

# Blank Minecraft Server File

I've downloaded the java model as an alternative of simply the exe. file as I have seen others with the identical problem try to repair the difficulty this fashion. More I'm certain that the exports and imports for the IP handle connections and have entered the 25565, and listed both TCP and UDP or no matter. I exploit the CT-5374 which is a Comtrend router. But the Minecraft server file; the stats, log and chat, and gamers all show up clean. Nevertheless it doesn't record it as a "java" or ".jar" or no matter after the file identify. I am undecided what the problem is other than it's having to deal with the blankness however I'm tired of running into all of these issues. I have been troubleshooting for practically 3 straight hours and nonetheless can not appear to fairly fix it. I can join onto my multiplayer server, however my friends cannot, and I'm unsure of what to do now.
