

What do you know about the world's most popular casino? Chances are you've heard of it: online casino slots, video poker, roulette, craps and a number of other games. But did you know that Pai Cow is the name of the girl behind one of the most famous casinos in Vegas? This is the woman who founded the Las Vegas Review Board, which has regulated the gambling industry in Las Vegas since its beginning. And today, Pai Cow is called a fierce opponent of online gambling and Internet gaming among other things.

The woman known as Pai Cow's accomplishments are almost unparalleled. But her biggest claim to fame is beginning a house advantage in casino games. What's a house edge? It's the difference between the casino's expected winnings and the true payoff when you bet. In basic gambling terms, this means that the house advantage is the difference between the expected winnings of casino games and the actual payouts.

House advantages are found all over the board in casino games. Slots, blackjack and roulette all have very high house advantages, meaning that they are mathematically nearly impossible to beat, at least in a long-term standstill. Pai Cow knew that this was a issue, and she set out to find a mathematical cure for it. Using the exact same mathematical equation used in calculating aircraft engines, she calculated that the home advantage for most casino games, such as blackjack, slots and craps, was too high to be profitable. Thus, she made the House Strategy algorithm, which remains in use today.

Although the algorithm is just now beginning to be used in the area of casino gaming, its application in real life can be fairly large. If you take a look at most cities around the country, you will see that casino loyalty passes down from one generation to another. Many citizens begin gambling at casinos when they are just teens and stay loyal to the casinos into their adult lives. Needless to say, most of them never get close enough to a casino to actually play any of the machines, but their loyalty is clearly visible.

The identical loyalty can be observed among gamblers in a number of other arenas. Most companies give their employees free casino tickets whenever promotions begin, and the same is true for many big corporations. Companies have a tendency to provide their workers whatever they want, as most workers are not prepared to risk their jobs on something which may fickle or be readily rendered useless. It's no wonder that casino workers are often the best sales people in the world, because they understand the ins and outs of this casino game, slot machines and blackjack better than any college graduate studying for his bachelor's degree in accounting. A casino employee has practically guaranteed themselves a permanent place in the worker files of most businesses.

The same loyalty can be observed between players in online casinos. Blackjack tournaments usually involve more than one player, which means that a player can change from table to table at any time, making it nearly impossible for any gamblers to win the pot on the first try. Online gamblers must also beware of cheats and hacks which make winning easy, but impossible in reality. A casino with a large customer base will probably use these tricks on a regular basis. To avoid having your personal information stolen, always check that there are

no malicious codes or hidden programs running in the background when you are playing.

Another reason casinos operate so well is due to the complex nature of gambling. In blackjack, for example, the odds against one player winning on a single card are astronomical, while the odds against a group of players hitting at exactly the same time are minuscule. This means that a casino's likelihood of any given machine winning on the first try is very high, while the odds of that identical machine winning two or more consecutive times are near zero. These numbers mean that the casino can turn a consistent profit by paying out small wins over again, thereby creating a sense of fairness among players. At exactly the same time, however, since the casino can't afford to pay out big sums of money to win small sums of money, it must resort to clever ways of enticing people to play more than their fair share.

If you would like to play slots, for instance, you might have noticed that there are lots of different casino games offered in online casinos, each with its own odds and odds of winning. For example, a casino could offer four different slot games, all of which have different odds of winning, and a bonus arrangement where each time you play a slot you get a free spin with a specific number of coins. This can create an incentive to play more, as you stand a better chance of getting a jackpot the more often you play. In addition to the slots, even however, you could realize that a casino offers video poker, blackjack, and roulette, all of which also have their chances and chances of winning.
