Dbol does not bid to the AR so is class 2 Therefore you have a good combo of class one and class 2 steroids, and with a short 4 week cycle, you should recover quite quickly, especially with the fact that if you take dbol only in the mornings its not suppressive and primo is the least suppressive.

Why is Dbol/Primo cycle not used anymore? I had insane gains and strength on a 3-4 week 20mg Dbol cycle on top of my 8-week 15mg YK11 cycle. Yes sounds dumb, but did blood work before, during, and after the cycle and all of my health markers stayed in range, no additional liver or kidney stress. No messed up lipids or BP.

Methenolone Enanthate (Primobolan Depot) Depot is the name of the injectable form of Primobolan. It is considered to be a more effective and slightly more powerful form of Primobolan, but the effects are still similar to the oral form and it remains a relatively mild steroid compared with most others out there.

Most sources will say 4 weeks, but with moderate dosing I've found that 6-8 weeks is suitable. I'd rather use Dbol at 25 mg/day for 8 weeks than 50 mg's/day for 4 weeks. But seriously limit your cycles on dbol because you don't want to kill your liver by staying on Dianabol all the time! Dbol Side Effects

As mentioned, Primo needs a more androgenic compound to truly get the maximum benefit so an additional steroid is often used and Arnold was thought to maybe use 50 mgs of d-bol a day, which was also pushing the envelope at the time. As little as 200 mgs of test will suffice to maintain a favorable androgenic environment.
