

Anyone Played Minecraft On An M1 Mac?

Anyone played Minecraft on an M1 Mac?

Hey!

When I read the reviews of the new Macs, especially the MacBook Pro, I'm very inclined to upgrade from my Surface Pro 4 to a Mac. I was a Mac user during the Snow Leopard to Mavericks days however, I switched to Windows some time ago.

I have many applications which I've read about working well on M1 however, do you know if Minecraft (Java) is compatible on an M1 Mac. It's one of my favorite games and I don't think I could replace my computer with one that doesn't support it. I'm aware Java exists for ARM, but I've not heard anyone play Minecraft on an M1 Mac!

Thanks! (I hope that I put it in the right place!)

It is highly recommended. Performance-wise, the M1 Mac will blow your mind. It's only a matter of time before Minecraft is optimized for the M1. Maimers's blog to run either version until then. Bedrock (because M1's are able to run natively applications for iOS/iPadOS today) and Java (translated in real time running Rosetta 2 which is built into. There is no noticeable difference).

I tried to side load Minecraft to my M1 Mac, but the keyboard and mouse wouldn't work. How did you side load it?

Yes

info from the video: Java is not a native M1 application, therefore it has to make use of Rosetta 2 emulation.

He was comparing the Baseline 7 core GPU MacBook Air to the Baseline8-core GPU MacBook Pro. The MBP produced the world (same seeds on both) like a second quicker however the MacBook Air seemed a bit quicker for some reason (he used the same graphics settings on both).

The issue in this comparison is that he kept Vsync running, so the FPS is limited to 60 FPS. It would've been interesting to see how high it can really go

iOS, Android and Windows 10 versions of Minecraft all play well together, but the PC and Mac versions of Minecraft will not work with a Pocket Edition Realms server. You can still play with your friends on Android and an iOS device.
