

SUPERIOR HULLS' SPEED & LIFT

Superior hulls, has developed from its original new discovery, the beneficial capabilities of making boats Fly on water, and for Ships to Surf forward with multilayer lubrication options.

The superior performance capabilities are gained in significantly improved comfort, economy, speed, maneuverability, safety and few related to racing and defence; and are gained by the automated simple installation of a Flexible Power Fins product which creates an alternating water lubrication cousin under the hulls which also allows an air plus gaseous lubrication option as in the invention, for existing hulls. Employing the yet newer Superior Hulls Designed Hulls, all these benefits are improved even more, as well as add internal hull space for use or hulling cargos without loss of performance.

The patent application is being processed, so at this time we are not yet free to share any of the IP description or share drawings or pictures which do show the invented fins.

We can share our awareness that this is a very special opportunity for a major partner to join our project, and help the market gain access to this new important technology which is highly beneficial for the maritime industry we as a small company can not serve.
