

# Blank Minecraft Server File

I have downloaded the java version as a substitute of just the exe. file as I've seen others with the same problem strive to fix the difficulty this fashion. I'm sure that the exports and imports for the IP deal with connections and have entered the 25565, and listed each TCP and UDP or whatever. I exploit the CT-5374 which is a Comtrend router. However the Minecraft server file; the stats, log and chat, and players all show up blank. Nevertheless minecraft servers doesn't checklist it as a "java" or ".jar" or no matter after the file title. I'm unsure what the issue is other than it's having to deal with the blankness but I am tired of working into all of those problems. I have been troubleshooting for practically three straight hours and nonetheless cannot seem to fairly repair it. I can be part of onto my multiplayer server, but my associates can't, and I am uncertain of what to do now.
