

# Minecraft Redstone Devices are now A Real Thing

In the past, people have tried making Minecraft things that are real such as building replicas of a piston using Lego. It's impossible to recreate redstone, the material that can be used for almost anything, and create devices and gadgets using it. Or is it?

Hebac, a Redditor, has been working on these devices for over two years and has achieved some amazing results. Some of their early work was focused on dispensers, but they eventually went on to make the redstone systems modular. This makes it work exactly the same way as it does in the game.

Hebac's latest post shows off an entire circuit, which stops a cute little sheep, and activates the block, as well as some astonishingly powerful pistons. Minecraftservers The end of the video also shows a range of blocks from previous videos, though we're certain that the TNT is just a standard block. It's awe-inspiring and more so as this is something Hebac does in their spare time.

Heblac's modular structures can easily be transformed into a variety of toys. However they have declared that it's difficult to make money from these toys. We'll have to admire the intricate and stunning Minecraft redstone creations until now. As always, the talent of the Minecraft community continues to impress.

In other news, an incredible new adventure has been released today called Spellcraft that includes new enemies and spells. The best part is that it's completely free.
