## About Radon Systems

Radon is a normally happening radioactive gas that has no odor, shade or taste and is created by the break down of uranium in soil, rock and also water. Uranium is discovered in all dirt as well as in greater focus in granite, shale and also phosphates. As it rots into radon gas, it relocates via the soil right into the environment, where it is harmlessly dispersed in outside air or can get in structures via structure openings and also end up being trapped inside.

Structures apart from houses can also have radon problems (such as industrial structures, schools, homes, etc.). Radon breaks down right into a number of contaminated components called radon decay items, which are solid fragments that come to be suspended in air. They are very little and also conveniently inhaled, where they can attach to lung cells.
