGE TO CV SOLENOID

- Key off.
- Disconnect canister vent (CV) solenoid.
- Connect a non-powered test lamp between CV and VPWR circuits at the CV solenoid harness connector.
- Key on, engine off.
- Attempt to close and open CV solenoid driver in PCM by accessing Output Test Mode.
- Select ALL OFF mode.
- Cycle START button ON and OFF, and observe the test lamp.

Does the test lamp cycle on and off (light up and turn off)?

Yes	No
<p>KEY OFF. GO to HX66.</p>	<p>For test lamp always off : GO to HX67.</p> <p>For test lamp always on : KEY OFF. GO to HX70.</p>

HX66 CHECK CV SOLENOID RESISTANCE

- Measure CV solenoid resistance.

Is resistance between 48 and 65 ohms?

Yes	No
Unable to identify fault at this time. GO to Z1 .	REPLACE damaged CV solenoid. COMPLETE an EVAP system leak test at the evaporative test port to VERIFY that a leak did not occur during component replacement. FOLLOW the Vehicle Preparation for Monitor Repair Verification Drive Cycle and COMPLETE an Evaporative Emission Leak Check Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).

HX67 CHECK FOR OPEN VPWR CIRCUIT BETWEEN CV SOLENOID AND POWER RELAY

- Measure voltage between VPWR circuit at the CV solenoid harness connector and battery negative post.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to HX68 .	KEY OFF. REPAIR open circuit.

HX68 CHECK VPWR CIRCUIT FOR OPEN IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Measure resistance of VPWR circuit between PCM harness connector pin (or for 150 PIN PCM, the VPWR fuse to the power relay) and CV solenoid harness connector.

Is resistance less than 5.0 ohms?

Yes	No
GO to HX69 .	REPAIR open circuit.

HX69 CHECK CV CIRCUIT FOR OPEN IN HARNESS

- Measure resistance of CV circuit between PCM harness connector pin and CV solenoid harness connector.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR open circuit.

HX70 CHECK CV CIRCUIT FOR SHORT TO PWR GND IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Disconnect scan tool from DLC.
- Measure resistance between CV circuit at the CV solenoid harness connector and battery negative post.

Is resistance greater than 10,000 ohms?

Yes	No
RECONNECT scan tool. GO to <u>HX71</u> .	REPAIR short circuit.

HX71 CHECK CV CIRCUIT FOR SHORT TO PWR OR CHASSIS GND IN HARNESS

- Key on, engine off.
- Measure voltage between CV circuit at the PCM harness connector and chassis ground.

Is voltage less than 1.0 volt?

Yes	No
KEY OFF. REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	KEY OFF. REPAIR short circuit to VPWR, VREF or chassis ground.

HX76 DTC P0460: CHECK FUEL TANK LEVEL

Note: For Focus, Escape, Mustang, LS6/LS8, Town Car, Windstar, Explorer/Mountaineer (150 Pin PCM), F-Series, 5.4L Lightning and Expedition/Navigator/Blackwood applications, go to Instrument Cluster Section 413-01, fuel level indicator or Rear Electronic Module (REM) diagnosis in the Workshop Manual.

- Key on, engine off.
- Observe and record fuel gauge reading.
- Access fuel level input (FLI) PID.

Are both the fuel gauge and the FLI PID indicating between slightly above one-third (33% on FLI PID) and three quarters (75% on the FLI PID) filled?

Yes	No
GO to <u>HX78</u> .	<p>KEY OFF. INSPECT fuel tank for leaks. REPAIR fuel tank if necessary. CHECK for a damaged fuse for the fuel pump (FP) to fuel gauge circuit.</p> <p>For a damaged fuse without a DTC P0460 :</p> <p>CHECK for CASE GND short to VPWR circuit. GO to <u>B1</u> or GO to <u>X1</u> (CCRM applications).</p> <p>For fuel gauge inoperative without a DTC P0460:</p>

REFER to Instrument Cluster Section 413-01 and 413-02 in the Workshop Manual.

For DTC P0460:

GO to [HX77](#).

HX77 CHECK FOR INADEQUATE FUEL LEVEL

- Key on, engine off.
- Observe both the fuel gauge and FLI PID.
- If fuel level is under one third (33% on FLI PID), add fuel (7.57 to 11.36 liters [2 to 3 gallons]) to the fuel tank.
- If fuel level is greater than three quarters (75% on FLI PID), drain (7.57 to 11.36 liters [2 to 3 gallons]) fuel from the fuel tank.

Did either the fuel gauge or FLI PID indicate a movement upward or downward as the fuel is either added or drained?

Yes	No
DRIVE vehicle and RERUN Quick Test for DTCs. If DTC P0460 is still present, GO to HX78 .	KEY OFF. GO to HX79 .

HX78 CHECK FLI CIRCUIT VOLTAGE

Note: The FLI V PID must not be used for diagnosis on the 2.5L Cougar in this Pinpoint Test Step, but only applications without returnless fuel systems.

For 2.5L Cougar (without returnless fuel systems only):

- Key on, engine running.
- Measure voltage between the FLI and SIG RTN circuits at the PCM harness connector.

For All Others:

- Key on, engine running.
- Access FLI V PID.

Is voltage or FLI V PID reading between 1.23 and 2.25 volts (6.14 and 4.39 volts on 2.0L/2.5L Cougar without returnless fuel system)?

Yes	No
KEY OFF. For Continental: GO to HX87 . For All others: GO to HX86 .	KEY OFF. GO to HX79 .

HX79 CHECK FUEL PUMP MODULE RESISTANCE

- Disconnect fuel pump (FP) module (refer to FP module pigtail connector at the beginning of this pinpoint test).
- Measure resistance between FLI and CASE GND pins on the FP module (at pigtail).

Is resistance between 15 and 160 ohms?

Yes	No
GO to HX80 .	CHECK for stuck fuel level float on fuel pump (FP) module. REPAIR as necessary. If free movement is present, REPLACE fuel pump module assembly.

HX80 CHECK FLI CIRCUIT VOLTAGE AT FP MODULE

- Disconnect the instrument cluster connector to the fuel gauge. (Refer to Instrument Cluster Section 413-01 in the Workshop Manual or Wiring Diagram manual for cluster connector configuration.)
- Key on, engine off.
- Measure voltage between FLI circuit at the FP module harness connector and battery negative post.

Is voltage greater than 5 volts?

Yes	No
KEY OFF. GO to HX81 .	KEY OFF. GO to HX82 .

HX81 CHECK FLI CIRCUIT FOR SHORT TO VPWR IN HARNESS

- Disconnect PCM.
- Key on, engine off.
- Measure voltage between FLI circuit at the FP module harness connector and battery negative post.

Is voltage greater than 10.5 volts?

Yes	No
REPAIR short circuit.	REPLACE PCM (REFER to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).

HX82 CHECK FLI CIRCUIT FOR SHORT TO PWR GND IN HARNESS

- Disconnect PCM.
- Measure resistance between FLI circuit at the PCM harness connector and battery negative post.

Is resistance greater than 10,000 ohms?

Yes	No

For Continental : GO to HX84 . For All others : GO to HX83 .	REPAIR short circuit.
---	-----------------------

HX83 CHECK FLI CIRCUIT FOR SHORT TO CASE GND IN HARNESS

- Measure resistance between FLI and CASE GND circuits at the PCM harness connector.

Is resistance greater than 10,000 ohms?

Yes	No
GO to HX85 .	REPAIR short between FLI and CASE GND circuits.

HX84 CHECK FLI CIRCUIT FOR SHORT TO CASE GND IN HARNESS ON CONTINENTAL

- Measure resistance between fuel level input Pin 4 and fuel level return Pin 28 at the virtual image instrument cluster harness connector at the fuel gauge. (Refer to the Wiring Diagram manual, fuel pump module to fuel gauge.)
- Measure resistance between fuel level input Pin 4 and fuel logic ground Pin 27 at the virtual image instrument cluster harness connector at the fuel gauge. (Refer to the Wiring Diagram manual, PCM to fuel gauge.)

Is each resistance greater than 10,000 ohms?

Yes	No
GO to HX85 .	REPAIR short between FLI and fuel level return circuits or FLI and fuel logic ground circuits.

HX85 CHECK FLI CIRCUIT FOR OPEN IN HARNESS

- Measure resistance of FLI circuit between PCM harness connector and fuel pump (FP) module (pigtail) harness connector.
- Measure resistance of FLI circuit between PCM harness connector and the instrument cluster fuel gauge harness connector.

Is each resistance less than 10.0 ohms?

Yes	No
For Continental : GO to HX87 . For All others : GO to HX86 .	REPAIR open circuit.

HX86 CHECK CASE GND CIRCUIT FOR OPEN IN HARNESS

- Measure resistance of CASE GND circuit between PCM harness connector and FP module (pigtail) harness connector.
- Measure resistance between the CASE GND circuit at the PCM harness connector and the fuel gauge ground at the instrument cluster fuel gauge harness connector.

Is each resistance less than 10.0 ohms?

Yes	No
REFER to Instrument Cluster Section 413-01 in the Workshop Manual (reference: Wiring Diagram manual) for fuel gauge diagnosis. REPLACE fuel gauge or REPAIR as necessary. Then RERUN Quick Test. If DTC P0460 is still present, REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPAIR open circuit.

HX87 CHECK CASE GND CIRCUIT FOR OPEN IN HARNESS ON CONTINENTAL

- Measure resistance of CASE GND circuit between PCM harness connector Pin 25 and virtual image instrument cluster harness connector Pin 27 at the fuel gauge.
- Measure resistance between CASE GND pin at FP module (pigtail) harness connector and virtual image instrument cluster harness connector Pin 28 at the fuel gauge.

Is each resistance less than 10,000 ohms?

Yes	No
REFER to Instrument Cluster Section 413-01 in the Workshop Manual (reference: Wiring Diagram manual) for fuel gauge diagnosis. REPLACE fuel gauge or REPAIR as necessary. Then RERUN Quick Test. If DTC P0460 is still present, REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPAIR open circuit.

HX88 CHECK FUEL CAP LAMP ALWAYS ON W/O DTCS

- Disconnect PCM.
- Key on, engine off.

Is the Check Fuel Cap Indicator Lamp OFF with the PCM disconnected?

Yes	No
KEY OFF. REPLACE PCM (REFER to Section 2, <u>Flash Electrically Erasable</u>	The PCM has not attempted to ground the circuit between the Check Fuel Cap Indicator Lamp and corresponding PCM pin. This has

Programmable Read Only Memory (EEPROM).

not turned the indicator lamp ON. REFER to Instrument Cluster, Section 413-01, in the Workshop Manual.

HX89 CHECK FUEL CAP LAMP ALWAYS OFF W/O DTCS

- Key off.
- Disconnect the Check Fuel Cap Indicator Lamp harness connector at the instrument cluster.
- Disconnect PCM.
- Measure resistance between PCM harness connector pin (refer to Fuel Cap Off Indicator Lamp PCM Pin Table at the beginning of this pinpoint test for correct pin number) and Check Fuel Cap circuit at the indicator lamp harness connector.

Is resistance less than 5.0 ohms?

Yes	No
REFER to Instrument Cluster, Section 413-01, in the Workshop Manual to diagnose instrument cluster and Check Fuel Cap Bulb. If OK, REPLACE PCM (REFER to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM).</u>). VERIFY repair by turning key to ON position (lamp will turn OFF in 3 seconds).	REPAIR open circuit. VERIFY repair by turning key to ON position (lamp will turn OFF in 3 seconds).

HY: Generator/Regulator System Introduction

HY: Pinpoint Tests →

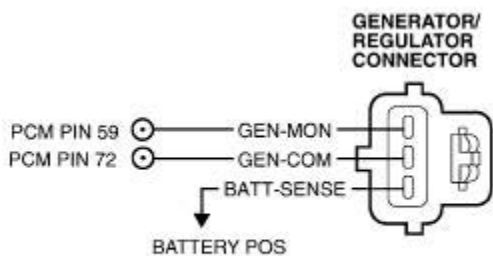

Note

This Pinpoint Test is intended to diagnose the following:

- Generator/Regulator
- Generator/Regulator harness circuits: GEN-MON, GEN-COM, BATT-SENSE
- PCM

Pinpoint Test Schematics and Connectors

Focus, 2.0L Escape

HY: Generator/Regulator System

← HY: Introduction

HY1 DTC P1246: VERIFY GENERATOR DRIVE FUNCTION

- Check generator drive belt condition.
- Check generator drive belt tension.
- Start engine, verify generator turning.

Does generator turn?

Yes	No
GO to HY2 .	REFER to Charging System Section 414-00 in the Workshop Manual.

HY2 VERIFY CHARGING SYSTEM IS EEC CONTROLLED

- Key off.
- Disconnect battery terminals at battery.
- Disconnect generator harness connector and measure resistance between battery-sense and gen-com pin at the generator.

Is resistance between 950 and 1050 ohms?

Yes	No
GO to HY3 .	REPLACE generator/regulator assembly.

HY3 CHECK BATTERY-SENSE VOLTAGE AT BATTERY

- Reconnect generator.
- Reconnect battery.

Is battery voltage at battery-sense circuit pin at the generator/regulator harness connector within plus or minus 0.5 volt of battery voltage?

Yes	No
GO to HY4 .	REPAIR battery-sense circuit.

HY4 CHECK GENERATOR FAILURE MODE

- All electrical load off.
- Access the GFSF PID.
- Increase engine speed to 2,000 rpm.
- Perform wiggle test.

Is a failure indicated?

Yes	No
GO to <u>HY5</u> .	REFER to Charging System, Section 414-00 in the Workshop Manual.

HY5 CHECK GEN-MON AND GEN-COM CIRCUIT FOR SHORT TO POWER

- Key off.
- PCM and generator/regulator disconnected.
- Key on.
- Measure voltage between gen-com signal pin at the PCM harness connector and chassis ground.
- Measure voltage between gen-mon signal pin at the PCM harness connector and chassis ground.

Is each voltage greater than 0.5 volt?

Yes	No
KEY OFF. REPAIR short circuit.	KEY OFF. GO to <u>HY6</u> .

HY6 CHECK GEN-MON AND GEN-COM CIRCUIT FOR SHORT TO GROUND

- Measure resistance between the gen-com signal pin at the PCM harness connector and chassis ground.
- Measure resistance between the gen-mon signal pin at the PCM harness connector and chassis ground.

Is resistance greater than 10,000 ohms?

Yes	No
GO to <u>HY7</u> .	REPAIR short circuit.

HY7 CHECK GEN-MON AND GEN-COM CIRCUIT FOR OPEN

- Measure resistance of the gen-com circuit between the generator/regulator harness connector and the PCM harness connector.
- Measure resistance of the gen-mon circuit between the generator/regulator connector and the PCM harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
GO to <u>HY8</u> .	REPAIR open circuit.

HY8 CHECK GENERATOR MONITOR SIGNAL

- Engine idling.
- Access GFS PID.

Is duty cycle between 6-98%?

Yes	No
GO to <u>HY9</u> .	REPLACE generator/regulator assembly.

HY9 CHECK GENERATOR COMMUNICATOR SIGNAL

- Access GENFDC PID.
- Engine idling.
- Toggle load on and off (headlights).

Does PID switch within 0-99% range?

Yes	No
Generator function is OK. GO to Pinpoint Test <u>Z</u> , intermittent circuit failure diagnosis.	REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).

JB: Secondary Ignition Introduction

JB: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Spark plugs (12405)
- Spark plug wires (12280, 12281)

Caution

A malfunctioning ignition system may cause high catalyst temperatures. Check components next to the catalyst and muffler for heat damage.

Escort, Focus, 2.0L Escape, Cougar, Taurus/Sable, 3.8L Mustang, Ranger, Windstar, 4.0L Explorer/Mountaineer, 4.2L E/F-Series, 5.0L Explorer/Mountaineer

3.0L Escape, 4.6L Mustang, Crown Victoria/Grand Marquis, LS6/LS8, Town Car, Continental, 4.6L Explorer/Mountaineer, Expedition, Navigator/Blackwood, Excursion, 4.6L/5.4L/6.8L E/F-Series, 6.8L E-Series

Tables

IGNITION COIL TO CYLINDER CORRELATION AND FIRING ORDER—ALL OTHERS

JB: Secondary Ignition

← JB: Introduction

JB1 VISUAL INSPECTION OF IGNITION SYSTEM

- Visually inspect the engine compartment to make sure all coils and spark plug wires are properly and securely connected.
- Examine all wiring harnesses and connectors for damaged, burned or overheated insulation and loose or broken conditions.
- Be certain the battery is fully charged.
- All accessories must be off during diagnosis.

Is a problem indicated?

Yes	No
REPAIR as necessary. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>).	For coil pack application using engine analyzer: GO to <u>JB2</u> . For coil pack applications not using engine analyzer: GO to <u>JB20</u> . For coil on plug applications: GO to <u>JB15</u> .

JB2 CONNECT ENGINE ANALYZER

Obtain an Engine Analyzer to diagnose concerns in the secondary side of the ignition system.

Note: In order for the diagnostic procedures to provide accurate results, it is essential that the calibration of the engine analyzer be maintained. Refer to the equipment manual for the procedure to calibrate the engine analyzer. If the equipment manual is not available, an estimate of the calibration can be made by connecting the Spark Tester D81P-6666-A or equivalent to a properly operating ignition system and measuring the firing voltage of the spark tester only. The spark tester firing voltage should be approximately 12KV.

Is the engine analyzer connected?

Yes	No
GO to <u>JB3</u> .	GO to <u>JB2</u> .

JB3 CHECK FOR IGNITION PATTERN

- Observe pattern on scope while cranking engine.

Is the pattern flat which indicates no spark on all cylinders?

Yes	No
<p>KEY OFF. LS6 and LS8: GO to <u>B5</u>.</p> <p>All others : IGN START/RUN circuit concern. CHECK condition of related fuses/fuse links. If OK, REPAIR open circuit. If fuse/fuse link is damaged, CHECK IGN START/RUN circuit for short to ground. REPAIR as necessary. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).</p>	<p>GO to <u>JB4</u>.</p>

JB4 CHECK FOR NORMAL IGNITION PATTERN

Note: Spark plugs are fired up to four strikes per firing. Multi-strike operating mode is dependent on the PCM calibration and is limited to less than 2000 rpm. Above 2000 rpm, spark plugs are fired once per firing.

- Key on, engine running.
- Check spark plug firing voltage average pattern.

Are the patterns even and is the average value of spark plug firing voltage 12KV (+/- 3KV)?

Yes	No
<p>Intermittents:</p> <p>GO to <u>Z1</u>.</p> <p>All others:</p> <p>If you were directed to this Pinpoint Test from <u>Section 3</u>, RETURN to <u>Section 3</u>. If you were</p>	<p>GO to <u>JB5</u>.</p>

directed to this Pinpoint Test from **HD3** , GO to **HD4**. If you were directed to this Pinpoint Test from Pinpoint Test Step **A6** , GO to **A6**.

JB5 CHECK FOR TWO MISSING SPARK PATTERNS ON THE SAME COIL

- Observe pattern on scope.

Is the spark pattern missing from two cylinders on the same coil?

Yes	No
INSPECT spark plug wires and spark plugs for missing cylinders. MEASURE resistance of spark plug wires. REPLACE if greater than 7,000 ohms per 30.5 cm (1 foot). Measure resistance of spark plugs. REPLACE if lower than 2000 or higher than 20000 ohms. If spark plug wires and spark plugs are OK, GO to <u>JE1</u> .	GO to <u>JB6</u> .

JB6 CHECK FOR ONE MISSING SPARK PATTERN

- Observe pattern on scope.

Is spark pattern missing from one cylinder?

Yes	No
INSPECT spark plug wire and spark plug for missing cylinder. MEASURE resistance of spark plug wire. REPLACE if greater than 7,000 ohms per 30.5 cm (1 foot). MEASURE	

resistance of spark plug. REPLACE if lower than 2000 or higher than 20000 ohms. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).

GO to JB7.

JB7 CHECK FOR HIGH SPARK PLUG FIRING VOLTAGE

- Check the spark plug firing voltage average pattern.

Is the average value of spark plug firing voltage greater than 15KV?

Yes	No
<p>Conditions affect all cylinders. INSPECT spark plug wires and spark plugs. MEASURE resistance of spark plug wires. REPLACE if greater than 7,000 ohms per 30.5 cm (1 foot). CHECK spark plug gaps. MEASURE resistance of spark plugs. REPLACE if lower than 2000 or higher than 20000 ohms. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>).</p>	<p>GO to <u>JB8</u>.</p>

JB8 CHECK FOR LOW SPARK PLUG FIRING VOLTAGE

- Check the spark plug firing voltage average pattern.

Is there consistently low spark plug firing voltage or sloping spark line on one or more cylinders?

Yes	No

INSPECT spark plug wire and spark plugs. MEASURE resistance of spark plug wires. REPLACE if greater than 7,000 ohms per 30.5 cm (1 foot). MEASURE resistance of spark plugs. REPLACE if lower than 2000 or higher than 20000 ohms. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).

GO to JB9.

JB9 CHECK FOR EVENNESS BETWEEN CYLINDERS

- Check the spark plug firing voltage average pattern.

Is the evenness of spark plug firing voltage greater than 6KV?

Yes	No
Inspect spark plug wires and spark plugs. MEASURE resistance of spark plug wires. REPLACE if greater than 7,000 ohms per 30.5 cm (1 foot). CHECK for damaged spark plugs or narrow spark plug gaps. MEASURE resistance of spark plugs. REPLACE if lower than 2000 or higher than 20000 ohms. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>).	GO to <u>Z1</u> .

JB15 DTC P0301 THROUGH P0310: MISFIRE ON CYLINDERS 1 THROUGH 10

Are any of the above listed DTCs present?

Yes	No
GO to <u>JB16</u> .	GO to <u>JB17</u> .

JB16 CHECK FOR SPARK AT CYLINDER(S) INDICATED BY DTC(S)

- Disable inertia switch.
- Disconnect ignition coil(s) from spark plug(s).
- Connect a Spark Tester 303-D037 (D81P-6666-A) or equivalent to a coil.
- Check for spark while cranking engine.

Is the bluish-white spark present?

Yes	No
KEY OFF. GO to JB18 .	KEY OFF. INSPECT spark plugs for missing cylinders. MEASURE resistance of spark plugs. REPLACE if lower than 2000 or higher than 20000 ohms. GO to JF1 .

JB17 CHECK FOR SPARK AT ALL CYLINDERS

- Disable inertia switch.
- Using a Spark Tester 303-D037 (D81P-6666-A) or equivalent, check for spark at each cylinder while cranking engine.

Is the bluish-white spark consistent between all cylinders?

Yes	No
KEY OFF. GO to JB18 .	KEY OFF. INSPECT spark plugs for missing cylinders. MEASURE resistance of spark plugs. REPLACE if lower than 2000 or higher than 20000 ohms. Record cylinders with inconsistent spark and GO to JF1 .

JB18 CHECK SPARK PLUGS

- Remove and check plugs for damage, wear, carbon deposits and proper plug gap.

Are plugs OK?

Yes	No
GO to JB19 .	REPAIR plugs. ADJUST gap or REPLACE as necessary. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).

JB19 CHECK SPARK PLUG RESISTANCE

- Measure spark plug resistance.

Is resistance between 2000 and 20000 ohms?

Yes	No
<p>Intermittents:</p> <p>GO to Z1.</p> <p>All others:</p> <p>If you were directed to this Pinpoint Test from Section 3, RETURN to Section 3. If you were directed to this Pinpoint Test from Pinpoint Test Step HD3, GO to HD4. If you were</p>	<p>REPLACE spark plugs. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).</p>

directed to this Pinpoint Test from Pinpoint Test Step A6 , GO to <u>A6</u> .	
--	--

JB20 DTC P0301 THROUGH DTC P0308: MISFIRE ON CYLINDERS 1 THROUGH 8

Are any of the above listed DTCs present?

Yes	No
GO to <u>JB21</u> .	GO to <u>JB22</u> .

JB21 CHECK FOR SPARK AT CYLINDER(S) INDICATED BY DTC(S)

- Disable inertia switch.
- Disconnect spark plug wire(s) from spark plug(s).
- Connect a Spark Tester 303-D037 (D81P-6666-A) or equivalent to a spark plug wire.
- Check for spark while cranking engine.

Is the bluish-white spark present?

Yes	No
KEY OFF. GO to <u>JB23</u> .	KEY OFF. INSPECT spark plug wires. MEASURE resistance of spark plug wires. REPLACE if greater than 7,000 ohms per 30.5 cm (1 foot). COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>). If spark plug wires are OK, GO to <u>JE1</u> .

JB22 CHECK FOR SPARK AT ALL CYLINDERS

- Disable inertia switch.
- Using a Spark Tester 303-D037 (D81P-6666-A) or equivalent, check for spark at each cylinder while cranking engine.

Is the bluish-white spark consistent between all cylinders?

Yes	No
KEY OFF. GO to <u>JB23</u> .	KEY OFF. INSPECT spark plug wires. MEASURE resistance of spark plug wires. REPLACE if greater than 7,000 ohms per 30.5 cm (1 foot). COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>). If spark plug wires are OK, GO to <u>JE1</u> .

JB23 CHECK SPARK PLUGS

- Remove and check plugs for damage, wear, carbon deposits and proper plug gap.

Are plugs OK?

Yes	No
GO to JB24 .	REPAIR plugs. ADJUST gap or REPLACE as necessary. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).

JB24 CHECK SPARK PLUG RESISTANCE

- Measure spark plug resistance.

Is resistance between 2000 and 20000 ohms?

Yes	No
<p>Intermittents:</p> <p>GO to Z1.</p> <p>All others:</p> <p>If you were directed to this Pinpoint Test from Section 3, RETURN to Section 3. If you were directed to this Pinpoint Test from Pinpoint Test Step HD3, GO to HD4. If you were directed to this Pinpoint Test from Pinpoint Test Step A6, GO to A6.</p>	REPLACE spark plugs. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).

JD: Crankshaft Position (CKP) Sensor

← JD: Introduction

JD1 CHECK CKP+ CKP—CONTINUITY

Note: Refer to the PCM connector pin numbers in the beginning of this Pinpoint Test.

- Disconnect the CKP sensor and PCM.
- Measure resistance of CKP(+) and CKP(-) circuits between the PCM harness connector and the CKP harness connector.

Is resistance greater than 5 ohms?

Yes	No
REPAIR open circuit.	GO to <u>JD2</u> .

JD2 CHECK FOR CKP+ BIAS VOLTAGE FAULT

- Key on, engine off.
- Reconnect the PCM.
- Measure voltage between CKP(+) at the CKP harness connector and battery negative post.
- Key off.

Was voltage greater than 1.0 volt but less than 2.0 volts?

Yes	No
GO to <u>JD3</u> .	Bias fault. GO to <u>JD19</u> .

JD3 CHECK FOR CKP- BIAS VOLTAGE FAULT

- Key on, engine off.
- Measure voltage between CKP(-) circuit at the CKP harness connector and battery negative post.

Was voltage between 1.0 and 2.0 volts?

Yes	No
KEY OFF. GO to <u>JD10</u> .	Bias fault. GO to <u>JD4</u> .

JD4 DETERMINE IF BIAS HIGH OR BIAS LOW FAULT

Was bias voltage reading in GO to JD3 less than 1.0 volt?

Yes	No
Bias low fault. GO to <u>JD5</u> .	Bias high fault. GO to <u>JD6</u> .

JD5 CHECK CKP- CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect PCM.
- Measure resistance of CKP(-) circuit at the PCM harness connector and battery negative post.

Is each resistance greater than 10K ohms?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPAIR short circuit.

JD6 CHECK CKP- CIRCUIT FOR SHORT TO POWER IN HARNESS

- Disconnect PCM.
- Key on, engine off.
- Measure voltage of CKP(-) circuit at the PCM harness connector and battery negative post.

Is voltage less than 0.5 volt?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPAIR short circuit.

JD10 CHECK CKP SENSOR AMPLITUDE AT PCM

- Reconnect CKP sensor.
- Disconnect PCM.
- Measure voltage between CKP(+) and CKP(-) at the PCM harness connector when cranking engine.
- Key off.

Was settled ac voltage reading greater than 0.4 volt?

Yes	No
CKP circuit is OK. GO to <u>JD11</u> .	Amplitude fault. GO to <u>JD12</u> .

JD11 CHECK CKP(+) CIRCUIT FOR SHORT TO GROUND AT SENSOR

- Measure resistance between CKP+ and battery negative post.

Is the resistance greater than 10K ohms?

Yes	No
GO to <u>JB1</u> .	GO to <u>JD17</u> .

JD12 CHECK CKP CIRCUIT RESISTANCE FOR AMPLITUDE FAULT

- Measure resistance between CKP(+) and CKP(-) at the PCM harness connector.

Is resistance between 300 and 800 ohms (900 and 1300 for LS6LS8)?

Yes	No
GO to <u>JD16</u> .	GO to <u>JD13</u> .

JD13 DETERMINE IF RESISTANCE HIGH OR RESISTANCE LOW FAULT

Was the resistance from GO to JD12 less than 300 ohms?

Yes	No
Low resistance fault. GO to <u>JD14</u> .	REPLACE CKP sensor.

JD14 CHECK CKP+ FOR SHORT TO CKP-

- Disconnect CKP sensor.
- Measure resistance between the CKP+ and CKP- at the harness connector.

Is resistance less than 5 ohms?

Yes	No
REPAIR short.	REPLACE CKP.

JD16 CHECK CKP SENSOR AND PULSE WHEEL

- Check pulse wheel and CKP sensor visually for damage.

Is CKP sensor and pulse wheel OK?

Yes	No
REPLACE CKP sensor.	REPAIR or REPLACE damaged parts.

JD17 CHECK FOR OPEN OR SHORT IN PCM

- Disconnect the CKP sensor and connect the PCM.
- Key off.
- Measure the resistance between the CKP+ and CKP- at the CKP harness connector.

Is the resistance between 16K and 24K ohms?

Yes	No
GO to <u>JD18</u> .	REPLACE the PCM.

JD18 CHECK CKP+ CIRCUIT FOR SHORT TO CKP- CIRCUIT IN HARNESS

- Disconnect PCM.
- Measure resistance between CKP+ and CKP- at the PCM harness connector.

Is resistance greater than 1000 ohms?

Yes	No
REPLACE CKP sensor.	REPAIR short circuit.

JD19 DETERMINE IF BIAS VOLTAGE HIGH OR BIAS VOLTAGE LOW FAULT

Was bias voltage reading in GO to [JD2](#) less than 1.0 volt?

Yes	No
Low bias voltage fault. GO to JD20 .	High bias voltage fault. GO to JD21 .

JD20 CHECK CKP+ CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect PCM.
- Measure resistance between CKP+ and battery negative post.

Is resistance greater than 10K ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR short circuit.

JD21 CHECK CKP+ CIRCUIT FOR SHORT TO POWER IN HARNESS

- Disconnect PCM.
- Key on, engine off.
- Measure voltage of CKP+ and battery negative post.

Is voltage less than 0.5 volt?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR short circuit.

JE: Integrated Ignition Coil A, B, C or D Failure

← JE: Introduction

JE1 DETERMINE WHICH COIL IS NOT FIRING

Note: Electronic ignition engine timing is entirely controlled by the PCM. Electronic ignition timing is NOT adjustable. Do not attempt to check base timing. You will receive false readings.

- Determine which coil is not firing using information from Pinpoint Test JB or DTC and the table at the beginning of this pinpoint test.
- Record cylinder, coil and PCM pin number from the table.

Have the cylinder number, coil driver and PCM pin number been recorded.

Yes	No
GO to JE2 .	To obtain required information, REPEAT GO to JE1 .

JE2 DTC P0351, P0352, P0353, P0354: CHECK IGN START/RUN VOLTAGE TO COIL PACK

- Disconnect suspect coil (determined from the table).
- Key on, engine off.
- Measure voltage between IGN START/RUN circuit at coil pack harness connector and ground.

Is voltage greater than 10.0 volts?

Yes	No
KEY OFF. GO to JE5 .	IGN START/RUN circuit fault. KEY OFF. CHECK condition of related fuses/fuse links. If OK, REPAIR open circuit. If fuse/fuse link is damaged CHECK IGN START/RUN circuit for short to ground. REPAIR as necessary. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).

JE5 CHECK FUNCTIONALITY OF SUSPECT COIL DRIVER (CD) CIRCUIT

- Connect incandescent test lamp between IGN START/RUN and suspect CD circuit (determined from the table) at the coil pack harness connector.
- Disable fuel pump by disconnecting inertia fuel shutoff switch.
- Observe incandescent test lamp while cranking engine.

Did test lamp blink consistently?

Yes	No

KEY OFF. GO to [JE11](#).

KEY OFF. GO to [JE6](#).

JE6 CHECK SUSPECT CD CIRCUIT FOR OPEN IN HARNESS

- Disconnect PCM.
- Measure resistance of suspect CD circuit between PCM harness connector pin (determined from the table) and coil pack harness connector.

Is resistance less than 5 ohms?

Yes	No
GO to JE7 .	REPAIR open circuit. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).

JE7 CHECK SUSPECT CD CIRCUIT FOR SHORT TO VPWR IN HARNESS

- Key on, engine off.
- Measure voltage between suspect CD circuit at the PCM harness connector (determined from the table) and ground.

Is voltage less than 1.0 volt?

Yes	No
KEY OFF. GO to JE8 .	KEY OFF. REPAIR short circuit. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).

JE8 CHECK SUSPECT CD CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect the scan tool.
- Measure resistance between suspect CD circuit at the PCM harness connector (determined from the table) and ground.

Is resistance greater than 10,000 ohms?

Yes	No
GO to JE9 .	REPAIR short circuit. After repair, GO to JE10 to check for damaged coil.

JE9 PERFORM INTERMITTENT TEST ON SUSPECT CD CIRCUIT HARNESS

- Connect digital multimeter between suspect CD circuit at the PCM harness connector (determined from the table) and CD circuit at coil pack harness connector.
- Wiggle and bend CD harness from PCM harness connector to coil pack harness connector.

Did resistance fluctuate during wiggle test?

--	--

Yes	No
REPAIR intermittent fault in harness. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).	REPLACE PCM. (REFER to Section 2, Drive Cycles .) After repair, GO to JE10 to check for damaged coil.

JE10 CHECK SUSPECT PRIMARY COIL FOR OPEN

- Measure resistance of suspect coil between CD and IGN START/RUN circuits at coil pack connector.

Is resistance less than 5 ohms?

Yes	No
COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).	REPLACE coil pack. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).

JE11 CHECK SUSPECT PRIMARY COIL FOR OPEN

- Measure resistance of suspect coil between CD and IGN START/RUN circuits at coil pack connector.

Is resistance less than 5 ohms?

Yes	No
GO to JE12 .	REPLACE coil pack. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).

JE12 CHECK SUSPECT SECONDARY COIL FOR OPEN

- Remove both plug wires from secondary towers of suspect coil.
- Measure resistance of suspect secondary coil between coil pack towers.

Is resistance between 8.6K and 11.1K for Series 5 coil pack, between 11.5K and 15.5K for all others?

Yes	No
<p>If DTC P0350 is present:</p> <p>GO to JB1.</p> <p>If no additional ignition DTCs are present:</p> <p>GO to Z1.</p>	REPLACE coil pack. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, Drive Cycles).

JF: Pinpoint Tests →

JF: Integrated Ignition Coil On Plug Coil A Through J Failure

← JF: Introduction

JF1 DETERMINE WHICH COIL IS NOT FIRING

Note: Electronic ignition engine timing is entirely controlled by the PCM. Electronic ignition timing is NOT adjustable. Do not attempt to check base timing. You will receive false readings.

- Determine which coil is not firing using information from Pinpoint Test JB or DTC and the table at the beginning of this pinpoint test.
- Record cylinder, coil and PCM pin number from the table.

Have the cylinder number, coil driver and PCM pin number been recorded?

Yes	No
GO to <u>JF2</u> .	To obtain required information, GO to <u>JF1</u> and REPEAT.

JF2 CHECK FUNCTIONALITY OF SUSPECT COIL DRIVER (CD) CIRCUIT

- Disconnect suspect coil (determined from the table).
- Connect incandescent test lamp between IGN START/RUN and suspect CD circuit (determined from the table) at the coil on plug harness connector.
- Disable fuel pump by disconnecting inertia fuel shutoff switch.
- Observe incandescent test lamp while cranking engine.

Is the test lamp blinking consistently?

Yes	No
KEY OFF. GO to <u>JF3</u> .	KEY OFF. GO to <u>JF4</u> .

JF3 CHECK FUNCTIONALITY OF SUSPECT COIL

- Remove suspect coil (determined from the table) from spark plug.
- Connect an air gap spark tester 303-D037 (D81P-6666-A) or equivalent to a suspect coil.
- Reconnect suspect coil harness connector.
- Observe spark tester while cranking engine.

Is the spark present?

Yes	No
KEY OFF. INSPECT spark plug, REPLACE if necessary. GO to <u>Z1</u> .	KEY OFF. REPLACE coil. INSPECT spark plug, REPLACE if necessary. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>).

JF4 CHECK IGN START/RUN VOLTAGE TO SUSPECT COIL

- Key on, engine off.
- Measure voltage between IGN START/RUN circuit at the coil on plug harness connector and ground.

Is voltage greater than 10.0 volts?

Yes	No
KEY OFF. GO to <u>JF5</u> .	KEY OFF. LS6 and LS8 : GO to <u>B5</u> . All others : IGN START/RUN circuit fault. CHECK condition of related fuses/fuse links. If OK, REPAIR open circuit. If fuse/fuse link is damaged, CHECK IGN START/RUN circuit for short to ground. REPAIR as necessary. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>).

JF5 CHECK SUSPECT CD CIRCUIT FOR OPEN IN HARNESS

- Disconnect PCM.
- Measure resistance of suspect CD circuit between PCM harness connector pin (determined from the table) and coil on plug harness connector.

Is resistance less than 5 ohms?

Yes	No
GO to <u>JF6</u> .	REPAIR open circuit. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>).

JF6 CHECK SUSPECT CD CIRCUIT FOR SHORT TO VPWR IN HARNESS

- Key on, engine off.
- Measure voltage between suspect CD circuit at the PCM harness connector (determined from the table) and ground.

Is voltage less than 1.0 volt?

Yes	No
KEY OFF. GO to <u>JF7</u> .	KEY OFF. REPAIR short circuit. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>).

JF7 CHECK SUSPECT CD CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect scan tool.
- Measure resistance between suspect CD circuit at the PCM harness connector (determined from

the table) and ground.

Is resistance greater than 10,000 ohms?

Yes	No
GO to <u>JF8</u> .	REPAIR short circuit. If symptom or DTC is still present, GO to <u>JF9</u> to check for damaged coil, otherwise COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>).

JF8 PERFORM INTERMITTENT TEST ON SUSPECT CD CIRCUIT HARNESS

- Connect digital multimeter between suspect CD circuit at the PCM harness connector (determined from the table) and CD circuit at coil on plug harness connector.
- Wiggle and bend CD harness from PCM harness connector to coil on plug harness connector.

Did resistance fluctuate during wiggle test?

Yes	No
REPAIR intermittent fault in harness. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>).	REPLACE PCM. (REFER to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u> .) If symptom or DTC is still present, GO to <u>JF9</u> to check for damaged coil, otherwise COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>).

JF9 CHECK SUSPECT COIL FOR DAMAGE

- Remove suspect coil (determined from the table) from spark plug.
- Connect an air gap spark tester 303-D037 (D81P-6666-A) or equivalent to a suspect coil.
- Disable fuel pump by disconnecting inertia fuel shutoff switch.
- Observe spark tester while cranking engine.

Is the spark present?

Yes	No
KEY OFF. INSPECT spark plug, REPLACE if necessary. GO to <u>Z1</u> .	KEY OFF. REPLACE coil. INSPECT spark plug, REPLACE if necessary. COMPLETE Misfire Monitor Repair Verification Drive Cycle (REFER to Section 2, <u>Drive Cycles</u>).

JH: Tachometer Output Failure Introduction

JH: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Powertrain control module (PCM) (12A650)

Pinpoint Test Schematic

JH: Pinpoint Tests →

JH: Tachometer Output Failure

← JH: Introduction

JH1 CHECK CTO CIRCUIT FOR SHORT TO POWER IN HARNESS

- Disconnect PCM.
- Key on, engine off.
- Measure voltage of CTO circuit between PCM harness connector pin 48 and ground.

Is the voltage less than 0.5 volt?

Yes	No
KEY OFF. GO to JH2 .	REPAIR short circuit. VERIFY symptom no longer exists.

JH2 CHECK CTO CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect instrument cluster connector.
- Measure resistance between PCM harness connector pin 48 and battery negative post.
- Measure resistance between PCM harness connector pin 48 and chassis ground.

Are both resistances greater than 10,000 ohms?

Yes	No
GO to JH3 .	REPAIR short circuit. VERIFY a symptom no longer exists.

JH3 CHECK CTO CIRCUIT FOR OPEN IN HARNESS

- Measure resistance between PCM harness connector pin 48 and instrument cluster harness pin.

Is the resistance less than 5.0 ohms?

Yes	No
GO to JH4 .	REPAIR open circuit. VERIFY symptom no longer exists.

JH4 CHECK CTO SIGNAL FROM PCM

- Reconnect PCM.
- Start engine.
- Measure voltage between CTO pin at the instrument cluster and battery negative post.

Is voltage between 3.0 and 9.0 volts?

--	--

Yes	No
REFER to the Instrument Cluster, Section 413-01A in Workshop Manual for diagnosis and testing.	REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).

KA: Fuel Pump Relay

← KA: Introduction

KA1 DTC P0230: CHECK VPWR (IGN START/RUN FOR TAURUS/SABLE) VOLTAGE TO FUEL PUMP RELAY

- Disconnect fuel pump relay.
- Key on, engine off.
- Measure VPWR (IGN START/RUN for Taurus/Sable) circuit voltage at the fuel pump relay harness connector.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to KA2 .	REPAIR open circuit.

KA2 CHECK FUEL PUMP RELAY

- Refer to the pin numbers moulded on the Fuel Pump Relay. There will be either a pin 1 or pin 85.
- Measure resistance between either pin 1 or pin 85 and all other pins of the Fuel Pump Relay. One measurement should be between 40 and 120 ohms, with the other measurements being greater than 10,000 ohms.

Are all resistance checks OK?

Yes	No
GO to KA3 .	REPLACE fuel pump relay.

KA3 CHECK FUEL PUMP (FP) CIRCUIT FOR SHORT TO POWER IN HARNESS

- Disconnect PCM.
- Key on, engine off.
- Measure voltage between FP circuit at the fuel pump relay harness connector and ground.

Is voltage less than 1.0 volt?

Yes	No
KEY OFF. GO to KA4 .	REPAIR short circuit.

KA4 CHECK FP CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect scan tool from DLC.
- Measure resistance between FP circuit at the fuel pump relay harness connector and ground.

Is resistance greater than 10,000 ohms?

Yes	No
GO to KA5 .	REPAIR short circuit.

KA5 CHECK FP CIRCUIT FOR OPEN IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Measure resistance of FP circuit between fuel pump relay harness connector and PCM harness connector.

Is resistance less than 5.0 ohms?

Yes	No
<p>If Key On Engine Off (KOEO) DTC P0231 or P0232 is also present with the P0230:</p> <p>GO to KA6.</p> <p>All others:</p> <p>REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).</p>	REPAIR open circuit.

KA6 CHECK THE FUEL PUMP PRIMARY CIRCUIT INSIDE THE PCM

Note: The next two test steps will check the FP circuit in the PCM. To do this the FPF PID will be monitored. The FPF PID is able to detect for faults on the FP circuit, and will indicate NO when no fault is detected and YES when a fault is detected.

- Reconnect PCM, fuel pump relay and scan tool.
- Key on, engine off.
- Access FPF PID.

Is the FPF PID Yes?

Yes	No
KEY OFF. REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	GO to KA7 .

KA7 CHECK THE FUEL PUMP PRIMARY CIRCUIT INSIDE THE PCM WHILE CRANKING ENGINE

Note: The scan tool must be connected to a reliable power source that is powered with the key in the START position (such as directly to the vehicle battery). Also verify that the vehicle battery is fully charged.

- While viewing the FPF PID, crank engine.

Is the FPF PID Yes during crank?

Yes	No
KEY OFF. REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	KEY OFF. The fuel pump primary circuit is OK in the harness and PCM. If KOEO P0231 is present: KEY OFF. GO to <u>KA20</u> . If KOEO P0232 is present: GO to <u>KA10</u> .

KA10 DTC P0232: DOES ENGINE START?

Does the engine start?

Yes	No
GO to <u>KA11</u> .	For F-150 Lightning: GO to <u>KA65</u> . All others: GO to <u>KA15</u> .

KA11 VERIFY THAT FUEL PUMP IS OFF

- Key on, wait five seconds.
- Listen for motor noise from fuel pump (it may be necessary to listen near fuel tank).

Is fuel pump off with the key on?

Yes	No
KEY OFF. GO to <u>KA13</u> .	KEY OFF. GO to <u>KA12</u> .

KA12 CHECK FOR FUEL PUMP RELAY ALWAYS CLOSED

- Disconnect fuel pump relay.
- Key on.

Is the fuel pump off?

Yes	No
REPLACE fuel pump relay.	REPAIR short to power in FP PWR/FPM circuit.

KA13 CHECK FOR OPEN FPM CIRCUIT

- Disconnect PCM.

- Disconnect fuel pump relay.
- Measure resistance between PCM harness connector pin 40 and FP PWR circuit at the fuel pump relay harness connector.

Is resistance less than 5.0 ohms?

Yes	No
<p>For P0232: GO to KA14.</p> <p>For P0231: REPLACE PCM (REFER to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).</p>	<p>REPAIR open circuit.</p>

KA14 CHECK FPM CIRCUIT IN PCM

- Reconnect PCM and fuel pump relay.
- Key on, engine off.
- Access FPM PID.

Is the FPM PID OFF?

Yes	No
<p>Key off.</p> <p>For F-150 Lightning:</p> <p>GO to KA55.</p> <p>All others:</p> <p>No fault is detected. The FPM circuit is OK in the harness and PCM. DISREGARD DTC P0232 at this time. RETURN to Section 3, Step 1: Quick Test and CONTINUE diagnosis as directed.</p>	<p>REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).</p>

KA15 CHECK INERTIA FUEL SHUTOFF (IFS) SWITCH

- Disconnect inertia fuel shutoff (IFS) switch (verify that switch is reset).
- Measure resistance between the C and NC pins of the IFS switch.

Is resistance less than 5.0 ohms?

Yes	No
<p>GO to KA16.</p>	<p>REPLACE or RESET IFS switch.</p>

KA16 CHECK FOR OPEN FP PWR CIRCUIT BETWEEN IFS SWITCH AND FUEL PUMP RELAY

- Disconnect fuel pump relay.
- Measure resistance of the FP PWR circuit between fuel pump relay and IFS switch harness

connectors.

Is resistance less than 5.0 ohms?

Yes	No
RECONNECT fuel pump relay. GO to KA17 .	REPAIR open in FP PWR circuit between IFS switch and FPM connection to circuit. (REFER to Wiring Diagram Manual to determine IFS switch location in circuit).

KA17 CHECK FOR OPEN FUEL PUMP GROUND CIRCUIT

- Disconnect fuel pump.
- Measure resistance of fuel pump ground circuit between fuel pump harness connector and ground.

Is resistance less than 5.0 ohms?

Yes	No
GO to KA18 .	REPAIR open circuit.

KA18 CHECK FOR OPEN FP PWR CIRCUIT BETWEEN IFS SWITCH AND FUEL PUMP

- Measure resistance of FP PWR circuit between IFS switch and fuel pump harness connectors.

Is resistance less than 5.0 ohms?

Yes	No
GO to KA19 .	REPAIR open circuit.

KA19 CHECK INTERNAL RESISTANCE OF FUEL PUMP

- Measure internal resistance of fuel pump between FP PWR pin and ground pin of the fuel pump.

Is resistance less than 10.0 ohms?

Yes	No
All fuel pump circuit checks are OK. VERIFY test step results. If all test steps are OK, RECONNECT all components. DISREGARD DTC P0232 at this time. RETURN to Section 3 , Step 1: Quick Test and CONTINUE diagnosis as directed.	REPLACE fuel pump.

KA20 DTC P0231: DOES ENGINE START?

Note: If key on, engine off DTC P0230 is also present and has not been diagnosed, GO to [KA1](#) (to check the primary fuel pump circuits first).

Does the engine start?

Yes	No
GO to KA13 .	GO to KA21 .

KA21 CHECK B+ VOLTAGE TO FUEL PUMP RELAY

- Disconnect fuel pump relay.
- Measure B+ circuit voltage at fuel pump relay harness connector.

Is voltage greater than 10.5 volts?

Yes	No
For F-150 Lightning: GO to KA23 . All others: GO to KA22 .	VERIFY integrity of fuse for B+ supply to fuel pump relay. If OK, REPAIR open circuit. If fuse is damaged, CHECK B+ and FP PWR circuits for short to ground before replacing.

KA22 CHECK FOR OPEN FP PWR CIRCUIT BETWEEN FUEL PUMP RELAY AND FPM SPLICE

- Measure resistance between FP PWR circuit at the fuel pump relay harness connector and the battery negative post.

Is resistance less than 10.0 ohms?

Yes	No
REPLACE fuel pump relay.	REPAIR open in FP PWR circuit between FPM splice and fuel pump relay.

KA23 CHECK VPWR AND INERTIA FUEL SHUTOFF (IFS) CIRCUITS TO INERTIA FUEL SHUTOFF SWITCH RELAY

- Disconnect inertia fuel shutoff (IFS) switch relay.
- Key on, engine off.
- Measure voltage between the VPWR and IFS circuits at the IFS switch relay harness connector.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to KA28 .	GO to KA24 .

KA24 CHECK FOR VPWR TO IFS SWITCH RELAY

- Measure voltage between the VPWR circuit at the IFS switch relay harness connector and chassis ground.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to KA25 .	REPAIR open VPWR circuit to IFS switch relay.

KA25 CHECK GROUND CIRCUIT TO IFS SWITCH

- Disconnect IFS switch (verify switch is set).
- Measure resistance of ground circuit between IFS switch harness connector and chassis ground.

Is resistance less than 5.0 ohms?

Yes	No
GO to KA26 .	REPAIR open circuit.

KA26 CHECK IFS SWITCH

- Measure resistance between the C and NC pins of the IFS switch.

Is resistance less than 5.0 ohms?

Yes	No
GO to KA27 .	REPLACE or RESET IFS switch.

KA27 CHECK FOR OPEN IFS CIRCUIT

- Measure resistance of IFS circuit between IFS switch and IFS switch relay harness connectors.

Is resistance less than 5.0 ohms?

Yes	No
No fault is detected. DISREGARD DTC P0232 at this time. RETURN to Section 3 , Step 1: Quick Test and continue diagnosis as directed.	REPAIR open circuit.

KA28 CHECK FP PWR CIRCUIT CONTINUITY BETWEEN FUEL PUMP RELAY AND IFS SWITCH RELAY

- Measure resistance of FP PWR circuit between the fuel pump relay and the IFS switch relay harness connectors.

Is resistance less than 5.0 ohms?

Yes	No
GO to KA29 .	REPAIR open circuit.

KA29 CHECK OPERATION OF IFS SWITCH RELAY AND FUEL PUMP RELAY

- Using jumper wires, energize the IFS switch relay by connecting B+ to pin 86 and battery ground to pin 85 of the relay (pin numbers molded on relay).
- With relay energized, measure resistance between pins 30 and 87 of the relay. Resistance should be less than 5.0 ohms.
- Repeat test using the fuel pump relay.

Are both relays OK?

Yes	No
REPAIR open in FP PWR circuit between FPM splice and IFS switch relay.	REPLACE applicable relay.

KA30 CONTINUOUS MEMORY DTC P0232: CHECK FUEL PUMP SECONDARY CIRCUITS

Note:

1. If Continuous Memory (DTC) P0230 is also present, GO to [KA40](#).
2. Be aware that P0232 could be set if the inertia fuel shutoff (IFS) switch was tripped then reset, or if power was supplied to the FP PWR circuit when the PCM expected the fuel pump to be off (i.e. fuel pump prime procedure).

- Key on, engine off.
- Access FPM PID on Scan Tool.
- Observe the FPM PID for an indication of a fault while completing the following (the FPM PID will turn ON when an open or short to power is detected):
 - Shake, wiggle, bend the FP PWR circuit between the FP PWR pin at the fuel pump relay and the fuel pump.
 - Shake, wiggle, bend the fuel pump ground circuit from the fuel pump to ground.
 - Shake, wiggle, bend the FPM circuit between the PCM and the splice to the FP PWR circuit.
 - Lightly tap the fuel pump, inertia fuel shutoff switch and fuel pump relay to simulate road shock.
 - For F-150 Lightning, disconnect low speed fuel pump relay and note FPM PID.
- Key off.

Was a fault indicated/found?

Yes	No
<p>For F-150 Lightning:</p> <p>If the FPM PID is consistently on with the low speed fuel pump relay disconnected; VERIFY condition of fuel pump ground circuit resistor. If OK, REPAIR open circuit between low speed fuel pump relay, through resistor to splice. Otherwise, GO to "All others" Action to Take.</p> <p>All others:</p> <p>ISOLATE fault and REPAIR as necessary.</p>	<p>Unable to duplicate or identify fault at this time. GO to Z1.</p>

KA35 CONTINUOUS MEMORY DTC P0231: CHECK HARNESS CIRCUITS

- Disconnect PCM.
- Install a jumper wire between PCM harness connector pin 80 (FP) and ground.
- Connect a digital multimeter between PCM harness connector pin 40 (FPM) and ground.
- Key on. The fuel pump will turn on and voltage will be greater than 10.0 volts.
- Observe voltage for an indication of a fault while completing the following (voltage will change suddenly when a fault is detected, indicating an open):
 - Shake, wiggle, bend the B+ circuit to the fuel pump relay.
 - Lightly tap the fuel pump relay to simulate road shock.
 - Shake, wiggle, bend the FP PWR circuit between the fuel pump relay and the FPM splice.
 - For F-150 Lightning, also shake, wiggle and bend the circuits connected to the inertia fuel shutoff (IFS) switch relay. Lightly tap the IFS switch and IFS switch relay.
- Key off.
- Inspect the fuel pump relay connector for corrosion and damaged pins.

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary.	Unable to duplicate or identify fault at this time. GO to <u>Z1</u> .

KA40 CONTINUOUS MEMORY DTC P0230: CHECK FUEL PUMP PRIMARY CIRCUITS

- Key on, engine off. Wait 5 seconds.
- Access FPF PID. The FPF PID will be NO, indicating that the PCM detects VPWR (IGN START/RUN for Taurus/Sable) voltage through the fuel pump relay coil and FP circuit.
- Observe the FPF PID for an indication of a fault while completing the following (the FPF PID will read YES, when an open is detected).
 - Shake, wiggle, bend the Fuel Pump (FP) circuit between the PCM and the fuel pump relay.
 - Shake, wiggle bend the VPWR (IGN START/RUN for Taurus/Sable) circuit between the electronic engine control power relay and the fuel pump relay.
 - Lightly tap the fuel pump relay (to simulate road shock).
- Key off.
- Inspect the PCM and fuel pump relay connectors for corrosion, damaged pins.

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary.	Unable to duplicate or identify fault at this time. GO to <u>Z1</u> .

KA45 DTC P1232: CHECK VPWR VOLTAGE TO LOW SPEED FUEL PUMP RELAY

- Disconnect low speed fuel pump relay.
- Key on, engine off.
- Measure VPWR circuit voltage at the low speed fuel pump relay harness connector.

Is voltage greater than 10.5 volts?

--	--

Yes	No
KEY OFF. GO to KA46 .	REPAIR open in VPWR circuit between the Electronic Engine Control power relay and the low speed fuel pump relay.

KA46 CHECK LOW SPEED FUEL PUMP RELAY

- Measure resistance between pin 85 and all other pin of the low speed fuel pump relay (pin numbers moulded on relay). One measurement must be between 40 and 100 ohms, with the other measurements being greater than 10,000 ohms.

Are all resistance checks OK?

Yes	No
GO to KA47 .	REPLACE low speed fuel pump relay.

KA47 CHECK LOW FUEL PUMP (LFP) CIRCUIT FOR SHORT TO POWER IN HARNESS

- Disconnect PCM.
- Key on.
- Measure voltage between LFP circuit at low fuel pump relay harness connector and ground.

Is voltage less than 1.0 volt?

Yes	No
KEY OFF. GO to KA48 .	REPAIR short circuit.

KA48 CHECK LFP CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect scan tool from DLC.
- Measure resistance between LFP circuit at low fuel pump relay harness connector and ground.

Is resistance greater than 10,000 ohms?

Yes	No
GO to KA49 .	REPAIR short circuit.

KA49 CHECK FOR OPEN LFP CIRCUIT

- Measure resistance of LFP circuit between PCM harness connector pin 19 and the low speed fuel pump relay harness connector.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash	

Electrically Erasable Programmable Read Only Memory (EEPROM).

REPAIR open circuit.

KA55 CHECK FOR OPEN FUEL PUMP GROUND CIRCUIT THROUGH RESISTOR

- Disconnect low speed fuel pump relay.
- Key on, engine off.
- Again, access FPM PID.

Is the FPM PID off?

Yes	No
KEY OFF. No fault is detected. DISREGARD DTC P0232 at this time. RETURN to Section 3 , Step 1: Quick Test and CONTINUE diagnosis as directed.	VERIFY condition of fuel pump ground circuit resistor. If OK, REPAIR open circuit between low speed fuel pump relay, through resistor, to splice.

KA60 CONTINUOUS MEMORY DIAGNOSTIC TROUBLE CODE (DTC) P1232: CHECK LOW SPEED FUEL PUMP PRIMARY CIRCUITS

- Key on, engine off. Wait 5 seconds.
- Access LFPF PID. The LFPF PID will be NO, indicating that the PCM detects VPWR voltage through the low speed fuel pump relay coil and LFP circuit (pin 19) to the PCM.
- Observe the LFPF PID for an indication of a fault while completing the following (the LFPF PID will be YES if a fault is detected).
 - Shake, wiggle, bend the LFP circuit between the PCM and the low speed fuel pump relay.
 - Shake, wiggle, bend the VPWR circuit between the electronic engine control power relay and the low speed fuel pump relay.
 - Lightly tap the low speed fuel pump relay (to simulate road shock).
- Key off.
- Inspect the PCM and low speed fuel pump relay connectors for corrosion, damaged pins.

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary.	Unable to duplicate or identify fault at this time. GO to Z1 .

KA65 CHECK RESISTANCE OF FUEL PUMP GROUND CIRCUIT THROUGH RESISTOR

- Disconnect low speed fuel pump relay.
- Measure resistance of ground circuit through resistor between low speed fuel pump relay harness connector and chassis ground.

Is resistance less than 7.0 ohms?

Yes	No
GO to KA66 .	VERIFY condition of fuel pump ground circuit resistor. If OK, REPAIR open circuit.

KA66 CHECK FOR OPEN GROUND CIRCUIT BETWEEN LOW SPEED FUEL PUMP RELAY AND FUEL PUMPS

- Disconnect fuel pumps.
- Measure resistance of ground circuit between one of the fuel pumps and the low speed fuel pump relay harness connectors (same relay pin as one used in previous step).
- Repeat same check except check ground to other fuel pump.

Are both resistances less than 5.0 ohms?

Yes	No
GO to KA67 .	REPAIR open circuit(s).

KA67 CHECK INTERNAL RESISTANCES OF EACH FUEL PUMP

- Measure internal resistance of one fuel pump between FP PWR pin and ground pin of the fuel pump.
- Repeat test for other fuel pump.

Are both resistances less than 10.0 ohms?

Yes	No
GO to KA68 .	REPLACE appropriate fuel pump(s).

KA68 CHECK FOR OPEN FP PWR CIRCUIT BETWEEN FPM SPLICE AND FUEL PUMPS

- Disconnect inertia fuel shutoff (IFS) switch relay.
- Measure resistance of FP PWR circuit between IFS switch relay and one of the fuel pump's harness connectors.
- Repeat test for other fuel pump.

Are both resistances less than 5.0 ohms?

Yes	No
No fault is detected. DISREGARD DTC P0232 at this time. RETURN to Section 3 , Step 1: Quick Test and continue diagnosis as	REPAIR open FP PWR circuit between fuel pump and FPM circuit splice to circuit.

directed.

KA70 HARD START/LACKS POWER: CHECK GROUND CIRCUIT USED FOR HIGH SPEED FUEL PUMP OPERATION BETWEEN LOW SPEED FUEL PUMP RELAY AND CHASSIS

- Disconnect low speed fuel pump relay.
- Measure resistance of ground circuit between low speed fuel pump relay harness connector and chassis ground.

Is resistance less than 5.0 ohms?

Yes	No
GO to <u>KA71</u> .	REPAIR open ground circuit.

KA71 MEASURE RESISTANCE OF FUEL PUMP GROUND CIRCUIT THROUGH THE RESISTOR TO CHASSIS GROUND

- Measure resistance of fuel pump ground circuit through resistor between low speed fuel pump relay harness connector and chassis ground.

Is resistance less than 7.0 ohms?

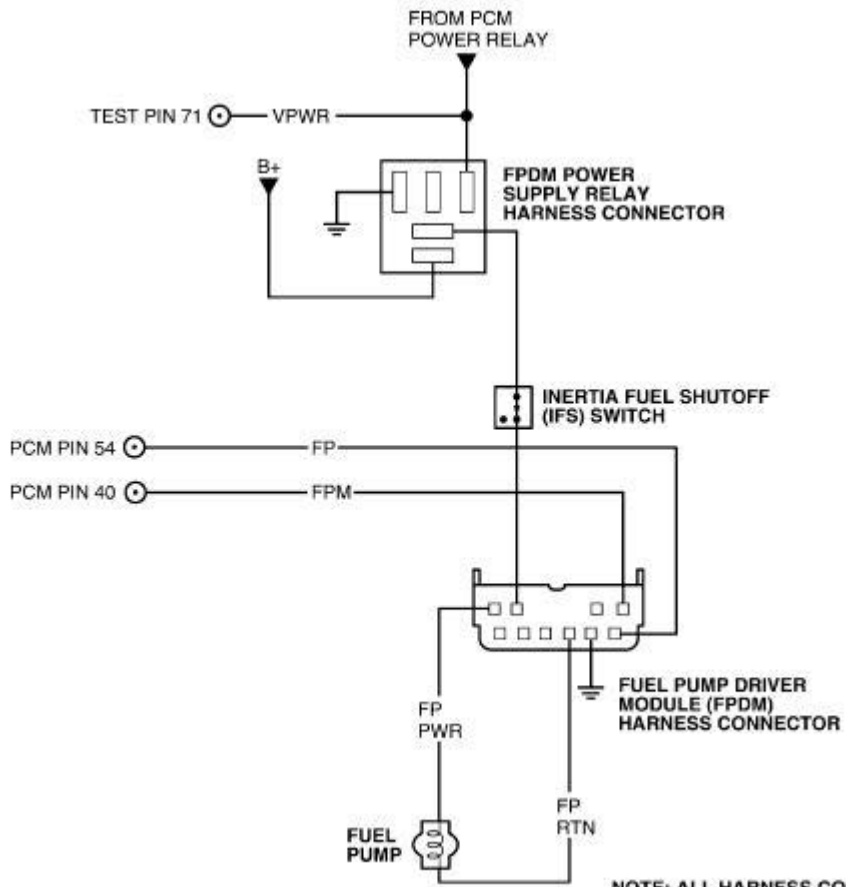

Yes	No
GO to <u>KA72</u> .	REPAIR open circuit between low speed fuel pump relay and splice to ground circuit that goes through resistor.

KA72 CHECK NORMALLY CLOSED CONTACTS OF LOW SPEED FUEL PUMP RELAY

- Measure resistance between pin 30 and pin 87A of the low speed fuel pump relay (pin numbers molded on relay).

Is resistance less than 5.0 ohms?

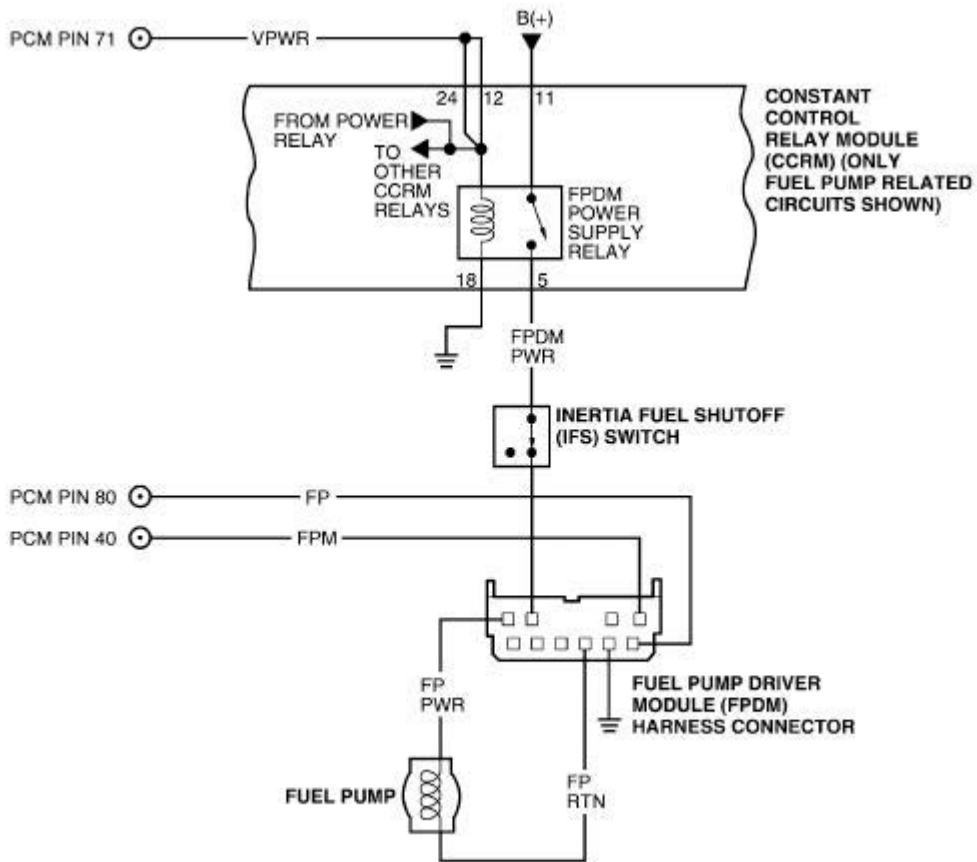

Yes	No
High speed fuel pump circuits OK. RETURN to Section 3 to continue diagnosis.	REPLACE low speed fuel pump relay.

KB: Pinpoint Tests →

KB: Fuel Pump Driver Module (FPDM)

← KB: Introduction

KB1 DTC P1233 OR P1234: IS DTC P1233 OR P1234 PRESENT IN KEY ON ENGINE OFF SELF TEST

Is DTC P1233 or P1234 present in Key On Engine Off Self-Test?

Yes	No
A hard fault is present. GO to KB2 .	<p>The PCM is now receiving a signal from the FPDM. One possible cause of the DTC P1233 or P1234 is that the IFS switch was tripped, then reset.</p> <p>If engine is now a no start:</p> <p>Disregard the DTC P1233 or P1234 at this time. RETURN to Section 3 and CONTINUE as directed. After servicing the no start, to diagnose intermittent causes of the DTC P1233 or P1234, RETURN to GO to KB25.</p> <p>If engine will start:</p> <p>GO to KB25 to diagnose intermittent condition.</p>

KB2 DOES THE ENGINE START?

Does the engine start?

Yes	No
GO to KB15 (to check the FPM circuit).	VERIFY IFS switch is set (button depressed). If OK, GO to KB3 .

KB3 CHECK POWER AND GROUND CIRCUITS TO FPDM

- Disconnect FPDM.
- Key on, engine off.
- Measure voltage between the FPDM PWR pin (VPWR for Continental) and ground pin at the FPDM harness connector.

Is voltage greater than 10.5 volts?

Yes	No
Key off. REPLACE FPDM.	GO to KB4 .

KB4 CHECK POWER TO FPDM

- Key on, engine off.
- Measure voltage between the FPDM PWR pin (VPWR for Continental) at the FPDM harness connector and chassis ground.

Is voltage greater than 10.5 volts?

Yes	No
REPAIR open ground circuit to FPDM.	<p>KEY OFF. No power to FPDM.</p> <p>For Escort, Mustang:</p> <p>GO to KB5.</p> <p>For Continental:</p> <p>GO to KB14.</p> <p>All Others:</p> <p>GO to KB8.</p>

KB5 CHECK B+ VOLTAGE TO CCRM PIN 11 (FPDM POWER SUPPLY RELAY)

- Disconnect CCRM.

- Measure B+ circuit voltage at Pin 11 of the CCRM harness connector.

Is voltage greater than 10.5 volts?

Yes	No
For Mustang: GO to KB6 . For Escort: GO to KB7 .	VERIFY integrity of related fuse. If OK, REPAIR open B+ circuit. If fuse is damaged, CHECK B+ and FPDM PWR circuits for short to ground before replacing.

KB6 CHECK GROUND CIRCUIT TO CCRM PIN 18

- Measure resistance of ground circuit between CCRM harness connector Pin 18 and chassis ground.

Is resistance less than 5.0 ohms?

Yes	No
GO to KB7 .	SERVICE open ground circuit.

KB7 CHECK FOR OPEN FPDM PWR CIRCUIT

- Measure resistance of FPDM PWR circuit between CCRM harness connector (pin 5) and FPDM harness connector.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE CCRM.	The FPDM PWR circuit is open. GO to KB13 to help isolate fault.

KB8 CHECK B+ VOLTAGE TO FPDM POWER SUPPLY RELAY

- Disconnect FPDM power supply relay.
- Measure B+ circuit voltage at the FPDM power supply relay harness connector.

Is voltage greater than 10.5 volts?

Yes	No
GO to KB9 .	VERIFY integrity of related fuse. If OK, REPAIR open B+ circuit. If fuse is damaged, CHECK B+ and FPDM PWR circuits for short to ground before replacing.

KB9 CHECK FOR GROUND TO FPDM POWER SUPPLY RELAY

- Disconnect scan tool from DLC.
- Measure resistance of ground circuit between FPDM power supply relay harness connector and battery negative post.

Is resistance less than 5.0 ohms?

Yes	No
GO to KB10 .	REPAIR open circuit.

KB10 CHECK FOR OPEN FPDM PWR CIRCUIT

- Measure resistance of FPDM PWR circuit between FPDM power supply relay harness connector and FPDM harness connector.

Is resistance less than 5.0 ohms?

Yes	No
RECONNECT FPDM. GO to KB11 .	The FPDM PWR circuit is open. GO to KB13 to help isolate fault.

KB11 CHECK VPWR CIRCUIT VOLTAGE TO FPDM POWER SUPPLY RELAY

- Key on, engine off.
- Measure VPWR circuit voltage at the FPDM power supply relay harness connector.

Is voltage greater than 10.5 volts?

Yes	No
REPLACE FPDM power supply relay.	REPAIR open VPWR circuit.

KB13 ISOLATE OPEN IN FPDM PWR CIRCUIT

- Disconnect IFS switch.
- Measure resistance of FPDM PWR circuit between IFS switch harness connector and FPDM power supply relay harness connector (for Escort, CCRM harness connector [pin 5]).
- Measure resistance of FPDM PWR circuit between FPDM harness connector and IFS switch harness connector.

Are both resistances less than 5.0 ohms?

Yes	No
VERIFY that the IFS switch is set (button depressed). If OK, REPLACE IFS switch.	REPAIR open in appropriate area of FPDM PWR circuit.

KB14 ISOLATE OPEN IN VPWR CIRCUIT TO FPDM

- Disconnect Electronic Engine Control (EC) Power Relay.
- Disconnect IFS switch.

- Measure resistance of VPWR circuit between IFS switch harness connector and electronic EC power relay harness connector.
- Measure resistance of VPWR circuit between IFS switch harness connector and FPDM harness connector.

Are both resistances less than 5.0 ohms?

Yes	No
VERIFY that the IFS switch is set (button depressed). If OK, REPLACE IFS switch.	REPAIR open in the appropriate area of the VPWR circuit to the FPDM.

KB15 CHECK FOR OPEN FPM CIRCUIT

- Disconnect FPDM.
- Disconnect PCM.
- Measure resistance of FPM circuit between PCM harness connector Pin 40 and the FPDM harness connector.

Is resistance less than 5.0 ohms?

Yes	No
GO to KB16 .	REPAIR open circuit.

KB16 CHECK FPM CIRCUIT FOR SHORT TO POWER IN HARNESS

- Key on, engine off.
- Measure voltage between PCM harness connector Pin 40 and ground.

Is voltage less than 1.0 volt?

Yes	No
KEY OFF. GO to KB17 .	REPAIR short circuit.

KB17 CHECK FPM CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect scan tool from DLC.
- Measure resistance between PCM harness connector Pin 40 and ground.

Is resistance greater than 10,000 ohms?

Yes	No
GO to KB18 .	REPAIR short circuit.

KB18 CHECK FOR FPM OUTPUT FROM FPDM

- Reconnect FPDM.
- Key on, engine off.
- Measure dc voltage between PCM harness connector Pins 40 and 51.

Is voltage between 0.02 and 1.0 volt dc? (It is OK for the voltage to cycle below this range and then return to within range.)

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPLACE FPDM.

KB25 CHECK CIRCUITS THAT MAY CAUSE AN INTERMITTENT LOSS OF POWER SUPPLY TO THE FPDM. ALSO CHECK FOR INTERMITTENT OPENS OR SHORTS ON THE FPM CIRCUIT.

- Key on, engine off.
- Access FP M PID on scan tool.

Note: With no fault detected, the FPDM will send a 50% duty cycle signal (all OK) to the PCM on the FPM circuit. Depending on scan tools, the FP_M PID may display 50%, or a random value that is fluctuating between 85 and 115%.

- Observe FP M PID for an indication of a fault while completing the following (look for the FP M PID to change from the 50% value, or to stop fluctuating):
 - Shake, wiggle, bend the following circuits:
 - FPDM ground.
 - Power supply circuit (VPWR or FPDM PWR) to FPDM.
 - For Escort and Mustang, the B+ circuit to CCRM pin 11. For Mustang, also the ground circuit to CCRM Pin 18.
 - For Focus, Contour/Mystique/Cougar, Taurus/Sable, the B+ and ground circuits to FPDM power supply relay.
 - FPM circuit between the FPDM and the PCM.
 - Lightly tap on the IFS Switch, FPDM and CCRM or FPDM power supply relay to simulate road shock.
- Key off.

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary.	Unable to duplicate or identify fault at this time. GO to <u>Z1</u> .

KB30 DTC P1235 OR P1236: IS DTC P1235 OR P1236 PRESENT IN KEY ON ENGINE OFF OR ENGINE RUNNING SELF TEST?

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

Note: For LS6/LS8, the FPDM functions are incorporated in the Rear Electronics Module (REM). In the following steps, if directed to perform an action with the FPDM, complete the action with the REM. Refer to the pin numbers in the beginning of this pinpoint test.

Is DTC P1235 or P1236 present in Key On Engine Off or Engine Running Self-Test?

Yes	No
	DTC P1235 or P1236 is intermittent.

<p>A hard fault is present. GO to KB31 to check the FP circuit.</p>	<p>For LS6/LS8 : GO to KB42.</p> <p>All others : GO to KB45.</p>
---	--

KB31 CHECK FOR OPEN FP CIRCUIT BETWEEN PCM AND FPDM

- Disconnect FPDM.
- Disconnect PCM.
- Measure resistance of FP circuit between PCM harness connector pin and the FPDM harness connector.

Is resistance less than 5.0 ohms?

Yes	No
GO to KB32 .	REPAIR open circuit.

KB32 CHECK FP CIRCUIT FOR SHORT TO POWER IN HARNESS

- Key on, engine off.
- Measure voltage between FP circuit at PCM harness connector pin and ground.

Is voltage less than 1.0 volt?

Yes	No
KEY OFF. GO to KB33 .	REPAIR short circuit.

KB33 CHECK FP CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect scan tool from DLC.
- Measure resistance between FP circuit at PCM harness connector pin and ground.

Is resistance greater than 10,000 ohms?

Yes	No
<p>For LS6/LS8 : GO to KB36.</p> <p>All others : GO to KB34.</p>	REPAIR short circuit.

KB34 CHECK FP CIRCUIT IN FPDM

- Reconnect FPDM.

- Key on, engine off.
- Measure voltage between FP circuit at PCM harness connector pin and ground.

Is voltage between 4.5 and 5.5 volts?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPLACE FPDM.

KB36 CHECK FPF PID

- Key on, engine off.
- Access the FP and FPF PIDs on the scan tool (the FP PID may be used in the next step).
- While viewing the FPF PID for 20 seconds, check if the FPF PID will indicate YES. The FPF PID may read NO in the 20 seconds, but will change back to YES.

Does the FPF PID indicate YES within 20 seconds?

Yes	No
GO to KB40 .	GO to KB37 .

KB37 CHECK FP PID

Does the FP PID indicate between 70 and 80%?

Yes	No
GO to KB38 .	TURN KEY OFF then back ON. Wait 5 seconds. REPEAT test step. If result is now YES, follow YES result. If result is still NO, REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).

KB38 ACCESS REM PIDS AND CHECK PWM_DC1 PID

- Access the PWM_DC1 PID from the REM menu (the PWM_DC1 PID indicates the signal sent to the REM from the PCM on the FP circuit).

Does the PWM_DC1 PID indicate between 70 and 80%?

Yes	No
KEY OFF. No fault indicated. Disregard DTC P1235 or P1236. RETURN to Section 3 where DTC was received and proceed as directed.	REPLACE REM.

KB40 CHECK REM CIRCUITRY VOLTAGE ON FP CIRCUIT AT PCM

- Key off.

- Disconnect PCM connector A.
- Key on, engine off.
- Measure voltage between Pin A58 at the PCM harness connector A and ground.

Is voltage greater than 8 volts?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPLACE REM.

KB42 CHECK FP CIRCUIT FOR INTERMITTENT CONCERNS

- Key on, engine off.
- Access the REM PID access menu on the scan tool.
- Access the PWM_DC1 PID from the REM menu (the PWM_DC1 PID indicates the signal sent to the REM from the PCM on the FP circuit).
- Observe the PWM_DC1 PID for indication of a fault while completing the following (the PID value will change when a fault is detected):
 - Shake, wiggle and bend the FP circuit between the PCM (Pin A58) and REM (Pin J2-19).

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary.	KEY OFF. Unable to duplicate or identify fault at this time. GO to <u>Z1</u> with the following data: PWM_DC1 PID (REM menu), FP PID (PCM menu, the FP PID is the signal the PCM is sending to the REM).

KB45 CHECK FP CIRCUIT FOR INTERMITTENT OPENS OR SHORTS

- Key on, engine off.
- Access FP M PID on scan tool.

Note: With no fault detected, the FPDM will send a 50% duty cycle signal (all OK) to the PCM on the FPM circuit. Depending on scan tools, the FP M PID may display 50%, or a random value that is fluctuating between 85 and 115%.

- Observe the FP M PID for an indication of a fault while completing the following (look for the FP M PID to change from the 50% value, or to stop fluctuating):
 - Shake, wiggle, bend the FP circuit between FPDM and the PCM.
 - Lightly tap on the FPDM (to simulate road shock).

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary.	KEY OFF. Unable to duplicate or identify fault at this time. GO to <u>Z1</u> .

KB47 DTC P1237 OR P1238: IS DTC P1237 OR P1238 PRESENT IN KEY ON

ENGINE OFF OR ENGINE RUNNING SELF TEST

Is DTC P1237 or P1238 present in Key On Engine Off or Key On Engine Running Self-Test?

Yes	No
A hard fault is present. GO to KB48 .	DTC P1237 or P1238 is possibly intermittent. For LS6/LS8 : GO to KB67 . All others : GO to KB56 .

KB48 DOES THE ENGINE START?

Does the engine start?

Yes	No
For LS6/LS8 : GO to KB80 . All others : DISCONNECT FPDM. GO to KB59 .	For LS6/LS8 : GO to KB61 . All others : GO to KB49 to check fuel pump secondary circuits.

KB49 CHECK FP PWR, FP RTN AND INTERNAL FUEL PUMP CIRCUIT RESISTANCE

- Disconnect scan tool from DLC.
- Disconnect FPDM.
- Measure resistance between FP PWR circuit and the FP RTN circuit at the FPDM harness connector.

Is resistance less than 10.0 ohms?

Yes	No
GO to KB50 .	An open secondary circuit exists. GO to KB54 to isolate fault.

KB50 CHECK FP RTN CIRCUIT FOR SHORT TO POWER IN HARNESS

- Key on, engine off.
- Measure voltage between the FP RTN circuit in harness and chassis ground.

Is voltage less than 1.0 volt?

Yes	No
GO to KB51 .	REPAIR short circuit.

KB51 CHECK FP PWR CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect fuel pump.
- Measure resistance between the FP PWR circuit in harness and ground.

Is resistance greater than 10,000 ohms?

Yes	No
GO to KB52 .	REPAIR short circuit.

KB52 CHECK FOR VOLTAGE TO FUEL PUMP

- Reconnect FPDM.
- Reconnect scan tool.
- Key on, engine off.
- Access Output Test Mode on scan tool. (To complete this test step without a scan tool, the fuel pump can be commanded on for one second by cycling the key from off to on. Repeat as needed.)
- Connect digital multimeter between the FP PWR circuit and the FP RTN circuit at the fuel pump harness connector.
- While monitoring voltage, command outputs on (this commands the fuel pump on for about 5 seconds).

With the fuel pump commanded on, is the voltage greater than 10.0 volts?

Yes	No
REPLACE fuel pump.	VERIFY vehicle battery was at proper charge during test. VERIFY pump on command did not time-out before voltage check was made. If OK, REPLACE FPDM.

KB54 ISOLATE OPEN CIRCUIT

- Disconnect fuel pump.
- Measure resistance of the FP PWR circuit between the FPDM and fuel pump harness connectors.
- Measure resistance of the FP RTN circuit between the FPDM and fuel pump harness connectors.
- Measure internal resistance of the fuel pump.

Is each resistance less than 10.0 ohms?

Yes	No
No fault is detected. VERIFY results of previous test steps.	REPAIR open in appropriate circuit (if open was internal to pump, REPLACE fuel pump).

KB56 VERIFY THAT DTC P1237 OR P1238 IS INTERMITTENT

Note: When the FPDM is detecting a secondary fuel pump circuit fault (the wires going to the fuel

pump), a 75% duty cycle signal will be sent to the PCM on the FPM circuit. On some scan tools, the FP M PID may display the 75% signal as a random value that is fluctuating between 250 and 400%.

- Key on, engine off.
- Access FP M PID.

Is the FP M PID 75% (or varying between 250 and 400%)?

Yes	No
A hard fault is present. GO to KB48 .	DTC P1237 or P1238 is intermittent. GO to KB57 .

KB57 CHECK FUEL PUMP SECONDARY CIRCUITS FOR INTERMITTENT OPEN OR SHORT

- Key on, engine off.
- Access FP M PID on scan tool.

Note: With no fault detected, the FPDM will send a 50% duty cycle signal (all OK) to the PCM on the FPM circuit. Depending on scan tools, the FP M PID may display 50%, or a random value that is fluctuating between 85 and 115%.

- Observe the FP M PID for an indication of a fault while completing the following (the FP M PID will change from the normal (all OK) reading when a fault is detected):
 - Shake, wiggle, bend the FP PWR circuit and FP RTN circuit between the FPDM and the fuel pump.
 - Lightly tap the fuel pump and the FPDM to simulate road shock.

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary.	KEY OFF. GO to KB58 .

KB58 CHECK FP PWR CIRCUIT FOR SHORT TO GROUND

- Disconnect FPDM.
- Connect a non-powered test lamp between the FP PWR circuit and the FPDM PWR circuit at the FPDM harness connector.
- Key on.
- Observe test lamp for an indication of a fault while completing the following (the test lamp will turn on when a fault is detected, indicating a short to ground):
 - Shake, wiggle, bend the FP PWR circuit between the FPDM and the fuel pump.

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary.	KEY OFF. Unable to duplicate or identify fault at this time. RECONNECT FPDM. GO to Z1 .

KB59 CHECK FP PWR CIRCUIT FOR SHORT TO POWER

- FPDM disconnected.
- Key on, engine off.
- Measure voltage between the FP PWR circuit at the FPDM harness connector and chassis ground.

Is voltage less than 1.0 volt?

Yes	No
GO to KB60 .	REPAIR FP PWR circuit short to power.

KB60 CHECK FP RTN CIRCUIT FOR SHORT TO GROUND

- FPDM disconnected.
- Key on.
- Measure voltage between the FPDM PWR (or VPWR) and FP RTN circuits at the FPDM harness connector.

Is voltage less than 1.0 volt?

Yes	No
REPLACE FPDM.	REPAIR FP RTN circuit short to ground.

KB61 CHECK REM/FP PWR AND GROUND CIRCUIT TO REM PINS J1-1, J1-2

Note: Verify inertia fuel shutoff (IFS) switch is not tripped.

- Disconnect REM connector J1.
- Key on.
- Measure voltage between pins J1-1 (REM/FP PWR) and J1-2 (GND) at the REM harness connector.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to KB49 (The FPDM functions are incorporated in the Rear Electronics Module (REM). In the following test steps, if directed to complete an action with the FPDM, complete the action with the REM. Refer to the pin numbers in the beginning of this pinpoint test).	GO to KB62 .

KB62 CHECK REM/FP PWR CIRCUIT VOLTAGE TO REM USING CHASSIS GROUND AS A REFERENCE

- Key on.
- Measure voltage between pin J1-1 of the REM harness connector and chassis ground.

Is voltage greater than 10.5 volts?

Yes	No
REPAIR open ground circuit in harness to pin J1-2 of the REM.	KEY OFF. GO to KB63 .

KB63 CHECK FOR B+ TO FUEL PUMP RELAY HARNESS CONNECTOR

- Disconnect fuel pump relay.
- Measure B+ circuit voltage at fuel pump relay harness connector.

Is voltage greater than 10.5 volts?

Yes	No
GO to KB64 .	VERIFY condition of related fuse(s). If OK, REPAIR open circuit. If B+ fuse is damaged, CHECK for B+ short to ground or FP RTN for short to power before replacing fuse.

KB64 CHECK FOR IGN START/RUN VOLTAGE (THROUGH IFS SWITCH) TO FUEL PUMP RELAY HARNESS CONNECTOR

- Disconnect REM connector J3.
- Key on.
- Measure IGN START/RUN circuit (from IFS switch) voltage at fuel pump relay harness connector.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to KB65 .	VERIFY condition of related fuse. If fuse is damaged, CHECK for IGN START/RUN circuit short to ground before replacing fuse. If fuse is OK, GO to KB69 (to isolate open circuit).

KB65 CHECK GROUND CIRCUIT TO FUEL PUMP RELAY

- Measure resistance of ground circuit between the fuel pump relay harness connector and ground.

Is resistance less than 5.0 ohms?

Yes	No
GO to KB66 .	REPAIR open circuit.

KB66 CHECK REM/FP PWR CIRCUIT CONTINUITY

- Measure resistance of REM/FP PWR circuit between the fuel pump relay harness connector and the REM harness connector (pin J1-1).

Is resistance less than 5.0 ohms?

Yes	No
REPLACE fuel pump relay.	REPAIR open circuit.

KB67 CHECK REM/FP PWR, REM GROUND AND CIRCUITS ASSOCIATED WITH THE FUEL PUMP RELAY FOR INTERMITTENTS

- Disconnect REM connector J1.
- Connect a non-powered test lamp between pins J1-1 (REM/FP PWR) and J1-2 (GND) of the REM harness connector.
- Key on.
- Observe test lamp for an indication of a fault while completing the following (the test lamp will go out when a fault is detected):
 - Shake, wiggle and bend the REM/FP PWR and GND (pin J1-2) circuits to REM.
 - Shake, wiggle and bend the circuits going to the fuel pump relay (IGN START/RUN, B+ ground).
 - Lightly tap the fuel pump relay and IFS switch to simulate road shock.

Is a fault detected?

Yes	No
ISOLATE fault and REPAIR as necessary.	KEY OFF. GO to <u>KB68</u> .

KB68 CHECK FP PWR AND FP RTN CIRCUITS FOR INTERMITTENT CONCERNS

- Connect a DVOM (set to measure resistance) between pins J1-11 (FP PWR) and J1-12 (FP RTN).
- Observe DVOM for an indication of a fault while completing the following (resistance will change suddenly [from less than 10 ohms] when a fault is detected):
 - Shake, wiggle and bend the FP PWR and FP RTN circuits between the fuel pump and REM.
- Connect DVOM between pin J1-12 (FP RTN) and ground.
- Observe DVOM for an indication of a fault while completing the following (resistance will change suddenly [from greater than 10,000 ohms] when a short to ground is detected):
 - Shake, wiggle and bend the FP PWR and FP RTN circuits between the fuel pump and REM.

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary.	KEY OFF. Unable to duplicate or identify fault at this time. REMOVE DVOM, RECONNECT REM. GO to <u>Z1</u> .

KB69 ISOLATE OPEN IN IGN START/RUN CIRCUIT

- Disconnect Inertia Fuel Shutoff (IFS) switch.
- Measure resistance across the normally closed contacts of the IFS switch. Note resistance.
- Measure resistance of IGN START/RUN circuit between the IFS switch and fuel pump relay

harness connectors.

Are both resistances less than 5.0 ohms?

Yes	No
REPAIR open IGN START/RUN circuit to IFS switch.	If open was in IGN START/RUN circuit, REPAIR open. If open was in IFS switch, REPLACE switch.

KB70 SENT HERE FROM PINPOINT TEST HC WITH LOW VOLTAGE AT FUEL PUMP AND NO DTCs: CHECK BATTERY VOLTAGE WITH OUTPUTS COMMANDED ON

Note: For LS6/LS8, verify REM Self-Test has been previously performed.

- Scan tool connected.
- Fuel pump disconnected.
- Key on.
- Connect digital multimeter to the battery positive and battery negative posts.
- While monitoring battery voltage, command outputs on. Note voltage within 5 seconds.
- Command outputs off.

Was battery voltage greater than 11.0 volts?

Yes	No
GO to KB71 .	Battery voltage is low. REFER to Charging System, General Information Section 414-00 in the Workshop Manual.

KB71 CHECK GROUND CIRCUIT TO FUEL PUMP BY MEASURING VOLTAGE AT FUEL PUMP USING BATTERY NEGATIVE AS A REFERENCE

- Connect digital multimeter between the FP PWR circuit at the fuel pump harness connector and the battery negative post.
- Key on.
- While monitoring voltage, command outputs on. Note voltage within 5 seconds.

Is voltage greater than 10.5 volts?

Yes	No
Ground fault to fuel pump indicated. CHECK all associated wiring and connections for the fuel pump and FPDM ground circuits. Carefully CHECK the FPDM ground connection to chassis ground. REPAIR as necessary.	KEY OFF. Ground circuit to fuel pump is OK. GO to KB72 .

KB72 CHECK VOLTAGE TO FUEL PUMP DRIVER MODULE (FPDM)

Note: For LS6/LS8, the FPDM functions are incorporated in the Rear Electronics Module (REM). In the following steps, if directed to complete an action with the FPDM, complete the action with

the REM.

- Disconnect fuel pump driver module (FPDM).
- Key on.
- Measure voltage between the FPDM PWR (VPWR for Continental) circuit at the FPDM harness connector and the battery negative post.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to KB73 .	KEY OFF. Improper voltage is being supplied to FPDM. GO to KB75 .

KB73 CHECK FP PWR CIRCUIT

- Connect a jumper wire between the FPDM PWR (VPWR for Continental) pin and FP PWR pin at the FPDM harness connector.
- Key on.
- Measure voltage between the FP PWR circuit at the fuel pump harness connector and the battery negative post.

Is voltage greater than 10.5 volts, AND within 0.5 volt of the reading in KB72?

AA0797-C

Yes	No
KEY OFF. REMOVE jumper. VERIFY previous test steps. CHECK related connectors for corrosion, etc. If all checks are OK, REPLACE FPDM.	KEY OFF. REMOVE jumper. CHECK for causes of high resistance in FP PWR circuit.

KB75 CHECK B+ TO ELECTRONIC ENGINE CONTROL (EC) POWER RELAY (CONTINENTAL), CCRM OR FPDM POWER SUPPLY RELAY

- Disconnect CCRM (Escort, Mustang), electronic EC power relay (Continental) or FPDM power supply relay (all others).
- Key on (to put same load on battery as previous steps).
- For Escort, Mustang:
 - Measure voltage between pin 11 (B+) of the CCRM harness connector and the battery negative post.
- For Continental:

- Measure voltage between the B+ circuit at the electronic EC power relay harness connector and the battery negative post.
- For all others:
 - Measure voltage between the B+ circuit at the FPDM power supply relay harness connector and the battery negative post.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to KB76 .	Improper voltage is being supplied to the CCRM, FPDM power supply relay or electronic EC power relay. CHECK associated wiring, connectors, etc. REPAIR as necessary.

KB76 CHECK FPDM PWR CIRCUIT

- For Escort, Mustang:
 - Connect a jumper wire between pin 11 (B+) and pin 5 at the CCRM harness connector.
- For Continental:
 - Connect a jumper wire between the B+ and the VPWR circuit at the electronic EC power relay vehicle harness connector.
- For all others:
 - Connect a jumper wire between the B+ and the FPDM PWR circuit at the FPDM power supply relay harness connector.
- Key on.
- Measure voltage between the FPDM PWR (VPWR for Continental) circuit at the FPDM harness connector and the battery negative post.

Is voltage greater than 10.5 volts?

Yes	No
VERIFY previous test steps. CHECK related connectors for corrosion, etc. If all checks are OK, REPLACE FPDM.	CHECK for causes of high resistance in associated connectors and wiring of the FPDM PWR VPWR circuit, including the IFS switch and its connector. REPAIR as necessary.

KB80 CHECK FP RTN CIRCUIT FOR SHORT TO GROUND

- Disconnect REM connector J1.
- Key on.
- Measure voltage between pins J1-1 and J1-12 at the REM harness connector.

Is voltage less than 1.0 volt?

Yes	No
GO to KB67 .	REPAIR FP RTN circuit short to ground.

KB85 COMPLETE REAR ELECTRONICS MODULE SELF-TEST TO VERIFY IFS SWITCH INPUT TO REM (REM PIN J3-8)

- Complete Rear Electronics Module Self-Test (refer to Workshop Manual section 419-10, Multifunction Electronic Control Modules, for directions).

Is REM DTC B2172 present?

Yes	No
GO to <u>KB86</u> .	GO to <u>A1</u> .

KB86 B2172: CHECK IFS SWITCH INPUT CIRCUIT TO REM (REM PIN J3-8)

- Disconnect REM connector J3.
- Key on, engine off.
- Measure voltage at pin J3-8 of the REM harness connector.

Is voltage greater than 10.5 volts?

Yes	No
<p>KEY OFF.</p> <p>If engine is a no start and REM DTC B2172 was received in on-demand self-test mode:</p> <p>REPLACE REM.</p> <p>If engine will start or REM DTC B2172 is a continuous memory DTC:</p> <p>DTC is intermittent. If engine is a no start, return to <u>Section 3</u> to continue diagnosis. If engine will start, GO to <u>Z1</u> (even though PPT Z is designed for PCM intermittents, the diagnostic techniques will help with the REM diagnosis).</p>	<p>KEY OFF. VERIFY IFS switch is not open. If OK, REPAIR open circuit between IFS switch and REM pin J3-8.</p>

KC: Fuel Shutoff Valve Relay Introduction

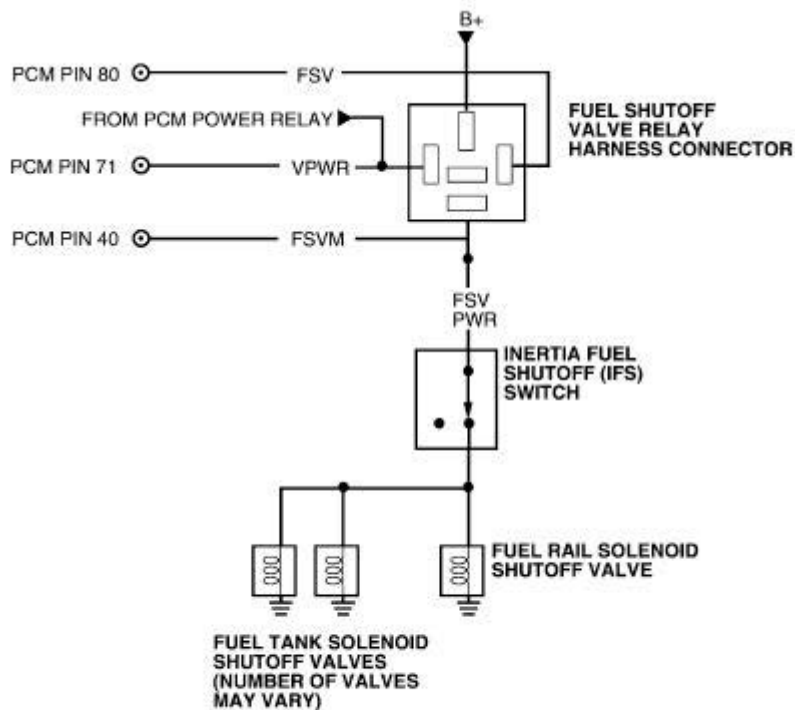

KC: Pinpoint
Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Fuel Shutoff Valve Relay
- Inertia Fuel Shutoff (IFS) switch (9341)
- Harness circuits: B+, VPWR, Fuel Shutoff Valve (FSV), GND, Fuel Shutoff Valve Monitor (FSVM) and Fuel Shutoff Valves Power (FSV PWR)
- Powertrain Control Module (PCM) (12A650)

Pinpoint Test Schematics and Connectors

NOTE: THE FSV AND VPWR CIRCUITS MAY BE REVERSED IN THE HARNESS CONNECTOR. REFER TO THE WIRING DIAGRAM MANUAL FOR MORE INFORMATION.

A0028509

KC: Pinpoint Tests →

KC: Fuel Shutoff Valve Relay

← KC: Introduction

KC1 DTC P0230: CHECK VPWR VOLTAGE TO FUEL SHUTOFF VALVE RELAY

- Disconnect fuel shutoff valve relay.
- Key on, engine off.
- Measure VPWR circuit voltage at the fuel shutoff valve relay harness connector.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to KC2 .	REPAIR open in VPWR circuit between the Electronic Engine Control power relay and the fuel shutoff valve relay.

KC2 CHECK FUEL SHUTOFF VALVE RELAY

- Refer to the pin numbers indicated on the fuel shutoff valve relay. There will be either a pin 1 or pin 85.
- Measure resistance between either pin 1 or pin 85 and all other pins of the relay. One measurement must be between 40 and 120 ohms, with the other measurements being greater than 10,000 ohms.

Are all resistance checks OK?

Yes	No
GO to KC3 .	REPLACE fuel shutoff valve relay.

KC3 CHECK FUEL SHUTOFF VALVE (FSV) CIRCUIT FOR SHORT TO POWER IN HARNESS

- Disconnect PCM.
- Key on.
- Measure voltage between FSV circuit at fuel shutoff valve relay harness connector and ground.

Is voltage less than 1.0 volt?

Yes	No
KEY OFF. GO to KC4 .	REPAIR short circuit.

KC4 CHECK FSV CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect scan tool from DLC.
- Measure resistance between FSV circuit at fuel shutoff valve relay harness connector and

ground.

Is resistance greater than 10,000 ohms?

Yes	No
GO to KC5 .	REPAIR short circuit.

KC5 CHECK FOR OPEN FSV CIRCUIT

- Measure resistance of the FSV circuit between PCM harness connector pin 80 and the fuel shutoff valve relay harness connector.

Is resistance less than 5.0 ohms?

Yes	No
<p>If Key On Engine Off (KOEO) DTC P0231 or P0232 is also present with DTC P0230:</p> <p>GO to KC6.</p> <p>All others:</p> <p>REPLACE PCM (REFER to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).</p>	REPAIR open circuit.

KC6 CHECK THE FUEL SHUTOFF VALVE PRIMARY CIRCUIT INSIDE THE PCM

Note: The next two test steps will check the FSV circuit in the PCM. To do this the FSVF PID will be monitored. The FSVF PID is able to detect for faults on the FP circuit, and will indicate NO when no fault is detected and YES when a fault is detected.

- Reconnect PCM.
- Reconnect fuel shutoff valve relay.
- Reconnect scan tool to DLC.
- Key on, engine off.
- Access FSVF PID on scan tool.

Is the FSVF PID YES?

Yes	No
KEY OFF. REPLACE PCM (REFER to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	GO to KC7 .

KC7 CHECK FUEL SHUTOFF VALVE PRIMARY CIRCUIT INSIDE PCM WHILE CRANKING ENGINE

Note: The scan tool must be connected to a reliable power source that is powered with the key in the START position (such as directly to the vehicle battery). Also verify that the vehicle battery is fully charged.

- Key on, engine off.
- While viewing the FSVF PID, crank the engine.

Is the PID display YES during crank?

Yes	No
KEY OFF. REPLACE PCM (REFER to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	KEY OFF. The fuel pump primary circuit is OK in the harness and PCM. If DTC P0231 is present: GO to <u>KC20</u> . If DTC P0232 is present: GO to <u>KC10</u> .

KC10 DTC P0232: DOES ENGINE START?

Does the engine start?

Yes	No
GO to <u>KC11</u> .	GO to <u>KC15</u> .

KC11 CHECK IF POWER IS ALWAYS BEING SUPPLIED TO FSV PWR CIRCUIT

- Disconnect scan tool from DLC.
- Disconnect PCM.
- Key on, engine off.
- All accessories off (such as interior lamps or radios).
- Measure voltage between PCM harness connector pin 40 and ground.

Is voltage less than 1.5 volts?

Yes	No
GO to <u>KC13</u> .	GO to <u>KC12</u> .

KC12 CHECK FOR FUEL SHUTOFF VALVE RELAY CONTACTS ALWAYS CLOSED

- Disconnect fuel shutoff valve relay.
- Key on, engine off (with accessories off).
- Again measure voltage between PCM harness connector pin 40 and ground.

Is voltage less than 1.5 volts?

Yes	No
REPLACE fuel shutoff valve relay.	REPAIR FSV PWR/FSVM circuit short to power.

KC13 CHECK FOR OPEN FSVM CIRCUIT BETWEEN PCM AND FUEL SHUTOFF VALVE RELAY

- Disconnect fuel shutoff valve relay.
- Measure resistance between PCM harness connector pin 40 and FSV PWR circuit at the fuel shutoff valve relay harness connector.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE PCM (REFER to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR open circuit.

KC15 CHECK INERTIA FUEL SHUTOFF (IFS) SWITCH

- Disconnect inertia fuel shutoff (IFS) switch (verify that switch is reset).
- Measure resistance between the C and NC pins of the IFS switch.

Is resistance less than 5.0 ohms?

Yes	No
GO to KC16 .	REPLACE or RESET IFS switch.

KC16 CHECK FOR OPEN FSV PWR CIRCUIT BETWEEN IFS SWITCH AND FUEL SHUTOFF VALVE RELAY

- Disconnect fuel shutoff valve relay.
- Measure resistance of FSV PWR circuit between the fuel shutoff valve relay and IFS switch harness connectors.

Is resistance less than 5.0 ohms?

Yes	No
RECONNECT fuel shutoff valve relay. GO to KC17 .	REPAIR open in FSV PWR circuit between IFS switch and FSVM connection to circuit.

KC17 CHECK FSV PWR CIRCUIT RESISTANCE TO GROUND THROUGH THE FUEL SOLENOID SHUTOFF VALVES

- Measure resistance between the FSV PWR circuit to the fuel solenoid shutoff valves at the IFS switch harness connector and chassis ground.

Is resistance less than 10.0 ohms?

Yes	No
No fault is indicated. VERIFY previous test step results. If OK, disregard DTC P0232 at this time. RECONNECT IFS switch. RETURN	REPAIR open circuit. Open is either in the common FSV PWR circuit before any splice to the individual fuel solenoid shutoff valves, or

to [Section 3](#), Step 1: Quick Test and CONTINUE diagnosis as directed.

in each of the individual fuel solenoid shutoff valve circuits path to ground.

KC20 DTC P0231: DOES ENGINE START?

Note: If Key On, Engine Off (KOEO) DTC P0230 is also present and has not been checked, GO to [KC1](#) to check primary fuel shutoff valve circuit first.

Does the engine start?

Yes	No
DISCONNECT PCM. GO to KC13 .	GO to KC21 .

KC21 CHECK B+ VOLTAGE TO FUEL SHUTOFF VALVE RELAY

- Disconnect fuel shutoff valve relay.
- Measure B+ circuit voltage at the fuel shutoff valve relay harness connector.

Is voltage greater than 10.5 volts?

Yes	No
GO to KC22 .	VERIFY integrity of fuse for B+ supply to fuel shutoff valve relay. If OK, REPAIR open B+ circuit. If fuse is damaged, check B+ and FSV PWR circuit for short to ground before replacing.

KC22 CHECK FOR OPEN FSV PWR CIRCUIT BETWEEN RELAY AND FSVM SPLICE

- Measure resistance between FSV PWR circuit at fuel shutoff valve relay harness connector and ground.

Is resistance less than 10.0 ohms?

Yes	No
REPLACE fuel shutoff valve relay.	REPAIR open in FSV PWR circuit between FSVM splice and fuel shutoff valve relay.

KC30 CONTINUOUS MEMORY DTC P0232: CHECK HARNESS

Note: If Continuous Memory Diagnostic Trouble Code (DTC) P0230 is also present, GO to [KC40](#).

- Key on, engine off.
- Access FSVM PID.
- Observe the PID for an indication of a fault while completing the following (the FSVM PID will turn ON when an open or short to power is detected):

- Shake, wiggle, bend the FSV PWR circuit between the fuel shutoff valve relay and the fuel solenoid shutoff valves.
- Shake, wiggle, bend the fuel shutoff valves ground circuits from each fuel solenoid shutoff valve to ground.
- Shake, wiggle, bend the FSVM circuit between the PCM and the splice to the FSV PWR circuit.
- Lightly tap inertia fuel shutoff switch and fuel shutoff valve relay to simulate road shock.
- Key off.

Is fault indicated/found?

Yes	No
ISOLATE fault and REPAIR as necessary.	Unable to duplicate or identify fault at this time. GO to <u>Z1</u> .

KC35 CONTINUOUS MEMORY DTC P0231: CHECK FUEL SHUTOFF VALVES SECONDARY CIRCUITS BETWEEN B+ SUPPLY AND FPM CONNECTION

- Disconnect inertia fuel shutoff switch.
- Disconnect PCM.
- Install a jumper wire between PCM harness connector pins 80 (FSV) and ground.
- Connect a digital multimeter between PCM harness connector pins 40 (FPM) and ground.
- Key on. The fuel shutoff valve relay will activate and voltage will be greater than 10.0 volts.
- Observe voltage for an indication of a fault while completing the following (the voltage will change suddenly when a fault is detected, indicating an open):
 - Shake, wiggle, bend the B+ circuit to the fuel shutoff valve relay.
 - Lightly tap the fuel shutoff valve relay to simulate road shock.
 - Shake, wiggle, bend the FSV PWR circuit between the fuel shutoff valve relay and the FSVM splice.
- Key off.
- Inspect the fuel shutoff valve relay connector for corrosion, damaged pins.

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary.	Unable to duplicate or identify fault at this time. GO to <u>Z1</u> .

KC40 CONTINUOUS MEMORY DTC P0230: CHECK FUEL SHUTOFF VALVE PRIMARY CIRCUITS

- Key on, engine off. Wait 5 seconds.
- Access FSVF PID. The PID will be NO, indicating that the PCM detects VPWR voltage through the fuel shutoff valve relay coil and FSV circuit to the PCM pin 80.
- Observe the FSVF PID for an indication of a fault while completing the following (the FSVF PID will be YES when an open is detected (this is because the PCM will not detect VPWR voltage on pin 80 (FSV))):
 - Shake, wiggle, bend the fuel shutoff valve circuit between the PCM pin 80 and the fuel shutoff valve relay.
 - Shake, wiggle bend the VPWR circuit between the electronic engine control power relay and the fuel shutoff valve relay.
 - Lightly tap the fuel shutoff valve relay (to simulate road shock).

- Key off.
- Inspect the PCM and fuel shutoff valve relay connectors for corrosion, damaged pins.

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary.	Unable to duplicate or identify fault at this time. GO to <u>Z1</u> .

KD: Exhaust Gas Recirculation (EGR) System (Electric) Introduction

KD: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- EGR Motor/Valve assembly (9D475)
- Harness circuit: EGR
- Powertrain Control Module (PCM) (12A650)

Pinpoint Test Schematic and Connectors

VIEWED INTO MATING SURFACE**

A0029263

KD: Pinpoint Tests →

KD: Exhaust Gas Recirculation (EGR) System (Electric)

← KD: Introduction

KD1 P0403: CHECK CONNECTION OF EGR TO HARNESS

Note: If the DTC (Diagnostic Trouble Code) was generated by an intermittent condition, maximum benefit of the following pin point tests will be obtained by having an assistant wiggle the harness/connectors when making measurements.

- Check the harness connector at the EGR motor.

Is the connector properly seated?

Yes	No
GO to KD2 .	Repair as necessary.

KD2 CHECK FOR B+ AT HARNESS CONNECTOR TO THE EGR MOTOR

- Key on, engine off.
- Measure the voltage at the EGR harness connector between pins 71, 97, and battery negative post.

Is the voltage greater than 10.5 volts?

Yes	No
GO to KD3 .	REPAIR open supply circuit.

KD3 CHECK EGR HARNESS CIRCUIT FOR SHORTS TO GROUND

- Key off.
- Disconnect the PCM and EGR harness connector.
- Measure the resistance of each EGR circuit between the PCM harness connector and battery negative post.

Is the resistance of each circuit greater than 10,000 ohms?

Yes	No
GO to KD4 .	Repair short to ground in the harness.

KD4 CHECK FOR OPEN CIRCUITS IN THE EGR HARNESS

- Measure the resistance between the PCM and EGR connector of each EGR circuit.

Is resistance of each circuit less than 5 ohms?

Yes	No
GO to KD5 .	REPAIR the open circuit in the harness.

KD5 CHECK EEGR HARNESS CIRCUIT FOR SHORTS TO EACH OTHER

- Key off.
- Measure the resistance at the PCM harness connector between pin 72, and pins 73, 98, 99, then pin73 and pins 98, 99.

Is the resistance of each measurement greater than 10,000 ohms?

Yes	No
GO to KD6 .	Repair short in harness

KD6 CHECK FOR SHORTS TO POWER IN THE EEGR HARNESS

- Reconnect the PCM harness connector.
- Key on engine off.
- Measure the voltage between the EEGR connector pins 72, 73, 98, 99, and battery negative post.

Is the voltage less than 0.1 volts?

Yes	No
GO to KD7 .	Repair short to power in harness.

KD7 CHECK EEGR MOTOR WINDINGS FOR OPEN AND SHORT CIRCUITS

- Key off.
- Disconnect the PCM connector and reconnect the EEGR connector.
- Measure the resistance at the PCM harness connector between pin 71/97 and pins 73 and 99 then between pin 71/97 and pins 72 and 98.

Is resistance between 20 and 24 Ohms?

Yes	No
GO to KD8 .	Replace the EEGR assembly.

KD8 CHECK THE EEGR MOTOR WINDINGS FOR SHORTS TO GROUND

- Key off.
- Measure the resistance at the PCM harness connector between the EEGR pins 72, 73, 98, 99, and the battery negative post.

Is the resistance greater than 10,000 Ohms?

Yes	No
Replace the PCM.	Replace EEGR motor.

KD9 DTC P0400/P1408 CHECK FOR STUCK EEGR VALVE OPERATION

Note: Service all of the following DTC's first if present: P0102, P0103, P0107, P0108, P1100, P1101

- Select the Output State Control (OSC) function on the scan tool.
- Enter the EEGR PID (EGRMDS) and the MAP PID (MAP).
- Operate the engine at normal operating temperature between 1000/1200 r.p.m. to prevent engine stalling.
- Add a small amount of EGR (approx. 8 to 12 steps) using the OSC function while monitoring the MAP PID.
- The MAP value should increase as EGR is introduced.

Note: The engine r.p.m. must be held at a fixed value during this test. Additionally, DTC's may have been generated as a result of this procedure. After running this test clear any DTC that may have been induced.

Is a increase in MAP value seen?

Yes	No
Condition is not present at this time, but be sure the MAP is properly seated and the vacuum source is not blocked.	Replace EEGR Motor/Valve assembly.

KE: Idle Air Control (IAC) Valve Introduction

KE: Pinpoint Tests →

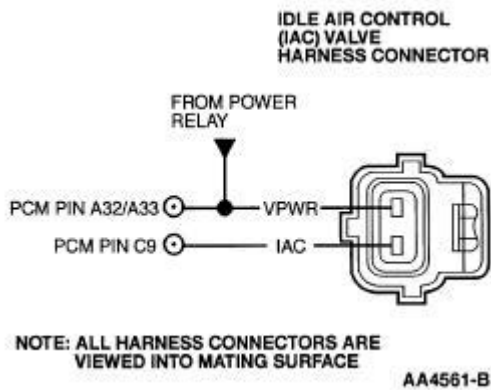

Note

This Pinpoint Test is intended to diagnose the following:

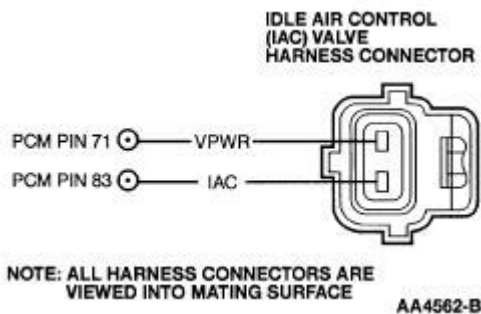

- Idle Air Control (IAC) Valve (9F715)
- Harness Circuits: IAC and VPWR
- Powertrain Control Module (PCM) (12A650)

Pinpoint Test Schematics and Connectors

LS6/LS8

All Others

KE: Idle Air Control (IAC) Valve

← KE: Introduction

KE1 IDLE CONCERNS OR STALLS: RUN KOER SELF-TEST AND OUTPUT CONTINUOUS MEMORY DTCS

The Symptom Charts have indicated that there was no change in idle quality when the IAC valve was disconnected.

- Retrieve all Continuous Memory DTCS.

Note: If unable to perform KOER Self-Test to completion, GO to [KE2](#).

- Run Key On Engine Running (KOER) Self-Test.

Is DTC P0505, P1504 or P1507 retrieved during KOER Self-Test or from Continuous Memory?

Yes	No
KEY OFF. GO to KE2 .	The IAC system is OK. RETURN to Section 3 , Symptom Charts.

KE2 DTC P0505, P1504, P1507 OR STARTS ONLY AT PART THROTTLE: CHECK VPWR VOLTAGE TO IAC VALVE

Note: If EGR DTC P0402 was output during Self Test, diagnose it first before continuing with this Pinpoint Test.

- Disconnect IAC valve.
- Key on, engine off.
- Measure VPWR circuit voltage at the IAC valve harness connector.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to KE3 .	REPAIR open circuit.

KE3 CHECK IAC VALVE RESISTANCE

- IAC valve disconnected.
- Measure IAC valve resistance.

Is resistance between 6.0 and 13.0 ohms?

Yes	No
GO to KE4 .	REPLACE IAC valve.

KE4 CHECK IAC VALVE FOR AN INTERNAL SHORT TO IAC CASE

- Measure the resistance from either IAC valve pin to IAC valve case.

Is resistance greater than 10,000 ohms?

Yes	No
For DTC P1504: GO to KE7 . All others: GO to KE5 .	REPLACE IAC valve.

KE5 CHECK AIR INLET FOR PLUGGING

- Inspect the entire intake air system for debris, blockage and other damage.
- Remove and inspect IAC air tubes (if equipped) for blockage and other damage.
- Remove and inspect the air cleaner element for excessive dirt.

Is the intake air system OK?

Yes	No
RESTORE inlet air system. GO to KE6 .	REPAIR as necessary.

KE6 CHECK FOR INLET AIR LEAKS

- Key on, engine running.
- With engine running at idle, listen for vacuum leaks.
- Inspect the entire intake air system from the mass air flow (MAF) sensor to the intake manifold for leaks such as:
 - Cracked or punctured intake air tube.
 - Damaged or loose IAC air tubes.
 - Loose intake air tube at air cleaner housing or throttle body.
 - IAC valve or gasket seal.
 - EGR valve gasket seal.
 - Vacuum supply connector and hose.
 - PCV connectors and hose.

Are any leaks detected in the above areas?

Yes	No
REPAIR as necessary.	KEY OFF. GO to KE7 .

KE7 CHECK IAC CIRCUIT FOR OPEN IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this Pinpoint Test.

- IAC valve disconnected.
- Disconnect PCM.
- Measure resistance of IAC circuit between PCM harness connector pin and IAC valve harness connector.

Is resistance less than 5.0 ohms?

Yes	No
GO to KE8 .	REPAIR open circuit.

KE8 CHECK IAC CIRCUIT FOR SHORT TO PWR IN HARNESS

- Key on, engine off.
- Measure voltage on IAC circuit between PCM harness connector pin and battery negative post.

Is voltage less than 1.0 volt?

Yes	No
KEY OFF. GO to KE9 .	REPAIR short circuit.

KE9 CHECK IAC CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect scan tool from DLC.
- Measure resistance between IAC and PWR GND circuits at the PCM harness connector.

Is each resistance greater than 10,000 ohms?

Yes	No
<p>For DTC P1504: REPLACE PCM.</p> <p>All Others: GO to KE10.</p>	REPAIR short circuit.

KE10 CHECK IAC SIGNAL FROM PCM

- Reconnect PCM and IAC valve.

Note: If stalling occurs place a shim under the hard stop screw to maintain idle conditions).

- Key on, engine running.
- Access IAC and RPM PIDS.
- With engine at normal operating temperature, accessories OFF and at closed throttle, the IAC duty cycle must be between approximately 22 percent and 45 percent.
- Slowly increase engine speed to 3000 rpm and return to closed throttle (Note: If closed throttle rpm is significantly higher than normal, ignore this step).

Is the IAC duty cycle within specification at closed throttle and does the duty cycle respond to

the change in rpm?

Yes	No
<p>For Continuous Memory DTCs P1504 and P1507:</p> <p>GO to KE30.</p> <p>All others:</p> <p>KEY OFF. INSPECT throttle body for damage. REPAIR as necessary. If OK, REPLACE IAC valve. RESET Keep Alive Random Access Memory (RAM). (REFER to Section 2, Powertrain Control Module (PCM) Reset).</p>	<p>For DTC P1507, REPLACE IAC valve, otherwise REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).</p>

KE20 DTC P1506: CHECK FOR VACUUM LEAKS

- Key on, engine running.
- With the engine at idle, listen for vacuum leaks.
- Inspect the entire intake air system from the mass air flow (MAF) sensor to the intake manifold for damage or leaks such as:
 - Cracked or punctured intake air tube.
 - Loose or cracked IAC air tubes.
 - Loose intake air tube at the air cleaner housing or throttle body.
 - IAC valve or gasket seal.
 - Intake manifold assembly or gasket seal.
 - EGR valve gasket seal.
 - Vacuum supply connectors and hose.
 - PCV valve, connectors and hose.

Are any leaks detected in the above areas?

Yes	No
KEY OFF. REPAIR as necessary.	KEY OFF. GO to KE21 .

KE21 CHECK EVAP SYSTEM FOR A STUCK OPEN VALVE

- Disconnect hoses at EVAP canister purge valve (or VMV).
- Connect a hand vacuum pump at the fuel vapor port to EVAP canister at the EVAP canister purge valve (or VMV).
- Apply 53 kPa (16 in-Hg) of vacuum to EVAP canister purge valve (or VMV).

Does the EVAP canister purge valve (or VMV) hold vacuum for 20 seconds?

Yes	No
RECONNECT hoses. GO to KE22 .	REPLACE EVAP canister purge valve.

KE22 CHECK IAC VALVE FOR PROPER FUNCTION

- Key on, engine running.
- Bring engine to normal operating temperature.
- Transmission in PARK or NEUTRAL.
- Disconnect IAC valve.

Does the rpm drop or engine stall?

Yes	No
KEY OFF. GO to KE23 .	KEY OFF. INSPECT throttle body for damage. REPAIR as necessary. If OK, REPLACE IAC valve. RESET Keep Alive Random Access Memory (RAM). (REFER to Section 2, Powertrain Control Module (PCM) Reset .)

KE23 CHECK IAC CIRCUIT FOR SHORT TO GND IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this Pinpoint Test.

- Disconnect scan tool from DLC.
- Disconnect PCM.
- Measure resistance between IAC circuit at the PCM harness connector and battery negative post.

Is each resistance greater than 10,000 ohms?

Yes	No
<p>For fast idle symptom currently present:</p> <p>REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).</p> <p>All others:</p>	REPAIR short circuit.

RESTORE vehicle. GO to KE30.

KE30 CHECK IAC SYSTEM FOR INTERMITTENT OPEN OR SHORT

- Scan tool connected.
- Key on, engine running.
- Access IAC PID and RPM PIDs.
- With engine at normal operating temperature, accessories off and at idle, the IAC duty cycle must be between 20% and 45%.
- Observe the PIDs for an indication of a fault while completing the following at idle:
 - Lightly tap on IAC valve and wiggle harness connector to simulate road shock.
 - Grasp the vehicle harness closest to the IAC valve. Shake and bend a small section of the harness from the IAC to the dash panel and from the dash panel to the PCM.

Do the IAC or RPM PIDs suddenly change in value indicating a fault?

Yes	No
ISOLATE fault and REPAIR as necessary.	For idle quality, starting or stalling symptoms currently present: REPLACE IAC valve. All others: Unable to duplicate or identify fault at this time. GO to <u>Z1</u> .

KF: Fan Control (FC) Relay Introduction

KF: Pinpoint Tests →

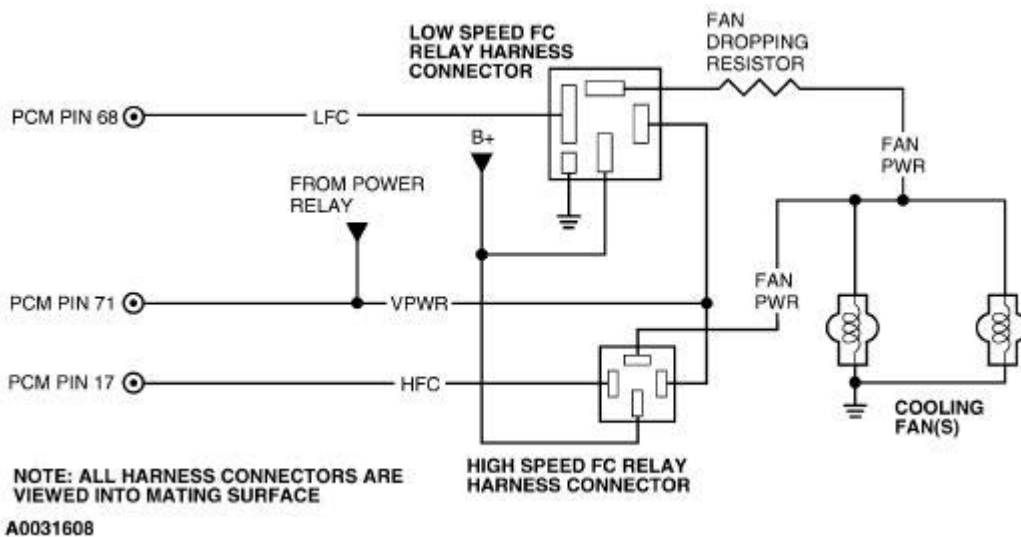

Note

This Pinpoint Test is intended to diagnose the following:

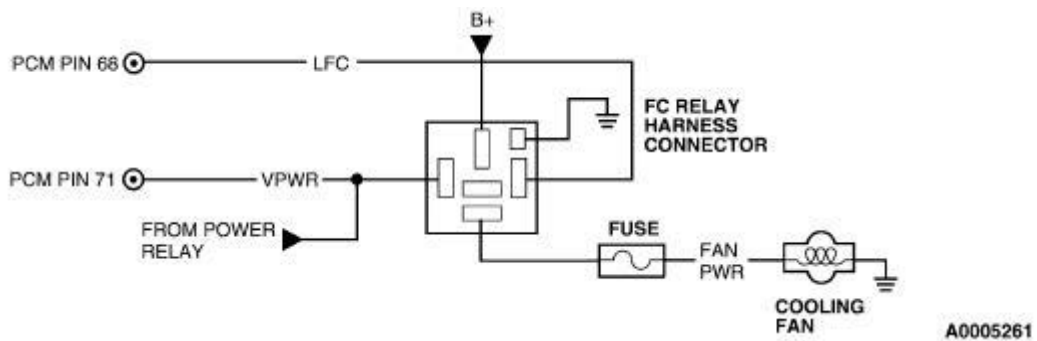

- Harness circuits: VPWR, B+, HFC, LFC, MFC, IGN START/RUN, FAN(s) PWR
- High speed fan control (FC), low speed FC and medium speed FC relays
- Powertrain control module (PCM) (12A650)

KF: Fan Control (FC) Relay

← KF: Introduction

KF1 DTC P1474/P1477/P1479 or FC PRIMARY CIRCUIT FAULT: CHECK VPWR (or IGN START/RUN for ESCAPE) VOLTAGE TO APPLICABLE FAN CONTROL RELAY

- NOTE: During diagnosis, use the chart below to determine the correct circuit and relay being tested.

DTC	Circuit/ Relay
P1474	LFC
P1477	MFC
P1479	HFC

- Disconnect appropriate fan control relay.
- Key on, engine off.
- Measure VPWR (IGN START/RUN for Escape) circuit voltage at the applicable fan control relay harness connector.

Is voltage greater than 10.5 volts?

Yes	No
GO to KF2 .	REPAIR open VPWR (or IGN START/RUN) circuit to the applicable fan control relay.

KF2 CHECK FOR LFC, MFC or HFC CIRCUIT CYCLING

- Key on, engine off.
- Connect a non-powered test lamp between the VPWR (or IGN START/RUN) circuit and the LFC, MFC or HFC circuit at the applicable fan control relay harness connector.
- Access Output Test Mode on scan tool.
- While observing test lamp, command the appropriate cooling fan speed on and off (for Escape, commanding the low speed fan on will also command the medium speed fan output on).

Does the test lamp turn on and off when the cooling fan output is commanded on and off?

Yes	No
REPLACE appropriate fan control relay.	REPEAT test step to VERIFY results. If test lamp still does not turn on and off as expected, turn KEY OFF. REMOVE test lamp. GO to KF3 .

KF3 CHECK LFC, MFC or HFC CIRCUIT FOR SHORT TO POWER IN HARNESS

- Disconnect PCM.

- Key on, engine off.
- Measure voltage between the LFC, MFC or HFC circuit at the applicable fan relay harness connector and ground.

Is voltage less than 1.0 volt?

Yes	No
KEY OFF. GO to KF4 .	REPAIR short circuit.

KF4 CHECK LFC, MFC or HFC CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect scan tool from DLC.
- Measure resistance between the LFC, MFC or HFC circuit at the applicable fan relay harness connector and ground.

Is resistance greater than 10,000 ohms?

Yes	No
GO to KF5 .	REPAIR short circuit.

KF5 CHECK FOR OPEN LFC, MFC or HFC CIRCUIT

Note: Refer to the PCM connector pin numbers at the beginning of this pinpoint test.

- Measure resistance of the LFC, MFC or HFC circuit between the appropriate PCM harness connector pin (LFC, MFC or HFC) and the appropriate fan control relay harness connector.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR open circuit.

KF7 DTC P1479 (3.0L Escape) CHECK IGNITION START/RUN CIRCUIT VOLTAGE TO HIGH SPEED FC RELAY #1

- Disconnect high speed FC relay #1 (MAIN FAN in BJB).
- Key on, engine off.
- Measure IGN START/RUN circuit voltage at the high speed FC relay #1 harness connector.

Is voltage greater than 10.5 volts?

Yes	No
GO to KF8 .	REPAIR open IGN START/RUN circuit.

KF8 CHECK FOR HFC CIRCUIT CYCLING AT HIGH SPEED FC RELAY #1

- Connect a non-powered test lamp between the IGN START/RUN circuit and the HFC circuit at the high speed FC relay #1 harness connector.
- Access Output Test Mode on scan tool.
- While observing test lamp, command the high speed cooling fan on and off .

Does the test lamp turn on and off when the high speed cooling fan output is commanded on and off?

Yes	No
REPLACE high speed FC relay #1.	Leave test lamp connected. GO to KF9 .

KF9 CHECK FOR HFC CIRCUIT CYCLING WITH HIGH SPEED FC RELAY #2 DISCONNECTED

- The non-powered test lamp still connected between the IGN START/RUN circuit and the HFC circuit at the high speed FC relay #1 harness connector.
- Cooling fans commanded off.
- Disconnect high speed FC relay #2 (ADD FAN 2 in BJB).
- While observing test lamp, again command the high speed cooling fan on and off .

Does the test lamp now turn on and off when the high speed cooling fan output is commanded on and off?

Yes	No
REPLACE high speed FC relay #2.	GO to KF3 to diagnose the HFC circuit. Make checks at the high speed FC relay #1 harness connector.

KF10 CONTINUOUS MEMORY DTC P1474: CHECK LOW SPEED FAN CONTROL (LFC) CIRCUIT FOR OPEN OR SHORT TO POWER

- A/C and defrost off.
- Disconnect cooling fan connector (both for applications with two fans).
- Connect a non-powered test lamp between the (LOW) FAN PWR circuit and ground circuit at the cooling fan harness connector. For applications with two fans, connect light to the following fan harness connector:
 - Driver's side for 2.0L Escape.
 - Passenger side for 3.0L Escape.
 - Other applications with two fans, either one can be used.
- Key on, engine off.
- Access Output Test Mode on scan tool.
- Command Low Speed Fan on.
- Observe test lamp for an indication of a fault while completing the following (the lamp will turn off when a fault is detected, indicating an open or short to power):
 - Shake, wiggle and bend the LFC circuit between the PCM and (low speed) FC relay.
 - Shake, wiggle and bend the VPWR (or IGN START/RUN) circuit to the (low speed) FC relay.
 - Lightly tap on the (low speed) FC relay to simulate road shock.

Is a fault indicated?

Yes	No

ISOLATE fault and REPAIR as necessary.

GO to KF11.

KF11 CHECK LFC CIRCUIT FOR SHORT TO GROUND

- Key on, engine off.
- Command Low Speed Fan off.
- Observe test lamp for an indication of a fault while completing the following (the lamp will turn on when a fault is detected, indicating LFC circuit short to ground):
 - Shake, wiggle and bend the LFC circuit between the PCM and (low speed) FC relay.
 - Lightly tap on the (low speed) FC relay to simulate road shock.

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary.	KEY OFF. GO to <u>Z1</u> .

KF15 CONTINUOUS MEMORY DTC P1477: CHECK MEDIUM SPEED FAN CONTROL (MFC) CIRCUIT FOR OPEN OR SHORT TO POWER

- A/C and defrost off.
- Disconnect both cooling fans.
 - **For 2.0L Escape:**
 - Connect a non-powered test lamp between the MEDIUM FAN PWR circuit and ground circuit at the passenger side cooling fan harness connector.
 - **For 3.0L Escape:**
 - Disconnect medium speed FC relay (ADD FAN 3, on fan shroud).
 - Connect a non-powered test lamp between the MFC circuit and IGN START/RUN circuit at the medium speed FC relay harness connector.
- Key on, engine off.
- Access Output Test Mode on scan tool.
- Command Low Speed Fan on (this also commands on the medium speed fan).
- Observe test lamp for an indication of a fault while completing the following (the lamp will turn off when a fault is detected, indicating an open or short to power):
 - Shake, wiggle and bend the LFC circuit between the PCM and medium speed FC relay.
 - Shake, wiggle and bend the IGN START/RUN circuit to the medium speed FC relay.
 - For 2.0L, lightly tap on the medium speed FC relay to simulate road shock.

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary.	GO to <u>KF16</u> .

KF16 CHECK MFC CIRCUIT FOR SHORT TO GROUND

- Key on, engine off.
- Command Low Speed Fan off.
- Observe test lamp for an indication of a fault while completing the following (the lamp will turn on when a fault is detected, indicating MFC circuit short to ground):
 - Shake, wiggle and bend the MFC circuit between the PCM and medium speed FC relay.

- For 2.0L, lightly tap on the medium speed FC relay to simulate road shock.
- For 3.0L, inspect medium speed FC relay for intermittent concerns.

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary.	KEY OFF. GO to <u>Z1</u> .

KF20 CONTINUOUS MEMORY DTC P1479: CHECK HIGH SPEED FAN CONTROL (HFC) CIRCUIT FOR OPEN OR SHORT TO POWER

- A/C and defrost off.
- Disconnect cooling fan connector(s) (both for applications with two fans).
- Connect a non-powered test lamp between the (HIGH) FAN PWR circuit and ground circuit at the cooling fan harness connector (for applications with two fans; passenger side for 2.0L Escape, driver's side for 3.0L Escape, either one for others).
- Key on, engine off.
- Access Output Test Mode on scan tool.
- Command High Speed Fan on.
- Observe test lamp for an indication of a fault while completing the following (the lamp will turn off when a fault is detected, indicating an open or short to power):
 - Shake, wiggle and bend the HFC circuit between the PCM and high speed FC relay.
 - Shake, wiggle and bend the VPWR (IGN START/RUN for Escape) circuit to the high speed FC relay (for 3.0L Escape, both relays).
 - Lightly tap on the high speed FC relay to simulate road shock.

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary.	GO to <u>KF21</u> .

KF21 CHECK HFC CIRCUIT FOR SHORT TO GROUND

- Command High Speed Fan off.
- Observe test lamp for an indication of a fault while completing the following (the lamp will turn on when a fault is detected, indicating an HFC circuit short to ground):
 - Shake, wiggle and bend the HFC circuit between the PCM and high speed FC relay.
 - Lightly tap on the HFC relay to simulate road shock.

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary.	KEY OFF. GO to <u>Z1</u> .

KF25 ONE OR ALL FAN SPEEDS INOPERATIVE: CHECK FAN CONTROL FAULT PIDs TO VERIFY FAN CONTROL PRIMARY CIRCUITS

- Verify A/C is off, and engine temperature is below the temperature where the cooling fan would come on.
- Key on, engine off.

- Access the LFCF, MFCF and HFCF PIDs (as appropriate, according to which circuits the vehicle has)(for Escape, early builds will not have the MFCF PID).

Does the LFCF, MFCF or HFCF PID indicate YES?

Yes	No
<p>For the fault PID(s) that are YES, a primary circuit fault is indicated for that circuit. .</p> <p>For 3.0L Escape with HFCF PID indicating YES:</p> <p>GO to KF7 .</p> <p>All others:</p> <p>GO to KF1 .</p>	<p>For Escape: .</p> <p>GO to KF85 .</p> <p>All others:</p> <p>GO to KF30 .</p>

KF30 ELECTRIC COOLING FAN CONCERN (WITH NO DTCs): CHECK FAN FUNCTION

- Key on, engine off.
- Access Output Test Mode on scan tool.
- Command the cooling fan on and check for fan operation. For two speed fan applications, check both fan speeds (wait 20 seconds after commanding high speed fan on, verify fan speed changes).

Does the fan(s) operate (all speeds)?

Yes	No
<p>KEY OFF. Cooling fan circuits OK. RETURN to Section 3 Chart.</p>	<p>COMMAND cooling fan off. REMAIN in Output Test Mode.</p> <p>For Focus (with A/C), Cougar and Windstar :</p> <p>GO to KF50 .</p> <p>For Focus (without A/C) and Ranger:</p> <p>Fan will not operate. GO to KF41 .</p> <p>All others :</p> <p>GO to KF31 .</p>

KF31 DID THE FAN(S) OPERATE AT ANY SPEED?

Note: For applications with two cooling fan motors, if one cooling fan motor does not operate when the other motor operates, GO to [KF70](#) .

During the operational check of both fan speeds, did the fan(s) operate at any speed?

Yes	No
<p>Only one fan speed is operational. GO to</p>	<p>Cooling fan will not operate at any speed. GO</p>

KF40.

to KF32.

KF32 COOLING FAN WILL NOT OPERATE AT ANY SPEED: COMMAND HIGH SPEED FAN ON AND CHECK FOR VOLTAGE TO COOLING FAN

- Key on, engine off.
- Still in Output Test Mode, with fan commanded off.
- Disconnect cooling fan(s) (both for applications with two fans).
- Command high speed fan on.
- Measure voltage between the HIGH FAN PWR circuit at the cooling fan harness connector (either one for Taurus/Sable) and chassis ground.

Is voltage greater than 10.0 volts?

Yes	No
KEY OFF. Power is being supplied to fan. For Taurus/Sable: GO to KF130 (to check fan braking relay and ground circuits). All others: GO to KF37 (to check cooling fan ground circuit).	KEY OFF. Power is not being supplied to fan. GO to KF33 .

KF33 CHECK B+ TO HIGH SPEED FC RELAY AND LOW SPEED FC RELAY

- Disconnect high speed and low speed FC relays.
- Measure B+ circuit voltage at the high speed FC relay harness connector.
- Measure B+ circuit voltage at the low speed FC relay harness connector.

Is voltage greater than 10.0 volts?

Yes	No
GO to KF34 .	B+ circuit fault. CHECK condition of related fuses. If OK, REPAIR open circuit. If fuse is damaged, CHECK B+ and FAN PWR circuits for short to ground before replacing.

KF34 CHECK FOR OPEN HIGH FAN PWR AND LOW FAN PWR CIRCUITS

- Measure resistance of the HIGH FAN PWR circuit between the High Speed FC relay harness connector and the cooling fan harness connector(s). Resistance should be less than 5.0 ohms.
- Measure resistance of the LOW FAN PWR circuit between the low speed FC relay harness connector and the cooling fan harness connector(s). Resistance should be less than 5.0 ohms (7.0 ohms for Taurus/Sable).

Do the HIGH FAN PWR and LOW FAN PWR circuits check OK?

--	--

Yes	No
GO to KF35 .	REPAIR open circuit (for Taurus/Sable, if open is in LOW FAN PWR circuit, verify condition of resistor that is in circuit).

KF35 COMMAND LOW SPEED FAN ON AND CHECK FOR VOLTAGE TO COOLING FAN

- Reconnect low speed FC relay and high speed FC relay.
- Key on, engine off.
- Again, enter Output Test Mode on scan tool.
- Command Low Speed Fan on.
- Measure LOW FAN PWR circuit voltage at the cooling fan harness connector (either one for applications with two fans).

Is voltage greater than 10.0 volts?

Yes	No
KEY OFF. REPLACE the High Speed FC relay, then GO to KF37 (for Taurus/Sable, GO to KF130).	KEY OFF. GO to KF75 , and follow directions for low speed fan inoperative. After repair, GO to KF75 and follow directions for high speed fan inoperative.

KF37 CHECK COOLING FAN GROUND CIRCUIT

- Disconnect scan tool from DLC.
- Measure resistance of ground circuit between the cooling fan harness connector and chassis ground.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE fan motor(s).	REPAIR ground circuit.

KF40 DETERMINE WHICH FAN SPEED IS OPERATIONAL

Is the low speed fan operational?

Yes	No
High speed fan inoperative. GO to KF46 .	Low speed fan inoperative. GO to KF41 .

KF41 (LOW SPEED) FAN INOPERATIVE: COMMAND LOW SPEED FAN ON AND CHECK FOR VOLTAGE TO COOLING FAN

Note: The following steps apply to applications with either a one or two speed fan. Refer to the fan speed in parenthesis as appropriate.

- Key on, engine off.

- Still in Output Test Mode with fan commanded off.
- Disconnect cooling fan(s) (both for applications with two fans).
- Command low speed fan on.
- Measure (LOW) FAN PWR circuit voltage at the cooling fan harness connector (either one for applications with two fans).

Is voltage greater than 10.0 volts?

Yes	No
For Taurus/Sable: REPLACE fan. All others: VERIFY ground circuit to fan. If OK, REPLACE fan motor.	KEY OFF. GO to KF42 .

KF42 CHECK B+ VOLTAGE TO (LOW SPEED) FAN CONTROL (FC) RELAY

- Disconnect (Low Speed) FC relay.
- Measure B+ circuit voltage at the (low speed) FC relay harness connector.

Is voltage greater than 10.5 volts?

Yes	No
GO to KF43 .	VERIFY condition of related fuse. If OK, REPAIR open B+ circuit. If fuse was damaged CHECK B+ and (LOW) FAN PWR circuit for short to ground before replacing.

KF43 CHECK FOR OPEN (LOW) FAN PWR CIRCUIT

- Measure resistance of the (LOW) FAN PWR circuit between the (low speed) FC relay harness connector and the cooling fan harness connector(s).

Is resistance less than 5.0 ohms (7.0 ohms for Taurus/Sable)?

Yes	No
GO to KF75 .	REPAIR open circuit (for Taurus/Sable, verify condition of resistor that is in circuit).

KF46 HIGH SPEED FAN INOPERATIVE: COMMAND HIGH SPEED FAN ON AND CHECK FOR VOLTAGE TO COOLING FAN

- Key on, engine off.
- Still in Output Test Mode with fan commanded off.
- Disconnect cooling fan(s) (both for applications with two fans).
- Command high speed fan on.
- Measure HIGH FAN PWR circuit voltage at the cooling fan harness connector.

Is voltage greater than 10.0 volts?

Yes	No
For Taurus/Sable: REPLACE fan. All others: VERIFY ground circuit to fan. If OK, REPLACE fan motor.	KEY OFF. GO to KF47 .

KF47 CHECK B+ VOLTAGE TO HIGH SPEED FAN CONTROL (FC) RELAY

- Disconnect high speed FC relay.
- Measure B+ circuit voltage at the high speed FC relay harness connector.

Is voltage greater than 10.5 volts?

Yes	No
GO to KF48 .	VERIFY condition of related fuse. If OK, REPAIR open B+ circuit. If fuse was damaged, CHECK B+ and HIGH FAN PWR circuit for short to ground before replacing.

KF48 CHECK FOR OPEN HIGH FAN PWR CIRCUIT

- Measure resistance of the HIGH FAN PWR circuit between the high speed FC relay harness connector and the cooling fan harness connector.

Is resistance less than 5.0 ohms?

Yes	No
GO to KF75 .	REPAIR open circuit.

KF50 LOW AND/OR HIGH SPEED COOLING FAN DOES NOT OPERATE: CHECK FOR B+ TO HIGH SPEED FC AND LOW SPEED FC RELAYS

Note: For applications with two cooling fan motors, if one motor does not operate when the other motor operates, GO to [KF70](#).

- Disconnect high speed FC and low speed FC relays.
- Measure B+ circuit voltage at both high speed FC and low speed FC relay harness connectors.

Are both voltages greater than 10.5 volts?

Yes	No
GO to KF51 .	VERIFY condition of related fuses. If OK, REPAIR open B+ circuit. If fuse was damaged, CHECK B+ and fan(s) PWR circuits for short to ground before replacing.

KF51 CHECK FOR OPEN FAN PWR, FAN GROUND AND INTERNAL FAN CIRCUITS

- Measure resistance between battery negative post and the FAN PWR circuit at both the high speed FC and low speed FC relay harness connectors.

Are both resistances less than 15.0 ohms?

Yes	No
GO to KF52 .	GO to KF56 .

KF52 CHECK FAN PWR CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect both cooling fans.
- Measure resistance between the FAN PWR circuit in harness and ground.

Is resistance greater than 10,000 ohms?

Yes	No
GO to KF53 .	REPAIR FAN PWR circuit short to ground.

KF53 CHECK HIGH SPEED FC AND LOW SPEED FC RELAY OPERATION

- Reconnect high speed FC and low speed FC relays.
- Key on, engine off.
- Access Output Test Mode on scan tool.
- Check high speed FC relay operation:
 - Command high speed fan on, wait 15 seconds.
 - Measure voltage to the FAN PWR circuit at the cooling fan harness connector (either one).
 - Voltage must be greater than 10.5 volts.
- Check low speed FC relay operation:
 - Command low speed fan on.
 - Measure voltage to the FAN PWR circuit at the cooling fan connector (either one).
 - Voltage must be greater than 10.0 volts.

Do the high speed FC and low speed FC relays operate correctly?

Yes	No
REPLACE cooling fan(s).	KEY OFF. NOTE which fan speed was inoperative. GO to KF75 .

KF56 CHECK FOR OPEN FAN PWR CIRCUIT BETWEEN COOLING FAN AND THE HIGH SPEED FC AND LOW SPEED FC RELAYS

- Disconnect cooling fan (either one).
- Measure resistance of FAN PWR circuit between cooling fan harness connector and both the

high speed FC and low speed FC relay harness connectors.

Are both resistances less than 15.0 ohms?

Yes	No
GO to KF57 .	REPAIR open in FAN PWR circuit (if open is only between low speed FC relay and fan, first verify dropping resistor connection).

KF57 CHECK COOLING FAN GROUND CIRCUIT

- Measure resistance of ground circuit between the cooling fan harness connector and chassis ground.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE inoperative cooling fan(s).	REPAIR ground circuit.

KF60 LOW, MEDIUM AND/OR HIGH SPEED COOLING FAN ALWAYS RUNS (NO DTCS): VERIFY FAN IS NOT ON BECAUSE OF A/C HIGH PRESSURE SWITCH INPUT TO PCM

- Start engine.
- Access ACP PID.

Is the ACP PID "CLOSED"?

Yes	No
The PCM will turn the cooling fan on when the A/C high pressure switch input is "closed". Leave engine running. GO to KF61 .	Input OK. GO to KF65 .

KF61 CHECK A/C HIGH PRESSURE SWITCH (the medium pressure, normally open contacts)

- Disconnect A/C high pressure switch (refer to pinpoint test KM cover pages if needed).
- Again, view the ACP PID on scan tool.

Is the ACP PID still "CLOSED"?

Yes	No
KEY OFF. GO to KF62 (to check A/C high pressure switch input to PCM).	KEY OFF. RECONNECT A/C high pressure switch. REFER to the Climate Control System, General Information Section 412-00 of the Workshop Manual to check for proper A/C high pressure switch function, over-pressurized A/C system and other checks as directed.

KF62 CHECK ACPSW CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect scan tool from DLC.
- Disconnect PCM.
- Measure resistance between PCM harness connector Pin 86 and ground.

Is resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPAIR short circuit.

KF63 LOW AND/OR HIGH SPEED COOLING FAN ALWAYS RUNS (NO DTCS): VERIFY FAN IS NOT ON BECAUSE OF A/C PRESSURE SENSOR INPUT TO PCM

- A/C off.
- Start engine.
- Access ACP V PID.

Is the ACP V PID greater than 3.0 volts?

Yes	No
KEY OFF. REFER to the Climate Control System, General Information Section 412-00 of the Workshop Manual to check for high A/C system pressure and other checks as directed.	Input is not causing the fan to run. GO to <u>KF65</u> .

KF65 CHECK FOR (LOW SPEED) FC RELAY ALWAYS CLOSED

Note: Verify A/C and defrost are off.

- Disconnect (low speed) FC relay.
- Key on, engine off.

Does fan continue to run?

Yes	No
<p>For Focus (without A/C) and Ranger: REPAIR FAN PWR circuit for short to power.</p> <p>All others: KEY OFF. GO to <u>KF66</u>.</p>	KEY OFF. GO to <u>KF80</u> .

KF66 CHECK HIGH SPEED FC RELAY

- Low speed FC relay disconnected.
- Disconnect high speed FC relay (for 3.0 Escape, high speed FC relay #1).

- Key on, engine off.

Does fan continue to run?

Yes	No
<p>For Focus, Contour/Mystique/Cougar, Taurus/Sable, Ranger and Windstar:</p> <p>REPAIR FAN PWR circuit for short to power.</p> <p>For 2.0L Escape:</p> <p>KEY OFF. GO to KF68.</p> <p>For 3.0L Escape:</p> <p>If passenger side fan always runs, REPAIR LOW FAN PWR circuit short to power. If driver's side fan always runs, REPAIR HIGH FAN PWR short to power.</p> <p>All others:</p> <p>KEY OFF. GO to KF67.</p>	<p>KEY OFF. GO to KF80.</p>

KF67 CHECK LOW FAN PWR CIRCUIT FOR SHORT TO POWER IN HARNESS

- Disconnect cooling fan(s).
- Key on, engine off.
- Measure voltage to the LOW FAN PWR circuit at the cooling fan harness connector.

Is voltage less than 1.0 volt?

Yes	No
<p>REPAIR HIGH FAN PWR circuit for short to power.</p>	<p>REPAIR LOW FAN PWR circuit for short to power.</p>

KF68 CHECK MEDIUM SPEED FC RELAY

- Low speed and high speed FC relays disconnected.
- Disconnect medium speed FC relay.
- Key on, engine off.

Does fan continue to run?

Yes	No
<p>KEY OFF. If both fans run, REPAIR HIGH FAN PWR circuit short to power. If only one fan runs, REPAIR the circuit to that fan for short to power (either the LOW FAN PWR or MEDIUM FAN PWR circuit).</p>	<p>KEY OFF. REPLACE medium speed FC relay.</p>

KF70 ONE COOLING FAN MOTOR DOES NOT OPERATE WHEN THE OTHER COOLING FAN MOTOR OPERATES (NO DTCs): CHECK FOR OPEN GROUND CIRCUIT TO INOPERATIVE FAN

- Disconnect inoperative cooling fan.
- **For Taurus/Sable:**
 - Disconnect fan braking relay.
 - Measure resistance of ground circuit between fan and fan braking relay harness connectors.
- **All others:**
 - Measure resistance of ground circuit between fan harness connector and ground.

Is resistance less than 5.0 ohms?

Yes	No
GO to KF71 .	REPAIR open circuit.

KF71 COMMAND FAN ON AND CHECK FOR POWER TO FAN

- Disconnect the other cooling fan (so both are disconnected).
- Access Output Test Mode on scan tool.
- Command high speed fan on.
- Measure voltage to the (HIGH) FAN PWR circuit(s) at the inoperative fan harness connector.

Is voltage greater than 10.0 volts?

Yes	No
REPLACE inoperative cooling fan.	REPAIR open in FAN PWR circuit between inoperative cooling fan and splice to other fan.

KF75 IS SCAN TOOL CAPABLE OF VIEWING PIDS WHILE IN OUTPUT TEST MODE?

Note: The symptom low, medium and/or high speed fan inoperative can be caused by a primary circuit fault, even though a DTC was not set. The next test step will check the primary circuit operation.

Is scan tool being used capable of viewing PIDs while in Output Test Mode?

Yes	No
GO to KF76 .	<p>For low speed fan inoperative (fan inoperative for one speed fan applications):</p> <p>GO to KF77.</p> <p>For medium speed fan inoperative (Escape):</p> <p>GO to KF78.</p> <p>For high speed fan inoperative:</p>

KF76 CHECK OPERATION OF LOW, MEDIUM and/or HIGH SPEED FAN PRIMARY CIRCUITS

- Reconnect cooling fan(s) and low, medium or high speed fan control relay(s).
- Key on, engine off.
- Enter Output Test Mode on scan tool.
- **For low speed fan inoperative (fan inoperative for one speed fan applications):**
 - Access LFC and LFCF PIDs.
 - With LFC PID off (low speed fan commanded off by PCM), the LFCF PID must be NO.
 - Command the Low Speed Fan on (the LFC PID will now be on).
 - The LFCF PID must still be NO.
- **For medium speed fan inoperative (Escape):**
 - Access MFC and MFCF PIDs (if MFC and MFCF PIDs are not available, GO to [KF78](#)).
 - With MFC PID off (medium speed fan commanded off by PCM), the MFCF PID must be NO.
 - Command the Low Speed Fan on (the MFC PID will now be on).
 - The MFCF PID must still be NO.
- **For high speed fan inoperative:**
 - Access HFC and HFCF PIDs.
 - With HFC PID off (high speed fan commanded off by PCM), the HFCF PID must be NO.
 - Command the high speed fan on (the HFC PID will now be on).
 - The HFCF PID must still be NO.

Is the LFCF, MFCF or HFCF PID Yes with the fan commanded on or off?

Yes	No
<p>KEY OFF. An LFC, MFC or HFC primary fault is detected.</p> <p>If the LFCF PID was yes: GO to KF1 and follow DTC P1474 diagnosis.</p> <p>If the MFCF PID was yes: GO to KF1 and follow DTC P1477 diagnosis.</p> <p>If the HFCF PID was yes: GO to KF1 and follow DTC P1479 diagnosis.</p>	<p>Primary circuits OK.</p> <p>For low speed fan inoperative, REPLACE low speed FC relay. For medium speed fan inoperative, REPLACE medium speed FC relay. For high speed fan inoperative, REPLACE high speed FC relay. VERIFY applicable FAN PWR circuit is not short to ground.</p>

KF77 CHECK OPERATION OF LOW SPEED FAN PRIMARY CIRCUITS

- Reconnect cooling fan (if it was disconnected).
- Key on, engine off.
- Connect a non-powered test lamp between the VPWR circuit and the LFC circuit at the low speed FC relay harness connector.
- Access Output Test Mode on scan tool.
- While observing test lamp, command the low speed fan on and off.

Does the test lamp turn on and off when the cooling fan output is commanded on and off?

Yes	No
Primary circuits OK. REPLACE the low speed FC relay. VERIFY applicable FAN PWR circuit is not short to ground.	KEY OFF. An LFC primary fault is detected. GO to <u>KF1</u> and follow DTC P1474 diagnosis.

KF78 CHECK OPERATION OF MEDIUM SPEED FAN PRIMARY CIRCUITS

- Reconnect cooling fan (if it was disconnected).
- Key on, engine off.
- Connect a non-powered test lamp between the VPWR circuit and the MFC circuit at the medium speed FC relay harness connector.
- Access Output Test Mode on scan tool.
- While observing test lamp, command the low speed fan on and off.

Does the test lamp turn on and off when the cooling fan output is commanded on and off?

Yes	No
Primary circuits OK. REPLACE the medium speed FC relay. VERIFY applicable FAN PWR circuit is not short to ground.	KEY OFF. An MFC primary fault is detected. GO to <u>KF1</u> and follow DTC P1477 diagnosis.

KF79 CHECK OPERATION OF HIGH SPEED FAN PRIMARY CIRCUITS

- Reconnect cooling fan (if it was disconnected).
- Key on, engine off.
- Connect a non-powered test lamp between the VPWR circuit and the HFC circuit at the high speed FC relay harness connector.
- Access Output Test Mode on scan tool.
- While observing test lamp, command the high speed fan on (wait 15 seconds) and off.

Does the test lamp turn on and off when the cooling fan output is commanded on and off?

Yes	No
Primary circuits OK. REPLACE the high speed FC relay. VERIFY applicable FAN PWR circuit is not short to ground.	KEY OFF. A HFC primary fault is detected. GO to <u>KF1</u> and follow DTC P1479 diagnosis.

KF80 CHECK OPERATION OF LOW SPEED FAN OR HIGH SPEED FAN PRIMARY CIRCUITS

Note: The symptom cooling fan always runs, can be caused by a primary circuit fault, even though a DTC was not set. This step will check the primary circuit operation.

- Reconnect FC relay(s).
- Key on, engine off.
- **If fan stops running with the (low speed) FC relay disconnected:**
 - Access LFC and LFCF PIDs.
 - With LFC PID off (low speed fan commanded off by PCM), the LFCF PID must be NO.
- **If fan stops running with the high speed FC relay disconnected:**
 - Access HFC and HFCF PIDs.
 - With HFC PID off (high speed fan commanded off by PCM), the HFCF PID must be NO.

Is the HFCF or LFCF PID Yes with the fan commanded off?

Yes	No
<p>KEY OFF. An HFC or LFC primary circuit fault is detected.</p> <p>If the HFCF PID was yes:</p> <p>GO to KF1 and follow DTC P1479 diagnosis.</p> <p>If the LFCF PID was yes:</p> <p>GO to KF1 and follow DTC P1474 diagnosis.</p>	<p>Primary circuits OK.</p> <p>If fan stopped running with the low speed FC relay disconnected, REPLACE the low speed FC relay. If fan stopped running with the high speed FC relay disconnected, REPLACE the high speed FC relay.</p>

KF85 ELECTRIC COOLING FAN CONCERN, WITH NO DTCs (ESCAPE): CHECK FAN FUNCTION

- Key on, engine off.
- Access Output Test Mode on scan tool.
- Command the low speed cooling fan on and note fan operation:
 - Both the low speed and medium speed fans will be commanded on by the PCM. Both cooling fans should be running at low speed (medium speed for 3.0L).
- Command the high speed cooling fan on and note fan operation:
 - Both fans should be running at high speed.

Do the fans operate as expected?

Yes	No
<p>KEY OFF. Cooling fan circuits OK. RETURN to Section 3 Chart.</p>	<p>KEY OFF.</p> <p>For 2.0L:</p> <p>Note which fan and/or fan speed did not operate (refer to PPT KF Pre-Diagnostic Information for schematic and the 2.0L Escape Fan Diagnosis Chart to help identify which fan or fan speed(s) needs to be diagnosed).</p> <p>GO to KF86.</p> <p>For 3.0L:</p> <ul style="list-style-type: none"> ■ For; fans do not operate with low speed fan commanded on, but both fans operate with high speed fan commanded on, GO to KF95.

	<ul style="list-style-type: none"> ■ For; fans do not operate with low speed fan commanded on, and only one fan operates with high speed fan commanded on, GO to KF105. ■ For; fans operate with low speed fan commanded on, but only one fan operates with high speed fan commanded on, GO to KF115. ■ For; only one fan operates with low speed fan commanded on, but both fans operate with high speed fan commanded on, GO to KF124.
--	---

KF86 CHECK B+ VOLTAGE TO LOW, MEDIUM and/or HIGH SPEED FAN CONTROL (FC) RELAYS

- Disconnect the low, medium and/or high speed FC relay(s) (as applicable).
- Measure B+ circuit voltage at the Low, Medium and/or High Speed FC relay(s) vehicle harness connectors.

Is voltage(s) greater than 10.0 volts?

Yes	No
GO to KF87 .	B+ circuit fault. CHECK condition of related fuses. If OK, REPAIR open circuit. If fuse is damaged, CHECK B+ and FAN PWR circuits for short to ground before replacing.

KF87 CHECK CONTINUITY OF APPLICABLE FAN PWR CIRCUITS

- Disconnect applicable cooling fan(s).
- Measure resistance of the LOW FAN PWR, MEDIUM FAN PWR and/or HIGH FAN PWR circuit between the applicable cooling fan harness connector(s) and the applicable FC relay harness connector(s).

Is resistance(s) less than 5.0 ohms?

Yes	No
GO to KF88 .	REPAIR open circuit(s).

KF88 CHECK FOR POWER TO FAN(S)

- Reconnect the low, medium and/or high speed FC relay(s) (whichever were disconnected).
- Disconnect both cooling fans, if not already disconnected.
- Key on, engine off.
- Access Output Test Mode on scan tool.
- **If low speed and/or medium speed fan is inoperative:**
 - Command the low speed fan on.
 - Measure LOW FAN PWR and/or MEDIUM FAN PWR circuit voltage at the applicable cooling fan harness connector(s).
- **If high speed fan is inoperative:**

- Command the high speed fan on.
- Measure HIGH FAN PWR circuit voltage at the applicable cooling fan harness connector (s).

Is voltage(s) greater than 10.0 volts?

Yes	No
GO to KF89 .	GO to KF75 to check cooling fan primary circuit(s).

KF89 CHECK COOLING FAN(s) GROUND

- Disconnect scan tool from DLC.
- Measure resistance of ground circuit between the applicable cooling fan harness connector(s) and chassis ground.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE fan(s) that did not operate correctly in KF85.	REPAIR ground circuit.

KF95 CHECK RESISTANCE OF LOW FAN GND CIRCUIT BETWEEN PASSENGER SIDE COOLING FAN AND MEDIUM SPEED FC RELAY

- Disconnect medium speed FC relay (ADD FAN 3, on fan shroud).
- Disconnect passenger side cooling fan.
- Measure resistance of the LOW FAN GND circuit between the passenger side cooling fan and medium speed fan FC relay harness connectors.

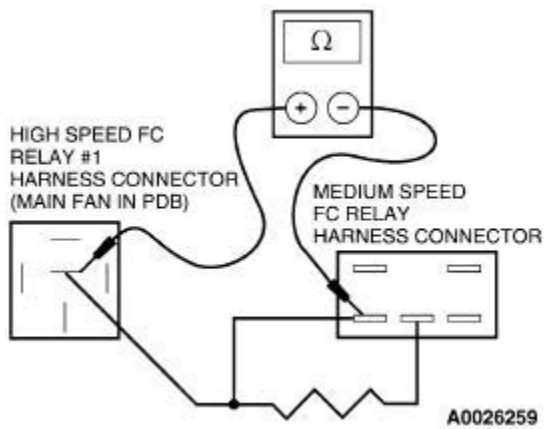

Is resistance less than 5.0 ohms?

Yes	No
GO to KF96 .	REPAIR open LOW FAN GND circuit (open is between medium speed FC relay and splice to high speed FC relay).

KF96 MEASURE RESISTANCE OF CIRCUIT BETWEEN MEDIUM SPEED FC RELAY AND HIGH SPEED FC RELAY #1

- Reconnect cooling fan.
- Disconnect high speed FC relay #1 (MAIN FAN in BJB).
- Measure resistance of the circuit between the medium speed FC relay and high speed FC relay #1 harness connectors as shown below (the circuit that does not go through the resistor is being tested).

Is resistance less than 5.0 ohms?

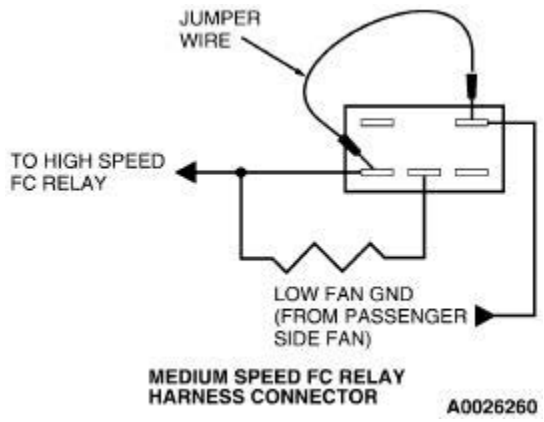

Yes	No
GO to KF97 .	REPAIR open circuit between medium speed FC relay and high speed FC relay #1.

KF97 BYPASS MEDIUM SPEED FC RELAY AND CHECK FAN OPERATION

- Reconnect high speed FC relay #1.
- Connect jumper wire in medium speed FC relay harness connector as shown below (jumper is between LOW FAN GND from passenger side cooling fan pin and circuit between medium speed and high speed FC relays that does not go through low speed resistor pin).
- Key on, engine off.
- Access Output Test Mode on scan tool.
- Command low speed fan on.

Do fans run?

Yes	No
KEY OFF. REPLACE medium speed FC relay.	KEY OFF. GO to KF98 .

KF98 CHECK NORMALLY CLOSED (N/C) CONTACTS OF HIGH SPEED FC RELAY #1

- Again, disconnect the high speed FC relay #1.
- Measure resistance of the normally closed contacts of the high speed FC relay #1 (relay pins 30 and 87A are for the normally closed contacts).

Is resistance less than 5.0 ohms?

Yes	No
No fault is detected. Reconfirm previous test steps. If OK, RETURN to Section 3 .	Replace high speed FC relay #1.

KF105 DID THE DRIVERS SIDE FAN OPERATE IN KF85?

In step KF85, was the driver's side cooling fan the one that DID operate?

Yes	No
Passenger side fan did not operate. GO to KF110 .	Driver's side fan did not operate. GO to KF106 .

KF106 COMMAND HIGH SPEED FAN ON AND CHECK FOR B+ TO DRIVER'S SIDE FAN

- Disconnect driver's side fan.
- Key on, engine off.
- Access Output Test Mode on scan tool.
- Command high speed fan on.
- Measure voltage between the HIGH FAN PWR circuit at the driver's side fan harness connector and chassis ground.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to KF107 .	KEY OFF. GO to KF108 .

KF107 CHECK DRIVER'S SIDE FAN GROUND CIRCUIT

- Measure resistance of the driver's side fan ground circuit between the fan harness connector and chassis ground.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE driver's side fan.	REPAIR open ground circuit.

KF108 CHECK HIGH FAN PWR CIRCUIT CONTINUITY

- Disconnect high speed FC relay #1 (MAIN FAN in BJB)
- Measure resistance of the HIGH FAN PWR circuit between the high speed FC relay #1 and fan harness connectors.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE high speed FC relay #1.	REPAIR open circuit.

KF110 CHECK B+ TO LOW SPEED FC RELAY

- Disconnect low speed FC relay (ADD FAN in BJB).
- Measure B+ circuit voltage at the low speed FC relay harness connector.

Is voltage greater than 10.5 volts?

Yes	No
GO to KF111 .	B+ circuit fault. CHECK condition of related fuses. If OK, REPAIR open circuit. If fuse is damaged, CHECK B+ and FAN PWR circuits for short to ground before replacing.

KF111 COMMAND LOW SPEED FAN ON AND CHECK FOR B+ TO PASSENGER'S SIDE FAN

- Reconnect low speed FC relay.
- Disconnect passenger's side fan.
- Key on, engine off.
- Access Output Test Mode on scan tool.
- Command low speed fan on.
- Measure voltage between the LOW FAN PWR circuit at the passenger's side fan harness connector and chassis ground.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to KF112 .	KEY OFF. GO to KF113 .

KF112 CHECK CONTINUITY OF LOW FAN GND CIRCUIT BETWEEN FAN AND HIGH SPEED FC RELAY #2

- Disconnect high speed FC relay #2 (ADD FAN 2 in BJB).
- Measure resistance of the LOW FAN GND circuit between the high speed FC relay #2 and the passenger side fan harness connectors.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE passenger side cooling fan.	REPAIR open LOW FAN GND circuit between fan and splice to high speed FC relay #2.

KF113 CHECK LOW FAN PWR CIRCUIT CONTINUITY

- Again, disconnect low speed FC relay.
- Measure resistance of the LOW FAN PWR circuit between the low speed FC relay and the passenger's side fan harness connectors.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE low speed FC relay.	REPAIR open circuit.

KF115 WHICH COOLING FAN DID OPERATE IN KF85?

In step KF85, was the driver's side cooling fan the one that DID operate?

Yes	No
Passenger side fan did not operate at high speed. GO to KF118 .	Driver's side fan did not operate at high speed. GO to KF116 .

KF116 CHECK B+ AND IGNITION START/RUN TO HIGH SPEED FC RELAY #1

- Disconnect high speed FC relay #1 (MAIN FAN in BJB).
- Measure B+ circuit voltage at the high speed FC relay #1 harness connector.
- Key on, engine off.
- Measure ignition start/run circuit voltage at the high speed FC relay #1 harness connector.

Are both voltages greater than 10.5 volts?

Yes	No
KEY OFF. REPLACE high speed FC relay #1.	KEY OFF. CHECK condition of related fuses. If OK, REPAIR open circuit. If fuse is damaged, CHECK B+ and HIGH FAN PWR circuits for short to ground before replacing.

KF118 CHECK IGNITION START/RUN AND GND CIRCUITS TO HIGH SPEED FC RELAY #2

- Disconnect high speed FC relay #2 (ADD FAN 2 in BJB).
- Key on, engine off.
- Measure voltage between the ignition start/run circuit and GND circuit at the high speed FC relay #2 harness connector.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to KF121 .	GO to KF119 .

KF119 CHECK IGNITION START/RUN VOLTAGE TO HIGH SPEED FC RELAY #2, USING CHASSIS GROUND AS REFERENCE

- Measure voltage between the ignition start/run circuit at the high speed FC relay #2 harness connector and chassis ground.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. REPAIR open ground circuit to high speed FC relay #2.	KEY OFF. REPAIR open ignition start/run circuit to high speed FC relay #2.

KF121 CHECK LOW FAN GND CIRCUIT BETWEEN FAN AND HIGH SPEED FC RELAY #2

- Disconnect passenger side cooling fan.
- Measure resistance of the LOW FAN GND circuit between the high speed FC relay #2 and the passenger side fan harness connectors.

Is resistance less than 5.0 ohms?

Yes	No
GO to KF122 .	REPAIR open LOW FAN GND circuit between high speed FC relay #2 and splice to passenger side fan.

KF122 CHECK HFC CIRCUIT CONTINUITY BETWEEN HIGH SPEED FC RELAYS #1 AND #2

- Disconnect high speed FC relay #1 (MAIN FAN in BJB).
- Measure resistance of HFC circuit between the high speed FC relay #1 and high speed FC relay #2 harness connectors.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE high speed FC relay #2.	REPAIR open circuit.

KF124 DISCONNECT HIGH SPEED FC RELAY #2 AND CHECK IF BOTH FANS WILL RUN WITH LOW FAN COMMANDED ON

- Disconnect high speed FC relay #2 (ADD FAN 2 in BJB).
- Key on, engine off.
- Again, access Output Test Mode on scan tool.
- Command low speed fan on.

Do both fans now operate?

Yes	No
REPLACE high speed FC relay #2 (contacts are stuck closed).	No fault is detected. Reconfirm previous test steps. If OK, RETURN to Section 3 .

KF130 BYPASS FAN BRAKING RELAY AND CHECK IF FAN WILL RUN

- Key off.
- Reconnect cooling fans.
- Disconnect fan braking relay.
- Connect a jumper wire between the ground circuit and the circuit from the cooling fans at the fan braking relay harness connector (refer to the relay pinout at the beginning of this pinpoint test).
- Again, access Output Test Mode on scan tool.
- Command high speed fan on.

Does the fan now operate?

Yes	No
KEY OFF. GO to KF135 .	KEY OFF. GO to KF131 .

KF131 CHECK GROUND CIRCUIT FROM FAN BRAKING RELAY

- Disconnect scan tool from DLC.
- Measure resistance of ground circuit between the fan braking relay harness connector and chassis ground.

Is resistance less than 5.0 ohms?

Yes	No
GO to KF132 .	REPAIR ground circuit.

KF132 CHECK CONTINUITY OF FAN GROUND CIRCUIT BETWEEN FAN AND RELAY

- Measure resistance of fan ground circuit between fan and fan braking relay harness connectors.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE FAN MOTOR(s).	REPAIR open circuit.

KF135 CHECK VPWR VOLTAGE TO FAN BRAKING RELAY

- Key on, engine off.
- Measure VPWR circuit voltage to fan braking relay harness connector.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to KF136 .	REPAIR open VPWR circuit.

KF136 CHECK CONTINUITY OF LFC CIRCUIT TO FAN BRAKING RELAY

- Disconnect low speed FC relay.
- Measure resistance of the LFC circuit between the low speed FC relay and fan braking relay harness connectors.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE fan braking relay.	REPAIR open circuit.

KH: Hydraulic Cooling Fan Introduction

KH: Pinpoint Tests →

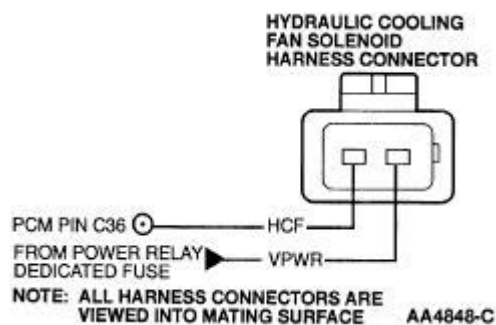

Note

This Pinpoint Test is intended to diagnose the following:

- Hydraulic cooling fan(HCF) solenoid/pump (14A464)
- Harness circuits: VPWR, HCF
- Powertrain control module (PCM) (12A650)

Pinpoint Test Schematics and Connectors

Hydraulic Cooling Fan Pump with Integral Solenoid

KH: Hydraulic Cooling Fan

← KH: Introduction

KH1 DTC P1474 OR COOLING FAN CONCERNS: CHECK HCF SOLENOID RESISTANCE

- Key off.
- Disconnect HCF solenoid.
- Measure HCF solenoid resistance.

Is resistance between 8.5 and 11.5 ohms?

Yes	No
GO to KH2 .	REPLACE HCF solenoid assembly.

KH2 CHECK VPWR VOLTAGE TO HCF SOLENOID

- Key on.
- Measure VPWR circuit voltage at HCF solenoid.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to KH3 .	REPAIR open circuit.

KH3 CHECK HCF CIRCUIT FOR OPEN IN HARNESS

- Measure resistance of HCF circuit between PCM harness connector and HCF solenoid harness connector.

Is resistance less than 5 ohms?

Yes	No
GO to KH4 .	REPAIR open circuit.

KH4 CHECK HCF CIRCUIT FOR SHORT TO POWER IN HARNESS

- Key on.
- Measure voltage between HCF circuit at the PCM harness connector and ground.

Is voltage less than 1.0 volt?

Yes	No
KEY OFF. GO to KH5 .	REPAIR short circuit.

KH5 CHECK HCF CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect scan tool from DLC.
- Measure resistance between HCF circuit at the PCM harness connector and ground.

Is resistance greater than 10,000 ohms?

Yes	No
REFER to Engine Cooling, Section 303-03 in the Workshop Manual for diagnosis and testing. If OK, REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPAIR short circuit.

KJ: Supercharge Bypass Control Introduction

KJ: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

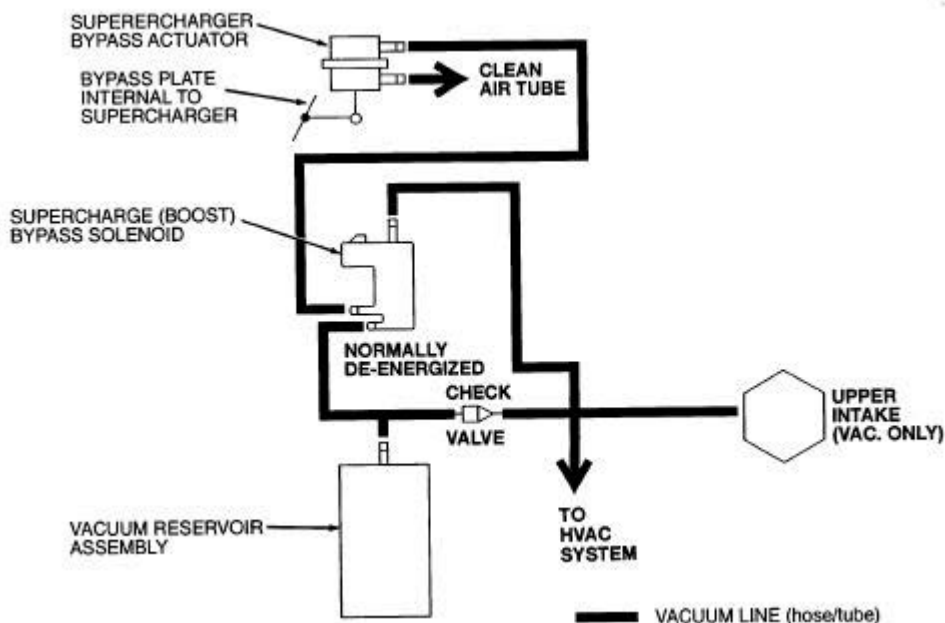

- Supercharger (boost) bypass solenoid (9H465) (service part name is: thermactor air control solenoid/vacuum valve assembly)
- Vacuum reservoir assembly (9J442)
- Vacuum hoses/tubes
- Harness circuits: SCB, vehicle power (VPWR), and power ground (PWR GND)
- Powertrain control module (PCM) (12A650)

This Pinpoint Test is used to assist in diagnosing the following Supercharger components:

- Supercharger assembly (including supercharger bypass actuator) (6F076)

Pinpoint Test Schematics and Connectors

5.4L Lightning

KJ: Pinpoint Tests →

KJ: Supercharge Bypass Control

← KJ: Introduction

KJ1 DTC P0234: CHECK FOR OTHER DTCS

Note: The supercharger will be bypassed when the brake is on and the throttle is depressed in the wide open throttle position. This is called brake torque and the engine torque is too high.

- Check that the engine has not been subjected to brake torque causing the P0234.
- Drive the vehicle for 10 to 15 minutes with the engine exceeding 2,000 rpm and the engine temperature stabilizing.

No Starts:

- GO to [A1](#) .

For Stalls:

- Return to [Section 3](#) , Symptom Charts.
- Return to repair area and check that upper radiator hose is hot and pressurized.
- Rerun Quick Test and retrieve KOER and continuous and retrieve DTCs.

Are any other KOEO, KOER and Continuous Memory DTCs present with the KOER or Continuous Memory P0234?

Yes	No
KEY OFF. GO to Section 4, Powertrain Diagnostic Trouble Code (DTC) Charts , for Pinpoint Test direction and REPAIR DTCs.	GO to KJ2 .

KJ2 CHECK SCAN TOOL PIDS FOR CAUSES OF OVERBOOST CONDITION

- Key on, engine running.
- Access IAT2, TFT and RPM PIDs.
- Observe the PIDs for values exceeding the following limits:
 - Intake air temperature (downstream), IAT2 PID greater than 230°F.
 - Transmission fluid temperature, TFT PID greater than 275°F.

Do any of the above PIDs exceed the limit?

Yes	No
<p>For IAT2:</p> <p>CHECK for low fluid level in Intercooler System. CHECK for cracked intercooler lines. REPAIR as necessary.</p> <p>For TFT:</p> <p>CHECK for low transmission fluid level. REFER to Automatic Transmission Section 307-01 and 307-02 in the Workshop Manual for fluid changes.</p>	GO to KJ3 .

KJ3 CHECK FOR LOW SPEED FUEL PUMP RELAY NOT SWITCHING

- Key on, engine running.
- Access LFPF PID.

Is a fault indicated on the low speed fuel pump (FP) output?

Yes	No
KEY OFF. GO to Section 4, Powertrain Diagnostic Trouble Code (DTC) Charts for diagnostic direction following DTC P1232.	CHECK for indications of engine knock while driving the vehicle. REPAIR as necessary. If OK, indicate to vehicle owner that transmission damage will occur upon brake torque (reference: GO to KJ1). Otherwise, unable to determine cause of overboost condition at this time.

KJ6 DTC P0243: CHECK SUPERCHARGER (BOOST) BYPASS SOLENOID OUTPUT

- Key off.
- Disconnect supercharger (boost) bypass (SCB) solenoid.
- Connect a non-powered test lamp between SCB and VPWR circuits at the SCB solenoid harness connector.
- Key on, engine off.
- Attempt to close and open SCB solenoid driver in PCM by accessing Output Test Mode or scan tool.
- While observing the test lamp, command the PCM outputs on and off.

Does the test lamp cycle on and off (light up and turn off)?

Yes	No
KEY OFF. GO to KJ7 .	<p>For test lamp always off :</p> <p>GO to KJ8.</p> <p>For test lamp always on :</p> <p>KEY OFF. GO to KJ11.</p>

KJ7 CHECK SCB SOLENOID RESISTANCE

- Measure SCB solenoid resistance.

Is resistance between 68 and 78 ohms?

Yes	No
CHECK for damaged vacuum hoses between engine intake manifold and SCB solenoid. CHECK for vacuum reservoir assembly leaks. REPAIR or REPLACE as necessary. If OK, GO to Z1 for intermittent diagnosis.	REPLACE damaged SCB solenoid.

KJ8 CHECK FOR OPEN VPWR CIRCUIT BETWEEN SCB SOLENOID AND POWER RELAY

- Measure voltage between VPWR circuit at the SCB solenoid harness connector and battery negative post.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to KJ9 .	KEY OFF. REPAIR open circuit.

KJ9 CHECK VPWR CIRCUIT FOR OPEN IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of the pinpoint test.

- Disconnect PCM.
- Measure resistance of VPWR circuit between PCM harness connector pin and SCB solenoid harness connector.

Is resistance less than 5.0 ohms?

Yes	No
GO to KJ10 .	REPAIR open circuit.

KJ10 CHECK SCB CIRCUIT FOR OPEN IN HARNESS

- Measure resistance of SCB circuit between PCM harness connector pin and SCB solenoid harness connector.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR open circuit.

KJ11 CHECK SCB CIRCUIT FOR SHORT TO PWR GND IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Disconnect scan tool from DLC.
- Measure resistance between SCB circuit and multiple PWR GND circuits at the PCM harness connector.

Are all resistances greater than 10,000 ohms?

Yes	No
RECONNECT scan tool. GO to KJ12 .	REPAIR short circuit.

KJ12 CHECK SCB CIRCUIT FOR SHORT TO PWR IN HARNESS

- Key on, engine off.
- Measure voltage between SCB circuit at the PCM harness connector and chassis ground.

Is voltage less than 1.0 volts?

Yes	No
KEY OFF. REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	KEY OFF. REPAIR short circuit to VPWR.

KJ13 LACK OF POWER (LOW BOOST) - CHECK VACUUM HOSES

- Check for holes or cracks in the vacuum hose/tube between the supercharger bypass actuator and the supercharger bypass solenoid.
- Check for holes or cracks in the vacuum hose/tube between the supercharger bypass solenoid and vacuum reservoir assembly.
- Check for bends or kinks in the vacuum hose/tube between the supercharger bypass actuator and the supercharger bypass solenoid.
- Check for bends or kinks in the vacuum hose/tube between the supercharger bypass solenoid and vacuum reservoir assembly.
- Check for disconnect hose(s) between the supercharger bypass actuator, supercharger bypass solenoid and vacuum reservoir assembly.

Are any leaks (holes or cracks) or restrictions (bends or kinks) in the vacuum hose(s) present?

Yes	No
REPAIR or REPLACE vacuum hose(s)/tube as necessary.	RETURN to <u>Section 3</u> , Symptom Chart 8 for Lack/Loss of Power.

KL: Shift Indicator Lamp (SIL) Introduction

KL: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Harness circuit: SIL
- Top gear switch
- SIL dimmer relay
- SIL bulb and SIL circuit fuse
- Powertrain Control Module (PCM) (12A650)

Pinpoint Test Schematic

Escort ZX2

KL: Pinpoint Tests →

KL: Shift Indicator Lamp (SIL)

← KL: Introduction

KL1 CHECK SHIFT INDICATOR LAMP (SIL) OPERATION

Note: When the SIL is operating properly, it comes on when optimum shift speed is reached. The SIL will turn off after a shift has been completed or while in top gear.

- Drive vehicle through all forward gears.
- Look for the SIL to come on before the next upshift.
- Look for the SIL to be off after a shift has been completed or while in top gear.

Is SIL on all the time?

Yes	No
KEY OFF. GO to KL4 .	KEY OFF. GO to KL2 .

KL2 CHECK SIL CIRCUIT FUSE

- Remove SIL circuit fuse and inspect.

Is fuse OK?

Yes	No
INSTALL SIL circuit fuse. GO to KL3 .	REPAIR short circuit. REPLACE SIL circuit fuse.

KL3 CHECK SIL BULB

- Remove SIL bulb and inspect.

Is SIL bulb OK?

Yes	No
GO to KL5 .	REPLACE SIL bulb.

KL4 CHECK SIL CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Shift transmission to highest gear.
- Disconnect PCM.
- Measure resistance between SIL circuit at PCM harness connector and battery negative post.

Is resistance greater than 10,000 ohms?

Yes	No

REPLACE PCM (refer to Section 2, [Flash Electrically Erasable Programmable Read Only Memory \(EEPROM\)](#)).

REPAIR short circuit.

KL5 CHECK IGN START/RUN VOLTAGE TO SIL SOCKET

- SIL bulb removed.
- Transmission in any gear except top gear.
- Key on, engine off.
- Measure voltage of the SIL circuit between the SIL socket and chassis ground.

Is the voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to KL7 .	KEY OFF. RECONNECT SIL bulb. GO to KL6 .

KL6 CHECK OPERATION OF TOP GEAR SWITCH

- Transmission in any gear except top gear.
- Disconnect top gear switch.
- Measure resistance of the top gear switch.

Is resistance less than 5.0 ohms?

Yes	No
REPAIR open circuit.	REPLACE top gear switch.

KL7 CHECK SIL CIRCUIT FOR OPEN IN HARNESS

- SIL bulb removed.
- Disconnect PCM.
- Measure resistance between SIL circuit at PCM harness connector and SIL bulb socket.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR open circuit.

KM: A/C Clutch Relay, A/C Circuits Introduction

KM: Pinpoint Tests →

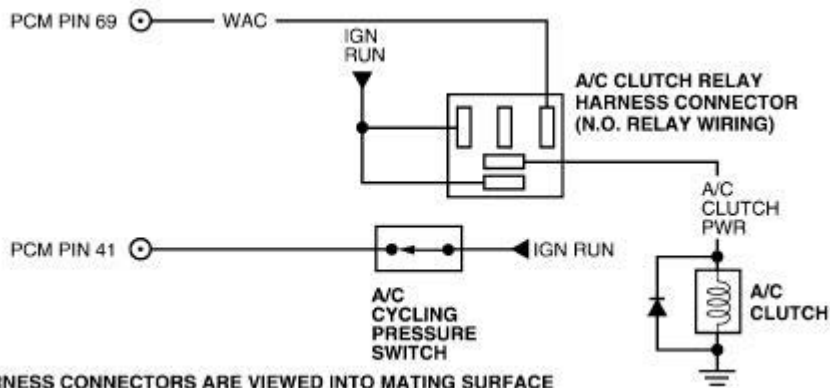

Note

This Pinpoint Test is intended to diagnose the following:

KM: Pinpoint Tests →

KM: A/C Clutch Relay, A/C Circuits

← KM: Introduction

KM1 KOEO/KOER DTC P1460: VERIFY ACCS PID IS OFF

Note: Verify A/C and defrost were off during KOEO/KOER Self-Tests. If the vehicle is not equipped with A/C, the WOT A/C Cutoff (WAC) circuit is not used and the DTC P1460 can be ignored.

- Start engine.
- A/C and defroster off.
- Access ACCS PID.

Is the ACCS PID off?

Yes	No
KEY OFF. GO to KM2 .	ACCS input to PCM is requesting A/C. REFER to the Climate Control System — General Information, Section 412-00, in the Workshop Manual to diagnose symptom (A/C always on).

KM2 CHECK VPWR VOLTAGE TO A/C CLUTCH RELAY

- Disconnect A/C clutch relay.
- Key on, engine off.
- Measure VPWR circuit voltage at the A/C clutch relay harness connector.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to KM3 .	<p>For LS6/LS8 :</p> <p>GO to B5.</p> <p>All others :</p> <p>REPAIR open circuit. START engine. Turn A/C on, WAIT 15 seconds. A/C off. RERUN Quick Test.</p>

KM3 CHECK A/C CLUTCH RELAY

- Refer to pin numbers molded on A/C clutch relay. There will be either a Pin 1 or Pin 85.
- Measure resistance between either Pin 1 or Pin 85 and all other pins of the A/C clutch relay. One measurement must be between 40 and 120 ohms, with the other measurements being greater than 10,000 ohms.

Are all resistance checks OK?

Yes	No
GO to KM4 .	REPLACE A/C clutch relay. START engine. TURN A/C on, WAIT 15 seconds. A/C off. RERUN Quick Test.

KM4 CHECK WAC CIRCUIT FOR SHORT TO POWER IN HARNESS

- Disconnect PCM.
- Key on, engine off.
- Measure voltage between WAC circuit at A/C clutch relay vehicle harness connector and ground.

Is voltage less than 1.0 volt?

Yes	No
KEY OFF. GO to KM5 .	REPAIR short circuit. START engine. Turn A/C on, WAIT 15 seconds. A/C off. RERUN Quick Test.

KM5 CHECK WAC CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect scan tool from DLC.
- Measure resistance between WAC circuit at A/C clutch relay vehicle harness connector and ground.

Is resistance greater than 10,000 ohms?

Yes	No
GO to KM6 .	REPAIR short circuit. START engine. Turn A/C on, WAIT 15 seconds. A/C off. RERUN Quick Test.

KM6 CHECK WAC CIRCUIT FOR OPEN IN HARNESS

Note: Refer to the PCM pin numbers at the beginning of this pinpoint test.

- Measure resistance of WAC circuit between PCM harness connector and the A/C clutch relay harness connector.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)). START engine. Turn A/C on, WAIT 15 seconds. A/C off. RERUN Quick Test.	REPAIR open circuit. START engine. Turn A/C on, WAIT 15 seconds. A/C off. RERUN Quick Test.

KM10 ACCS PID OFF WITH A/C ON: VERIFY A/C CLUTCH IS GETTING POWER

- Start engine.
- While listening for A/C clutch to engage, turn A/C on (if clutch cannot be heard, disconnect A/C clutch and connect a non-powered test lamp to A/C clutch PWR and ground circuit to check for power).

Does the A/C clutch engage (or the light turn on)?

Yes	No
Power is getting to A/C clutch, but ACCS PID is OFF. GO to KM11 .	The ACCS PID is OFF because power is not getting to the A/C clutch. This is not a cause of the low idle symptom. RETURN to Section 3 to continue low idle diagnosis, or REFER to the Climate Control System — General Information, Section 412-00, in the Workshop Manual to diagnose A/C system concerns.

KM11 CHECK ACCS CIRCUIT FOR OPEN IN HARNESS

- Disconnect PCM.
- Disconnect A/C clutch.
- Measure resistance between Pin 41 at the PCM harness connector and the A/C clutch power circuit at the A/C clutch harness connector.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE PCM (REFER to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR open circuit.

KM19 DTC P1464: CHECK ACCS PID

Note: Verify A/C and defrost were off during Self-Test. If A/C or defrost were on, turn off and rerun Self-Test.

- Key on, engine off.
- A/C and defrost off.
- Access ACCS PID.

Is ACCS PID on?

Yes	No
<p>E-Series (except 4.2L):</p> <p>GO to KM20.</p> <p>All others:</p> <p>ACCS input to PCM is requesting A/C. REFER to the Climate Control System — General Information, Section 412-00, in the Workshop Manual to diagnose symptom (A/C always on).</p>	The ACCS PID indicates that the ACCS input to the PCM is low. VERIFY test results. With A/C and defrost off, RERUN Self-Test where P1464 was received.

KM20 ACCS PID ON: DISCONNECT A/C CYCLING SWITCH AND CHECK IF ACCS PID TURNS OFF

- Disconnect A/C cycling switch.
- Key on, engine off.
- Access ACCS PID.

Is ACCS PID off?

Yes	No
VERIFY operation of A/C demand switch. REFER to the Climate Control System, General Information Section 412-00 in the Workshop Manual. If OK, REPAIR short to power in A/C Demand circuit to A/C cycling switch.	KEY OFF. GO to KM21 .

KM21 CHECK ACCS CIRCUIT FOR SHORT TO POWER IN HARNESS

- Disconnect PCM.
- Key on.
- Measure voltage between PCM harness connector pin 41 and ground.

Is voltage less than 1.0 volt?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR short circuit.

KM30 CONTINUOUS MEMORY DTC P1460: CHECK WAC CIRCUIT FOR INTERMITTENT SHORT TO GROUND

Note: If the vehicle is not equipped with A/C, the WAC circuit is not used and the P1460 can be ignored.

Note: Refer to the beginning of this pinpoint test for PCM pin numbers.

- Key on, engine off.
- Check WAC circuit for short to ground while completing the following (the A/C clutch will click on when a fault is detected):
 - Shake, wiggle and bend the WAC circuit between the PCM and the A/C clutch relay.
 - Lightly tap on the A/C clutch relay (to simulate road shock).

Is a fault indicated?

Yes	No
KEY OFF. ISOLATE fault and REPAIR as necessary. COMPLETE PCM Reset to clear DTCs. START engine. Turn A/C on, WAIT 15 seconds. A/C off. RERUN Quick Test.	GO to KM31 .

KM31 CHECK WAC CIRCUIT FOR INTERMITTENT OPEN OR SHORT TO POWER

- Key on, engine off.
- Access Output Test Mode on scan tool.
- Turn outputs on.
- Check WAC circuit for open or short to power while completing the following (the A/C clutch will click off when a fault is detected):
 - Shake, wiggle and bend the WAC circuit between the PCM and the A/C clutch relay.
 - Shake, wiggle and bend the VPWR circuit to the A/C clutch relay.
 - Lightly tap on the A/C clutch relay (to simulate road shock).

Is a fault indicated?

Yes	No
KEY OFF. ISOLATE fault and REPAIR as necessary. COMPLETE PCM Reset to clear DTCs. START engine. Turn A/C on, WAIT 15 seconds. A/C off. RERUN Quick Test.	KEY OFF. Unable to duplicate or identify fault at this time. GO to <u>Z1</u> .

KP: Charge Air Cooler Pump (CAC) Introduction

KP: Pinpoint Tests →

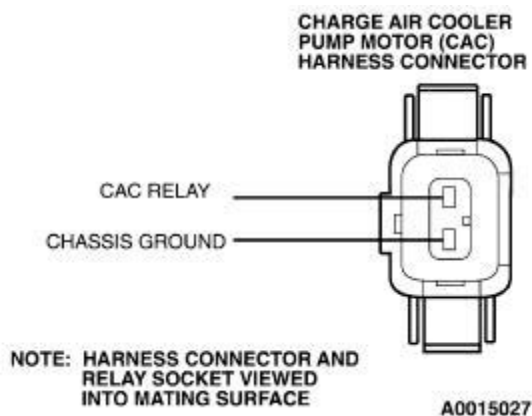

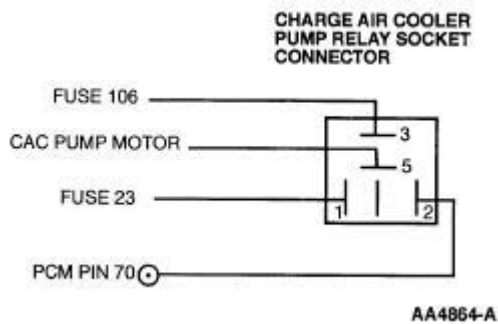

Note

This Pinpoint test is intended to diagnose the following:

- Charge Air Cooler Pump Relay (148192)
- Charge Air Cooler Pump Motor (8501)
- Harness circuits: CAC, Fuse 23, Fuse 106, vehicle power (VPWR) and power ground (PWR GND)

Pinpoint Test Schematics and Connector

5.4L Lightning

KP: Charge Air Cooler Pump (CAC)

← KP: Introduction

KP1 P1229: CHECK POWER FEED TO CAC PUMP RELAY COIL

- Check Fuse 23.

Is the fuse OK?

Yes	No
GO to <u>KP2</u> .	CHECK Circuit 391 and 369 for short to ground.

KP2 CHECK POWER FEED TO CAC PUMP RELAY

- Check Fuse 106.

Is the fuse OK?

Yes	No
GO to <u>KP3</u> .	CHECK Circuit 17 and 18 for short to ground.

KP3 CHECK INTEGRITY OF CAC PUMP GROUND CONNECTION

- Disconnect the CAC pump.
- Measure the resistance between chassis ground circuit at the CAC pump connector and battery negative post.

Is the resistance less than 2 ohms?

Yes	No
GO to <u>KP4</u> .	CHECK the tightness of the ground lug. If tight check wire back to the CAC connector.

KP4 CHECK CAC PUMP MOTOR RESISTANCE

- Disconnect the CAC pump motor.
- Measure the resistance between the pins at the CAC connector to the pump motor.

Is the resistance less than 10 ohms?

Yes	No
GO to <u>KP5</u> .	REPLACE CAC pump motor.

KP5 CHECK CAC PUMP RELAY

- Remove relay from power distribution box.
- Measure resistance between pin 1 or 2 and all other pins. One reading must be between 65-90 ohms and all other readings must be greater than 10K ohms.

Are resistance checks OK?

Yes	No
GO to <u>KP6</u> .	REPLACE CAC pump relay.

KP6 CHECK FOR OPEN CAC CIRCUIT BETWEEN PCM AND CAC RELAY

Note: Refer to PCM Pin numbers in the beginning of this pinpoint test.

- Key off.
- Disconnect the PCM and the CAC pump relay.
- Measure the resistance of the CAC circuit at the PCM harness connector and pin 2 of the relay socket.

Is the resistance less than 5 ohms?

Yes	No
GO to <u>KP7</u> .	REPAIR open circuit.

KP7 CHECK CAC CIRCUIT BETWEEN PCM AND CAC RELAY FOR SHORT TO GROUND

- Key off.
- Measure the resistance of the CAC circuit at the PCM harness connector and the battery negative post.

Is the resistance greater than 10K ohms?

Yes	No
GO to <u>KP8</u> .	REPAIR short to ground condition.

KP8 CHECK CAC CIRCUIT BETWEEN PCM AND CAC RELAY FOR SHORT TO POWER

- Key on, engine off.
- Remove CAC pump relay.
- Measure the voltage between the CAC circuit at the PCM harness connector and the battery negative post.

Is the voltage less than 0.05 volt?

Yes	No

GO to KP9.

REPAIR short to B+.

KP9 CHECK FOR OPEN CIRCUIT BETWEEN CAC PUMP RELAY COIL AND POWER FEED

- Remove the CAC pump relay and fuse 23.
- Measure the resistance between relay socket pin 1 and fuse 23 (load side).

Is resistance less than 5 ohms?

Yes	No
GO to <u>KP10</u> .	REPAIR open circuit.

KP10 CHECK FOR OPEN POWER FEED CIRCUIT AT CAC PUMP MOTOR RELAY

- Remove CAC Pump Relay and fuse 106 from their sockets.
- Measure resistance between relay socket pin 3 and load side of fuse socket.

Is resistance less than 5 ohms?

Yes	No
GO to <u>KP11</u> .	REPAIR open circuit.

KP11 CHECK FOR OPEN CAC CIRCUIT BETWEEN CAC, CAC PUMP RELAY AND PUMP MOTOR

- Disconnect the CAC pump motor.
- Measure resistance between relay socket pin 5 and the CAC harness connector.

Is the resistance less than 5 ohms?

Yes	No
Replace CAC RELAY, FUSE 23, AND FUSE 106. GO to <u>KP12</u> .	REPAIR open circuit.

KP12 CHECK STATUS OF PID

- Key on, engine off.
- Access SCIPC PID.

Does the SCIPC indicate PID on?

Yes	No
If the CAC reservoir is full, no air flow blockage at the CAC radiator, the IAT 2 and	

connecting circuits are not high resistance or open circuited, intercooler hoses are not reversed and DTC P1229 is present in KOEO and KOER, then REPLACE PCM.

Unable to duplicate or identify fault at this time. GO to Z1.

KQ: Thermostat Heater Control (THTRC) Introduction

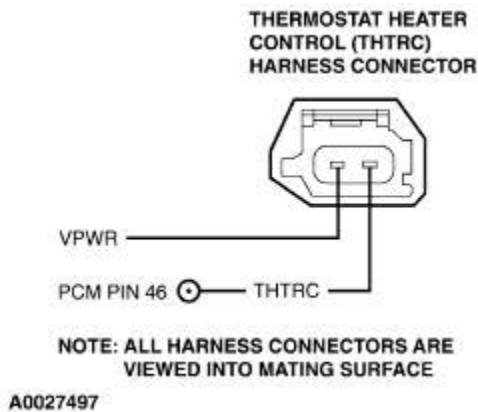

KQ: Pinpoint
Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Thermostat (8575)
- Harness circuits: THTRC and VPWR
- Powertrain Control Module (PCM) (12A650)

Pinpoint Test Schematic and Connector

KQ: Pinpoint Tests →

KQ: Thermostat Heater Control (THTRC)

← KQ: Introduction

KQ10 DTC P1432: CHECK VPWR AT THTRC HARNESS CONNECTOR

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect the thermostat harness connector.
- Key on.
- Measure VPWR circuit voltage at THTRC harness connector.

Is the voltage reading greater than 10.5 volts?

Yes	No
KEY OFF. GO to KQ11 .	KEY OFF. REPAIR VPWR circuit.

KQ11 CHECK THERMOSTAT RESISTANCE

- Measure resistance of the thermostat at the two pin terminal connector.

Is resistance between 14.0 and 16.0 ohms?

Yes	No
GO to KQ12 .	REPLACE thermostat.

KQ12 CHECK THTRC CIRCUIT FOR OPEN IN HARNESS

- Disconnect PCM.
- Measure resistance between THTRC circuit between PCM harness connector pin and the THTRC harness connector.

Is the resistance less than 5.0 ohms?

Yes	No
GO to KQ13 .	REPAIR open circuit.

KQ13 CHECK THTRC CIRCUIT FOR SHORT TO GROUND OR VPWR IN HARNESS

- Measure resistance between THTRC PCM pin and PCM pins VPWR, SIG RTN and PWR GND.

Is each resistance greater than 10,000 ohms?

Yes	No
For Continuous DTC P1432 only, GO to Z1.	REPAIR short to GND or VPWR.

For KOEO or KOER DTC P1432, REPLACE
PCM.

NB: Malfunction Indicator Lamp (MIL) Introduction

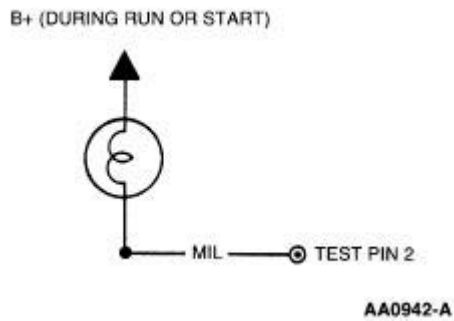

NB: Pinpoint
Tests →

Note

This Pinpoint Test is intended to diagnose only the following:

- Malfunction Indicator Lamp (MIL) circuit
- Powertrain Control Module (PCM)
- Fuse

Pinpoint Test Schematic

NB: Pinpoint Tests →

NB: Malfunction Indicator Lamp (MIL)

← NB: Introduction

NB1 MALFUNCTION INDICATOR LAMP (MIL) ALWAYS ON: CHECK MIL CIRCUIT FOR SHORTS TO GROUND IN HARNESS

Note: If vehicle will not start, GO to A1.

- If any Key On Engine Off or Continuous Memory Diagnostic Trouble Codes are present, repair before proceeding.
- Disconnect PCM.
- Measure resistance between PCM harness connector Pin 2 and PCM harness connector Pin 51 or 103.

Is resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPAIR short circuit.

NB2 MALFUNCTION INDICATOR LAMP (MIL) NEVER ON

Note: If vehicle will not start, GO to A1.

- Key on, engine off.
- Measure voltage from battery negative post to Ground side of the MIL fuse. Refer to the Wiring Diagram Manual for the specific location of the MIL fuse.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to <u>NB4</u> .	KEY OFF. GO to <u>NB3</u> .

NB3 CHECK B+ VOLTAGE TO FUSE

- Key on, engine off.
- Measure voltage from battery negative post to B+ side of the fuse.

Is voltage greater than 10.5 volts?

Yes	No
REPLACE the fuse. VERIFY repair by turning ignition key to the on position.	KEY OFF. REFER to the Wiring Diagrams to repair power distribution (to the fuse) from the Power Distribution Box.

NB4 CHECK VOLTAGE ON THE B+ CIRCUIT

Note: Refer to the Wiring Diagrams for connector location.

- Disconnect Instrument Cluster harness connector.
- Key on, engine off.
- Measure voltage of B+ circuit between the Instrument Cluster harness connector and battery negative post.

Was voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to NB5 .	REPAIR open circuit.

NB5 CHECK FOR OPEN MIL CIRCUIT BETWEEN PCM AND INSTRUMENT CLUSTER

- Disconnect PCM.
- Measure resistance between PCM harness connector Pin 2 and MIL circuit at the instrument cluster connector.

Is resistance less than 5.0 ohms?

Yes	No
REFER to Instrumental Cluster, Section 413-01 in the Workshop Manual to diagnose Instrument Cluster and Bulb. If OK, REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)). VERIFY the repair by turning key to the ON position.	REPAIR open circuit. VERIFY repair by turning key to the ON position.

NC: Ignition Engine Speed Input Circuit Introduction

NC: Pinpoint

This Pinpoint Test is intended to diagnose the following:

- Powertrain Control Module (PCM) (12A650)

NC: Pinpoint Tests →

NC: Ignition Engine Speed Input Circuit

← NC: Introduction

NC1 DTC P0320: ERRATIC IGNITION

Note: Verify all 2-way radio installations. Carefully follow manufacturer's installation instructions regarding the routing of antenna and power leads.

Are any faults present?

Yes	No
REPAIR as necessary.	For No Starts: GO to <u>A1</u> . For Intermittent Faults: GO to <u>Z1</u> . All others: Loss of PIP. GO to <u>JD1</u> .

ND: Engine RPM/Vehicle Speed Limiter

ND1 DTC P1270: EXCESSIVE ENGINE RPM/VEHICLE SPEED

Check for:

- Water, ice, mud and snow causing wheel slippage.
- Excessive engine rpm in NEUTRAL.
- Vehicle driven at high rate of speed.

Was the vehicle operating in any of the above conditions?

Yes	No
OBD II system is OK. RETURN vehicle to customer with information about DTC P1270.	GO to Section 3 , Symptom Charts if there are other driveability concerns. If there are no other symptoms, RETURN vehicle to customer.

QA: Unable To Activate Self-Test/SCP Communication Error/DTC Not Listed Introduction

QA: Pinpoint Tests →

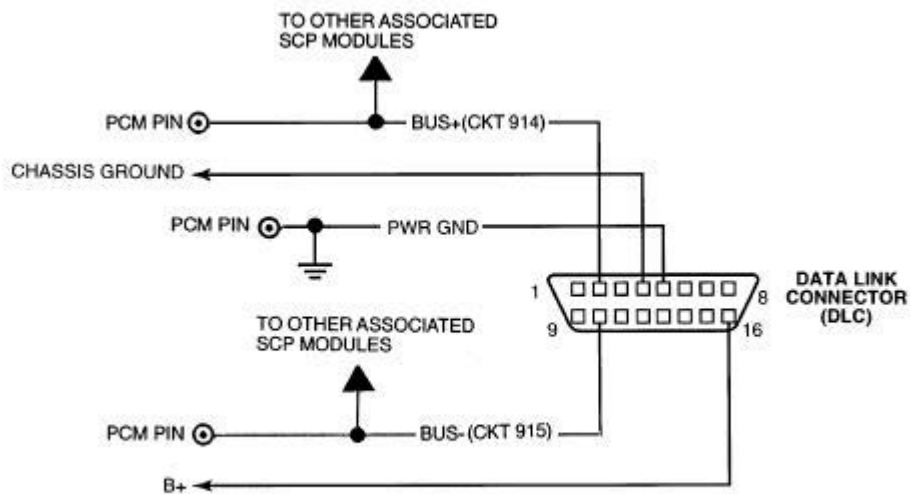

Note

This Pinpoint Test is intended to diagnose the following:

- Standard corporate protocol (SCP) communication bus harness circuits: BUS+, BUS-, between DLC and PCM
- Data link connector harness circuits: chassis ground, power ground (PWR GND), battery positive voltage (B+)
- Powertrain control module (PCM) (12A650)

Note: Concerns found that affect the entire network are referred to in the Module Communication Network, Section 418-00 in the Workshop Manual.

Pinpoint Test Schematics and Connectors

NOTE: ALL HARNESS CONNECTORS ARE VIEWED INTO MATING SURFACE

AA0934-C

PCM CONNECTOR PIN NUMBERS

Application	BUS (+)	BUS (-)	PWR GND

All Others	16	15	51,77,103

QA: Unable To Activate Self-Test/SCP Communication Error/DTC Not Listed

← QA: Introduction

QA1 VERIFY SELF-TEST PROCEDURE

- This pinpoint test addresses the following concerns:
 - Unable to access Continuous Memory DTCs.
 - Unable to activate KOEO Self-Test.
 - Unable to activate KOER Self-Test.
 - Scan tool communication concern.
 - DTC displayed by scan tool not listed.
 - Power Take Off (PTO), if equipped.
 - DTC P1001 KOER Self-Test cannot be completed.
- Possible causes:
 - Damaged DLC.
 - Incorrect Self-Test procedure.
 - VREF is not in specification.
 - Idle rpm out of specification.
 - Open in DLC harness circuit.
 - Short in DLC harness circuit or associated modules.
 - Damaged PCM power relay circuit.
 - Damaged PCM.
 - PTO circuit, if equipped.
- Disconnect scan tool from DLC. Inspect vehicle and scan tool DLC for damage. Repair as necessary.
- PTO switch/actuator in OFF position.
- Verify that the correct procedure was used to activate CONT, KOEO or KOER Self-Test for the scan tool (refer to Section 2, [Diagnostic Methods](#)).

Was the correct Self-Test procedure used?

Yes	No
Correct procedure was used for activating Self-Test. GO to QA2 .	Correct procedure was not used for activating Self-Test. RETURN to Section 3 , Symptom Charts, Step 1: PCM Quick Test, and COMPLETE Self-Test using the correct procedure.

QA2 CHECK VREF VOLTAGE TO TP SENSOR

- Disconnect throttle position (TP) sensor.

Note: GO to Pinpoint Test [DH](#) and refer to **Pinpoint Test Schematics and Connectors** for TP harness connector pin-out information.

- Key on, engine off.
- Measure voltage between VREF and SIG RTN circuits at the TP sensor harness connector.

Note: Loss of VREF caused by an open or short to power or ground can cause a SCP link communication error and/or unable to self-test.

Is the voltage between 4.0 and 6.0 volts?

Yes	No
Voltage is in specification. GO to QA3 .	Voltage is not in specification. RECONNECT the TP sensor. GO to C1 .

QA3 CHECK LINK COMMUNICATION WITH TP SENSOR DISCONNECTED

- TP sensor disconnected.
- Scan tool connected.
- Key on, engine off.
- Attempt to access TP V PID.

Note: If TP V PID cannot be accessed. GO to [QA4](#).

- Reconnect TP sensor while monitoring PID.

Does scan tool communication error occur only when TP sensor is reconnected?

Yes	No
VREF shorted to SIG RTN in the sensor. REPLACE TP sensor.	GO to QA4 .

QA4 ABILITY TO ACCESS CONTINUOUS MEMORY DTCs

Can Continuous Memory DTCs be accessed?

Yes	No
GO to QA5 .	UNABLE to access Continuous Memory DTCs. KEY OFF. GO to QA8 .

QA5 ABILITY TO ACTIVATE KOEO SELF-TEST

Can KOEO Self-Test be activated?

Yes	No
GO to QA6 .	UNABLE to activate KOEO Self-Test. GO to QA7 .

QA6 ABILITY TO ACTIVATE KOER SELF-TEST

Can KOER Self-Test be completed?

Yes	No
If here for P1001 and other KOER DTCs are	

present, GO to Section 4, [Diagnostic Trouble Code \(DTC\) Charts and Diagnostic Trouble Code \(DTC\) Descriptions](#), for Pinpoint Test direction. Begin diagnosis with the first KOER DTC outputted. If the DTC is not listed in the (DTC) Charts, CHECK that the correct PCM is installed in the vehicle. Also CHECK for a Technical Service Bulletin (TSB) or OASIS message that indicates a PCM change or calibration (flash) update.

UNABLE to activate or complete KOER Self-Test. GO to [QA7](#).

QA7 RETRIEVE ANY CONTINUOUS MEMORY DTCs

NOTE 1: If failures are present in the following components or systems, this can prevent the Electronic EC strategy from completing Self-Test or cause the PCM to generate a scan tool communication error message: idle speed control; EGR system; fuel control system; electronic secondary air system; vehicle speed sensor circuits; mass air flow sensor circuits; transmission range sensor circuits.

NOTE 2: For information on retrieving MIL and non-MIL DTCs, refer to Section 2, [Quick Test](#), Continuous Memory Self-Test.

- Key on, engine off.
- Retrieve and record all Continuous Memory DTCs (MIL and non-MIL).
- Key off.

Were any Continuous Memory DTCs present?

Yes	No
Continuous Memory DTCs are present. GO to Section 4, Diagnostic Trouble Code (DTC) Charts and Diagnostic Trouble Code (DTC) Discriptions , for Pinpoint Test direction.	UNABLE to retrieve any Self-Test DTCs. GO to QA8 .

QA8 CHECK B+ VOLTAGE TO DATA LINK CONNECTOR (DLC)

- Disconnect scan tool from DLC.
- Inspect the DLC for damage. Repair as necessary.
- Measure voltage between B+ circuit cavity at the DLC and ground.

Is voltage greater than 10.5 volts?

Yes	No
GO to QA9 .	REPAIR open in DLC B+ circuit.

QA9 CHECK DLC CHASSIS GROUND CIRCUIT FOR OPEN HARNESS

- Measure resistance between chassis ground circuit at the DLC and chassis ground.

Is resistance less than 5.0 ohms?

Yes	No
-----	----

GO to [QA10](#).

REPAIR open circuit.

QA10 CHECK DLC PWR GND CIRCUIT FOR OPEN IN HARNESS

- Measure resistance between PWR GND circuit at the DLC and battery negative post.

Is resistance less than 5.0 ohms?

Yes	No
GO to QA11 .	REPAIR open circuit.

QA11 DATA LINK DIAGNOSTIC NETWORK TEST

- Connect scan tool.
- Key on, engine off.
- Run Data Link Diagnostics.
- NOTE: If scan tool does not have Data Link Diagnostic Network Test capability, GO to [QA21](#).
- Typical PCM network error messages:
 - PCM: NO RESPONSE/NOT EQUIPPED
 - PCM: NO RESPONSE CKT914 (BUS+)
 - PCM: NO RESPONSE CKT915 (BUS-)

Are any PCM network error messages displayed?

Yes	No
GO to QA12 .	Data Link passed. RERUN Quick Test.

QA12 NETWORK TEST RESULT — CIRCUIT 914 (BUS+) AND CIRCUIT 915 (BUS-)

- Check the DATA LINK DIAGNOSTIC Network Test Results.
- Typical ECU network error messages:
 - CKT914=ALL MODULE NO RESP/NOT EQUIP
 - CKT915=ALL MODULE NO RESP/NOT EQUIP

Are there any messages indicating "ALL ECU modules are not responding" displayed?

Yes	No
Only BUS(+) CKT914=ALL MODULE NO RESP/NOT EQUIP. GO to QA13 . Only BUS(-) CKT915=ALL MODULE NO RESP/NOT EQUIP. GO to QA16 . Both BUS(+) CKT914 and BUS(-) 915=ALL MODULE NO RESP/NOT EQUIP. GO to QA21 .	CKT914=SOME MODULE NO RESP/NOT EQUIP, PCM: NO RESPONSE ON CKT914 (BUS+). GO to QA15 . CKT915=SOME MODULE NO RESP/NOT EQUIP, PCM: NO RESPONSE ON CKT915 (BUS-). GO to QA18 .

QA13 CHECK BUS+ FOR SHORT TO GROUND IN HARNESS

- Key off.

- Disconnect PCM.
- Measure resistance of BUS+ circuit between PCM harness connector pin and chassis ground.

Is resistance greater than 50 ohms?

Yes	No
GO to QA14 .	REPAIR short circuit. Note: Short circuit can exist in harness or associated modules. REFER to Module Communication Network, Section 418-00 in Workshop Manual for further diagnosis.

QA14 CHECK BUS+ CIRCUIT FOR SHORT TO B+ IN HARNESS

- Key on, engine off.
- Measure voltage between BUS+ circuit at the PCM harness connector pin and chassis ground.

Is the voltage greater than 1.0 volt?

Yes	No
REPAIR short circuit. Note: Short circuit can exist in harness or associated modules. REFER to Module Communication Network, Section 418-00 in Workshop Manual for further diagnosis.	GO to QA15 .

QA15 CHECK DLC BUS+ CIRCUIT FOR OPEN IN HARNESS

- Key off.
- Disconnect PCM.
- Measure resistance of BUS+ circuit between PCM harness connector pin and BUS+ circuit at the DLC.

Is resistance less than 5.0 ohms?

Yes	No
GO to QA19 .	REPAIR open circuit.

QA16 CHECK BUS- FOR SHORT TO GROUND IN HARNESS

- Key off.
- Disconnect PCM.
- Measure resistance of BUS+ circuit between PCM harness connector pin and chassis ground.

Is resistance greater than 50 ohms?

Yes	No
	REPAIR short circuit.

GO to [QA17](#).

Note: Short circuit can exist in harness or associated modules. REFER to Module Communication Network, Section 418-00 in Workshop Manual for further diagnosis.

QA17 CHECK BUS- CIRCUIT FOR SHORT TO B+ IN HARNESS

- Key on, engine off.
- Measure voltage between BUS- circuit at the PCM harness connector pin and chassis ground.

Is the voltage greater than 6.0 volts?

Yes	No
REPAIR short circuit. Note: Short circuit can exist in harness or associated modules. REFER to Module Communication Network, Section 418-00 in Workshop Manual for further diagnosis.	GO to QA18 .

QA18 CHECK DLC BUS- CIRCUIT FOR OPEN IN HARNESS

- Key off.
- Disconnect PCM.
- Measure resistance of BUS- circuit between PCM harness connector pin and BUS- circuit at the DLC.

Is resistance less than 5.0 ohms?

Yes	No
GO to QA19 .	REPAIR open circuit.

QA19 POWER TAKE OFF (PTO) APPLICATIONS

Is the vehicle equipped with a Power Take Off?

Yes	No
GO to QA20 .	Vehicle is not equipped with PTO. REPLACE PCM. (Refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM) .)

QA20 CHECK PTO ON/OFF INPUT

- Key on, engine off.
- Measure the voltage between PCM harness connector Pin 4 and chassis ground while cycling the PTO switch/actuator.

Does the voltage cycle greater than 1.0 volt with the PTO on, and less than 1.0 volt with the PTO

off?

Yes	No
PTO circuit is OK. REPLACE PCM. (Refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u> .)	PTO circuit is not OK. GO to <u>FB1</u> for further diagnosis.

QA21 CHECK FOR BUS+ SHORT TO BUS-

- Key off.
- Disconnect PCM.
- Measure resistance between BUS+ and BUS- circuits at the PCM harness connector.

Is resistance greater than 5.0 ohms?

Yes	No
GO to <u>QA22</u> .	REPAIR short circuit. Note: A short circuit can exist in the harness or associated SCP modules. REFER to Module Communication Network, Section 418-00, in the Workshop Manual for further diagnosis.

QA22 CHECK FOR OPEN BUS+/- OPEN IN HARNESS

- Measure resistance of BUS+ circuit between PCM harness connector pin and BUS+ circuit at the DLC.
- Measure resistance of BUS- circuit between PCM harness connector pin and BUS- circuit at the DLC.

Are both resistances less than 5.0 ohms?

Yes	No
For scan tools with Data Link Diagnostic Network Test capability, GO to <u>QA19</u> . For scan tools without Data Link Diagnostic Network Test capability, REFER to Module Communication Network, Section 418-00, in the Workshop Manual for further diagnosis. NOTE: If after completing Workshop Manual diagnosis and referred back to PC/ED. REPLACE PCM.	REPAIR open circuit.

QB: Diagnostic Trouble Code (DTC) P0603/P1605/P1633 Introduction

QB: Pinpoint
Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Battery terminal condition
- Keep Alive Power (KAPWR) wire routing
- Harness circuit: KAPWR
- Powertrain Control Module (PCM) (12A650)

Pinpoint Test Schematics and Connectors

QB: Pinpoint Tests →

QB: Diagnostic Trouble Code (DTC) P0603/P1605/P1633

← QB: Introduction

QB1 CHECK BATTERY TERMINALS

Note: If KAPWR is interrupted to the PCM (that is, when a breakout box is installed or the battery is disconnected), DTC P0603/P1605 can be generated on the first power-up.

- Inspect the battery cables for loose connections, corrosion.

Are the battery terminal connections in good condition?

Yes	No
KEY OFF. Battery terminals are OK. GO to QB2 .	REPAIR battery terminals as necessary.

QB2 INSPECT ENGINE COMPARTMENT FOR PROPER WIRE ROUTING

- Inspect Electronic Engine Control (EC) System wiring for proximity to ignition components or wires.

Is wiring too close to ignition components or wires?

Yes	No
REROUTE as necessary.	Engine compartment wire routing is OK. GO to QB3 .

QB3 CHECK KEEP ALIVE POWER (KAPWR) TO PCM

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Measure voltage between KAPWR circuit at the PCM harness connector and ground.
- While observing digital multimeter, grasp the Electronic EC harness and wiggle, shake or bend a small section while working from the PCM to the dash panel.

Does the voltage reading indicate less than 10.5 volts?

Yes	No
ISOLATE and REPAIR open circuit.	No open in KAPWR harness circuit detected. GO to QB4 .

QB4 CHECK FOR REPEAT OF DTC P0603/P1605/P1633

- Reconnect PCM.
- Start engine and allow it to reach operating temperature.
- Run Key On Engine Off Self-Test.
- Retrieve Continuous Memory DTCs.

Is DTC P0603, P1605 or P1633 present?

Yes	No
REPLACE the PCM.	REPAIR other DTCs as necessary. If none, testing is complete.

QC: OBD II Monitor Testing Not Complete - DTC P1000 Introduction

QC: Pinpoint
Tests →

Note

It is not necessary to clear DTC P1000 from the PCM by driving the vehicle unless it is requested by the customer to pass an inspection/maintenance test.

Inform the customer of the need for additional driving when required to pass an inspection/maintenance test.

Diagnostic Trouble Code (DTC) P1000 indicates that not all of the On Board Diagnostic II (OBD II) monitors have completed. In some states, this DTC must be cleared to pass an inspection/maintenance test. The customer should be informed that the law specifies additional city and highway driving must be done to complete the check of the On Board Diagnostic system. This additional driving must occur before the vehicle is tested at the inspection/maintenance station. The amount of driving required varies with individual driving patterns. To complete this requirement in the shortest amount of time, refer to Section 2, [Drive Cycles](#).

The only way a DTC P1000 can be removed from memory is when all the OBD II monitors have successfully completed.

DTC P1000 is set by the PCM with any of the following conditions:

- The vehicle is new from the factory and has not yet completed an OBD II Drive Cycle.
- The battery or PCM has been disconnected.
- An OBD II monitor failure had occurred before completion of an OBD II Drive Cycle.
- The PCM DTCs have been cleared with a scan tool as part of a repair process.

DTC P1000 cannot be cleared from the PCM when:

- The vehicle has a PTO and the circuit is shorted to VPWR or B+ or the PTO is on during testing.

QC: Pinpoint Tests →

QC: OBD II Monitor Testing Not Complete - DTC P1000

← QC: Introduction

QC1 DTC P1000: CHECK FOR OTHER DTCS

Note: Only perform this pinpoint test if a Diagnostic Trouble Code (DTC) P1000 was received from Continuous Memory. Ignore any DTC P1000s in KOEO or KOER.

DTC P1000 indicates that all of the OBD II monitors have not yet been successfully tested.

Were any other DTCs received with the P1000?

Yes	No
GO to Section 4, Powertrain Diagnostic Trouble Code (DTC) Charts , for Pinpoint Test direction and REPAIR other DTCs.	For vehicles with PTO: GO to QC2 . All others: GO to QC3 .

QC2 CHECK PTO PID

- Connect scan tool.
- Key on, engine running.
- Access PTO STAT PID.
- Cycle PTO switch/actuator ON and OFF (follow PTO aftermarket instructions).

Did PTO PID cycle ON, delay, then OFF?

Yes	No
PTO circuit is OK. GO to QC3 .	GO to FB1 .

QC3 REQUEST TO CLEAR DTC P1000

Note: A complete OBD II Drive Cycle has not yet been performed to clear the DTC P1000 from the PCM.

Has the customer requested the DTC P1000 be cleared from the PCM memory?

Yes	No
COMPLETE an OBD II Drive Cycle (REFER to Section 2, Drive Cycles).	INFORM the customer that if the law in this state requires additional driving in order to clear the DTC P1000 from the PCM memory, it must be completed before an inspection/maintenance test.

QD: Diagnostic Trouble Code (DTC) P1260 Introduction

QD: Pinpoint
Tests →

Note

This Pinpoint Test is intended to diagnose DTC P1260.

QD: Pinpoint Tests →

QD: Diagnostic Trouble Code (DTC) P1260

← QD: Introduction

QD1 CHECK FOR PATS DTCs

- Repair all Passive Anti-Theft (PATS) DTCs before P1260. (Refer to Workshop Manual, Anti-Theft Section 419-01 for System Description and Operation).

Have all PATS DTCs been diagnosed?

Yes	No
GO to QD2 .	REFER to Workshop Manual Anti-Theft Section 419-01 for DTC diagnosis.

QD2 CHECK FOR OTHER POWERTRAIN DTCs

- Repair all powertrain DTCs other than P1260.

Have all other powertrain DTCs been diagnosed?

Yes	No
GO to QD3 .	REFER to Section 4, Powertrain Diagnostic Trouble Code (DTC) Charts , for Pinpoint Test direction and REPAIR other DTCs.

QD3 ATTEMPT TO START ENGINE

- Complete Keep Alive Memory Reset to clear DTC P1260. Refer to Section 2, [Powertrain Control Module \(PCM\) Reset](#) for detail instructions.
- Attempt to start the engine.

Will the engine start?

Yes	No
<p>No system faults exist at present time. For intermittent No Starts or Start Stalls, CHECK for intermittent PATS faults. (PATS cannot stall the engine after 1 second of operation.) For intermittent stalls while driving, VERIFY scan tool-to-PCM communication during concern. If PCM communication error occurs, possible causes are:</p> <ul style="list-style-type: none"> • Loss of PWRS or GNDS to PCM • Faulty PCM PWR relay • Faulty EEC PWR diode • Shorted VREF signal <p>REPAIR as necessary. RETURN vehicle to</p>	<p>DTC P1260 is not the cause of the No Start. GO to Section 3, Symptom Charts to diagnose the No Start symptom.</p>

customer.

TA: Park/Neutral Position (PNP)/Clutch Pedal Position (CPP) Switches

Introduction

TA: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Clutch Pedal Position Switch (11A152)
- Park Neutral Position Switch (7A247)
- Harness circuits: CPP, PNP and SIG RTN
- Powertrain Control Module (PCM) (12A650)

Pinpoint Test Schematic

Ranger/Explorer

LS6

NOTE: ALL HARNESS CONNECTORS ARE VIEWED INTO MATING SURFACE

A0009693

TA: Park/Neutral Position (PNP)/Clutch Pedal Position (CPP) Switches

← TA: Introduction

TA1 CHECK CPP OR PNP SWITCH FUNCTION

P0704, P1709

Note: During KOEO Self-Test, clutch pedal must be down or gearshift lever in NEUTRAL.

- Key off.
- Connect scan tool.
- Key on, engine off.
- Access CPP/PNP PID and observe PID cycling ON/OFF with clutch pedal up, then down or gear shift lever in gear, then NEUTRAL.

Does reading change from ON to OFF?

Yes	No
Fault intermittent DISCONNECT PCM. INSPECT both ends of the connector for damaged or pushed out pins, corrosion, loose wires. REPAIR as necessary. If OK, REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	GO to <u>TA2</u> .

TA2 CHECK CPP OR PNP SWITCH RESISTANCE

- Key off.
- Locate the CPP switch or the PNP switch near the transmission shift linkage.
- Inspect switch and bracket for damage, bent or broken conditions. Repair as required.
- Disconnect CPP or PNP harness connector.
- Measure the CPP or PNP switch resistance with the clutch pedal down.

Is the resistance less than 5.0 ohms?

Yes	No
GO to <u>TA3</u> .	REPLACE the CPP or PNP switch.

TA3 CHECK CPP/PNP CIRCUIT FOR OPEN IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect scan tool.
- Disconnect PCM.
- Measure resistance of the (CPP/PNP) circuit between PCM harness connector pin and CPP or

PNP switch harness connector.

- Where applicable, measure resistance of the SIG RTN circuit between PCM harness connector pin and CPP or PNP switch harness connector.

Are both resistances less than 5.0 ohms?

Yes	No
GO to TA4 .	REPAIR open circuit.

TA4 CHECK CPP OR PNP CIRCUIT FOR SHORT TO SIG RTN OR CHASSIS GROUND IN HARNESS

- Measure resistance between CPP and SIG RTN circuits at the PCM harness connector.
- Measure resistance of CPP circuit between PCM harness connector pin and chassis ground.

Are both resistances greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR short circuit.

TA5 CHECK CPP/PNP SWITCH FUNCTION

P0704, P1705, P1709

Note: During Self Test, clutch pedal must be down and gearshift lever in NEUTRAL.

- Key off.
- Connect scan tool.
- Key on, engine off.
- Look for CPP/PNP PID cycling ON/OFF with:
 - Transmission in NEUTRAL, then shift into gear and the clutch pedal up.
 - Transmission in GEAR and the clutch pedal up then down.

Does reading change from ON to OFF for both switches?

Yes	No
Fault intermittent DISCONNECT PCM. INSPECT both ends of the connector for damaged or pushed out pins, corrosion and loose wires. REPAIR as necessary. If OK, REPLACE PCM (refer to Section 2, Flash	GO to TA6 .

Electrically Erasable Programmable Read Only Memory (EEPROM).

TA6 CHECK CPP/PNP SWITCHES RESISTANCE

- The CPP switch is near the clutch pedal and the PNP switch is near the transmission shift linkage.
- Inspect both switches and brackets for damage. Repair as required.
- Disconnect CPP and PNP harness connector.
- Measure CPP switch resistance with the clutch pedal down.
- Measure PNP switch resistance with the shift lever in NEUTRAL.

Is the resistance less than 5.0 ohms for both switches?

Yes	No
GO to <u>TA7</u> .	REPLACE damaged CPP or PNP switch.

TA7 CHECK CPP/PNP CIRCUIT FOR OPEN IN HARNESS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect scan tool.
- Disconnect PCM.
- Measure resistance of the SIG RTN circuit between PCM harness connector pin and CPP or PNP switch harness connector.
- Measure resistance of the CPP/PNP circuit between PCM harness connector pin and CPP or PNP switch harness connector.

Are both resistances less than 5.0 ohms?

Yes	No
GO to <u>TA8</u> .	REPAIR open circuit.

TA8 CHECK CPP/PNP CIRCUIT FOR SHORT TO SIG RTN OR CHASSIS GROUND IN HARNESS

- Measure resistance between CPP/PNP and SIG RTN circuits at the PCM harness connector.
- Measure resistance of CPP/PNP circuit between the PCM harness connector pin and chassis ground.

Are both resistances greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM).</u>)	REPAIR short circuit.

TB: Transmission Control Switch (TCS)/Transmission Control Indicator Lamp (TCIL) Introduction

TB: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Harness circuits: Transmission Control Indicator Lamp (TCIL) and transmission Control Switch (TCS)
- Powertrain Control Module (PCM) (12A650)

Pinpoint Test Schematics and Connectors

Cougar

LS6/LS8, Explorer/Mountaineer with 150pin PCM

E/F-Series, Expedition/Navigator, Excursion

A0013930

All Others

NOTE: ALL HARNESS CONNECTORS ARE VIEWED INTO MATING SURFACE

A0028394

TB: Pinpoint Tests ➔

TB: Transmission Control Switch (TCS)/Transmission Control Indicator Lamp (TCIL)

← TB: Introduction

TB1 CHECK TCS FUNCTION

DTC P1780

- Key on, engine off.
- Access the TCS PID.
- Cycle the TCS switch button, then hold it depressed for three seconds. Release the button
- Key off.

Did TCS PID reading switch from ON to OFF, and did reading indicate ON when button was held depressed?

Yes	No
RERUN KOER Self-Test to cycle TCS.	GO to <u>TB2</u> . FOR WINDSTAR, REFER to Section 307-05 Automatic Transaxle/Transmission External Controls in the Workshop Manual.

TB2 CHECK VOLTAGE TO TCS

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Disconnect PCM.
- Key on, engine off.
- Measure the voltage between the PCM harness connector pin and battery negative post while cycling the TCS several times.
- Key off.

Did the voltage cycle?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	GO to <u>TB3</u> .

TB3 CHECK TCS CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect TCS.
- Measure the resistance TCS circuit between PCM harness connector pin and battery negative post.

Is resistance greater than 10,000 ohms?

Yes	No
GO to <u>TB4</u> .	REPAIR short circuit.

TB4 CHECK TCS CIRCUIT FOR OPEN IN HARNESS

- Measure the resistance of the TCS keypower between fuse junction panel and power side of the TCS harness connector.
- Measure resistance of TCS circuit between PCM harness connector pin and the transmission control switch harness connector.

Are both resistances less than 5.0 ohms?

Yes	No
GO to <u>TB5</u> .	REPAIR open circuit.

TB5 CHECK TCS CIRCUIT FOR SHORTS TO POWER IN HARNESS

- Measure the resistance between TCS and VPWR circuits at the PCM harness connector.

Is resistance greater than 10,000 ohms?

Yes	No
REPLACE damaged transmission control switch.	REPAIR short circuit.

TB6 CHECK TCIL FUNCTION

- Key on, engine off.
- Cycle the transmission control switch (TCS).

Did the TCIL lamp change state?

Yes	No
GO to <u>Z1</u> to check for an intermittent fault .	GO to <u>TB7</u> .

TB7 CHECK TCIL CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Key off.
- Disconnect PCM.
- Key on, engine off.

Did the TCIL lamp change state?

Yes	No
TCIL turns off when PCM is disconnected. REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read</u>	REPAIR short circuit between bulb and the TCIL Test Pin. VERIFY a symptom no longer exists.

Only Memory (EEPROM)).

TB8 CHECK FOR DTC P1780

- Run Key On Engine Running (KOER) Self-Test.

Is DTC P1780 present?

Yes	No
REPAIR DTC 1780. GO to <u>TB1</u> .	GO to <u>TB9</u> .

TB9 CHECK VOLTAGE TO TCIL

Note: Refer to the PCM connector pin numbers in the beginning of this pinpoint test.

- Key off.
- Disconnect PCM.
- Key on, engine off.
- Measure voltage between TCIL circuit at PCM harness connector pin and battery negative post.

Are voltage readings greater than 2.0 volts?

Yes	No
Using proper Wiring Diagram, verify integrity of wiring between the TCIL indicator and the PCM harness connector pin. If no concern exists, REPLACE PCM. (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>). CYCLE TCS to check operation of TCIL.	CHECK indicator bulb and fuse. If OK, open is in the wiring between the Ignition switch and the TCIL Test Pin at the harness connector. REPAIR as necessary.

TG: 4x4 Low (4x4L) Range Introduction

TG: Pinpoint Tests →

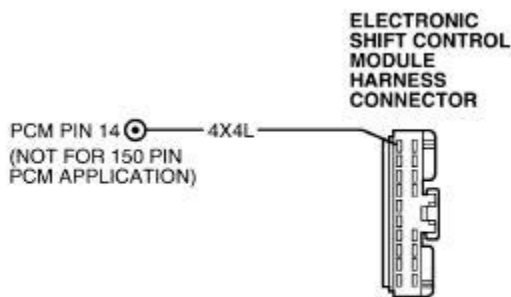

Note

This Pinpoint Test is intended to diagnose the following:

- Harness circuits from Electronic Shift Control Module
- Harness circuit for mechanical 4x4L
- Powertrain Control Module (PCM) (12A650)

Pinpoint Test Schematic and Connectors

Electronic Shift

NOTE: ALL HARNESS CONNECTORS ARE VIEWED INTO MATING SURFACE

A0028395

Mechanical Shift

NOTE: ALL HARNESS CONNECTORS ARE VIEWED INTO MATING SURFACE AA0915-B

TG: 4x4 Low (4x4L) Range

← TG: Introduction

TG1 VERIFY 4x4L SELECTOR POSITION

DTC P1729, P1781

Note: The transmission range (TR) sensor must indicate NEUTRAL position before 4x4L shift.

- Verify vehicle is equipped with 4x4.
- Verify selector is in 4x2 or 4x4H.

Is the selector in 2WD or 4x4H mode during Quick Test ?

Yes	No
GO to <u>TG2</u> .	VERIFY transmission shift lever is in neutral position. SELECT 2WD or 4x4H. Rerun Quick Test.

TG2 CHECK 4x4L CIRCUIT FOR INTERMITTENT FAULT

- Connect scan tool.
- Key on, engine off.
- Access 4x4L PID.
- Cycle the 4x4L switch to 2WD.
- Grasp the vehicle harness starting at the transfer case vehicle harness connector. Shake and bend a small section of the harness all the way to the PCM.
- Tap the vehicle harness connector at the transfer case.
- Shake and bend a small section of the harness between the Instrument Cluster Connector and the PCM.
- Key off.

Did the 4x4L PID reading go ON/OFF during harness and connector movement?

Yes	No
ISOLATE fault and REPAIR as necessary.	GO to <u>TG3</u> .

TG3 CHECK 4X4L SIGNAL VOLTAGE TO PCM

- Disconnect PCM.
- Key on, engine off.
- Observe voltage between 4x4L circuit at PCM harness connector and battery negative post while cycling the switch.
- Key off.

Did the voltage cycle?

--	--

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	GO to <u>TG4</u> .

TG4 CHECK 4X4L CIRCUIT FOR OPEN IN HARNESS

- Disconnect the electronic shift control module.
- Measure resistance of 4x4L circuit between PCM harness connector pin and 4x4L switch harness connector pin.

Is the resistance less than 5.0 ohms?

Yes	No
GO to <u>TG5</u> .	REPAIR open circuit.

TG5 CHECK 4x4L CIRCUIT FOR SHORT TO POWER OR GROUND IN HARNESS

- Connect electronic shift control module.
- Measure resistance between 4x4L circuit at PCM harness connector pin and battery negative post.
- Measure resistance between 4x4L and VPWR circuits at PCM harness connector.

Are both resistances greater than 10,000 ohms?

Yes	No
REFER to the Transfer Case, Section "Four Wheel Drive Systems" in the Workshop Manual for diagnosis.	REPAIR short circuit.

TH: Reverse Switch (RS) Introduction

TH: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose the following:

- Reverse Switch (RS)
- RS harness circuits RS and SIG RTN
- PCM

Pinpoint Test Schematics and Connectors

TH: Pinpoint Tests →

TH: Reverse Switch (RS)

← TH: Introduction

TH1 DTC P0812: CHECK RS SWITCH FUNCTION

Note: During KOEO Self-Test, gearshift lever in NEUTRAL.

- Key on, engine off.
- Access RS PID and observe PID cycling ON/OFF with gear shift lever in and out of REVERSE.

Does reading change from ON to OFF?

Yes	No
KEY OFF. Fault intermittent DISCONNECT PCM. INSPECT both ends of the connector for damaged or pushed out pins, corrosion, loose wires. REPAIR as necessary. If OK, REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	KEY OFF. GO to TH2 .

TH2 CHECK RS SWITCH RESISTANCE

- Locate the reverse switch (RS) near the transmission shift linkage.
- Inspect switch and bracket for damage, bent or broken conditions. Repair as required.
- Disconnect RS harness connector.
- Measure the resistance between the reverse switch terminals with the shift lever in reverse.

Is the resistance less than 5.0 ohms?

Yes	No
GO to TH3 .	REPLACE the RS switch.

TH3 CHECK RS CIRCUIT FOR OPEN IN HARNESS

- Disconnect scan tool.
- Disconnect PCM.
- Measure resistance of the RS circuit between PCM harness connector pin and RS harness connector.
- Where applicable, measure resistance of the SIG RTN circuit between PCM harness connector pin and RS harness connector.

Are both resistances less than 5.0 ohms?

Yes	No
GO to TH4 .	REPAIR open circuit.

TH4 CHECK RS CIRCUIT FOR SHORT TO SIG RTN OR CHASSIS GROUND IN HARNESS

- Measure resistance between RS and SIG RTN circuits at the PCM harness connector.
- Measure resistance between RS circuit at the PCM harness connector and chassis ground.

Are both resistances greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPAIR short circuit.

TJ: Output Shaft Speed (OSS) Sensor

← TJ: Introduction

TJ1 DTC P0720, P0721, P0722, P0723, AND P1900: VERIFY DRIVE CYCLE

- Monitor the OSS PID.
- Drive vehicle.
- Through all gear ranges, shift up and down.

Does PID reading increase and decrease with engine and vehicle speed?

Yes	No
OSS performed as expected. GO to <u>TJ2</u> .	For Hall Effect Type OSS: KEY OFF. GO to <u>TJ3</u> . For VR Type OSS: GO to <u>TJ5</u> .

TJ2 VISUAL INSPECTION

- Disconnect OSS sensor.
- Inspect OSS harness for damage. Inspect OSS vehicle harness connector for damage and proper seating.
- If possible, complete wiggle test.

Have any problems been found?

Yes	No
REPAIR fault.	GO to <u>Z1</u> for intermittent fault diagnosis.

TJ3 CHECK VPWR TO OSS SENSOR

- Key on.
- Disconnect OSS sensor.
- Measure VPWR circuit voltage at OSS sensor harness connector.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to <u>TJ4</u> .	KEY OFF. Repair open circuit.

TJ4 CHECK VPWR GND TO OSS SENSOR

- Measure resistance of PWR GND circuit between OSS sensor harness connector and negative

battery post.

Is resistance less than 5.0 ohms?

Yes	No
GO to <u>TJ5</u> .	Repair open circuit.

TJ5 CHECK HARNESS FOR SHORT TO PWR

- Key on.
- Disconnect OSS sensor.
- Measure voltage between the OSS signal circuit at the OSS sensor harness connector and ground.

Is voltage less than 1.0 volt?

Yes	No
KEY OFF. GO to <u>TJ6</u> .	KEY OFF. REPAIR short circuit.

TJ6 CHECK HARNESS FOR OPEN

- Disconnect PCM.
- Measure resistance of the OSS signal circuit between the OSS sensor harness connector and the PCM harness connector.
- Measure resistance of the OSS SIG RTN circuit between the OSS sensor harness connector and the PCM harness connector.

Is each resistance less than 5.0 ohms?

Yes	No
GO to <u>TJ7</u> .	REPAIR short circuit.

TJ7 CHECK HARNESS FOR SHORT TO GROUND

- Measure resistance between OSS signal and SIG RTN circuits at the OSS sensor harness connector.
- Measure resistance between the OSS signal at the the OSS sensor harness connector and chassis ground.

Is each resistance greater than 10,000 ohms?

Yes	No
For VR Type OSS: GO to <u>TJ8</u> . For Hall Effect Type OSS: GO to <u>TJ9</u> .	REPAIR short circuit.

TJ8 CHECK RESISTANCE OF OSS SENSOR

- Measure resistance of the OSS sensor between the pins of the OSS sensor.

Is resistance between 450 and 750 ohms?

Yes	No
REPLACE PCM (REFER to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPLACE OSS sensor.

TJ9 CHECK OSS SIGNAL OUTPUT TO PCM, HALL TYPE OSS

- Disconnect PCM.
- Raise vehicle to allow rotation of the front drive wheel.
- Key on, transmission in neutral.
- Measure voltage between OSS+ and PWR GND circuits at the PCM harness connector while slowly rotating the drive wheel.

Note: Opposite wheel must be held stationary.

- The voltage should rise above 5.0 volts and fall below 1.0 volts in a regular cycle. Observe several cycles.

Does the OSS output voltage rise and fall as specified?

Yes	No
REPLACE PCM (REFER to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>).	REPLACE OSS sensor. REFER to the workshop manual group for manual transmissions.

X: Constant Control Relay Module (CCRM) Introduction

X: Pinpoint Tests →

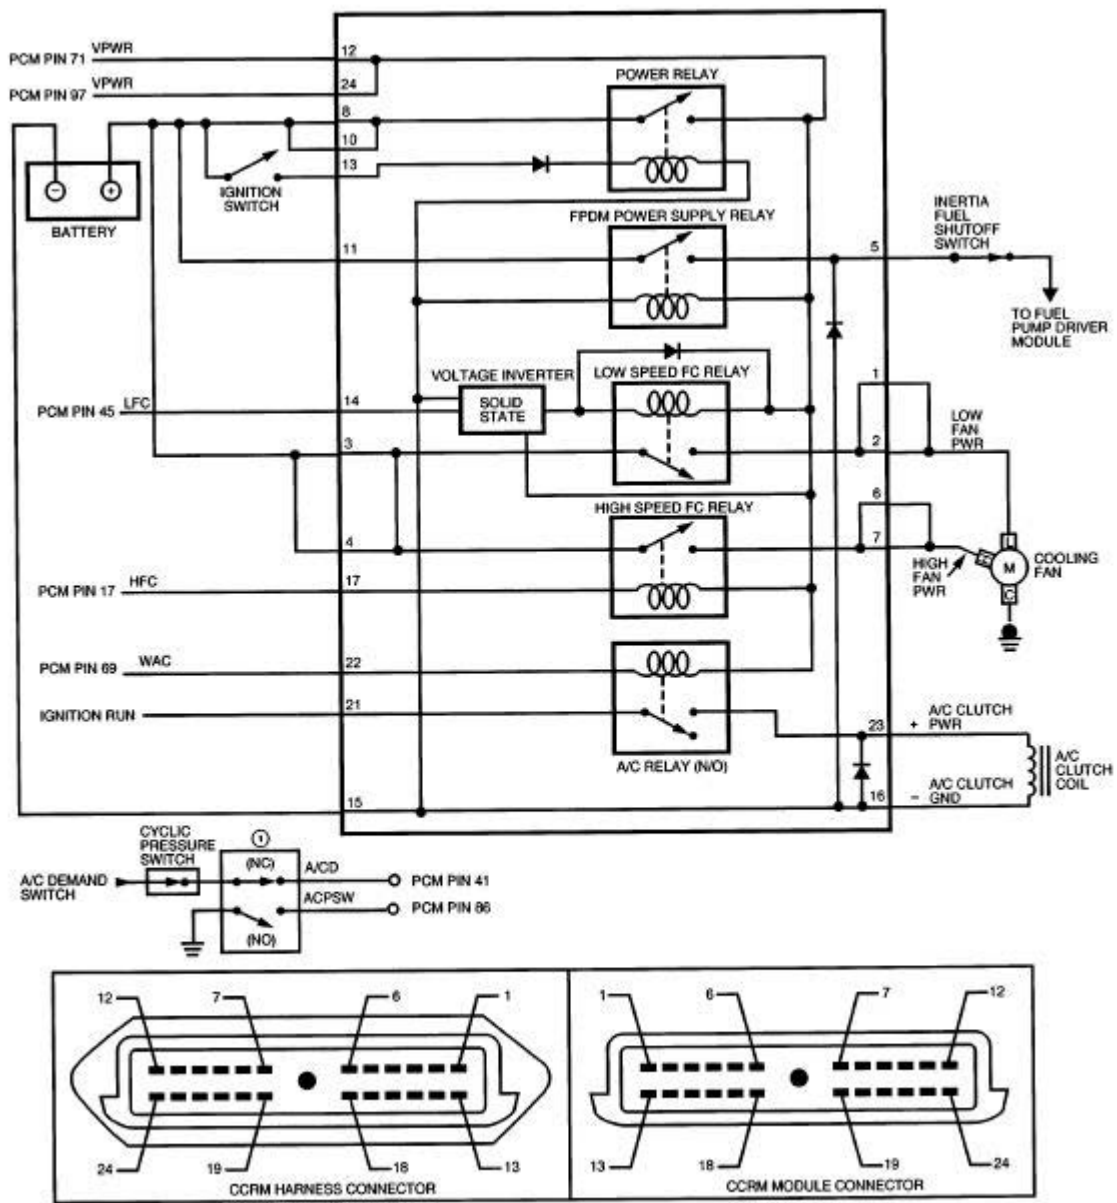

Note

This Pinpoint Test is intended to diagnose the following:

- Constant Control Relay Module (CCRM) (12B581 (w/ bracket), 12B577 (module only))
- Harness circuits: B+, FC, LFC, HFC, ACCS, WAC, VPWR (TO CCRM), A/C Clutch PWR, (Low/High) Fan PWR, GND
- Powertrain Control Module (PCM) (12A650)

Pinpoint Test Schematics and Connectors

A0029815

X: Pinpoint Tests →

X: Constant Control Relay Module (CCRM)

← X: Introduction

X1 VPWR CHECK AT IAC VALVE FAILED IN PINPOINT TEST C: CHECK FOR OPEN VPWR CIRCUIT BETWEEN IAC VALVE AND CCRM

- Disconnect IAC valve.
- Disconnect CCRM.
- Disconnect scan tool from DLC.
- Measure resistance of VPWR circuit between IAC valve harness connector and pins 12 and 24 (VPWR) of the CCRM harness connector.

Is either resistance less than 5.0 ohms?

Yes	No
RECONNECT IAC valve. GO to <u>X2</u> .	BOTH resistances GREATER than 5.0 ohms. REPAIR open VPWR circuit between the CCRM and the splice to the IAC valve.

X2 CHECK B+ AND IGN START/RUN VOLTAGE TO CCRM

- Measure voltage to Pin 8 and Pin 10 (B+) of the CCRM harness connector.
- Key on, engine off.
- Measure voltage to Pin 13 (IGN START/RUN) of the CCRM harness connector.

Are all voltages greater than 10.5 volts?

Yes	No
KEY OFF. GO to <u>X3</u> .	B + or IGN START/RUN circuit fault. CHECK condition of related fuse(s). If OK, REPAIR open circuit. If fuse is damaged, CHECK IGN START/RUN or B+ and VPWR circuits for short to ground before replacing.

X3 CHECK CCRM GROUND CIRCUIT

- Measure voltage between pin 8 (B+) and pin 15 (GND) at the CCRM harness connector.

Is voltage greater than 10.5 volts?

Yes	No
REPLACE CCRM.	REPAIR open ground circuit to CCRM (pin 15).

X15 DTC P1479: CHECK HIGH SPEED FAN CONTROL (FC) RELAY AND HFC CIRCUIT IN CCRM

Note: For one-speed fan applications, disregard DTC P1479.

- Disconnect CCRM.
- Check high speed FC relay coil resistance:
 - Measure resistance between pin 17 and pin 24 of the CCRM.
 - Resistance must be between 65 and 100 ohms.
- Check CCRM for internal shorts:
 - Measure resistance of CCRM between pin 17 and the following pins: 1 through 11, 13, 15 and 21.
 - Measure resistance between pin 17 and the CCRM case.
 - Each resistance must be greater than 1,000 ohms.

Are the CCRM checks OK?

Yes	No
GO to <u>X16</u> .	REPLACE CCRM.

X16 CHECK FOR OPEN HFC CIRCUIT

- Disconnect PCM.
- Measure resistance of HFC circuit between PCM harness connector and pin 17 of CCRM harness connector.

Is resistance less than 5.0 ohms?

Application	HFC PCM Pin
Escort	17
Mustang	46

Yes	No
GO to <u>X17</u> .	REPAIR open circuit.

X17 CHECK HFC CIRCUIT FOR SHORT TO POWER IN HARNESS

- Key on.
- Measure voltage between HFC circuit at PCM harness connector and chassis ground.

Is voltage less than 1.0 volt?

Yes	No
KEY OFF. GO to <u>X18</u> .	REPAIR short circuit.

X18 CHECK HFC CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect scan tool from DLC.
- Measure resistance between HFC circuit at PCM harness connector and chassis ground.

Is resistance greater than 10,000 ohms?

Yes	No
<p>If DTC P1479 was received in Quick Test:</p> <p>CONNECT scan tool to DLC. Key on, engine off. Access Output Test Mode on scan tool. Command high speed fan on, wait 10 seconds, then turn fan off. If high speed fan turns on, and off as expected, disregard P1479 and return to Section 3. If fan does not operate correctly, REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).</p> <p>All others:</p> <p>REPLACE CCRM. VERIFY HIGH FAN PWR circuit is not short to ground.</p>	<p>REPAIR short circuit.</p>

X20 DTC P1474: DOES FAN RUN WITH KEY ON?

Note: During diagnosis, FC applies to the fan control circuit (single-speed fans), and LFC applies to the low fan control circuit (two-speed fans).

Does the cooling fan always run with the key on?

Yes	No
KEY OFF. GO to X24 .	KEY OFF. GO to X21 .

X21 CHECK FC/LFC CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect scan tool from DLC.
- Disconnect PCM.
- Disconnect CCRM.
- Measure resistance between pin 14 of the CCRM harness connector and chassis ground.

Is resistance greater than 10,000 ohms?

Yes	No
GO to X22 .	REPAIR short circuit.

X22 CHECK FAN RUNNING MODE

- Connect CCRM.
- Key on, engine off.

Is fan running with the key on?

Yes	No
REPLACE PCM (refer to Section 2, Flash	

Electrically Erasable Programmable Read Only Memory (EEPROM).

REPLACE CCRM.

X24 CHECK FOR OPEN FC/LFC CIRCUIT IN HARNESS

- Disconnect PCM.
- Disconnect CCRM.
- Measure resistance of the FC/LFC circuit between PCM harness connector and pin 14 of the CCRM harness connector.

Is resistance less than 5.0 ohms?

Application	FC/LFC PCM Pin
4.6L Mustang	19
All Others	45

Yes	No
GO to <u>X25</u> .	REPAIR open circuit.

X25 CHECK FC/LFC CIRCUIT FOR SHORT TO POWER IN HARNESS

- Key on.
- Measure voltage between pin 14 of the CCRM harness connector and chassis ground.

Is voltage less than 1.0 volt?

Yes	No
KEY OFF. GO to <u>X26</u> .	REPAIR short circuit.

X26 FC/LFC CIRCUIT FAULT ISOLATION CHECK

- Reconnect CCRM.
- Jumper FC/LFC circuit at PCM harness connector to chassis ground.
- Key on, engine off.

Does fan continue to run?

Yes	No
KEY OFF. REPLACE CCRM.	KEY OFF. REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).

X30 CONTINUOUS MEMORY DTC P1474: CHECK FAN CONTROL (FC) OR LOW FAN CONTROL (LFC) CIRCUIT FOR OPEN OR SHORT TO POWER

- Disconnect cooling fan connector.
- Connect a non-powered test lamp between the (LOW) FAN PWR circuit and ground circuit at the cooling fan harness connector.
- Key on, engine off.
- Observe test lamp for an indication of a fault while completing the following (since the FC/LFC circuit is grounded to turn the fan OFF, the lamp will illuminate when an open or short to power is detected):
 - Shake, wiggle, bend the FC/LFC circuit between the PCM and CCRM.
 - Lightly tap on the CCRM to simulate road shock.

Is a fault indicated?

Yes	No
KEY OFF. ISOLATE fault and REPAIR as necessary.	GO to <u>X31</u> .

X31 CHECK FC/LFC CIRCUIT FOR SHORT TO GROUND

- Key on, engine off.
- Access Output Test Mode on scan tool.
- Command Low Speed Fan on.
- Observe test lamp for an indication of a fault while completing the following (the lamp will turn off when a fault is detected, indicating a short to ground or an open in VPWR):
 - Shake, wiggle, bend the FC/LFC circuit between the PCM and CCRM.
 - Lightly tap on the CCRM to simulate road shock.

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary.	KEY OFF. GO to <u>Z1</u> .

X35 DTC P1479: CHECK HIGH FAN CONTROL (HFC) CIRCUIT FOR OPEN OR SHORT TO POWER

Note: For one-speed fan applications, disregard DTC P1479.

- Disconnect cooling fan connector. Inspect connector for damaged or pushed out pins, corrosion and loose wires. Repair as necessary.
- Connect a non-powered test lamp between the HIGH FAN PWR circuit and ground circuit at the cooling fan harness connector.
- Key on, engine off.
- Access Output Test Mode on scan tool.
- Command high speed fan on.
- Observe test lamp for an indication of a fault while completing the following (the lamp will turn off when a fault is detected, indicating an open or short to power):
 - Shake, wiggle, bend the HFC circuit between the PCM and CCRM.
 - Lightly tap on the CCRM to simulate road shock.

Is a fault indicated?

Yes	No
KEY OFF. ISOLATE fault and REPAIR as	

necessary.

GO to X36.

X36 CHECK HFC CIRCUIT FOR SHORT TO GROUND

- Key on, engine off.
- Command high speed fan off.
- Observe test lamp for an indication of a fault while completing the following (the lamp will turn on when a fault is detected, indicating a short to ground):
 - Shake, wiggle, bend the HFC circuit between the PCM and CCRM.
 - Lightly tap on the CCRM to simulate road shock.

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary. RESTORE vehicle.	KEY OFF. GO to <u>Z1</u> .

X40 ELECTRIC COOLING FAN FUNCTIONAL CHECK

Note: For the proper results of these pinpoint tests, no DTCs must have been present during PCM Quick Test.

- Key on, engine off.
- Access Output Test Mode on scan tool.
- Command of the cooling fan on and check for fan operation. For two speed fan applications, check both fan speeds (wait 30 seconds after commanding high speed fan on).

Does the fan operate (all speeds)?

Yes	No
KEY OFF. Cooling fan circuits OK. RETURN to <u>Section 3</u> chart.	COMMAND cooling fan off. REMAIN in Output Test Mode. GO to <u>X41</u> .

X41 ELECTRIC COOLING FAN CONCERN: DID THE FAN OPERATE AT ANY SPEED?

- For 3.8L Mustang, GO to X42.

During the operational check of both fan speeds, did the fan operate at any speed?

Yes	No
Only one fan speed is operational. GO to <u>X50</u> .	Cooling fan will not operate at any speed. GO to <u>X42</u> .

X42 COOLING FAN WILL NOT OPERATE AT ANY SPEED: COMMAND FAN ON (HIGH SPEED FOR TWO-SPEED APPLICATIONS) AND CHECK FOR VOLTAGE AT FAN

- Key on, engine off.
- Disconnect cooling fan.
- Command fan on (high speed for two speed fan applications).
- Measure voltage between the (HIGH) FAN PWR circuit at the cooling fan harness connector and chassis ground.

Is voltage greater than 10.0 volts?

Yes	No
KEY OFF. Power is being supplied to fan. GO to <u>X45</u> .	KEY OFF. GO to <u>X43</u> .

X43 CHECK FOR B+ TO FAN CONTROL RELAYS IN CCRM

- Disconnect CCRM.
- Measure voltage at pins 3 and 4 of the CCRM harness connector.

Is voltage greater than 10.0 volts?

Yes	No
GO to <u>X44</u> .	B+ fault. CHECK condition of related fuses. If OK, REPAIR open circuit. If fuse is damaged, CHECK B+ and FAN PWR circuits for short to ground before replacing.

X44 CHECK FOR OPEN FAN PWR CIRCUIT BETWEEN CCRM AND COOLING FAN

- **For 3.8L Mustang:**
 - Measure resistance of FAN PWR circuit between pin 2 of the CCRM harness connector and the fan harness connector.
- **All others:**
 - Measure resistance of HIGH FAN PWR circuit between pin 6 of the CCRM harness connector and the fan harness connector.
 - Measure resistance of LOW FAN PWR circuit between pin 2 of the CCRM harness connector and the fan harness connector.

Is each resistance less than 7.0 ohms?

Yes	No
For 3.8L Mustang: GO to <u>X70</u> . All others: REPLACE CCRM. VERIFY FAN PWR circuit (s) are not short to ground.	REPAIR open circuits(s).

X45 CHECK FOR OPEN COOLING FAN GROUND CIRCUIT

- Disconnect scan tool from DLC.
- Measure resistance of ground circuit between the cooling fan harness connector and chassis ground.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE fan.	REPAIR open circuit.

X50 DETERMINE WHICH FAN SPEED IS OPERATIONAL

Was the low speed fan operational?

Yes	No
High speed fan inoperative. GO to <u>X65</u> .	Low speed fan inoperative. GO to <u>X51</u> .

X51 LOW SPEED FAN INOPERATIVE: COMMAND LOW SPEED FAN ON AND CHECK FOR VOLTAGE TO COOLING FAN

- Key on, engine off.
- Disconnect cooling fan.
- Command low speed fan on.
- Measure LOW FAN PWR circuit voltage at the cooling fan harness connector.

Is voltage greater than 10.0 volts?

Yes	No
KEY OFF. For 4.6L Mustang: GO to <u>X54</u> . All others: REPLACE fan.	KEY OFF. GO to <u>X52</u> .

X52 CHECK FOR OPEN LOW FAN PWR CIRCUIT BETWEEN CCRM AND FAN

- Disconnect CCRM.
- Measure resistance of the LOW FAN PWR circuit between the cooling fan harness connector and pins 1 and 2 of the CCRM harness connector.

Are both resistances less than 5.0 ohms?

Yes	No
GO to <u>X70</u> .	REPAIR open circuit.

X54 CHECK FOR OPEN DROPPING RESISTOR ON FAN SHROUD ASSEMBLY

- Measure resistance between the LOW FAN PWR and HIGH FAN PWR pins of the fan shroud assembly.

Is resistance less than 6.0 ohms?

Yes	No
REPLACE fan.	Verify condition of dropping resistor, replace as necessary (use care when removing resistor from mounts). If OK, replace fan assembly.

X65 HIGH SPEED FAN INOPERATIVE: COMMAND HIGH SPEED FAN ON AND CHECK FOR VOLTAGE TO COOLING FAN

- Key on, engine off.
- Disconnect cooling fan.
- Command high speed fan on.
- Measure HIGH FAN PWR circuit voltage at the cooling fan harness connector.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. REPLACE fan.	KEY OFF. GO to <u>X66</u> .

X66 CHECK FOR OPEN HIGH FAN PWR CIRCUIT

- Disconnect CCRM.
- Measure resistance of HIGH FAN PWR circuit between the cooling fan harness connector and pin 6 of the CCRM harness connector.

Is resistance less than 5.0 ohms?

Yes	No
GO to <u>X70</u> .	REPAIR open circuit.

X70 IS SCAN TOOL CAPABLE OF VIEWING PIDS WHILE IN OUTPUT TEST MODE?

Note: The symptom low speed fan or high speed fan inoperative can be caused by a primary circuit fault, even though a DTC was not set.

Is scan tool being used capable of viewing PIDS while in Output Test Mode?

Yes	No
	For low speed fan inoperative (fan inoperative for 3.8L Mustang):

GO to X71.

GO to X73.

For high speed fan inoperative.

GO to X16.

X71 CHECK OPERATION OF LOW SPEED FAN OR HIGH SPEED FAN PRIMARY CIRCUITS

- Reconnect CCRM and cooling fan.
- Key on, engine off.
- Access Output Test Mode on scan tool.
- **For low speed fan inoperative (fan inoperative for 3.8L Mustang):**
 - Access LFC and LFCF PIDs.
 - With LFC PID off (low speed fan commanded off by PCM), the LFCF PID must be no.
 - Command the Low Speed Fan on (the LFC PID will now be on).
 - The LFCF PID must still be no.
- **For high speed fan inoperative:**
 - Access HFC and HFCF PIDs.
 - With HFC PID off (high speed fan commanded off by PCM), the HFCF PID must be no.
 - Command the high speed fan on (the HFC PID will now be on).
 - The HFCF PID must still be no.

Is the HFCF or LFCF PID yes with the fan commanded on or off?

Yes	No
KEY OFF. An HFC or LFC primary fault is detected. If the HFCF PID was yes: GO to <u>X15</u> and follow DTC P1479 diagnosis. If the LFCF PID was yes: GO to <u>X20</u> and follow DTC P1474 diagnosis.	Primary circuits OK. REPLACE CCRM. VERIFY applicable FAN PWR circuit is not short to ground.

X73 CHECK FC/LFC CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect scan tool from DLC.
- Disconnect PCM.
- Measure resistance between pin 14 of the CCRM harness connector and chassis ground.

Is resistance greater than 10,000 ohms?

Yes	No
REPLACE CCRM. VERIFY applicable FAN PWR circuit is not shorted to ground.	REPAIR short circuit.

X80 LOW AND/OR HIGH SPEED COOLING FAN ALWAYS RUNS (NO DTCS):

VERIFY FAN IS NOT ON BECAUSE OF A/C HIGH PRESSURE SWITCH INPUT TO PCM

- Start engine.
- Access ACP PID.

Is the ACP PID "CLOSED"?

Yes	No
The PCM will turn the cooling fan on when the A/C high pressure switch input is "closed". Leave engine running. GO to X81 .	Input OK. GO to X82 .

X81 CHECK A/C HIGH PRESSURE SWITCH (THE MEDIUM PRESSURE, NORMALLY OPEN CONTRACTS)

- Disconnect A/C high pressure switch.
- Again, view the ACP PID on scan tool.

Is the ACP PID still "CLOSED"?

Yes	No
KEY OFF. GO to X135 (to check A/C high pressure switch input to PCM).	KEY OFF. RECONNECT A/C high pressure switch. REFER to the Climate Control System - General Information, Section 412-00 of the Workshop Manual to check for proper A/C high pressure switch function, over-pressurized A/C system and other checks as directed.

X82 DISCONNECT CCRM AND CHECK IF FAN STILL RUNS

- Accessories off (A/C, blower, lamps).
- Key on, verify cooling fan always on symptom.
- Key off.
- Disconnect CCRM.
- Key on, engine off.

Is cooling fan still on?

Yes	No
KEY OFF. For 3.8L Mustang: REPAIR FAN PWR circuit short to power. For all others: GO to X83 .	Key off. GO to X84 .

X83 CHECK LOW FAN PWR AND HIGH FAN PWR CIRCUITS FOR SHORT TO POWER

- Disconnect cooling fan.
- Key on, engine off.
- Check for voltage on both the LOW FAN PWR and HIGH FAN PWR circuits at the cooling fan harness connector.

Are both voltages less than 1.0 volt?

Yes	No
KEY OFF. No fault is indicated at this time. VERIFY results of previous test steps. If OK, RECONNECT all components and RETURN to Section 3 for further diagnosis of this or any other symptom.	REPAIR short circuit.

X84 CHECK OPERATION OF LOW SPEED FAN OR HIGH SPEED FAN PRIMARY CIRCUITS

Note: The symptom cooling fan always runs can be caused by a primary circuit fault, even though a DTC was not set. This step will check the primary circuit operation.

- Reconnect CCRM.
- Key on, engine off.
- Access LFC and LFCF PIDs. With LFC PID off (low speed fan commanded off by PCM), the LFCF PID must be no.
- For all except 3.8L Mustang, access HFC and HFCF PIDs. With HFC PID off (high speed fan commanded off by PCM), the HFCF PID must be no.

Is the HFCF or LFCF PID yes with the fan commanded off?

Yes	No
KEY OFF. An HFC or LFC primary circuit fault is detected. If the HFCF PID was yes: GO to X15 and follow DTC P1479 diagnosis. If the LFCF PID was yes: GO to X20 and follow DTC P1474 diagnosis.	Primary circuits OK. REPLACE CCRM.

X98 LACK OF COOLING (A/C)/A/C NOT FUNCTIONING: CHECK FOR VOLTAGE TO A/C CLUTCH

Note: If the A/C clutch will engage, follow the "YES" Action to Take of this test step. If not, or unsure, continue this test step.

- Key off.
- Disconnect A/C cycling switch.

- Install a jumper wire in the A/C cycling switch harness connector (to complete the circuit).
- Disconnect A/C clutch.
- Connect digital multimeter between the power pin and ground pin at the A/C clutch vehicle harness connector.
- Start engine.
- Turn A/C on, wait 15 seconds.
- Check voltage reading.
- After testing, turn key off and reconnect A/C clutch.

Was voltage greater than 10.5 volts?

Yes	No
<p>REMOVE jumper. RECONNECT A/C cycling switch.</p> <p>For all except 3.8L Mustang with the symptom "poor A/C system performance in hot ambient temperature":</p> <p>GO to <u>X145</u> to check A/C high pressure switch input to PCM.</p> <p>All others:</p> <p>REFER to the Climate Control System - General Information, Section 412-00 of the Workshop Manual to diagnose symptom. Also be aware that if the engine coolant temperature is detected high, the PCM will disengage the A/C clutch.</p>	<p>No voltage to A/C clutch. GO to <u>X99</u>.</p>

X99 CHECK ACCS INPUT TO PCM WITH A/C ON

- Start engine.
- A/C on.
- Access and view ACCS PID.
- After testing, remove jumper reconnect A/C cycling switch and turn key OFF.

Was the ACCS PID "ON"?

Yes	No
<p>GO to <u>X110</u>.</p>	<p>The PCM is not receiving the ACCS signal, and as a result will not allow the A/C to turn on. GO to <u>X100</u>.</p>

X100 ACCS PID OFF WITH A/C ON: CHECK FOR VOLTAGE TO A/C CYCLING SWITCH

- Key on, engine off.
- Disconnect A/C cycling switch.
- A/C demand switch to A/C on.
- Measure voltage at the A/C demand switch side of the A/C cycling switch harness connector.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to <u>X101</u> .	KEY OFF. REFER to the Climate Control System - General Information, Section 412-00 in the Workshop Manual to check for causes of no voltage to the A/C cycling switch.

X101 CHECK IF A/C CYCLING SWITCH CONTACTS ARE CLOSED

- Measure resistance of the A/C cycling switch contacts at the A/C cycling switch connector.

Is resistance less than 5.0 ohms?

Yes	No
GO to <u>X102</u> .	REFER to the Climate Control System - General Information, Section 412-00 in the Workshop Manual to check the operation of the A/C cycling switch and proper refrigerant charge. REPAIR as necessary.

X102 CHECK FOR VOLTAGE TO DUAL FUNCTION A/C HIGH PRESSURE SWITCH

- Reconnect A/C cycling switch.
- Disconnect A/C high pressure switch.
- Key on, engine off.
- A/C on.
- Measure voltage on the A/C demand switch pin at the A/C high pressure switch harness connector.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF. GO to <u>X103</u> .	REPAIR open between A/C cycling switch and A/C high pressure switch.

X103 CHECK RESISTANCE OF A/C HIGH PRESSURE SWITCH HIGH PRESSURE CONTACTS

- Measure resistance of the normally closed A/C high pressure switch high pressure contacts.

Is resistance less than 5.0 ohms?

Yes	No
GO to X104 .	REFER to the Climate Control System - General Information, Section 412-00 in the Workshop Manual to check for overpressurized A/C system, etc. If OK, REPLACE A/C high pressure switch, following instructions in the Climate Control System - General Information, Section 412-00 of the Workshop Manual.

X104 CHECK FOR VOLTAGE TO PCM ON ACCS CIRCUIT

- Reconnect A/C high pressure switch.
- Disconnect PCM.
- Key on.
- A/C ON.
- Measure voltage at PCM harness connector pin 41.

Is voltage greater than 10.5 volts?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).	REPAIR open circuit between the A/C high pressure switch and PCM.

X105 KOEO/KOER DTC P1460: VERIFY ACCS PID IS OFF

Note: Verify A/C and Defrost were off during KOEO/KOER Self-Test. If vehicle is not equipped with A/C, the WAC circuit is not used and the DTC P1460 can be ignored.

- Start engine.
- A/C and defroster off.
- Access ACCS PID.

Is the ACCS PID off?

Yes	No
KEY OFF. GO to X106 .	KEY OFF. GO to X125 (to check A/C circuits for short to power).

X106 CHECK WAC CIRCUIT AND WOT A/C CUTOFF RELAY IN CCRM

- Disconnect CCRM.
- Check WOT A/C cutoff relay coil resistance:
 - Measure resistance between pin 22 and pin 24 of the CCRM.
 - Resistance must be between 130 and 200 ohms.
- Check CCRM for internal short circuit:
 - Measure resistance of CCRM between pin 22 and the following pins: 1 through 11, 13, 15 and 21.
 - Measure resistance between pin 22 and the CCRM case.
 - Each resistance must be greater than 1,000 ohms.

Are the CCRM checks OK?

Yes	No
GO to X107 .	REPLACE CCRM. Start engine. TURN A/C on, WAIT 15 seconds. A/C off. RERUN Quick Test.

X107 CHECK WAC CIRCUIT FOR SHORT TO POWER IN HARNESS

- Disconnect PCM.
- Key on.
- Measure voltage between pin 22 of the CCRM harness connector and chassis ground.

Is voltage less than 1.0 volts?

Yes	No
KEY OFF. GO to X108 .	REPAIR short circuit. START engine. TURN A/C on, WAIT 15 seconds. A/C off. RERUN Quick Test.

X108 CHECK WAC CIRCUIT FOR SHORT TO GROUND IN HARNESS

- Disconnect scan tool from DLC.
- Measure resistance between pin 22 of the CCRM harness connector and chassis ground.

Is resistance greater than 10,000 ohms?

Yes	No
GO to X109 .	REPAIR short circuit. START engine. TURN A/C on, WAIT 15 seconds. A/C off. RERUN Quick Test.

X109 CHECK FOR OPEN WAC CIRCUIT

- Measure resistance of WAC circuit between PCM harness connector pin 69 and pin 22 of the CCRM harness connector.

Is resistance less than 5.0 ohms?

Yes	No
REPLACE PCM (refer to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>). START engine. TURN A/C on, WAIT 15 seconds. A/C off. RERUN Quick Test.	REPAIR open circuit. START engine. TURN A/C on, WAIT 15 seconds. A/C off. RERUN Quick Test.

X110 NO/LOW VOLTAGE TO A/C CLUTCH (ACCS PID IS ON WITH A/C ON AND NO DTCS): CHECK FOR VOLTAGE TO CCRM

- Disconnect CCRM.
- Key on.
- Measure voltage to pin 21 of the CCRM harness connector.

Is voltage greater than 10.5 volts?

Yes	No
KEY OFF, A/C OFF. GO to <u>X111</u> .	Voltage is not being supplied to pin 21 of the CCRM. CHECK condition of any related fuses. If OK, REPAIR open circuit. If fuse is damaged, check IGN RUN/B+ and A/C CLUTCH PWR circuits for short to ground before replacing.

X111 CHECK FOR OPEN A/C CLUTCH PWR AND A/C CLUTCH GROUND CIRCUITS

- Disconnect A/C clutch.
- Disconnect scan tool from DLC.
- Measure resistance of A/C clutch PWR circuit between pin 23 of the CCRM harness connector and the A/C clutch harness connector.
- Measure resistance of A/C clutch ground circuit between pin 16 of the CCRM harness connector and the A/C clutch harness connector.

Are both resistances less than 5.0 ohms?

Yes	No
VERIFY engine is not overheating when there is no voltage to A/C clutch (if engine coolant temperature is high, the PCM will turn off the A/C). If OK, REPLACE CCRM. VERIFY A/C Clutch PWR circuit is not shorted to ground.	REPAIR open circuit.

X115 DTC P1469: CHECK FOR CAUSES OF FAST A/C COMPRESSOR CLUTCH CYCLING

- Refer to the Climate Control System - General Information, Section 412-00 in the Workshop Manual to test A/C compressor clutch cycle times, and to check causes of fast A/C compressor clutch cycling.

Is a fault indicated?

Yes	No
REPAIR as required according to Workshop Manual direction. COMPLETE PCM Reset to clear DTC(s). START engine and turn A/C on for about 2 minutes. A/C off. RERUN Quick Test.	GO to <u>X116</u> to CHECK for intermittent electrical concern.

X116 CHECK FOR INTERMITTENT OPEN IN ACCS CIRCUIT

- Key on.
- Access ACCS PID.
- A/C on.
- Observe ACCS PID for an indication of a fault while completing the following (the ACCS PID will turn off and on quickly when a fault is detected, indicating an intermittent open):
 - Shake, wiggle, bend the ACCS circuit between the PCM and the source of the circuit (such as A/C switch, EATC module).
 - Lightly tap any pressure switches in the circuit to simulate road shock.
- Disconnect and inspect the A/C cycling switch connector.

Is a fault indicated?

Yes	No
KEY OFF. ISOLATE fault and REPAIR as necessary. COMPLETE PCM Reset to clear DTC(s). START engine and TURN A/C on for about two minutes. A/C off. RERUN Quick Test.	UNABLE to duplicate fault at this time. COMPLETE PCM Reset to clear DTC(s). RETURN to <u>Section 3</u> to service any additional symptoms.

X120 DTC P1460: CHECK FOR INTERMITTENT OPEN OR SHORT IN WAC CIRCUIT

Note: If vehicle is not equipped with A/C, the WAC circuit is not used and the DTC P1460 can be ignored.

- Disconnect A/C cycling switch.
- Install a jumper wire in the A/C cycling switch vehicle harness connector (to complete the circuit).
- Key on, engine off.
- For Mustang, A/C demand switch on.
- For Escort:
 - Access Output Test Mode on scan tool (refer to Section 2).
 - Turn outputs on (this will engage the A/C clutch).
- Check WAC circuit for open or short to power while completing the following (the A/C clutch will click on (off for Escort) when a fault is detected):
 - Shake, wiggle, bend the WAC circuit from the CCRM to the PCM.
 - Lightly tap the CCRM to simulate road shock.
- Access Output Test Mode on the scan tool.
- Turn outputs off.
- Check WAC circuit for short to ground while completing the following (the A/C clutch will click off (on for Escort) when a fault is detected):
 - Shake, wiggle, bend the WAC circuit from the CCRM to the PCM.

- Lightly tap the CCRM to simulate road shock.
- Key off, A/C off.

Is a fault indicated?

Yes	No
ISOLATE fault and REPAIR as necessary. COMPLETE PCM Reset to clear DTCs. START engine. TURN AC on, WAIT 15 seconds. A/C off. RERUN Quick Test.	REMOVE jumper wire. GO to <u>Z1</u> .

X124 DTC P1464: CHECK ACCS PID

Note: Verify A/C and defrost were off during Self-Test. If A/C or defrost were on, turn off and rerun Self-Test.

- Key on, engine off.
- A/C and defrost off.
- Access ACCS PID.

Is ACCS PID on?

Yes	No
GO to <u>X125</u> .	The ACCS PID indicates that the ACCS input to the PCM is low. VERIFY test results. With A/C and defrost off, RERUN Self-Test where DTC P1464 was received.

X125 ACCS PID ON: DISCONNECT A/C CYCLING SWITCH AND CHECK IF ACCS PID TURNS OFF

- Disconnect A/C cycling switch.
- Key on, engine off.
- Access ACCS PID.

Is ACCS PID off?

Yes	No
KEY OFF. VERIFY operation of A/C demand switch (REFER to the Climate Control System - General Information, Section 412-00 of the Workshop Manual). If OK, REPAIR short to power in A/C demand circuit to A/C cycling switch.	KEY OFF. For Escort: GO to <u>X127</u> . All others: GO to <u>X126</u> .

X126 CHECK A/C CLUTCH PWR CIRCUIT FOR SHORT TO POWER IN HARNESS

- Disconnect CCRM.

- Key on.
- Measure voltage between pin 23 of the CCRM harness connector and ground.

Is voltage less than 1.0 volt?

Yes	No
KEY OFF. GO to X127 .	REPAIR short circuit. RESTORE vehicle. VERIFY a symptom no longer exists.

X127 CHECK ACCS CIRCUIT FOR SHORT TO POWER IN HARNESS

- Key off.
- A/C cycling switch and CCRM (except Escort) disconnected.
- Disconnect PCM.
- Key on.
- Measure voltage between PCM harness connector pin 41 and ground.

Is voltage less than 1.0 volt?

Yes	No
For Escort: REPLACE PCM. All others: KEY OFF. GO to X128 .	REPAIR short circuit.

X128 CHECK ACCS CIRCUIT VOLTAGE TO PCM WITH CCRM CONNECTED

- Reconnect CCRM.
- Key on.
- Again, measure voltage between PCM harness connector pin 41 and ground.

Is voltage less than 1.0 volt?

Yes	No
REPLACE PCM.	REPLACE CCRM.

X130 DOES THE A/C TURN OFF WHEN THE A/C DEMAND SWITCH IS TURNED OFF?

Does the A/C turn off when the A/C demand switch is turned off?

Yes	No
GO to X131 .	GO to X140 .

X131 CHECK IF A/C CUTS OFF DURING WOT

- Start engine.
- A/C on.
- Initiate brief Wide Open Throttle (WOT) and return to idle. Listen for the A/C clutch to disengage during the WOT, then re-engage a few seconds after returning to idle (a "click" sound will be heard when the clutch re-engages).

Note: If the clicking sound cannot be heard, disconnect the A/C clutch. With a test lamp connected between the power pin and ground pin of the A/C clutch harness connector, observe the test lamp while performing the brief WOT. The test lamp must go off during the brief WOT, then come back on a few seconds after returning to idle.

- Repeat test, if necessary, to verify results.

Does A/C clutch or test lamp operate as indicated?

Yes	No
KEY OFF. RECONNECT A/C clutch (if necessary). The WAC circuit is operating properly. At this time the A/C will cut-off during WOT. GO to Z1 to diagnose intermittent concerns, or RETURN to Section 3 to service any other concerns.	GO to X132 .

X132 NO WOT A/C CUTOFF, NO DTCS PRESENT: CHECK CCRM

- Reconnect A/C clutch (if necessary).
- Key on, engine off.
- Access Output Test Mode on scan tool.
- A/C demand switch on.
- While listening to the A/C clutch, command the outputs off and on a couple of times.

Does the A/C clutch engage and disengage when the outputs are cycled off and on?

Yes	No
KEY OFF. WOT A/C cutoff is operating properly. If symptom is intermittent, GO to Z1 . Otherwise, testing is complete. RETURN to Section 3 to service any other symptoms.	VERIFY that the A/C clutch was engaged during testing. If not, REPEAT test with clutch engaged. If clutch was engaged, REPLACE CCRM.

X135 ACPSW PID CLOSED WITH A/C HIGH PRESSURE SWITCH DISCONNECTED: CHECK ACPSW CIRCUIT FOR SHORT TO GROUND IN HARNESS

- A/C high pressure switch disconnected.
- Disconnect scan tool from DLC.
- Disconnect PCM.
- Measure resistance between PCM harness connector pin 86 and ground.

Is resistance greater than 10,000 ohms?

Yes	No
REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read	REPAIR short circuit.

Only Memory (EEPROM).

X140 A/C ALWAYS ON: CHECK FOR VOLTAGE AT A/C CLUTCH WITH A/C OFF

- A/C and defroster OFF.
- Disconnect A/C clutch.
- Connect a digital multimeter between the power pin and ground pin at the A/C clutch harness connector.
- Start engine.
- Monitor voltage.
- After testing, turn key off and reconnect A/C clutch.

Was voltage less than 2.0 volts?

Yes	No
The electrical portion of the A/C system is not at fault. REFER to the Climate Control System - General Information, Section 412-00 in the Workshop Manual.	A fault is indicated in the A/C electrical system. GO to <u>X141</u> .

X141 CHECK ACCS INPUT TO PCM WITH A/C OFF

- Key off.
- Connect scan tool to data link connector.
- Start engine.
- A/C and defrost off.
- Access ACCS PID (Powertrain Menu).

Is the ACCS PID "OFF"?

Yes	No
KEY OFF. REFER to the Climate Control System - General Information, Section 412-00 in the Workshop Manual.	KEY OFF. GO to <u>X125</u> .

X145 CHECK A/C HIGH PRESSURE SWITCH MEDIUM PRESSURE CIRCUITS

Note: An A/C high pressure switch medium pressure circuit concern can result in the high speed cooling fan not coming on when the A/C refrigerant pressure becomes high. In hot ambient conditions, this may result in the refrigerant pressure continuing to increase until the A/C high pressure switch high pressure contacts open, shutting off the A/C until the pressure drops to an acceptable range.

- Key off.
- Disconnect A/C high pressure switch.
- A/C off (to prevent chance of short circuits).
- Connect a jumper wire between the A/C high pressure switch circuit and ground circuit at the A/C high pressure switch harness connector.
- Start engine, wait 15 seconds.

Does the high speed fan come on?

Yes	No
<p>KEY OFF. A/C high pressure switch medium pressure circuits are OK. REMOVE jumper. RECONNECT A/C high pressure switch. REFER to the Climate Control System, General Information Section 412-00 in the Workshop Manual to diagnose symptom.</p>	<p>An A/C high pressure switch medium pressure circuit concern may exist. GO to X146.</p>

X146 CHECK FOR OPEN GROUND CIRCUIT TO A/C HIGH PRESSURE SWITCH

- Key on, engine running.
- Connect jumper wire between the A/C high pressure switch circuit at the A/C high pressure switch harness connector and the battery negative post.
- Wait 15 seconds.

Does the high speed fan come on now?

Yes	No
<p>KEY OFF. REPAIR open ground circuit to the A/C high pressure switch. REMOVE jumper wire.</p>	<p>KEY OFF. REMOVE jumper wire. GO to X147.</p>

X147 CHECK FOR OPEN A/C HIGH PRESSURE SWITCH (ACPSW) CIRCUIT BETWEEN A/C HIGH PRESSURE SWITCH AND PCM

- Disconnect PCM.
- Measure resistance of the ACPSW circuit between the PCM harness connector pin 86 and the A/C high pressure switch harness connector.

Is resistance less than 5.0 ohms?

Yes	No
<p>REPLACE PCM (refer to Section 2, Flash Electrically Erasable Programmable Read Only Memory (EEPROM)).</p>	<p>REPAIR open circuit.</p>

Z: Intermittent Introduction

Z: Pinpoint Tests →

Note

This Pinpoint Test is intended to diagnose and isolate intermittent concerns for the following:

- All Electronic EC subsystems
- Coil Pack ignition systems using the Distributorless Ignition System Tester (DIST)

This chart is used to determine which test to run for the suspect circuit. Corresponding PIDs to each circuit are listed. Some circuits do not have an associated PID or the PID may not be available and will to be measured with a digital multimeter. If the vehicle has a coil pack system with no start, perform the ignition test with the distributorless ignition system tester. Do not use the DIST for coil on plug applications.

INTERMITTENT TEST CHART

Z: Intermittent

← Z: Introduction

Z1 DIRECTION FOR INTERMITTENT DIAGNOSTIC PATH

- There are two main procedures used in this section to isolate and repair an intermittent concern. One will utilize the Rotunda Distributorless Ignition System Tester (DIST) and the other, a scan tool with digital multimeter.
- The DIST is only available for use on vehicles with coil pack ignition systems. If a DIST is not available, GO to Z2.

Is this a predetermined ignition concern?

Yes	No
GO to <u>Z50</u> for a coil pack application except 2.0L Cougar/Contour/Mystique/ Focus, GO to <u>Z2</u> .	GO to <u>Z2</u> .
GO to <u>Z2</u> for coil on plug application.	

Z2 PERFORM PCM RESET TO CLEAR FMEM

Note: Proceed with this step only if a PCM Reset was not done earlier; otherwise, GO to Z3. Eliminating FMEM will insure reproduction of any PCM related symptom.

- Connect scan tool to Data Link Connector (DLC).
- Key on, engine off.

Note: Be sure freeze frame data has been recorded before resetting the PCM.

- Complete a PCM reset.

Is the PCM Reset complete?

Yes	No
GO to <u>Z3</u> .	Complete PCM Reset. GO to <u>Z3</u> .

Z3 SELECT PIDS RELATED TO THE SYMPTOM

- A list of PIDs is needed for use with the scan tool to indicate the area of fault. Obtain the customer symptom description. Use the Reference Value Symptom Chart and proceed to the Reference Value PID/Masurement Signal Chart. These are located in the beginning of Section 6, Reference Values.
- Highlight each PID recommended by the charts under the PID selection menu on the scan tool.

Have all PIDs related to the symptom been chosen?

--	--

Yes	No
GO to Z4 .	REPEAT Z3 .

Z4 DECISION TO VERIFY SYMPTOM

- The path to symptom verification is optional, but is recommended for several reasons; some are because:
 - Vehicle is in for repeat repair.
 - No DTC is present.
 - Customer has difficulty describing the symptom.

Does symptom need to be verified?

Yes	No
GO to Z5 .	GO to Z11 .

Z5 COLLECT ANY AVAILABLE DATA TO AID IN SYMPTOM VERIFICATION

Note: Only MIL codes will trigger freeze frame data. Refer to scan tool instruction manual to retrieve freeze frame information.

- Prepare freeze frame data for use which was recorded earlier from the Symptom Charts in [Section 3](#).
- Continuous Memory DTCs should already be recorded from an earlier pinpoint test.
- Access information from the customer worksheet or any other available data from the customer.

Has all data been recorded?

Yes	No
GO to Z6 .	GATHER as much data as possible to aid in isolation of the intermittent fault area. REPEAT Z5 .

Z6 RECREATE SYMPTOM USING ALL DATA

Note: Vehicle may require some driving to proceed with this test step. The concern must be verified by recreating the conditions that originally set the DTC or caused the symptom.

- With the scan tool, select and monitor the same PIDs as displayed in freeze frame along with the previous highlighted PIDs from Step **Z3** . Using freeze frame data recorded earlier, recreate the conditions described by each freeze frame PID. Pay special attention to ECT, LOAD, RPM and VSS. Also, use any available customer data to aid in producing the correct conditions for recreating the symptom.
- When the symptom occurs, press trigger to begin recording (Refer to the scan tool instruction manual for recorder function).

Could symptom be reproduced?

Yes	No

GO to [Z11](#).

GO to [Z7](#).

Z7 RECREATE SYMPTOM USING KOEO ROAD TEST PROCEDURE

- The road test is the last attempt to locate the area of concern before physically disturbing vehicle circuits.

Note: PIDs for outputs in the Reference Value Charts represent commanded values only. Circuit measurements with digital multimeter indicate actual output status. Therefore, in the case of a fault, the PID and circuit reading on the vehicle may not correspond with each other. PIDs for PCM inputs with a mismatch to the circuit measurement indicate a possible PCM concern.

- The Intermittent Road Test Procedure is a set of instructions for monitoring PIDs with a scan tool and circuit measurements with a digital multimeter. This is done under four different conditions - KOEO, HOT IDLE, 48 and 88 kmh (30 and 55 mph). Use the [Typical Diagnostic Reference Values](#) from Section 6, Reference Values to compare with the actual vehicle values. For 48 and 88 kmh (30 and 55 mph) procedures, a planned route with passenger is required.
- Locate the corresponding Reference Value chart in [Section 6](#).
- Set vehicle up to measure circuits with a digital multimeter and scan tool.
- Connect scan tool to DLC.
- Key on, engine off.
- With the scan tool, select and monitor PIDs and also measure circuits shown in the Reference Value Chart in [Section 6](#).
- Compare the scan tool PIDs and digital multimeter values to the Reference Value Charts.

Are any values out of range?

Yes	No
GO to Z11 .	GO to Z8 .

Z8 RECREATE SYMPTOM USING HOT IDLE ROAD TEST PROCEDURE

- Key on, engine running and at least 87°C (195°F).
- Continue to monitor the same PIDs and circuits as in the previous step at hot idle.

Are any values out of range?

Yes	No
GO to Z11 .	GO to Z9 .

Z9 RECREATE SYMPTOM USING 48 KMH (30 MPH) SLOW CRUISE ROAD TEST PROCEDURE

- Drive vehicle on preplanned route.
- Continue to monitor the same PIDs and circuits during slow cruise as in the previous step.

Are any values out of range?

Yes	No
GO to Z11 .	GO to Z10 .

Z10 RECREATE SYMPTOM USING 88 KMH (55 MPH) HIGH CRUISE ROAD TEST PROCEDURE

- Continue to drive vehicle on preplanned route.
- Continue to monitor the same PIDs and circuits during high cruise as in the previous step.

Are any values out of range?

Yes	No
GO to Z11 .	It is now necessary to physically disturb selected vehicle circuits in an attempt to recreate the intermittent concern. GO to Z11 .

Z11 SELECT CIRCUITS FROM THE INTERMITTENT TEST CHART

- Remain in the PID selection menu with the scan tool.
- If the Intermittent Road Test was used to verify the symptom, highlight PIDs or signals that displayed a mismatch to the Reference Values from [Section 6](#). Otherwise, highlight only the PIDs from Step **Z3**.
- Proceed to the Intermittent Test Chart located at the beginning of this pinpoint test.
- Match selected PIDs to the corresponding circuit in the chart. There may be more than one circuit to test. If a PID recording was made with the scan tool, it may be helpful to replay at this time (refer to the scan tool instruction manual for recorder function).
- From the same chart, select and proceed to the appropriate test:
 - Input Test - Used on sensing devices such as temperature, position or oxygen.
 - Output Test - Used on output devices such as relays, coils or solenoids.

Has a test been chosen?

Yes	No
For Input Test : GO to Z12 . For Output Test : GO to Z16 .	To diagnose other driveability symptoms, GO to Section 3 , Symptom Charts.

Z12 KOEO INPUT TEST PROCEDURE FOR PCM SENSORS

WARNING: WHEN PERFORMING ANY OF THE TEST STEPS, ALWAYS BE AWARE OF HANDS, CLOTHING OR TOOLS NEAR COOLING FANS, OR HOT SURFACES.

- Using circuits chosen from the Intermittent Test Chart, select only the recommended PID(s) to monitor with the scan tool. If a PID is not available for the circuit, use a digital multimeter.
- Proceed to the area of the suspect wiring or component fault.
- Key on, engine off.
- If the input is a switch-type component, turn on manually.
- Monitor the PID or digital multimeter values while tapping on component.

- Monitor while wiggling sensor harness wire from component to PCM.
- Look for abrupt changes in values. Compare the actual values to the KOEO [Typical Diagnostic Reference Values](#) in Section 6 Reference Values.

Are values fluctuating in and out of range?

Yes	No
REPAIR as necessary. VERIFY repair.	GO to Z13 .

Z13 KOER INPUT TEST PROCEDURE FOR PCM SENSORS

 **WARNING: WHEN PERFORMING ANY OF THE TEST STEPS, ALWAYS BE AWARE OF HANDS, CLOTHING OR TOOLS NEAR COOLING FANS, ENGINE DRIVE BELTS OR HOT SURFACES.**

- Key on, engine running.
- Continue to monitor PIDs or circuits as in Step **Z12**.
- Proceed to the area of the suspect wiring or component fault.
- If the input is a switch-type component, turn on manually.
- Monitor the PID or digital multimeter values while tapping on component.
- Monitor while wiggling sensor harness wire from component to PCM.
- Look for abrupt changes in values. Compare the actual values to the HOT IDLE [Typical Diagnostic Reference Values](#) in Section 6, Reference Values.

Are any values fluctuating in and out of range?

Yes	No
REPAIR as necessary. VERIFY repair.	GO to Z14 .

Z14 KOEO WATER SOAK TEST PROCEDURE FOR PCM SENSORS

 **WARNING: WHEN PERFORMING ANY OF THE TEST STEPS, ALWAYS BE AWARE OF HANDS, CLOTHING OR TOOLS NEAR COOLING FANS OR HOT SURFACES.**

- Key on, engine off.
- Continue to monitor PIDs or circuits scan tool as in Step **Z13**.
- Proceed to the area of the suspect wiring or component fault.
- If the input is a switch-type component, turn on manually.
- Monitor the PID or digital multimeter values while lightly spraying a water mist on the component.
- Monitor while spraying sensor harness wire from component to PCM.
- Look for abrupt changes in values. Compare the actual values to the KOEO [Typical Diagnostic Reference Values](#) in Section 6, Reference Values.

Are any values fluctuating in and out of range?

Yes	No
REPAIR as necessary. VERIFY repair.	GO to Z15 .

Z15 KOER WATER SOAK TEST PROCEDURE FOR PCM SENSORS

 **WARNING: WHEN PERFORMING ANY OF THE TEST STEPS, ALWAYS BE AWARE OF HANDS, CLOTHING OR TOOLS NEAR COOLING FANS, ENGINE DRIVE BELTS OR HOT SURFACES.**

- Key on, engine running.
- Continue to monitor PIDs or circuits scan tool as in Step **Z14** .
- Proceed to the area of the suspect wiring or component fault.
- If the input is a switch-type component, turn on manually.
- Monitor the PID or digital multimeter values while lightly spraying a water mist on the component.
- Monitor while spraying sensor harness wire from component to PCM.
- Look for abrupt changes in values. Compare the actual values to the KOEO [Typical Diagnostic Reference Values](#) in Section 6, Reference Values.

Are values fluctuating in and out of range?

Yes	No
REPAIR as necessary. VERIFY repair.	GO to Z16 .

Z16 KOEO OUTPUT TEST PROCEDURE FOR PCM ACTUATORS

 **WARNING: WHEN PERFORMING ANY OF THE TEST STEPS, ALWAYS BE AWARE OF HANDS, CLOTHING OR TOOLS NEAR COOLING FANS OR HOT SURFACES.**

Note: PIDs selected from the Intermittent Test Chart will display commanded values only. Digital multimeter measurements will display actual values.

- Using circuits chosen from the Intermittent Test Chart, select the recommended PID(s) to monitor using the scan tool. Also, use a digital multimeter to compare circuit values with the scan tool PID values. If PIDs are not available for a particular circuit, look for a digital multimeter fluctuation to occur when doing any of the following tests.

Note: Output Test Mode may not control some outputs, such as injectors and ignition coils. To test these output types, GO to [Z17](#) . Caution must be used for the next steps. Cooling fans or fuel pump may turn on.

- Key on, engine off.
- With the scan tool, turn all outputs on using Output Test Mode (refer to scan tool instruction manual).
- Proceed to the area of the suspect wiring or component fault.
- Monitor the PID and digital multimeter values while tapping on component.
- Monitor while wiggling actuator harness wire from component to PCM.
- Look for abrupt changes or PID to digital multimeter value mismatches. Also, compare the actual values to the KOEO [Typical Diagnostic Reference Values](#) in Section 6, Reference Values.

Is there a mismatch or are any values fluctuating in and out of range on the Reference Value Charts?

Yes	No
REPAIR as necessary. VERIFY repair.	GO to Z17 .

Z17 KOER OUTPUT TEST PROCEDURE FOR PCM ACTUATORS

 **WARNING: WHEN PERFORMING ANY OF THE TEST STEPS, ALWAYS BE AWARE OF HANDS, CLOTHING OR TOOLS NEAR COOLING FANS, ENGINE DRIVE BELTS OR HOT SURFACES.**

- Key on, engine running.
- Proceed to the area of the suspect wiring or component fault.
- Monitor PIDs with the scan tool (if PIDs are available) using the PID monitor function. Compare the digital multimeter values with scan tool or look for a fluctuation in idle while tapping on the component.
- If a coil for a coil on plug application has been tapped and is suspect, with key off, it may be helpful to remove the coil and measure continuity from the spark plug terminal to the signal terminal while tapping the coil. A large fluctuation in resistance will indicate an intermittent open. Otherwise, monitor while wiggling actuator harness wire from component to PCM.
- Look for abrupt changes in idle or PID to digital multimeter value mismatches or fluctuation. Also, compare the actual values to the HOT IDLE [Typical Diagnostic Reference Values](#) in Section 6, Reference Values.

Is there an idle fluctuation, a digital multimeter value mismatch or fluctuation?

Yes	No
REPAIR as necessary. VERIFY repair.	GO to Z18 .

Z18 KOEO WATER SOAK TEST PROCEDURE FOR PCM ACTUATORS

 **WARNING: WHEN PERFORMING WATER SOAK TEST ON ELECTRICAL COMPONENTS AND/OR HARNESSSES, AVOID CONTACT WITH EEC, GEM AND OTHER MODULES IF POSSIBLE. ALWAYS BE AWARE OF HANDS, CLOTHING OR TOOLS NEAR COOLING FANS OR HOT SURFACES.**

Note: Output Test Mode may not control some outputs, such as injectors. To test these output types, GO to [Z19](#).

- Key on, engine off.
- With the scan tool, turn all outputs on using Output Test Mode (refer to scan tool instruction manual).
- Proceed to the area of the suspect wiring or component fault.
- Monitor the PID and digital multimeter value while spraying a light mist of water on the component.
- Monitor while spraying actuator harness wire from component to PCM.
- Look for abrupt changes or PID to digital multimeter value mismatches. Also, compare the actual values to the KOEO [Typical Diagnostic Reference Values](#) in Section 6, Reference Values.

Is there a PID to digital multimeter value mismatch or fluctuation in and out of range according to the Reference Value Charts?

Yes	No
REPAIR as necessary. VERIFY repair.	GO to Z19 .

Z19 KOER WATER SOAK TEST PROCEDURE FOR PCM ACTUATORS

WARNING: WHEN PERFORMING WATER SOAK TEST ON ELECTRICAL COMPONENTS AND/OR HARNESSSES, AVOID CONTACT WITH EEC, GEM AND OTHER MODULES IF POSSIBLE. ALWAYS BE AWARE OF HANDS, CLOTHING OR TOOLS NEAR COOLING FANS, ENGINE DRIVE BELTS OR HOT SURFACES.

- Key on, engine running.
- Monitor PIDs (if available) with the scan tool using the PID monitor function and continue to compare with the digital multimeter.
- Proceed to the area of the suspect wiring or component fault.
- Monitor the PID and digital multimeter value while spraying water mist on the component.
- Monitor while lightly spraying actuator harness wire from component to PCM.
- Look for abrupt changes in idle or PID to digital multimeter value mismatches. Also, compare the actual values to the Hot Idle [Typical Diagnostic Reference Values](#) in Section 6, Reference Values.

Is there an idle fluctuation, value mismatch or values fluctuating in and out of range according to the Reference Value Charts?

Yes	No
REPAIR as necessary. VERIFY repair.	KEY OFF. GO to Z20 .

Z20 INSPECT FOR INTERMITTENT MECHANICAL CONCERNS

Note: It is possible for an intermittent mechanical concern to cause a good PCM system to react abnormally.

- An inspection of mechanical systems relating to the DTC or symptom should have been performed in an earlier section. If not, visually inspect at this time.
- Look for the possibility of wires, vacuum lines or hoses that may short or kink during normal engine operation, such as:
 - Engine rock during acceleration.
 - Components moving during conditions of vibrations (high rpm or rough road).
 - Accelerator or transmission linkage contact or interference.

Is a mechanical concern detected?

Yes	No
REPAIR as necessary. VERIFY repair.	It is necessary to seek additional help. REFER to the OASIS system or Hotline. A customer flight recorder may also be useful.

Z50 INTERMITTENT IGNITION PROCEDURE

PRELIMINARY CHECKS

Note: This pinpoint test must be used with the Rotunda DIST Tester 418-F024 (007-00075) or equivalent for non coil on plug applications. The DIST cannot be used on the 2.0L Cougar/Contour/Mystique/Focus coil pack application. Quick Test must be performed and instructions in [Section 5](#) Pinpoint Test steps completed before starting the intermittent ignition procedure.

- Check sensor shield connector.
- Be certain the battery is fully charged.

- All accessories must be off during diagnosis.

Is vehicle prepared for equipment set-up?

Yes	No
GO to Z51 .	REPEAT Z50 .

Z51 INSTALL DIST TESTER

- All accessories must be off during testing.
- Select proper Overlay and Program Cartridge to match the ignition system to be tested.
- Install overlay on front panel of tester.
- Insert Program Cartridge into the cartridge slot (marked on the RH side of the front panel). Make sure the cartridge is fully inserted.
- Select and install the proper harness adapter to the Rotunda DIST Distributor/Less Ignition System Tester 104-Pin PCM Adapter 007-00110. Set the rotary knob to position I.
- Verify that the WIGGLE TEST switch is in the OFF position. For 2.5L Ranger, verify that the SYSTEM TYPE switch is set to DUAL PLUG; all other four cylinders set to NON DUAL PLUG.
- WIGGLE TEST can only be used during key on, engine off.
 - WIGGLE TEST monitors circuits for intermittent faults.
 - WIGGLE TEST MODES A, B, and C check for short to power, open, and short to ground respectively.
 - Simulate fault conditions by wiggling the wiring harness and tapping on connectors and components.
 - The DIST will beep and turn on the LED for the circuit on which a fault is detected.
- Disconnect the vehicle wiring harness from PCM.
- Hook Tester to PCM and vehicle wiring harness.
- Key on, engine off. Press Tester RESET button. The tester performs Self-Test when it is reset or powered up. During the Self-Test, all LEDs will light and a beep will be heard.
- If the CASE GND (CKP SHIELD) FAULT MEMORY LED (EI only) stays on, run a ground line from the PCM Case to GND and continue with test.

Does the tester perform Self-Test and is the VPWR LED on?

Yes	No
GO to Z223 .	REFER to warranty supplied with the DIST tester.

Z223 RECREATE THE CONCERN

- With the DIST connected to the vehicle, try to recreate the fault by test driving the vehicle. If the vehicle is a No Start, crank engine for 5 to 10 seconds.

Are any FAULT MEMORY LEDs on during crank or engine run?

Yes	No
KEY OFF. GO to Z234 .	RECREATE the fault with Freeze Frame data or information from the customer. GO to Z234 .

Z234 WIGGLE TEST MODE

- Place WIGGLE TEST switch to ON.
- Place MODE switch to A.
- Press RESET button.
- Wait for WIGGLE TEST ACTIVE LED to light.
- Wiggle Test and tap circuit components.
- Repeat procedure with mode switch to B and C.

Are any **FAULT MEMORY** LEDs on?

Yes	No
PRESS RESET and WAIT for WIGGLE TEST ACTIVE LED to light. CONTINUE to test until intermittent is isolated. REPAIR as necessary. VERIFY repair.	REPLACE PCM (REFER to Section 2, <u>Flash Electrically Erasable Programmable Read Only Memory (EEPROM)</u>). VERIFY repair.

Powertrain Control/Emissions Diagnosis Manual

2001

On Board Diagnostics II

SECTION 6: Reference Values

Choose an item on the left side to display section contents.

Reference Value Symptom Chart

The Reference Value Symptom Chart is used to provide guidance in selecting the appropriate PID or measured signal related to the fault area. Select a symptom from the symptom chart along with the category number and proceed to the PID/Measured Signal Chart. For multiple symptoms, select the most evident.

Symptom Chart

Symptom occurs during	Symptom	Category Number
STARTUP:	No start/Normal crank	1
	Hard start/Long crank	2
	Stall after start	3
	Diesels/Runs on	4
IDLE:	MIL	5
	Stalls/Quits	6
	Slow	7
	Slow return	8
	Rolling	9
	Fast	10
	Rough	11
	Misses	12
	Backfires	13
	ACCELERATION:	Stalls/Quits
Misses		12
Bucks/Jerks		14
Backfires		13
Hesitation		15
Lack/Loss of power		16
Surge		17
Spark knock		18
Cooling system temperature		19
Poor fuel economy		20
Emissions compliance	21	
CRUISE:	Stalls/Quits	6
	Misses	12
	Bucks/Jerks	14
	Backfires	13
	Lack/Loss of power	16

	Surge	17
	Spark knock	18
	Cooling system temperature	19
	Poor fuel economy	20
	Emissions compliance	21
DECELERATION:	Stalls/Quits	6
	Backfires	13
TRANSMISSION OPERATION: (AUTOMATIC)	Shift/Engagement Concerns	22
	No overdrive	23
TRANSMISSION OPERATION: (MANUAL)	No reverse lights	24

Reference Value PID/Measured Signal Chart

The listing reflects PIDS and/or measured values which may reveal a possible concern within each system shown. Match the category number with the related PID/measured signal and proceed to the Typical Diagnostic Reference Value Charts.

^a Generic PID

Some signals are measured only and will require the use of a breakout box and digital multimeter.

Typical Diagnostic Reference Values

Notes:

The footnotes are referenced throughout the Typical Diagnostic Reference Value Charts. A letter in parentheses next to a value indicates supplemental information is applicable.

An attempt is made to provide as much information as possible; some vehicles may not display all input and output signals.

The Typical Diagnostic Reference Value Charts do not display fault PIDs. These are PIDs which indicate a hard fault with the circuit. They display a value of "YES" or "NO" and are PIDs ending with an "F".

Reference values may vary +/-20% depending on operating conditions and other factors. RPM values are axle and tire dependent.

For downstream O2S (12, 22) greater activity will result when catalyst monitor is active.

Refer to Section 2, Parameter Identification Access, for PID descriptions.

gs-green state

fs-federal state

- A. A/C on.
 - B. Cooling fan on (single, low or high speed).
 - C. O2S(s) should switch from rich to lean at least once every 3 seconds. O2S voltage should toggle above and below 0.450 DCV and never be a negative value. Valid O2S switching only occurs during closed loop fuel control.
 - D. Downstream O2S(s) will stay close to a constant voltage when the catalyst monitor is off (positive value only). When the catalyst monitor is on, O2S will switch rich to lean above and below 0.450 DCV and never be a negative value.
 - E. Brake pedal applied.
 - F. Catalyst monitor off.
 - G. While pressing transmission control switch (TCS) or switching to manual drive mode.
 - H. Values shown are commanded by the PCM and may not be actual.
 - I. Steering wheel turned.
 - J. Clutch pedal applied.
 - K. Value is dependent upon ambient air temperature and may fall outside of range.
 - L. Value is not useful under this condition.
 - M. If equipped.
 - N. Transmission in selected range.
 - O. Values recorded using 100% unleaded gasoline.
 - P. May change state under this condition.
 - Q. While pressing switch.
 - R. Frequency cycles high within a few seconds of turning headlamps on. Frequency cycles back to 0 Hz shortly after cycling high.
 - S. Generator under full load.
 - T. Refer to Workshop Manual Section 419-01.
-
