How To Set Up A Minecraft Server On Windows 10

Step 5: Play on your server.

Now that you have adjusted everything you probably want to play some Minecraft with your friends. To play you have 3 options.

1. Locally (Same PC): This is for those who just want to play by themselves. 2. Internally (Lan), - This is where you and your friends can play on the same WIFI. 3. Externally (Outside Lin) - This is a place for your friends from all over the world to connect.

Option 1. Locally: Let's start with option 1. Open Minecraft and hit Multiplayer to connect. Next, click on "Add Server". For the server name you make it whatever you want. You have two options for the server address: "0" and "LocalHost". This will connect you to your server and you are free to play.

Option 2. Internally (Lan). So you have some friends who you would like to play with. Your ipv4 addresses is necessary to connect with your friends. I personally recommend going to https://www.whatismyip.com/what-is-my-public-ip-address/ and getting it. You can also access it by opening cmd, and typing "ipconfig". This will also show you all of your other IP configurations. Once you have the file, share it with friends and have them enter it in to the server address field.

Option 3. Externally (Outside Lan) - This is the best option if you want to play with friends who live far away. You will need your ipv4 for this, but there are additional steps. Port forwarding your router will allow others to connect through your port. MINECRAFT SERVERS LIST The default Minecraft port is at 25565. There are many videos on Youtube to help you port forward. Every provider is different. You can find out how to portforward for "your provider". Once this is done then just send your ipv4 to your friends and they should be able to connect.

The End.
