I. INTERNATIONAL CONGRESS ON MEDICINAL AND AROMATIC PLANTS "NATURAL AND HEALTHY LIFE"

TABKON' 17

BOOK OF ABSTRACTS

Kitabın Adı

I. INTERNATIONAL CONGRESS on MEDICINAL and AROMATIC PLANTS: "NATURAL and HEALTHY LIFE" BOOK of ABSTRACTS

Kurucu(İmtiyaz Sahibi)

Prof. Dr. Muzaffer ŞEKER

Editör

Prof. Dr. Selman TÜRKER
Prof. Dr. Ayşe Saide ŞAHİN
Doç. Dr. Murat ERTEKİN
Yrd. Doç. Dr. Ahmet ÜNVER
Yrd. Doç. Dr. Süleyman DOĞU
Öğr. Gör. Hasan Ali AKYÜREK
Uzm. Hasan İbrahim KOZAN

Grafik

Mustafa ALTINTEPE

Tasarım

Hasan Ali AKYÜREK
Hasan İbrahim KOZAN

Çok Dil Bilgileri

Türkçe: I. Uluslararası Tıbbi ve Aromatik Bitkiler Kongresi:
"Tabii ve Sağlıklı Hayat" Özet Kitabı
İngilizce: I. International Congress on Medicinal and Aromatic
Plants: "Natural and Healthy Life" Book of Abstracts

Yayın Tarihi

Mayıs 2017

ISBN: 978-605-4988-14-3

HONOR COMMITTEE

Prof. Dr. Veysel EROĞLU

Orman ve Su İşleri Bakanı

Faruk ÇELİK

Gıda, Tarım ve Hayvancılık Bakanı

Prof. Dr. Recep AKDAĞ

Sağlık Bakanı

Yakup CANBOLAT

Konya Valisi

Tahir AKYÜREK

Konya Büyükşehir Belediye Başkanı

Prof. Dr. Mustafa SOLAK

Afyon Kocatepe Üniversitesi Rektörü

Prof. Dr. Muzaffer ŞEKER

Necmettin Erbakan Üniversitesi Rektörü

İsmail ÜZMEZ

Orman Genel Müdürü

ADVISORY COMMITTEE

Prof. Dr. Tahir YÜKSEK

Necmettin Erbakan Üniversitesi – Rektör Yardımcısı

Doç. Dr. Evren ALĞIN YAPAR

Sađlık Bakanlığı – TİTCK, Kozmetik Ürünler Dairesi Başkanı

Yrd. Doç. Dr. Ahmet ÜNVER

Necmettin Erbakan Üniversitesi – Gıda Mühendisliđi Bölümü

Dr. Ecz. Aslı CAN AĞÇA

Sađlık Bakanlığı – TİTCK, Bitkisel, Destek ve İleri Tedavi Tıbbi Ürünleri Dairesi Başkanı

Dr. Mehmet Zafer KALAYCI

Sađlık Bakanlığı – Geleneksel, Tamamlayıcı ve Alternatif Tıp Uygulamaları Dairesi Başkanı

Dr. Tuncay PORSUK

Orman Genel Müdürlüğü – İç Anadolu Ormanlık Araştırma Enstitüsü Müdürü

Galip Çađtay TUFANOĐLU

Orman Genel Müdürlüğü – Envanter Planlama Şube Müdürü

Özgür BALCI

Orman Genel Müdürlüğü – Bitkisel Ürünler Şube Müdürü

İbrahim ÖZTÜRK

Konya Orman Bölge Müdürlüğü – Bölge Müdür Yardımcısı

Erdal TUNÇEZ

Konya Orman Bölge Müdürlüğü – Odun Dışı Ürün ve Hizmetler Şube Müdürü

Ecz. Mücahit YINANÇ

İlaç Eczacılık Sađlık Bilim ve Teknolojileri Vakfı

ORGANIZING COMMITTEE

KONGRE DÖNEM BAŞKANI

Prof. Dr. Selman TÜRKER

Necmettin Erbakan Üniversitesi – Gıda
Mühendisliği Bölümü

KONGRE DÖNEM BAŞKANI

Prof. Dr. Ayşe Saide ŞAHİN

Necmettin Erbakan Üniversitesi – Tıbbi
Farmakoloji Anabilim Dalı

GENEL SEKRETER

Doç. Dr. Murat ERTEKİN

Necmettin Erbakan Üniversitesi – İç Mimari Ve
Çevre Tasarımı Bölümü

ÜYE

Dr. Ahmet İPEK

Orman Genel Müdürlüğü – Genel Müdür
Yardımcısı

ÜYE

Dr. Hakkı GÜRSÖZ

Türkiye İlaç ve Tıbbi Cihaz Kurumu – Kurum
Başkanı

ÜYE

Doç. Dr. Burak Cem SONER

Necmettin Erbakan Üniversitesi – Tıbbi
Farmakoloji Anabilim Dalı

ÜYE

Doç. Dr. Cesarettin ALAŞALVAR

Tübitak Mam Gıda Enstitüsü Müdürü

ÜYE

Emin ŞİMDİ

Orman Genel Müdürlüğü – Odun Dışı Ürün ve
Hizmetler Daire Başkanı

ÜYE

Bekir KARACABEY

Konya Orman Bölge Müdürlüğü – Bölge Müdürü

ÜYE

Yrd. Doç. Dr. Süleyman DOĞU

Necmettin Erbakan Üniversitesi – Bitkisel Ve
Hayvansal Üretim Bölümü

SEKRETERYA

Öğr. Gör. Hasan Ali AKYÜREK

Necmettin Erbakan Üniversitesi – Yönetim Bilişim
Sistemleri Bölümü

SEKRETERYA

Uzm. Hasan İbrahim KOZAN

Necmettin Erbakan Üniversitesi – Gıda İşleme
Bölümü

SCIENTIFIC COMMITTEE

Abderrahmane Romane

Coordinator of REMAPAM, Morocco / Cadi
Ayyad University

Abdollah Hassanzadeh Gorttapeh

Agricultural and Natural Sources Reserech and
Education Center of West Azarbayjan
Province, Urmia, Iran

Abdullah ÖKSÜZ

Necmettin Erbakan Üniversitesi, Sađlık
Bilimleri Fakültesi

A.K.M. Shahidullah

University of Manitoba / Canada

İçindekiler

SAĞLIK BAKANLIĞI'NCA DÜNDEN BUGÜNE TAB ÇALIŞMALARI.....	1
ASLI CAN AĞCA.....	1
ORMAN VE SU İŞLERİ BAKANLIĞI'NCA DÜNDEN BUGÜNE TAB ÇALIŞMALARI.....	2
EMİN ŞİMDİ.....	2
GIDA, TARIM VE HAYVANCILIK BAKANLIĞI'NCA DÜNDEN BUGÜNE TAB ÇALIŞMALARI.....	3
MEHMET HASDEMİR.....	3
TÜRKİYE'NİN TEHLİKE ALTINDAKİ ENDEMİK BİTKİLERİN EKOLOJİSİ VE İKLİM DEĞİŞİKLİĞİ İLE İLİŞKİSİ.....	4
MUNİR ÖZTÜRK.....	4
GIDANIZ İLACINIZ, İLACINIZ GIDANIZ OLSUN.....	5
AHMET ÜNVER.....	5
ENDEMIC MEDICINAL AND AROMATIC PLANTS OF TURKIYE - CONSERVATION AND SUSTAINABLE USE.....	6
MUNİR ÖZTÜRK, VOLKAN ALTAY ²	6
ST.JOHN'S WORT; IS IT A PANACEA?.....	7
ERDEM YEŞİLADA.....	7
THE ROLE OF MEDICINAL PLANTS IN DRUG DISCOVERY AND THE POTENTIAL OF TURKISH MEDICINAL PLANTS FOR BIOACTIVE METABOLITES.....	8
HASAN KIRMIZİBEKMEZ.....	8
MANAGEMENT OF CANCER: ARE POLYPHENOL-RICH FUNCTIONAL FOOD A NEW AVENUE TO BE PURSUED?..	9
VIDUSHI S NEERGHEEN-BHUNJUN.....	9
DIVERSE BIOLOGICAL FUNCTIONS OF KOREAN MISTLETOE.....	10
JONG-BAE KIM.....	10
FUTURE PERSPECTIVES OF FUNCTIONAL FOODS AND HEALTH.....	12
CESARETTİN ALAŞALVAR.....	12
A PRELIMINARY STUDY ON THE SPAWN PRODUCTION OF OYSTER MUSHROOM (PLEUROTUS OSTREATUS) .	13
AHMET ÇAT, TURHAN ÇOMAK ² , MÜRSEL ÇATAL ²	13
PHENOLIC ACIDS DETERMINATION IN SIX WILD MUSHROOM SPECIES BY HPLC-DAD.....	14
FATİH ÇAYAN, EBUR DEVECİ ² , GÜLSEN TEL ÇAYAN ¹ , MEHMET EMİN DURU ²	14
THE USE OF A DIFFERENT SPECIES BELONGING TO THE GENUS AGARICUS IN THE MUSHROOM CULTIVATION: AGARICUS MACROCARPUS F.H. MOLLER.....	16
GIYASETTİN KAŞIK, SINAN ALKAN ¹ , CELALEDİN ÖZTÜRK ¹ , HATİCE ESRA AKGÜL ¹	16
ISOLATION OF NEW STEROIDS FROM SARCOSPHAERA CRASSA (SANTI) POUZAR; A POISONOUS EDIBLE MUSHROOM.....	17
ZAIN ULLAH, MEHMET ÖZTÜRK ¹	17
AN ANALYSIS FOR THE USAGE OF KANLICA MUSHROOM ON THE PRACTICE FIELD OF GASTRONOMY AS A TYPE OF HIGH AROMATIC MUSHROOM.....	18

OYA ÖZKANLI, ÖZKAN SÜZER ¹ , CEYHUN UÇUK ¹	18
BIOCHEMICAL AND DEMOGRAPHIC EVALUATION OF EMERGENCY DEPARTMENT PATIENTS WITH MUSHROOM POISONING	19
MUSTAFA FATİH HAYIRLIOĞLU, CEMİLE TOPCU ¹ , KÜRŞAT AYRANCI ² , MEHMET GÜRBİLEK ¹	19
AXILLARY SHOOT REGENERATION OF POGOSTEMON ERECTUS (DALZELL) KUNTZE FROM NODAL EXPLANTS	20
MUHAMMET DOĞAN, MEHMET KARATAS ² , MUHAMMAD AASIM ²	20
PRODUCTION POTENTIAL OF COLCHICINE AS A SECONDARY METABOLITE FROM COLCHICUM AUTUMNALE L. PLANT BY IN VITRO CULTURE	21
GÜLSEREN EKER, AYŞEGÜL YILMAZ ¹ , SERVET KEFİ ¹	21
EFFECTS OF MAGNETIC FIELD TREATMENTS ON SEED GERMINATION OF MELISSA OFFICINALIS L.....	22
CANAN ÜLGEN, ARZU UÇAR TÜRKER ¹ , ARZU BİRİNCİ YILDIRIM ¹	22
EFFECTS OF OSMOTIC CONDITIONING TREATMENTS OF LAVENDER (LAVANDULA ANGUSTIFOLIA) SEEDS ON MEAN GERMINATION TIME AND GERMINATION RATE	23
MUSTAFA DEMIRKAYA, BILGE AYDIN ¹ , AKIFE DALDA ŞEKERCİ ¹ , OSMAN GÜLŞEN ¹	23
THE EFFECT OF DIFFERENT SOWING TIMES ON YIELD AND QUALITY OF MARIGOLD (CALENDULA OFFICINALIS L.) AT ÇUKUROVA CONDITIONS.....	24
SELİN GEDİK, LEYLA SEZEN TANSİ ¹	24
THE PHYSICOCHEMICAL AND STRUCTURAL CHARACTERISTICS OF CULTIVATED SALEP.....	25
ABDULLAH KURT, TALIP KAHYAOĞLU ²	25
THE HEALTH BENEFITS OF HİGHBUSH CRANBERRY (VIBURNUM OPULUS L.) TEA	26
AYŞEN MELDA ÇOLAK, FATMA ALAN ² , VOLKAN OKATAN ³	26
POSSIBLE USE OF EPIGALLOCATECHIN-3-GALLATE FROM GREEN TEA AS PREVENTION OF PERIODONTAL DISEASE.....	27
ARZU BEKLEN	27
THE EFFECT OF ADDING HONEY AT DIFFERENT TEMPERATURES ON ANTIOXIDANT PROPERTIES AND HYDROXYMETHYL FURFURAL FORMATION IN LINDEN TEA PREPARED WIHT INFUSION AND DECOCTION	28
DUYGU BENZER GÜREL, ÖZLEM ÇAĞINDI ¹	28
THE EFFECTS OF TOXIC LEVELS OF HEAVY METALS ON ANTIOXIDATIVE CAPACITY IN AERIAL PARTS OF SAGE	29
ÖZLEM ARSLAN	29
INVESTIGATION OF THE EFFECTS OF ULTRASOUND ON GREEN TEA (CAMELLIA SINENSIS) AQUEOUS EXTRACT	30
GAMZE ÜÇÖK, DURMUŞ SERT ¹	30
INVESTIGATION ON THE EFFECT OF TEA (CAMELIA SINENSIS (L.) KUNTZE) EXTRACTS ON ORAL BIOFILM	31
ALP KAYAHAN KIVANÇ, MERİH KIVANÇ ² , GÜLBEN GÜNEY ³ , ZUHAL KIRZIOĞLU ³	31
NEUROPROTECTIVE ACTION OF FERULA COMMUNIS IN OXIDATIVE STRESS-INDUCED APOPTOSIS CELLS.	33
GÜLŞAH YILDIZ DENİZ, ESRA LALOĞLU ¹	33
EFFECT OF OCIMUM BASILICUM ON MESENCHYMAL STEM CELL PROLIFERATION AND DIFFERENTIATION: DOES THE EFFECT CHANGE ACCORDING TO NICHES?	34

AYŞEGÜL H. MENDİ, BEYZA GÖKÇINAR YAĞCI ² , NURDAN SARAC ³ , MUSTAFA KIZILOĞLU ⁴ , AYSEL UĞUR ⁵ , DERSİŞ YILMAZ ⁴ , DUYGU UÇKAN ⁶	34
THE CYTOTOXIC AND APOPTOTIC EFFECTS OF ARUM DIOSCORIDIS EXTRACT AND TOZASERTIB COMBINATION ONTO THE CFPAC-1 PANCREATIC ADENOCARCINOMA CELL LINE	35
ERSİN ÖZTÜRK, A. ATA ÖZÇİMEN ² , DERYA YETKİN ³	35
EVALUATION OF ANTICANCEROGENIC AND ANTIBACTERIAL EFFECT OF MURT (MYRTUS COMMUNIS) PLANT EXTRACTS ON SOME CELL LINES IN VITRO	36
F. AZİZE BUDAK YILDIRAN, ABDULLAH MELEKOĞLU ² , MUSTAFA TÜRK ¹ , SİYAMİ KARAHAN ¹	36
DIANTHUS CARMELITARUM EXTRACT INDUCES CELL CYCLE ARREST AND APOPTOSIS IN HUMAN COLON CANCER CELLS	37
İBRAHİM TURAN, SELİM DEMİR ² , SERAP OZER YAMAN ³ , KUBRA AKBULUT CAKIROĞLU ³ , REZZAN ALIYAZIOĞLU ⁴ , AYSE ARSLAN ⁵ , AHMET MENTESE ⁶ , YUKSEL ALIYAZICIOĞLU ³	37
THE PRODUCTION OF ANTICANCER SECONDARY COMPOUNDS BY PLANT CELL CULTURES.....	39
BELMA KONUKLUGİL	39
THE EFFECTS OF PROPOLIS ON THE QUALITY OF SPERM, REPRODUCTIVE ORGANS AND TESTICULAR ANTIOXIDANT STATUS OF RATS TREATED WITH CYCLOSPORINE-A	40
BURCU GÜL BAYKALIR, PINAR TATLI SEVEN ² , SEYFETTİN GÜR ² , İSMAIL SEVEN ³	40
THE THERAPEUTICS EFFECTS AND TOXIC RISK OF HERACLEUM PERSICUM DESF. EXTRACT ON EXPERIMENTALLY STREPTOZOTOCIN-INDUCED DIABETIC RATS	41
ELİF EBRU ALKAN, İSMAIL ÇELİK ¹ , BEDIA BATI ²	41
THE INVESTIGATION OF BIOLOGICAL EFFECTS OF THE IN RATS WITH METABOLIC SYNDROME NIGELLA SATIVA OIL.....	42
NACI ÖMER ALAYUNT, BİLAL ÜSTÜNDAĞ ²	42
THE EFFECTS OF JUNIPERUS COMMUNIS(CUPRESSACEAE) APPLICATION ON THE SERUM PARAOXONASE ACTIVITIES AND PANCREATIC ENZYMES ACTIVITY AND LIPOPROTEINS LEVELS IN EXPERIMENTAL DIABETIC RATS.....	43
TAHIR KAHRAMAN, EVAN ABDULKARİM MAHMOOD ²	43
ANTIOXIDANT AND ANTIHYPERLIPIDEMIC EFFECT OF SOLANUM NIGRUM FRUIT EXTRACT ON EXPERIMENTAL DIABETES MODEL	44
AHMET CİHAT ÖNER, FATMAGÜL YUR ² , MOHAMMED NOORADDİN FETHULLA ³	44
HERBAL PRODUCTS USED IN THE TREATMENT OF DIABETES	45
GÜLAY ŞAHİNER ÖNAL (ARAŞT. GÖR. DR.), KEMAL MACİT HISAR (YRD. DOÇ. DR.) ¹	45
COMPARISON OF ESSENTIAL OILS OF ENDEMIC SALVIA DICHROANTHA STAPF COLLECTED FROM KONYA	47
AYLA KAYA, SÜLEYMAN DOĞU ² , MUHİTTİN DİNÇ ² , MİNE KÜRKCÜOĞLU ³	47
EVALUATION OF TURKISH MEDICINAL PLANTS AS TEA: INDUSTRIAL POTENTIAL	48
İFFET İREM TATLI ÇANKAYA	48
GIDA TAKVİYELERİNDE TIBBİ BİTKİLERİN DÜNÜ, BUGÜNÜ VE GELECEĞİ	49
İBRAHİM ADNAN SARAÇOĞLU	49
GOLDEN SECRET OF WHEAT: GERM.....	50
ADEM ELGÜN	50

RESEARCHING THE POTENTIAL OF ECONOMICALLY IMPORTANT MEDICINAL AND AROMATIC PLANTS OF TOKAT PROVINCE	51
HAKAN METE DOĞAN, ESRA GÜREL ² , EKREM BUHAN ³ , ÇİSEM NILDEM DOĞAN ⁴	51
RESEARCH OF THE ORCHIDS GROWING IN THE NIGDE CITY AND THEIR HABITAT QUALITIES AND THREAT FACTORS	52
GÜLDEN SANDAL ERZURUMLU	52
A SOCIO-ECONOMIC VIEW ON MEDICAL AND AROMATIC PLANTS IN OUR COUNTRY	53
ŞULE TURHAN, MOHAMMAD MASOUD MORADI ¹	53
MEDICINAL AND AROMATIC PLANTS EXPORTED FROM GAP REGION	54
HASAN AKAN	54
DEVELOPMENTS IN TURKEY'S THYME PRODUCTION AND FOREIGN TRADE	55
DR. MUSTAFA ÖZTÜRK, MÜKREMIN TEMEL ¹ , AHMET BIRCAN TINMAZ ¹ , DR. YASIN ÖZDEMİR ¹	55
ESTIMATION OF TURKEY'S MEDICAL AND AROMATIC PLANT IMPORTS WITH ARTIFICIAL NEURAL NETWORKS	56
MUHAMMET ESAT OZDAG, MURAT YESILKAYA ¹	56
DIFFERENT HORMONE CONCENTRATIONS AND MARINE EFFECT EFFECTS OF BLUEBERRY STEEL PRODUCTION	57
VILDANE GERÇEK	57
ESSENTIAL OIL CHARACTERIZATION OF ANGELICA SYLVESTRIS L. VAR. SYLVESTRIS FROM VARIOUS GEOGRAPHICAL LOCATIONS IN LAKES REGION, TURKEY	58
ARIF ŞANLI, TAHSİN KARADOĞAN ¹ , BEKİR TOSUN ¹ , HAMİDE BAKIRKAYA ¹ , SABRİ ERBAŞ ¹	58
DETERMINATION OF PESTICIDE RESIDUE STATUS OF SOME MEDICINAL AND AROMATIC PLANTS	59
TAMER KUŞAKSIZ, HÜSEYİN ÇİMER ² , ESEN KUTLU KUŞAKSIZ ¹ , MEHMET ERTÜRK ² , MUSTAFA KORKMAZ ³	59
STUDIES FOR MEDICINAL PLANTS' ADAPTATION IN ZEYTİNBURNU MEDICINAL PLANTS GARDEN	60
ERSİN YÜCEL, MURAT DİNÇER ÇEKİN ² , MERVE ZENGİN TINMAZ ³ , TUĞÇE AĞBA SEVENCAN ³ , MEHMET ALI ALTIOKKA ³ , MEHMET ŞİRİN YALVAÇ ³	60
GROWTH AND PHYSIOLOGICAL RESPONSES OF 'CHRYSANTHEMUM PALUDOSUM' UNDER SALINITY STRESS	61
SARA YAŞEMİN, NEZİHE KÖKSAL ¹ , ASLIHAN ÖZKAYA ¹ , MİTHAT YENER ¹	61
THE EFFECT OF SEAWATER USED FOR HYDRODISTILLATION ON ESSENTIAL OIL YIELD AND COMPOSITION OF OIL-BEARING ROSE (ROSA DAMASCENA MILL.)	62
NİMET KARA, SABRİ ERBAŞ ¹ , HASAN BAYDAR ¹	62
USE OF EGG WHITE PROTEIN POWDER BASED FILMS FORTIFIED WITH LEMON BALM ESSENTIAL OILS IN THE STORAGE OF KASHAR CHEESE	63
GÖKHAN KAVAS, NAZAN KAVAS ¹	63
INVESTIGATION OF CHEMICAL PROPERTIES OF HERBY CHEESES WITH MELENGIC (PISTACIA TEREBINTHUS)	64
İBRAHİM HAYOĞLU, BÜLENT BAŞYİĞİT ¹ , ALI YILDIRIM ¹ , A. FERİT ATASOY ¹	64
USING QUINOA FLOUR IN TARHANA TO IMPROVE NUTRITIONAL AND FUNCTIONAL PROPERTIES	65
ASUMAN ÇEVİK, NILGÜN ERTAŞ ¹	65

EFFECT OF LAVENDER POWDER ON MICROBIAL, PHYSICOCHEMICAL, SENSORY AND FUNCTIONAL PROPERTIES OF YOGHURT.....	66
HALE İNCİ ÖZTÜRK, SÜMEYYE AYDIN ¹ , NİHAT AKIN ¹	66
BIOLOGICAL ACTIVITIES AND HEAVY METAL POLUTION OF POLLENS FROM AFYON AND KIRKLARELİ.....	68
İLGİNÇ KIZILPINAR TEMİZER, AYTAÇ GÜDER ¹ , FULYA AYDIN TEMEL ¹	68
A COMPARATIVE STUDY ON THE ANTIOXIDANT AND ANTIMICROBIAL ACTIVITIES OF MULTIFLORAL HONEYS AND CASTANEA SATIVA HONEYS.....	69
AYTAÇ GÜDER, İLGİNÇ KIZILPINAR TEMİZER ¹ , DUYGU ODABAŞ ALVER ¹	69
MELANOMA IS JUST NOT SKIN CANCER	71
FATMA AYDOĞMUŞ ÖZTÜRK, KERİMAN GÜNAYDIN ² , MEHMET ÖZTÜRK ¹ , MUHAMMAD IQBAL CHOUDHARY ³	71
SELECTIVE CYTOTOXIC EFFECT OF PRIMULA VULGARIS LEAF EXTRACT ON HUMAN BREAST, COLON AND LIVER CANCER CELLS	73
İBRAHİM TURAN, SELİM DEMİR ² , REZZAN ALIYAZICIOĞLU ³ , YUKSEL ALIYAZICIOĞLU ⁴	73
DETERMINATION OF APOPTOTIC EFFECTS OF FİSETİN ON MALIGNANT GLIAL CELLS.....	75
PINAR ÖZTOPCU-VATAN, FULYA PAK ¹	75
ACTIVE PHYTOCHEMICAL DETECTION AND CYTOTOXIC EFFECTS OF THE METHANOL /ACETONE MIXTURE EXTRACT OF PLANTAGO MAJOR L. SUBSP. INTERMEDIA	76
ÖZLEM SULTAN ASLANTÜRK, TÜLAY AŞKIN ÇELİK ¹	76
USE OF HERBAL PRODUCTS AND AROMATHERAPY BY PATIENTS WITH CANCER.....	78
SERPİL SÜ, NACİYE ESRA KOYUNCU ²	78
SUPPLEMENTATION OF PROPOLIS PROTECTS HUMAN LYMPHOCYTES IN VITRO FROM THE GENOTOXIC DAMAGE BY İMAZALİL	79
HASAN TURKEZ, BUGRAHAN EMSEN ² , OZLEM OZDEMİR ¹ , ABDULGANI TATAR ³	79
EFFECTS OF PHYSALIS PERUVIANA AND LUPINUS ALBUS ON MALONDIALDEHYDE, GLUTATHIONE, CHOLESTEROL, VITAMINS AND FATTY ACID LEVELS IN KIDNEY AND LIVER TISSUES OF DIABETIC RATS	80
OĞUZ AYHAN KİREÇÇİ, ORHAN ERMAN ² , TUBAY KAYA ² , ÖKKEŞ YILMAZ ²	80
THE EXTRACTS OBTAINED FROM PORTULACA OLERACEA L. AND THEIR IN VITRO EFFECTS.....	81
HALİT KIZİLET, HANDAN UYSAL ²	81
INVESTIGATE FOR THE EFFECT OF THYMUS VULGARIS THERAPY ON CERTAIN ADİPOKİNES IN EXPERIMENTAL DIABETIC RATS	83
HÜLYA ÖZDEMİR, GÖKHA OTO ¹ , FİLİZ KARADAŞ ¹ , AHMET UFUK KÖMÜROĞLU ¹ , ZAFER AKAN ¹ , MELEK DİKİLİDAL ¹	83
UTILIZATION OF SOME ANTİOXİDANT AND DIETARY FİBRE RİCH-SOURCES IN FRESH AND DRY PASTA PRODUCTION	84
AYŞE BÜŞRA MADENCİ, SELMAN TÜRKER ¹ , NERMIN BİLGİÇLİ ¹	84
POMEGRANATE (PUNICA GRANATUM L.) FLOWERS THE EFFECTS OF VİTAMİN A AND E LEVELS BY EXPERIMENTAL DIABETES MELLİTUS IN RATS.....	85
NACİ ÖMER ALAYUNT, ZAFER ÇAMBAY ² , NEVİN İLHAN ²	85
ARTEMİSİA TAXA REGISTERED IN TURKEY FLORA AND ITS USAGE AREAS AND BIOLOGICAL ACTİVİTY OF A. ANNUA L. ESSENTIAL OİL.....	87
BELGİN COŞGE ŞENKAL, CÜNEYT CESUR ¹ , ARZU TÜRKER ¹ , TANSU USKUTOĞLU ¹	87

FUMIGANT ACTIVITY OF SOME PLANT ESSENTIAL OILS AGAINST THE PULSE BEETLE, CALLOSOBRUCHUS CHINENSIS (L.) (COLEOPTERA: BRUCHIDAE).....	88
FEDAI ERLER, HILAL ŞULE TOSUN ² , HALİL GÜVEN ³ , BARIŞ İMREK ⁴	88
COMPOSITION OF ESSENTIAL OIL OF TEUCRIUM SCORDIUM L. SUBSP. SCORDIODES (SCHREB.) ARCANG. SPECIES	89
İBRAHİM HALİL GEÇİBESLER, LÜTFİ BEHÇET ² , FATİH GÜL ³ , İBRAHİM DEMİRTAŞ ³	89
IDENTIFICATION OF VOLATILE COMPOUNDS (VCS) OF ‘GEMLIK’, ‘HALHALI’ AND ‘SARI HASEBI’ OLIVE LEAVES	90
AHMET DURSUN, ZEHRA GÜLER ¹ , DİLEK ÖZKAN ¹ , DİLŞAT BOZDOĞAN KONUŞKAN ¹	90
ANALYSING OF BIOCHEMICAL CONSTITUENTS IN LAVANDULA ANGUSTIFOLIA	91
İŞİL KUTBAY, FUNDA ŞENTÜRK AKFİRAT ²	91
OBTAINED OF THE ESSENTIAL OIL, IDENTIFIED OF CHEMICAL COMPOSITIONS AND TESTED BIOLOGICAL ACTIVITIES OF ZIZIPHORA TENUIOR THAT WAS COLLECTED FROM EAGEN SEA REAGION	93
PROF. DR. İSA KARAMAN, NAZAN GÖKŞEN ¹	93
EFFECT OF HARVEST TIME ON ESSENTIAL OIL RATIO, LINALOOL AND LINALOOL ACETATE COMPONENTS İN LAVANDULA CULTIVARS.....	94
YASİN ÖZGEN, NEŞET ARSLAN ¹ , NİLGÜN BAYRAKTAR ¹	94
EFFECTS OF DIFFERENT SALT CONCENTRATIONS ON QUINOA SEEDLING QUALITY	95
SELDA ÖZMEN, CANSU KÜÇÜK, NURAY ÖKTEM, AYŞE ÖZEROĞLU, FATMA BURCU OKUR, YAKUP ONUR KOCA ⁶	95
PRODUCTION OF INSTANT TEA FROM SAGE TEA (SALVIA) PLANTS, DETERMINATION OF ITS PHYSICO-CHEMICAL PROPERTIES, AND PACKAGING	96
CEMALETTİN BALTACI, MUHAMMED ŞİDİM ¹ , ZEYNEP AKŞİT ¹	96
GENERAL OUTLOOK OF HARVESTİNG AND THRESHİNG MECHANIZATION OF MEDICINAL AROMATIC PLANTS İN TURKEY	98
DENİZ YILMAZ, MEHMET EMİN GÖKDUMAN ¹	98
EFFECTS OF DIFFERENT MEDIUM ON SEED GERMINATION OF SPARTIUM JUNCEUM L. WITH MEDICINAL AND AROMATIC IMPORTANCE	99
MÜBERRA PULATKAN, NEBAHAT YILDIRIM ² , İBRAHİM TURNA ²	99
THE EFFECTS OF VARIOUS TYPE PRESS WHEEL MOUNTED ON PNEUMATIC PRECISE DRILLING MACHINE ON SOME QUALITY CRITERIA OF BLACK CARROT	100
HÜSEYİN BÜLBÜL, HAYDAR HACİSEFEROĞULLARI ²	100
THE EFFECTS OF MINT(MENTHA SPICATA) ESSENTIAL OIL FORTIFIED EDIBLE FILMS ON THE SOME PROPERTIES OF KASHAR CHEESE	101
NAZAN KAVAS, GÖKHAN KAVAS ¹	101
PRODUCTION OF BAR WITH FRUIT	102
BÜLENT BAŞYİĞİT, İBRAHİM HAYOĞLU ¹ , ALI YILDIRIM ¹ , A. FERİT ATASOY ¹	102
OTTOMAN SHERBET	103
MESUT KAPLAN	103
PHYSICO-CHEMICAL PROPERTIES DETERMINATION OF COMMERCIAL/HOME MADE SOUR POMEGRANATE JUICE CONCENTRATE (POMEGRANATE SOUR-NAR EKŞİSİ) FROM ŞANLIURFA REGION.....	104

SELİN ALİHANOĞLU, DEMET EKTİREN, MEHMET KARAASLAN ¹ , HASAN VARDİN ¹	104
A TRADITIONAL TASTE OF KAHRAMANMARAS' CUISINE: TIRSİK	105
MUHAMMET ALİ CEBİRBAY, SAADET CEBİRBAY ² , NERMIN IŞIK ¹	105
BASARA BEKMEZİ WHICH OBTAINED FROM QUERCUS VULCANICA (BOISS. ET. HELDR EX) KOTSCHY LEAVES	106
SÜLEYMAN DOĞU, TURAN AKDAĞ ² , MEHMET BAKANLAR ² , SEREN NUR SARI ²	106
ANTICANCER ACTIVITIES OF SOME PLANT GROWING IN TURKEY	107
FERDA ARI	107
ANTI-ACHE AND ANTI-PROLIFERATIVE EFFECTS OF GLAUCIUM ACUTIDENTATUM AND GLAUCIUM CORNICULATUM ALKALOID EXTRACTS	108
FATMA GONCA KOÇANCI, BELMA ASLİM ¹	108
EFFECT OF GRAPE SEED ON CANCER TREATMENT	110
TUĞBA TATAR, NİLÜFER ACAR TEK ¹ , GAMZE AKBULUT ¹ , YASEMİN ERTAŞ ¹	110
ANTIOXIDANT, ANTIMICROBIAL AND ANTITUMORAL EFFECTS OF STACHYS ANNUA (L.) L. SUBSP. ANNUA IN COMPARATIVE CANCER PROFILES	111
MERVE ALPAY, GÖRKEM DÜLGER ² , ERSİN KARABACAK ³	111
APOPTOTIC EFFECT OF ALPHA LIPOIC ACID ON HUMAN COLON CANCER CELL LINE SW-480: AN IN VITRO STUDY	113
İLKAY ARMAĞAN, DİLEK BAYRAM ¹ , MELTEM ÖZGÖÇMEN ¹ , MURAT SEVİMLİ ¹ , GÜLÇİN YAVUZ TÜREL ⁵	113
INVESTIGATION OF CHROMIUM TOXICITY EFFECTS ON CONTENTS PHOTOSYNTHETIC PIGMENT, PROTEIN CONTENTS AND LIPID PEROXIDATION OF CERATOPHYLLUM DEMERSUM L., AN IMPORTANT MEDICINAL AQUATIC PLANT	114
MUHAMMET DOĞAN, MEHMET KARATAS ² , MUHAMMAD AASİM ²	114
COULD THYMOL PROTECT THE LIVER AGAINST DRUG-INDUCED GASTRIC ULCER	115

MEHMET HASDEMİR¹

ABSTRACT

Gıda ve sağlık sektöründe yaşanan gelişmeler, tıbbi ve aromatik bitkilere olan talebin hızla arttığını göstermektedir. Sentetik ilaçların kullanımı sonucu meydana gelen ciddi yan etkiler ve bunların yol açtığı medikal ve ekonomik sorunlar doğal ürünlere olan talebi artırmakta, bitkisel kökenli ilaç ve kozmetik sanayinin hızla gelişmesine neden olmaktadır. Küresel bazda yaşanan bu gelişmeler yanında, mevcut doğal kaynakları ile potansiyel pazarlara yakınlığın verdiği stratejik konum, Türkiye'ye tıbbi ve aromatik bitkiler sektöründe büyük avantajlar sağlamaktadır. Türkiye doğal bitki örtüsünde belirlenen 11.707 bitki çeşidi ile küresel ölçekte büyük zenginliğe sahiptir. Bu bitkilerin 3.649'u yöreye özgü iklim ve toprak şartlarında yetişen endemik tür ve çeşitlerden oluşmaktadır. İç piyasada ticarete konu olan bitki sayısı ise 350 olup bu bitkilerden yaklaşık 100 bitkinin yurt dışına ihracatı yapılmaktadır. İhracatta en önemli bitkiler; kekik, haşhaş, defne, çay, anason, kimyon, adaçayı, mahlep ve kırmızıbiberdir. Bu güne kadar geliştirilerek tescil ettirilmiş tıbbi ve aromatik bitki çeşidi sayısı ise 63 olup bunun 24 adedi Gıda Tarım ve Hayvancılık Bakanlığı'na bağlı araştırma enstitüleri tarafından geliştirilmiştir. Ayrıca Sideritis, Thymus, Origanum ve Salvia türlerinde birçok bitki kültüre alınmış olup halen Bakanlığa bağlı 12 araştırma enstitüsünde toplam 36 AR-GE projesi yürütülmektedir. Türkiye'nin mevcut toprak ve su kaynakları ile biyoçeşitlilik durumu dikkate alınarak, küresel rekabet gücünü artırmak, uluslararası piyasaların talep ettiği miktar ve kalitede tıbbi-aromatik bitki üretimini sağlamak üzere, 2015 yılında Gıda Tarım ve Hayvancılık Bakanlığı'nca "İtrî ve Tıbbî Bitkiler ile Boya Bitkileri Üretimini Geliştirilmesi Projesi" başlatılmıştır. 2016 yılı itibariyle projenin uygulandığı 35 ilde, tıbbi ve aromatik bitkiler teknik ekibi oluşturularak 4.690 çiftçiye yönelik eğitim ve yayım faaliyetleri ile 26 ayrı türde demonstrasyon çalışması yürütülmüştür. AR-GE çalışmaları tamamlanan tür ve çeşitlerin yaygınlaştırılması için yapılan yayım faaliyetleri yanında, destekleme politikalarıyla da tıbbi ve aromatik bitkiler üretiminin geliştirilmesi hedeflenmektedir. Bu amaçla ilk kez 2015 yılında özel bir destekleme programı başlatılarak, iyi tarım uygulamaları kapsamında tıbbi ve aromatik bitkiler yetiştiren çiftçilere 100 TL/da destekleme ödemesi yapılmaktadır. Ayrıca küçük aile işletmeciliği, mazot-gübre, organik tarım, kırsal kalkınma ve genç çiftçi hibe programı ile sektör desteklenmekle birlikte, Milli Tarım Projesi ve Havza Bazlı Destekleme Modeli kapsamında tıbbi ve aromatik bitkilerinin üretim planlamasına yönelik çalışmalar yürütülmektedir.

TÜRKİYE’NİN TEHLİKE ALTINDAKİ ENDEMİK BITKİLERİN EKOLOJİSİ VE İKLİM DEĞİŞİKLİĞİ İLE İLİŞKİSİ

MUNİR OZTURK¹

ABSTRACT

Türkiye'nin endemik bitkilerinin neredeyse tamamı 50.000 km²'den daha az alanda görülür. Bunların % 68'i 500 km²'nin altındaki alanlarda görülmektedir ve bunların büyük bir kısmı ilk (tehdit altındaki türler) kriterini de tetikler. Ülkemize ait endemik ve sınırlandırılmış alanda yayılış gösteren bitkilerinin % 70'inden fazlası tehdit altındaki tür kriterleri tarafından karşılanmaktadır. Ülkemizde endemik iletim demetli bitki taksonlarının sayısı 3035 (% 31.12) dir, toplam iletim demetli taksonun sayısı 11.707, cins sayısı 1320 ve familya sayısı 167 dir. En çok göze çarpan familyalar is asteraceae, fabaceae, brassicaceae, lamiaceae ve caryophyllaceae olup bunlar sırası ile 1311, 1059, 602, 586 ve 559 tür içermektedir. Bunlar içerisinde endemik türlerin sayıları sırası ile 485, 322, 228, 239 ve 230 dir. En çok temsil edilen cinler ise; Astragalus, Verbascum, Allium, Cantareua ve Silene olup bunlar sırası ile 440, 341, 179, 158 ve 144 tür içermektedir ve endemik tür sayısı is yine sırası ile 194, 165, 67, 94 ve 57 dir. Tehlike altında olan tür sayısı is 777. En çok endemikler Iran-Turan (1229), Doğu Akdeniz (1098) ve Öksin (207) fitocoğrafik bölgelerde yer almaktadır. 1985-2015 yıllar arasında, Türkiye’de toplam 102 endemik bitki taksonun yalnızca toprak analizi yapılmıştır : Alchemilla paracompactilis, A. rivularis, Allium flavum ssp. flavum var. minus, A. kurtzianum, A. sibthorpiatum, Alyssum pinifolium, A. trapeziforme, Ankyropetalum arsusianum, A. reuteri, Asperula daphneola, Asphodeline prismatocarpa, Astragalus flavescens, A. stenosemioides, A. stridii, A. tmoleus var. tmoleus, Campanula bornmuelleri, C. saxonorum, C. tomentosa, Centaurea amaena, C. chrysantha, C. derderiifolia, C. kurdica, C. odyssei, C. polyclada, C. ptosimopappoides, C. saligna, C. scleropis, Chamaecytisus drepanolobus, Cirsium sipyleum, Consolida staminosa, Corydalis oppositifolia ssp. oppositifolia, C. wendelboi ssp. wendelboi, Cousinia birandiana, C. caesarea, C. cirsioides, C. davisiana, C. decolorans, C. eleonora, C. ermenekensis, C. halysensis, C. humilis, C. iconica, C. sivasica, C. stapfiana, C. vanensis, Crocus baytopiorum, C. biflorus ssp. isauricus, C. biflorus ssp. pseudonubigena, C. candidus, C. flavus ssp. dissectus, C. gargaricus ssp. gargaricus, C. olivieri ssp. istanbulensis, C. pestalozzae, Cyanus woronowii, Delphinium nydeggeri, Dianthus goerkii, D. ingoldbyi, Digitalis trojana, Erodium somanum, Galium aladaghense, G. nigdeensis, Gentiana boissieri, G. brachyphylla ssp. favratii, Gentianella holosteoides, Gypsophila bitliensis, Hyacinthella lineata, Hypericum crenulatum, Iris danfordiae, I. pamphylica, Linum empetrifolium, Liquidambar orientalis, Marrubium rotundifolium, Medicago rhytidocarpa, Minuartia nifensis, Muscari bourgaei, M. latifolium, Noccaea sintenisii ssp. crassum, Ononis sessilifolia, Origanum hypericifolium, O. leptocladum, O. saccatum, Papaver virchowii, Pastinaca zozimoides, Potentilla aladaghensis, P. pulvinaris ssp. argentea, P. pulvinaris ssp. pulvinaris, Prenanthes glareosa, Psephellus pecho, Ranunculus reuterianus, Rosa dumalis var. antalyensis, Salsola grandis, Salvia kronenburgii, Scrophulariascopoli var. parryi, Sideritis phlomoides, S. trojana, Silene anatolica, S. lycanica, Tripleurospermum baytopianum, Verbascum tauri, Veronica kotschyana, V. surculosa and V. tauricola. 1998-2016 yıllar arasında 49 endemik bitki taksonu üzerinde nispeten kapsamlı ekolojik (bitki + toprak özellikler) çalışmalar gerçekleştirilmiştir : Alkana haussknechtii, Centaurea antiochia, C. arifolia, C. consanguinea, C. foliosa, C. haradjianii, C. hermannii, C. kilaea, C. lycopifolia, C. ptosimopampa, Cephalaria taurica, Colchicum micranthum, Cirsium cassium, Cyclamen alpinum, Erysimum amasianum, Glycyrrhiza flavescens ssp. flavescens, Iris histrioides, I. sari, I. taochia, Isoetes anatolica, Lathyrus tukhtensis, Onosma bornmuelleri, O. bracteosa, O. propontica, Origanum bilgeri, O. husnucan-baseri, O. minutiflorum, O. sipyleum, O. solymicum, Polygonum istanbulicum, Psephellus bornmuelleri, P. brevifimbriatus, P. gracillimus, P. hadimensis, P. huber-morathii, P. mucronifer, P. oltensis, P. pergamaceus, P. pyrrhoblepharus, P. schischkinii, Salvia longipedicellata, S. rosifolia, S. wiedemannii, Stachys annua ssp. cilicica, S. cretica ssp. anatolica, S. iberica ssp. iberica var. densipilosa, S. setifera ssp. lycia, S. sosnowskyi, ve S. tmolea.

İklim değişikliği uzun süredir devam ediyor ve bazı yönlerin yakın ya da orta vadede büyük etkileri olmayacak ancak iklim değişikliğinin bazı yerlerde zaten bir etkisi olduğu gerçeğini göz önüne almak çok önemlidir. Kısa vadeli iklim projeksiyonlarıyla ilişkili büyük belirsizlik göz önüne alındığında anlamlı bir sonuç çıkarmak elbette zordur; bu tahminler daha uzun vadeli tahminlerle azalır. İnsan tepkileri, sinerjik ve geribildirim etkileşimleri açısından, yerel (insan odaklı değişim) sürücü ile küresel (iklim değişikliği) sürücüler arasındaki ayırım ve bunları yönetmek için alınan seçenekler, eylemlerin uygun ölçekte çalışmasını sağlamak için kritik önem taşır. Bir yönetim kararı vermeden önce ekolojik belirsizliğin azaltılmasının yararlarını inceleyebilir. Yönetim eylemlerini uygulamadan önce tür ekofizyolojisi veya yaşam öyküleri özelliklerinin rafine edilmesinin faydalarını değerlendirmek için bilgi değeri analizinin yeni uygulanması için önemli bir kapsam mevcuttur. Uyarlamalı yönetim, koruma yöneticilerinin belirsizliğe yaklaşımının başka bir yoludur: koruma eylemleri bir tekrarlama sistemi içinde uygulanabilir; böylece izleme, değerlendirmeyi bilgilendirir ve koruma eyleminin ayarlanmasına yol açar.

GIDANIZ ILACINIZ, ILACINIZ GIDANIZ OLSUN

AHMET ÜNVER¹

ABSTRACT

Bu sözü Hipokrat'ın söylediğine inanılır. Hipokrat'tan bu zamana kadar ona olan saygı sabit kalmışken, çok şey değişmiştir. Mesela, günümüzde gıda ve ilaç kelimeleri farklılıkları vurgulanması gereken ve birbirine karıştırılmaması gereken kelimeler haline gelmiştir.

Günümüzde 'Fonksiyonel Gıdalar' kavramı terminolojiye girmiştir. Bu kavramın kullanımı ile gıdalara ilaç yakıştırması yapmak da bilimsel etik olarak yasaklanmış durumdadır. Günümüzde gelişen ve bilinir hale gelen diğer terimler de 'Özel Beslenme Amaçlı Gıdalar' ve 'Takviye Edici Gıdalar'dır. Bunlar da ilaç kavramı dışında anılması gereken kavramlardır.

Son yıllarda bu konuda en büyük sorun ilaç olma iddiasını perdeleyip, Gıda Tarım ve Hayvancılık Bakanlığı'ndan kısa sürede ruhsat alınması ve rant elde edilmesi çabalarıdır. Bu çabalar 'Milli İlaç' hedefine balta vurmaktadır. Bu konudaki müeyyidelerin yükseltilerek yeniden ele alınması önemlidir. Baharatçıların veya aktarların da bu kapsamda ciddi sertifikasyon ve denetimler ile işlevlerinin ıslah edilmesi de önemlidir.

Bu açıdan 'Geleneksel bitkisel tıbbi ürünler yönetmeliği' ile 'Takviye edici gıdalar yönetmeliği' ne ülkemiz şartlarına göre bir bakış yapılarak, bu konuda aksaklıkların giderilmesi ile 'Milli İlaç' hedefine doğru hızlıca yol alınmalıdır.

ENDEMIC MEDICINAL AND AROMATIC PLANTS OF TURKIYE - CONSERVATION AND SUSTAINABLE USE

MUNİR OZTURK¹, VOLKAN ALTAY²

ABSTRACT

Turkiye has more or less continental characteristics regarding its plant diversity with nearly 3500 taxa of endemics distributed in seven different geographical divisions of the country. These taxa comprise more than 30 percent of the total flora, majority being confined to narrow and restricted ecological niches. In this study the use of approximately 250 endemic medicinal and aromatic plant taxa in the traditional medicine in Turkiye is presented. These belong to 37 families and 98 genera. The families with the highest number of taxa are; Lamiaceae (68 taxa), Asteraceae (54 taxa), Scrophulariaceae (24 taxa), Apiaceae (12 taxa), and Fabaceae (12 taxa). These five families constitute 65.89 percent of the endemic medicinal and aromatic plant taxa distributed in Turkiye. The genera with highest number of taxa are; Sideritis (23 taxa), Verbascum (21 taxa), Salvia (11 taxa), Achillea (10 taxa), and Astragalus (10 taxa). Local people in different regions of Turkiye generally use endemic herbal remedies as follows; respiratory diseases (24.27%), digestive disorders (20.17%), urogenital diseases (12.41%), dermal diseases (10.79%), and other ailments (32.36%). The endemic medicinal and aromatic plants are used mostly against major diseases like; cold and flu, wound healing, stomachache, asthma, and as expectorants. In all 18 taxa are widely used for different applications in different regions of Turkiye. We have tried to catalogue these genetic resources, together with their need for conservation and for an enrichment of seed bank of the country. This will help in the establishment of database for a sustainable use and conservation of the endemics within different ecosystems.

ST.JOHN'S WORT; IS IT A PANACEA?

ERDEM YEŞİLADA¹

ABSTRACT

The flowering aerial parts of *Hypericum perforatum* L. (Hypericaceae), or with its popular name St.John's wort, has been recognized as a universal remedy to treat the nervous system disorders, particularly for the treatment of mild to moderate depressions and related nervous symptoms such as hysteria, neurosis, neuralgia etc. In Turkish traditional medicine, however, use of the plant against mood disorders is unknown. Among the wide range of utilizations which had been recorded during the ethnobotanical surveys, the olive oil extract is used for wound healing, burns and eczema, and for treatment of peptic ulcer, while the aqueous extract (infusion) is used for treatment or to alleviate the liver disorders (jaundice, hepatoprotective, choleric), urinary problems (kidney stone, enuresis, infection), infectious diseases (fungal, bacterial, tuberculosis), cardiac disorders (atherosclerosis, hypertension), earache, haemorrhoids, diabetes and endometriosis. The present study aims to report the results of ethnopharmacological investigations to evidence this latter group of traditional uses.

THE ROLE OF MEDICINAL PLANTS IN DRUG DISCOVERY AND THE POTENTIAL OF TURKISH MEDICINAL PLANTS FOR BIOACTIVE METABOLITES

HASAN KIRMIZIBEKMEZ¹

ABSTRACT

The use of plants for the treatment and prevention of diseases date back to ancient times. World Health Organization estimates that around 80% of world population, particularly in developing countries, rely on medicinal plants for the prevention and treatment of diseases [1]. Of the taxonomically classified around 300.000 territory plants, over 10.000 are said to be utilized in different traditional systems of medicine [2]. From the beginning of 19th century, with achievements in the area of chromatography and spectroscopy, isolation of compounds that are responsible for the bioactivities of plants was launched. Drugs such as morphine, digoxin, quinine and atropine were introduced into clinic use after purification from several plants. The compounds obtained from plants can either be used directly as a drug or their semi-synthetic derivatives can also be prepared based on structure-activity relationship studies. Plants, besides their rich chemical composition, also inspired scientist with their constituents having interesting skeleton. It seems that around half of the currently prescribed conventional drugs are derived from natural products (plant, microorganism and marine organism) [3]. One of the most rational approach to discover new drug candidates from traditionally used plants is to isolate the compounds that are responsible for the bioactivities of the extracts through bioassay-guided fractionation technique. It is wort to say that the number of drugs derived from medicinal plants that are recently introduced into clinical use is increasing. Additionally, several standardized herbal extracts were approved by the authorities to be used in therapy. Drug discovery from medicinal plants is a very long, laboring and expensive task that requires the multidisciplinary approach. Turkey with its rich flora and high biodiversity constitutes a tremendous source for the discovery of new drug molecules. In this talk, it is aimed to present the recently approved plant derived new drugs that are introduced into clinic. Further, the potential of Turkish plants in the discovery of new drug entities will be mentioned by referring to recent studies carried out in our laboratory. References: 1. MANAGEMENT OF CANCER: ARE POLYPHENOL-RICH FUNCTIONAL FOOD A NEW AVENUE TO BE PURSUED?

VIDUSHI S NEERGHEEN-BHUNJUN¹

ABSTRACT

Functional food, defined as foods and food components that provide health benefit beyond basic nutrition, is part of the new self-care paradigm since it can co-exist with traditional medical systems for prevention and treatment of diseases. Research using cellular, molecular and experimental systems contributes to identify the biological basis through which food components promote health and wellness. In this vein, the scientific relevance and potentials of Pleurotus mushrooms, pomegranate and noni based on their polyphenolic richness, antioxidant and anti-inflammatory capacities will be discussed. Since the process of carcinogenesis has been linked to oxidative stress by increasing DNA mutations or inducing DNA damage, genome instability, and cell proliferation, it can be speculated that antioxidant agents could interfere with the disease onset and progression. In addition, given that conventional cancer treatments influence tumour outcome through reactive oxygen species modulation and that these treatments have important side effects, the challenge to develop alternative and/or complementary strategies for patients is more than ever pressing. Moreover, the induction of apoptosis in preneoplastic or neoplastic cells through various growth inhibitory mechanisms such as the activation of cytochrome c and caspases, the arrest of cell cycle, and the modulation of signaling pathways by functional food are remarkable. The dietary nature of food plants and edible fungi make them invaluable candidates as inducers of apoptosis in neoplastic cells and against oxidative stress. The data herein presented show that selected functional food fit into a continuum that ranges from health maintenance or promotion to disease treatment.

DIVERSE BIOLOGICAL FUNCTIONS OF KOREAN MISTLETOE

JONG-BAE KIM¹

ABSTRACT

Mistletoe is a semi-parasitic plant that has been utilized as a traditional medicine in many countries to treat various human illnesses. In particular, Korean mistletoe (*Viscum album* var. *coloratum*) has been widely studied in the last decades since the report that it has an anticancer activity. We have been investigating the various biological activities of Korean Mistletoe such as mainly anti-cancer and immunological activities, and others including anti-diabetes, anti-obesity, enhancement of exercise capacity, inhibition of muscle atrophy and extension of life-span. We demonstrated the prophylactic Korean Mistletoe extract (KME) on tumor metastasis produced by highly metastatic tumor cells. Intravenous administration of KME significantly inhibited lung metastasis of B16-BL6 melanoma and colon 26-M3.1 cells by enhancing macrophages and NK cells activity. We also purified two Korean mistletoe lectins (KML), which is the main component of anti-cancer and immuno-stimulatory activity. KML is a potent immunoadjuvant to enhance cellular and humoral immune responses. Especially, KML B-chain exhibits potent immunomodulatory properties in enhancing dendritic cell maturation and might be considered a potential dendritic cell-based cancer therapy. We identified anti-diabetic effects of KME compared with several controls including AICAR and metformin. KME significantly lowered blood glucose and increased the glucose uptake in alloxan-induced diabetic mice. We also found the activation of AMPK by KME similar to current anti-diabetic drugs. Besides, KME have inhibitory effects on the development of obesity and nonalcoholic fatty liver disease in mice fed high-fat diets. Body and epididymal fat pad weights were reduced in KME-treated mice, and histological examination showed an amelioration of fatty liver in KME-treated mice. In addition, we have recently reported that KME improved the endurance capacity in mice by enhancing PGC-1 α and SIRT1 expression involved in mitochondrial activity. In the treadmill and swimming tests, KME-treated mice showed an increased exercise capacity compared to chow-fed control mice. Interestingly, KME induced the mRNA expression of SREBP-1c and GLUT4, known positive regulators of muscle hypertrophy. On the contrary, KME reduced the expression of Atrogin-1, which is directly involved in the induction of muscle atrophy. In animal models, KME mitigated the decrease of muscle weight in denervated mice. These findings indicate that Korean mistletoe might be a potential candidate as a functional food promoting the restoration from muscle atrophy. Furthermore, we investigated the effects of Korean mistletoe extract (KME) on lifespan in experimental models using *Caenorhabditis elegans* and *Drosophila melanogaster*. Supplementation of KME extended the mean survival time by 9.61 and 19.86 % in worms and flies, respectively. Collectively, our findings on suggest that Korean mistletoe is one of the most powerful candidates with great potentialities to develop the ideal multi-functional anti-cancer drug as well as functional foods.

FUTURE PERSPECTIVES OF FUNCTIONAL FOODS AND HEALTH

CESARETTİN ALAŞALVAR¹

ABSTRACT

Functional foods, nutraceuticals, and natural health products (NHP) still represent one of the fastest growing areas of research. The health food industry is growing by about 7.4% per year in sale. Japan was the first country introduced functional foods in early 1980's and the FOSHU (food for specified health uses) was adapted in 1993. Following the Japanese example, the Food and Drug Administration (FDA) has adapted GRAS (generally recognised as safe) status process as a regulatory venue in the US, while EU introduced a NOVEL FOODS system for approval of functional foods. Diet related chronic diseases including cardiovascular disease (CVD), cancer, type-2 diabetes, and obesity has been on the rise, representing 60% of all deaths. Although there are several ways of combating these diseases, but one of the most important ones is proper diet. With a proper diet, these diseases can be reduced up to 40%. Therefore, consumptions of functional foods, nutraceuticals, and NHP are of great importance for health promotion and disease risk reduction. Hypercholesterolemia is a common condition in which the risk for the development of cardiovascular disease (CVD) is increased. Due to their hypocholesterolemic effects, phytosterols are considered to be effective in the prevention of CVD, particularly coronary heart disease. This presentation will covers future perspectives of functional foods, nutraceuticals, NHP; global regulatory issues of functional foods and nutraceuticals; and cardio-protective effects of phytosterol-enriched functional black tea in mild hyperchoelsterolemic subjects (a case study).

A PRELIMINARY STUDY ON THE SPAWN PRODUCTION OF OYSTER MUSHROOM (PLEUROTUS OSTREATUS)

AHMET ÇAT¹, TURHAN ÇOMAK², MÜRSEL ÇATAL²

ABSTRACT

Currently, few edible mushroom species have been commercially cultivated in Turkey. *Pleurotus ostreatus* (Jacq. ex Fr. P.Kumm.) known as the oyster mushroom or tree oyster is the second most cultivated mushroom species after the white button mushroom *Agaricus bisporus* (Lange) Imbach in the country. The mushroom is preferred over other mushroom species for its taste, nutritional contents as well as medicinal values. Many research revealed that it contains essential amino acids, minerals (potassium, iron and phosphorus) and source of vitamins (B1, B2, B12, C, D and E). As it is still case with *A. bisporus*, the spawn of *P. ostreatus* has also not been produced in Turkey and a significant amount of money were spent every year to import the mushroom spawn. Here, we first time discovered an oyster mushroom strain candidate for spawn production on the stem of a honey locust (*Gleditsia triacanthos* L.) (Fabaceae) tree at the Campus of Akdeniz University and identified based on morphological characters. The mushroom mycelium was isolated from the cap and stem of the fruiting body on Agar media. In addition, the mushroom culture was obtained from the spore prints. Colony and growth characteristics of the mushroom mycelium indicated that the strain might be a good candidate for spawn production. The mushroom mycelium colonized the rye grain spawn media in less than 2 weeks at 24°C comparable to the commercially available strains of the mushroom. Further studies were undertaken to evaluate the mushroom strain on wheat straw compost in mushroom growth facilities of a commercial company. According to literature search, this is one of the first reports of oyster mushroom culturing for spawn and mushroom production from a native isolate of oyster mushroom.

PHENOLIC ACIDS DETERMINATION IN SIX WILD MUSHROOM SPECIES BY HPLC-DAD

FATİH ÇAYAN¹, EBRU DEVECİ², GÜLSEN TEL ÇAYAN¹, MEHMET EMİN DURU²

ABSTRACT

Mushrooms have been consumed for many years in oriental culture as tea and nutritional food due to their special flavour and texture. In addition to nutritional properties, mushrooms are therapeutic foods and exhibit antioxidant, anticholinesterase, antimicrobial anti-tumor, antiviral, immunomodulatory activities because of they are rich in bioactive secondary metabolites such as phenolic compounds, terpenes, polysaccharides and sterols [1]. The phenolic compounds are separated into two groups: phenols and phenolic acids such as gallic acid, benzoic acid, syringic acid, chlorogenic acid another associates and polyphenols such as flavonoids, tannins and stilbenes [2]. Phenolic compounds have biological properties which arose from their antioxidant activity. Therefore, phenolic compounds have a vital role in the stability of food products, as well as in the antioxidative defense mechanisms of biological systems. The antioxidative effect of phenolic compounds is caused from a direct free radical scavenging activity, reducing activity and chelating of prooxidant metal ions [3]. Phenolic acids of *Agrocybe cylindracea*, *Coprinus comatus*, *Clathrus ruber*, *Hypholoma fasciculare*, *Lentinus tigrinus* and *Mitrophora semilibera* were identified by HPLC-DAD. The phenolic profile was determined according to the method of Barros et al. [3] with slight modification. The mobile phases were as follows: (A) 0.5% acetic acid in water, (B) 0.5% acetic acid in methanol and gradient system used. Detection was carried out photodiode array detector (PDA) using 280 nm as the preferred wavelength. The phenolic compounds were characterized according to their retention times and UV data were compared with commercial standards. Sixteen phenolic compounds namely, gallic acid, fumaric acid, protocatechuic acid, catechin hydrate, p-hydroxybenzoic acid, 6,7-dihydroxy coumarin, caffeic acid, vanillin, 2,4-dihydroxy benzoic acid, p-coumaric acid, ferulic acid, coumarin, trans-2-hydroxycinnamic acid, ellagic acid, rosmarinic acid and trans-cinnamic acid were analyzed. Protocatechuic acid was (7.39±0.74- 144.4±1.48 µg/g) found as major phenolic compound in *A. cylindracea*, *C. comatus*, *C. ruber*, *H. fasciculare*, *L. tigrinus*. The most abundant phenolic compounds in *M. semilibera* were identified as p-coumaric acid (17.49±0.83 µg/g) followed by p-hydroxybenzoic acid (11.89±0.69 µg/g). References [1] T.H. Wang, T.F. THE USE OF A DIFFERENT SPECIES BELONGING TO THE GENUS AGARICUS IN THE MUSHROOM CULTIVATION: AGARICUS MACROCARPUS F.H. MOLLER

GIYASETTİN KAŞIK¹, SINAN ALKAN¹, CELALEDDİN ÖZTÜRK¹, HATİCE ESRA AKGÜL¹

ABSTRACT

Agaricus macrocarpus F.H. Moller samples used in this study were collected from the field work Yenice district of Karabük. The mushroom diagnoses were made with the help of diagnostic books and literature. Macroscopic and microscopic features of the fungus are given. In this study, mushroom spawns were firstly developed by tissue culture method. After this, cultivation of Agaricus macrocarpus F.H. Moller in a commercial fungal composts produced in Konya region has been examined. It has been observed that micelle of Agaricus macrocarpus is well developed in laboratory conditions stipulated for Agaricus bisporus. But, it has been determined that Agaricus macrocarpus develops in the soil and compost more slowly than Agaricus bisporus. As a result, Agaricus macrocarpus can be used as culture mushroom, however, it is necessary to create a species-specific environment with a suitable compost.

ISOLATION OF NEW STEROIDS FROM *SARCOSPHAERA CRASSA* (SANTI) POUZAR; A POISONOUS EDIBLE MUSHROOM

ZAIN ULLAH¹, MEHMET ÖZTÜRK¹

ABSTRACT

Isolation of New Steroids from *Sarcosphaera crassa* (Santi) Pouzar; A Poisonous Edible Mushroom Zain ULLAH, Mehmet ÖZTÜRK zainullah@posta.mu.edu.tr Department of Chemistry, Faculty of Sciences, Muğla Sıtkı Koçman University, Mentese-48121, Muğla, Turkey *Sarcosphaera crassa* (Santi) Pouzar is known as pink crown or Violet Star Cup mushroom, consumed particularly in south-west Anatolia in Turkey. *S. crassa* is a poisonous mushroom and only edible after cooked, well. Thus, the poisonous compound(s) are discarded using bakery [1]. The current research is focused on activity based mychochemical investigation on *S. crassa*. In this study, the *S. crassa* was purchased from a local market in Muğla-Turkey. It was baked in an oven at 200 °C for 30 minutes, then air-dried under shadow. The dried baked samples were grinded and extracted with petroleum ether, acetone and methanol, successively. The extracts were studied for their cytotoxic activity against Hela (human cervical) and MCF-7 (human breast) cancer cell lines. The extract indicating cytotoxic activity was studied to isolate its steroids as well as other bioactive compounds. 1D-, and 2D-NMR and various spectroscopic techniques were used for structure elucidation. The methanol and acetone extracts exhibited close cytotoxic activity to each other against HeLa cancer cell lines. While the acetone extract exhibited moderate activity against MCF-7 cell lines. From the acetone and methanol extract three new steroidal 3 β fatty acid compounds (1-3) which were in the similar skeleton to following steroid were isolated and elucidated. AN ANALYSIS FOR THE USAGE OF KANLICA MUSHROOM ON THE PRACTICE FIELD OF GASTRONOMY AS A TYPE OF HIGH AROMATIC MUSHROOM

OYA ÖZKANLI¹, ÖZKAN SÜZER¹, CEYHUN UÇUK¹

ABSTRACT

It is known that gastronomy is a science researching all phases of food and beverage. In this case indigenous products are also a field of study of gastronomy. These products are developed through gastronomy and can be carried out through new implements. Türkiye is home to many endemic plants and is fertile in terms of indigenous products. Kanlıca Mushroom is a member of the family Russulaceae and is the general name for *Lactarius salmonicolor*, *Lactarius delicious* and *Lactarius deterrimus* mushrooms in our country. In addition to this, it is one of the valuable indigenous products found in our country and it is a high-aroma mushroom. Furthermore, it is also known as Çam, Melki and Çintar mushroom. Kanlıca Mushroom is a type of fungi that has a high aroma value and a high nutrition grows in our country. As a type of mushroom, Kanlıca Mushroom is practicable to use in variable fields of gastronomy and has a potential to make gastronomy of country valuable. The aim of this study is to draw attention to Kanlıca Mushroom, to focus on possible uses in the gastronomy and to shed light on future work on this product. In this study, qualitative research technique was used. As research design, a case study was used. In addition, face-to-face interviews with field experts were used and the data were analyzed in the SPSS 15 package program and the results were evaluated. The development of local products and the processing of similar products have been reviewed in the literature. It is understood that Kanlıca Mushroom is a high aromatic plant, which can be used as a way to revise existing recipes and to produce new ones. Moreover, it is possible that this product converts into various forms. So, this factor can provide practicability about transportation and storage. It is considered that Kanlıca Mushroom has not been used enough in the gastronomy sector and that the usage areas in our country are limited and promotion and product development studies are needed in this subject.

BIOCHEMICAL AND DEMOGRAPHIC EVALUATION OF EMERGENCY DEPARTMENT PATIENTS WITH MUSHROOM POISONING

MUSTAFA FATİH HAYIRLIOđLU¹, CEMİLE TOPCU¹, KÜRŞAT AYRANCI², MEHMET GÜRBİLEK¹

ABSTRACT

Abstract English: Introduction: Mushroom toxicity is a worldwide concern. In the adult population, mushroom toxicity constitutes seven percent of all acute intoxications. The clinical feature may vary from mild nausea and vomiting to hepatic insufficiency according to the type of mushroom. Aim: This study aimed to present demographic and clinical features of patients presenting with suspected mushroom poisoning to emergency department. Method: In this retrospective study, we investigated 61 patients who were seen at the Emergency Department of Necmettin Erbakan University, Meram Medical Faculty from 01.01.2010 to 31.12.2016. We analyzed the data on the seasonal variation, demographic characteristics of the cases. Results: 61 patients were reported to emergency department, where 52% (32) of them were female. The mean age of the patient group was 48.47 ± 15.65 and the mean age of the control group was 50.2 ± 15.20 . Most of the patients recovered without any problems. Most of the poisonings occurred in autumn and spring (72%). 24 of 32 patients have LDH which is above the reference levels (125-220 U/L), 13 of 61 patients have SGOT which is above the r.l (5-34 U/L), 10 of 61 patients have SGPT which is above the r.l (0-55 U/L), 27 of 61 patients have Glucose which is above the r.l (70-105mg/dl), 4 of 33 patients have Amilase which is above the r.l (25-125 U/L), 1 of 33 patients have Lipase which is above the r.l (8-78 U/L), 12 of 42 patient have PT(INR) which is below the r.l (1.00-1.50); 5 of 42 patients have PT(sec) which is above the r.l (11-15); 3 of 42 patient have PT(%) which is below the r.l (70-120); 12 of 42 patient have APTT (sec) which is below the r.l (26.5-40); 30 of 42 patient have WBC which is above the r.l ($4-10 \cdot 10^3/u/l$). Conclusion: Mushroom poisoning still remains as an important public health problem. Mushroom poisoning is a health problem that can be fatal in our country and affects all parts of our homeland. Mushroom poisoning in Konya and around were mostly diagnosed in patients over 30 years and in autumn and spring. As a result, mushroom poisoning is among the causes of preventable morbidity and mortality in adults. It is important for the society to be conscious about mushroom poisoning and for patients to apply to the health facility without delay in the early period.

AXILLARY SHOOT REGENERATION OF POGOSTEMON ERECTUS (DALZELL) KUNTZE FROM NODAL EXPLANTS

MUHAMMET DOGAN¹, MEHMET KARATAS², MUHAMMAD AASIM²

ABSTRACT

The present study was designed for an efficient and rapid in vitro propagation from nodal explants of *Pogostemon erectus* (Dalzell) Kuntze. The explants were cultured on Murashige and Skoog (MS) medium containing 0.25 - 1.25 mg/L Thidiazuron (TDZ) and on plant growth regulator-free MS (MS0) medium for the purpose of control for eight weeks. Shoot regeneration frequency ranged between 27.77-100.00 % and the highest shoot regeneration frequency (100%) was recorded on MS medium containing 0.25 mg/L TDZ. Maximum number of shoots per explant (36.62) and maximum of shoot length (2.48 cm) were obtained on MS medium containing 0.25 mg/L TDZ. Regenerated shoots were successfully rooted on MS medium containing 0.25–1.00 mg/L IAA. The acclimatization of the rooted plants to the water environment was achieved successfully. This study provides an alternative method for commercial production of *P. erectus* plant. It can also facilitate as a base for the extraction of medicinally important compounds from this important aquatic plant.

PRODUCTION POTENTIAL OF COLCHICINE AS A SECONDARY METABOLITE FROM COLCHICUM AUTUMNALE L. PLANT BY IN VITRO CULTURE

GÜLSEREN EKER¹, AYŞEGÜL YILMAZ¹, SERVET KEFİ¹

ABSTRACT

In recent years, studies on the production of secondary metabolites from plants has accelerated considerably. Secondary metabolites synthesized by plants, which do not affect plant life as much as primer metabolites, are economically important chemical compounds in the fields such as medicine, agriculture, perfumery and food. There are some factors that affect the yield in the production of various secondary metabolites by in vitro techniques. The colchicine of secondary metabolites, which has broad usage field, has production potential from *Colchicum autumnale* L. plant by in vitro techniques. There are total 35 species of *Colchicum* genus, in which 27 of them flower in autumn and 8 in spring, in Anatolia and 15 of them are endemic. In our country the seeds of these plants have been collected and exported abroad at low prices, whereas the colchicine has been imported to our country at high prices. The colchicine alkaloid, obtained as a secondary metabolite, is an important compound that has poison effect used for treatment of various diseases and plant breeding studies. Although techniques for obtaining colchicine have not yet been developed in our country, the mass production of colchicine from *Colchicum autumnale* L. plant by using in vitro techniques and also biotechnological methods will cause our economy to gain added value.

EFFECTS OF MAGNETIC FIELD TREATMENTS ON SEED GERMINATION OF MELISSA OFFICINALIS L.

CANAN ÜLGEN¹, ARZU UÇAR TÜRKER¹, ARZU BİRİNCİ YILDIRIM¹

ABSTRACT

Melissa officinalis L., commonly known as lemon balm, is a perennial herb belonging to Lamiaceae family. It has therapeutic properties, such as sedative, carminative, antispasmodic, anti-viral, wound healing, digestive, diuretic, diaphoretic, anti-septic and anti-thyroid. Lemon balm has been used for the treatment of headache, indigestion, colic, nervousness, cardiac problems, depression, rheumatism, indigestion, hypersensitivities, anxiety and depression traditionally. Beneficial effects of lemon balm are ascribed to the phenolic compounds such as rosmarinic acid, tannins and flavonoids. Studies showed that magnetic field applications in agriculture can be used to improve the quality and quantity of the product. Positive effects of the stationary magnetic field on the plant seed germination have been recorded with some plant species. In this study, effects of magnetic field on *M. officinalis* seeds were investigated. Seeds were sterilized in 0.1 % HgCl₂ for 10 min and 70 % Ethanol for 1-2 min. After surface sterilization of the seeds, they were placed in petri dishes containing Murashige and Skoog's medium with sucrose and agar. Neodymium block magnets (100 X 50 X 5 mm) were used to create magnetic fields (50 mT and 100 mT). Ten seeds were placed in each petri plates and 10 petri plates were used for each treatment. Petri dishes containing surface sterilized seeds were placed in 3 different conditions [without magnetic field application (control) and magnetic field applications (low-50 mT and high-100 mT)] and the germination (radicle protrusion) was assessed. Seeds were exposed to magnetic fields for 1, 3, 6, 12, 24, 48, 72, 144 and 240 hours. The number of germinated seeds was recorded for 20 days. Best seed germination was obtained with 100 mT magnetic field application for 1 hour (52 %). Seed germination rate was rather low (28 %) without magnetic field application (control). In consistent with 100 mT magnetic field application, 1 hour exposure to 50 mT magnetic field gave better germination rate (36 %) than control. The lowest seed germination was observed with 240 hours exposure to both magnetic fields (27 % for 100 mT and 16 % for 50 mT). Magnetic field applications also decreased the seed germination time. Although seed germination was observed in 11. day with control, it was obtained in 7. day with both magnetic field applications. Magnetic field application enhanced the percentage of germinated seed and shortened the period of seed germination in *M. officinalis*.

EFFECTS OF OSMOTIC CONDITIONING TREATMENTS OF LAVENDER (*LAVANDULA ANGUSTIFOLIA*) SEEDS ON MEAN GERMINATION TIME AND GERMINATION RATE

MUSTAFA DEMIRKAYA¹, BILGE AYDIN¹, AKİFE DALDA ŐEKERCİ¹, OSMAN GÜLŐEN¹

ABSTRACT

Lavender is an important perfume, cosmetic and pharmaceutical plant cultured in the world because of its high content and high quality essential oil. Besides, it is an important ornamental plant with pleasant fragrance and beautiful vegetative pattern in bush form. In seed propagation, there are some problems such as low germination times and germination rate. Relevant studies on seed properties in our country are very limited and there is an external dependency on the seed. The aim of this study was done to facilitate and speed up germination in lavender seeds. Osmotic conditioning was performed in seeds with Methyl Jasmonate (1.0 mM MeJA) and seaweed (*Ascophyllum nodosum*) extract (1:500 seaweed extract) at 20°C for 1 and 2 days. After the application seeds were taken to germination tests at 25°C. Germination indexes of the seeds, germination rates and germination time were determined. Seaweed1 and 2 days and MeJA 2 days treatments increased the germination rates in lavender seeds statistically compared to the control. Seaweed 2 day and methyl jasmonata 2 day treatments increased the germination index, statistically.

THE EFFECT OF DIFFERENT SOWING TIMES ON YIELD AND QUALITY OF MARIGOLD (*CALENDULA OFFICINALIS* L.) AT ÇUKUROVA CONDITIONS

SELİN GEDİK¹, LEYLA SEZEN TANSI¹

ABSTRACT

Marigold (*Calendula officinalis* L.), belonging to Asteraceae family, is biennial herbaceous plant and grown as annual, a native of the Mediterranean region. The flowers and seeds of marigold are used in horticulture, landscape, medicine, cosmetics, perfume, pharmaceutical preparation, dye, food and other industries. Especially dried petals of the marigold come in to prominence with uses for treat burns, bruises, cuts and dermatitis in people with breast cancer during radiation therapy. In this study it was detected plant height, number of branch per plant, fresh and dry plant weight, seed weight per plant, oil content of the seeds from internal and external receptacle of different sowing times (8, 15 and 22 December 2015) at Çukurova Conditions. Maximum oil content (% 15.07) obtained from internal receptacle seeds at 3rd sowing time.

THE PHYSICOCHEMICAL AND STRUCTURAL CHARACTERISTICS OF CULTIVATED SALEP

ABDULLAH KURT¹, TALIP KAHYAOđLU²

ABSTRACT

Salep is obtained from tubers of orchids which grown in mediterranean countries, especially in Turkey. The main polysaccharide content of salep is glucomannan. As hydrocolloid, it is used for preparing hot drink and ice cream as stabilizer. However, orchid plants are damaged and sold with high priced. Therefore, searching of alternative production methods of salep are in progress. The important and favorable development for salep production was revealed by Aegean Agricultural Research Institute with the project of -the growing possibilities of salep orchids at farm conditions (cultivation)-. Salep tubers was obtained with a high yield with mentioned project. In our studies, the naturally grown salep which belongs to *Serapias vomeracea* and *Orchis sancta* species compared with cultivated products of them. The main constituents glucomannan and starch, protein, cellulose, lignin were determined in the physicochemical analyses part. In addition, molecular weight, fourier infrared spectroscopy (FTIR), XRD, scanning electron microscopy (SEM), particle size and thermal analysis (DSC and TGA) were conducted for the structural characterization. The tubers obtained from *Serapias vomeracea* exhibited higher similarity in physicochemical properties with naturally grown one than *Orchis sancta*. Rheological experiments showed that samples have newtonyen flow. FTIR experiments which provide knowledge about chemicals bonds in structure revealed that cultivation studies did not vary of salep chemical structure. Amorph structure was determined with the XRD experiment for all samples. The variation of surface morphology of salep was observed with the cultivation by SEM. DSC and TGA analysis exhibited that samples had similar termal stabilities. The results obtained in this study showed that salep with the same physicochemical and structural characteristics with naturally grown could be achived by cultivation. The development and widening in this production method provides both protection of wild orchids and cheaper salep production.

THE HEALTH BENEFITS OF Highbush CRANBERRY (VIBURNUM OPULUS L.) TEA

AYŞEN MELDA ÇOLAK¹, FATMA ALAN², VOLKAN OKATAN³

ABSTRACT

Medical plants encompass a large scope in terms of active ingredient. For centuries, natural components extracted from plants have been used in treating various diseases without any scientific base. From ancient times to modern era, human beings have made use of the plants in order to heal the ailments in the field of medicine, pharmacy and biology. Natural products out of medical plants are generally consumed most in terms of human healthy. One of the plants, classified both as berry fruits and as medicinal as well as aromatic plants is highbush cranberry. Highbush cranberry (*Viburnum opulus* L.) is a red fruit with idiosyncratic sour taste and is often consumed and grown generally in central Anatolia, especially in Kayseri province and its neighbourhood. It is believed that highbush cranberry prevents renal calculi and it also has healing properties for high tension, asthma, digestion problems and cold. Highbush cranberry with high vitamin c content and rich in phenolic components, has a strong odor caused by valeric acid found in its structure. Highbush cranberry (*Viburnum opulus* L.) is consumed, however uncommon, as fruit, fruit juice, Turkish delight, dried fruit roll up as well as tea. Highbush cranberry (*Viburnum opulus* L.) tea is believed to consist some components beneficial to human healthy. Future studies may show how beneficial Highbush cranberry tea is to human healthy and for what diseases it may work.

POSSIBLE USE OF EPIGALLOCATECHIN-3-GALLATE FROM GREEN TEA AS PREVENTION OF PERIODONTAL DISEASE

ARZU BEKLEN¹

ABSTRACT

“Periodontology” is a dental research field addressing the tooth supporting tissues. Teeth are surrounded and supported initially by gum tissue. The periodontal disease is a multifactorial disease that causes the destruction of the supporting soft tissue and if not treated, extends to the underlying bone tissue. Loss of soft and hard support cause the teeth to become loose and eventually fall out. Periodontal disease is initiated by a microbial biofilm called dental plaque, which is a sticky film that constantly forms on the teeth. Dental plaque is made mostly of bacteria that grows on surfaces within the mouth. These bacteria produce toxins or enzymes that can irritate the tissues that support the teeth. In another words, toxins or enzymes can damage the attachment of the gums and bone of the teeth. Among these enzymes, matrix metalloproteinases (MMPs) are produced and released by the immune cells to break soft and hard tissue around teeth. Gelatinases form a subgroup of enzymes within the MMP family and include MMP-2 and MMP-9. Natural compounds are one of the promising molecules for diminishing MMPs to prevent and to treat oral diseases since they act on both bacteria and immune response. In recent years, the health benefits of consuming green tea, like antibacterial effect is under investigation. Green tea polyphenols are mostly catechins, the most predominant being epigallocatechin-3-gallate (EGCG), which presents various beneficial pharmacological properties. The aim of this study is to evaluate the effect of EGCG on the inhibition of MMP-2 and MMP-9 on gingival epithelial cells. For this purpose the released levels of MMP-2 and MMP-9 from gingival epithelial cell cultures following stimulation with tumor necrosis factor alpha alone or with additional EGCG (5 µg/ml) were analyzed by enzyme-linked immunosorbent assays. The results showed that the cultured gingival epithelial cells stimulated with inflammation mimicker tumor necrosis factor alpha produced MMP-2 and MMP-9, whereas addition of EGCG to cell culture significantly decreased the levels of MMPs ($P < 0.05$). The findings of the experiments showed that green tea acts in a way to reduce the secretion of MMPs by a TNF-alpha stimulated oral epithelial cells. Such data show promising result as a possible adjunctive remedy for periodontal inflammation therapy.

THE EFFECT OF ADDING HONEY AT DIFFERENT TEMPERATURES ON ANTIOXIDANT PROPERTIES AND HYDROXYMETHYL FURFURAL FORMATION IN LINDEN TEA PREPARED WITH INFUSION AND DECOCTION

DUYGU BENZER GÜREL¹, ÖZLEM ÇAĞINDI¹

ABSTRACT

Tilia species, known as linden flowers are used to relieve upper respiratory infection, cough and irritation coughs. Linden, which is often consumed among the population, is prepared by different methods as infusion and decoction in the treatment of such diseases, consumed by adults and children. It is also used together with honey and linden tea because of its effective compounds and sweetening. Besides the strong antioxidant activity of honey, the reducing sugars present in the honey with heat treatment lead to maillard reaction's result of formation of hydroxymethyl furfural (HMF) which is known as toxic. In this study, the effect of adding honey in linden tea prepared by infusion and decoction methods, immediately after filtering, at 5, 10 and 15 minutes waiting in different temperature was investigated on total antioxidant capacity, total phenolic compounds, total flavonoid and HMF amount. Total phenolic compounds and total flavonoids of 150 ml linden tea samples, which may be equivalent to a cup, varied between 24,41-36,75 mg / 150 ml tea, 12,09-18,66 mg / 150 ml tea, respectively. Total antioxidants, total phenolic compounds and total flavonoids were found to be higher in the linden tea prepared by the decoction method. There were differences in the amounts of HMF formed by adding honey to linden tea at different temperatures. HMF was not observed in linden tea prepared by infusion method but it changed in the range of 0,31 - 0,38 ppm in tea prepared by the method of decoction. The highest content of HMF was observed of prepared by decoction method after filtering (95 °C) linden tea in adding honey immediately.

THE EFFECTS OF TOXIC LEVELS OF HEAVY METALS ON ANTIOXIDATIVE CAPACITY IN AERIAL PARTS OF SAGE

ÖZLEM ARSLAN¹

ABSTRACT

Phenolic compounds and flavonoids are among the most effective and widely distributed secondary products in the plant kingdom. Most of them play important physiological role, being involved in tolerance to various types of stress. These metabolites have several defence functions and their biosynthesis in plants is generally induced in response to biotic and abiotic stress such as UV-B radiation, drought, chilling, heavy metals, and attacks by pathogens, wounding, or nutrient deficiency. High environmental concentrations of heavy metals may be accumulated by plants and in certain concentrations will inhibit plant growth and development. Heavy metals including cadmium (Cd), lead (Pb), cobalt (Co), nickel (Ni) stimulate the formation of free radicals and reactive oxygen species leading to oxidative stress. This study was conducted to assess the heavy metal stress responses of sage (*Salvia officinalis* L.). Sage grown in aquatic culture at optimum conditions (at 25°C, 250 µmol m⁻²s⁻¹ light intensity, 16 hour light/8 hour dark, %40-50 humidity) for 20 days with half strength Hoagland solution was subjected to heavy metal stress conditions occurred by 100 ppm Cd, 100 ppm Co, 100 ppm Ni, 100 ppm Pb for 7 days. The aim of this study was to evaluate the heavy metal toxicity in the leaves, to compare toxicity levels of heavy metals and antioxidative capacity of the leaves, to understand the deteriorative effects of heavy metals on phenols, flavonoids and cellular membranes and to find out the Cd, Co, Ni and Pb tolerance levels of sage. Free radical scavenging capacities of leaves increased by different heavy metal treatments but, there was no significant difference of scavenging capacity between heavy metals. Total phenol and flavonoid contents of heavy metal treated leaves were increased and the highest increasement was determined in Ni and Co treated leaves. In conclusion, all heavy metal treatments lead oxidative stress in sage leaves and leaves accumulated all heavy metals at toxic levels. Though the leaves of sage is drunk as tea, higher accumulation of heavy metals in the leaves will also threaten the human health. As medicinal plant, it is very important to grow these plant at healthy environment.

INVESTIGATION OF THE EFFECTS OF ULTRASOUND ON GREEN TEA (CAMELLIA SINENSIS) AQUEOUS EXTRACT

GAMZE ÜÇOK¹, DURMUŞ SERT¹

ABSTRACT

This work investigates the aqueous extraction from green tea (*Camellia sinensis*) assisted by ultrasound irradiations (UI). It aims the identifying differences of the extracts with total phenolic content, DPPH radical scavenging activity, color, turbidity (OD620) and brix. Watered green tea grinding of size max. 500 μm , were treated by shaking (stirring: 100 rpm and treatment duration: 30 min) and ultrasound (intensity: 85 W/cm², frequency: 20 kHz and treatment duration: 30 min). The liquid-to-solid (volume/weight) ratio equal to 20. All tests were carried out at room temperature (20oC) and duplicate. Ultrasonication of green tea solute has been shown to significantly ($p < 0.01$) increase the amount of antioxidant activity (93.268 %), but the total phenolic content remained unchanged. A significant decrease in the L* values of the UI extracts was observed, while the b* values increased. It was also found that the samples had a significant increase in OD620 value (0.446 nm) by UI treatment. No significant ($p > 0.01$) difference was found in Brix values. In this study, ultrasound application to aqueous extracts of green tea was found to more effective than classical extraction.

INVESTIGATION ON THE EFFECT OF TEA (CAMELIA SINENSIS (L.) KUNTZE) EXTRACTS ON ORAL BIOFILM

ALP KAYAHAN KIVANÇ¹, MERİH KIVANÇ², GÜLBEN GÜNEY³, ZUHAL KIRZIOĞLU³

ABSTRACT

One of the major causes of tooth decay and gum disease is the adhesion of plaque to the tooth surface. In addition to tooth surface, the plaque adheres to dental restorations, prosthesis and implant surfaces, and this leads to problems. In children, chemical agents and mechanical applications such as tooth brushing are the basic tools used to prevent or limit the formation of plaques. Besides, plants are used for this purpose and support modern medicine nowadays. Tea, effects and activities of which vary depending on characteristics of the area it is cultivated, is one of the important plants used for this purpose. It is considered that the catechin contained in the structure of tea plays an important role in its effect on oral microorganisms. The tea plant should be evaluated as an alternative to many chemical agents which are effective in removing dental plaque in long term use, considering its side effects on children especially. The purpose of this study is to investigate the effect of tea against microorganisms obtained from dental plaque in pediatric patients. **MATERIALS AND METHODS** In the study, methanol, hexane and water extracts were prepared with the tea produced in the Rize region of Turkey. For this purpose, methanol and hexane were added separately to green tea in certain amounts, the mixture was allowed to stand in incubator, the methanol and hexane were evaporated and then the remaining weight was calculated. Distilled water was added to the material and used by being sterilized. For the extract prepared by using sterile distilled water, dry leaves of green tea and tea plant were kept in the Brain Heart Infusion (BHI) liquid medium and used by sterilizing. Microorganisms are *S. anginosus*, *S. dysgalactiae*, *S. mutans* and *E. faecium* which were defined in previous studies by isolating them from the mouths of children. In the prevention of biofilm formation, the effect of tea extracts was confirmed on microtiter plates. The results were evaluated spectrophotometrically. **RESULTS** In the study, it was observed that both tea extracts had an important effect on the oral biofilm and their effectiveness changed according to the bacteria. The low amount of substance may have led to this change. As the concentration of tea extract increased, the amount of biofilm decreased. As a result of the study, it was observed that the hexane extract was more effective while the effect of methanol extract is lower. **CONCLUSION** Tea may prevent tooth decay by affecting oral biofilm. Since it is available, inexpensive and reliable, it can be a herbal extract that is used successfully in children. However, since tea may be harmful directly to oral tissues, there is a need for more in-vivo and in-vitro studies, especially in children.

EFFECT OF OCIMUM BASILICUM ON MESENCHYMAL STEM CELL PROLIFERATION AND DIFFERENTIATION: DOES THE EFFECT CHANGE ACCORDING TO NICHES?

AYŞEGÜL H. MENDİ¹, BEYZA GÖKÇINAR YAĞCI², NURDAN SARAÇ³, MUSTAFA KIZILOĞLU⁴, AYSEL UĞUR⁵, DERViŞ YILMAZ⁴, DUYGU UÇKAN⁶

ABSTRACT

It is a big issue that reduced bone density and large fractures in dentistry and orthopedics. Side effects caused by synthetic drugs lead to medical and ethical problems. Thus, plants and medicinal plant research take attention. Aim of this preliminary in vitro study is to investigate the effect of *Ocimum basilicum* extract on dental pulp (DP) and bone marrow (BM) derived mesenchymal stem cell (MSC) proliferation, osteogenic differentiation and immunological response to TNF- α . Human dental pulp tissue was obtained from patients (15-20 years of age) who were undergoing extraction of third molars for orthodontic reasons at the Department of Oral and Maxillofacial Surgery, University of Gazi University*. xCELLigence system was used to determine proliferation of DP- and BM-MSCs. Adipogenic and osteogenic differentiation was shown and calcium concentration, osteocalcin and osteonectin levels were examined. Inflammatory environment was mimicked through TNF- α stimulation and IL-6 and IL-10 levels were defined by ELISA. Doubling time with *O. basilicum* was found in DP- MSCs (38 h) and BM-MSCs (76 h). IC50 value was shown as 148 μ g/mL in DP-MSCs and 178 μ g/mL in BM-MSCs. Calcium concentration of BM-MSCs was found decreased in *O. basilicum* treated groups. Level of osteonectin was reduced in *O. basilicum* treated cells suggesting that the Extract accelerated the osteogenic differentiation. We suggest that *O. basilicum* could be a smart osteoinductive agent where BM-MSCs should be investigated further. Rich flora of Turkey is an opportunity for us and encouragement can easily give inside to medicinal plant investigations. * B.30.2.GÜN.0.20-122 Ethics Committee Report

THE CYTOTOXIC AND APOPTOTIC EFFECTS OF ARUM DIOSCORIDIS EXTRACT AND TOZASERTIB COMBINATION ONTO THE CFPAC-1 PANCREATIC ADENOCARCINOMA CELL LINE

ERSİN ÖZTÜRK¹, A. ATA ÖZÇİMEN², DERYA YETKİN³

ABSTRACT

Pancreatic cancer is a difficult form of cancer since its silence and progression as well as its resistance to medical treatment. The mechanisms of formation and progression of pancreatic cancer are being tried to be explained and many different methods are being sought to halt the proliferation of cancer cells. For years, people have used some wild plants as "traditional" and "natural medicine" in the treatment of various diseases. Tannins (phenolic compounds) are effective in many pathways in cancer initiation, progression, angiogenesis and metastasis. Arum dioscoridis plant, collected and identified in the village of Tarsus Keşbukü, was dried and subjected to ethanol extraction (1:10 v / v). The HPLC-DAD was used to determine the amount of Vitexin in the extract as 4.1 mM in the extraction. Using the xCELLigence E-Plate 16 system, the Vitexin IC50 value was calculated as 15.4 µM for 48 hours. Tozasertib 10 nM and Vitexin ext 10 µM were applied CFPAC-1 cells for 48 and 72 hours for synergic effect and Annexin V apoptosis test and DNA cell cycle analysis test were performed. The combination of drug and extraction directed apoptosis of cancer cells at a high rate of over 50% for 72 hours. Furthermore, according to the DNA cell cycle analysis of the combination on the CFPAC-1 cells, it was demonstrated that the S phase level dropped significantly at 72 hours. As a result, the vitexin and tozasertib treated cells were arrested in the G1 and G2 phase respectively. This study was supported by the Research Fund of Mersin University with Project Number: BAP-TP3-1414. This study was performed in Mersin University Stem Cell and Regenerative Medicine (MERKÖK) Tissue Culture and Flow Cytometry Laboratory.

EVALUATION OF ANTICANCEROGENIC AND ANTIBACTERIAL EFFECT OF MURT (MYRTUS COMMUNIS) PLANT EXTRACTS ON SOME CELL LINES IN VITRO

F. AZİZE BUDAK YILDIRAN¹, ABDULLAH MELEKOĐLU², MUSTAFA TÜRK¹, SIYAMI KARAHAN¹

ABSTRACT

Cancer is the second leading cause of death worldwide and is predicted to increase by 70% over the next 20 years. Damage to healthy cells and severe side effects limits the use of chemotherapeutic agents and other treatments. Thus, it is of great importance to search for alternative medicinal products obtained from natural sources with the least side effects. In this study, we evaluated antimicrobial activities of ethyl alcohol and water extracts from Murt (*Myrtus communis*) plants stem and leaves using *Staphylococcus aureus* (ATCC 29213), *Candida albicans* (ATCC 8459581 20913) and *Escherichia coli* (ATCC 20913). Various concentrations of the extracts (12.5, 25, 50, 100, 200 $\mu\text{g/ml}$) were evaluated for cell proliferation and cytotoxicity on L929 fibroblast, A549 lung cancer, and DLD-1 colon cancer cell lines. In the test of antimicrobial activity, Murt extract was found to reduce the zone diameter by 50% in *Escherichia coli* (ATCC 20913) compared to the control, but not on other species of bacteria tested. There was also no difference between alcohol and water extracts for antimicrobial effects. In evaluation of cell proliferation and cytotoxicity, no high toxicity was observed on L929 fibroblast and A549 lung cancer cell lines with an IC50 value of 120 $\mu\text{g/ml}$. On the other hand, the extracts caused a decrease in cell proliferation on DLD-1 colon cancer cell lines with an IC50 value of 75 $\mu\text{g/ml}$. In this study, Murt (*Myrtus communis*) plant extract was investigated in terms of antibacterial, cytotoxicity and cell proliferation. It can be said that this plant has anti-cancer activity for colon cancer in the light of data obtained from the present study.

DIANTHUS CARMELITARUM EXTRACT INDUCES CELL CYCLE ARREST AND APOPTOSIS IN HUMAN COLON CANCER CELLS

IBRAHİM TURAN¹, SELİM DEMİR², SERAP ÖZER YAMAN³, KUBRA AKBULUT CAKIROĞLU³, REZZAN ALIYAZIOĞLU⁴, AYSE ARSLAN⁵, AHMET MENTESE⁶, YUKSEL ALIYAZICIOĞLU³

ABSTRACT

Background/Aim: Colon cancer is the third most common type of cancer and leading cause of death throughout the world. Chemotherapy is the most commonly used strategy against colon cancer, although there are a number of disadvantages to this, such as various side effects on healthy cells and its gradual increase of drug resistance in cancer cells. Natural products have represented an important source of drug development studies for many years, and many new generation chemotherapeutic agents are derived from such products. Dianthus which is a medicinal plant, belongs to family of Caryophyllaceae and includes more than 300 species. There have been reported 76 Dianthus species from Turkey and 33 species of them are endemic (including Dianthus carmelitarum). Dianthus species have been used in traditional medicine to treat chronic pains, urinary infections, carbuncles, menostasis, gonorrhea, cough, liver diseases, and some types of cancer. Dianthus species are rich in phenolic (kaempferide, quercetin, kaempferol, apigenin, luteolin, acacetin, naringenin, and their glycosides), and volatile compounds (monoterpene and sesquiterpene hydrocarbons). Also, Dianthus species and their isolated components exhibit antibacterial, antifungal, cytotoxic, antioxidant, and antidiabetic activities due to the above mentioned compounds. Several studies have investigated the cytotoxic effect of different species of the genus Dianthus, however there have been no previous studies of the cytotoxic effect of D. carmelitarum. We therefore investigated the antiproliferative activity of D. carmelitarum extract along with the mechanisms involved, focusing on apoptosis and the cell cycle in human colon cancer (WiDr) cells. Materials and Methods: Samples of Dianthus carmelitarum were collected from Sinop, Turkey. The aerial parts of the plant were air-dried at 25°C for 20 days and powdered using blender and milling into fine powder. The powder then was mixed with dimethyl sulfoxide (DMSO) and extracted by maceration. The cytotoxic activity of extract was determined in human colon cancer and normal colon cells using MTT assay. The mechanisms involved in the cytotoxic effect of extract was then evaluated in terms of apoptosis, and the cell cycle using flow cytometry. Results: D. carmelitarum extract exhibited selective cytotoxicity on colon cancer cells compared with normal colon cells. Extract arrested the cell cycle of colon cancer cells at

THE PRODUCTION OF ANTICANCER SECONDARY COMPOUNDS BY PLANT CELL CULTURES.

BELMA KONUKLUGİL¹

ABSTRACT

Medicinal plants and their derived natural products, principally plant secondary metabolites have long been used to treat numerous diseases. Plants are an important source of effective anti-cancer agents: over 60% of the chemotherapeutic agent is currently derived directly from natural sources or based on natural structures . Also most secondary metabolites are present in extremely low amounts in the plant. This inefficacy can make natural harvestation unpractical for bulk production, especially in the case of slow growing species. Plant cell culture is an alternative production technology for complex natural products that cannot be chemically synthesized or extracted in high yields from native sources. Studies on the production of plant metabolites by callus and cell suspension cultures have been carried out on an increasing scale since the end of the 1950's. The aim of using such culturing techniques is for obtaining important secondary metabolites for pharmaceuticals ,cosmetics , food additives and natural pesticides from the harvest of the cultured cells or tissues. Cytotoxic lignans derived from podophyllotoxin are currently used in cancer chemotherapy. Podophyllotoxin is still extracted from rhizomes and roots of Podophyllum hexandrum and P. peltatum plants collected in the wild, because agricultural production of the plant material as well as chemical synthesis of PTOX are not economic. Therefore, there is a great interest in alternative sources of PTOX supply. An alternative source for podophyllotoxin or related lignans may in future be cell cultures derived from different plant species, such as Linum spp. These cell cultures were shown to accumulate considerable amounts of podophyllotoxin or 5-methoxypodophyllotoxin. This work summaries the production of some anticancer compounds (podophyllotoxin, 5-Methoxypodophyllotoxin, justicidin B) from plant cell culture of Linum species.

KEYWORDS

THE EFFECTS OF PROPOLIS ON THE QUALITY OF SPERM, REPRODUCTIVE ORGANS AND TESTICULAR ANTIOXIDANT STATUS OF RATS TREATED WITH CYCLOSPORINE-A

BURCU GÜL BAYKALIR¹, PINAR TATLI SEVEN², SEYFETTİN GÜR², İSMAIL SEVEN³

ABSTRACT

This study was designed to determine the effects of propolis on the quality of sperm and reproductive organs in male rats treated with cyclosporine-A (CsA). In this study, 24 male Sprague-Dawley rats (280-300 g, 8-10 weeks) were used. The animals were randomly divided into 4 groups and the administrations were continued for 21 days. Group 1 served as control group. Group 2 was given 15 mg/kg of CsA by subcutaneously. Group 3 was given 100 mg/kg of propolis by gavage. Group 4 was given 15 mg/kg of CsA subcutaneously and 100 mg/kg of propolis by gavage. Administration of CsA to rats decreased sperm motility ($p<0.01$) and sperm concentration ($p<0.01$), and it was increased total abnormal sperm rates ($p<0.05$) as compared with the control group. Significant improvements were observed in the sperm motility ($p<0.01$) and total abnormal sperm rates ($p<0.05$) in CsA plus propolis group. Also, seminal vesicle ($p<0.01$) and prostat glands weights ($p<0.01$) were significantly higher in CsA plus propolis group than CsA group. Administration CsA caused a significant increase in MDA level ($p<0.01$) and significant decreases ($p<0.01$) in GSH level and CAT activity in CsA group compared with the control. In CsA plus of propolis group significantly decreased the MDA level ($p<0.01$), significantly increased the GSH level and CAT activity compared with the CsA group ($p<0.01$). As a result, it was determined that oral supplementation of 100 mg/kg of propolis had amendatory effect on the quality of sperm and reproductive organs treated with CsA administered rats.

THE THERAPEUTICS EFFECTS AND TOXIC RISK OF HERACLEUM PERSICUM DESF. EXTRACT ON EXPERIMENTALLY STREPTOZOTOCIN-INDUCED DIABETIC RATS

ELIF EBRU ALKAN¹, İSMAIL ÇELİK¹, BEDİA BATI²

ABSTRACT

The aims of this study were the evaluation of the therapeutics effect, antioxidant role and toxic risk of *Heracleum persicum* plant against streptozotocin (STZ)-induced diabetic rats. The study groups was designed as I [Normal Control (NC)], II [Diabetic Control (DC)], III [Diabetes + Acarbose (DAC) (20mg/kg bw)], IV [Diabetes + HP (100mg/kg bw) (DH1)], V [Diabetes + HP (200mg/kg bw) (DH2)] and VI [Diabetes + HP (400mg/kg bw) (DH3)] groups. According to results; the levels of blood glucose (BG), glycosylated hemoglobin (HbA1c) and malondialdehyde (MDA) of DC group were increased significantly compared to NC group, whereas these parameters of the groups treated with the plant extracts were observed significant declines compared to DC. The biochemical analyses showed a considerable decrease in insulin and c-peptide levels and fluctuated antioxidant defence system constituents (ADSC) in the DC group as compared to control group, whereas the extract supplementations diet restored the diabetic complications parameters towards to the NC. On the other hands, hepatocyte damage serum enzymes as serum aspartate aminotransferase (AST) and alanine aminotransferase (ALT) levels increased in the the plant extract supplementations groups as compared to NC and DC groups. It was concluded that while the extracts of *Heracleum persicum* have had therapeutic effects on some complications caused by diabetes, but might be caused hepatocyte damage changes as the transport functions and membrane permeability of these cells, thus causing enzymes to leak.

THE INVESTIGATION OF BIOLOGICAL EFFECTS OF THE IN RATS WITH METABOLIC SYNDROME NIGELLA SATIVA OIL

NACI ÖMER ALAYUNT¹, BİLAL ÜSTÜNDAĞ²

ABSTRACT

It was known that the Nigella sativa oil and its derivatives show numerous pharmacological and biological activities. Nigella sativa oil have strong biological activities such as on cancer, hypertension, kidney stones and diabetes mellitus. In this study, we had the purpose to contribute to the literature with the data to be obtained from investigating of the Nigella sativa oil on VMA and kidney enzymes levels, having a metabolic syndrome formed in rats with a fructose diet. In the study, 21 male Sprague-Dawley rats about weight of 200-240 g have been used. The rats were separated to 3 groups, each of which has 7 rats. Group1; control group (10 weeks), group 2; metabolic syndrome with fructose (10 weeks), group 3; given Nigella sativa oil after metabolic syndrome progress (10+4 week) in created. Rats were decapitated after the study. Blood samples were taken VMA, Urea, Creatine, Uric acid, Inorganic P and ALP, were measured in the serum and the effects of Nigella sativa oil on these parameters were examined. Serum Uric acid levels measuring were compared to the control group found statistically significantly higher and the formation of metabolic syndrome, that we gave the Nigella sativa oil group serum Urea and Uric acid levels compared to the group levels significantly different were lower ($P<0,05$). Formation of metabolic syndrome, that we gave the Nigella sativa oil group Inorganic P and ALP levels were lower, but the decrease did not have a statistical significance ($p>0,05$). Metabolic syndrome group VMA levels were compared to the control group lower, but the decrease did not have a statistical significance ($p>0,05$). According to data obtained as a result of the study, Mann Whitney-U test and Kruskal Wallis the value of $p<0,05$ was used as a level of statistical significance in pair wise comparisons between the groups. In conclusion, nigella sativa oil has a positive effect on Urea, Creatine, Uric acid, Inorganic P and ALP, measured in patients with metabolic syndrome and this is a promising option.

**THE EFFECTS OF JUNIPERUS COMMUNIS(CUPRESSACEAE)
APPLICATION ON THE SERUM PARAOXONASE ACTIVITIES AND
PANCREATIC ENZYMES ACTIVITY AND LIPOPROTEINS LEVELS
IN EXPERIMENTAL DIABETIC RATS**

TAHIR KAHRAMAN¹, EVAN ABDULKARIM MAHMOOD²

ABSTRACT

This study was designed to evaluate the influence treatment of *J. communis* oil on paraoxonase activity, lipoprotein levels, pancreatic function in streptozotosin induced diabetic rats. Thirty two adult male rats were used in this study and randomly divided into four groups. Group one which contained eight male healthy rats given normal standard diet and determined as control group (C). Animals in group two contained eight rats was exposed to single dose of 45 mg/kg of streptozotosin in citrate buffer and named as diabetes group (D). Group three for the animals in group four, 200 mg/kg of *J. communis* was dissolved in distilled water (0.5% CMC) and was given to rats and it was named by healthy group with *J. communis* (J). Group four also contained eight male rats, during three weeks of the study, 200 mg/kg of *J. communis* was dissolved in distilled water (0.5% CMC) and have given to rats and determined as diabetes and *J. communis* group (DJ). Glycated hemoglobin (HbA1c) in whole blood and glucose, lipoproteins, paraoxonase (PON), amylase and lipase enzyme activities in serum were measured. All of the data analyzed by SPSS 13.00. Glucose, glycated hemoglobine (HbA1c), total cholesterol, triglycerides, HDL, LDL, VLDL, paraoxonase (PON), amylase and lipase enzymes were measured. Glucose and glycated hemoglobin were increased significantly in group of diabetes, and decreased significantly when treated with *J. communis* oil in DJ group. Total cholesterol level was increased significantly and by using *J. communis* oil, the level of cholesterol in diabetes and *J. communis* group (D) was decreased significantly ($p<0.05$). LDL and VLDL level were significantly increased in diabetes group and decrease significantly in DJ group. HDL level elevation was not statically significant ($p>0.05$). Level of amylase and lipase enzymes was considerably increased ($p<0.05$) in D group, and significantly decreases ($p<0.05$) in DJ group. Serum paraoxonase activity was had a significant decrease ($p<0.05$) in D group. Paraoksonase enzyme activity, a significant increase ($p<0.05$) was seen in DJ and J group when compared to D group. The results of this study indicated that *J. communis* plant can treat hyperglycemia, and also has a big effect on increasing paraoxonase enzyme, and lipoproteins.

ANTIOXIDANT AND ANTIHYPERLIPIDEMIC EFFECT OF SOLANUM NIGRUM FRUIT EXTRACT ON EXPERIMENTAL DIABETES MODEL

AHMET CİHAT ÖNER¹, FATMAGÜL YUR², MOHAMMED NOORADDİN FETHULLA³

ABSTRACT

Diabetes mellitus (DM) is a chronic, progressive disease characterized by hyperglycaemia, impaired carbohydrate, protein and lipid metabolism. Diabetes mellitus is also one of the chronic diseases that result in incorrect food balance. experimental diabetes models, studies on tissue and cell lines affected by diabetes play an important role in studies of diabetes mellitus complications and determination of treatment approaches, Solanum nigrum (SN) is an annual herbaceous plant species that grows in India and other dry regions of the World. There is a long history of medical use. It has also been used as a traditional folk medicine in the treatment of various disorders such as pain, fever, inflammation and liver disorders. In this study, it was aimed to investigate the antioxidative and antihyperlipidemic effect of Solanum nigrum fruit extract on diabetic rats In the study, 28 rats weighing 200-250 g were used. The rats divided four groups consisted of seven rats, each one; Control group (K), cerated diabetes mellitus and not given Solanum nigrum (SN) (D), cerated diabetes mellitus and given SN (DSN) and only given SN (SN) group. Pre-test blood glucose values of all animals were measured. D and DSN group rats received a single dose of streptozocin 45 mg / kg intraperitoneally. The same amount of saline was injected into the control group. D and DSN groups, 72 hours after injection of STZ, glucose levels were determined by glucose meter and strips in blood samples taken from the tail of rats. Blood sugar levels of 270 mg / dl and above were included in the study. The rats in the SN and DSN groups were given gavage daily at a dose of 250 mg / kg / 28 days of SN extract dissolved in distilled water. In terms of TAS level; D group was found to be significantly higher when compared with control and SN groups (p <0,05). At TOS level; D group was significantly higher than control, SN and DSN groups (p <0,05). Serum triglyceride level was found to be the highest group D and it was significantly higher than the SN group (p <0,05). There was no difference in cholesterol levels. D group glucose level was significantly higher than controls, SN and DSN groups (p <0,05). In addition, glucose level of DSN group was significantly higher than control and SN group (p <0,05). In conclusion, it was determined that the SN plant extract is statistically significant on shaped diabetes and that reduced the increased diabetes level, but the developing diabetes and rising sugar, can not be reduced at the level of healthy living.

HERBAL PRODUCTS USED IN THE TREATMENT OF DIABETES

GÜLAY ŞAHİNER ÖNAL (ARAŞT. GÖR. DR.)¹, KEMAL MACİT HISAR (YRD. DOÇ. DR.)¹

ABSTRACT

As a food supplement, various vitamins and some herbal products are used today. Many patients with diabetes use complementary and alternative medicine in addition to pharmacological treatment to obtain better glycemic control, reduce diabetes complications and / or complement existing diabetes medications. Objective: In this study, it is aimed to investigate herbal products commonly used in diabetes treatment in the world, especially in Turkey. Method: The study investigated herbal products and their effects widely used in diabetes treatment in Turkey and in the world. 45 domestic and 30 foreign sources were screened. It has benefited from Google Academic and Pubmed. Findings: Many natural products have been tested for the purpose of support for treatment. Efforts are continuing to work on the long-term use of these products. Especially Cinnamomum Zeylanicum and Panax Quinquefolium extracts are frequently used according to the results of clinical trials. Procyanidin type A polymers found in Cinnamomum Zeylanicum plant improve insulin receptor autophosphorylation and act by increasing insulin sensitivity. Panax Quinquefolium: Clinical studies have shown that American ginseng (roots directly dusted and used) lowered satiety blood sugar and HbA1c. Both Panax ginseng and American ginseng contain ginsenosides that reduce insulin resistance and are thought to increase insulin sensitivity. It is thought that the hypoglycaemic effect is caused by these substances. Detailed clinical trials on Gymnema Sylvestre, Momordica Charantia and Trigonella Foenum Graecum continue and promising results are achieved. The Momordica Charantia plant is in the forefront of natural products used against diabetes in Southeast Asia and has an insulin-like effect with a compound known as 'p-insulin', plant insulin or 'polypeptide-P'. Trigonella flavum Graecum plant has the effect of reducing the hunger, satiety glucose levels and HbA1C levels of the patients. It also reduces carbohydrate absorption from the gastrointestinal tract. Morus Nigra, Aloe Vera, Coccinia Indica, Allium Cepa, Allium sativum and Vaccinium Myrtillis are the products of our country and in the world. Effect mechanisms of commonly used preparations in the world: Insulinomimetic agents: Alcoptera, Alcoptera, Aloe Barbadensis, Camellia Sinensis, Cynnamomum Zeylanicum, Eucalyptus, Ipomoea Batatas, Juniperus, Olea Europaea, Urtica Dioica, Zingiber Officinalis, Nigella Sustain, Allium Porrum, Glycine Max, Coccinia Indica, Momordica Charantia, Regulators of enzymes involved in glycolysis, gluconeogenesis and cannabishydrate metabolism: Allium sativum, Silybum marianum, Allium sativum, Allium sativum, Allium sativum, Allium sativum, Allium sativum, Mangostica Charantia, Cinnamomum Zeylanicum, Caesalpinia Bonducella, Capparis Desidua, Phyllanthus Amarus, Viscum Album, Cuminum Cyminum, Foeniculum Vulgare, Trigonella Foenum Graecu, Increase in insulin release: Teucrium Polium, Helianthus tuberosus, Curcuma longa Conclusion: Phytotherapy based on the use of plant and plant extracts (herbalism, herbal medicine) is most frequently used in alternative and complementary methods of medicine. However, there is no consensus in the science community about the effectiveness and reliability of these methods. It is very

¹S.Ü. TIP FAK. HALK SAĞLIĞI AD.

important that patients who use or use hypoglycemic drugs with hypoglycaemic drugs should share this with doctors and pharmacists since there is no worldwide standard for the presentation and licensing of products and terms related to herbal medicinal products sold as medicines and food supplements.

COMPARISON OF ESSENTIAL OILS OF ENDEMIC SALVIA DICHROANTHA STAPF COLLECTED FROM KONYA

AYLA KAYA¹, SÜLEYMAN DOĞU², MUHİTTİN DİNÇ², MİNE KÜRKCÜOĞLU³

ABSTRACT

In the Anatolia folk medicine, *Salvia* L. (Lamiaceae) species are used by many people in various villages and towns for the therapeutic value of their essential oils. *Salvia dichroantha* Stapf is an endemic plant of the Irano-Turanian phytogeographic region. Plant materials were collected during the flowering period from Konya Cihanbeyli (900 m) and Konya Taşkent (1800 m). In this study, water-distilled essential oil of *Salvia dichroantha* were analyzed. The analysis was performed by using a gas chromatography (GC-FID) and gas chromatography-mass spectrometry (GC-MS) systems, simultaneously. Eight compounds were identified from the oil of Taşkent representing 96.4 % of the total oil and nine compounds were identified from the oil of Cihanbeyli representing 98.3% of the total oil. The major components were found as caryophyllene oxide (38.6%), caryophyllenol I (16.7%), caryophyllenol II (15.6%) and caryophylladienol II (11.1%) for Taşkent; caryophyllene oxide (65.8%), caryophyllenol II (14.3 %) for the oil of Cihanbeyli.

EVALUATION OF TURKISH MEDICINAL PLANTS AS TEA: INDUSTRIAL POTENTIAL

IFFET IREM TATLI ANKAYA¹

ABSTRACT

Plants have been used for centuries to prevent and /or treat a variety of medical illnesses. Today, about 80% of the world's population uses medicinal plants as part of their health care. Many of the uses have come from traditional cultures. Different cultures use herbs grown in their geographical locations for curing common illnesses. Medicinal teas are obtained from medicinal and aromatic plants. Medicinal teas consist exclusively of one or more herbal drugs intended for oral aqueous preparations by means of decoction, infusion or maceration. In order to obtain high value-added products (medicinal teas), it is necessary to identify and collect strategic/priority plants for each locality. Flora of Turkey is the best source for this purpose. Turkey is a transitional region between three phyto-geographical regions, which are Irano-Turanian, Mediterranean and European-Siberian regions and has a rich flora as well as a cultural accumulation. Therefore, traditional medicinal plants play an important role in Turkey. Hence, it will be very important to evaluate the medicinal plants as tea, to make the plants to be used in tea production as a standard plant in terms of quality and to produce them by the Good Agricultural Practices (GAP/GACP) regulation. In addition, geographical, agricultural and environmental factors, applied methods/ processes/methods of handling and storage conditions should be determined so that the desired effect can be ensured and used reliably. Herbal medicinal teas, also determined in European Pharmacopoeia as monographs will be evaluated in terms of our industrial potential1-6. References: 1. PLANATUS ORIENTALIS VERSUS PLANATUS ANATOLIAS

İBRAHİM ADNAN SARAÇOĞLU¹

ABSTRACT

Planatus orientalis (çınar), Anadolu'nun endemik bitkisidir. Geleneksel Çin tıbbında, uzak dođu ÷lkelerinde ve İran'da yüzyıllardır tedavi amaçlı kullanılmaktadır. Özellikle çınar yaprađında bulunan flavonoidler, proantosiyanidin glikositler, penta-aromatik triterpenoidler, tanen ve fitol türevleri ve kafeik asit geleneksel tedavide başarı ile kullanılmasında rol oynayan biyoaktif bileşenleridir.

İbni Sina, çınar yaprađını diř ağrılarında, antiinflamatuar ve dizlerde ağrı kesici (analgesic) olarak önermektedir. İran, çınar yaprađını günümüzde bazı dermatolojik, gastrointestinal ve romatizmal şikayetlerde geleneksel tedavi yöntemleri arasında uygulamaktadır. Dioscorides, çınar yaprađını dizanteride (dysentery) önermiştir. Antikanser gücü yapılan klinik çalışmalarla da ortaya konmuştur. Antiseptic ve antimicrobial özellikleri oldukça güçlüdür. Bu anlamda çınar yaprađından hazırlanan ađız çalkalama suyu hem antiseptic hem de aft şikayetlerinde başarıyla uygulanabilir.

GOLDEN SECRET OF WHEAT: GERM

ADEM ELGÜN¹

ABSTRACT

Wheat germ composes 2-3% of the kernel. It is consisted of embryonic axe and scutellum parts. Biologically, it is the living part of wheat kernel together with nutrient store for germination. At the present time wheat germ is obtained as a byproduct at the amount of 3-5 kg/ton wheat kernel in the flour and semolina milling. It has been used as a feed for animal stocks and babies for many years due to its vital nutrients rich enough for the plant to geminate and to move out the ground. Now, in the last times, wheat germ has been raised to the functional food status quickly, and found many sophisticated application areas. Wheat germ has 30% protein in the quality at those of egg, meat and milk. It is very tasteful food and rich in some vital nutrients like unsaturated fatty acids, minerals specially calcium, phosphorus, potassium, magnesium, zinc and ferrum, dietary fiber, sugars, B complex vitamins specially folic acid, and vitamin E. Other than these it contains various minor nutrients and functional compounds. Wheat germ take place in the functional food has some components effective in strengtening the immune system and in increasing the physical and mental activities. These nutrients have important rolls, in satiation for a long time, decreasing cholesterol, delaying aging, arranging digestive and nervous systems, and bring in the man stronger constitution versus chronic illnesses. The functional properties of germ are transferred to whole wheat and flour products too. The whole grain products without germ are not the whole, and don't have these functional properties. Raw wheat germ lose out these favorable properties and deteriorate fast, in regular environmental conditions too when to produce, protect and consume it according to the ways is not well enough. On account of consuming, it may be eat like cereal breakfast first hand and can be used as additives or in seasoning the other foods. The fermentation products of wheat germ carry out considerable distinctions in the point of functional nutrition. A person with has celiac and diabet disturbance and, gluten and egg intolerance could be cautious in wheat germ consumption. To use it over than needed, could be dangerous. Daily intake of wheat germ is not to pass 3% of bread ate by a person a day. As a result germ is a golden secret of wheat with its functional components. However wheat germ is not a medicine, but it must be used like a medicine.

RESEARCHING THE POTENTIAL OF ECONOMICALLY IMPORTANT MEDICINAL AND AROMATIC PLANTS OF TOKAT PROVINCE

HAKAN METE DOĞAN¹, ESRA GÜREL², EKREM BUHAN³, ÇİSEM NILDEM DOĞAN⁴

ABSTRACT

Tokat province is located in the Yeşilirmak Basin that is between the Middle Black Sea and the Inner Anatolia regions, and is important in terms of ecosystem and plant biological diversity. Nowadays, researching plant species that are economically important has become a necessity in the province. In this study, the potential of economically important medicinal and aromatic plants of Tokat province was researched by utilizing new Geographic Information Systems (GIS) methodologies and questionnaire techniques. The research was completed three main steps. First, an original GIS database for the flora of Tokat province was created by utilizing geo-referenced data collected from the field between 2008 and 2016. Then, a questionnaire prepared by the economists and plant taxonomists were applied to the target audiences selected among the local people and plant sellers in 2016. Finally, the questionnaire results and the GIS database were evaluated together in order to map important plant species areas. According to the questionnaire results, a total of 40 medicinal aromatic plant species were identified as economically important. These medical aromatic plant species have been evaluated as spice (1 species), spice-cosmetic (2 species), herbal tea-spice (2 species), herbal tea (3 species), herbal tea-spice-cosmetic (7 species), herbal tea-cosmetic (10 species) and herbal tea-cosmetic-perfume (15 species) in the study area. After querying the GIS database, 16 of these species were found in the Tokat flora and their locations were mapped. These species can be summarized as *Allium sativum* L., *Calendula officinalis* L., *Hypericum perforatum* L., *Laurus nobilis* L., *Matricaria chamomilla* L., *Melissa officinalis* L., *Mentha piperita* L., *Mentha pulegium* L., *Mentha spicata* L., *Nigella orientalis* L., *Rosa canina* L., *Thymus leucotrichus* Hal., *Thymus praecox* Opiz, *Tilia rubra*, *Tilia tomentosa*, and *Trigonella foenum graecum* L. These results are important for researchers, plant vendors, farmers and decision-makers.

RESEARCH OF THE ORCHIDS GROWING IN THE NIGDE CITY AND THEIR HABITAT QUALITIES AND THREAT FACTORS

GÜLDEN SANDAL ERZURUMLU¹

ABSTRACT

Niğde province is located at the intersection of Iranian-Turanian and Mediterranean phytogeographical areas and is located within B5 and C5 squares according to Davis' Grid system. This study was carried out in Altınhisar (6 towns, 2 villages), Bor (5 towns, 19 villages), Çamardı (2 towns, 18 villages), Çiftlik (4 towns, 9 villages) , And Ulukışla (4 towns, 34 villages) within the boundaries of Niğde which is in the specified grids. Niğde and its surroundings are composed of rural areas, having very few forest areas, and due to the destruction caused by various reasons, many plant species are destroyed and face the danger of extinction. One of these plant species is the orchid species. In the research, primarily the types of orchids that have been recorded in the research area within the literature studies have been determined. Orchid species were examined on site, during the field works conducted in March-July 2015-2016. Areas of orchid species were identified in the study and was assessed according to Braun Blanquet cover abundance scale method (1964). In the field studies, various data about the habitat of the species (height, view, sunlight condition, plant species which found together) were collected. *Epipactis helleborine*, *E. Persica*, *Orchis stevenii*, *Dactylorhiza saccifera* species stated as endemic in Niğde according to TÜBİVES data and *E. helleborine* have been found in the area of the study. As a result of the field studies in general, orchid species were found only in Çamardı (Pınarbaşı, Çukurbağ, Demirkazık villages) and Ulukışla (Maden Village) districts. Harvesting orchids in the villages of Pınarbaşı and Çukurbağ still continues. As a result of the research, 14 orchid species belonging to the 7 genus which are; *Anacamptis laxiflora*, *Cephalanthera damasonium*, *Dactylorhiza romana*, *Epipactis helleborine*, *E.purpurata*, *Ophrys İsaura*, *O. reinholdii*, *Orchis mascula*, *O.anatolica*, *O.purpurea*, *O. boryi*, *O.palustris*, ve *Serapias vomeracea* were determined to live in the area. Morphological information about each species has been given; some suggestions have been made to provide effective protection according to the existing area usage in the habitats. It has been mentioned that harvesting of orchids around Çamardı still continues and the Directorate of Provincial Food Agriculture and Livestock to work on the orchid cultivation.

A SOCIO-ECONOMIC VIEW ON MEDICAL AND AROMATIC PLANTS IN OUR COUNTRY

ŞULE TURHAN¹, MOHAMMAD MASOUD MORADI¹

ABSTRACT

Since long time ago, medicinal and aromatic plants have been used for food, flavoring, medicine and healing purposes. In the Ottoman period the medicine requirements of the people were met with herbal mixtures prepared by doctors or herbalists. In the year 1868 at Istanbul there were 2000 herbalists against 45 pharmacies, this was appeared to be a proof of importance of these plants in human health. Turkey is one of the leading countries in the trade of medical and aromatic plants through Its geographical location, climate and plant diversity, agricultural potential and large surface area. This significance of Turkey; Is due to the fact that plants that provide many herbal products, which are the inputs of established herbal medicine, plant chemicals, food and additives, cosmetics and perfumery industries in developed countries, are found in our country. Therefore, these plants are mostly collected from nature and marketed. In order to promote cultivation of medicinal and aromatic plants, the Ministry of Food, Agriculture and Livestock has included supporting medical and aromatic plants for the first time in 2015. Thyme, caraway, anise and poppy are among the first lines in the cultivated plants. For example, Turkey is one of the leading countries in the production of oregano and is in the first place in exports of this plant. Our country makes 80% of the world's thyme production alone. Moreover, 90% of the annual production of 10-12.000 tons of thyme is exported to approximately 70 countries. In order to adequately evaluate the sustainable production and market potential of medicinal and aromatic plants, these products must be of the desired quantity and quality. When evaluated from this point of view, it will provide significant contributions to the economy of our country. In the study, medical and aromatic plants will be evaluated economically and their current problems will be concentrated.

MEDICINAL AND AROMATIC PLANTS EXPORTED FROM GAP REGION

HASAN AKAN¹

ABSTRACT

In this study, medical and aromatic plants in the GAP region were identified and the latest status of their populations was determined. As a result of our research, we have found that Capparis ovata Desf, Capparis spinosa L., Thymbra spicata L (Zahter, thyme), Pistacia terebinthus L. (menengic), Pistacia khinjuk Stocks (Btntim), Rhus coriaria L (sumac), Cerasus mahaleb (L.) Mil. (Mahlep) and Glycyrrhiza glabra L. (liquorice) have been sold to domestic and foreign markets, exports have been made and collected from nature. In addition, some of the most widely consumed plant species in the country have been examined in their natural state and their use patterns.

DEVELOPMENTS IN TURKEY'S THYME PRODUCTION AND FOREIGN TRADE

DR. MUSTAFA ÖZTÜRK¹, MÜKREMIN TEMEL¹, AHMET BIRCAN TINMAZ¹, DR. YASIN ÖZDEMİR¹

ABSTRACT

Turkey is one of the most important countries of the world with thyme plant production and exports, which are collected from natural flora and cultured if necessary. Thyme; production and export figures and the contribution to our national economy and the income provided to the local people, it has an important place among the medical and aromatic plants. Thyme, which has many uses such as spices, medicines, cosmetics and chemistry sector, have an important place in medical and aromatic plants foreign trade of our country. Among the important medicinal and aromatic products demanded in the world are thyme, and Turkey holds about 70-80% of the world's thyme trade. Thanks to the use of alternative medicine, the demand for deafness has increased even more with the widespread usage in recent years. Thus thyme was a product with increasing economic value. In 2016, the production of 14724 tons of thyme was carried out in 121 thousand decares area. Denizli is the most important province in Turkey with 91.8% of the thyme plantation area and 85.7% of the country production in 2016. Manisa, Kütahya and Usak are other important producer cities. Thyme exports of Turkey, which was around 16,7 million dollars in 2004, increased by 263,5% and reached 60,7 million dollars in 2016. Turkey exports thyme to are close to 90 countries its 21.6% was USA. Germany, Netherlands, Poland, Canada and France are other countries had highest imports of thyme form Turkey in 2016. Exports to the Aegean Free Zone are at significant levels. Thyme provided by a company operating in the Aegean Free Zone is subjected to ground with high temperature steam under vacuum sterilization process and then packed and exported to especially Europe and America and around the world. In 2016, imports of 4.6 million dollars were received for 1661 tons of thyme. Albania, Morocco, Poland, Mexico and France are among the important countries we import thyme. It is necessary to support initiatives for increase and sustainability in thyme production and exports, which have the potential to add value and foreign exchange input to the country's economy.

ESTIMATION OF TURKEY'S MEDICAL AND AROMATIC PLANT IMPORTS WITH ARTIFICIAL NEURAL NETWORKS

MUHAMMET ESAT OZDAG¹, MURAT YESILKAYA¹

ABSTRACT

The consumption of medicinal and aromatic plants is increasing globally in parallel to the use in a wide variety of industrial fields in recent years. Although Turkey's medical and aromatic plants are potentially one of the most important countries in the world, they are not at the desired level of spreading this power to the economic arena. According to TURKSTAT, sector exports in the last few years have been realized as approximately 140 million dollars while imports have been recorded as 20 million dollars. In this case Since the sector can not meet all of domestic consumption and exports, it is important to estimate the import figures of future medical and aromatic plants. Planning that does not reside on demand estimates can not be expected to yield efficient results. In the changing global market, forecasting import figures will provide sectoral economic benefits to keep pace with the competition and to direct investments. This study presents estimates of imports of annual medicinal and aromatic plants from 2017 to 2027 of Turkey and aims to shed light on the future plans of those concerned by minimizing the error rate with the help of real data and kalman filter. Gross national product (GDP) (w1) and Turkey population figures (w2), which are influential on consumption and import as independent factors, were used taking into account correlation dependence in estimation. GDP and population figures for the last 15 years are provided by the Turkish Statistical Institute (TURKSTAT) and import figures for Turkish medicinal and aromatic plants from the International Trade Center (ITC) website. In recent years it has been observed that artificial neural networks are heavily used in estimation and that the estimated data show higher performance than other methods. In this study, the 15- year data set obtained is divided into two sections as verification (between 2012 and 2017) and education (between 2002 and 2011). The data for education is generated by artificial neural networks and import data for the following years. It has been reworked with the Kalman filter to verify with the data and to obtain a more stable result.

DIFFERENT HORMONE CONCENTRATIONS AND MARINE EFFECT EFFECTS OF BLUEBERRY STEEL PRODUCTION

VILDANE GERÇEK¹

ABSTRACT

The aimed to in this study, Blueberry is produced from steel, which is important as a non-wood forest product and naturally grown in the Eastern Black Sea Region. In this context, the effect of IBA and seaweed is examined on the rooting of hard steels, which from the phenotypically superior blueberry. The steels were taken in mid-February. The steel was applied to three different concentrations of doze IBA (2000 ppm, 3000 ppm, 4000 ppm) and marine algae, also to be controlled. In the greenhouse environment, the pure perlite planted steels were allowed to take root for 60 days in the fogging unit. At the end of the evaluation; IBA applications increased rooting compared to control steels. The steels treated with marine algae concentration showed the best growth in terms of height, diameter and root development.

ESSENTIAL OIL CHARACTERIZATION OF ANGELICA SYLVESTRIS L. VAR. SYLVESTRIS FROM VARIOUS GEOGRAPHICAL LOCATIONS IN LAKES REGION, TURKEY

ARIF ŐANLI¹, TAHSİN KARADOĐAN¹, BEKİR TOSUN¹, HAMİDE BAKIRKAYA¹, SABRİ ERBAŐ¹

ABSTRACT

The fruits of *Angelica sylvestris* L. var. *sylyestris*, growing wild in Lakes Region in Turkey, were collected at seed maturing stage from different localities to study the essential oil composition. The essential oils of fruits were obtained by hydro distillation and components of the oils were identified by gas chromatography/mass spectrometry. The oil yields on a dry weight basis ranged from 0.45% to 1.50%. The number of essential oil components ranged from 43 to 72 based on locations and a total of 97 compounds were identified. Major qualitative and quantitative variations of some compounds were determined with respect to localities of collection. The major components were β -phellandrene (8.07%-29.55%), 1-Phellandrene (2.27%-16.04%), sabinene (0.36%-14.85%), bicyclogermacrene (1.36%-11.38%), germacrene B (2.11%-9.11), α -bisabolol (0.73%-7.46%) geranyl acetate (1.68%-7.38) and germacrene D (2.57%-6.83%). Considering the major components, the localities were represented by different chemotypes (β -phellandrene / 1-Phellandrene / germacrene B), (β -phellandrene / 1-Phellandrene / bicyclogermacrene), (β -phellandrene /sabinene / bicyclogermacrene / 1-Phellandrene) and (β -phellandrene /geranyl acetate / α -bisabolol / germacrene B).

DETERMINATION OF PESTICIDE RESIDUE STATUS OF SOME MEDICINAL AND AROMATIC PLANTS

TAMER KUŞAKSIZ¹, HÜSEYİN ÇİMER², ESEN KUTLU KUŞAKSIZ¹, MEHMET ERTÜRK², MUSTAFA KORKMAZ³

ABSTRACT

Dried parts of Lemon Balm-(*Melisa officinalis*-Leaves), St. John's Wort(*Hypericum perforatum*-Herb), Peppermint(*Mentha piperita*-Leaves), Sage(*Salvia officinalis*-Leaves), Jasmine(*Jasminum officinale*-Flowers-imported), Green tea(*Camellia sinensis*-Leaves- imported), Eggplant(*Solanum melongena*-Fruits), Paprika(*Capsicum annum* –Fruits), Pumpkin(*Cucurbita sp.*-Fruits), were analyzed for pesticide residues by LCMSMS and GSMS devices with AOAC 2007.01 method and Quechers procedures in 2017. Among the 9 herbal samples analyzed, pesticide residues were detected in 7 samples except for Melissa and Sage. In the case of dried Jasmine flowers and pumpkin, the results were found to be higher than the values indicated in Turkish Food Codex Pesticide MRL Regulation. As a result, consumption of dried herbal materials with over-limit values as food may cause problems in terms of human health. Pre-sale inspections of these products, especially imported ones, by the Ministry of Food, Agriculture and Livestock should be made not only in terms of diseases and pests but also in terms of pesticide residues. The importance of this issue in this study has been pointed out.

STUDIES FOR MEDICINAL PLANTS' ADAPTATION IN ZEYTİNBURNU MEDICINAL PLANTS GARDEN

ERSİN YÜCEL¹, MURAT DİNÇER ÇEKİN², MERVE ZENGİN TINMAZ³, TUĞÇE AĞBA SEVENCAN³, MEHMET ALI ALTIOKKA³, MEHMET ŞİRİN YALVAÇ³

ABSTRACT

STUDIES FOR MEDICINAL PLANTS' ADAPTATION IN ZEYTİNBURNU MEDICINAL PLANTS GARDEN Zeytinburnu Medicinal Plants Garden is a pioneer joint project of Merkezefendi Traditional Medicine Society with Zeytinburnu Municipality. Opened in 2005, it is the first medicinal plants garden in Turkey. Besides plantation areas, an education and research center, two greenhouses, herbarium, laboratory, drying room and animal shelter are located in 3.5 acres land wherein no chemical is used. Supporting many projects by seed, seedling or consultancy, the Garden has contributed to development of biodiversity and promoted cultivation and the use of medicinal plants efficiently and safely. With guided tours, courses, workshops, internship and volunteer programs, publications and a yearly festival, it has become a lifelong learning center for all age groups. The Garden is open daytime throughout the year. Total number of taxa in Zeytinburnu Medicinal Plants Garden has reached to 708. Adaptation of 8% of indoor (greenhouse) plants and 52% of outdoor plants has been completed and these are grown extensively in their parcels. 92% of indoor plants and 48% of outdoor plants are still tried to be adapted. The families with highest number of taxa are Cactaceae, Rutaceae, Zingiberaceae and Annonaceae indoors the ratios being 23.3%, 11.6% and 3.2% respectively; and Asteraceae, Lamiaceae, Rosaceae, Fabaceae, Apiaceae and Brassicaceae outdoors the ratios %11.6, %10.1, %6.4, %5.8, %4.0 and %3.2 respectively. The genera with highest number of taxa are Citrus sp., Opuntia sp. and Annona sp. indoors the ratios being %8.1, %5.8 and %3.5; and Allium sp. Prunus sp., Salvia sp. and Mentha sp. outdoors the ratios being %1.6, %1.6, %1.6 and %1.4 respectively.

GROWTH AND PHYSIOLOGICAL RESPONSES OF 'CHRYSANTHEMUM PALUDOSUM' UNDER SALINITY STRESS

SARA YASEMİN¹, NEZİHE KÖKSAL¹, ASLIHAN ÖZKAYA¹, MİTHAT YENER¹

ABSTRACT

Chrysanthemum paludosum, belongs to Asteraceae family, is a perennial medicinal herb and ornamental plant. It has aesthetical values together with several medical effects. Excess of salinity in soils is one of the major problems which reduce plant growth. The purpose of this study was to determine the effects of saline water on *Chrysanthemum paludosum* by assaying plant growth and some physiological traits. In this work, the effects of salinity stress on diameter of flower and disc floret, number of flowers, shoot height, root length, thickness of root collar and, stem, fresh weight of root and, shoot, dry weight of root and, shoot, leaf chlorophyll concentration (SPAD readings), moisture content on wet basis, relative water content and ion leakage were investigated. *Chrysanthemum paludosum* plants were irrigated with five different levels of NaCl concentrations (0, 50, 100, 150, 200 mM) for 30 days with 3 days intervals in pots under greenhouse conditions. According to the results, flower diameters, disc florets, number of flowers, shoot height, root collar thickness, root and shoot fresh weights were negatively affected in 150 and 200 mM NaCl treatments. In parallel ion leakage was also highly increased in 150 and 200 mM NaCl treatments. Leaf chlorophyll concentrations were decreased by increasing salinity stress.

THE EFFECT OF SEAWATER USED FOR HYDRODISTILLATION ON ESSENTIAL OIL YIELD AND COMPOSITION OF OIL-BEARING ROSE (ROSA DAMASCENA MILL.)

NİMET KARA¹, SABRİ ERBAŞ¹, HASAN BAYDAR¹

ABSTRACT

Oil-bearing rose (*Rosa damascena* Mill.) is the most important rose species having a high-value volatile oil, used in the fragrance and cosmetic industries. Epidermal cells of the flower petals are the main essential oil source. During the boiling process of hydrodistillation, the essential oil in the cells diffuses through the cell walls by means of osmosis. The purpose of this research was to find out what happens when seawater or salt water used instead of distilled water for hydrodistillation. Fresh rose flowers collected at full blooming stage in the early hours of morning were distilled with pure water (control) and Mediterranean sea water using Clevenger hydrodistillation apparatus. Constituents of essential oils obtained by hydro distillation were identified with GC-FID/MS apparatus. Essential oil yield were not significantly affected by the distillation practices. However, the hydrodistillation with seawater gave a little higher yield as 0.045% than the hydrodistillation with pure water as 0.042%. A total of 23 essential oil constituents were detected by GC-FID/MS analyses. The main compounds in both rose oils distilled by tap water and seawater were citronellol, geraniol, nerol, and nonadecane. As a results, hydrodistillation of oil-bearing rose with seawater provided a statistically insignificant increase in the essential oil yielded from 0.040 to 0.045%, but caused a significant decrease in citronellol rate from 41.49 to 33.56 %, and significant increases in geraniol rate from 17.58 to 27.44 % and nerol rate from 6.45 to 12.21 %. The results obtained from this research should be examined in more detail at industrial scales.

USE OF EGG WHITE PROTEIN POWDER BASED FILMS FORTIFIED WITH LEMON BALM ESSENTIAL OILS IN THE STORAGE OF KASHAR CHEESE

GÖKHAN KAVAS¹, NAZAN KAVAS¹

ABSTRACT

Edible film was produced by adding 3% sorbitol (w/v) to egg white protein powder (EWPP). kashar cheese samples was coated with film fortified with lemon balm essential oil (LBEO) at various concentrations [1%, 2% (v/v)]. The films were labeled as EWPLBEO1, EWPLBEO2 to indicate the type and concentration of additive. The 2rd batch of the kashar cheese samples was coated exclusively with non-fortified EWPP and the 3th batch was left uncoated (K). All of the cheese samples were artificially contaminated with Escherichia coli O157:H7 (E. coli O157:H7), Listeria monocytogenes(L. monocytogenes) and Staphylococcus aureus (S. auerus) at 10⁶ cfu/g. All the samples were stored at +4±1°C. Their microbiological properties were examined on the 1st, 7th, 15th and 30th days of the storage. It was determined that coating the cheese samples with EWPP based film and edible films obtained with the addition of LBEO at different concentrations to EWPP all had bacteriostatic effects from the 1st day of storage and bactericidal effect in the further days of storage. The antimicrobial effects of all LBEO supplemented films were higher than EWPP based film. E. coli O157:H7 was the most resistant microorganism to the LBEO essential oil while L. monocytogenes was the most sensitive. It was found that the relationships between the increase in the essential oil concentrations and the increase in film thickness, water vapor permeability, inner and outer hardness, decrease in the weight loss, improvement in fat barrier property, and microbial counts during storage were significant (p<0.05). These properties were found to be significantly affected in the 2% (v/v) SEO and BEO samples, while the effects of other additive concentrations were not significant (p>0.05).

INVESTIGATION OF CHEMICAL PROPERTIES OF HERBY CHEESES WITH MELENGIC (*PISTACIA TEREBINTHUS*)

İBRAHİM HAYOĐLU¹, BÜLENT BAŞYİĐİT¹, ALI YILDIRIM¹, A. FERİT ATASOY¹

ABSTRACT

Melengic (*Pistacia terebinthus*) is one of the medicinal plants of which fruit, leaves, seeds, gum have been used. Melengic is consumed widely as coffee in Turkey. Additionally, melengic has been used for producing cheese in Southeast and Eastern Anatolia in Turkey. The aim of this study was investigated chemical properties of herbed cheese with melengic traditionally produced in Hakkari city (Turkey). The findings of this study showed that average dry matter, ash, fat, protein, acidity (as lactic acid), salt values of products were 50.86 ± 3.87 , 7.92 ± 0.528 , 26 ± 0.707 , 18.51 ± 3.67 , 3.09 ± 0.02 , 5.55 ± 1.12 respectively. These results were expressed as %. Average pH of herbed cheese with melengic was 4.24 ± 0.20 .

USING QUINOA FLOUR IN TARHANA TO IMPROVE NUTRITIONAL AND FUNCTIONAL PROPERTIES

ASUMAN ÇEVİK¹, NILGÜN ERTAŞ¹

ABSTRACT

In this study, quinoa flour was used to improve the technological, nutritional and sensorial properties of tarhana. Four different levels of quinoa flour (0, 10, 20, 30 and 40%) were added instead of wheat flour in tarhana production. In the samples of tarhana, the colour, viscosity, chemical (moisture, crude ash, crude protein), nutritional (mineral content, phytic acid content, total phenolic content, antioxidant capacity) and sensorial properties were determined. Highest L* value was determined with 40 % quinoa flour tarhana sample. When the addition of quinoa flour was increased, the L* and b* color values, ash, protein, calcium, iron, potassium, phosphorus contents, total phenolic content of the samples increased, but moisture and magnesium content decreased. Highest viscosity value was found in control tarhana samples and the increasing the amount of quinoa flour showed a decrease of viscosity values. The antioxidant capacity of samples, determined by TEAC and DPPH methods, increased with the enrichment of quinoa flour. According to sensorial analysis, tarhana samples enriched with 20 % quinoa flour got the highest scores as taste, flavor, sourness, color and general likes from the panelists.

EFFECT OF LAVENDER POWDER ON MICROBIAL, PHYSICOCHEMICAL, SENSORY AND FUNCTIONAL PROPERTIES OF YOGHURT

HALE İNCİ ÖZTÜRK¹, SÜMEYYE AYDIN¹, NİHAT AKIN¹

ABSTRACT

Yoghurt is a fermented milk product that is produced by *Streptococcus thermophilus* and *Lactobacillus delbrueckii ssp. bulgaricus* and consumed all around the world. Yoghurt fortification has an important role to develop nutritional, sensorial and health promoting effects of the yoghurt. *Lavandula officinalis* L. is a fragrant herb belonging to Lamiaceae family and called lavender. It is known as having therapeutic and antimicrobial effects. The objective this research was to determine changes in microbial flora and functional properties of A1, A2, A3 and A4 yoghurts containing lavender powder at rates of 0.010, 0.025, 0.050 and 0.075%, respectively. In this context, the antioxidant activities and total phenolic contents of yoghurts were investigated as functional properties. The effect of lavender powder on the potential flora during fermentation was determined, furthermore, alterations in microbiological properties of yoghurts were examined during the storage period (1d, 7d and 14d). Yogurts produced by adding lavender powder at different ratios were subjected to sensory testing to determine consumer acceptance. The highest antioxidant activity according to DPPH and ABTS method was determined in A4 sample. The TEAC value (μM Trolox) of control sample was found as 170.89 ± 0.06 , while the TEAC values of A1, A2, A3 and A4 samples were 190.87 ± 0.13 , 240.47 ± 0.12 , 284.75 ± 6.50 and 311.01 ± 0.91 , respectively. There was an increase in the TEAC values of the samples due to the increase in the amount of lavender powder. The total phenolic contents of control, A1, A2, A3, and A4 samples were determined as 0.05 ± 0.00 , 0.07 ± 0.01 , 0.07 ± 0.01 , 0.08 ± 0.01 , and 0.10 ± 0.01 mg gallic acid/g, respectively. Streptococcal counts were 8.89 ± 0.21 , 8.71 ± 0.09 , 8.77 ± 0.13 , 8.66 ± 0.04 and 8.91 ± 0.13 cfu / mL, respectively, in the control, A1, A2, A3, and A4 samples. No decrease in streptococcal counts was observed during storage in all samples. Lactobacilli counts were 8.58 ± 0.06 , 8.43 ± 0.26 , 8.34 ± 0.26 , 8.02 ± 0.02 and 8.53 ± 0.34 cfu/mL, respectively, in the control, A1, A2, A3, and A4 samples. While the lactobacilli count of the control sample decreased during the storage period, it remained constant in A1, A2, A3 and A4 samples at the end of the storage time. It was determined that the lavender powder supplementation contributed the viability of lactobacilli during storage. No statistically significant difference was found in the total bacterial counts between the samples in 1 d, however the highest total bacteria content was determined in A4 sample (8.31 ± 0.01 cfu/mL) at the end of the storage period (14 d). The best appearance, consistency and taste scores was determined in the A1 sample according to the sensory acceptability test. The odor scores of yogurts added with lavender powder were higher than the control sample. The highest overall acceptability score was determined in the A1 and A2 samples. Considering the scores of sensory properties and functional properties of lavender powder, it can be thought to be a good supplement for yogurt.

BIOLOGICAL ACTIVITIES AND HEAVY METAL POLLUTION OF POLLENS FROM AFYON AND KIRKLARELİ

İLGİNÇ KIZILPINAR TEMİZER¹, AYTAÇ GÜDER¹, FULYA AYDIN TEMEL¹

ABSTRACT

Pollen is male gametophyte and has plenty of biological activities. Thus, pollen used by human for varied purposes. Many studies carry out on botanic origin, antioxidant activities and heavy metals of honey bee pollen. Pollen analysis, antioxidant activities, total phenol-flavonoid contents and 20 heavy metals of pollen samples from Afyon and Kırklareli cities were studied based on the international received literatures. The antioxidant capacity of pollen extracts was assessed through the hydrogen peroxide scavenging activity (in terms of SC50), ferric reducing antioxidant power capacity (FRAP), DPPH radical scavenging activity (in terms of SC50), metal-chelating activity (%), total phenol content (TPC), and total flavonoid content (TFC). Their values were found as 25.56-30.28 µg/mL, 72.29-72.58%, 52.26-52.39 µg/mL, 54.65-55.93%, 1692.86-1583.35 mg GAE/100 g and 111.69-110.49 mg CAE/100 g, respectively. For comparison of these results, butylated hydroxy anisole (BHA), butylated hydroxy toluene (BHT) and α -tocopherol (TOC) were used as standard antioxidant compounds. The investigated activities of samples could be related with their pollen composition. In this study, bioaccumulation of heavy metals in pollen samples were examined and 20 heavy metal concentrations in pollen samples were detected by using ICP-MS Spectrometer (Model Bruker 820-MS). From the results, the pollen samples were found to be contaminated with most of heavy metals (Al, Cr, Mn, Fe, Ni, Cu, Zn, B, As, Te, U) to a lesser or greater extent while some heavy metals (Ag, Co, Cd, Ga, Mo, Pb, Tl and V) were never encountered. As only a difference, Bi was determined in the pollen sample taken Afyon city, while it was not found in the other sample. Others, except for a few metals, were found in pollen collected from Afyon in high quantities. From results, pollen samples can be used as an important indicator for evaluation of heavy metal contamination in the environment.

A COMPARATIVE STUDY ON THE ANTIOXIDANT AND ANTIMICROBIAL ACTIVITIES OF MULTIFLORAL HONEYS AND CASTANEA SATIVA HONEYS

AYTAÇ GÜDER¹, İLGINÇ KIZILPINAR TEMİZER¹, DUYGU ODABAŞ ALVER¹

ABSTRACT

Honey is produced by honeybees from the nectar of various plants and honeydew and consist of mainly sugar types (glucose, fructose and sucrose), proteins, organic and inorganic acids, enzymes, vitamins, hormones, phenol-flavonoids, amino acids and elements. Honey composition depends on floral source. Pollen analysis, antioxidant activities, total phenol-flavonoid contents of honey samples were studied based on the international received literatures. In this study, multifloral and Castanea sativa honeys were compared with using different antioxidant and antimicrobial test methods. The antioxidant capacity of honeys was assessed through the hydrogen peroxide scavenging activity (in terms of SC50), ferric reducing antioxidant power capacity (FRAP), DPPH radical scavenging activity (in terms of SC50), metal-chelating activity (%), total phenol content (TPC), and total flavonoid content (TFC). Also, antimicrobial activities of honey samples were investigated by using disc diffusion assay method (DDM) against *B. subtilis*, *S. aureus*, *L. monocytogenes*, *C. perfringens*, *P. aeruginosa*, *E. coli*, *Salmonella enteritidis*, *K. pneumoniae*, *Candida albicans*. The multifloral honeys were found between 265.23-279.63 µg/mL, 71.85-74.48%, 608.32-632.14 µg/mL, 36.2-36.87%, 26.66-112.8 mg GAE/100 g and 5.39-9.32 mg CAE/100 g, respectively. The *C. sativa* honeys varied between 257.44-269.09 µg/mL, 72.91-73.86%, 572.19-650.54 µg/mL, 36.34-36.85%, 61.22-138.6 mg GAE/100 g and 7.54-10.42mg CAE/100 g, respectively. For comparison of these results, butylated hydroxy anisole (BHA), butylated hydroxy toluene (BHT) and α -tocopherol (TOC) were used as standard antioxidant compounds. The antimicrobial activity of multifloral honeys were found against *B. subtilis*, *S. aureus*, *L. monocytogenes*, *C. perfringens*, *P. aeruginosa*, *E. coli*, *S. enteritidis*, *K. pneumoniae*, *C. albicans* between 11.15-12.60, 10.65-11.23, 6.00-11.11, 10.55-10.89, 6.00-10.98, 9.31-11.42, 10.40-12.78, 10.42-13.43 and 6.00 mm, respectively. The antimicrobial activity of *C. sativa* honeys were found against *B. subtilis*, *S. aureus*, *L. monocytogenes*, *C. perfringens*, *P. aeruginosa*, *E. coli*, *S. enteritidis*, *K. pneumoniae*, *C. albicans* between 6.00-11.39, 6.00, 6.00-11.47, 6.00-10.64, 6.00, 6.00-10.16, 6.00-9.53, 6.00-11.01 and 6.00 mm, respectively. The investigated activities of samples could be related with their botanic origin. According to obtained results, *C. sativa* honeys show higher hydrogen peroxide scavenging activity, DPPH radical scavenging activity, total phenol content (TPC) and total flavonoid content (TFC) than multifloral honeys. On the other hand, each honey samples demonstrate similar metal chelating activity. Both sample species show antimicrobial activity against Gram (+) and Gram (-) bacteria but not fungi.

MELANOMA IS JUST NOT SKIN CANCER

FATMA AYDOđMUS ÖZTÜRK¹, KERIMAN GÜNAYDIN², MEHMET ÖZTÜRK¹, MUHAMMAD IQBAL CHOUDHARY³

ABSTRACT

Melanoma is a cancer type that begins in the melanocytes. Although it has been considered uncommon, the incidence of the disease has been increasing dramatically in the past few decades. The high malignancy is based on a pronounced resistance to conventional chemotherapy, related to defects in pro-apoptotic signaling. Thus, targeting melanoma by efficient induction of apoptosis appears as promising. Exposure to solar ultraviolet radiation seems to play a predominant role in the development of skin cancers. The UV-A component of light initiates oxidative stress in human skin, and accordingly initiate the skin cancer, particularly malignant melanoma. As a continuous searching, a cure from natural compounds *S. cedronella* was investigated against Malign Melanoma. For this purpose, firstly, the singlet oxygen production capacity of methanol extract of *S. cedronella* was tested using RNO bleaching method. The Cytotoxic activity of methanol extract producing singlet oxygen was investigated against human malign melanoma cancer cells lines (HT 144) and against mouse fibroblast cell lines (3T3) using MTT assay. In addition, the effect of visible light on the cytotoxic activity was also searched. For this purpose, 150 W halogen lamp and a visible light permeable filter (Plexiglas) were used to be carried out the experiment. The role of methanol extract on apoptosis was analyzed using Annexin V-FITC/PI. Specific stains such as DCFH-DA were used for the enhancement of production of reactive oxygen species (ROS). TNF- α (Tumor necrosis factor-alpha) secretion was investigated using Duo St ELISA Human TNF- α . Treatment of cells with methanol extract at various concentrations inhibited cell viability in a dose-dependent manner. Methanol extract of *S. cedronella* showed a cytotoxic effect against HT 144 at 12.5 $\mu\text{g/ml}$. The highest cytotoxic effect observed at 100 $\mu\text{g/ml}$ concentration. When standard and illuminated cytotoxic activities results compared, higher activity was observed in the illuminated cytotoxic activity at 100 $\mu\text{g/ml}$ concentration. Intracellular ROS was measured in terms of fluorescence by DCFH-DA. The intracellular ROS production increased after the incubation of HT 144 cells with the *S. cedronella* methanol extract, when compared to that of control (H₂O₂). *S. cedronella* induced cell death. To discriminate whether the extract induced apoptosis in malign melanoma cells, the appearance of the early apoptosis biomarker phosphatidylserine at the cell surface was also analyzed by flow cytometry using annexin V-FITC and propidium iodide. In addition, the extract exhibited TNF- α secretion. Reactive oxygen species produced by TNF- α have an important function in cell death. Growth inhibition and ROS generation in HT 144 cells by *S. cedronella* methanol extract indicated that ROS production probably caused apoptotic cell death via TNF- α secretion.

SELECTIVE CYTOTOXIC EFFECT OF PRIMULA VULGARIS LEAF EXTRACT ON HUMAN BREAST, COLON AND LIVER CANCER CELLS

IBRAHİM TURAN¹, SELİM DEMİR², REZZAN ALIYAZICIOĞLU³, YUKSEL ALIYAZICIOĞLU⁴

ABSTRACT

Background/Aim: Cancer is the most challenging global health problem and leading cause of death throughout the world. The treatment of many cancer patients often involves chemotherapy and radiotherapy, and these treatments over time harm normal cells and cause resistance in targeted cancer cells, reducing the success rate of these therapies. For this reason, current researches focus on new generation drug development studies with fewer side effects. *Primula vulgaris* belongs to the genus *Primula* and this genus is frequently used in traditional medicine. *Primula* species are reported to be rich in saponins, alkaloids, tannins, terpenes, and phenolic compounds. Antioxidant, antimicrobial, antigenotoxic, anti-inflammatory, hypoglycemic, and wound healing properties of *Primula* species have been studied in various studies. Several studies have investigated the cytotoxic effect of different species of the genus *Primula*, however there have been no previous studies of the cytotoxic effect of *P. vulgaris*. The purpose of this study was to determine total phenolic content and the cytotoxic effect of dimethyl sulfoxide (DMSO) extract of *P. vulgaris* leaves in human breast (MCF-7), colon (WiDr), liver (HepG2) cancer cell lines and human normal foreskin fibroblast cells. **Materials and Methods:** The leaves of *P. vulgaris* were collected from Trabzon-Turkey in Spring 2015. These were air-dried at 25°C and powdered using a blender and milling into fine powder. The powder then was mixed with DMSO and extracted by maceration. The total phenolic content was established using the spectrophotometric method adapted to microscale using gallic acid as a standard. The cytotoxic effects of extract on cell proliferation were determined using MTT assay. Cisplatin was used as a positive control. **Results:** Total phenolic content value was 1890.1±11.2 mg gallic acid equivalents per 100 g sample. The extract showed selective cytotoxic effects on all studied cancer cell lines compared to normal fibroblast cells and IC50 values ranged from 133.3-160.8 µg/mL. **Conclusion:** This is the first study to reveal the antioxidant properties of *P. vulgaris* leaf extract and its cytotoxic effect on cancer cell lines. Further studies are now needed to identify the antioxidant and cytotoxic molecules in the extract and their mechanisms.

DETERMINATION OF APOPTOTIC EFFECTS OF FISETIN ON MALIGNANT GLIAL CELLS

PINAR ÖZTOPCU-VATAN¹, FULYA PAK¹

ABSTRACT

Flavonoids, a group of plant secondary metabolites, show anticancer properties in variety of cancer cells in vivo and in vitro. Fisetin (3,3',4',7-tetrahydroxyflavone), is a polyphenol flavonoid found in many plants and fruits. Previous studies, have shown the anticancer effects of fisetin against on different cancer cells and model animals. Brain and spinal cord tumors develop in glial cells; these tumors are collectively called gliomas. Glioblastoma multiforme (GBM) remains the most aggressive and resistant brain tumor in adults. Besides a limited number of drugs, therapy resistance is the major obstacle for efficient treatment of GBM. For all these reasons, researchers are maintain search the more effective drugs and have fewer side effects on normal cells than today drugs in the treatment of glioma. In this study the apoptotic effects of fisetin on glioma cells were evaluated. The cytotoxic effects of fisetin (1 to 500 μ M) was examined in T98G human glioma cells for by MTT assay 24 and 48 h. After human bronchial epithelium (BEAS-2B) cells were used to determine the toxic effects of fisetin on healthy cells. Carmustine was used as positive control. For the statistical analysis one-way ANOVA test and after Tukey's multiple comparison test were used. Apoptotic alterations on the T98G cells by fisetin treatment were also analyzed by transmission electron microscopy. DNA fragmentation analysis and quantitative real time PCR (QRT-PCR) were used to evaluate the apoptotic effects of the treatment. Fisetin exerted a dose- and time-dependent growth inhibitory effect on both cells. The IC50 values of fisetin were determined as 93 and 75 μ M for T98G, and 270 and 90 μ M for BEAS-2B cells, respectively in 24 and 48 h. After treatment with 50 and 100 μ M doses of fisetin in T98G cells, chromatin condensation, increased vacuolization and organelles swelling were observed. According to DNA fragmentation results apoptosis was found 3,7, 4,4 ve 5,3 fold increased respectively in T98G cells. We observed increased expression of apoptotic genes CASPASE 3, 9, 8, BAX and decreased expression of BCL-2 and SURVIVIN in T98G cells. According to the findings of this study, fisetin was found to have more efficient cytotoxic and apoptotic effects in T98G cells depending on the dose and the time. Furthermore, cytotoxic and apoptotic effects of fisetin were found to be stronger in glioma cells compared to normal cells. Additional in vivo and in vitro studies will show the place of this chemical in the treatment of glioma in the future. Funding: This study was supported by Eskisehir Osmangazi University, Scientific Research Projects Committee (Project number: 201319A112).

ACTIVE PHYTOCHEMICAL DETECTION AND CYTOTOXIC EFFECTS OF THE METHANOL /ACETONE MIXTURE EXTRACT OF PLANTAGO MAJOR L. SUBSP. INTERMEDIA

ÖZLEM SULTAN ASLANTÜRK¹, TÜLAY AŞKIN ÇELİK¹

ABSTRACT

Plants have been used for centuries to nutrition, spice, health care and cosmetic preparations. There is a growing interest to use of medicinal plant because of their medical effectiveness, low toxicity and the many natural anticancer agents derived from these plants. Medicinal plants are commonly rich in phenolic compounds, which have multiple biological effects. *Plantago major* L. is a perennial plant from Plantaginaceae family and it is almost found all over the world. *Plantago* is an important medicinal plant which has different compounds such as phenolic compounds, flavonoids, alkaloids, terpenoids and vitamin C. The leaf infusion of the plant is taken a drink for its depurative, diuretic febrifuge, bile stimulant and antitumor effects. It is used externally to wash wounds and treat skin infections. The aim of this study was to detecting active phytochemicals in methanol/acetone mixture (1:1 v:v) extract of *Plantago major* L. subsp. *intermedia* leaves and determines in vitro cytotoxic effect of this extract on MCF-7 human breast cancer cells and BJ human normal foreskin fibroblast cells. The phytochemicals present in the plant extract were determined using standard methods. 50, 100, 150 and 200 µg/ml concentrations of methanol /acetone (1:1 v:v) extract was tested for cytotoxic effect on MCF-7 and BJ cells by using MTT assay. As a result of phytochemical screening of *Plantago major* L. subsp. *intermedia* leaves extract, phenols, tannins, alkaloids, anthroquinones and saponins were detected. In cytotoxicity assay (MTT assay), we found that methanol/acetone extract of *P. major* exhibited concentration-dependent cytotoxic effect on MCF-7 and BJ cells. Cytotoxic effect of the extract on BJ cells was found statistically significant at all concentrations in comparison with control ($p < 0.05$). Except of 50 µg/ml extract concentration, cytotoxic effect of the extract on MCF-7 cells was found also statistically significant, compared to control ($p < 0.05$). Interestingly, extract was found more cytotoxic on human normal fibroblast cells (BJ) than on human breast cancer cells (MCF-7). At 50 µg/ml concentration, cytotoxic effect of the extract was found higher two fold on BJ cells than on MCF-7 cells (16.12 % and 8.52 %, respectively). Although, 100 µg/ml extract concentration exhibited slightly more cytotoxic effect on MCF-7 cells than on BJ cells (19.12 % and 16.49 %, respectively), cytotoxic effect of 150 and 200 µg/ml extract concentrations were found slightly higher on BJ cells than on MCF-7 cells. At 200 µg/ml extract concentration, cytotoxic effect of extract reached to 30.66 % on BJ cells and 27.73 % on MCF-7 cells. As a result, *Plantago major* L. subsp. *intermedia* leaves methanol/acetone extract have moderately cytotoxic effect on MCF-7 human breast cancer and BJ human normal fibroblast cells but, this effect is higher on BJ cells than on MCF-7 cells. Results of this study showed that medicinal plant extracts have a potential to be toxic for normal cells due to their active contents.

USE OF HERBAL PRODUCTS AND AROMATHERAPY BY PATIENTS WITH CANCER

SERPİL SÜ¹, NACIYE ESRA KOYUNCU²

ABSTRACT

Patients with cancer apply to supplementary and alternative treatment methods for the purpose of supporting the cancer treatment, preventing the relapse of cancer, increasing their life quality, coping with side effects of treatment and disease, strengthening their immune system and increasing their well-being. They generally apply to methods primarily like; herbal products, relaxation, hypnosis, bio-feedback, acupuncture, acupressure, yoga, meditation, massage, music and reflexology, criotherapy and aromatherapy. Herbal products are generally preferred by patients with cancer primarily for providing a supplementary use to their treatment. Herbal products that are frequently used by patients include dead nettle, garlic, green tea, echinacea, polemonium and tipton's weed. Examining the studies on this subject; the rate of patients to use herbal products as a supplementary and alternative treatment method varies between 44% and 100%. Aromatherapy is the therapeutic use of essential oils that are extracted from herbal sources like leaves, flowers, peels, fruits and roots and then concentrated. Aromatherapy basically aims to control the symptoms rather than curing them. Examining the studies on aromatherapy applied to patients with cancer; it is seen that the method decreases pain, fatigue, constipation, anxiety and depression, and increases well-being and life quality. As a consequence, these methods that are frequently used by patients with cancer without consulting their physicians may change the efficiency of treatment and increase side effects. On the other hand, there is a very limited number of evidence-based studies evaluating the efficiency of these methods. This study aims to draw attention to herbal products and aromatherapy used by patients with cancer.

SUPPLEMENTATION OF PROPOLIS PROTECTS HUMAN LYMPHOCYTES IN VITRO FROM THE GENOTOXIC DAMAGE BY IMAZALIL

HASAN TURKEZ¹, BUGRAHAN EMSEN², OZLEM OZDEMIR¹, ABDULGANI TATAR³

ABSTRACT

Propolis (PRP) is a sticky material that is collected from plants by honeybees. PRP has many biological functions including antioxidative, anti-carcinogenic and anti-mutagenic properties. PRP also has the ability to reduce the toxic effects of various toxicants when used in a combination. Imazalil (IMA) is one of the most commonly used fungicide in agricultural and clinical purposes, is thought to lead very serious side effects in animals and humans. The aim of the present in vitro study was to investigate the ability of PRP to minimize the genotoxicity of IMA on cultured human peripheral lymphocyte cells. Cells were treated with both agents at different concentrations (PRP 50, 100, 200 microM and IMA 336 microM) and incubated for 72 h. We used the cell proliferation rate index (CPRI) and the sister chromatid exchange (SCE) rates for measuring cytotoxicity and genotoxicity, respectively. Our results showed the protective effect of PRP on cells treated with IMA in in vitro conditions. The greatest protective effect of PRP at 200 microM was determined against IMA in comparison with all other doses of PRP. These observations suggest that PRP may be proved useful in reducing some of the toxic effects associated with chemical mutagens and carcinogens. In conclusion our findings may have an important application for the protection of human lymphocytes from the genotoxic damage and side effects induced by medical and agricultural chemicals hazardous for people.

**EFFECTS OF PHYSALIS PERUVIANA AND LUPINUS ALBUS ON
MALONDIALDEHYDE, GLUTATHIONE, CHOLESTEROL,
VITAMINS AND FATTY ACID LEVELS IN KIDNEY AND LIVER
TISSUES OF DIABETIC RATS**

OĐUZ AYHAN KİRECCİ¹, ORHAN ERMAN², TUBAY KAYA², ÖKKEŞ YILMAZ²

ABSTRACT

In this study, the effects of goldenberry and lupin on lipid peroxidation and antioxidant system parameters of liver and kidney tissues of streptozotocin-induced diabetic rats were investigated. Type II diabetes was produced in rats by the streptozotocin injection. Albino rats were divided into four groups, each one containing 10 rats: non-diabetic control group, STZ-Diabetes type II group, STZ-Diabetes+goldenberry type II group, and STZ-Diabetes+lupin type II group. After one week from the injection, goldenberry and lupin were injected to rats for 2 months. Malondialdehyde, glutathione, cholesterol, and fatty acid levels, which are signs of lipid peroxidation, were measured in these tissues. At the beginning and end of the study, postprandial blood glucose levels and weights of the rats were measured. In type II diabetes, malondialdehyde increased compared to the control group. Glutathione decreased in the other tissues and all of the streptozotocin-induced diabetic groups. In type II diabetes, liver cholesterol levels increased. Treatment with similar doses of goldenberry and lupin significantly reduced postprandial hyperglycemia, oxidative stress, and augmented antioxidant system. The results of the present study showed that the herb suspensions exerted anti-hyperglycemic effects and consequently may alleviate liver and kidney damage caused by streptozotocin-induced diabetes.

ABSTRACT

Neonicotinoids have been used since 1980. There are new classes of insecticides which are specific only for the targeted organism that does not harm the others. In this study, genotoxic effects of imidacloprid (IMI), a commonly used insecticide, were evaluated in vitro sister chromatid exchange (SCE) test and we attempted to resolve these effects with purslane (Portulaca oleracea L.) methanol (POmet) and water (POwtr) extract. We determined four different IMI application groups (50, 100, 250 and 500 ppm) in this study. The chromosome medium containing 5 bromo-deoxyuridine (BrdU) was used to prepare cell cultures. We added 0.25 ml blood and different doses of IMI into this medium. Then, colchium was added to the tubes after 70,5 hours. After 72 hours of incubation, smears were prepared and stained by Giemsa technique. The preparations were examined by light microscope with 10x100 magnification. The SCE numbers of the application groups were compared with the control groups. For this purpose, two control groups were defined. Distiled water and the solvent of IMI, dimethyl sulphoxide (DMSO), were used as the negative control and ethyl metansulphate (EMS), which is a well known antimutagen, is used as the positive control. The mean SCE frequency was 3.60 ± 0.02 and 3.70 ± 0.01 for distiled water and DMSO, respectively, without any statistically significant difference ($p < 0.05$). This parameter for EMS was found to be 32.61 ± 0.01 and there was a statistically significant difference between EMS and distiled water ($p < 0.05$). The SCEs after application of 50, 100, 250 and 500 ppm IMI were observed to be $4,43 \pm 0,01$; $4,68 \pm 0,01$; $5,92 \pm 0,01$ and $7,12 \pm 0,01$, respectively. The comparison of all of these results with DMSO yielded a statistically significant difference ($p < 0.05$). Additionally, the replication index (RI) was calculated in IMI application groups. The RI was 2.24 ± 0.07 in DMSO and decreased to 1.95 ± 0.04 , 1.88 ± 0.07 , 2.01 ± 0.08 and 1.99 ± 0.03 in IMI treated groups, respectively, the difference of these values with DMSO was insignificant ($p > 0.05$). Antigenotoxicity studies have been conducted based on the results of genotoxicity. POmet and POWtr (1:1 v/v) were added separately to the highest application groups of IMI for SCE. POmet and POWtr was found to have effective antigenotoxicity in vitro studies. The SCEs of IMI+POmet and IMI+POwtr were observed to be $3,88 \pm 0,04$ and $3,86 \pm 0,06$, respectively. According to these results, DNA damage was observed in all IMI application groups. However, DNA repair mechanisms were detected not to be inhibited. The increases in the incidence of SCEs are indicators of damage to the genetic material. Also, removal of such damage by Portulaca oleracea L. extracts showed its strong antigenotoxic agent.

INVESTIGATE FOR THE EFFECT OF THYMUS VULGARIS THERAPY ON CERTAIN ADIPOKINES IN EXPERIMENTAL DIABETIC RATS

HÜLYA ÖZDEMİR¹, GÖKHA OTO¹, FILİZ KARADAŞ¹, AHMET UFUK KÖMÜROĞLU¹, ZAFER AKAN¹, MELEK DİKİLİDAL¹

ABSTRACT

Herbs are being used as alternative strategies in the treatment of diabetes in various countries. Nowadays, it is required to have an efficient protection against diabetes mellitus, which is the major health problem of the age, and its harmful effects. Therefore, the medical effects of various herbal extracts have been searched in this regard. In the present study, we aimed to search the effect of *Thymus vulgaris* (thymus) herbal extract (TVE) on diabetic rats. A total of 70 male Wistar Albino rats aged 2-3 months, weighing 250-300 gr, were used in the study. Rats were fed a standard pellet diet under appropriate moisture levels in rooms at 22±2°C of light for 12 hours and dark for 12 hours. STZ (50mg/kg) solution dissolved in sodium citrate buffer (0.1M, pH: 4.5) was administered to rats intraperitoneally, except control group, to induce diabetes. Following 72 hours of STZ infection, blood was drawn from the tails of the rats via insulin infector and blood glucose concentrations were analyzed by glucometer. Rats having the blood glucose concentrations of > 200 mg/dl were accepted as diabetic and rats were divided into 4 groups with 10 rats in each group; group1 (control), group 2 (diabetic), group 3 (diabetic +100mg/kg TVE) and group 4 (diabetic + 200mg/kg TVE). TVE was administered to group 3 and 4 for 30 days. Adipokine and vitamin levels were determined by using ELISA In group 3, plasma levels of adipokine and nesfatin 3 were significantly higher than control and diabetic groups. Leptin levels were significantly higher in control group in comparison to group 3. In the control group, serum betatrophin levels were found to be significantly higher than the levels of group 3 and group 4. According to these findings, it might be concluded that *Thymus vulgaris* extract has antidiabetic effects by affecting adipokines.

UTILIZATION OF SOME ANTIOXIDANT AND DIETARY FIBRE RICH-SOURCES IN FRESH AND DRY PASTA PRODUCTION

AYŞE BÜŞRA MADENCİ¹, SELMAN TÜRKER¹, NERMIN BİLGİÇLİ¹

ABSTRACT

In this study, different sources of antioxidant (black cumin seed, pomegranate seed and flaxseed) and dietary fiber (wheat fiber, oat fiber and barley fiber) were used in fresh and dry pasta formulation to improve functional properties of pasta. Antioxidant (5%) and dietary fiber (15%) sources were used as replaced with wheat semolina in pasta formulation. Nine different formulations for fresh pasta production were performed by using antioxidants and dietary fiber sources individually and in combinations. Control fresh and dry pasta were prepared with wheat semolina. The effect of different additives and drying process on colour values and mineral matter, antioxidant activity, total phenolic and phytic acid contents of pasta samples were determined. L*, a* and b* values of the fresh and dry pasta samples changed between 42.05-70.51, -3.32-9.97 and 7.90-39.12; 31.62-64.28, 0.13-9.09 and 4.70-22.02, respectively. Wheat fiber gave higher L* values in fresh and dry pasta samples compared to other antioxidant and fiber sources. Among the different additives, pomegranate seed resulted in the greatest redness of the fresh and dry pasta. Black cumin seed gave the lowest L* and b* values on fresh pasta surface. Drying process decreased L* and b* values of the pasta samples. In fresh pasta, the greatest increments with respect to Ca, Fe, K, Mg, P and Zn contents were obtained with combined use of dietary fibers and antioxidant sources, followed by the usage of oat and barley fibers. The highest antioxidant activity and total phenolic content values were observed in fresh pasta containing both oat fiber and pomegranate seed. Drying process did not changed significantly mineral matter, antioxidant activity and total phenolic content of the pasta sample. Although the least phytic acid amount was determined in fresh and dry pasta containing wheat fiber, combined use of oat fiber and flaxseed have the greatest phytic acid in pasta. Drying process decreased the phytic acid content of the pasta samples significantly ($p<0.05$). Bu çalışma, TÜBİTAK tarafından 1140389 nolu proje ile desteklenmiştir.

POMEGRANATE (PUNICA GRANATUM L.) FLOWERS THE EFFECTS OF VITAMIN A AND E LEVELS BY EXPERIMENTAL DIABETES MELLITUS IN RATS

NACI ÖMER ALAYUNT¹, ZAFER ÇAMBAY², NEVIN İLHAN²

ABSTRACT

Vitamin A and E levels of Punica granatum flowers on the antioxidant effects of experimentally induced diabetic rats with STZ of our study is based on the determination. A total of 60 male Wistar-albino rats weighing 220 g (220 ± 40 gr) were used in the experimental studies. Group 1: Control group (n = 12) fed rat and water. Group 2: Diabetes (STZ) group (n = 12) STZ was administered in a single dose with intraperitoneal injection as 60 mg / kg. After one week, rats passing the end of fasting blood glucose measurement 220 mg / dl on the gauge instrument from the tail vein were considered diabetic. Rats were fed only with rat diet + water daily for 6 weeks. Group 3: STZ + Pomegranate (Punica granatum) flowers I (n = 12) diabetic rats were fed regularly orally with 300 mg / kg / day of pomegranate flowers every day for 6 weeks. Diabetic rats were regularly given 400 mg / kg / day of pomegranate flowers every day for 8 weeks. Group 5: diabetic rats in group STZ + Pomegranate (Punica granatum) flower III (n = 12) 500 mg / kg / day of pomegranate flowers were given. After experimental applications, the blood of the rats decapitated in accordance with the decisions of the ethics committee was taken into biochemical tubes and centrifuged for 5 min at 5000 g, and analyzed for serum samples and analyzed by HPLC (CECIL 1100 series Cambridge England) using methanol: acetonitrile: chloroform . The flow rate of the mobile phase was set to be 1 ml / min in a Supelcosil LC-18 column (25 cm, 4.6 mm ID; 5 μ m particles). Vitamin A (retinol) 326, vitamin E (a-tocopherol) was determined at a wavelength of 296 nm. Vitamin A levels in blood serum of diabetic rats were found to be significantly lower than the other groups (p <0.05). Vitamin A levels were increased in the 3. and 4. groups, but not statistically significant. Vitamin E levels were significantly lower in diabetic rats compared to control (p <0.05). In the 5. group, vitamin E level was increased but statistical significance was not found. The amount of antioxidant vitamins (vitamins A and E), which are antioxidant defense systems, is reduced in the period before the application of pomegranate juice, indicating the metabolic response to oxidative reactions. For this reason, diet is an indispensable part of diabetes treatment and should be carried out in conjunction with medical treatment. Diabetics should be very careful with diet. Taking adequate nonenzymatic antioxidants (vitamins) with the diet will help the enzymatic defense systems and help reduce the complications of diabetes. This is why it is thought that the pomegranate flower increases the level of antioxidant that reduces the oxidative stress caused by diabetes.

**ARTEMISIA TAXA REGISTERED IN TURKEY FLORA AND ITS
USAGE AREAS AND BIOLOGICAL ACTIVITY OF A. ANNUA L.
ESSENTIAL OIL**

BELGİN COŞGE ŞENKAL¹, CÜNEYT CESUR¹, ARZU TÜRKER¹, TANSU USKUTOĞLU¹

ABSTRACT

The Artemisia genus includes more than 400 species spreading in the northern hemisphere of the world, mainly in Asia, Europe and North America, and is represented by 27 taxa, including 21 species, 3 subspecies and 3 varieties in our country. The plants including this genus are known as "Kâbe süpürgesi, pelin otu, yavşan otu, Kâbe kekiđi, peygamber süpürgesi "in our country. Some of the Artemisia species are used in spice and wine making, while some are used as appetizing, anti-fever, tonic and wolf-reducing in folk medicine. Research conducted out has shown that the plant exhibits a wide range of bioactivity (antifungal, anticancer, antioxidant, antimicrobial and insecticidal etc.). As known, artemisin used in the treatment of malaria is an alkaloid derived from annual wormwood plants. The essential oil (0.3-0.7%) obtained from the aerial parts of plant, and this oil is used in perfume and cosmetic industry. In this study we had conducted; the essential oil was obtained from the aerial parts of A. annua L. grown by seed with Clevenger apparatus and chemical composition of this essential oil was analyzed by GC / MS. In addition, antioxidant capacity and antibacterial activity of essential oil were investigated by DPPH (2,2-diphenyl-1-picrylhydrazyl) radical scavenging activity and disk diffusion technique, respectively. While the essential oil in drug herbage of plants harvested during flowering period was average 1.18%, artemisia ketone (32%) and camphor (21%) were recorded as main components. It had been found that the essential oil exhibits free radical scavenging activity. In addition, it was observed that the obtained essential oil showed strong activity against the gram-negative bacteria Escherichia coli, which did not show any activity against gram-positive bacteria (Streptococcus pyogenes and Staphylococcus epidermidis) used in the research.

**FUMIGANT ACTIVITY OF SOME PLANT ESSENTIAL OILS
AGAINST THE PULSE BEETLE, CALLOSOBRUCHUS CHINENSIS
(L.) (COLEOPTERA: BRUCHIDAE)**

FEDAİ ERLER¹, HILAL ŐULE TOSUN², HALİL GÜVEN³, BARIŐ İMREK⁴

ABSTRACT

Dry pulses including beans, lentils and peas, are a great source of low-fat protein, fiber, vitamins and minerals. But unfortunately these valuable food-stuffs are prone to insect attacks from different bruchid species. The pulse beetle, *Callosobruchus chinensis* (Coleoptera: Bruchidae), is a common species of bruchids and is known to be a pest to many stored pulses. This serious pest damages chickpeas and cowpeas and causes decreases in the yield and in the nutritional quality. In the present study, fumigant toxicity of two essential oils extracted from anise (*Pimpinella anisum* L.) and fennel (*Foeniculum vulgare* Mill.) (Apiaceae) was evaluated against the 0-48-h-old adults and eggs of *C. chinensis* under controlled conditions. Four different doses (15, 30, 60 and 120 μ l/ l air) of each essential oil and three different exposure periods (24, 48 and 96 h) were used in the bioassays. An untreated control set was also included for each 'dose x time' combination. The results from the study revealed that both oils showed a fumigant toxicity by varying the dose and the exposure period tested. Fumigant activity was generally dose- and exposure time-dependent. Based on the highest dose (120 μ l/ l air) and the longest exposure period (96 h), anise oil caused 100% mortality of both adults and eggs of the pest. Fennel oil showed slightly lower toxicity against adults with a mortality of 96.6%, but it caused 100% mortality of eggs. The test on the seed germination using the highest dose of essential oils and the longest exposure period, showed no damage to the germinating seeds. The germination rate was about 99%. These findings suggest that the tested plant essential oils can be used as a bio-insecticide for control of the *C. chinensis* pest in stored pulses.

COMPOSITION OF ESSENTIAL OIL OF TEUCRIUM SCORDIUM L. SUBSP. SCORDIODES (SCHREB.) ARCANG. SPECIES

İBRAHİM HALİL GEÇİBESLER¹, LÜTFİ BEHÇET², FATİH GÜL³, İBRAHİM DEMİRTAŞ³

ABSTRACT

The Lamiaceae family, including the genus of *Teucrium* L., is the third richest family in Turkey with 45 genera, 846 species, 735 taxa and 44.2% endemism rate. Different *Teucrium* L. species are a kind of medicinal aromatic plant used for therapeutic purposes for thousands of years. *Teucrium* L. species are used in the treatment of diuretic, antispasmodic, antiseptic, antipyretic, antiulcer and diabetes mellitus in folk medicine in Turkey. The physiological activities of these species are due to the terpenoid, flavonoid and phenolic compounds in which they contain. In this context, grown in natural habitats in Bingol and its surroundings, 500 g was collected from species of *Teucrium scordium* L. subsp. *scordioides* (Schreb.) Arcang. Volatile oil of the plant material was obtained in 0.89% yield by water distillation method using Clavenger apparatus. The essential oil components were identified by GC-FID and GC/MS analyzes. In total 47 organic components were identified in the volatile oil of *T. scordium* L. subsp. *scordioides*. Eucalyptol was identified as the main component in this essential oil composition with a ratio of 30.09%. In addition to the main component, borneol (12,40%), α -pinene (10,63%), camphor (9,89%), camphene (7,60%), β -pinene (3,81%) bornyl acetate (3.78%) were analyzed as other dominant components. When considering the major components of the *T. scordium* L. subsp. *scordioides*, its volatile oil may recommended to use in cosmetic, medical and food applications.

IDENTIFICATION OF VOLATILE COMPOUNDS (VCS) OF 'GEMLIK', 'HALHALI' AND 'SARI HASEBI' OLIVE LEAVES

AHMET DURSUN¹, ZEHRA GÜLER¹, DILEK ÖZKAN¹, DILŞAT BOZDOĞAN KONUŞKAN¹

ABSTRACT

There is a considerably interest on some fruits and leaves extracts such as olive leaf, due to their beneficial health effects. Olive leaf has been consumed as tea for many years. Although there are many studies on composition and/or bioactive compounds of olive leaves, the studies on volatile compounds (VCs) of leaves are scarce. Therefore, the objective of this study was to evaluate of VCs in three olive tree cultivars 'Gemlik', 'Halhali' and 'Sari Hasebi' leaves obtained from Hatay province. The VCs were analyzed by gas chromatography-mass spectrometry (GC-MS) using solid phase micro-extraction (SPME). A total of 126 VCs were identified in olive leaves. Among these 97 VCs were found in all olive leaves. Terpenes, aldehydes, alcohols and ketones were identified in olive leaves as major VCs groups, which accounted for about 36-60 %, 20-28 %, 6-14 % and 4-8 % of total VCs identified in leaves, respectively. The relative proportions of these chemical groups were significantly varied from cultivar to cultivar ($p < 0,05$). α -Cubebene was found as major VC, followed by trans-caryophyllene, α -farnesene, trans-2-hexenal, benzeneethanol, nonanal, trans,trans-2,4-heptadienal, cycloisositivene, trans-4,8-dimethyl-1,3,7-nonatriene, 2,4-heptadienal, α -humulene, α -muurolene and benzaldehyde. These compounds accounted for 56-75 % of total VCs identified in olive leaves. While 'Halhali' olive leaf had highest ($p < 0,01$) levels of α -cubebene (31,79 %), cycloisositivene (7,69 %) and α -muurolene (4,05 %), 'Sari hasebi' had trans-caryophyllene (23,16 %), trans-4,8-dimethyl-1,3,7-nonatriene (4,65 %), α -humulene (3,64 %) and 'Gemlik' cultivar had benzeneethanol (6,93 %), nonanal (5,07 %), and benzaldehyde (2,17 %) at the highest levels. Twenty nine VCs were identified sporadically in all the leaves. VCs including β -bourbonene, caryophyllene, α -cubebene, α -amorphene, γ -muurolene, tridecanal, 1-octen-3-ol, D11-dodecene-1-ol, m-cresol, 2-methoxy-4-(2-propenyl)-phenol, heptanoic acid methyl ester, hexanoic acid methyl ester, nonanoic acid methyl ester, 2,5-dimethyl-2,4-hexadiene, 4,8-dimethyl-1,7-nonadiene, 5-methyl-dodecane, 8-hexyl-pentadecane, trans-3-hexenoic acid were routinely identified in 'Gemlik' and 'Sari Hasebi' olive leaves whereas they were not found in 'Halhali' olive leaf. As a result, cultivar significantly affected the profile and proportions of VCs identified in olive leaves.

ANALYSING OF BIOCHEMICAL CONSTITUENTS IN LAVANDULA ANGUSTIFOLIA

İŞİL KUTBAY¹, FUNDA ŞENTÜRK AKFIRAT²

ABSTRACT

Lavandula spp. (Lavander) from Lamiaceae family is used in different areas such as ornamental in landscape and aromatic garden design, aromatic and medicinal in health care systems and on the central nervous system, fragrance and perfume in cosmetic industries, aromatherapy and massage, topical remedy in pharmaceutical industries, effective corrosion inhibitor, plasma polymerised thin films in biomedical and biomaterials industries. Lavandula angustifolia which is grown primarily in Mediterranean and Balkan countries and in many countries around the World is known the one of designated specifically genus for directly or indirectly medicinal use. The stems, leaves, and blossoms of L. angustifolia are known as parts of extract and isolated compounds in many industries. In the present study, L. angustifolia were obtained from Afyonkarahisar region of Turkey at the summer period. The spike, bracteole, stem, leaf of specimen were dried in air before using in all analysis. All of the specimens were analyzed by using X-ray diffraction (XRD), Attenuated Total internal Reflectance- Fourier Transform Infrared Spectroscopy (ATR-FTIR), and Scanning Electro Microscopy- Energy-dispersive X-ray spectroscopy (SEM-EDX). All analysis were performed for providing an accurate detection of the specimens molecular structure, crystalline phase, chemical compositions (organic or inorganic constituent), elemental index, morphology and microstructure. By X-ray diffraction pattern, crystalline phase and chemical compositions of the specimens were identified as ammonium hydrogen oxalate hydrate (C₂H₅NO₄.1/2H₂O), stigmasterol hydrate (C₂₉H₄₈OH₂O), carbolite (C). According to ATR-FTIR analysis results, characteristic peak values of the specimens were detected functional groups as (N-H), (P-O-C), (C-H), (O-C=O), (Ca-C≡O), (P-O), (C-H), (CO-O-C), (N≡H), (C-O), (C=H), (P-OH), (N=O), (P=O), (C=O), (O-H), (C≡H), (C-N), (C=N-OH), (C-Cl), (H-C-N), (H-O-H). SEM-EDX analysis also showed that the present of carbon, nitrogen, oxygen, magnesium, silicon, chloride, potassium, calcium in the specimens. Morphology and microstructure of opened or closed stomas, trichomes on the leaf surface, fiber-like layers and damaged xylem and floem vessels on the stem surface, hair-like spotted trichomes on blossom surface of the specimens were monitored. In conclusion, the chemical compositions, the functional groups and the elements are responsible for various medicinal properties, favourite scent and sweet aromatic properties of L. angustifolia. Nanoparticles obtained from each parts of the L. angustifolia by using developed plant extract process can be used in many different industries as biomaterial, biosynthesis, and nanomedicine.

OBTAINED OF THE ESSENTIOL OIL, IDENTIFIED OF CHEMICAL COMPOSITIONS AND TESTED BIOLOGICAL ACTIVITIES OF ZIZIPHORA TENUIOR THAT WAS COLLECTED FROM EAGEN SEA REAGION

PROF. DR. İSA KARAMAN¹, NAZAN GÖKŞEN¹

ABSTRACT

Lamiaceae family are represented with about 250 genus and 7000 species in the World. The species of this family extensive illustrate the distribution in Australia, South West Asia South America and especially mediterranean sea countries. Turkey is one of important gene pools of Lamiaceae family. This family is represented with 45 genus and 574 species in our country. It is acknowledged as the most wealthy third family of Turkey. The most of Lamiaceae family's species is rich on account of essential oils, aromatic oils and similar secondary metabolites. Therefore, this family has great importance in the areas like medicine, pharmacy, food, cosmetic and perfumery. On the other hand, the ethnobotanical usage of this family is also rather widespread. The aerial parts of the plant are used as a whole, in folk medicine especially in mountainous villages of Akhisar and Gordes, in the Aegean Sea region, in our country. Also, this plant is used as carminative and analgesic. The aerial parts of this plant were collected from mountainous regions of Akhisar and Demirci district, in Manisa province, in Turkey. The aerial parts of the plant were dried in the shade according to the method and were ground with the help of the grinder and were prepared for obtaining essential oil. Clavenger System was used to obtain essential oil. Essential oil was taken with Hydrodistillation method. The chemical composition of essential oil was analyzed by GC and GC-MS. Antimicrobial activity was determined by Disc diffusion and microdilution assay. The 14 different chemical compositions were described by Perkin-Elmer Clarus 500 Series GC System. In the result of analysis of essential oil, 4 major components were determined as pulegone(77.07%), α -Terpinolene (7.10%), D-isomenthone(3.03%), mentol(3.17%) and Piperitenone(3.42%). In the biological activity tests, standard bacterial strains, hospital bacterial strains and fungal isolate were used. In the results of biological activity test, in the disc diffusion assay 9-22 mm zone and in the microdilution assay 0.40-12.50 μ l/ml effects were observed. At the same time, the results were compared to antibiotics. It was described that the hospital pathogen *Acinetobacter baumannii* and *Enterococcus faecalis*, and *Shigella boydii* that are resistant to antibiotics were not resistant to the essential oil as a result of investigation.

EFFECT OF HARVEST TIME ON ESSENTIAL OIL RATIO, LINALOOL AND LINALOOL ACETATE COMPONENTS IN LAVANDULA CULTIVARS

YASİN ÖZGEN¹, NEŞET ARSLAN¹, NİLGÜN BAYRAKTAR¹

ABSTRACT

This study was carried out in 2016 in the experiment field of Ankara University Faculty of Agriculture Field Crops Department. As the material in the experiment, Supper A and Zarif of *Lavandula intermedia* L. and Munstead and Tina varieties of *Lavandula angustifolia* L. were used. In these varieties, harvests are made in 3 repetitions in June and July. Flower harvests of lavender varieties were made and dried in a shadowy environment at room temperature. Dried flowers were separated from their stems and essential oils were obtained using Clevenger aparate. Analysis of variance of the results of essential oil was made and LSD grouping was made among the significant averages. Varieties and harvest times interactions were found to be significant at the 1% level of the analysis. The mean essential oil content of lavender varieties was found to be 1,1-7,53%, linalool content 23,1-31,8% and linalool acetate content 21,2-26,3,3%.

EFFECTS OF DIFFERENT SALT CONCENTRATIONS ON QUINOA SEEDLING QUALITY

SELDA ÖZMEN¹, CANSU KÜÇÜK, NURAY ÖKTEM, AYŞE ÖZEROĐLU, FATMA BURCU OKUR, YAKUP ONUR KOCA⁶

ABSTRACT

Salinity in agricultural soils in the Mediterranean region is the most important problem for agricultural production. Quinoa is shown as an alternative crop tolerant to salinity condition. The experiment designed a completely randomized experimental design was carried out Adnan Menderes University, Agriculture Faculties greenhouse with six replicates for different salinity concentration effects on quinoa seedling quality certainly. Quinoa variety candidate named "Saponinsiz" is used experimental material. The seeds were sowed in plastic pots filled with soil and perlite (%50+%50) at the greenhouse. Five different salt concentrations were determined as 0 (control), 4 ds m⁻¹, 8 ds m⁻¹, 16 ds m⁻¹ and 30 ds m⁻¹ and were applied with NaCl solution which was prepared before sowing. Leaf number, leaf length, leaf width, leaf thickness, stem thickness and green biomass weight values were measured when the quinoa plant reached 6 leaf stage (45 days after the germination). As a result of the study, it was observed that the differences between the salt concentrations in leaf number, leaf length, leaf width and green biomass weight were significant. The maximum leaf length (11.53 mm) was measured with 8 ds m⁻¹ salt concentration applied plants, whereas the maximum leaf width (4,99 mm) and green biomass (1019,5 mg) were measured with 4 ds m⁻¹. The control plot only showed the highest values for the leaf number value. These results confirmed that the quinoa plant was facultative halophytic species (salt-resistant). Difference among concentrations of salt at the leaf and stem thickness values was found nonsignificant. It was determined that 16 ds m⁻¹ dose gave the lowest values in all measurements. And any plant wasn't growing at the 30 ds m⁻¹ applied pots. The values of the experiment measured of 4 ds m⁻¹ pots and 8 ds m⁻¹ pots, which is considered the limit values for the field crops, were approximately equal or greater than control pots. Moreover, there was a rapid decline of plant on the 16 ds m⁻¹ values. Therefore, new salt doses between 8 ds m⁻¹ and 16 ds m⁻¹ (10 ds m⁻¹, 12 ds m⁻¹ and 14 ds m⁻¹) may be determined because of be able to see that the certain limit of salt concentration range which is quinoa seedling resistant.

**PRODUCTION OF INSTANT TEA FROM SAGE TEA (SALVIA)
PLANTS, DETERMINATION OF ITS PHYSICO-CHEMICAL
PROPERTIES, AND PACKAGING**

CEMALETTİN BALTACI¹, MUHAMMED ŞİDİM¹, ZEYNEP AKŞİT¹

ABSTRACT

PRODUCTION OF INSTANT TEA FROM SAGE TEA (Salvia) PLANTS, DETERMINATION OF ITS PHYSICO-CHEMICAL PROPERTIES, AND PACKAGING
*Cemalettin Baltacı, Muhammed ŞİDİM, Zeynep AKŞİT aGumushane University, Department of Food Engineering, Bağlarbaşı, 29100. Sage tea (Salvia) is also known by the names of leadwort and common sage. Furthermore, scientific studies have shown that it has positive effects on memory in addition to its antioxidant, antibacterial, antidiabetic and anti-tumor effects [1]. Sage tea is a plant which is used as an aroma and spice in foods around the world. With its strong and even bitter taste, sage tea has been traditionally used as an effective solution to many health problems for centuries. It has been shown to have the best antioxidant activity among many plants [2,3]. It helps to whiten the teeth when it is used as a mouthwash, and its anti-infective feature is good for gingival diseases. It is rich in compounds such as etheric oil (thujone, cineol, borneol, pinene), saponin, tannin, glycoside, picrosalvin, resin, fumaric acid, irsol acid, oleanolic acid, flavone, asparagine, and uvaolpa radiphenol. In this study, instant tea production was performed from the dried samples of sage plant (Salvia) using two drying methods of lyophilization and spray drying. In spray drying method, the sage leaves were extracted in boiling water and the extract was evaporated till to a certain concentration and then powdered using a spray dryer [4]. In lyophilization method, the sage leaves were powdered under vacuum in a freeze drier after being extracted in boiling water and evaporated under vacuum. The sensorial properties, physical properties and chemical properties of the products obtained by both methods were analyzed. Yield analysis (20% spray dring; 24% lyophilization), analysis of hunter color values, analysis of solubility in water, moisture analysis (21% spray dring; 4% lyophilization), total phenolic content analysis, antioxidant activity analysis (TEAC, FRAP), analysis of the aroma content (19 organic compounds were detected in the spray dried samples and 82 organic compounds were found in the freeze dried samples), sugar analysis, crude protein analysis (4.46% spray dring; 5.29% lyophilization), ash analysis, mineral analysis, cellulose analysis, antimicrobial analysis and sensory analysis were performed. Significant differences were found between soluble teas obtained by the spray drying method and the freeze drying method especially in terms of aroma compounds and antioxidant activity [5]. The differences between the products obtained by using both methods were also revealed. The soluble herbal tea produced in this study will allow consumers to consume natural herbal tea that is rich in bioactive ingredients and easy to use. The importance of this study originated from that the prepared instant sage tea was studied for the first time, and it is aimed to be a preliminary resource for the studies to be carried out on this subject. GENERAL OUTLOOK OF HARVESTING AND THRESHING MECHANIZATION OF MEDICINAL AROMATIC PLANTS IN TURKEY

DENİZ YILMAZ¹, MEHMET EMİN GÖKDUMAN¹

ABSTRACT

In agricultural sector, important changes have took place in parallel with the applications of developing technology and agricultural mechanization. The increasing demand for medicinal and aromatic plants in the world markets necessitate the development of the mechanization in this scope. The fact that our country has different climatic and ecological conditions and the presence of many plant species reveals the necessity of harvesting and threshing mechanization of medicinal and aromatic plants. The harvesting and processing of medicinal and aromatic plants in Turkey are mostly conducted by hand. However, in recent years, various medicinal and aromatic plants have been cultivated and started to be produced, and studies have been carried out to increase yield and quality. Harvesting, threshing and separating mechanisms are developed in various forms depending on the variety of medicinal aromatic plants and product characteristics. Harvesting systems are based on the principle of directing crops to free or shear-cutting units. Threshing systems are consisted of various form and a number of finger-type or groined-type-thresher units, produced tangentially and axially, On the other hand separating of medicinal aromatic plants is carried out by passing the product through various types and several numbers of sieves. In the process of harvesting and threshing mechanization of medicinal aromatic plants, leaves and flowers are required to be separate from stalk and other materials without any damage. Therefore, it is necessary to increase mechanization studies for harvesting, threshing and separating of medicinal and aromatic plants, using new technologies, for high yield and quality product.

EFFECTS OF DIFFERENT MEDIUM ON SEED GERMINATION OF SPARTIUM JUNCEUM L. WITH MEDICINAL AND AROMATIC IMPORTANCE

MÜBERRA PULATKAN¹, NEBAHAT YILDIRIM², İBRAHİM TURNA²

ABSTRACT

Spartium junceum L., the natural vegetation of Turkey flora, is one of the indicator plants of the Mediterranean climate. Especially in rural landscape, they offer aesthetic values with floral beauties in dense stands. Functionally, they are effective in planting design in many ecologically distressed areas, such as in sloping areas, highway vegetation, coastal areas affected by sea salt, and so on. They are also preferred for controlling dune areas. In addition to these properties, this species is mainly used as a medicinal and aromatic plant. In particular, the aim of the study were 1) to evaluate the aesthetic, medicinal and aromatic properties of *Spartium junceum* L. in rural and urban areas in landscape architecture 2) to investigate the effect of different medium on the germination of seeds of *Spartium junceum* L. As a result of the study, the success of the germination of seeds has been determined: peat 34%, peat + soil (7: 3) 35,33% and peat + sand (7: 3) 42,67%. In addition, root lengths, root counts and plant height of germinated seedlings were measured. In the statistical analysis results, the best medium of root length and number of roots was determined as peat + sand (7: 3) medium. Peat + sand (7: 3) and peat + soil (7: 3) medium are in the same group in terms of plant height.

THE EFFECTS OF VARIOUS TYPE PRESS WHEEL MOUNTED ON PNEUMATIC PRECISE DRILLING MACHINE ON SOME QUALITY CRITERIA OF BLACK CARROT

HÜSEYİN BÜLBÜL¹, HAYDAR HACİSEFEROĞULLARI²

ABSTRACT

Black carrots are consumed as fresh vegetables in Turkey and are preferred in the form of fermented beverages in large quantities. Black carrots are cultivated in different regions of Turkey. The black carrot are cultivated heavily in Eređli region. In the region, the highest yields for black carrots are obtained by planting on the ridge at narrow interval range with triplet drilling. In this study, the effects of front and rear stainless steel press wheel (BT1), front and rear rubber press wheel (BT2) and front and rear rubber press wheel and triple narrow intermediate rubber wheels (BT3) on black carrot quality criteria on field conditions were investigated. According to results, plant number per meter, yield, single carrot mass, diameter and length varied between 11.47 and 43.87 number/m², 15.11 and 41.61 t/ha, 76.96 and 226.43 g, 33.61 and 53.14 mm, 193.65 and 237.33 mm respectively. It was found that total phenolics varied 349.80 ile 745.37 mg gallic acid equivalent/100ml and antioxidant activity value determined by DPPH was found between %26.71 and %54.80

**THE EFFECTS OF MINT(MENTHA SPICATA) ESSENTIAL OIL
FORTIFIED EDIBLE FILMS ON THE SOME PROPERTIES OF
KASHAR CHEESE**

NAZAN KAVAS¹, GÖKHAN KAVAS¹

ABSTRACT

Sorbitol + whey protein isolate and 2 different edible films containing mint essential oil (*Mentha spicata*) were prepared in 1.5 % (v/v) (Me1) and 3 % (v/v) (Me2) concentrations. These films were used for coating kashar cheese samples and stored at +4°C for 30 days. Microbiological and physical-chemical analyses were carried out on the 1st, 7th, 15th and 30th days of storage. The increase in the concentration of essential oil had a significant effect on the fat content, titratable acidity, water vapor permeability, weight loss and antimicrobial activity. For the determination of antimicrobial activity, the cheese samples were artificially contaminated with *Escherichia coli* and *Staphylococcus aureus*. The general results showed that addition of mint essential oil to S+WPI based film in 3 % (v/v) concentrations had a positive effect on the extension of the shelf life of kashar cheese.

PRODUCTION OF BAR WITH FRUIT

BÜLENT BAŞYİĞİT¹, İBRAHİM HAYOĞLU¹, ALI YILDIRIM¹, A. FERİT ATASOY¹

ABSTRACT

Different parts of plants have been used as medicinal purpose for long time. One of these parts of the plants is fruits. Fruits are a valuable source of different bioactive compounds. They have also played an important role on human diet. Therefore, different processes are applied to fruits to increase their consumption. Bars with fruit were produced using banana, apple, carrot, orange in different formulations in this study. Baking and frying methods were used in production. The lowest and highest values of L*, a*, b*, pH and % acidity (as malic acid), moisture, ash in product were 33.51-53.84, 7.23-11.66, 17.62-38.87, 6.77-7.4, 0.93-1.20, 5.41-10.82, 1.95-2.45 respectively. Additionally, bars with fruit produced using frying method had a higher score.

OTTOMAN SHERBET

MESUT KAPLAN¹

ABSTRACT

Summary: Sherbet is a widely consumed beverage variety in Anatolia at the time of Seljuk and Ottoman States. Anatolia, where various trade routes intersected, also hosted many civilizations. This diversity is also reflected in the food and drink culture. Despite the fact that there are more than 200 variety of sherbet is known, sherbets with regional characteristics show a very limited diversity. The Sherbets which used for medical purposes still continue to be used for centuries. A significant portion of the sherbets used for medical purposes have been used in Bilecik province. This study was carried out with the cooperation of various institutions in Bilecik province with the aim of modernizing the taste and the development of sherbets which are used for medical purposes and also used as beverages on special occasions. Since 2012, with contribution of Bilecik Municipality and Bilecik Chamber of Commerce and Chamber of Industry the historical sherbets made in Bilecik was examined and modernized in accordance with today's taste. There were studies have been done on 125 varieties of sherbet. Eight kinds of sherbet formulations were created which are suitable today's tastes. The sherbets served to the people of Bilecik has been spread depending on the seasonal conditions. The sherbet drinking habits have being tried to gain to our people on important days and nights, in Ramadan nights, ethical celebrations and setra. The sherbet formulations have been tested primarily with fruit varieties grown in the region and with quality spices brought from far-east. In the tests, we tried about 40 spices and 22 fruit varieties.

**PHYSICO-CHEMICAL PROPERTIES DETERMINATION OF
COMMERCIAL/HOME MADE SOUR POMEGRANATE JUICE
CONCENTRATE (POMEGRANATE SOUR-NAR EKŞİSİ) FROM
ŞANLIURFA REGION**

SELİN ALİHANOĞLU¹, DEMET EKTİREN, MEHMET KARAASLAN¹, HASAN VARDİN¹

ABSTRACT

Pomegranate (*Punica granatum*) fruit has a tough skin and many seeds. It is rich in vitamin C, pantothenic acid, potassium, flavonoids, and other natural phenols such as ellagitannins, a powerful antioxidant. The pomegranate also has unsaturated oils, fiber, and many additional micronutrients in seeds. Pomegranate is an ancient fruit with an illustrious medical history. It shows anti-oxidative, anti-inflammatory, anti-carcinogen properties due to its composition. Pomegranate can be processed into wine, jam, pomegranate juice, fruit leather (pestil), and concentrated sour pomegranate juice (Pomegranate sour) as well as raw consumption as a fruit. In this study 42 different commercial pomegranates sour were examined and their pH, brix, titratable acidity%, color, total phenolic compounds, anthocyanins, antioxidant activity, HMF (Hydroxy Methyl Furfural) contents, formol number were determined. There was a significant difference ($p < 0,05$) between pH, brix, titratable acidity%, formol number of pomegranate syrup samples. Total phenolic contents of samples were varied between 1.08-3.06 mg GAE/g and there was no phenolic compound in one of pomegranate sour sample. Antioxidant activity of samples were determined in a wide range between 11.78-82.38 %. Anthocyanin was observed in only three samples and maximum value was observed 2.78 mg/100g. Color values of samples were determined as L*, a*, b* values. Their results were varied between 13.70-20.26 ; -0.13 - 7.77 ; 0.58-4.38 respectively and HMF values determined between 48.5-761 mg/kg in pomegranate syrup samples. This study reveal that the pomegranate sour obtained from Şanlıurfa markets are display different physico-chemical properties but all of them are suitable for consumption according to the characteristics that are measured. Results of analysis shows that usage of different source of pomegranate and process condition change the physico-chemical properties of pomegranate sour. Pomegranate sour production techniques are required to improve. It is necessary to use a vacuum for the concentration process especially limiting HMF content with adverse health effects which is resulting from prolonged thermal processing and storage.

A TRADITIONAL TASTE OF KAHRAMANMARAS' CUISINE: TIRSIK

MUHAMMET ALI CEBİRBAY¹, SAADET CEBİRBAY², NERMIN İŞİK¹

ABSTRACT

Kahramanmaraş is a province with rich plant life thanks to its climate, geographical conditions and other factors. The biodiversity of edible wild flora in Kahramanmaraş has also affected its cuisine culture. Tirsik is one of the most important wild plant dishes of Kahramanmaraş. Tirsik is a dish made from the fresh leaves of a wild plant that grows in mountainous terrain at high altitudes on the east side of Mediterranean region and is known as tirsik beets, gentian and *Arum dioscoridis*. The aim of this study was to determine the traditional preparation and production stages of tirsik, a wild plant dish peculiar to Kahramanmaraş cuisine. A qualitative research design was used in the study with descriptive analyses. It was conducted with 5 volunteers who were older than 40 years, residents of the Andırın District of Kahramanmaraş Province and producing tirsik traditionally for more than ten years. The data were collected using a semi-structured interview form, which was prepared by the researchers and included questions to determine the demographic information of the participants and information about tirsik's properties, production and consumption. Audio and video recordings were also made. The interview form was assessed by the experts for content validity. The preparation stage of tirsik consists of collecting fresh leaves, breaking them into pieces and washing them. In terms of its production stage, this study found that tirsik is fermented for 8-12 hours at temperatures between 20°C and 30°C by adding yogurt and whole wheat flour, then removing its upper layer and giving it a good texture by adding bulgur wheat, garlic and water and cooking it for 3-4 hours. It is consumed cold with lemon juice or pomegranate syrup. This study found that tirsik is a dish made from wild plants specific to the Kahramanmaraş cuisine. It is produced by fermentation and can be beneficial for health due to its type of production and ingredients.

VULCANICA (BOISS. ET. HELDR EX) KOTSCHY LEAVES**

SÜLEYMAN DOĐU¹, TURAN AKDAĐ², MEHMET BAKANLAR², SEREN NUR SARI²

ABSTRACT

Some taxa of the Quercus L. (oak) genus, formed at the large forests in temperate regions of the Northern Hemisphere with more than 400 species, numerous subspecies, varieties and natural hybrids, are found in high mountainous regions in the tropics. Quercus is a family of beech family and appearance as woody, long-lived trees, shrubs and large shrubs. They are in winter or always leafy woody plants and they have an important place in the Turkish Flora. There are 18 species of Quercus that grow naturally in Turkey, of which 4 are endemic. There are 11 subspecies of 6 these species. In addition to its main beneficiaries, the leaves and fruits are important for animal feeding. The mushroom crust, which is obtained by robbing the tannin-rich shells and fruit glasses, oak texts and the bastions of the mushroom stand grown are important by-products in some Mediterranean countries. Quercus vulcanica (Boiss et al. Heldr ex) Kotschy (Kasnak meşesi) is endemic for our country. An ethnobotanical use of Q. vulcanica has been identified in negotiations held in Çavuş Village under the name of the ongoing project of ethnobotanical features of Seydisehir. The molasses, named as "Basara Bekmezi ", is obtained as a result of the collection of leaves when the parasite called "Basara" is placed among the leaves of Q. vulcanica. The ethnobotanic use of our endemic species determined for the first time in the study and the production of this molasses are given in detail.

ANTICANCER ACTIVITIES OF SOME PLANT GROWING IN TURKEY

FERDA ARI¹

ABSTRACT

Natural products from plant sources are used for treatment of various diseases for more than thousands of years either in the pure forms or as crude extracts. As a possible source for anti-cancer compounds, the plants are still gaining importance. Several investigations were conducted related to cytotoxic activity and antiproliferative effects of plant extracts or its compounds. We have investigated the anti-cancer activity of different plant extracts, growing in Turkey. In our previous studies, we showed that the methanol extract of *Prunella L.* species extracts inhibited anti-growth activity against breast cancer cell lines (MCF-7, MDA-MB-231) [1]. We also exhibited the methanol extracts from *Hypericum adenotrichum* is an endemic plant from Turkey induced apoptosis in human breast cancer cells [2]. Recently, we investigated anti-growth/apoptotic effects of methanol extracts of *Hypericum adenotrichum* and *Hypericum olympicum* against on human lung cancer cell lines (A549 and PC3), as well as apoptosis-inducing effects in PC3 cells [3]. In addition, we showed the extract of *Pelargonium quercetorum* have anticancer potential inducing by apoptosis in lung [4] and breast cancer cells. Our data and previous studies demonstrate that plant extracts and their compounds are potential sources of anticancer drugs and need further analysis. [1] Sahin S, Ari F, Demir C, Ulukaya E. ANTI-ACHE AND ANTI-PROLIFERATIVE EFFECTS OF GLAUCIUM ACUTIDENTATUM AND GLAUCIUM CORNICULATUM ALKALOID EXTRACTS

FATMA GONCA KOÇANCI¹, BELMA ASLIM¹

ABSTRACT

Alzheimer's disease (AD) is a progressive neurodegenerative disease characterized by loss of neuron and synapse in various parts of central nervous system (CNS) and associated with decrease in cognitive function and self-care deficiencies. As noted in World Alzheimer's Report 2015, there are an estimated 46 million people living with dementia worldwide and the number is expected to be increased up to 74.7 million in 2030 and 131 million in 2050. Until now, the major mechanism that results in successful symptomatic treatment of AD is the inhibition of AChE. Recent studies have demonstrated that the AChE metabolism also associated with cancer. Accumulating evidence suggests that AChE activity is increased in some tumor types and some AChE inhibitors (AChEi) are suppressive for the growth of some cancer cells. But, none of the identified AChEi were able to completely cure AD and cancer so far. Therefore new studies on the identification of new AChE inhibitory agents that can provide the treatment of AD and cancer are required. It is known that alkaloids, which are secondary metabolites of plants, have different pharmacological effects such as anti-tumor, anti-proliferative, AChE inhibitory and cytologic activities. The Papaveraceae family members are remarkable because of they are biosynthesizing pharmacologically active alkaloids. In this study, methanol and water alkaloid extracts of *Glaucium acutidentatum* and *Glaucium corniculatum*, they are members of the Papaveraceae family, were evaluated for their anti-AChE and anti-proliferative activities. The total alkaloid, phenol and flavonoid content were analyzed for the determination of active compounds. The amount of total alkaloid was analyzed by chloride colorimetric method, total phenol was determined by Folin-Ciocalteu assay and total flavonoid was determined by aluminium chloride method. The anti-AChE activity was examined by Ellman's method. Also the cellular anti-AChE effects of these extracts were analyzed on NGF-differentiated PC12 cells (dPC12). For anti-AChE activity determination dPC12 were subjected to a necrotic insult by hydrogen peroxide (H₂O₂). Also these extracts were assayed for their ability to exert anti-proliferative activities on HeLa and HT-29 cell lines using the MTT assay. According to our results, alkaloid was major compound (76.65-100.61 mg AE/g) and it was determined that flavonoid and phenolic content was less than a substantial degree compared to alkaloid. It was also found that *G. corniculatum* methanol extract had the highest amount of total alkaloid. Our data showed that all extracts of plants demonstrated AChE inhibitory properties in a dose dependent manner. The methanol extracts of *G. corniculatum* showed the most in vitro AChE inhibitory activity (90±2%). Results show that all the plant extracts prevented an increase in AChE activity in H₂O₂ treated dPC12 cells. The methanol extracts of *G. acutidentatum* showed the greatest cellular inhibitory effects of AChE (54±2%). It was also found that all the extracts had anti-proliferative effects on both HeLa and HT-29 cells. The methanol extracts of *G. acutidentatum* showed the highest anti-proliferative activity in HT-

29 cells ($55\pm 5\%$) and in HeLa cells ($36\pm 3\%$). According to these results, Glaucium alkaloid extracts may have favourable pharmacological profile in the treatment of AD and cancer. Also, this study may have provide further works of the importance of Glaucium alkaloid compound as potential AChEi targeting the inhibition of cancer. This study constitutes a strong awareness about the therapeutical use of AChEi in carcinogenetic diseases.

EFFECT OF GRAPE SEED ON CANCER TREATMENT

TUĐBA TATAR¹, NILÜFER ACAR TEK¹, GAMZE AKBULUT¹, YASEMIN ERTAŐ¹

ABSTRACT

Cancer is a major public health problem in many country of the world. The second most important cause of death in America is cancer. In a few years it is expected to override heart diseases and take the first place. For prevention and treatment of this disease a wide variety of phytochemicals, especially flavonoids or polyphenolics are consumed. Grape seed includes mixture of several polyphenolic components and proanthocyanidins such as dimers, trimers, tetramers, and oligomers/polymers of monomeric catechins and/or epicatechins. These compounds may promote to the pharmacologic properties of grape seeds. It has been significantly shown that high level of flavonoids and proanthocyanidins intake are linked together with a lower risks of cancers. Grape seed proanthocyanidins have preventive and therapeutic benefits on various stages of neoplastic processes and carcinogenesis including detoxification of carcinogenic metabolites. Chung et al. indicated that grape seed procyanidin prevent the proliferation of pancreatic carcinoma cells by cell cycle blockage or apoptotic induction. Therefore they concluded grape seed procyanidin has potency of chemotherapeutic or preventive effect for pancreatic carcinoma. Raina et al. reported that grape seed extract has inhibitory effect on bladder cancer. They found that the extract reduced cancer cell viability due to apoptotic cell death. Similarly, Dinicola et al. determined that high concentrations of grape seed extracts prevent metastasis in breast cancer via inhibiting cell proliferation and apoptosis. In another study, HaCaT cells that are cell line from adult human skin pre-treated with grape seed extract after exposing ultraviolet B radiation. As a result of treatment, cell viability increased, lipid peroxides level, the lesions cores and DNA photolesions lowered. Also they found significant reduction of the cells undergoing apoptosis. The results suggest that use of grape seed extract single or in combination with sunscreens have photochemoprotective effect. Huang et al. found that grape seed proanthocyanidins inhibited colon tumor-induced angiogenesis. Tumor cells stimulate angiogenesis via overexpression of some angiogenic factors. Grape seed proanthocyanidins inhibit the expression of these factors. Thus the compounds act as chemopreventive agent for colon cancer. The results of all these studies obviously shows that compounds found in the natural composition of grape seed, such as flavonoids or polyphenolics have beneficial effect on various types of cancer. However it must be used under the supervision of health professionals.

ANTIOXIDANT, ANTIMICROBIAL AND ANTITUMORAL EFFECTS OF STACHYS ANNUA (L.) L. SUBSP. ANNUA IN COMPARATIVE CANCER PROFILES

MERVE ALPAY¹, GÖRKEM DÜLGER², ERSİN KARABACAK³

ABSTRACT

The genus *Stachys* (Lamiaceae) is represented by 89 species and 51 of the 113 taxa are endemic in Turkey. Plants of this genus have been used for the treatment of cold, cough, diarrhea, urinary system disorders, hypertension, throat pain and as an antipyretic or stomachic in folk medicine. Also they have been used as tea which is made from whole plant or leaves. Natural compounds have been used extensively in the treatment of many diseases including cancer and are of interest to researchers both in their natural forms and as templates for synthetic modification. Sample sources and molecular mechanisms are highly important in the development of novel, clinically useful anticancer agents for treatment. Numerous cancer research studies have been conducted using traditional medicinal plants in an effort to discover new therapeutic agents that lack the toxic side effects, drug costs and safety associated with current chemotherapeutic agents. This study was designed to investigate the *in vitro* antioxidant, antimicrobial and antitumor effects of *Stachys annua* (L.) L. subsp. *annua*. Plant samples were collected from region of Duzce/Turkey during the flowering stage *Stachys annua* subsp. *annua*. The leaves of the plant were dried and powdered. Each dry powdered plant material (20 g) was extracted with 150 mL of 99% ethanol (Merck) for 24 h by using Soxhlet equipment. Antimicrobial susceptibility testing was determined with using the disc diffusion method according to the protocol applied by CLSI. All the bacteria were incubated at 35 ± 0.1 °C for 24 h by inoculation into nutrient broth (Merck), and the yeast cultures studied were incubated in malt extract broth (Merck) at 27 ± 0.1 °C for 24 h. Inoculums containing 1.5x10⁸ cfu/ml bacterial cells or yeast cells were spread on Mueller Hinton Agar plates (1 mL for each plate). The discs were impregnated with 75 µL of each extracts solution. After the discs were placed on the agar and incubated at 35 °C (24 h) and at 25 °C (72 h) for bacteria and yeast, respectively. For determination, anticancerogen effect, we used HeLa and PC3 cells to test urinary effect. The cells were cultured in sterile T25 flasks in RPMI 1640 medium supplemented with fetal bovine serum 10% v/v, penicillin (100 units/ml) and streptomycin (100 mg/ml) were grown in monolayer cultures in humidified air containing 5% CO₂ at 37 °C. The 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyl tetrazolium bromide (MTT) assay is one of the most widely used methods for viability screening due to its simple and rapid procedure. The potency of cell growth inhibition for each extract was expressed as IC₅₀ value. The absorbance of different wells was measured at 570 nm. As a result of our study, *Stachys annua* subsp. *annua* extract had strong antibacterial activity against test bacteria as compared to test fungi. We have determined that plant revealed similarly effect against Gram (+) and Gram (-) bacteria as compared to standart antibiotics. Also, we were investigated the antioxidant activity of methanol extract. We

APOPTOTIC EFFECT OF ALPHA LIPOIC ACID ON HUMAN COLON CANCER CELL LINE SW-480: AN IN VITRO STUDY

İLKAY ARMAĞAN¹, DILEK BAYRAM¹, MELTEM ÖZGÖÇMEN¹, MURAT SEVİMLİ¹, GÜLÇİN YAVUZ TÜREL⁵

ABSTRACT

Colon cancer is the fourth commonest cancer and the most frequent causes of cancer morbidity and mortality worldwide so treatment alternatives are always on the agenda. ROS levels increase in a tumoral formation, thereby destroying signaling pathways caused by oxidative damage and contributing to the proliferation and apoptosis suppression of tumor cells. Alpha lipoic acid (ALA) is a natural antioxidant found in some foods and at the same time is de novo synthesized in humans. In addition, ALA has been shown to play an important role in caspase activation in tumor cells. In light of this information, we aimed to investigate whether ALA has apoptotic effect on SW-480 colon cancer cells. The SW-480 colon cancer cell line was cultured in monolayer model. Cells were treated with ALA at 24, 48, and 72 hours of incubation. TUNEL assay were used to determine the apoptotic cells in the monolayer culture. The BrdU labeling index was used to determine the proliferation of cells. An IC₅₀ inhibition dose of ALA in SW-480 colon cancer cell was 250 µM/ml at 24, 48, and 72 hours of incubation. The control group had a normal pattern of S-phase fraction and many of the SW-480 cells nuclei were observed to be positive for BrdU. TUNEL positive cells were detected after treatment with ALA in the monolayer cultures. The dead cell count was higher in the SW-480 cell lines with ALA applied than in the control. We concluded that ALA inhibit colon cancer growth by apoptosis. Further in vivo studies are needed to confirm our findings in humans. Three-dimensional studies and Caspase and AIF immunostainings are still ongoing.

**INVESTIGATION OF CHROMIUM TOXICITY EFFECTS ON
CONTENTS PHOTOSYNTHETIC PIGMENT, PROTEIN CONTENTS
AND LIPID PEROXIDATION OF CERATOPHYLLUM DEMERSUM L.,
AN IMPORTANT MEDICINAL AQUATIC PLANT**

MUHAMMET DOGAN¹, MEHMET KARATAS², MUHAMMAD AASIM²

ABSTRACT

Ceratophyllum demersum L., belonging to the family Ceratophyllaceae, is one of the major medicinal aquatic plant. It has been traditionally used in the treatment of diseases such as ulcer, diarrhoea, dysentery, wounds, fever, burning sensation, haemorrhoids, intrinsic haemorrhages, epistaxis. This study presents the photosynthetic pigment (chlorophyll a, chlorophyll b, total chlorophyll and carotenoid) and protein contents and lipid peroxidation of C. demersum exposed to chromium (Cr) at different concentrations (0-12 mg/L) and durations (1, 3 and 5 days). The plants exposed to Cr showed significant decreases ($p < 0.05$) in their chlorophylls and carotenoids with increasing metal concentration and exposure time. Compared with the control groups, minimum photosynthetic pigment levels were determined at 12 mg/L Cr after 5 days. In general, the protein contents of the plants decreased with increasing concentrations of metal and exposure time. The maximum decrease in protein content was found 35.84% less than that of the controls. Malondialdehyde (MDA) content was measured as a product of lipid peroxidation. A significant increase in the MDA content was recorded with the increase in exposure of concentration and duration ($p < 0.05$). The maximum MDA level in the plant was measured as 15.58 nmol mg L⁻¹ at 12 mg L Cr (58.23% higher than that of the control).

COULD THYMOL PROTECT THE LIVER AGAINST DRUG-INDUCED GASTRIC ULCER

KUBRA KOC¹, FATIME GEYIKOGLU¹, SALIM CERIG¹, NIHAL SIMSEK OZEK¹, ELIF GULCAN YILMAZ¹

ABSTRACT

Non-steroidal anti-inflammatory drugs (NSAIDs) are used massively worldwide and are among the most common drugs associated with drug induced liver injury. Although there are many studies attempting to decrease the toxicity of NSAIDs and till date no any drugs and effective therapeutic strategies are available for the therapy or prevention of hepatic damage caused by NSAIDs. Indomethacin is one of the most commonly used NSAIDs. It is rapidly absorbed from the gastrointestinal tract after oral administration and hepatic clearance is low. Thymol, a monoterpene phenolic compound, is found in the oils of thyme and and produced from different plant species such as *Thymus vulgaris*, *Thymbra spicata*, *Thymus ciliates*, *Origanum vulgareae*, *Trachyspermum ammi* species, *Monarda fistulosa* and *Nigella sativa* seeds. It have been reported to have many pharmacological biological activities such as antibacterial, antifungal, anti-inflammatory, anti-hepatotoxic, antioxidant, antiapoptotic, anti-hyperlipidemic, anti-hyperglycemic, neuroprotective and radioprotective activities. However, to the best of our knowledge, this is the first study performed on the hepatoprotective effects of Thymol with a broad dosage range (75–500 mg/kg) on gastric ulcer model caused by oral administration of Indomethacin in rats. In this study we have used antioxidant/oxidant capacity (TOS/TAS), tumor necrosis factor-alpha (TNF- α) and prostaglandin E2 (PGE2) levels, Caspase-3 activity assay, as well as AST, ALT, LDH levels and histopathologic examination in the liver tissue. With this aim, thirty five Sprague-Dawley rats were divided into seven groups: control, ulcer control (30 mg/kg Indomethacin), Indomethacin + reference standard (50 mg/kg Ranitidine), Indomethacin + Thymol (75, 150, 250 and 500 mg/kg) groups. Thymol was orally administered to rats after 10 minutes from induction of ulcer with Indomethacin. Six hours later, the animals were anesthetized and liver tissue samples were obtained for analysis. All biochemical assays were evaluated on homogenized pancreas samples using ELISA methods. The results of the present study showed that the administration of Indomethacin (30 mg/kg) caused severe liver dysfunction in rats, demonstrated by significant elevation of serum AST, ALT and LDH levels, elevation of TNF- α level and caspase-3 activation, reduction of PGE2 activity, induction of hepatic oxidative stress and histopathological changes. However, treatment with Thymol exhibited a significant improvement in these parameters. This improvement was more pronounced in the group treated with Thymol 250 mg/kg. Treatment with Thymol 75 and 150 mg/kg did not also succeed to reverse the parameters. On the other hand, treatment with Thymol 500 mg/kg dramatically affected the parameters much worse than Indomethacin treated group. The effect of Thymol on the measured biochemical parameters in hepatic tissue is well correlated with the improvement observed in hepatic histological picture of the Thymol treated animals. Our results demonstrated that Thymol has an impressive hepatoprotective effect on acute liver injuries induced by Indomethacin; however, its high dosage (500 mg/kg) should take into account for further examination.

PROTECTIVE EFFECTS OF SILYMARIN AND CURCUMIN ON CYCLOPHOSPHAMIDE-INDUCED CARDIOTOXICITY

HAMDİ AVCI¹, ERKMEN TUĞRUL EPIKMEN¹, EMRAH İPEK¹, RECAİ TUNCA¹, SÜMBÜL SERAP BIRINCIOĞLU¹,
HASAN AKŞİT¹, SELİM SEKKİN², AYŞE NUR AKKOÇ¹, MURAT BOYACIOĞLU²

ABSTRACT

Cyclophosphamide (CP) is a potent anticancer agent; its clinical use is limited due to its marked cardiotoxicity. In the present study was aimed at evaluating the cardioprotective effects of silymarin (SLY) and curcumin (CUR), which have strong antioxidant properties, against the toxic effects of high-dose CP on the heart of rats. A total of 36 adult Wistar albino female rats were randomly divided into six groups. Group I (control group; nothing was administered), Group II (CP group; 30 mg/kg/day CP was administered intraperitoneally to each animal for seven days), Group III (SLY group; 100 mg/kg/day SLY by gavage for 14 days), Group IV (CUR group; 100 mg/kg/day CUR by gavage for 14 days), Group V (SLY+CP group; 100 mg/kg/day SLY by gavage for 14 days plus 30 mg/kg/day CP intraperitoneally starting from the seventh day) and Group VI (CUR+CP group; 100 mg/kg/day CUR by gavage for 14 days plus 30 mg/kg/day CP intraperitoneally starting from the seventh day). Biochemical, histopathological and immunohistochemical methods were utilised for evaluation of the cardiotoxicity. The result showed that an increase in heart MDA and DNA fragmentation levels were detected while significant decreases were seen in SOD levels in CP alone group when compared to the other groups. CP caused severe damage in the histopathological status of heart tissue including oedema, haemorrhage, degeneration and necrosis in muscle fibrils and perinuclear vacuolization. A significant increase in the percentage of TUNEL-positive cells and γ H2AX protein expression was detected in the CP-treated group compared to the control and other treated groups. There was significant increase in the percentage of caspase 3-positive cells and decrease in the percentage of Bcl-2 positive cells in the CP group compared to the control group and other treated groups. However, a significant decrease in the percentage of cTnI and cTnT immunoreactivity was also observed in the CP-treated group compared to the control and other treated groups. These results lead to conclusion that the SLY and CUR might have protective effects against CP-induced cardiotoxicity and oxidative stress in rats.

CYTOPROTECTIVE EFFECTS OF RHEUM RIBES RESVERATROL AND QUERCETININE TREATMENTS IN CCI-CREATED LIVER DAMAGE

SEVGİ YÜKEK¹, SEMA KAPTANOĞLU¹, GÖKHAN OTO¹

ABSTRACT

Aim:It is known that the role of free radicals in liver damage is great and it is a coronary effect of antioxidants. Many pharmacological agents have been tried in order to prevent acute and chronic liver damage. This study aimed to test Rheum ribes L. for the investigation of resveratrol, quercetin and cytoprotective effects known to have cytoprotective effect on acute liver damage in rat liver with carbon tetrachloride. **Materials and Methods:**In this study, 70 Wistar -Albino female rats weighing 200-220 gr were used in the experiment. The animals were divided (n=7), 10 different groups.1st Group: (Control, n=7, standard pellet for 7 days), 2 nd Group : (DMSO n=7, 0.3 ml/kg i.g, for 7 days), 3 rd group: (Olive oil, n=7, 1 ml/kg i.p, single dose 7th day), 4 th Group: (CCI4, n=7, 1 ml/kg i.p, olive oil 1:1), 5th Group:(Rheum ribes L., n=7,water extract, 100 mg/kg i.g for 7 days),6 th group: (Resveratrol, n=7, 100 mg/kg i.g for 7 days), 7 th group: (Quercetin n=7, 100 mg/kg i.g for 7 days), 8th group: (CCI4, n=7, 1 ml/kg, single dose 7th day and Rheum ribes L. water extract, 100 mg/kg i.g for 7 days), 9 th Group: (CCI4, n=7, 1 ml/kg i.p single dose 7 th day and resveratrol 100 mg/kg i.g for 7 days), 10 thGroup: (CCI4, n=7, 1 ml/kg, i.p single dose 7 th day and Quercetin, i.g 100 mg/kg for 7 days). CCI4 stimulating was done on 7 th day and animals were sacrificed on 8 th day. **Results:**In blood samples, alanine transaminase (ALT) and aspartate aminotransferase analyses were performed. Serum ALT and AST levels increased in CCI4 group. It was found that, although serum ALT levels decreased in Rheum ribes L. + CCI4 group, It not changed in resveratrol + CCI4 and quercetin + CCI4 groups. AST levels more increased in all therapy groups in according to CCI4 group. After sacrifice, %10 the formaldehyde was placed for examination histopathological.After 48 hours of detection, the running tap water was washed for 10 hours. Routine tissue was implanted in blocks of paraffin after it was done.Sections examined in the light microscope were evaluated as no (-), mild (+), moderate (++) and severe (+++) according to the specificity of the fire.1st group, 2 nd DMSO group,3 rd olive oil group, were found to be in normal histological structure (-).4 thCCI4 group, hydropic degeneration in the portal region, fatty degeneration in hepatocytes, coagulation necrosis, intrahepatic cholestasis, hyperplasia in kupffer cells, mononuclear cell infiltration were observed in the liver of rats. Severe (+++) necrotic hepatitis and haemorrhages were found in hepatocytes, especially those close to the serosa of the liver.5th group, Rheum ribes L. water extract group, 6th group Resveratrol and 7 th group Quercetin, were examined, it was determined that they had normal histological appearance (-). 8 th, the CCI4 and Rheum ribes L. group; Hydropic degeneration of the hepatocyte in the central region of the liver, dilatation of the sinusoids, and severe (+++) degenerative and necrotic hepatocytes in the vicinity of the serosurface of the liver.9 thgroup,CCI4 and Resveratrol group, the liver was found to have few (+) degenerative and necrotic hepatocytes in the area close to

EFFECTS OF NIGELLA SATIVA ON OXIDATIVE STRESS PARAMETERS AND LIVER HISTOPATHOLOGY IN DICHLORVOS RATS

GÖKHAN NUR¹, HACI AHMET DEVECİ¹, NEGAR EBRAHİM POUR MOKHTARI¹, AKRAM MUDHER KAREEM ALJBORI¹

ABSTRACT

As a result of the rapid increase of the world population after the industrial revolution, it is unavoidable to anticipate the increase in the same amount in the agriculture sector which will feed this population. To this end, thousands of chemicals have begun to be used in this sector in order to remove the factors that cause pathogens in crop production and low yields. In our study, dichlorvos, an organophosphate insecticide, was used. For the study, the control group (each of which was given orally 12 days with corn oil gavage in the form of 5 mg / kg of rats), each group of 7 rats, was dissolved in dichlorvos corn oil in the dichlorvos group (5 mg / kg in rats)) And a group of dichlorvos + nigella sativa (gavage was given for 12 days in dichlorvos such that the rats were given 5 ml / kg of donut oil and 5 mg / kg after half an hour). At the end of the experiment, blood samples were taken from the animals by entering the heart. Plasmas were centrifuged at 3000 rpm for 10 minutes and the resulting samples were stored at -20 [deg.] C. until analysis. Total oxidant, total antioxidant and total sialic acid levels were measured in the obtained plasma samples. Liver tissue samples taken for histological examinations were prepared after tissue tracing procedures and examined by light microscope. Dichlorvos group; Degeneration in the liver, cell infiltrations around the central and portal vein, and areas of focal necrosis were detected. Histopathological findings were also found in the same group, although the prevalence was less in Dichlorvos + nigella sativa group. The statistical significance of the increase in total sialic acid level is insignificant, while the total oxidant level in the dichlorvos plasma increases the statistical significance compared to the control group. Again, dichlorvos and total antioxidant levels decreased the statistical significance compared to the control group. It has been determined that nigella sativa oil acts to reduce the toxic effect against the pathological and biochemical effects of Dichlorvos.

ASSESSMENT OF THE CARDIOTOXICITY BY SUBCHRONIC GLYPHOSATE-BASED HERBICIDE EXPOSURE: AMELIORATIVE EFFECT OF N-ACETYLCYSTEINE IN WISTAR RATS

RUHI TÜRKMEN¹, MUSTAFA KABU²

ABSTRACT

The aim of this study was to clarify the the ameliorative effects of N-Acetylcysteine on oxidan and antioxidant status in heart tissue and some cardiac biomarkers by subchronic glyphosate-based herbicide exposure in Wistar rats. Twenty-eight male Wistar rats were used for the study. Group I (control group) was given normal rodent diet and tap water for eight weeks. The agent(s) administered are as follows: Group II (NAS), N-Acetylcysteine (160 mg/kg), group III (GBH), glyphosate-based herbicide (375 mg/kg, 10 % of the LD50), group IV (NAS+GBH), N-Acetylcysteine (160 mg/kg) and glyphosate-based herbicide (375 mg/kg). The treatment regimens were administered orally by gavage once daily for eight weeks. Serum cardiac damage markers (troponin I, creatine kinase-MB, IgE), oxidative and antioxidant status (malondialdehyde, glutathione, superoxide dismutase and catalase) in heart homogenate were measured. Increased levels of troponin I, creatine kinase-MB, IgE, and malondialdehyde, and decreased glutathione levels were observed after GBH administration for eight weeks. In contrast, treatment with NAS reversed GBH-induced oxidative stress, lipid peroxidation, and cardiac parameters. Consequently, our results demonstrate that NAS treatment has ameliorative effect on cardiotoxicity by subchronic glyphosate-based herbicide in Wistar rats.

**MEDICINAL HERBS AS MANIFESTATION OF GOD’S NAME AL-
SHĀFĪ/ HEALTH-GIVING ACCORDING TO SUFIS (FORMER TITLE:
HERBAL MEDICINE/TREATMENT ACCORDING TO SUFIS)**

HÜLYA KÜÇÜK¹

ABSTRACT

Using herbal extracts to cure patients was the very first way of curing. For instance Lokman, who was known with the nickname “Hakīm/Physician” in the Qoran, was perceived as a person who knows the essence of the herbs and prepare extracts from them. Furthermore, when the Quran asks: Do they not look at the earth? We have produced therein beautiful and useful things/plants of all kinds” (Quran 26:7) implies that there are many useful plants on earth. According to Sufis, all the beings are alive; they glory the name of God in a way peculiar to them. They say: "Behave well to all the plants. Don't say that this or that plant is not alive!", confirms this idea. According to them, being a plant is even a stage in humans’ being a human. The Quran also emphasize that human being is like a plant: “God has produced you from the earth like a plant.” (Quran 71/17) Some Sufis believed that herbs cannot be deemed and used as medicinal things as only God can be considered as the Shāfī / Health-Giving, since the Quran says: “And when I am ill, it is he who cures me” (Quran 26:80). Ibn al -Arīf (d. 536/1141) was such a Sufi. His disciple Abū Abdallah al-Ghāzalī relates the following story concerning his attitude towards this issue: One day, I went out of presence of my sheikh Ibn al-Arīf, and wandered in open country. Every tree or plant I came across, told to me: “Come here! I am good at curing such sickness, I can restore its damage.” When I entered to the presence of my sheikh again, I told him what happen. He did not like what I told and even rebuked me saying: “Did I train you fort his end? What was your response against the trees and plants claiming to be useful or restoring or causing damage? Don’t you know that it is only God who can be curing and restoring health? ” Then I said: “O my master! I really repented from what I said. ”. He said again: “God tested you such way. I showed you the way to God; not to anyone else. Go out immediately and see that those trees and plants do not say a word to you.” I went out, and came across the same trees and plants. They did not utter a word to me. He came to his sheikh and told what had happened. His sheikh prostrated to God paying his thanks to him and said: “Thanks God for choosing you for Himself and did not submit you to another creature like you.” But according to majority of the Sufis, herbs/spices can play a role when they became sick, that is, physically or spiritually not well. This does not change the fact that God is the real health Giving. Since everything on the earth are manifestations of God’s names and attributes. Hence, it is necessary that some items on the earth became the manifestations of His name “al-Shāfī. Among the defenders of this idea we can cite the names of Abū Tālib al-Makkī (d. 388/998), Abū Hāmid al-Ghazalī (d. 505/1111), Sa’d al-dīn Jabawī (d. 575/1180), Muhyī al-dīn Ibn al-Arabī (d. 638/1240), Mawlāna Jalāl al-dīn Rūmī (d. 672/1273), Shaykhī/Yūsuf Hakīm Sinan (d. after 832/1429), Taqī al-dīn Ibn Hakīm (d. 1007/1598), Omar Shifāī (d. 1155/1742), Hajī Ali Pasha (d. 1333/1917). We take a couple of examples of medicinal herbs from Abū Hāmid al-Ghazalī’s epistle entitled Sirr al-

Corresponding Author: **HÜLYA KÜÇÜK**, khulya2014@gmail.com

ālamayn wa kashfu mā fi-l-darayn: 1. Honey is a very useful food for health. But it does not suit for everybody. For instance, it is not good for people with high blood pressure; it can be deemed even as “unlawful” to them to consume honey. 2. Fig is a very useful food. It can cure leprosy and gout. 3. Quince juice is good for high fever (it brings the fever down). 4. Apple juice is a very useful drink for a weak heart. It is also important to note that some Sufis like Abū Tālib al-Makkī and al-Ghazalī say that a healthy person should not use something that cures an illness. In this case, they say, he/she catch that illness. They also say: Do not use medicine when you are healthy; if you use you become sick, as your body will interpret your taking medicine as something wrong in the body and becomes sick accordingly.” This statement looks like a little to the verdict of Samuel Hahnemam’s (1755-1843) “Similia Similia” in Homoe Pathie: The medicines that cause some illnesses, can cure these illnesses. In fact, something that is good for an illness, is not good for a healthy person. Therefore, a diet that is good for a sick person, is not good for a healthy person.

EVALUATING THE CANON OF MEDICINE BY AVICENNA BASED ON CURRENT PHYSIOTHERAPY AND AROMATHERAPY LITERATURE

ECE ACAR¹, TUBA ZOROĞLU¹

ABSTRACT

Introduction: Physiotherapy and rehabilitation is an interdisciplinary science that uses aromatic oils or plants with massage, compress, hot and cold baths or electrophysical agents. The Canon Of Medicine by Avicenna have been studied and used for many years in the medical science. When researching a field-specific observation on The Canon of Medicine is made, it is seen that many of the important issues are explained as closer as today's physiotherapy and rehabilitation literature . **Objective:** We aimed to analyze and elaborate Avicenna's herbal practices which related to physiotherapy rehabilitation based on the our current knowledge and cause-effect relation. **Material and Method:** The first, fourth and fifth books of Canon of Medicine, which translated by the Kahya into Turkish, were examined. In addition, related publications have been reviewed. The first book consist of the articles about bones, spine and muscles. The fourth book has the chapters related fractures and edema. Also Avicenna's own practices are in fifth book. All of the practices and thesis by Avicenna was discussed. **Results:** It is noticed that the almost practices which was used Avicenna based on the same principle with today's practices suprisingly. One of the more interesting result is, his using sheep wool after rubs on the skin with a cream which consist of olive oil and iris oil. It is evident that his aim was not to keep the region warm. Sheep wool contains high moisture so that it has too few electric charge. In those days, the existence of electric charges was unknown undoubtedly. But nowadays it is known that the materials are electrically charged and the same charges push each other and the opposite charges pull each other. We use this principle in the practice of iontophoresis. Thus, we provide electrical transmission of the desired substance into the skin. If he had used some other material instead of sheep's wool, perhaps the material he was using and the medicine it prepared would attract the electrical charges and would reduce ion passage into the tissue. **Discussion:** We noticed that how Avicenna's practices or assumptions was quite accurate as closer as today's literature. In this way our respect for his knowledge is increasing. We will learn from him is not over yet. In addition this, reading his book again and again will inspire all health care professionals.

HISTORY OF DOG ROSE (ROSA CANINA) PLANT IN STAMPS

ÖZÜM ERKİN¹

ABSTRACT

Since antiquity people, various natural resources have been used for medical purposes. World Health Organization announced that 75 -80 % of the world's population is treated with natural remedies. Rosa canina- known in English as "Dog rose" and in Turkish as "Kuşburnu"- grows crazy in various parts of the world. Dog rose as a remedy in traditional folk medicine is caused by high phenolic compounds and minerals. Dog rose is a rich source of vitamin C and it was used as syrup because of its preventive effect on the scurvy during World War II. Rosa canina contain vitamins A, B1, B2, B3, K, and tannins, flavonoids. Dog rose mostly used in the prevention and treatment of colds, gastrointestinal disorders, diabetes, kidney disorders and other infections. A postage stamp, is a valuable and generally square or rectangle shaped label which is used to show that postage is paid. The most important of these tasks is its role as an advertisement tool and as a cultural reflection of its country through the graphics on it. Aim of this study to show the importance of Dog rose (Rosa Canina) plant as a medical and aromatic plant through past to the present by stamps. The most respected sources (Scott and Michel catalogues) of philately world were searched . Twenty three philatelic materials were found from 19 countries of the world about Rosa Canina.

PLANTS USED IN THE PRODUCTION OF TRADITIONAL ARTS

ALI FUAT BAYSAL¹, AYŞE ZEHRA SAYIN¹

ABSTRACT

Plants undertake a vital function in protecting human health by providing the oxygen and nutrients necessary for people to survive. Therefore, the to protect presence of plants means to protect the existence of human beings. In addition to the basic benefits of plants for vital functions such as health and nutrition, there are also important tasks and benefits during the formation stages of works of art. The plants used for different purposes in different branches of art form one of the basic materials especially in traditional Turkish arts. Thanks to the different plants growing in our geographical area with a rich plant cover and diversity, it is obtained different colors that reflect our culture. This tradition which protected until todays is applied in arts such as calligraphy, illumination, ebru or weaving arts such as carpets and rugs, which we refer to as daisies, linden, walnuts, indigo grasses and similar plants and book arts. The subject of declaration is to indicate of importance the plants in our culture and to introduce the usage areas and features of plants in our traditional arts. The plants used in our Traditional Arts will be classified and It will be presented visually to the participant in which art branch the plant is used for what purpose.

NECESSITY, FEASIBILITY AND PROBABLE OPPORTUNITY OF DETERMINATION OF REAL TARIFF PRICE FOR NON-WOOD VEGETAL PRODUCTS

MUSTAFA FEHMI TÜRKER¹, ELİF BERKER¹, CANAN YILMAZ¹

ABSTRACT

Forests have a special place among natural resources, and have provided several benefits for human beings since historical times and continue to do so. The benefits of forest resources were mainly wood raw material in the past, while today demand for non-wood forest products has also increased as a result of increasing requirements of versatile utilization of forests and the changing demands of the people for forest products. On the other hand, although Turkey is an importer of wood products, it is an exporter for non-wood forest products, and this fact reflects the significance of this issue. Within non-wood forest products, non-wood vegetal products (NWVP) are significant and these products constitute about 98% of forest product exports of Turkish forestry industry and provide important source of income in foreign trade. Furthermore, when national and international NWVP markets are considered, these products are also an important source of revenue for state forest enterprises (SFE) and the forestry industry, but despite all these favorable conditions, the forestry industry does not receive the attention it deserves in Turkey. However, it is also important that NWVP operations, management and marketing should be conducted effectively and efficiently. But, when we examine the distribution of income among the stakeholders in the distribution channels in the industry from procurement to the market, it could be observed that there is an unfair distribution in the country. A significant portion of the generated revenue is hold by wholesalers and, if any, retailers, and the raw material producer SFE and the forest villagers who collect the raw materials cannot get a fair share. One of the major underlying problems is the low tariff prices. The fact that the tariff rates are low decreases the economic success of the SFE and negatively affects the efficient and effective use of the resources. To correct these problems, the real NWVP tariffs should be calculated and the sales in marketing distribution channels should be conducted with these prices and the policies implemented should prioritize rural development. The present study will aim to identify the official calculation of the real tariffs for these products, the negative effects of the official calculation method on the economic success of the SFE, and its insufficiency for the development of forest villagers, and will establish the need to recalculate real tariff rates for these products.

**PHYTOCHEMICAL COMPOSITIONS OF ENDEMIC SPECIES GROW
IN TURKEY: IRIS TAOCHIA WORONOW EX GROSSH. (IRIDACEAE)
AND ITS NEW CHOLESTEROL-LOWERING PLANT STEROL
ESTER: BETA-SITOSTEROL**

ŞEYMA BAKIRCI¹, HAKAN AŞKIN¹, ARIF AYAR³, BİLAL YILMAZ¹

ABSTRACT

Introduction Beta-sitosterol is a substance found in plants. Chemists call it a plant sterol ester. It is found in fruits, vegetables, nuts, and seeds. It is used to make medicine. Beta-sitosterol is used for heart disease and high cholesterol. The federal Food and Drug Administration (FDA) allows manufacturers to claim that foods containing plant sterol esters such as beta-sitosterol are for reducing the risk of coronary heart disease (CHD). Iris taochia (IT) is a species in the genus Iris. The Taochia lived in a mountainous area of the Black Sea to the current borders of Georgia, Armenia and Turkey. This plant is endemic to the Caucasus (Kandemir 2006). Native to upland basalts in the north-eastern corner of Turkey around especially in Erzurum. We investigated of the chemical constituents from dried whole plant of IT. Material and Method Whole plant of IT were collected in Erzurum province. Hexane, ethyl acetate and ethanol extraction were done by Soxhlet extractor. The plant extracts obtained from IT was analyzed using an Agilent GC-MS system. Results Fourteen compounds were obtained and identified as L- α - terpineol, tetradecanoic acid, neophytadiene, 2-pentadecanone, 6,10,14 trimethyl, phthalic acid, n-hexadecanoic acid, linolenic acid, oleic acid, octadecanoic acid (stearic acid), hexacosanoic acid, docosanoic acid 1,2,3-propanetriylester, β - sitosterol, α - tocopherol and α - amyryn. Discussion and Conclusion All of these compounds are isolated from IT for the first time. These findings may shed light on the design of new drugs, the cholesterol-lowering effect. **DETERMINATION OF BIOLOGICAL ACTIVITY AND ACTIVE
SUBSTANCES OF THREE LOCAL ENDEMIC (HEDYSARUM
VANENSE, TRIGONELLA MACRORRHYNCHA, ASTRAGALUS
GUZELSUENSIS) BELONGING TO FABACEAE**

MEHMET EMRE EREZ¹, SÜLEYMAN MESUT PINAR², MEHMET FİDAN¹, ABDULLAH DALAR²

ABSTRACT

Hedysarum vanense Hedge & Hub.-Mor., Trigonella macrorrhyncha Boiss., Astragalus guzelsuensis F. Ghahrem. Behçet & Demir are genus of Fabaceae. The Fabaceae (Leguminosae) is a family of flowering plants comprising about 269 genera and 5100 species (Mabberley, 2008) and it is one of the largest plant families in Turkey and in the world. It has 68 genera and more than 900 species in Flora of Turkey (Davis, 1970, 1988). Many species of genus Hedysarum have been employed in traditional Chinese medicine to strengthen the immune system and improve the energy of the body (Dong et al., 2013). Several reports focus on trigonelline belonging to Trigonella, a major active constituent having hypoglycemic activity, hypocholesterolemic, antiseptic, antimigraine, antitumor, mutagenic and osmoregular properties (Barnes et al., 2002). Several species of this Astragalus genus are used in foods, medicines, and cosmetics (Zarre-Mobarakeh, 2000). The aim of the present study was to examine the biological activity and active substances of aerial part of three different species by different solvents and methods. First, the methanol extracts were used and then fractionated extracts (Acetone, Ethanol and water) were studied. The results were compared with each other. For this aim the total phenolic and flavonoid content, DPPH and FRAP activity were determined. Finally the active substances of methanol extract were also examined. According to results; the maximum DPPH activity was found in H. vanense as 85,58 % comparing with all extractions. Consideration of total phenolic and flavonoids contents the methanol extract of Astragalus guzelsuensis were shown the maximum value as 40,40 mg/ml gallic acid and 83,13 rutin equivalent respectively . Also comparing to the FRAP activity of plant extract, H. vanense was estimated the maximum inhibition activity in fractionated method. The values were estimated as 270, 62 µmol Fe+2/g in acetone, 152,68 in ethanol and 80,50 in water extracts. Evaluation of volatile compound and fatty acid compositions on the plant extracts. Cyclopentane, Cyclohexane and palmitic acid in H. vanense, Octadecane, 3-Eicosyne and α-Linolenic acid in T. macrorrhyncha and Heptacosane, 2-Propenoic acid and Linoleic Acid substances were detected in A. guzelsuensis. Finally according to obtained data, these three endemic species were having a potential for using as medicinal plants and have to evaluate.

JUNIPERUS SSP. FORESTS IN KONYA REGIONAL DIRECTORATE OF FORESTRY

BEKİR KARACABEY¹, ERDAL TUNÇEZ¹, MEHMET VEHBİ TEMİRCİ¹

ABSTRACT

Because of Konya Regional Directorate of Forestry is located in climate zone of Central Anatolia, behind of Taurus Mountains and low annual rainfall, the spread and growth of forests is limited. The main tree species forming forests are Larch (torch pine), oak, juniper, cedar and fir. The juniperus which has wide spreading capacity in our country is an important forest tree of this climate zone. Konya Regional Directorate of Forestry have rich in juniper species and its areas. 344677.3 hectares of the total area of 704058 hectare forest area in this region consists of pure and mixed juniper forests. Because of the medicinal properties of juniper tree and its wide use area and other characteristics, this study has been dealt with.

**ANTIFUNGAL ACTIVITY OF ENDEMIC ANATOLIA SIGLA TREE
(LIQUIDAMBAR ORIENTALIS MILL.) PLANT EXTRACTS AGAINST
FUSARIUM OXYSPORUM F.SP. CUCUMERINUM AND MONILINIA
FRUCTIGENA**

YUSUF YIKILMAZ¹, ABDURRAHMAN ONARAN¹

ABSTRACT

Natural antifungal substances obtained from plants are used as an alternative method of struggle from past to present day. In this study, the antifungal activity of resin and leaf methanol extract obtained from Liquidambar orientalis Mill. plant, endemically grown in our country, was investigated. In our study, activity studies were carried out using agar plate method against Fusarium oxysporum f. sp. cucumerinum (FOC) and Monilinia fructigena plant pathogens causing damage in cucumber and apple plants. Concentrations of plant parts of 0 (negative control), 500, 1000 and 2000 mg/ml were used. Mycelial growth inhibition (MGI) and lethal doses (LD50-90) were obtained as a result of the obtained data. Activity was observed at every concentration used against plant pathogens. MGI values increased as the amount of concentration increased. Thus, the highest MGI ratio for L. orientalis resin is calculated 100% against M. fructigena (same as positive control) and 74% for FOC. These values were 66% for M. fructigena and 51% for FOC for L. orientalis leaf extract. In addition, LD50 values were found between 732 (for M. fructigena) to 442 (for FOC) mg/ml in resin extract and 1698 (for M. fructigena) to 765 (for FOC) mg/ml in leaf extract. According to these results, the resin extract against the test organisms was found to be more effective than the leaf extract. Natural antifungal agents are among the preferred products due to their low cost and less side effects.

PRODUCTION AND QUALITY OF MEDICAL PLANT ENDEMIC FOR TURKEY

PROF DR YÜKSEL KAN¹

ABSTRACT

Turkey, where a myriad of plants are used in traditional medicine and food, is one of the world's richest countries in terms of genetic diversity. The main reasons for the richness of the endemic plant species in Turkey are due to different types of soil and topography which are the results of the climate and other environmental conditions. Turkey's flora has a total of 12,000 endemic plant taxons, including about 4,000 plant taxons. In Turkey, about 500 plant taxons are used for medicinal purposes. Some of the plants used for medicinal purposes are endemic taxons. These medicinal plants are used in many different purposes by Turkish populations, such as food, tea, spices, as well as pharmaceuticals and cosmetics. Phytochemical investigations of these endemic plants which grow naturally in Turkey have revealed many interesting bioactive compounds. Part of the medicinal plants, collected from natural habitats in Turkey, has been assessed for external and internal trades. In recent years, some medicinal plants have been cultivated for the purpose of commercial production in Turkey. In this presentation, investigation of medicinal plants with high economic values, both natural habitats and cultivated areas to promote the conservation of the biodiversity in natural flora of Turkey will be discussed.

**REPELLENT ACTIVITY OF SOME PLANT ESSENTIAL OILS
AGAINST THE CITRUS MEALYBUG, PLANOCOCCUS CITRI RISSO
(HEMIPTERA: PSEUDOCOCCIDAE)**

TUĐBA ERDEMİR¹, FEDAI ERLER²

ABSTRACT

The citrus mealybug, *Planococcus citri* Risso (Hemiptera: Pseudococcidae), is one of the most important pests of citrus groves in Turkey. In recent years, it caused important damages in some cut-flowers (especially in roses) in greenhouses in Antalya (South-western part of Turkey). In the present study, repellent activity of essential oils extracted from anise (*Pimpinella anisum* L.), rosemary (*Rosmarinus officinalis* L.), mint (*Mentha piperita* L.), Turkish oregano (*Origanum onites* L.) and thyme (*Thymus vulgaris* L.) was investigated against the adults of *P. citri* using choice and no-choice test methods under laboratory conditions. In choice tests, the insects were given a choice to select the eligible food for them by placing two sprouted potato tubers, one of which was treated with a chosen concentration of a chosen essential oil and the other with distilled water, in the same container. In no-choice tests, the insects were given no choice to select the eligible food for them by placing the essential oil-treated and water-treated tubers in two separate containers. Four different doses (0.625, 1.25, 2.5 and 5.0 mg/l water) of essential oils and four different exposure periods (24, 48, 72 and 96 h) were used in all the bioassays. The controls were treated only with distilled water including 0.001% Tween-20). According to the results from the study, all the essential oils showed a repellent activity by varying the dose and the exposure period tested. Repellency increased with increasing doses of the essential oils, but it considerably decreased with increase in the exposure period (elapsed time). Based on the highest dose (5 mg/l water) and the longest exposure period (96 h), the essential oils from *O. onites* and *T. vulgaris* had the highest repellency (%) in both choice and no-choice tests (respectively, *O. onites*: %88.9 and %65.4; *T. vulgaris*: %88.8 and %69.6), and followed by *P. anisum* (%80.1 and %50) and *R. officinalis* (%57.1 and %45.2) essential oils. *M. piperita* essential oil had the lowest repellent activity against adults of the pest in both choice and no-choice tests (%37.8 and %28.6, respectively). Overall results suggest that the essential oils tested in the present study (especially, *O. onites*, *T. vulgaris* and *P. anisum*) may be eco-friendly alternatives of synthetic insecticides in controlling *P. citri* in various agro-ecosystems.

**CHEMICAL COMPOSITION AND FUMIGANT TOXICITY AGAINST
COLORADO POTATO BEETLE, LEPTINOTARSA DECEMLINEATA
SAY (COLEOPTERA: CHRYSOMELIDAE) OF THE ESSENTIAL OIL
OF FERULAGO MUGHLAE**

SELÇUK KÜÇÜKAYDIN¹, MEHMET EMİN DURU¹, MEMİŞ KESDEK¹, MEHMET ÖZTÜRK¹, MEHMET ALİ ÖZLER¹

ABSTRACT

The Colorado potato beetle (*Leptinotarsa decemlineata* Say) is the most destructive pest of potatoes, eggplants and tomatoes in the world (Hare, 1990). Synthetic chemical insecticides and fumigants are commonly used in the pest control. However, there is a considerable problem in the use of these chemicals due to their residual toxicity in the post-harvest products and occurrence of insecticide resistant (Gelman et al., 2001). Synthetic pesticides also cause the environmental pollution owing to their slow biodegradation in the environment (Barnard et al., 1997). Hence, there is a need to develop natural and safe bio-pesticides. *Ferulago mughlae* is the endemic plant to Mugla-Turkey member of Apiaceae family. In this study, the chemical composition of the essential oils of *Ferulago mughlae* was analyzed. As well as chemical composition of essential oils, fumigant toxicities of essential oil obtained from *Ferulago mughlae* (Apiaceae) were evaluated against the adults of Colorado potato beetle (*Leptinotarsa decemlineata*). The aerial parts of *Ferulago mughlae* were identified and collected from southern of Turkey (Muğla) in July 2015. Essential oil was obtained using a Clevenger apparatus from the dried aerial parts of *Ferulago mughlae*. Chemical compositions of the essential oils analyzed by GC-FID and GC-MS. In addition to, fumigant toxicities of essential oil were evaluated against the adults of Colorado potato beetle (*Leptinotarsa decemlineata*) in the Petri dishes. After exposure, mortality of the adults was determined at 24th, 48th and 96th hours. The essential oils of *Ferulago mughlae* 20 constituents were identified. The main components of the essential oil were Limonene (42.86%), alpha-pinene (12.68%) and p-cymene (9.78%). The insecticidal effect was influenced by the concentrations of the essential oil and the exposure time. Experiments showed increased mortality rate as a result of the increase in concentration. The mortality rates after 72 h of treatment with the concentration (10 µl) %23,6, (20 µl) %42,3 and (30 µl) %87,4. Considering on all these results, essential oils of *F. mughlae* may be used as potential natural and non-toxic insecticidal agent against adults of *Leptinotarsa decemlineata*.

ANTIFEEDANT EFFECTS OF EXTRACTS OF AN ENDEMIC PLANT (FERULAGO LONGISTYLIS BOISS) ON STORED PRODUCT PEST, EPHESTIA KUEHNIELLA ZELLER

HILAL BAKI¹, CAđRI BEKİRCAN², ERSAN BEKTAŞ¹, AYŞEGÜL AKTAŞ¹, ALI KANDEMİR³

ABSTRACT

Ferulago longistylis Boiss. (Apiaceae) is an endemic species in Turkey. Naturally grown in Eastern Anatolia Region in Erzincan and Malatya provinces. Antifeedant effects of hexane, chloroform and water extracts of *F. longistylis* against *Ephestia kuehniella* (Lepidoptera: Prelidae) larvae were evaluated in this study. was investigated in this study. Both our country and all around the world, insect pests living in the stored products cause a serious decline in the quality of products. One of them is *Ephestia kuehniella* which is well-known and called as a flour moth. The use of plant extracts against insect pests is becoming increasingly popular. On this purpose, collected endemic plant samples belong to *F. longistylis* are dried in the shade in the laboratory with good air space. Dried aerial parts of the plant were powdered. A portion (20 gm; 5 gm portions into 3 cartridges and 1 control) of dried plant material was extracted with hexane, chloroform and water in Soxhlet apparatus. The potential of the antifeedant effect of the extract against to *E. kuehniella* was determined by the antifeedant test. Accordingly, in this study, consumption of wheat flour eaten by *E. kuehniella* larvae were determined by following. Larvae were cultivated in sterile petri dishes including 50, 100, 250 and 500 ppm for each hexane, chloroform and water extracts for 24 hours and the average of the difference between the final and initial weight of the petri dishes was determined as the amount of consumption. Each test group was set up with petri dishes (6 cm in diam.) each including 10 larvae (4th instar). According to the results, the highest antifeedant effect was observed in the petri including 50 ppm water extract. Hexan extract at 50 ppm and doses of water extracts at 250 and 500 ppm showed low antifeedant effect when compared to the control. All of chloroform extracts showed similar effects to the control.

**OVICIDAL ACTIVITIES OF EXTRACTS OF SOME MEDICINAL AND
AROMATIC PLANTS TO EURYGASTER MAURA L.
(HEMIPTERA:SCUTELLERIDAE)**

FATMA NUR ELMA¹

ABSTRACT

Turkey has a rich flora of medicinal and aromatic plants. Their toxic effects against insects have centre of attention during the last twenty years. Botanical insecticides may be alternative to synthetic chemical insecticides in the future. In this search, the ovicidal effects of four medicinal and aromatic plant extracts *Melissa officinalis* L, *Humulus lupulus* L, *Origanum vulgare* L. and *Syzygium aromaticum* (L.) were tested against *Eurygaster maura* L. (Hemiptera: Scutelleridae) under laboratory conditions. One to three day old eggs were dipped in plant extracts. The effects of three concentrations of plant extracts 2.5, 5 and 10% were studied. It was observed that as the concentration increased, the inhibition of egg hatchability increased. *Melissa officinalis* extract didn't show significant ovicidal effect. On the other hand, *Origanum vulgare* and *S. aromaticum* extracts moderately showed ovicidal effect. *Humulus lupulus* extract revealed the best result in inhibiting egg hatchability (57.49%) at 10% concentration. It can be concluded that *H.lupulus* extract may be used as supportive in an integrated pest management programme aimed at controlling *E.maura*.

**FIRST REPORT OF DOWNY MILDEW CAUSED BY PERONOSPORA
SP. ON SWEET BASIL (OCIMUM BASILICUM) IN WEST
MEDITERRANEAN REGION OF TURKEY**

ESIN BASIM¹, HÜSEYİN BASIM¹, DERYA BAKI¹

ABSTRACT

First Report of Downy Mildew Caused by Peronospora sp. on Sweet Basil (*Ocimum basilicum*) in West Mediterranean region of Turkey Esin BASIM1* Hüseyin BASIM2 Derya BAKİ2
1 The University of Akdeniz, Korkuteli Vocational School, Department of Horticulture, Antalya/Turkey 2The University of Akdeniz, Faculty of Agriculture, Department of Plant Protection, Antalya/Turkey *Corresponding Author: esinbasim@akdeniz.edu.tr Sweet basil (*Ocimum basilicum* L.) is an annual aromatic plant, grown mostly for culinary use for both fresh and dry consumption as well as a source of essential oil. During the spring and fall of 2015, a damaging foliar disease, Downy mildew was detected from as observed in sweet basil (*Ocimum basilicum*) grown in greenhouses in Antalya province of Turkey. More than 80% of basil plants were affected in produced greenhouse-grown for fresh and processed consumption. The disease incidence was determined to be nearly 85% and caused economically important yield losses on sweet basil grown in greenhouse in Antalya. Symptoms on the leaves of infected basil plants were initially chlorotic, and then a characteristic gray as well as purplish sporulation and velvety fungal growth were observed on the lower and sometimes on the upper leaf surfaces. Dichotomous branching, hyaline sporangiophores with a length of 200 to 600 µm bearing single sporangia were detected by microscopic examination. Sporangia were light brown, ovoid, and measured 15 to 22 × 15 to 20 µm. The pathogen was identified as *Peronospora* sp. on the basis of light microscopy examination of its morphological characteristics. Pathogenicity was confirmed by inoculating leaves of 30-day-old healthy plants with a sporangial suspension (1×10⁵ sporangia/ml). The healthy basil plants were inoculated by sterilized water served as controls. The plants were maintained in a growth chamber at 20°C± 2 for 12 h of light per day and at 90 % relative humidity until typical symptoms of downy mildew developed on the plants. The pathogenicity test was repeated twice. Control plants did not show any symptoms. To our knowledge, this is the first report of *Peronospora* sp. on sweet basil in Turkey. Keywords: Antalya, Downy mildew, *Ocimum basilicum* L., *Peronospora* sp., Sweet basil

THE EFFECT OF COMBINATIONS OF AMPHOTERISIN B AND SOME HERBAL QUORUM SENSING INHIBITORS ON CANDIDA ALBICANS BIOFILMS

DIDEM KART¹, MERAL SAđIROđLU¹

ABSTRACT

Biofilms are common problem in nosocomial infections. Quorum sensing is an alternative strategy in fighting biofilm infections and some natural quorum sensing inhibitors (QSI) were found successful to interfere with the infections. *Candida albicans*, one of the major pathogen related with the biofilm infections, is an important trouble in hospitals. Development of *Candida albicans* biofilm model which is reproducibly grown in a 96-well microtiter plate was performed in this study. We determined the antibiofilm effect of amphotericin B and some natural QSIs alone or in combinations on biofilm cells of *C. albicans* SC 5314. Amphotericin B combinations with QSIs such as cinnamaldehyde, resveratrol, L-canavanin, 4-nitropyridine N-oxide, p-benzoquinon, farnesol, epigallocatechin gallate, catechin hydrate, curcumin, baicain hydrate ve esculin hydrate and cyclic di-GMP inhibitors such as sulfatiazol and azathioprine were tested with MBEC assay and MBIC (minimum biofilm inhibition concentration), MBEC (minimum biofilm eradication concentration) and log reduction of the antimicrobials were determined. Amphotericin B significantly decreased the sessile cells of *C. albicans* in mono biofilms in range of 0.0625-4 $\mu\text{g/ml}$. However, combinations of Amphotericin B with azathioprine killed completely the biofilm cells even in the minimum concentration tested (0.0625 $\mu\text{g/ml}$). Moreover, the combinations of amphotericin B with curcumin, L-canavanine, sulphatiazole, 4-Nitro N-oksit, p-benzokinon, esculin hydrate, baicalein hydrate, cinnamaldehyde and farnesol were found effective to kill the cells completely in concentrations of 1 and/or 2 $\mu\text{g/ml}$ when compared with amphotericin B only.

DETERMINATION OF ANTIMICROBIAL ACTIVITY OF TRIGONELLA FOENUM-GRÆCUM L. SEED EXTRACT

PERİHAN AKBAŞ¹, GÖZDE ATILA¹, HAMİT USLU¹, HİCRAN ALKAN¹

ABSTRACT

Nowadays alternative antimicrobial agents have been searching because developing products antimicrobial resistance will decrease. In this study we aimed to investigate antibacterial and antifungal activity of *Trigonella foenum-græcum* seed, it is known hypoglycaemic, hypocholesterolemic, antioxidant, antiulcer and immunomodulator effects. *Trigonella foenum-græcum* seed was extracted with water-alcohol by maceration method. Its antimicrobial activity was tested by well diffusion technique against *Bacillus subtilis*, *Bacillus cereus*, *Escherichia coli*, *Pseudomonas aeruginosa*, *Pasteurella multocida*, *Yersinia enterocolitica*, *Klebsiella pneumoniae*, *Staphylococcus aureus* bacteria, *Candida albicans*, *Rhodotorula glutinis* yeast and standard antibiotics. *Trigonella foenum-græcum* seed extract was detected to be effective against Gram (+) and Gram (-) bacteria and yeasts. Best antibacterial activity of *Trigonella foenum-græcum* has been found against *P. multocida* (22 mm), its other antibacterial activities were *B. subtilis*, *B. cereus*, *K. pneumoniae*, *S. aureus* 10 mm, *E. coli* 8 mm, *Y. enterocolitica* 14 mm. The extract showed best activity for yeasts against *R. glutinis* (20 mm), this activity was equal penicilin antibiotic and there is no antifungal activity for *C. albicans*. In general, *Trigonella foenum-græcum* seed extract has antimicrobial activity, but this is lower than penicillin and erythromycin antibiotics.

ANTIMICROBIAL EFFECT OF SOME PLANT OILS AGAINST SOME BACTERIAS IZOLATED FROM PATIENTS SAMPLES

ÇİĞDEM EDA BALKAN¹, ŞABAN KORDALI², AYŞE USANMAZ BOZHÜYÜK³

ABSTRACT

ANTIMICROBIAL EFFECT OF SOME PLANT OILS AGAINST SOME BACTERIAS IZOLATED FROM PATIENTS SAMPLES AİM The aim of present study was to compare the antibacterial potential of *Thymus sipyleus* boiss. subsp. *sipyleus* boiss. var. *sipyleus* L. (Thymol and camphor both tested), *Satureja thymbra* L. and *Origanum onites* L. by Kirby bauer discdiffusion method. We isolated *Enterococcus* spp., *E.coli*, *Morgonella morganii*, *Pseudomonas aeruginosa*, MSSA, *Klebsiella pneumonia* and *Proteus mirabilis* from different patient samples. Key Words: Antimicrobial, Bacterias, Essential oils INTRODUCTION This study was undertaken to determine the in vitro antimicrobial activities of three commercial essential oils and their main components in order to pre-select candidates for potential infections. The antibacterial effects against pathogenic bacteria which are isolated from patients samples (*Enterococcus* spp., *E.coli*, *Morgonella morganii*, *Pseudomonas aeruginosa*, MSSA, *Klebsiella pneumonia* and *Proteus mirabilis*) were tested using paper disk diffusion method. These materials could be served as an important natural alternative to prevent bacterial enfections in the future. MATERIALS AND METHODS Plant material and isolation of essential oil *Origanum onites* L. (Lamiaceae), *Satureja thymbra* L. (Labiatae), *Thymus sipyleus* boiss. subsp. *sipyleus* boiss. var. *sipyleus* L. (Lamiaceae) were collected at the flowering stage from different regions of Turkey between June and August. Voucher specimens have been deposited in the herbarium of Ataturk University, Faculty of Agriculture, the Department of Plant Protection, Erzurum, Turkey. Aerial parts of the plants were dried in shade and ground in a grinder. The dried plant samples (500 g) were subjected to hydro distillation for 4 h using a Clevenger-type apparatus. The oil yields of *O. onites*, *S. thymbra* and *T. sipyleus* were 4.5, 2.3 and 1.17 % (w/w, dry weight basis), respectively. The yield was based on dry materials of plant samples. The oils were dried over an hydrous Na₂SO₄ and stored in a sealed vial until required, and then stored at 4°C until used for toxicity bioassays. The pure compounds were purchased commercially from Fluka and Sigma. (Camphor (Fluka, purity 97%), Thymol (Sigma, purity 95%)). The compounds tested for toxicity against *Enterococcus* spp., *E.coli*, *Morgonella morganii*, *Pseudomonas aeruginosa*, MSSA, *Klebsiella pneumonia* and *Proteus mirabilis*. Collection of bacterias *Enterococcus* spp., *E.coli*, *Morgonella morganii*, *Pseudomonas aeruginosa*, MSSA, *Klebsiella pneumonia* and *Proteus mirabilis* isolated from different patient samples in the laboratory of clinical microbiology with VITEC microbial identification system. Kirby Bauer Disc Diffusion Method The experiment was performed with a bacterial inoculum of 0.5 McFarland; Mueller-Hinton (MH) was inoculated with each bacterial strain. Each oil was applied to a sterile fitler paper disc (6-mm diameter) 2µl placed on the surface of inoculated plates; duplicate plates for each oil were used. After overnight incubation at 37 C, the inhibition zones were measured. Control plates was

prepared by placing sterile water for negative controls. RESULTS Table 1: Table 1 shows the results of the antibacterial assays in terms of Kirby Bauer. Inhibition ranged from 0 to 30 mm. *Proteus mirabilis* were the most susceptible, followed by *Klebsiella pneumonia* and *Morganella morganii*, *Pseudomonas aeruginosa* did not show susceptibility to any oil. *Klebsiella pneumonia* susceptible, other oils did not show susceptibility to the Camphor oil. DISCUSSION In the literature, the results of experiments showed that the oil from *Thymus* exhibited extremely strong activity against all of the clinical strains. In our hands, comparison of the results of this study with previously published data is difficult because the composition of plant oil products is known to vary according to local air conditions, soil composition and to extraction techniques. Moreover, the results obtained may differ because of the method used to assess antimicrobial activity and quantity of oil. The essential oils of the *T. sipyleus*, *O. onites* and *S. thymbra* were especially very effective against the resistant strains such as *Enterococcus* spp. and *Klebsiella pneumonia*. The maximum antimicrobial activity was observed with the essential oils of *Origanum onites* and *Satureja thymbra*.

ANTIMICROBIAL POTENTIAL OF TARAXACUM OFFICINALE F.H.WIGG CLONALLY PROPAGATED VIA ORGANOGENESIS

BURCU ÇETİN¹, FATİH KALYONCU², TÜLİN EZGİ ÖZEN¹

ABSTRACT

Taraxacum officinale, commonly named dandelion is an edible plant distributed worldwide, which belongs to the Asteraceae or Compositae family. Dandelion contains flavonoids including luteolin, apigenin, isoquercitrin, caffeic acid, chlorogenic acid, terpenoids, triterpenes, and sesquiterpenes. It has been used as an herbal remedy in Europe, North America, and China. In this study, the antimicrobial effects of plantlets cloned by organogenesis method from leaf explants of *Taraxacum officinale* were investigated. *T. officinale* seeds were immersed in 70% (v/v) ethanol for 3 min followed by 0.5% sodium hypochlorite for 5 min, then three rinses in sterile water. Later on, the seeds were germinated in glass jar containing 30 ml Murashige and Skoog medium (MS; Murashige and Skoog, 1962). One leaf excised from four-weeks-old germinating seedling was used as an explant. The leaf explant was cut into 2cm² segments and transferred on MS medium supplemented with 2mg/l benzil amino purine (BAP) and 2mg/l naphthalene acetic acid (NAA) for organogenesis studies. Obtained shoots were subcultured twice every 4 weeks. The shoots were harvested and dried at 24±2°C room temperature. For antimicrobial studies, *T. officinale* cultivated by tissue culture was tested for its antibacterial activities by using agar well diffusion method. Ethanol and chloroform extracts from this plant were assayed against nine bacteria species (*Staphylococcus aureus* ATCC 6538, *Escherichia coli* ATCC 25922, *Bacillus cereus* ATCC 7064, *Bacillus subtilis* ATCC 6633, *Salmonella typhimurium* CCM 5445, *Proteus vulgaris* ATCC 6896, *Enterococcus faecalis* ATCC 29212, *Enterobacter cloacae* ATCC 13047, and *Kocuria rhizophila* ATCC 9341). Seed germination of *T. officinale* was observed in 10 days. One were sliced and transferred on 2 mg/l BAP and 2 mg/L NAA. Adventitious shoot regeneration was obtained at the end of the third week on leaf explants at MS medium supplemented with 2mg/l BAP and 2mg/L NAA. After eight weeks the shoots were harvested and dried for antimicrobial studies. As a result, ethanol extracts of *T. officinale* showed 21 mm and 23 mm inhibition zones against *Escherichia coli* and *Proteus vulgaris*, respectively. *T. officinale* was found weakly effective on gram negative bacteria.

PLANT-EXTRACT MEDIATED SYNTHESIS OF ZNO NANOPARTICLES USING SARCOPTERIUM SPINOSUM (L.) SPACH LEAF EXTRACT AND THEIR ANTIMICROBIAL ACTIVITY

OSKAY KAHRAMAN¹, ERSAN TURUNÇ¹, RIZA BİNZET¹, HAKAN ARSLAN¹

ABSTRACT

In this study, green synthesis of zinc oxide nanoparticles have been performed utilizing of leaves extract of *Sarcopoterium spinosum* (L.) Spach. This method is simple, nontoxic, inexpensive and eco-friendly. The ZnO nanoparticles synthesized using *S. spinosum* leaves as a reducing and stabilizing agent have been evaluated for antibacterial activity against Gram-positive and Gram-negative bacterial strains. Moreover the effect of pH and temperature on the size and shape of the synthesized ZnO nanoparticles have been evaluated. The nanoparticles were synthesized with three different pH (4, 7 and 10) values and at different temperatures (100, 200, 300, 400 and 500 °C). The particle size and morphology of the synthesized nanoparticles is characterized by using UV-Vis spectroscopy, Scanning Electron Microscope, X-ray Powder Diffraction, Zeta sizer and Energy-Dispersive X-ray spectroscopy. The antibacterial property of synthesized nanoparticles was observed by modification microdilution broth method with bacteria strains. The synthesized nanoparticles size are between 60.86 and 226.6 nm. The largest nanoparticle size was observed at pH = 10 and at temperature of 200 °C and the smallest nanoparticle size was observed at pH = 4 and at temperature of 500 °C. It is observed that the synthesized nanoparticles size decreased depending to the increasing temperature. According to the antimicrobial studies, all extractions inhibited the growth of Gram-negative bacteria and anti-yeast activity with the same MIC values ranging between 250 – 15.625 µg/cm³. While the MIC values in *Candida albicans* is 15.625 µg/cm³, in others are between 250-31.25 µg/cm³. The obtained results was showed that the best inhibition effect against bacterial and fungal strains was obtained at pH value of 10 and at temperature of 500 °C. DETERMINATION OF THE ANTIBACTERIAL EFFECT ON ORAL MICROORGANISMS OF GINGER OIL (ZINGIBER OFFICINALE)

ZUHAL KIRZIOĐLU¹, ALP KAYAHAN KIVANÇ, CANAN BAYRAKTAR¹, MERİH KIVANÇ

ABSTRACT

Oral diseases are a major cause of health problems worldwide. Many oral diseases such as tooth decay and gum disease are caused by the oral plaque. Oral plaque removal is provided by chemical agents as well as mechanical cleaners. In addition to these chemicals, plants such as ginger, propolis, green tea, garlic and thyme have been used in some countries for many years. Among these plants, ginger (*Zingiber officinale*) has effects on removal of oral plaque and prevention of toothache and halitosis. Ginger has immunostimulatory, antiinflammatory, and anti-oxidant effects. Thus, it can lessen or prevent the formation of free radicals. Besides, by inhibiting the growth of oral pathogens, it reduces the reproduction of dental plaque and affects the surface adhesion of bacteria. Prevention of decay, especially in children, requires products that will not harm children, and herbal products can be an alternative in this respect. However, it is very important to determine the effective concentrations of these plants and the number of studies done in this regard is low. Side effects may occur, if they are not used at appropriate doses. Therefore, it is important to know the required bactericidal and bacteriostatic concentration of the medicinal plant that can be used for the removal of the oral plaque. In this study; the antibacterial activity of ginger in oral bacteria was tried to be determined. Materials and Methods In previous studies, *S. anginosus*, *S. dysgalactie*, *S. mutans*, *E. faecium*, *S. agalactie*, *S. pyogenes*, *S. salivarius* and *L. paracasei* were isolated and described from the samples obtained from saliva, gingival fluid, caries and oral plaque of children. The antimicrobial activity of ginger oil on the 30 strains was determined by the microtubule dilution method to the minimum inhibitory concentration (MIC). We have tried to determine the minimum bactericidal concentration (MBC) in appropriate media of samples from non-reproductive tubes. Results Ginger oil was found to be 0.33 mg / mL for *E. faecium* 11.3, while MIC value for *E. faecium* 13.1.1 and *E. faecium* 13.3.1 was found to be 21.3 mg / mL. *S. mutans* 3.3. *L. paracasei* 6.2 and *S. anginosus* microorganisms have an MIC value of 21.2 mg / mL. It has been observed that the antibacterial activity of ginger oil varies according to the test bacteria. Ginger oil against oral bactericide was found to be bacteriostatic effective. Conclusion Ginger oil is useful in the prevention of oral bacterial growth and can be used in oral preparations. These plants exhibit different activities according to their species and growth area and may cause allergic and toxic effects. For this reason, especially in children, more and more long-term follow-up studies are required.

**THE EFFECTS OF N-ACETYLCYSTEINE ON ANTIOXIDANT
DEFENCE SYSTEM, SOME BIOCHEMICAL PARAMETERS AND
HISTOPATHOLOGICAL CHANGES IN THE LIVER AND KIDNEY
DURING SUBCHRONIC EXPOSURE OF WISTAR RATS TO
GLYPHOSATE-BASED HERBICIDE**

RUHI TÜRKMEN¹, HASAN HÜSEYİN DEMİREL², YAVUZ OSMAN BIRDANE¹, SINAN İNCE¹, HİDAYET YAVUZ¹

ABSTRACT

In this subchronic toxicity study was to determine the glyphosate-based herbicide (GBH) induced oxidative stress, some biochemical parameters and histopathological changes in the blood, liver and kidney of rats and the ameliorative effect of N-Acetylcysteine (NAS). Twenty-eight male Wistar rats were divided into four equal groups of seven each. Group I (control group) was given normal rodent diet and tap water for eight weeks. The agent(s) administered are as follows: Group II (NAS), N-Acetylcysteine (160 mg/kg), group III (GBH), glyphosate-based herbicide (375 mg/kg, 10 % of the LD50), group IV (NAS+GBH), N-Acetylcysteine (160 mg/kg) and glyphosate-based herbicide (375 mg/kg). The treatment regimens were administered orally by gavage once daily for eight weeks. The GBH significantly increased serum biochemical parameters and malondialdehyde levels in blood, liver and kidney tissues while reduced glutathione levels in blood, liver and kidney tissues. In contrast, treatment with NAS reversed GBH-induced oxidative stress, lipid peroxidation, and biochemical parameters. Moreover, histopathologically NAS also exhibited protective action against the GBH-induced mononuclear cells infiltration around the portal tracts in liver and increased in number of Kupffer cells, necrotic and degenerative changes in tubular epithelium of kidney. It was concluded that NAS protected against GBH-induced oxidative stress and GBH-induced hepatotoxicity and nephrotoxicity in Wistar rats possibly through their antioxidant activity as well as an inhibition of lipid peroxidation.

COSMETIC PLANTS TRADITIONALLY USED BY THE PEOPLE IN TURKEY

VOLKAN ALTAY¹, MÜNİR ÖZTÜRK²

ABSTRACT

From day to day, human beings (especially women) have prepared and used herbal dyes, ointments, lotions, perfumes for several purposes such as dermatological applications, look younger, against hair loss or change of hair color. The plant preparations have been preferred for natural cosmetic use in the traditional folk medicine. This tradition still continues in the rural areas of several countries even today, where these herbal cosmetic products prepared by the public are easily found, cheaper and have no side effects. In this study, ethnobotanical studies carried out uptill now in the country have been compiled with the aim to provide an overview of the herbal cosmetic products used by the people. The data evaluated has revealed that, a total of 122 plant taxa are used for this purpose. Out of these taxa, 40 are used for hair care (hair coloring, for glossy hairs), 25 against hair loss, 11 against hair dandruff, 24 for skin care, 19 as essence, 17 for bad breath, 10 for soap making, 7 for mouth and dental hygiene, 6 against foot odor and sweating, and 4 for other purposes. Moreover, among the herbal cosmetics most commonly used taxa are; *Juglans regia*, *Urtica dioica*, *Vitis vinifera*, *Matricaria chamomilla*, and *Laurus nobilis*. These are traditionally used in our country especially for hair care; *Juglans regia* against hair loss; *Ammi visnaga* in mouth and dental hygiene; and *Vites agnus-castus* against the odor and sweating of feet. An attempt is made here to evaluate the role of plants used for cosmetic purposes in different regions of Turkey for alternative treatments in the context of sustainability. In addition, it has been emphasized that there is need for evaluation of new plant taxa present in the country, which may have a strong commercial impact as herbal raw materials.

THE USAGE OF OILS OBTAINED FROM SHELL AND SEEDS OF CITRUS RETICULATA IN NATURAL COSMETIC FORMULATIONS

ŞEYDA KIVRAK¹, TOLGA GÖKTÜRK¹, İBRAHİM KIVRAK¹

ABSTRACT

In recent years, consumers' interest in products derived from natural sources has increased rapidly. For this reason, many studies carried out on flowers, leaves or all body of the medicinal and aromatic plants which have economic value in the food, medicine, cosmetic and dye industries. The cosmetic characters of medicinal and aromatic plants, especially as fragrance, originate from the volatile and fixed oils, which they contain. One of the basic reason of usage of essential oils in cosmetic formulations is the improvement of the final product's fragrance. They also have broad spectrum antimicrobial and antifungal properties and are also used as preservatives in cosmetic products. Another very important feature of essential oils is their antioxidant activity, which prolongs the shelf life of the products and protects the skin from free radicals that cause aging. One of the plants that have been investigated many times because of the volatile and fixed oils they have is the *Citrus reticulata*, one of the 17 species of the Rutaceae family, which are outspred in temperate and tropical regions. Citrus oil and D-Limonen are included in the GRAS class (Generally Recognized as Safe) by the FDA since the products obtained from citrus fruits are natural, biodegradable and non-toxic. Studies on *C. reticulata* show that the peels show antioxidant, anticollagenase, antielastase, antifungal, antimicrobial properties and the seeds have antioxidant properties. In this study, *C. reticulata* (also known as Bodrum mandarin) peels were left in open air for 3 days and then their volatile oils were obtained by water vapor distillation method. Again, the *C. reticulata* seeds were washed and then dried for 10 days in the open air. The dry seeds were crushed by a 20 ton press. The components of the obtained volatile and fixed oils were determined using Agilent 6890 Gas Chromatography (GC) and 5975 Mass Spectrometry (MS). Alpha-Limonene was found as the major component in the volatile oil whereas 38% Linoleic acid, 28% Oleic acid and 22% Palmitic acid were detected as major components in the fixed oil obtained from the seeds, respectively. The obtained oils were used to make moisturizing skin lotion. For this purpose, 10 g fixed oil which obtained from seeds and 2 g of essential oil obtained from peels were added into 87 g of purified water. Then this mixture stirred with magnetic stirrer for 10 minutes. Finally, the formulation is completed by the addition of the homogenized polymer mixture. The rheological properties of the final product were determined after all treatments were completed. Stability tests have been performed on the product (Centrifugation assay, temperature stability, pH and rheological measurements). The product viscosity was found to be 14.024 cP (pH 6 and 1% polymer concentration).

THE POSSIBILITIES OF USING SOME NATURAL SPECIES IN KOCAELI URBAN LANDSCAPE PLANNING

SELDA AKGÜL¹, HÜLYA TAMYÜKSEL²

ABSTRACT

Despite 12 500 plant species found in whole Europe, our country is hosting about 10 thousand plant species and about 1/3 of them are endemic in our country. If we add to this quantity also species that have been brought and adapted to the conditions of our country many years ago you can understand better how rich our flora is. Our country with a huge variety of flora reserves lots of medical and aromatic plants within its structure. In Turkey, almost all nurseries which are producing or supplying botanical materials are taking plantations in Europe-where the climate conditions are partially-/humid-as a model by producing or importing water absorbent species. These species belong to ecologies having no water shortage or only for limited periods. And in these cultivation areas the soil and water show acidic characteristic. In our country -except a part of Blacksea region- the situation is the opposite; in our country long-term periodic droughts reigns, it seems scorching heat of the desert from time to time and the soil is of alkaline characteristic. If we take into consideration that a wide region of our country is under influence of a steppe and semi-arid ecosystem and we think that we will soon feel the negative effects of global climate change that it is obvious necessity of using natural or long years tested species without irrigation or less, which can be based on alkaline soil as soon as possible. As in whole world, use of plants existing in the natural flora for different purposes in public such as treatment food tea, spice, paint, insecticide, veterinary cure, resin, glue, essential oil, beverage and cosmetic industry has been a part of our traditional cultere for years. On the other hand, this existance is facing a danger of being lost by contemporary urbanisation. With this study, the biological wealth of the city has tried to be analyzed on a small scale. In natural forest areas in Kocaeli, natural species that can be used in urban landscape planning was aimed at identifying. In addition, the phenological observations to be made in determining the type, aimed to obtain information that will form the basis of the production work. For this purpose, Kartepe, Yuvacık and Kerpe in the forest areas in Kocaeli, Aceraceae, Cornaceae, Rosaceae, Celastraceae, Aquifoliaceae, Lauraceae, Staphyleaceae and Ericaceae, including total eight families the Ericaceae, belonging to 13 natural species, seed collection time, habitats and seasonal views have been determined. In addition, the seeds are collected for production work, 1000 dane weights were calculated

**MYTHOS AND OPPORTUNITIES OF USAGE IN LANDSCAPE
ARCHITECTURE OF SOME MEDICINAL AND AROMATIC PLANTS
NATURALLY GROWING IN TURKEY**

MÜKERREM ARSLAN¹, ERDI EKREN²

ABSTRACT

For people who have witnessed various natural phenomena since ancient times, mythos has been the best reflective for this. The plants that are accepted as a gift by the gods to humans have an important place in mythology. People used plants for various purposes such as food, warming, defense, tapping their feelings, and most importantly finding healing throughout the history. As the ages progressed, with the development of medical science, the importance of medicinal and aromatic plants used for the purpose of healing has also increased and it has become a big market that deals with various professions. In addition to these developments, medicinal and aromatic plants have a very important place in the aesthetic and functional aspects of plant design works with leaf forms, different colors and flowers and fruits in different colors and textures. The use of natural plant species belonging to the region to be studied in landscape architecture applications is very important for the preservation of the ecological integrity of the region and also natural plant species adapt more easily to climate conditions, thus they reduce the risk of failure and maintenance costs to a minimum. In this context, the preference of natural species in plant design works which will be formed by using medicinal and aromatic plants in our country is important in terms of ensuring the sustainability of the works. Our country has a diversity of flora that is similar to the other in terms of having three different floristic regions, different geographical features and having different climate varieties. While the European continental flora has close to 12,000 species, this number is about 9,500 in our country. Furthermore, while the number of endemic plant species in the continental flora of Europe was around 2.750, approximately 3.700 of the species in our country are endemic. Our country has a very important potential for medicinal and aromatic plants thanks to this floristic richness. In this study; some of medical and aromatic plants, naturally growing in Turkey, will be informed about past daily usages, mythos and it will be conveyed that their importance which they have in various cultures and opportunities of usage in landscape architecture. As a result, importance of the usage of natural plant species in landscape architectural application works will be given and it will be emphasized that the importance of plant design works of medicinal and aromatic plants.

**DETERMINATION LEVELS OF ANTIOXIDANT ACTIVITY AND
PHENOLIC COMPOSITION OF SUMAC (RHUS CORIARIA L.)
EXTRACTS IN DIFFERENT REGION**

SEVİM ÇİFTÇİ YEGİN¹

ABSTRACT

This study aimed to determine the antioxidant activity levels of sumac sour collected from different regions. *Rhus coriaria*, is the only species of *rhus* in Turkey. It shows spread in different regions in Turkey. Particularly, it is used as sour spice in Anatolia. Sumac sour is usually consumed in Hatay, Gaziantep, Mersin in Turkey. Phenolic compounds, which are secondary metabolites in plant materials are known to be responsible for antioxidant effect. Recent epidemiological studies have strongly suggested that consumption of certain plant materials may reduce the risk of chronic diseases related to oxidative stress due to their antioxidant activity and promote general health benefits. The antioxidant effects of phenolic compounds are explained by bonding of free radicals, the activity of methal chelating, inactivation of some enzymes. In this study, DPPH (SC50), the activity of scavenging H₂O₂ (SC50), the levels of total phenol-flavanoid (mg/g), the activity of methal chelating (%), FRAP activity (%) are evaluated. The highest DPPH, the highest levels of total phenol-flavanoid, the highest activity of scavenging H₂O₂ was detected in Gaziantep sumac syrup, the highest FRAP and the highest metal chelating activity were observed in Hatay sumac syrup.

SCENTED PLANTS, HEALING GARDENS AND PRINCIPLES OF ENVIRONMENTAL DESIGN

MURAT ERTEKİN¹, ÖMER LÜTFÜ ÇORBACI²

ABSTRACT

One of the most powerful and attracting properties of plants is scent. In today, apart from their visual and ecological properties, the scent of plants is used in landscape designing, as well. Scented gardens that have been designed with those plants are arousing interest in society. There are a few things to note when creating a healing garden of scented plants. The healing or scented gardens are often designed in fractions of aromatic plants in various parks and gardens. In this study; examples from scented plant species are mentioned and points to be noted in the healing gardens to be formed with scented plants.

MINERAL AND FATTY ACID COMPOSITION OF BITTER GOURD GENOTYPES (*MOMORDICA CHARANTIA* L.) SEEDS FROM TURKEY

AKİFE DALDA ŐEKERCİ¹, KEVSER KARAMAN¹, HALİT YETİŐİR¹

ABSTRACT

Momordica charantia L. known as bitter melon, bitter gourd, bitter cucumber belongs to Cucurbitaceae family. In Turkey, it is known as "kudret narı" locally and consumed as oil, paste made by seeds and also vegetable. It is used to treat the digestive system diseases and to enhance the immune system in traditional medicine. Besides, several studies that have been carried with *M. charantia*, in related to therapeutic effects such as antidiabetic, antiviral, antitumor, antileukemic, antibacterial, anthelmintic, antimutagenic, antimycobacterial, antioxidant, antiulcer, anti-inflammatory, hypocholesterolemic, hypotriglyceridemic, hypotensive, immunostimulant, and insecticidal properties. In this study, the seeds of *M. charantia* genotypes collected from different geographical regions of Turkey were used as material. The seedling of 12 different genotypes were grown in unheated greenhouse belonging to Erciyes University, Faculty of Agriculture, Department of Horticulture. The seedlings are transplanted at the 2-3 true leaf stage and seeds were produced by selfing from each genotype. The seeds were extracted from mature fruit and dried at room temperature in laboratory for fatty acid and mineral compositions. To determine the fatty acid composition of the extracted oil, a methylation process was performed to produce fatty acid methyl esters and Gas Chromatography (GC) System was used. Additionally, mineral composition was evaluated with using ICP-OES system. Palmitic (C16:0), stearic (C18:0), oleic (C18:1), linoleic (C18:2) and eleostearic acid (C18:3n5) were major fatty acids detected and the most abundant fatty acid was eleostearic acid. Ca, K, and P were also measured as to be major elements. Other elements found present in the seeds include sodium, magnesium, iron, sulphur, manganese, zinc and copper. The study demonstrates the presence of nutritional components that are beneficial and curative properties of the plant.

ANTI-CARCINOGENIC EFFECT OF FUNGI SPECIES AND THAT'S CONTENT OF BIOACTIVE SUBSTANCES

MEHMET UFUK KASIM¹, REZZAN KASIM¹, PINAR ŐANLIBABA²

ABSTRACT

Medical fungi have long been recognized as natural sources of bioactive compounds, are regarded as immune system regulatory and anti-cancer agents. It has been thought that the consumption of these fungi had positive effects on human health. Cancer is a general term for a variety of diseases that can be chronic and is responsible for many deaths worldwide. Although significant progress has been made in modern cancer treatment trials, the difficulties in understanding the molecular behavior of various cancer types and the numerous side effects patients experience are still important problems. For this reason, natural bioactive compounds have been used in supportive treatments in traditional cancer treatments. There are many types of fungi containing anti-carcinogenic bioactive substances. These genres are; Lentinula, Lentinus, Lepista, Marasmius, Omphalotus, Panus, Phellinus, Pholiota, Pholiota, Cryptoporus, Flammulina, Ganoderma, Grifola, Hericium, Hypsizygyus, Grifola, Hericium, Agaricus, Agrocybe, Albatrellus, Antrodia, Armillaria, Auricularia, Pleurotus, Polyporus, Poria, Russula, Schizophyllum, Sparassis, Taiwanofungus, Thelephora, Trametes, Tremella and Tricholoma. The bioactive substances found in these fungi may be high molecular weight compounds such as polysaccharides, proteins and lipids as well as a number of low molecular weight metabolites such as lectins, lactones, terpenoids, alkaloids, sterols and phenolic substances. In this review, studies on the anticarcinogenic fungus types, their bioactive substances and their usefulness in cancer treatments have been compiled.

EFFECTS OF CAPSAICIN ON ENERGY METABOLISM

MERVE PEHLİVAN¹, NILÜFER ACAR TEK¹, GAMZE AKBULUT¹, MERVE ŞEYDA KARAÇİL ERMUMCU¹

ABSTRACT

Red peppers, which are plants belonging to the genus *Capsicum*, contain a class of pungent compounds called capsaicinoids. Capsaicin (CAP, 8-Methyl-N-vanillyl-trans-6-nonenamide) is one of the most active components of red and chili peppers and it is a naturally occurring phytochemical. It is an odorless, white crystal with harsh flaring pungency. Even a solution with 1 in 17,000,000 concentration causes pain in humans. Capsaicin preserves its original potency through storage, freezing and cooking. Capsaicin is an important molecule widely researched in medicine. This compilation aims to study the effects of capsaicin on energy metabolism. Capsaicin moves along tongue epithelials when placed in the mouth cavity. It binds to the TRPV1 receptor (Transient receptor potential vanilloid receptor-1) with high affinity. It is passively absorbed from stomach and upper small intestine with higher than 80% efficiency. Capsaicin stimulates catecholamine secretion by the TRPV1 receptor and this increases energy consumption by stimulating the sympathetic nervous system (SNS). Furthermore, activation of the sympathetic nervous system increases thermogenesis and excess energy is released as heat. This prevents weight gain. Another intriguing point is that TRPV1 dependent effect of capsaicin consumption activates brown adipose tissue. The activation of neurons expressed by the capsaicin receptor in the digestive system signals the brain via the vagal nerve. This stimulates selective activation of sympathetic neurons for brown fat, thus increasing total energy consumption. Many clinical trials have studied the effects of capsaicin consumption on metabolic rate and respiratory quotient. The result is that capsaicin temperately increases energy consumption. A study on rats reports that activation by TRPV1 signalization has a positive effect on energy consumption. In human studies; in a randomized controlled study conducted by Ludy et al. on 25 healthy adults, energy consumption at 30-60, 120-150 and 240-270 minute intervals after eating and body temperature in 270 minutes of the group that consumed 1 g red pepper capsules with test meal (red pepper: 1995 mcg/g capsaicin, 247 mcg/g nordihydrocapsaicin and 1350 mcg/g dihydrocapsaicin; 53 800 SHU) was statistically significantly higher than that of the control group. In another study conducted by Lejeune et al. on 91 slightly overweight adults, the subjects were first put on a diet to lose at least 4 kg of body weight in 4 weeks. At the end of 4 weeks, they moved on to a 12-week maintenance program. The subjects were then divided into two groups in a randomized fashion. The first group was given 135 mg capsaicin capsules daily, whereas the second group was the control group. At the end of 12 weeks, the resting energy consumption of the group that took capsaicin (6.9 ± 1.1 MJ/d) was statistically significantly higher than that of the control group (6.5 ± 0.8 MJ/d). In conclusion; even though study populations, study methods, capsaicin dosage, duration and form of consumption differ, capsaicin consumption generally increases energy consumption through its boosting effect on basal metabolism rate and thermogenesis. However, due to the variations mentioned above, daily dosage of capsaicin required to increase energy consumption is not exactly clear. Further experimental study is required to precisely declare the effects and dosage of capsaicin.

TOTAL POLYPHENOL CONTENT, ANTIOXIDANT ACTIVITY AND CHEMICAL COMPOSITION OF METHANOLIC EXTRACT FROM ALLIUM KHARPUTENSE FREYN ET. SINT.

ERDAL YABALAK¹, A. MURAT GİZİR¹

ABSTRACT

Allium Kharputense Freyn Et. Sint which is belongs to Allium genus and regionally called Soryaz is one of the numerous of herb species used worldwide for their various benefits [1-3]. In addition, we have determined the mutagenic and antimicrobial effect of methanolic extract from Allium Kharputense in our previous work [4]. Many health risks based on free radicals that formed in metabolism can be prevented through consuming natural foods containing functional ingredients that exhibit antioxidative properties. Thus, antioxidant compounds protect organism against damages caused by free radicals [5]. Polyphenols are also known as powerful antioxidants. Thus, evaluation of antioxidants activity, total polyphenol content and identifying of chemical compounds of herbs gain great importance. Allium Kharputense had never been investigated by researchers for its antioxidant activities, total polyphenol content and chemical composition. In the present study, these properties were investigated for methanolic extract from Allium Kharputense. Total polyphenol content was determined as 257 mgGA/100 g dried weight. In DPPH test, IC₅₀ values of gallic acid (GA) and Trolox (Tr) were determined as 0.02642 mg.mL⁻¹ and 0.225 mg.mL⁻¹, respectively. IC₅₀ value of extract from Allium Kharputense was found as 2.186 mg.mL⁻¹. Thus, DPPH free radical-scavenging activity of extract from 1 mg of Allium Kharputense was determined 0.01207 mg GA and 0.1029 mg Tr, respectively. Dimethyl trisulfide, Pyrazine, L-Glutamic acid, L-Proline, palmitic acid, γ -Tocopherol are some of the chemical compounds of methanolic extract from Allium Kharputense. This herb should be evaluated for its probable effects for bio-chemical processes in further studies. **PHYSICAL AND CHEMICAL PROPERTIES OF A TYPE OF
ALMOND CALLED "AKBADEM" GROWN IN THE AEGEAN REGION
IN TURKEY**

NIZAM MUSTAFA NIZAMLIOđLU¹, SEBAHATTİN NAS²

ABSTRACT

A type of almond, called "Akbadem", grown in the Aegean region in Turkey were evaluated in terms of several physical and chemical properties of nut and kernel. The average length, width, thickness, arithmetic mean diameter, geometric mean diameter, particle size and surface area of nuts were 39.04±2.94 mm, 23.56±1.88 mm, 15.60±1.15 mm, 26.07±1.19 mm, 24.29±1.75 mm, 5053.05±1100.12 mm³ and 1565.14±225.63 mm² respectively. Corresponding values for kernel were 28.25±1.92 mm, 14.28±1.17 mm, 6.87±0.53 mm, 16.46±1.05 mm, 14.03±0.87 mm, 887.05 ± 167.28 mm³ and 533.90±65.86 mm² respectively. "Akbadem" nut shell has a significant impact on the dimensional properties. Dimensional properties were decreased significantly than the almond nut to almonds kernel. The average almond nut shell thickness was determined as 3.35±0.34 mm. Akbadem nut gravimetric properties; thousand seed weight, seed density and bulk density were determined 4950±0.01 g, 1140±0.001 kg/m³ and 375±5.00 kg/m³ respectively. Corresponding values for "Akbadem" kernel were determined 1430±0.08 g, 1080±0.003 kg/m³ ve 485±5.00 kg/m³ respectively. Internal efficiency of Akbadem was determined as 30±0.50%. The "Akbadem" kernel was determined L-value 59.56±1.98, a-value 5.68±0.79 and b-value 16.74±0.54. "Akbadem" kernel shell is quite dark as shown in Hunter color values. Chemical composition of Akbadem kernel; moisture, total oil, total ash, protein, oleic acid, linoleic acid, palmitic acid and palmitholeic acid were 3.57±0.15%, 52.32±1.21%, 3.15±0.01%, 20.57±0.07%, 76.11±1.18%, 17.71±1.14%, 6.14±0.05% and 0.04±0.01%. "Akbadem" is seen that fatty acids and the relatively high amount of protein.

CHIA SEED (SALVIA HISPANICA L.) AND IT'S EFFECTS ON METABOLIC DISEASES

MELDA KANGALGİL¹, NAZLI NUR ASLAN², AYŞE ÖZFER ÖZÇELİK²

ABSTRACT

Chia (*Salvia hispanica* L.) is a plant that blooms in summer, whose leaves are 4-8 cm long, 3-5 cm wide and about 1 meter long. Chia seeds are classified as non-classical seeds because they are not consumed frequently in the daily diet, but this changes from day to day. Chia seed contains approximately 64.0% omega-3 and 19.0% omega-6 fatty acid. The α -linolenic acid, which is an essential fatty acid, is present in high proportion. The protein content of the chia seed varies between 15.0% and 23.0% depending on the geographical position of the crop and growth conditions. In Chia, 9 essential amino acids have been found in significant quantities. The water content of the Chia seed, which is water up to 15 times the weight of the seed, is quite high. Dietary fiber content is high compared to cereals, such as kinoa, flaxseed, amaranth, which is a pulp source; At 100 g there are 34-40 g dietary fiber. The niacin content of the chia seed, which is a rich source of vitamin B group, is higher than corn, soya bean and rice. Tiamine and riboflavin contents are similar to rice and maize. Chia is an excellent mineral source and contains 6 times more calcium, 11 times more phosphorus and 4 times more potassium than 100 grams of milk. Another feature that makes Chia seed even more attractive is that it has a number of antioxidant compounds. The most important phenolic compounds found in Chia seed are chlorogenic and caffeic acid, followed by mycetin, quercetin and kaempferol. These phenolic compounds have antioxidant, antiinflammatory, anticancerogenic and antithrombotic activity. It is thought that Chia seed can be used to prevent metabolic diseases such as diabetes and cardiovascular diseases due to both fatty acid pattern and high pulp contents. As a result of studies using animal models, it was found that Chia seed developed insulin and glucose tolerance, reduced insulin resistance and dyslipidemia, increased antioxidant capacity and decreased lipid peroxidation. It was also found that consumption of Chia seed increased the function of intestinal tissue. Chia seed was shown to cause weight loss, decrease in waist circumference, and decrease in CRP level and increase in adiponectin level in Type 2 diabetic individuals. It was determined that it accelerated weight loss, decreased total cholesterol, VLDL-C, and increased HDL-C in obese people. It was found that triglycerides and blood glucose levels decrease in individuals with metabolic syndrome as well as in weight loss. Chia provides blood pressure reduction both in treated and untreated hypertensive individuals. Based on the present research findings, it seems that Chia seed is a healthy choice to provide weight loss, improvement in lipid profile, decrease in blood glucose level and blood pressure, but more work is needed for definite results.

VOLATILE OIL COMPOSITION OF KASTAMONU-TAŞKÖPRÜ GARLIC

DEREN TAHMAS KAHYAOĞLU¹

ABSTRACT

Medicinal and aromatic plants are attractive with their taste and aroma as well as their therapeutic properties. Volatile oil that impart flavor and smell to these plants is used in many areas such as the food industry and perfumery, and there are many researches on their pharmaceutical effects. Volatile oil is complex mixtures obtained from leaves, fruits, shells and root parts of plants by distillation or pressing and natural products that is liquid at room temperature, easily crystallizable, generally colorless or pale yellow, volatile, strongly aromatic. Studies are shown that volatile oil exhibits antibacterial, antiviral, antioxidant and antidiabetic activities. Many studies suggest that volatile oil of spices and some plants can be used as food preservatives and it is emphasized that volatile oil is used as a natural preservative may be an alternative of the used chemicals. Kastamonu is first in garlic production in Turkey and approximately 85% of the production is done in the Taşköprü. In this study is carried out to determine the volatile oil composition of Kastamonu-Taşköprü Garlic, volatile oil is obtained by steam distillation method in Clevenger type device and the composition of the volatile oil is determined by GC-MS analysis. Garlic is provided from 25 different fields of Taşköprü and the average of 37 components are detected. The main components of volatile oil of Kastamonu-Taşköprü garlic are determined as diallyl trisulfide (39.18%) and diallyl disulfide (20.24%). Other major components are Diallyl tetrasulfide (9.83%), Allyl methyl trisulfide (8.72%) and Diallyl sulfide (1.63%).

THE ANTIPROLIFERATIVE AND ANTIOXIDANT ACTIVITIES OF THE ESSENTIAL OILS OF STINKING JUNIPER (JUNIPERUS FOEDITISSIMA WILLD.)

FERDA ESER¹, AYŞE ŞAHİN YAĞLIOĞLU², MUHAMMET ŞAMIL YAĞLIOĞLU³, İBRAHİM DEMİRTAŞ²

ABSTRACT

The genus *Juniperus* (Cupressaceae) consists of approximately 68 species [1]. It is reported that *Juniperus* species exhibited several biological activities. The essential oils of *J. foetidissima* Willd. have been reported for their antimicrobial [2], antioxidant and anti-inflammatory [3] activities. The present study aims to determine the essential oil compositions of *Juniperus foetidissima* Willd. along with its antioxidant and antiproliferative activities. The experiments were carried out both on the needles and the cones of the plant, as well. The antiproliferative activity of the essential oils was determined against HeLa (human cervix carcinoma) and C6 (rat brain tumor cell) cell lines by BrdU cell proliferation assay. The essential oils were tested for their total reducing power activity, DPPH (2,2'-diphenyl-1-picrylhydrazyl) free radical scavenging activities and hydrogen peroxide scavenging activities. Thirty-four components were determined from the essential oils of the cones and the needles of *J. foetidissima*. The major components of *J. foetidissima* was defined as α -pinene (56.1 %) and cedrol (25.5 %) in the needles, and α -pinene (90.2 %) in the cones, respectively. Essential oils of *J. foetidissima* exhibited interesting biological activity on C6 and HeLa cells. The antiproliferative activity of the needle of the plant was considerably higher than the cones.

INVESTIGATION OF TOTAL PHENOLIC CONTENTS, ANTIOXIDANT AND ANTIBACTERIAL ACTIVITY OF CENTAUREA PULCHERRIMA

KADRIYE ÖZCAN¹, TUBA ACET²

ABSTRACT

Centaura pulcherrima is a local endemic plant which grows on Artabel, Gümüşhane. It is a special plant because of endemism. For this reason the plant was explored in terms of total phenolic contents, antioxidant and antibacterial activity abilities in this study. Firstly, the plants were collected Artabel National Park on August, 2016. Plants were dried on away from sunlight. Then dry plants were dismissed by miller and used for extraction. Ethanol, methanol, ethyl acetate and hexane were used as solvent. Totally four extracts were investigated. To determine the antioxidant activity, extracts were evaluated by UV-spectrophotometer. DPPH (2,2-diphenyl-1-picrylhydrazyl) and ABTS (2,2'-azino-bis-(3-ethylbenzothiazoline-6-sulfonic acid)) were used for antioxidant activity and Kirby- Bauer disk diffusion method was used for determine antibacterial activity. Total 12 bacteria strain were used for test. Plants extracts have shown that highly antioxidant properties. For instance, results were found for DPPH on the ethanol extract: 36.64 µg/ml and ABTS on the methanol extract: 1.34 mg/ml. Total phenolic contents were found 20 mg GAE/g extract on the methanol extract. All extracts exhibited significant antimicrobial activity against at least one test organisms. Especially ethyl acetate extracts showed significant inhibition activity to *P. aeruginosa*, *S. aureus*, MRSA, *E.coli* and *S. typhimurium*, respectively. As a results, it has been found that Centaura pulcherrima various extracts have strong antimicrobial activity especially on Gram (-) microorganisms. According to this study, this plant could be potential source of as an antimicrobial agents and a natural antioxidant. Therefore, the plant might be used for industrial application.

MYCELIUM ON HUMAN BLOOD CELLS: CYTOTOXICITY,
GENOTOXICITY AND OXIDATIVE DAMAGE**

FATİME GEYİKOĞLU¹, SALİM CERİĞ¹, MURAT ÖZDAL¹, KÜBRA KOC¹, ÖMER FARUK ALGUR¹, GÜLŞAH DENİZ YILDIZ¹

ABSTRACT

Mushrooms produce a variety of bioactive antioxidant secondary metabolites including ectins, polysaccharides, pigments, phenolic compounds, sterols and terpenes. Extracellular and intracellular compounds produced by submerged liquid fermentation are important industrially and economically. *Phanerochaete chrysosporium* (PC) is the model white-rot fungus that easy cultivation on lignocellulose-containing substrates. PC can be used as a bioprotein source. Objectives of this investigation were to determine the in vitro antioxidant, cytotoxic and genotoxic effects of hot water extract obtained from PC on human blood mononuclear cells (hBMCs). Cytotoxicity was determined by neutral red (NR) and lactate dehydrogenase (LDH) leakage assay. Total antioxidant capacity (TAC) and total oxidant status (TOS) were detected to appreciate the oxidative damage. Genotoxicity was characterized by micronuclei and chromosome aberrations assays for specify DNA damage. PC (5-75 µg/ml) significantly increased antioxidant capacity and didn't cause significant alterations to cytotoxicity on hBMCs. The increasing doses of PC (5-250 µg/ml) didn't cause increase as genotoxic. Whereas, 250 and 500 µg/ml doses of mushroom statistically increased TOS levels, NR uptake, LDH release, CA/cell frequency and MN formation and also decreased TAC levels. This study is the first research on cytotoxicity, genotoxicity and oxidative damage of PC on hBMCs. In conclusion, the consumption of PC can be safely for humans, but it has also exposure period and dose-dependent effects on inducing oxidative damage and toxicity on hBMCs.

ABSTRACT

Thymus praecox OPIZ subsp. *grossheimii* (Ronniger) Jalas, locally known in Sürmene town of Trabzon as yaylaçayı, is an aromatic plant which finds widespread use as aqueous infusion. There is a limited number of scientific articles on this plant in the literature. The current study focused on the components of the essential oil of this plant and its antioxidant activity based on ferric reducing / antioxidant power (FRAP) assay. The essential oil of the plant was obtained in two ways: first with normal hydrodistillation using Clevenger type apparatus and second hydrodistillation after acidification with HCl to cause acid catalyzed hydrolysis and other catalytic conversions of the plant components in order to increase the amount of the oil and total bioactivity. The normal hydrodistillation procedure resulted in 1,3 mL essential oil with 73 components of which monoterpenoids form the major class. The major compounds with percentages higher than 10% were α -terpinyl acetate (11,99%), linalool (17,46%), and thymol (27,73%). On the other hand, the essential oil obtained with acid hydrolysis/catalysis (AHC) procedure resulted in 1,5 mL essential oil with 77 components of which monoterpenes form the major class. The major compounds with percentages higher than 10% were α -terpinolene (10,11%), o-cymene (11,45%), thymol (11,92%) and δ -terpinene (18,46%). The essential oils were tested with FRAP antioxidant assay, and the activity was found to be about 1,5 fold higher in the case of AHC sample. The results of the current study conform to the previous findings with other aromatic plants investigated in our laboratory. The findings of this study confirm that application of AHC procedure in the essential oil production increases the product yield and also improve the antioxidant activity.

INVENTORY METHODS OF NON-WOOD FOREST PRODUCTS.

YILMAZ ÇATAL¹, YELİZ ALBAYRAK ÇATAL²

ABSTRACT

In our country, non-wood forest products (NWFP) provided of forests that known to provide primarily wood products provide a wide range of human needs including food, medicines and construction materials. NWFP are often proposed as an environmentally friendly and socially equitable way of using forest resources Many of these NWFP are important sources of income and employment for rural people. Due to increasing interest in the national and international market, awareness about the use of these products has increased. Until today, the NWFP's have been used as unconscious and unplanned. Determining the quantity and spread of the NWFP's are the most important problem to be transferred to the plan. A number of biological characteristics have a key impact on the elaboration and improved of inventory for NWFP species. Practical methodologies for inventorying NWFP are under development, but still not yet fully elaborated neither widely available for implementation. Aim of this paper, methods of NWFP inventory are described and current knowledge gaps and needs are analysed. In addition, inventory classification methods of some NWFP important in Turkey are highlighted.

NON-WOOD PRODUCTS SPREADING IN KARADAĞ (BURSA)

HAFİZE HANDAN ÖNER¹, NİHAL ÖZEL¹, GIYASETTİN AKBİN², NURAN ALTUN¹

ABSTRACT

Karadağ (Bursa) replaces in the Karacabey district of Bursa and Bandırma district of Balıkesir. It is one of the important altitudes of South Marmara. The boundaries of the study area are formed by the Bandırma district in the west and the Kocayağ Delta in the east. Due to geographical position and climatic conditions it has very rich floristic diversity. The flora is consist of 1117 plant taxa belonging to 108 families and 498 genuses. In this study, plant taxa spreading in Bursa (Karadağ) nd Bandırma district of Balıkesir were examined in terms of non-wood products. As a result of this study 92 families, 328 genus and 648 taxa are specified as economically important species. Usage of these plants are as follows; 308 taxa for health, 147 for food, (vegetable, fruit, spiceetc.), 89 taxa for posture, 109 taxa for commercial 118 taxa landscape architecture and 152 taxa for paint finish and other uses (traditional, evil eye, making pot and spoon etc.). 270 taxa are important for the apiculture. In addition, 18 of these species with economic value are endemic. 32 of these species are in the scope of CITES. In this study, the number of 153 plants have been found as toxic.

USING REMOTE SENSING AND GEOGRAPHICAL INFORMATION SYSTEM IN THE PROVINCE OF ERZURUM SEEN IN THE WILD OLEASTER (HIPPOPHAE RHAMNOIDES L.) DETERMINATION OF THE NATURAL DISTRIBUTION AREA

MEHMET SIRAÇ KARAGÖL¹, MEHMET ALİ BAŞARAN¹, SELAMİ ÖKSÜZ¹, MURAT KÖSE¹, FAZİLET SARPDAĞ¹, YAŞAR AYHAN¹

ABSTRACT

Our country has different plant diversity and geographical features and is different from many countries around the country. The number of plant species spreading in Turkey is close to the number of plant species spreading throughout Europe. With the addition of the discoveries made in recent years, it has become clear that Turkey has about 12 000 plant taxa. Numerous geographical factors such as changes in short distances in climate characteristics, variations due to morphological characteristics, differences in soil types cause differentiation of plant formations and diversification of species. Because of its medical value, the wild plant (*Hippophae rhamnoides* L.) plant, which is called 'miraculous plant' and contains more than 190 bioactive substances, shows a promising feature for humanity in terms of pharmacological applications. In the province of Erzurum where it has spread widely, it forms the richest fruits of our country in terms of chemical content. In this study, the distribution of wild spots in some of the districts of Erzurum (Erzurum, Aşkale, Ilıca, Pasinler, Köprüköy, Tortum and Uzundere) was determined with the help of geographic information system and remote sensing. In the study, Landsat TM, 7 band satellite image of July 7, 2000 with a resolution of 30 m was used as satellite image material. In terrestrial studies, GPS (global positioning system) device was used for coordinate determination in some areas where wild spruce plants spread. ArcGIS 10 software was used for analysis and classification of satellite images. The coordinates of the spots where the wild spikelets are located were taken by GPS and processed on the map. NDVI classification method was used for classification of images. The results obtained vary between -1 and +1 depending on the area of the plant cover. In this study uncontrolled classification was made. The area is divided into 10 classes to see clearly the distinctions of vegetation, rocky and wetlands. Later, according to the reflection values of the 10 determined classes, which groups were formed, forest management was determined with the help of stand map. The wild spots forming the working position are classified according to the reflection values at the points where the coordinates are obtained by means of the GPS.

INVESTIGATION OF SOME EXTREME ECOLOGICAL FEATURES OF *ACHILLEA ARMENORUM* BOISS. & HAUSSKN.

TURGAY DINDAROđLU¹, MURATHAN GÜRBÜZ¹, ÖMER BOLAT¹, MEHMET ÖNAL²

ABSTRACT

Achillea armenorum Boiss. & Hausskn. is a perennial plant belonging to the family Asteraceae. It is an endemic plant that spreads in alpine regions especially located in karst ecosystems. This research - known as "Baytaran" among its people - *Achillea armenorum* Boiss. & Hausskn has been conducted to investigate climate, physiography and soil characteristics. This research was carried out on the Berit Mountain, which is located in Kahramanmaraş-Göksun. This species is found at an altitude of 2750-2900 m in the research area. It is located in the sub-alpine region in very steep and steep terrain. It is grown on karst landscape has soils with organic matter content of between 1,25 and 5,50%. These lands have soil textures such as "Clay", "Clay loam" and "Sandy clay loam". Soil reaction (pH) is between 7.55-7.97 in basic character. According to electrical conductivity values (1-5,69 mS / cm), soils are in the salt-free and slightly salty class. The surface stoniness ratio is over 50%. In addition, lime content was found to be high (12,3% - 18%). The wilting point of the soil was 3.64% and the field capacity was 31.78%. It has been determined that the nitrogen content is between 0.09% and 0.12%, the phosphor content is between 0.5-1.1 ppm and the potassium content is between 160-280 ppm. These soils are poor in phosphorus content and potassium content is sufficient. The C / N ratio ranges from 10 to 29. Decomposition rate is fast or normal. It has been used as a part of life in the region for many years with its long and effective smell. It is also used for breathing. Just as karst ecosystems are fragile and vulnerable, also they are habitats of many endemic species. Determination of the ecological conditions of these endemic species and evaluation of "in situ" or "ex situ" scopes should increase the number of species from which local people can make income from non-wood forest products.

**THE EFFECTS OF SOME SOIL PROPERTIES ON THE
DISTRIBUTION OF ORNITHOGALUM OLIGOPHYLLUM E. D.
CLARKE SPECIES IN SEMI-ARID AREAS**

EBRU GÜL¹, MELDA DÖLARSLAN¹

ABSTRACT

The semi-arid areas in Turkey cover mostly the areas where the Inner Anatolian Steppe is spreading. This study was carried out in order to determine the soil properties which are effective in the distribution of *Ornithogalum oligophyllum* E. D. Clarke geophytes species which is distributed on different main materials in semi - arid grassland areas of Center, Eldivan, Orta and Şabanözü districts of Çankırı province in Central Anatolian Region. Soil and plant sampling was carried out in 2016 year at 116 different points in 25m² quadrates. To determine the physical and chemical properties (texturing, pH, electrical conductivity (EC), lime content (CaCO₃) and soil organic matter content (TOM)) of the study area, composite soil sampling was performed at depths of 0-30 cm in quadrates. In order to determine the distribution of *O. oligophyllum* E. D. Clarke geophytes species, new quadrates of 1 m² were also settled into the determined quadrates and were taken the average of the obtained data. As a result of the obtained data, a correlation analysis was performed in order to determine the relationship between the distribution of *O. oligophyllum* E. D. Clarke geophytes species and soil properties. As a result of the study, it was determined that the chemical properties of soil (OM, EC) are particularly effective in the distribution of *O. oligophyllum* E. D. Clarke geophyte species at examined 116 points. OM and EC was high in areas where it was determined that a high number of plant species. This request shows that the salt demand of this species is high.

ASSESSMENT OF THE GENOTOXICITY OF USNIC ACID FROM LICHEN SECONDARY METABOLITES IN RAT NEURON AND GLIOBLASTOMA CELL LINES

BUGRAHAN EMSEN¹, HASAN TURKEZ², ALI ASLAN³

ABSTRACT

Glioblastoma multiforme (GBM) is the highest grade (grade IV) glioma tumor. Since glioblastoma always grows rapidly and shows highly malignant property, it is known as grade IV tumor. Since surgery, radiotherapy and chemotherapy methods utilized in treatment process with glioblastoma, usage of herbal products in the treatment process come into prominence. Lichens are symbiotic organisms used medicinal purposes for many years. It was reported that antitumorigenic activities of secondary metabolites from lichens on different cancer cells. The purpose of this study is determining of genotoxic effects in the cells via calculation of 8-hydroxy-2'-deoxyguanosine (8-OH-dG) level in U87MG, GBM cell line and primary rat cerebral cortex (PRCC) cells. 8-OH-dG level was measured using commercial oxidative DNA damage assay kit. 8-OH-dG level increased in a concentration-dependent manner for both cells. Correlation coefficient was 0.94 between concentration and oxidative DNA damage for both cells and this correlation was significant at the 0.01 level. While maximum concentration (40 mg/L) of usnic acid showed 4.55 pg/ml 8-OH-dG level on U87MG cells, 4.18 pg/ml 8-OH-dG level was seen in PRCC cells. There was statistically ($p < 0.05$) significant difference among the 8-OH-dG level of negative control and all concentration for both cells. Acknowledgment: We would like to thank Karamanođlu Mehmetbey University for granting us to conduct this study (BAP/01-D-13).

GENOTOXICITY EVALUATION OF BIFENTHRIN ON EUKARYOTIC CELLS AND ANTIGENOTOXIC EFFECT OF PORTULACA OLERACEA ON ITS GENOTOXICITY

HALİT KIZILET¹, HANDAN UYSAL²

ABSTRACT

In this study, bifenthrin's (BIF) genotoxic effects were evaluated in vitro and in vivo that were intensely used insecticide and attempted to resolve this effect with purslane (*Portulaca oleracea* L.) methanol extract (POmet). Somatic mutation and recombination test (SMART) was used for the in vivo study in *Drosophila melanogaster*, sister chromatid exchange (SCE) and micronucleus test (MN) tests were used for in vitro studies in human peripheral lymphocyte cells. Application groups were prepared in *Drosophila* instant medium (DIM) including different concentrations (4, 5, 6 and 7ppm) of BIF for SMART. 200 transheterozygote larvae were added to DIM. Wing preparations of hatching adult flies were made and were inspected. Different concentrations (50, 100, 250 and 500ppm) of BIF were added to human peripheral blood culture for SCE and MN. Spread preparations were made from the incubated cultures for 72 hours and were inspected. Ethyl methanesulfonate (EMS) was used as a positive control. When the all BIF application groups were compared with the DMSO application group for SMART, a positive result (+) was determined for the 7ppm BIF application group in normal wings phenotypes ($P<0.05$). All treatment groups of human peripheral lymphocyte cells in both in vitro tests results were statistically significant ($P<0.05$). Antigenotoxicity studies have been conducted being on the results of genotoxicity. 1% POmet was added to the highest application group of BIF for SMART, itself up POmet (1:1 v/v) was added to the highest application groups of BIF for SCE and MN. POmet has been found to be effective antigenotoxicity in both of in vivo and in vitro studies. Mutations increase on SMART, increase in the incidence of chromatid exchange on SCE and frequency increase on MN are indications of damage to genetic material. Also, removal of such damage by POmet, showed that POmet is a strong antigenotoxic agent.

CHRYSIN AND FLUNIXIN MEGLUMINE ATTENUATES TESTICULAR AND SPERMATOLOGICAL DAMAGES INDUCED BY COPPER SULFATE IN RATS

TUBA PARLAK AK¹, PINAR TATLI SEVEN², SEYFETTİN GUR², BURCU GÜL BAYKALIR², MİNE YAMAN², İSMAİL SEVEN²

ABSTRACT

Thirty-six healthy adult male Sprague-Dawley rats (6-8 weeks old, 250-300 g BW) were used in this study. Rats were randomly divided into the control and 5 treatment groups. During 21 days' period, group 1: Control group were not given any supplement, group 2: Copper Sulfate group (Cu) were given by gavage 500 mg/kg BW of copper sulfate every day; group 3: Flunixin Meglumine group were given intraperitoneally 2.2 mg/kg BW of flunixin meglumine every day; group 4: Chrysin group were given by gavage 50 mg/kg BW of chrysin every day; group 5: Cu+Flunixin Meglumine group were given by gavage 500 mg/kg BW of copper sulfate and intraperitoneally 2.2 mg/kg BW of flunixin meglumine every day; group 6: Cu+ Chrysin group were given by gavage 500 mg/kg BW of copper sulfate and 50 mg/kg BW of chrysin every day. In this study, sperm motility ($P<0.001$), sperm concentration ($P<0.05$), glutathione (GSH) and superoxide dismutase (SOD) activities ($P<0.001$) of rats given Cu decreased significantly in comparison with those in the control group. But malondialdehyde (MDA) activities indicating oxidative stress in testes tissues of rats given Cu increased significantly in comparison with those in the control group ($P<0.001$). In histopathological analyses, the testes tissues from the Cu-treated rats showed apoptotic indices along with degeneration, vacuolization, disorganization and destruction in seminiferous tubules when compared with the control group. The present study demonstrated that chrysin and flunixin meglumine to administrations Cu-treated rats provided significant improvements in the sperm qualities, disturbed oxidant/antioxidant balance, increased apoptotic cells and induced testicular damage. Chrysin and flunixin meglumine administrations to rats who were also treated with Cu increased significantly sperm motility ($P<0.001$), sperm concentration ($P<0.05$), GSH and SOD activities ($P<0.001$) whereas these agents decreased significantly MDA activities in the testes tissues in comparison to than that of the Cu group ($P<0.001$). In conclusion, it was determined that copper sulfate has quite toxic effect to on male reproductive system. Chrysin, that is a natural product, appeared to ameliorate the adverse effects on the sperm quality, the testicular antioxidant status and the testis tissue. Consequently, chrysin which has antioxidant effect may be prevents and treatments largely against the copper sulfate-induced reproductive system toxicity.

PROTECTIVE EFFECTS OF HIPERICUM TRIQUETRIFOLIUM TURRA UPON CHEMOTHERAPY-INDUCED TESTICULAR TOXICITY IN RATS

SENANUR CAN¹, VAROL SAHİNTÜRK², SONGÜL ÇETİK³, CUMALİ KESKİN³, ÖZGÜN TEKSOY⁴, ADNAN AYHANCİ⁴

ABSTRACT

Drugs used for treating cancer are known to have acute toxic effects upon the tissues with a high proliferation. Such factors as high doses alkylating agents, Cyclophosphamide (CP) in particular, cause multiple-organ toxicity. While testicular damage is not uncommon, the adverse effects of anti-cancer drugs upon this organ have been studied less extensively than those on other organs. Therefore, the present study aims to investigate the possible preventive effects of Hypericum triquetrifolium Turra (HT, hypericum), a plant extract known for its effective antioxidant and anti-cancer properties, against the testicular toxicity due to CP, a widely-used anti cancer drug. With this in mind, healthy male albino Wistar rats, aged 3-4 months weighing 200±20 g, were divided into 9 groups, each of them containing 7 members (Control, 150 mg/kg CP Group, 25, 50, 100 µg/ml HT Groups, CP+25, 50, 100 µg/dl HT Groups and 0.2 ml DMSO Group). All the injections were applied intraperitoneally. Except for CP, all the other chemicals were given for 6 consecutive days. In the CP groups, the drug was given only one dose a day. On the 7th day, the rats were sacrificed under ketamine/xylazine anaesthesia before their blood and tissue samples could be taken for analysis. The samples were then analysed biochemically, histopathologically, and immunohistochemically (caspase 3, Bcl-2, Bax). In order to determine the effects of antioxidant properties of HT, malondialdehyde (MDA), glutathione (GSH), superoxide dismutase (SOD), catalase (CAT), total antioxidant level (TAL), total oxidant level (TOL) and oxidative stress index (OSI) were analysed. In the groups given CP, oxidative damage was observed and this CP-related damage was attributed to MDA and TOS the decrease of GSH and TAL. Caspase 3, Bcl-2, Bax immunoactivities showed CP-related testicular damage depending on the severity of coloration. Our experimental results have shown that HT has got antioxidant and anti-carcinogenic effects, and that it becomes highly protective and curative when used along with various cytotoxic drugs. This study was conducted with the approval Local Animal Ethics Committee Eskişehir Osmangazi University (No: 531-2/2016).

HERBAL MEDICINE METHODS USED IN PEDIATRIC PATIENTS

SERPİL SÜ¹, GÜLSÜM GÜRSOY²

ABSTRACT

This compilation has been conducted for the purpose of explaining herbal medicine methods used in pediatric patients. The rate of using supplementary and alternative treatment methods in children especially with chronic illnesses varies between 1.8% and 84. Parents apply to these treatment methods due to believing in and adopting traditional applications, feeling unsatisfied with medical services, getting no result from modern medicine applications, feeling pain during efficient treatment methods, being tested and rejecting medicine and technology. Examining the treatment methods being applied; it is seen that herbal teas (mint-lemon, linden, sage) and ginger are used in upper respiratory tract infections; mint, lemon, linden in vomiting; herbal teas (anasone, razıyane, linden) in gas pains; herbal teas (linden, althaea pallida, cinnamon, mint-lemon, daisy) in coughing; mint-lemon in diarrhea; carob and pekmez in anemia. According to these results, it is recommended to inform families about consulting a physician before giving herbal products to their children.

THE EFFECTS OF MEDICINAL PLANTS ON CANCER CELL LINES AND EFFICACY OF EXPERIMENTAL ANIMAL MODEL

MEHMET İBRAHİM TUĐLU¹, İŐIL AYDEMİR¹, PINAR KILIĐARSLAN SÖNMEZ¹, TAHİR BURAN¹, MESUT METE¹

ABSTRACT

The use of medicinal plants as an alternative treatment is a historical process and has been known for a long time so that classical treatment can be more effective in wound and cancer treatment. It is important to use these products in terms of the efficiency of treatment as well as the reduction of costs. There is not enough consciousness and evidence-based information for their use and it is a major problem. The purpose of this study was to investigate the effects of plant extracts used for therapeutic purposes in cancer cell lines in vitro wound model and in vivo experimental animal model in order to obtain this information. The medicinal plants or extracts, olive (*Oleocanthal*) oil, mistletoe (*Viscum album*), common centaury (*Centaurium erythraea*), *Momordica charantia*, *Inula viscosa*, *Citrus aurantium*, thyme oil (*Thymus vulgaris*) and algae (*Jania longifurca*), were used. MCF-7, MB-MDA-231, 67NR and 4T1 for breast, NB2a for neuron cell, L929 for fibroblast and normal somatic mesenchymal stem cell for comparison were selected for in vitro wound models. As an in vivo experimental animal model, breast cancer model with 4T1 cells and skin wound healing were investigated. The effects of medicinal plants were evaluated using MTT assay for viability and proliferation, TUNEL for apoptotic cell death, and immunohistochemistry staining NOS for oxidative stress and wound TGFbeta1 for skin healing wound. The cells were photographed using phase contrast microscopy and light microscopy for cells in tissues. In terms of wound healing effects, it was found that in the in vitro wound model with (+) plus shape these extracts were beneficial effective by increasing the cell proliferation and migration in the varying the degree of the somatic normal cells. This effect was found to reduce antioxidative damage and inhibit apoptosis. Similar results was found with cancer cells for all extracts, but it was understood that depending on the type of cancer, proliferation and migration were reduced and cell death was increased. It was observed that oxidative stress and apoptosis were increased in cancer cells, but less effective in invasive cell lines. In vivo experiments showed that wound healing was accelerated and that these rates were achieved with antioxidative and antiapoptotic effects. Increased oxidative stress and apoptosis-associated cell death occurred in adenocarcinomas induced with 4T1 cells in the breast cancer model, also it was revealed that tumor growth rate was decreased by the antiproliferative effect. Only the neurotoxic effect of the algae extract was shown in the experimental animal model, which had serious clinical consequences. The use of medicinal plants both in preventive medicine and in cases where treatment is difficult is an application that should be done as a medical procedure based on scientific data. Investigation of these effects with existing techniques is very important to prevent harmful effects of insensible use. In this study, the mechanisms by which the beneficial effects of the medicinal plants used among the people are revealed and influenced. The neurotoxic algae extract proved to be very important in terms of showing the meaning of these scientific studies. The frequent use of algae, based on the beneficial effects of the vast majority of them, emphasized that this harmful effect should be kept in mind. It has

Corresponding Author: MEHMET İBRAHİM TUĐLU, mituglu@yahoo.com

¹MANİŐA CELAL BAYAR ÜNİVERSİTESİ

been concluded that medicinal plants are beneficial for treatment of difficult diseases in which patient quality of life is very effective and they should be used as scientific-based medical applications.

THE EFFECT OF GARLIC ON HYPERLIPIDEMIA

SONA AĐLAR (ARAŐT. GÖREVLİSİ DR.)¹, FATMA BETÜL ŐAHIN (ARAŐT. GÖREVLİSİ DR.)¹, KEMAL MACİT HİSAR (YRD. DOĐ. DR.)¹

ABSTRACT

Introduction: Garlic is an important diet and medicinal herb in human history. It has been used as food and medicine since ancient times. Garlic is a family of alliaceae and has the name *Allium Sativum* botanical. It is thought that the garlic is one of the first cultivated plants and the plantation started in the Middle East about 5000 years ago. It is a medicinal plant which is used in cardiovascular diseases, which is effective against blood pressure regulating, blood sugar and cholesterol lowering, bacterial, viral, fungal and parasitic infections, immunity system strengthening, antitumor and antioxidant properties as a result of information transferred between generations of generations and scientific studies. Reported. The investigation of the garlic began with an examination of antibacterial activity in 1930, and then continued with research on cancer inhibition at the end of 1940. Garlic is one of the most searched medicinal plants between 1960 and 2007. More than three thousand research articles on the chemical and biological effects of garlic and garlic preparations have been published. Aim: Hyperlipidemia is a significant risk factor for atherosclerosis and other cardiovascular diseases. Garlic, an important spice in human food, can contribute to lowering blood lipids and contributing to anti-atherogenic effects. For this reason, the hyperlipidemia effect of garlic has been evaluated in various clinical investigations to date. Studies on the effect of oral garlic on serum lipids have shown positive results in the majority of cases of low hyperlipidemia. In the light of the available information, the aim of this study is to systematically look into the investigations of the hypolipidemic effect of garlic. Material and Method: The survey of this work took place between 20-27 March 2017. Systematic literature reviews were conducted on Wiley-Blackwell, Web of Science, Scopus, Science Direct Journals, PubMed, Medline, Google Scholar, and electronic databases to gather the necessary information. Numerous articles in English, Russian and Turkish published between 2008-2017 have been reviewed. In total, over 60,000 articles related to the "garlic" key word have been reached on 18,900 articles on the key phrase "the traditional use of garlic", and 2000 articles on the "hyperlipidemia effect of garlic" key. A total of 100 full-text articles were reviewed, with a focus on the review type and articles containing meta-analysis. Results: The recent rise in the popularity of alternative medicine and natural products has increased the current interest because garlic and its derivatives are regarded as potential natural remedies. This systematic oversight can be useful for increasing our knowledge of the therapeutic effects of garlic and for improving our future experimental and clinical research plans. Nevertheless, although it has been shown that garlic may have significant clinical potential as an adjuvant treatment on its own or in different disorders, methodological insufficiencies, small sample sizes, lack of knowledge of dose justification, lack of placebo comparator or absence of control groups, beneficial effects of garlic There is a need for more standardized experiments and investigations to confirm. For better comparison in experimental investigations, studies on the effect of garlic should include information on the dosage of the active

Corresponding Author: **KEMAL MACİT HİSAR (YRD. DOĐ. DR.)**, kmhisar@hotmail.com

¹S.Ü. TIP FAK. HALK SAĐLIĐI AD..

ingredients of standard garlic preparations. It will be positive to discover the effect of different forms of the garlic extract on standard drug therapy, especially when used as adjuvant therapy. While it is believed that garlic is safe to use, it can provide insight into the possible side effects of different garlic extracts for long enough to work. The safety of garlic should be tested in young children as well, especially in pregnant or lactating women. Long-term and major research is needed to assess the mortality, serious adverse events and morbidity of cancer and cardiovascular diseases after garlic treatment. In an experimental study comparing amaranth, linseed and olive oils and chitosan, alginate and pectin, it was found that garlic powder significantly reduced triglycerides (-23.6% -22.8%). Garlic can be considered as a complementary treatment option for lowering elevated cholesterol. There is a need for long-term work in the future to elucidate the effect of garlic on cardiovascular morbidity and mortality.

A SYSTEMATIC REVIEW OF HERBAL MATERIALS USED TO ELIMINATE MENOPAUSAL COMPLAINTS

FILIZ HISAR (DOÇ. DR.)¹, KEMAL MACİT HISAR (YRD. DOÇ. DR.)²

ABSTRACT

Introduction: Menopause is a period of life in which the reproductive ability of women over reproductive functions has disappeared. Menopause according to the definition of World Health Organization (WHO); Is the permanent termination of menstruation as a result of the loss of ovarian activity. During menopause, hormonal, physical and emotional changes occur in women due to the decrease of estrogen hormone. The problems experienced during the menopausal period are: short-term vasomotor, atrophic and psychological changes, long-term cardiovascular diseases and osteoporosis. 75% of menopausal women in developed countries such as USA, Netherlands, Australia, Japan have a hot press, 41% nervousness, 40% fatigue, 39% sweating, 38% headache, 32% insomnia And 30% had complaints of depression. In our country, there are problems such as night sweats in 31.3%, rare cases of menstruation in 38.8%, hair loss in 42.2%, headache in 63.1%, dizziness in 39.7% and tingling of hands and feet in 45.2% . Women use different pharmacological and non-pharmacological treatment options to relieve the symptoms of menopause. They are used in herbal remedies in non-pharmacological treatments. These plants include flax seeds, peanuts and sage. **Purpose of the study:** In this study, it is aimed to examine the systematic compilation of the herbal materials applied to eliminate menopausal symptoms in the world and in our country. **Method:** The survey of the workshop was conducted between 3-15 March 2017. Through the use of 360 search by electronic scan engines, 55 articles have been reached with menopause in Wiley-blackwell, Web of Science, Scopus, Science Direct Journals, Pubmed, Medline and Cinahl plus full text databases. Menopausal symptoms expression has reached 12 articles. 20 articles have been reached with public health statement. In the context of herbal applications on menopause, 2 articles have been reached. In addition, 9 articles have been reached by systematic review. There are also scans in the google search engine (20 English, 4 Turkish articles reached). A total of 120 articles have been reached. 24 items related to menopause and plant use **Conclusion:** It has been determined that women use herbal materials in 80% of studies investigating menopausal symptoms and their relationship with herbal materials. The usage rates of these materials vary according to the countries and races. In 88.8% of the articles, there is a direct correlation between the severity of women's menopausal complaints and the use of herbal materials.

THE USE OF MEDICINAL AND AROMATIC PLANTS IN DENTISTRY

DERYA CEYHAN¹, GÜLBEN GÜNEY¹, ZUHAL KIRZIOĞLU¹

ABSTRACT

Our country locates in a geography where four seasons are lived and shapes of the earth are varied and so, the richest plant species of the world grow. The studies from past to present have aimed to determine the efficiencies and effects of plants that have traditionally been used for years on human health. In this respect, it is important to establish a framework for the use of these plants in the field of oral health by determining purposes of the use, appropriate concentrations and side effects. In this study, it was aimed to consider the most studied plants in dentistry and to provide a guide presenting the current status for clinical applications by considering previous researches performed. In our age, supporting modern medical approaches with alternative medicinal methods has become widespread. Plants have been used for centuries as a healing resource in diseases. Using plants for this purpose has led to emergence of the science of "Phytotherapy". The most common problem faced with using plants for medicinal therapies is the lack of information about the action mechanisms and side effects in tissues. In studies conducted in different countries in both medicine and dentistry, analgesic, sedative, antiinflatuar, antimicrobial, antibacterial, antiviral, antifungal, antihistaminic, antiseptic, and antioxidant properties of various plants have been utilized, and treatment alternatives have been presented. These herbal products which are used as an alternative to the traditional treatments in dentistry and are easily accessible and cheap have been used during and after dental treatments, in the presence of gum diseases, after surgical procedures, in microbial, viral, bacterial and fungal lesions of mouth and in temporomandibular joint pain. For these purposes, the most studied plants have been chamomile, propolis, green tea, ginger, aloe vera, sage, garlic, clove and rosemary, and positive features of those plants have been mentioned. Side effects such as halitosis, soft tissue burns, allergic reactions, cytotoxicity, digestive problems and abortion during pregnancy have also been reported in addition to the positive features of the plants used for alternative medicinal therapies. The use of plants for medicinal purposes increases day by day, but there are also some inaccurate informing about the subject in audial and visual media. To prevent this situation, the number of scientific researches dealing with plants should be increased, and the informing should be done by physicians with reference to results of the researches. On the other hand, it is also thought that the inclusion of alternative therapies, especially "Phytotherapy", with defined areas of usage and doses to the education of clinicians would be beneficial. In dentistry, there is a need for further long-term scientific studies for plants to be used routinely.

REAL-TIME CELL ANALYSIS OF THE CYTOTOXICITY OF EUPHORBIA CHAMAESYCE EXTRACTS ON HUMAN COLORECTAL ADENOCARCINOMA (HT-29) CELL LINE

FEYZA OKE-ALTUNTAS¹, MUHAMMED ALTUN², İBRAHİM DEMİRTAŞ²

ABSTRACT

Euphorbia L. (Euphorbiaceae) is one of the largest genus among flowering plants, with approximately 2160 species and represented by two subgenera (subg. Chamaesyce, subg. Esula) with 111 taxa (except for cultivated ones) in Turkey. Euphorbia chamaesyce belongs to subgenus Chamaesyce and known as “şebrem”, “alçak boylu sütleğen” in Turkey. In this study, various solvent extracts were obtained from stem and seed parts of Euphorbia chamaesyce L. Cytotoxic effects of the all extracts on human colorectal adenocarcinoma (HT-29) cell lines were investigated by Real Time Cell Analyzer xCELLigence method. The highest cytotoxic effect was observed from stem chloroform extract (IC₅₀ < 50 µg/mL) against HT-29 cell line. All the extracts exhibited moderate cytotoxic activity at 50 and 100 µg/mL concentrations and remarkable cytotoxic effect at the highest concentration (250 µg/mL). The stem acetone extracts exhibited low cytotoxic on HT-29 cells at tested concentrations. The results showed that E. chamaesyce extracts, especially stem chloroform extract, could be used as a natural source for pharmacy industry.

OPTIMIZATION OF GALLIC ACID EQUIVALENCE OF TOTAL POLYPHENOLICS EXTRACTION FROM BLACK CUMIN BY RESPONSE SURFACE METHODOLOGY

BURCU ÖZTÜRK¹, SİBEL YİĞİTARSLAN¹

ABSTRACT

Because free radicals are active molecules, any molecule in the environment can bind freely to itself, allowing them to proliferate in an uncontrolled manner, and this proliferation is predicted as the cause of cancer in the cells. Antioxidants are important compounds that neutralize and inactivate these free radicals. Gallic acid, a potent antioxidant, is known as showing cytotoxicity to cancerous cells without damaging healthy cells. Extraction, which is a separation process, is used to obtain the gallic acid from the plant source. Extraction is a process by which a particular material in a source is diffused into a suitable solvent. In this study, it was aimed to obtain gallic acid equivalence of total phenolics of black cummin by microwave extraction. As stated in the literature, polyphenols and lignans in plants can be separated by this method. In batch extraction experiments, selected parameters were solid-to-liquid ratio, extraction time and microwave power. In addition to utilizing the microwave power to achieve the maximum efficiency, multiple optimizations had been made to ensure that this maximum efficiency required minimum cost. In the study, multiple optimization was applied through the Design-Expert program using a three-parameter three-level Box-Behnken design. In the experiments, 1 gr black cummin was extracted with the different amounts of methanol (30, 45, 60 ml), within different time courses (10, 20, 45 sec) and by applying different microwave powers (0.3-0.6-0.9 kW). The samples were filtered with FilterLab paper (110 mm) and taken into the glass tubes. The amount of gallic acid equivalence of total phenolics in the samples was determined by the Folin-Chiocalteu Method (400µl sample, 100µl pure water, 0.5ml folin, 1.5ml Na₂CO₃, 5ml distilled water). Optimum function, three-dimensional surface graphics and optimum conditions transferable to the industry had been achieved by transferring the obtained data to the response surface method. In the study, optimum microwave extraction parameters were determined as 0,9 kW for the microwave power, 25 seconds for extraction time, and 1/60 g/ml for solid-to-liquid ratio. The quadratic model (R² = 0.9949) was found to be the best function when the ANOVA table was interpreted, and the most effective single parameter was found to be the microwave power by comparing F and p values. In binary interactions, it was determined that the most effective parameter pair on yield was the microwave power-time parameter. The optimum extraction conditions resulted from the best surface function obtained by the response surface methodology were 10.84 seconds, 1/46.97 g/ml, and 0.62 kW for time, solid-to-liquid ratio, and the microwave power, respectively. Under these conditions, the maximum amount of gallic acid (309.597 mg) was obtained.

INVESTIGATION AND DETERMINATION OF FATTY ACID, TRIGLYCERIDE AND TOCOPHEROL COMPOSITIONS OF COLD PRESSED THISTLE SEED OIL

MUSTAFA TOPKAFA¹, HAMIDE FILİZ AYYILDIZ², RAZIYE NUR TENEKECİ², HÜSEYİN KARA²

ABSTRACT

The cold-pressing procedure introduces neither heat nor chemicals in comparison with conventional screw press and organic solvent extraction practices to the raw material. Therefore, Cold pressed seed oils have important nutritional and chemical properties and retain higher levels of beneficial phytochemicals such as high content of tocopherols, sterols, carotenoids, phospholipids and antioxidative phenolic compounds as well as essential fatty acids. Among these seeds, thistle (*Silybum marianum*) grows easy cultivation, high yields in Turkey. Thistle seed contains vary valuable oil about 30 % on dry matter basis. The cold pressed thistle seed oil has triglycerides containing unsaturated fatty acids, rich in linoleic and oleic acids and, contains significant levels of tocopherols and tocotrienols (tocols). These triglycerides and tocols have nutraceutical, cytotoxic and biological activities such as reduce the risk of cardiovascular diseases, decreasing LDL oxidation, inhibiting lipid peroxidation in biological membranes, breaking free radical chain reactions and provides some natural oxidative protection to the oil. The goal of this study was to investigate the nutritional value and chemical properties of cold pressed thistle seed oil grown in Turkey by considering of fatty acid triglyceride and tocol composition. Fatty acid composition was performed by GC method. Triglyceride and tocol composition were performed by HPLC method. Cold pressed thistle seed oil contained greater amount of unsaturated fatty acids. Linoleic acid was found to be dominant (48 %) followed by oleic acid (30 %) and palmitic acid (7 %). Dominant triglycerides were found to be Oleic-Linoleic-Linoleic Acid (OLL) (24 %) and Linoleic-Linoleic-Linoleic Acid (LLL) (23 %) in cold pressed thistle seed oil, followed by Palmitic-Linoleic-Linoleic Acid (PLL) (12 %) containing palmitic acid and linoleic acid. The total tocol content was found as 185 mg/kg, while α -tocopherol (120 mg/kg) and γ -tocopherol (51 mg/kg) were the most abundant tocol forms. As a result, the obtained data demonstrate that cold pressed thistle seed oil should be regarded as nutritional and medicinal product due to its superior properties such as unsaturated fatty acid and triglyceride contents.

**VARIATION OF FATTY ACID COMPOSITIONS IN CORIANDRUM
(CORIANDRUM SATIVUM L.) CULTIVAR GROWN IN TWO
DIFFERENT ECOLOGY**

MEHMET NECAT İZGİ¹, İSA TELCİ²

ABSTRACT

Coriander, *Coriandrum sativum* L., belonging Apiaceae family is an important spice plant grown different locations of Turkey. The study was aimed to investigate the composition of fatty acid compositions of 6 coriander cultivars (Gamze, Arslan, Erbaa, Pelmus, Kudret, Grbz) in two different ecologies of Turkey (Tokat and Mardin). The oil compositions of the obtained oils with cold extraction were analyzed by Gas Chromatography. In the results, total 22 fatty acids were identified in the cultivars Petroelinic acid was the major fatty acid in all varieties, followed by linoleic acid and palmitic acid. The variation of the major fatty acids was limited in the study. The highest amount of petroselinic acid was changed between 80.5-82.61% and the highest value was reached in Aslan variety in Mardin. Palmitic acid, which is saturated fatty acid in all varieties, was found high in Mardin, while unsaturated fatty acid linoleic acid in Tokat. It concluded that the effect of regions on fatty acids was limited in the study.

INTEGRITY INTACT CORIANDER FRUIT OIL: FRESH! NATURAL! MIRACLE! AND FUTURE PROSPECTS

ALEV ÖNDER¹

ABSTRACT

Nature is full of miracle plant species which serve for human health with a wide diversity of beneficial effects such as in foods, cosmetics, and pharmaceutical industry. Coriander (*Coriandrum sativum* L.) is a very popular medicinal plant from Apiaceae family which is widely used as a spice in folk medicine and also desired in pharmacy and food industries mainly employed as food in the Western and Eastern countries. Since 1550, it has been used in Egypt as one of the earliest spices. Coriander (Cilantro, Kişniş, Chinese parsley; *Coriandrum sativum*) is extensively known in almost every recipe. In the history, coriander was determined in the Neolithic level of the Nahal Hemar Cave in Israel and the tomb of Tutankhamun. *C. sativum* L. belongs to the family Apiaceae in taxonomic classification, but its origin is unclear. The genus Coriander was represented in Flora of Turkey with two different species as *C. sativum* and *C. toridylum*. It is mainly cultivated for the seeds in the countries which contain an essential oil (linalool, % 60-70), besides fatty acid content, coumarins, flavonoids, polyphenols. Nowadays, the seeds are exhibited internally carminative, digestive, spasmolytic, and galactagogic effects in many disorders and diseases. Using forms include a wide assortment of fresh and dried herbs, the seeds of coriander, extracts, varied oil, alcohol and water-based solutions, teas, essential oils. The current study is concentrated on integrity intact essential oil, which is extra virgin oil cold pressed from coriander seed with zero treatment other than mechanical at 30⁰ Celsius. In this presentation, of all the miracle effects of coriander, we aimed to focus on its skin regenerative properties of coriander essential oil, besides derive the methods, discover the formulations together with future prospects!!.

JUNIPER TREE (*JUNIPERUS COMMUNIS L.*), JUNIPER'S SEEDS AND JUNIPER OIL

AYLA ÜNVER ALÇAY¹, MERYEM BADAYMAN¹, EKİN DİNÇEL¹, CANSU AKGÜL¹

ABSTRACT

Juniper tree (*Juniperus communis L.*) is a fragrant tree and has got long and needle-like leaves, bright black, conifer-like fruit. It can grow to an average of 8-9 meters and live for hundreds of years. There are 60 species that grow in the Northern Hemisphere and 8 species of juniper grow in our country. It is also cultivated as an erosion preventative, wind, snow and sound curtain and ornamental plant. The juniper plant was a very popular plant in ancient Mesopotamia and Europe, medieval times and later periods. For protection from the witches, juniper were sew up on the garden and the juniper was burnt to expel the snakes. People in the Middle Ages ate plenty of juniper fruit in many parts of Europe to be protected from the plague disease. It was burned in plague outbreaks, the doctors used it as a primitive filter by putting it in the beaked masks. For thousands of years, Turkish culture has become one of the symbolic trees. The juniper can keep up for hundreds of years after the tree has been killed. It is a resilient species that can tolerate the most difficult climatic conditions such as drought and frost, and is also known as the last tree that leaves the juniper forest. The juniper word means "remains, not to disappear" in the Turkic language. It is a tradition to plant juniper in Central Asian Turkish graves. There are many sacred places in ancient Turks carrying the name of juniper. Currently, in our country people tie a cloth to the branch of the tree which are considered sacred in some regions to make a wish. It is obtained a easy-workable and semi-precious stone called "oltu stone" from the fossilized roots of the juniper tree. It is believed that the oltu stone known as the luck stone among the people today is good for the evil eye and gives positive energy to the human body. Juniper trees are used in abundance in the medical, pharmaceutical and food sectors due to the chemical compounds found in their leaves and seeds. The seeds are used to give a different smell to meals, snacks or different food. It is used to flavor many alcoholic beverages. The aroma is very strong and sharp. Antibiotic, analgesic, hepatoprotective, antidiabetic and antihyperlipidemic, antimicrobial, anti-inflammatory, diuretic, antioxidant, antihypercholesterolemic, anticathaleptic activity and neuroprotective activities in Parkinson's disease have been reported for this plant. Traditionally, the plant has been used as antidiarrheal, antiinflammatory, astringent, antiseptic, and in the treatment of various abdominal disorders. The major chemical components reported in *J. communis L.* can be summarized as α -pinene, β -pinene, apigenin, sabinene, β -sitosterol, campesterol, limonene, cupress flavone, flavonoids, lignans, tannins and others. The juniper, the most durable tree against tough conditions among tree species, once formed about ten percent of Turkey's forest entity. Today, however, juniper forests are rapidly disappearing in our country. The juniper trees that can not be cultivated from the seeds before and can only be grown by germinating seeds in stool of the juniper bird can now be produced by human hands. The recovery of juniper forests, which have an important tree of Turkish culture, and which have been lost to the present day, will provide economic and cultural value. This review contains pharmacological activity and health benefits and the place of this plant in Turkish and Anatolian culture.

EVALUATION OF SELECTED MEDICINAL HERBS' COLD PRESSED OILS ACCORDING TO THEIR PHYSICOCHEMICAL PROPERTIES WITH CHEMOMETRY

ZELİHA USTUN ARGON¹, ALI GOKYER², ZINAR PINAR GÜMÜŞ³, MEVLUT BÜYÜKHELVACIL²

ABSTRACT

There is growing interest in herbal preparations, such as oils from plant sources. Vegetable oils have significant antioxidant properties and unique phytochemicals and these have been used since the beginning of history to treat diseases due to the positive effects on human health [1]. Since these oils have been used to treat certain health problems, there is a significant increase in the use of these oils not only in the food industry but also in medicine and cosmetics [2]. In this study, we investigated the effects of cold pressed oil on physicochemical properties of milk thistle (*Silybum marianum*), anise seed (*Pimpinella anisum*), fennel seed (*Foeniculum vulgare*), terebinth (*Pistacia terebinthus*), coriander (*Coriandrum sativum*) and nettle seed (*Urtica dioica*) cold pressed oil according to their physicochemical characteristics. As a result of previous scientific studies of these medicinal plants, extensive collections of pharmacology and chemistry of plants have emerged [3-9]. Selected oils were investigated in terms of the fatty acid methyl esters (FAME) compositions, peroxide value (PV), free fatty acid (FFA) content, refraction index (RI) 40 ° C and oil seed yields. Seeds have been chosen from Central Anatolia Region and samples range differs from 4-7. The data obtained from the analyzes were evaluated chemometrically. The diagrams were obtained by a principal component analysis (PCA) score and loading plot and hierarchical clustering analysis dendrogram of seed oils. According to PCA and HCA results, selected seed oils have different properties in terms of FAME, FFA, PV and RI. This suggests that each fat originates from the physicochemical properties of its unique pharmacological properties. As a result, in this study, information on the physicochemical properties of oils obtained from six medicinal plants was given. These results indicate that the seeds of the Central Anatolian region can be used as acceptable raw materials for herbal natural support products. In addition, these analyzes can be used in quality control laboratories and production lines as they are intended to determine the purity and quality parameters of seed oils. It has been shown that the FAME, PV, FFA and RI analyzes can be used to determine any adulteration to these oils by chemometric analysis. CHEMICAL COMPOSITION OF THE ESSENTIAL OILS FROM ROSINS OF TURKISH PINUS BRUTIA AND PINUS NIGRA

MEHMET HAKKI ALMA¹, FATİH TUNCAY EFE², TUFAN SALAN³

ABSTRACT

In Turkey, the genus *Pinus* (Pinaceae) is represented by 5 species, e.g. *P. brutia*, *Pinus nigra*, *P. sylvestris*, *P. halepensis*, and *P. pinea*, *P. nigra* is distributed in Anatolia, Cyprus, Crimea, West Caucasus, Balkans, the South Carpathians, and Western Syria. All the *pinus* species contains essential oils, which have economic value and have been used in cosmetic, paint, pharmacology, agricultural protection and various chemical industries as solvent or main components. The essential oil yield greatly varied with tree parts of the *pinus* species. In this study, the rosins were provided from from *P. brutia* L. and *P. nigra* L. trees grown in Andırın state forests located in Emirler village in Kahramanmaraş province of Turkey. The stems of the living trees, having age of 20 years, were injured, and the flowed rosin were collected after 10 days. The essential oil from the rosins of Turkish *Pinus brutia* and *Pinus nigra* (Pinaceae) was obtained by the hydro-distillation method, and its chemical composition was analyzed by GC and GC-MS. The results showed that yields of essential oil from *P. brutia* and *P. nigra* were 5.09% and 2.52% (on the basis of wt% of rosin), respectively. The major components of essential oil from rosin of *P. brutia* were α -pinene (44.97%), Δ^3 -carene (15%), β -pinene (10.83%) and camphene (2.88%), while the major components of essential oil from rosin of *P. nigra* L. tree were α -pinene (62.22%), Δ^3 -carene (18.25%), limonene (6.46%) and β -pinene (4.55%).

DETERMINATION ON ESSENTIAL OIL RATE AND COMPOSITION OF SOME CISTUS SPECIES IN MUĞLA-ULA PROVINCE

ÖZDERİN SEVGİN¹, HÜSEYİN FAKİR²

ABSTRACT

In this study; it was aimed to determine the essential oil percentage and assign on composition of ; *Cistus cretius*, *Cistus laurifolius*'s that are in the family of Cistaceae which are important species of Turkey. These species were provided from Muđla-Ula. Samples were dried in room conditions and hydrodistilled by Clevenger apparatus for 3 h. Thus, essential oil yield was determined as percentage and compounds were identified by GC-MS. It was found that the essential oil yield and the most abundant three componets *Cistus cretius* 0.1%, Carvacrol 32.56%, Cineole 23.73%, Hexahydrofarnesyl Acetone 20,9, %, *Cistus laurifolius* 1.1%, carvacrol 20.53%, cymene 9.50%, farnesol/bergamotene 7.62% were determined according to GC-MS analysis results.

**SUBJECTIVE EFFECTS OF LEMON , ROSE AND LAVENDER
ESSENTIAL OILS ON HUMANS: A CASE STUDY FROM DIFFERENT
TWO AGE GROUPS**

FATMA ÇİĞDEM SAKİNOĞLU ORUÇ¹, SEVDA DURSUN¹

ABSTRACT

Plant volatile oils have been used for different purposes for years, especially in the scientific and commercial areas. Among the major areas of their uses were the cosmetic, pharmaceutical and food industries, and the aroma/phyto therapeutic applications. The lemon, rose and lavender oils were the most commonly used oils and their effects on humans also differed individually. In this study, effects of these essential (volatile) oils on two age groups, 17-24 and 25-40 were thus investigated. The study was conducted on 80 people for one hour and the effects were evaluated using questionnaires. In 17-25 age group, lavender oil caused drowsiness and weakness in 60% and 50% of respondents respectively, and also some mild giddiness, nausea, headache and dizziness. In 25-40 age group it caused giddiness and weakness in 40% respondents, and also gave mild vigor and tranquility. Lemon oil caused drowsiness in 85%, weakness and headache in 50%, and clear sensation in 55% of the respondents from 17-24 age group, while in 25-40 age group it caused clear sensation in 80% of respondents, and gave the mood of tranquility in 70% and happiness in 60%. However, rose oil demonstrated more intense effects on people, causing drowsiness and nausea in 55%, weakness and headache in 50%, and also giddiness, face flush and palpitation in 17-24 age-group-respondents. In 25-40 age group it caused drowsiness and nausea in 40% while it gave happiness and tranquility in 60% of respondents. Study results indicated that effects of different types of volatile oils on humans vary based on the age groups. So, the preference of essential oils in our daily lives is implied to have great importance. Therefore, further studies on the subject should be conducted to better emphasize the choice and use of these oils based on the age groups.

EVALUATION OF CHEMICAL CONTENT OF ALLIUM VINEALE L. EXTRACT USING SUBCRITICAL WATER EXTRACTION

İBRAHİM TEĐİN¹, BETÜL SADIK², ERDAL YABALAK³, MEHMET FİDAN²

ABSTRACT

Subcritical water extraction method (SWE) has gained great attention in the food and pharmaceutical industry, due to its excellent characteristics for the extraction of valuable ingredients from various matrixes [1, 2]. Subcritical water is known as water that heated between 100-374 °C temperatures and pressurized enough to keep it in the liquid form [3]. Physicochemical properties of SWE, especially adjustable solvent power based on applying temperature make it unique [4-6]. Even, SWE can behave as a non-polar solvent at high temperature [7]. Although various traditional methods have been used as extraction process, they have several disadvantages such as consuming time, low selectivity and releasing large amounts of toxic solvents [2]. Subcritical water extraction offer a reliable alternative which able to overcome these drawbacks. *Allium Vineale L.* has many application areas around the world. Nowadays, *Alliums* is used to produce flavor, aroma and taste as raw material in various food production processes (dehydration, freezing, canning and acidification) [8,9]. Different clinical studies have shown that such plants are responsible for reducing cholesterol and blood pressure, relieving stress, anti-cancer, brain and neurotrophic, liver protection, enhancing immune system and anti-infection [8]. Many studies have shown that *Allium* is of great importance for the prevention and treatment of many diseases due to antioxidant effects [8, 10]. Dried and crushed samples of *Allium Vineale L.* was extracted using the experimental set-up as shown in our previous work [7]. Extracts were collected after specific time under 105 °C and 40 bar. Samples were analyzed by GC-MS according to Wiley7Nist05.L, NIST05a.L, W9N11.L, to determine extracted compounds. Some of these compounds are as follows: 1,3-Dioxolane, 3-Piperidinol, p-Vinylguaiacol, Acetic acid, Cyclobutanol, 2-Aminopropane, 1-Isopropylidiaziridine, Inosine, Butanedioic acid, p-Vinylguaiacol, L-Proline, Trithiapentane

RESIN PRODUCTION BY ACID-PASTE AND BORE HOLE METHOD FROM RED PINE (*PINUS BRUTIA* TEN.) AND MARITIMA PINE (*PINUS PINASTER* AIT.) AND CHEMICAL ANALYSIS OF TURPENTINE

ILHAN DENİZ¹, İSMAIL AYDIN¹, KEVSER ALTINTAŞ¹

ABSTRACT

Resin Production by Acid-Paste and Bore Hole Method from Red Pine (*Pinus brutia* Ten.) and Maritima Pine (*Pinus pinaster* Ait.) and Chemical Analysis of Turpentine The effects of acid paste and borehole method, region, tree species (*Pinus brutia* Ten., *Pinus pinaster* Ait.), tree diameter and altitude on oleoresin and colophane and turpentine yield and chemical composition of turpentine were investigated for 2 years(2015-2016). Turpentines were analyzed by GC-MS. Resin production was made in maritima pine 375 trees and red pine 540 trees. According to the results obtained, oleoresin average yields in acid-paste method for maritima pine were found as 2015 and 2016 respectively 1457-2042,4 gr/tree in Kocaeli and 2200-2497,5 gr/tree in Yalova, whereas for red pine 448-615 gr/tree in Mugla and 723-919 gr/tree in Silifke; as for the borehole method, 290 gr/tree in Kocaeli for maritima pine, whereas for red pine 138.2 gr/tree in Mugla and 580 gr/tree in Silifke. For the maritima pine, the general average of oleoresin yield for 2 year was 1750 gr/tree whereas for red pine the overall average was 676.3 gr/tree. The maritima pine has generally yielded higher oleoresin yields than the red pine. The lower yield of red pine can be due to the fact that the ratio of lead acid/paste is 1/9. The borehol method overall oleoresin average was 290 gr/tree for the maritima pine and 359 gr/tree for the red pine. The yield of oleoresin increased as the diameter of the tree increased, but generally decreased with increasing altitude. Maximum resin yield for both trees was obtained at 0-100 m altitude, and from trees at diameter level of 38 cm and above.

**GREEN SYNTHESIS OF SILVER NANOPARTICLES USING
CINNAMON EXTRACT AND ITS COMPARATIVE TOXIC EFFECT
VERSUS AQUEOUS EXTRACT AGAINST CALLOSBRUCHUS
MACULATUS (COLEOPTERA: BRUCHIDAE)**

**FATMA NUR ELMA¹, MASOOD HUSSAIN², AHMET AVCI³, EROL PEHLIVAN⁴, SYED TUFAIL HUSSAIN SHERAZI²,
SIRAJ UDDIN²**

ABSTRACT

ABSTRACT Green silver nanoparticles were synthesized using cinnamon extract as reducing agent. The fabricated silver nanoparticles covered with cinnamon extract were characterized by several spectroscopic and optical techniques. UV-Visible spectroscopy was carried on to confirm the formation of silver nanoparticles covered with cinnamon extract (cinnamon-AgNPs) by optimizing various reaction parameters such as concentration of precursor salt, volume of cinnamomum extract, pH value and temperature. FT-IR study was performed to confirm the interactions of cinnamon with silver nanoparticles. In order to study the crystalline nature of silver nanoparticles XRD study was carried out and results indicated the crystalline nature of silver nanoparticles. Size analysis was carried on using TEM. Nanotechnology has been one of the promising new approach for the management of insect pest since the last decades. In this study, the toxic effects of silver nanoparticles (Ag NPs) covered with cinnamon extract were tested against adult stage of *Callosobruchus maculatus* (Coleoptera:Bruchidae). The toxic effect were evaluated for 24, 48 and 72 h with varying concentrations of aqueous cinnamomum extract without Ag nanoparticles and silver nanoparticles covered with cinnamon extract . Results showed that the synthesised silver nanoparticles covered with cinnamon extract showed maximum toxic effect with the highest concentration after 72 h (60.72%). The aqueous extract of Cinnamon extract did not have a significant effect on *C. maculatus*. The results also showed that the silver nanoparticles covered with Cinnamon extract were detected a significant toxic effect against adult of *C.maculatus*. **ACKNOWLEDGEMENTS** The authors pay thanks to TUBITAK for financing this work via BIDEB 2216 Research Fellowship Programme Ref: 21514107-115.02-188888.

CULTIVATION AND PROTECTION STRATEGIES OF GENTIANA LUTEA

AYŞE SERMİN ÖZER¹, RAGIP AKDEMİR², CIHAN KÖSE³, NEŞET ARSLAN⁴

ABSTRACT

Cultivation and protection strategies of *Gentiana lutea* L. The plant naturally grows in Bursa (Uludağ), Kütahya (Radar, Domuzkertiği, Acısu, Üçtepelere ve Daritepe -fire towers locality) and Ödemiş (Bozdağ), our country. *Gentiana lutea* L., one of our most important endangered species is the species of Gentianaceae family having around 87 varieties and 1650 species. The plant which possesses therapeutic property and economic value is also known with the various names such as yellow herb and bitter root, etc. among the public. In the report prepared by the Traffic being an international institution, it is stated that our country is one of the most significant shelters for this plant and the cultivation studies and the researches to be conducted for *Gentiana lutea* L. in Turkey should be supported. Considering that *Gentiana lutea* L. could not be grown from seed in our country and the presence of difficulty for germination of its seeds, it is of vital importance that it is grown in other ecosystems where it shows natural dissemination and in the ecosystem with the seeds taken from their natural growing environment, the current situation in their natural growing environments are observed. Therefore, a detailed Project study is initiated about *Gentiana lutea* L. They are grown from around 200 individual seeds first time in Turkey through their natural environment as a part of growing studies. The parent material used in this Project study is *Gentiana lutea* L. seeds collected from their natural environments. The roots which are dried in the shade of the plant collected from natural growing environment are used for root analyses too. The performed studies are soil analyses, growing studies, root analyses, the observation related to current situation in Turkey and the inventory studies made in Bursa and Kütahya. Extinction is the process which depends on possibility and many factors. The global warming, climate change and drought experienced in recent years also affects *Gentiana lutea* L. negatively like all vegetable resources. When no efficient protection measures are taken, it is estimated that extinction possibility of *Gentiana lutea* L. will rise more in the forthcoming years. For this reason, *Gentiana lutea* L. should be placed in higher (urgent) threat class. It is recorded by trying to determine the changes in current situation and its speed by way of the observation and inventory studies to be carried out periodically. According to IUCN criteria, *Gentiana lutea* L. is recorded as "endangered (EN)" for Turkey. However the rarity, littleness of current locations and the populations in the area where it is found, the number of plant giving seed in population, observable negative effects of climate change are taken into consideration, taking in CRITICAL (CR) class is offered after this study. But, after the study ends, the observations in the field are also continued and it is observed that substantial increases have taken place in their natural spreading areas. As per the results of the conducted inventory study, natural spreading area of *Gentiana lutea* L. in Kütahya is 99 ha.

Over the course of pre-survey studies made before and after starting to the study, the small individuals developed from seed, young individuals close to blossoming and flowered fertile individuals are found in Kütahya- Radar, Kütahya-Domaniç and Bursa- Uludađ. This case has demonstrated that the populations' distribution is normal and become promising for protection studies. With regard to search of the chemical substances present within its structure, the roots of *Gentiana lutea* L. collected from each area and dried under the sun are grounded and the weighing of 5 gr is made and extracted and employed in HPLG analyses.

ETNO-BOTANICAL PROPERTIES OF SOME MEDICINAL AND AROMATIC PLANTS USED IN ERZURUM PROVINCE AND USE IN TREATMENT

FAZİLET SARPDAĞ¹, YAŞAR AYHAN¹, SAİME BAŞARAN²

ABSTRACT

Because of its different ecological conditions, Erzurum region hosts many plant species. According to Flora of Turkey, there are 1392 taxa in Erzurum province and 294 of these taxa are endemic. The endemism rate of Erzurum province is calculated as 21.1%. In this study, the usage and application forms of plants with medicinal and aromatic characteristics of 20 species which were traditionally used for treatment in Erzurum province were determined. Within this scope, a survey study was conducted with 75 people (23 female, male 52) in 21 villages in 9 provinces of Erzurum (Çat, Khorasan, İspir, Tekman, Oltu, Tortum, Uzundere, Pasinler and Merkez). In the questionnaire study, information about 20 plant species was asked to the subjects and the answers given for each plant species were entered into the database separately in the computer environment. For this reason, a data set of 312 lines of 75 people was created in the database. Therefore, one person gave us information about 4.16 plants on average. In the study, there were 42 people for nettles (*Urtica duoica* and *Urtica urens*), 29 for ryegrass (*Rumex crispus*), 24 for hibiscus (*Malva sylvestris*), 23 for hermit crab (*Polygonum cognatum*) and 23 for hawthorn (*Crataegus orientalis*) have used these plants for the treatment of various diseases. It has also been determined that the locals use the 20 plants used in the study in the treatment of certain diseases. According to the frequency of use of these diseases, infections (33 people), stomach ailments (31 people), cancer (22 people), cough (13 people), intestinal distress (11 people) 10 people) and urinary tract disorders (7 people). In addition, many of these plant species are dried in the villages where the living conditions of winter are very difficult and meet the needs of people's fruits and vegetables. Some species are also used in the treatment of animals in these regions where livestock are the source of their livelihood. *Juniperus communis* has been known to burn animals in their stalls, such as incense, in their stalls, in order to make tar from caterpillars with localized names, and to use animals to cure colds. This work seems to be very important in the context of exploring the ways in which hundreds of thousands of local people use thousands of years to treat diseases.

AN ETHNOBOTANICAL RESEARCH ON FLORA AND MEDICINAL PLANTS OF TÜRKÖGLÜ (KAHRAMANMARAŞ)

YUSUF ZIYA KOCABAŞ¹, FARUK KARAHAN²

ABSTRACT

The research area is located in the Kahramanmaraş province and on the C6 square in grid system. This area has a rich and various vegetation structure due to complex physical geographical structure and other environmental factors. Total 742 plant taxa was determined by floristic studies in different period and rate of endemism is 10 %. This study was carried out between 2015 and 2017 and the plants used in medical and aromatic purposes of the native flora were investigated. As a result, it was determined that 77 plant taxa belonging to 42 families for used medically. In terms of species number, the largest families are as following; Labiatae (11), Asteraceae (8), Rosaceae and Fabaceae (5), Brassicaceae and Poaceae (4) . These plant taxa were alphabetically indicated according to their family names, Latin and local names as well as with their used parts and usage purposes.

ECOLOGICAL CHARACTERISTICS OF AJUGA L. TAXA GROWING IN WESTERN ANATOLIA

ŞÜKRÜ TEOMAN GÜNER¹, YAVUZ BÜLENT KÖSE², SEVİM KÜÇÜK²

ABSTRACT

In this study, some ecological characteristics of 9 taxa including [*A. orientalis* L., *A. genevensis* L., *A. reptans* L., *A. laxmanii* (L.) Benth., *A. salicifolia* (L.) Schreber, *A. chamaepitys* (L.) Schreber subsp. *chia* (Schreber) Arcangeli var. *chia*, subsp. *chia* (Schreber) Arcangeli var. *ciliata*, subsp. *palaestina* (Boiss.) Bornm., subsp. *glaerosa* P.H. Davis] belonging to the genus *Ajuga* L. spreading in Western Anatolia and used for different purposes colloquially were investigated. In this context, geographical features of spreading area of the taxa were determined. Then a soil pit was dug in each area sampled and soil samples were taken according to the depth steps (0-10, 10-20 and 20-30 cm). Plant samples were taken to determine the leaf, stem and root nutrient contents of the taxa. Data of the nearest meteorological stations to sampling sites were used to determine climatic characteristics. In the laboratory, texture, total lime, organic carbon, pH, EC, N, P, K, Ca, Mg, Na, Fe, Cu, Zn, Mn in soil samples; N, P, K, Ca, Mg, Na, Fe, Cu, Zn and Mn in plant samples were analyzed. The taxa were determined to spread over elevations between 130 and 2307 m, sunny (SE-S-SW-W), shaded (NW-N-NE-E) aspects, inclination 2-34%, and the various slope position including upper, middle, lower slopes and valley bottom. Taxa were found to grow on calcareous and mildly alkaline soils having middle level organic matter and low electrical conductivity and they rarely grew on soils which varied between non-calcareous and neutral-light acid. N (0.50-1.94%), P (592-3000 ppm), K (8815-44490 ppm), Ca (4809-74550 ppm), Mg (973-20443 ppm) Na (88-2108 ppm), Fe (187-13200 ppm), Cu (1-26 ppm), Zn (8-102 ppm) and Mn (25-312 ppm) were found in the leaves, stems and roots of taxa. The type of climate in the locality of the taxa varies between semi-moist and very moist. Although water deficit for *A. chamaepitys* subsp. *palaestina* occurred for a period of 5-6 months, it occurred for a maximum period of 3-3.5 months in the distribution areas of other taxa. Findings are important for cultivation of the taxa belonging to the genus *Ajuga*, which are used as medical and ornamental plants.

**ANATOMICAL PROPERTIES OF MEDICINAL PLANT SIDERITIS
DICHOTOMA HUTER (LAMIACEAE) FROM TURKEY**

İLKAY ÖZTÜRK ÇALI¹

ABSTRACT

The genus *Sideritis* L. is represented by 46 species and altogether 55 taxa, 42 taxa being endemic and this genus named Dađçayı or Adaçayı in Turkey. *Sideritis* L. taxa are annual or perennial herbs or small shrubs, aromatic, pilose or tomentose, with or without glands, rarely glabrous and an endemic plant in Flora of Turkey. The genus *Sideritis* L. is comprised by medicinal and aromatic plants widely used in folk medicine for their anti-inflammatory, antirheumatic, antimicrobial, digestive, diuretic, anti-inflammator, antispasmodic-antibacterial, activities and often used as herbal tea and folk medicine in Turkey. The plant specimens were collected in its flowering period from Amasya on 27.06.2016. The plant materials were identified and deposit at Amasya University. Anatomical studies were carried out on specimens that were fixed in 70% alcohol. The anatomical studies on cross-sections of root, stem, leaf and flower of the plant were presented. The plant has quadrangular stem and collenchyma on the corners of stem. The leaf is monofacial. The type of stomata is diasitic. Besides, *S. dichotoma* has various glandular trichomes on stem, leaf and flower.

ENVIRONMENTAL AND SPECIES INDICATORS OF PISTACIA TEREBINTHUS L.: A CASE STUDY FROM GAZİANTEP DISTRICT

CANPOLAT KAYA¹, ÖZDEMİR ŞENTÜRK², SERKAN GÜLSOY¹, MEHMET GÜVENÇ NEGİZ¹, MERVE BAŞ¹

ABSTRACT

This study was carried out to investigate relationships between the distribution of *Pistacia terebinthus* L. and some site characteristics (elevation, slope, radiation index, climatic variables, parent materials etc.) in the Gaziantep district. Besides, indicator species of the species were investigated in the study area. In accordance with this purpose, presence and absence data of the species were collected from 165 sample plots. Spearman correlation and interspecific correlation analysis were applied to determine the relationships between distribution of target species and environmental variables. According to these analysis results, *P. terebinthus* showed positive correlation with slope degree whereas it has negative correlation with annual precipitation. However, there isn't any significant result between *P. terebinthus* and bedrock formations. Interspecific correlation analysis was also applied to determine indicatory species of *P. terebinthus* in the study area. As a result of this analysis, *P. terebinthus* has positive association with *Crataegus orientalis*, *Euphorbia orientalis*, *Jasminum fruticans*, *Juniperus oxycedrus*, *Quercus coccifera*, *Rhus coriaria* and *Tamarix smyrnensis*. Knowing to the site characteristics and indicatory plants of *P. terebinthus* can contribute crucial information for sustainability, conservation and marketing possibilities of *P. terebinthus* as a non-wood forest product in the district.

DETERMINATION OF TUNCELI RURAL GARLIC (ALLIUM TUNCELIANUM) EFFECT ON THE ANTIOXIDANT ENZYME AND LIPID PEROXIDATION LEVELS ON RAT INTESTINAL

KASIM TAKIM¹, TÜRKAN KUTLU²

ABSTRACT

Turkey, like in many plant species, is also a rich country in terms of Allium species. There are about 500 Allium species in the world, of which about 170 of them have been encountered in Turkey. It is reported that about 40% of Allium species in Turkey are endemic [1]. Tunceli Rural Garlic (TRG) is evaluated within the plants that are considered to be protected as the plant is an endemic and has the possibility to be damaged as mentioned in Red Book of Turkey Plants [2]. Wistar albino type female rats were used for the determination of the effect of TRG on the antioxidant enzyme levels. Wistar albino female rats were used to determine the effect of TRG on lipid peroxidation and antioxidant enzyme levels. Group 1, Control group (K); Group 2, DMBA Group (D); Only given 7,12-DMBA; Group 3 (DA-1 Group); In addition to 7,12-DMBA, given dose of TRG 250 mg/Kg/day. Group 4 (DA-2 Group); In addition to 7,12-DMBA, dose of TRG 500 mg/Kg/day. Group 5 (DE Group); In addition to 7,12-DMBA, dose of 200 mg/Kg/(twice a week) of vitamin E. Accepted as significant reduction in catalase enzyme activity in DMBA-induced rat tissues [3]. Accepted as significant decrease a decrease in SOD enzyme activity in DMBA-induced rat tissues [4]. Total glutathione is a compound used by the glutathione peroxidase enzyme to cleanse peroxide radicals. The decrease in GSH levels in DMBA-induced rat tissues is considered to be a significant decrease. Antioxidative substances given to DMBA-induced rats have been reported as a significant increase in oxidative damage resulting in reduced levels of GSH Increasing the amount of MDA in DMBA-induced rats has generally been regarded as a positive result. [5]. Intestinal catalase activity of rats; In the DE group, the decrease compared to the K group was significant ($P < 0.05$). There was a significant increase in DA-1 group according to the DE group. SOD enzyme activity results in intestinal tissues of rats; A statistically significant increase was observed in the DA-1 group compared to the K and D groups. According to my study results, total GSH levels of intestinal tissues of rats; There was no significant decrease in group D compared to group K. There was a significant increase in the DA-1 group compared to the K and D groups. A significant increase was found in the DA-2 group compared with the K, D and DA-1 groups. Intestinal MDA levels of rats; There was a significant increase in group D compared to group K. A significant decrease was found in the DA-2 group compared to the D group. As a result, besides the taste of *A. tuncelianum*, we can say that the antioxidative substances and sulfur components contained in it positively affect the antioxidant enzyme activities and can protect the body tissues against oxidative damage, by regulating enzyme activities and preventing lipid damage, thus preventing diseases caused by oxidative damage.

**DETERMINATION OF PHENOLIC COMPOUNDS AND SUGAR
CONTENT, ANTIOXIDANT PROPERTIES AND INHIBITION
ACTIVITIES ON CLINICALLY IMPORTANT ENZYMES OF STEVIA
REBAUDIANA**

NİMET BALTAŞ¹, ZEHRA CAN²

ABSTRACT

The aim of the study was to evaluate some of the bioactive components and total phenolic compounds, flavonoids and tannins, as well as the sugar contents, and the urease and XO enzyme inhibition associated with *Stevia rebaudiana* from Turkey (Rize). The polyphenolic contents of methanol extracted samples were evaluated in three different ways: total phenolic contents, total flavonoid content and condensed tannin. The antioxidant activity was determined using ferric reducing antioxidant power and using the free radical scavenging activity of 2,2-diphenyl-1-picrylhydrazyl (DPPH) radicals and 2,2'-azinobis-(3-ethylbenzothiazoline-6-sulfonic acid) (ABTS) tests. Phenolic compounds were determined by high-performance liquid chromatography. Results of antioxidant activity gave a total phenolic content of 12.303-8.477 mg/g gallic acid equivalent, total flavonoid content of 2.378-1.518 mg/g quercetin equivalent and condense tannin of 3.435-0.713 mg/g catechin equivalent in leaf and flower extracts. Ferric reducing antioxidant power values of the *Stevia rebaudiana* leaf and flower were discovered to be 202.499-116.826 $\mu\text{M FeSO}_4\cdot 7\text{H}_2\text{O/g}$ respectively. The radical scavenging activity values of the DPPH and the ABTS tests ranged between 0.533-0.398 and 6.637-17.382 mg/mL respectively. The inhibitory effect of the *Stevia* leaf extract on xanthine oxidase and urease was also investigated and the concentrations that gave 50% inhibition of maximal activity were found to be 23.51 $\mu\text{g/mL}$ and 9.45 $\mu\text{g/mL}$ respectively. Glucose and fructose were determined to be the sugars in the *Stevia* leaf. *Stevia* leaf may be good alternative in terms of glucose and fructose.

ANTIOXIDANT ACTIVITY OF REDDELLOMYCES PARVULOSPORUS WITH TOTAL PHENOLIC CONTENT

FATİH ÇAYAN¹, GÜLSEN TEL ÇAYAN¹, EBRU DEVECİ², MEHMET EMİN DURU²

ABSTRACT

Truffles are large family comprising of Tuber, Terfezia, Picoa and Tirmania genus, spread geographically in the arid and semiarid lands all over the world [1]. Truffle species are known as the world's most expensive mushroom and they have popularity because of their delicious taste and flavor [2]. Also, truffle species are rich in proteins, amino acids, fatty acids, carbohydrates, minerals, and fiber. In literature survey show that Truffles have various biologic properties such as antioxidant, antibacterial, antitumor, anti-aging, anti-inflammatory, anticancer, antifungal, immunomodulatory and antimutagenic activities [3]. Reddellomyces parvulosporus (G.W. Beaton & Malajczuk) Trappe, Castellano & Malajczuk is a Truffle species which is associated with Eucalyptus tree and growing under soil. The aim of this study was to investigate the antioxidant and total phenolic content of R. parvulosporus collected from Muđla. For this purpose, Dried Reddellomyces parvulosporus was extracted with hexane, chloroform, acetone, methanol and water at room condition, filtered and evaporated under vacuum. The obtained extracts were evaluated using five complementary test systems i.e. β -carotene-linoleic acid, DPPH free radical scavenging, ABTS radical scavenging, cupric reducing power (CUPRAC), metal chelating assays. In addition, total phenolic content of the extracts was determined as pyrocatechol equivalent. Among the extracts, the methanol extract showed the best DPPH• and ABTS•+ scavenging assays with percentage inhibition values of 74.44±0.13 and 89.15±0.71 at 800 μ g/mL concentrations, respectively. The chloroform extract exhibited the highest lipid peroxidation (93.78 ±0.34 %) and cupric reducing power (1.65±0.06 %) activities. In metal chelating assay, the water extract (72.34±0.16 %) indicated the best activity. The highest total phenolic content was calculated in the acetone extract followed by chloroform extract. This study was financed by The Scientific and Technological Research Council of Turkey (TUBITAK-114Z644). References [1] Trappe, J.M. and Sundberg, W.J. Mycologia 69 (1977), 433–437. ACTIVE PHYTOCHEMICAL DETECTION AND EVALUATION CELL PROLIFERATIVE AND IN VITRO WOUND HEALING ACTIVITY OF THE METHANOL AND WATER EXTRACTS OF AESCULUS HIPPOCASTANUM

TÜLAY AŞKIN ÇELİK¹, ÖZLEM SULTAN ASLANTÜRK¹

ABSTRACT

Aesculus hippocastanum L. (Hippocastanaceae) is commonly known as Horse chestnut, and it is a major amenity tree native to Greece and the central Balkan peninsula and planted across Europe, and today widely distributed and cultivated throughout Europa. Traditionally, the fruits, leaves and bark of *A. hippocastanum* were used in medicinal and cosmetic preparations due to their beneficial effects such as high active oxygen-scavenging activity, cell protective effects in vitro associated with antiaging properties of their antioxidants activity. The research study aimed to extract *A. hippocastanum* fruits using with methanol and water view to determine the phytochemical constituents and determines in vitro effects of these extracts on proliferation and cell migration/wound healing of BJ Human foreskin fibroblast cells. The phytochemicals present in the fruits were determined using standard methods. Methanol and water extracts were subjected to standard phytochemical qualitative screening for the presence or absence of various primary or secondary metabolites. The methanol and water extracts of *A. hippocastanum* fruits have been screened on cell proliferation by using in vitro assay (WST-8 assay) and cell migration/wound healing by using Wound healing assay on BJ fibroblast cells with three different concentrations. Phytochemicals such as flavonoids, tannins, phenols, saponins and anthroquinones were detected except alkaloids that were absent in the methanol and water extracts of *A. hippocastanum* fruits. Result from the performed assay showed that methanol and water extracts of *A. hippocastanum* has not significant cytotoxic effect on BJ cells at any concentration from 10 to 30 µg/ml. Especially, 10 and 30 µg/ml methanol extract concentrations increased proliferation of BJ cells significantly compared with control (121.22 and 112.23 %, respectively). Methanol extracts was found more effective than water extracts on proliferation of BJ fibroblast cells. Crystalin, which was used as standard wound healing agent in experiment. Although crystalline significantly stimulated BJ fibroblast cells migration compared to control, methanol extract and water extract slightly stimulated BJ cell migration. 30 µg/ml methanol extract improved wound healing after 24 h only by approximately 3.81% and 30 µg/ml water extract improved only approximately 4.12 % in BJ fibroblast cells, compared with control group. 10 and 20 µg/ml methanol extract and 20µg/m l water extract delayed cell migration significantly compared with control ($p<0.05$). As a result, methanol and water extracts of *A. hippocastanum* inhibited and/or delayed cell migration and consequently, these extracts haven't wound healing effect on BJ fibroblast cells.

**INVESTIGATING OF PHYTOCHEMICALS, ANTIOXIDANT,
ANTIMICROBIAL AND PROLIFERATIVE PROPERTIES OF
DIFFERENT EXTRACTS OF THYMUS SPATHULIFOLIUS HAUSSKN.
AND VELEN. ENDEMIC MEDICINAL PLANT FROM SIVAS, TURKEY**

NURANIYE ERUYGUR¹, MEHMET ATAŞ², ÖZGE ÇEVİK³, MEHMET TEKİN⁴

ABSTRACT

Today, the use of plant-based natural compounds such as phenolic substances like flavonoids and phenolic acids in the prevention and treatment of disease is increasingly accepted. Thymus species have many pharmacological properties such as anticancer, antiphlogistic, antiviral, antibacterial, and antioxidant. Thymus, a member of Lamiaceae family, is largely used in Turkey as herbal tea, condiments and folk medicine. T.spathulifolius is a rare and endemic species, narrowly distributed in Sivas. In the present study, phytochemical screening, antioxidant, antimicrobial and proliferative activities were carry out. The ethanol (ethanol:su=80:20) extract and fractions prepared from aerial parts of T.spathulifolius were assessed for their phytochemical screening, total phenolic and flavonoid contents, antioxidant, antimicrobial and proliferative activities. Some common and standard tests were conducted for phytochemical analysis. Phytochemical screening tests revealed the presence of coumarins, triterpenes, flavonoids, tannins, volatile oils and carbohydrates. Total phenolic and flavonoid contents of the extracts varied between 98.52–320.29 mg GAE/g extract and 12.08-160.05 mg QE/g extract, respectively. In vitro antioxidant activity were examined with 2, 2-diphenyl-1-picrylhydrazyl (DPPH) and ABTS reducing power, FRAP, and iron chelating tests. The results of activity tests were compared with standards namely BHA and ascorbic acid. Antimicrobial activity was tested against two gram positive, two gram negative bacteria and one fungi. The fractions except for Water fraction was generally more active according to MIC concentration. The fractions were measured for proliferative activity on breast cancer cells and concentration dependent increment in proliferation caused by the extract and fractions were indicative of the presence of proliferative compounds in this extract. The present study demonstrates that herbs of Thymus spathulifolius extracts have significant antioxidant, antimicrobial and proliferative effects. These results indicate that the importance of further bioassay guided isolation of the active constituents from this plant and identify compounds which are responsible for the activity.

**ANTI-INFLAMMATORY, ANTIOXIDANT, ANTI-TYROSINASE
ACTIVITIES OF PERSEA AMERICANA MILL.**

TÜLAY ÇOBAN¹, SEZEN YILMAZ SARIALTIN¹, MUHAMMED MESUD HÜRKUL², AYŞEGÜL KÖROĞLU²

ABSTRACT

The Lauraceae is a tropical or subtropical family and include with evergreen, leathery trees and shrubs. The family has 50 genera and about 2500-3000 species. *Persea americana* Mill. (the avocado) is a member of the Lauraceae with a one-seeded berry fruit. *P. americana* fruits contain steroids, monoterpenoids, sesquiterpenoids, triterpenoids, flavonoids, carotenoids and alkaloids. Bioactivities of *P. americana* has been reported such as antifungal, antiviral, antibakterial and antioxidant. Present study was designed to evaluate the polyphenolic composition as well as antioxidant, anti-inflammatory, anti-tyrosinase potentials of *Persea americana* of different parts (pericarp, pulp and seed) fruits. With different polarity solvents ABTS, DPPH free-radical scavenging activities and lipid peroxidation were analysed to determine antioxidant potentials of *Persea americana*. The anti-inflammatory activity was assessed by investigating membrane stabilizing effects of extracts against heat-induced human red blood cell hemolysis. The anti-tyrosinase activity of the extracts was evaluated by using mushroom tyrosinase as a convenient model system.

KEYWORDS

THE EFFECTS OF RHEUM RIBESAQUEOUS EXTRACT, RESVERATROL AND QUERCETINON HEMATOLOGICAL PARAMETERS AND ERYTHROCYTE FRAGILITY OF CARBONTETRACHLORIDE ADMINISTERED RATS

SEMA KAPTANOĐLU¹, OKAN ARIHAN¹, GÖKHAN OTO¹, SEVGI YÜKSEK¹

ABSTRACT

Aim:Rheum ribes L. is used for medicinal purpose in Turkey and especially in Van. It has various applications in traditional medicinal practices. Rheum ribes L., resveratrol and quercetin has antioxidant activity. This study aims to assess potential protective effect of Rheum ribes L. aqueous extract, resveratrol and quercetin on hematological parameters and erythrocyte fragility in carbontetrachloride (CCL4) administered rats. **Materials and Methods:** In this study 70 male Wistar-albino rats were divided into 10 groups (n=7 in each group). Groups and administrations were as follows: control (saline, i.p.), DMSO (0.3 ml, gastric gavage), olive oil (1ml/kg, i.p.), CCL4 (1ml/kg, i.p.), Rheum ribes L. aqueous extract (100 mg/kg, gastric gavage), resveratrol (100 mg/kg, gastric gavage), quercetin (100 mg/kg, gastric gavage), CCL4+ Rheum ribes L. aqueous extract (same as above), CCL4+ resveratrol (same as above), CCL4+ quercetin (same as above). Except CCL4 administrations were done for 7 days. CCL4 administration was done at 7th day and animals were sacrificed at 8th day. **Results:** Red blood cell count was reduced significantly in CCL4 and DMSO groups ($p<0.05$). Administration of quercetin, resveratrol and Rheum ribes L. extracts prevented this attenuation. Administration of CCL4 and DMSO also reduced hematocrit and hemoglobin levels but they didn't exceed statistical significance. Erythrocyte osmotic fragility was found lower in CCL4 group without statistical significance. **Discussion:** The results of this study showed that CCL4 posed a negative impact on red blood cell count of erythrocytes. Administration of Rheum ribes L.extract, quercetin and resveratrol prevented this impact of CCL4. This finding suggests a protective role of Rheum ribes L., resveratrol and quercetin in rats in this experimental setup.

THE EFFECT OF THYMOQUINONE APPLICATION TO ACUTE SWIMMING EXERCISE RATS ON NESFATIN-1 AND BETATROPHIN

AHMET UFUK KÖMÜROĞLU¹, FATMAGÜL YUR², SELÇUK EMEKÇİ²

ABSTRACT

Objective: *Nigella sativa* has been used for medicinal and culinary purposes. Different parts of the plant are used to treat many disorders. Thymoquinone (TQ), an active component derived from the medial plant *Nigella sativa*, is a flavonoid used as a treatment and preventive in several conditions. Nesfatin-1 is primarily expressed in adipose tissue and its expression is significantly affected by nutritional status. It was shown that betatrophin, synthesized in adipose tissue and liver is related to obesity and diabetes. In this present study, the aim was to investigate the effects of thymoquinone application to acute swimming exercise rats on serum nesfatin-1 and betatrophin levels. Material and Method: In this study, 32 rats were divided in to four groups of 8 rats each: group 1 (control group; only corn oil applied), group 2 (25 mg/kg/7days TQ in corn oil applied), group 3 (25 mg/kg/7days TQ in corn oil acute exercise applied applied), group 4 (only corn oil and acute exercise applied). Swimming exercise was applied to group 3 and group 4 on the 2nd and 7th days of the experiment by letting them swim in a 80 x 60 x 60 cm pool until they were exhausted. At the end of the 7 days long experiment, rats' blood was taken from their hearts under ketamine anesthesia into biochemical tubes and serum was separated through centrifuge. Nesfatin-1 and betatrophin levels were studied on serum samples using the ELISA method. Result: It was determined in the study that group 1 (600.78 ± 19.63) nesfatin-1 level was significantly higher than group 2, group 3, and group 4 (513 ± 17.97 $p < 0,011$, 422.61 ± 21.15 $p < 0,001$ and 430.13 ± 34.25 $p < 0,001$, respectively). Furthermore, group 2 nesfatin level was significantly higher than group 3 ($p < 0,011$) and 4 ($p < 0,005$). Group 1 serum betatrophin level (8.53 ± 0.39) was significantly higher when compared to groups 2, 3, and 4 (7.28 ± 0.25 $p < 0,027$, 6.84 ± 0.32 $p < 0,016$ and 6.71 ± 0.18 $p < 0,001$, respectively). Conclusion: It was observed that TQ application caused a reduction in nesfatin-1 and betatrophin expressions and acute exercise could intensify this condition. As a result, it could be stated that thymoquinone and acute exercise have a repressive effect on adipose tissue. Keywords: Acute exercise, Betatrophin, Nesfatin-1, Rat, Thymoquinone

EFFECTS OF EREMURUS SPECTABILIS BIEB. EXTRACTS ON SKIN DISEASE RELATED ENZYMES

BERTAN BORAN BAYRAK¹, REFIYE YANARDAĐ¹

ABSTRACT

For many years, plants are consumed as a food by human beings as well as being used as an alternative treatment to modern medicine. Because synthetic drugs have the possible side effects and considerably high cost, searching the usage of various plants in the treatment of some ailments become more important. The genus *Eremurus*, one of the important genera of the Liliaceae, are widely distributed on dry and stony grazed hillsides in Central Asia and Middle East, including Afghanistan, Iran, Palestine, Iraq, Syria and Turkey. *Eremurus spectabilis* Bieb. is commonly used as a wild edible vegetable and/or its leaves and roots have been traditionally used in folk medicine to treat some ailments such as hemorrhoids, diabetes, pains of eyes, eczema, jaundice, fungal infection and antihypertensive in these regions. In recent years, collagenase, elastase and tyrosinase inhibition have gained great important in skin disease. In this study, the inhibition activities of ethyl alcohol and ethyl acetate extracts of *Eremurus spectabilis* Bieb. on the collagenase, elastase and tyrosinase enzymes were investigated. It was found that *Eremurus spectabilis* Bieb. exhibit anticollagenase, antielastase and antityrosinase activities increasing in a dose dependent manner. According to these results, *Eremurus spectabilis* Bieb. extracts may be considered as an important source of pharmaceutical and cosmetic area due to their collagenase, elastase and tyrosinase inhibition activities.

BEHAVIORAL EFFECTS OF HYPERICUM UNIGLANDULOSUM ESSENTIAL OIL INHALATION ON RAT MODEL OF ALZHEIMER'S DISEASE

EMEL AKBABA¹, EYUP BAGCI¹

ABSTRACT

Hypericum (Hypericaceae) species have been attracting interest due to their sedative and relaxing actions. In the current study, rats exposed to Hypericum uniglandulosum essential oil (HYP) at the concentrations of 1.0%; and 3.0%, by inhalation during 15 minutes for 21 continuous days in plexyglass boxes were evaluated on scopolamine model of Alzheimer's disease. Memory-enhancing effects of HYP were tested by well-characterized tasks namely Y-maze test and radial-arm maze test. Furthermore, anxiolytic, and antidepressant effects of the inhaled essential oil were evaluated by elevated plus maze and forced-swimming tests, respectively. As expected, scopolamine administration decreased the spontaneous alternation percentage in Y-maze test, and working memory errors and reference memory errors in radial-arm maze test. HYP 1% and HYP 3% administration in scopolamine-induced rats caused statistically significant increases on the spontaneous alternation percentage in Y-maze task. Number of arm entries do not show any significant differences between scopolamine-alone treated and Sco+ HYP1% and Sco+HYP3% treated rats; thus, essential oil treatment does not change the motor activity in rats. In order to evaluate spatial memory performances further, radial-arm maze test was used. Scopolamine treatment showed an increase on the working memory errors, a type of short-term memory, and reference memory errors, a type of long-term memory, in this test. However, HYP inhalation significantly decreased these values. These results show the spatial memory-enhancing activities of the inhaled HYP in scopolamine-treated rats. In addition, anxiolytic and antidepressant-like effects of inhaled HYP were assessed. Diazepam, an anxiolytic drug, significantly increased the time spent in the open arms, number of open arm entries and number of crossings in the elevated plus maze task as compared to control rats. However, scopolamine-alone treated rats showed decreases in these parameters. HYP 1% and HYP3% inhalation increased these values in scopolamine -induced rats, therefore, acted as an anxiolytic drug. Forced-swimming test was used to evaluate antidepressant-like behavior of rats. As expected, tramadol, known antidepressant agent, increased the swimming time, and decreased the immobility time as compared to control group. Scopolamine-alone treated rats exhibited significant decrease in the swimming time, while increasing the immobility time. Both doses of HYP, but especially HYP1% significantly decreased the immobility time and increased the swimming time as compared to scopolamine-alone treated rats. In conclusion, Hypericum uniglandulosum essential oil inhalation was showed to induce memory-enhancing, anxiolytic and antidepressant-like effects on scopolamine-induced rats. These results suggest that Hypericum uniglandulosum essential oil could be used as an alternative or complementary therapy against neurological diseases related to Alzheimer's Disease.

THE EFFECT OF ELLAGIC ACID USAGE ON HEMATOLOGICAL PARAMETERS IN RATS

SEYİT ANKARALI¹, ERSİN BEYAZÇİÇEK², ÖZGE BEYAZÇİÇEK², HANDAN ANKARALI³, AYHAN ÇETİNKAYA³

ABSTRACT

Ellagic acid (EA) is a polyphenolic compound found in nature in a wide variety of fruits and nuts such as raspberries, pomegranate, walnuts and grapes. Ellagic acid is a molecule with a molecular weight of 302.197 g/mol, a density of 1.67 g/cm³ and a melting point of 350 °C. The aim of this study was to investigate the effects of acute and chronic administration of ellagic acid, which is known to be antimutagenic, anti-proliferative and anticancer effects on erythrocyte, leukocyte, thrombocyte, hemoglobin and hematocrit levels in rats. In this study 49 adult male Wistar rats were used. Rats were divided 7 different groups which were control group, acute groups as 10, 50 and 100 mg/kg doses of EA, and chronic groups as 10, 50 and 100 mg/kg doses of EA. All of the substances were administered intraperitoneally. While applying substances throughout 21 days to the chronic study group, to the acute study group was administered 2 hours before the blood samples were taken. Rats were anesthetized with 1.25 g/kg dose urethane intraperitoneally after the administration of EA. In rats, to determine the effects of acute and chronic administration of EA on erythrocyte, leukocyte, thrombocyte, hemoglobin and hematocrit levels, 2.5 ml blood samples were taken from each rat by cardiac puncture method. The levels of blood parameters were manually studied. Kruskal-Wallis test were used for statistical comparisons of groups in terms of erythrocyte, leukocyte, thrombocyte, hemoglobin and hematocrit values, and homogeneous subgroups multiple comparison method were used for determining different groups. The groups were compared in terms of erythrocyte, hematocrit and hemoglobin values, there was no statistically significant difference between the groups (p values = 0.538, p = 0.666 and p = 0.648, respectively). When the groups were compared in terms of leukocyte values, mean number of leukocytes in chronic groups was determined to be higher than the acute group (p < 0.05). While the groups were compared in terms of thrombocyte values, mean thrombocyte counts of chronic groups were statistically higher than the control and acute groups (p = 0,05). Consequently, in this study has been shown that chronic usage of ellagic acid increases leukocyte and platelet counts, but there is no effect on erythrocyte, hematocrit and hemoglobin values.

GASTROPROTECTIVE EFFECTS OF DIFFERENT APPLE (*MALUS DOMESTICA* BORKH.) CULTIVARS EXTRACTS AGAINST ETHANOL-INDUCED GASTRIC ULCER IN RATS

AYHAN TANYELI¹, ERSEN ERASLAN², MUSTAFA CAN GÜLER², MEHMET RAMAZAN BOZHÜYÜK², TUNCER NACAR³, ERDEM TOKTAY⁴

ABSTRACT

Aim: Gastric ulcer is one of the most common diseases in the world and is a global problem. Aggressive factors that cause gastric mucosal damage are hypochloric acid, mucosal hypoperfusion, free oxygen radicals, and ethanol. Among them, alcohol consumption is the biggest cause of gastric ulceration. Excessive alcohol consumption usually weakens gastric mucosal defence and induces gastric ulcer. The underlying mechanisms of ethanol-induced gastric ulcer have not been fully identified. Today, various herbal medicines are used in ulcer treatment. Apples contain high amounts of phenolic substances and antioxidants. Their consumption reduces the risk of many diseases. The aim of this study is to investigate gastroprotective effects of extracts of different apple cultivars on ethanol-induced gastric damage in rats. **Method:** 64 Wistar albino male rats were randomly divided into 8 groups (n=8/group). Group 1: Control; Group 2: Ethanol (5 ml/kg absolute ethanol was administered to the rats by oral gavage); Group 3: Ethanol + golden delicious [low dose (LD)]; Group 4: Ethanol + golden delicious [high dose (HD)]; Group 5: Ethanol + Granny Smith (LD); Group 6: Ethanol + Granny Smith (HD); Group 7: Ethanol + Starking delicious (LD); Group 8: Ethanol + Starking delicious (HD). Apples (LD=4 ml/kg and HD=8 ml/kg) were administered to the rats by oral gavage for 10 days. On 11th day, the rats were euthanized under anesthesia 90 minutes after ethanol application and then the gastric tissues were obtained. They were stored in 10% formalin until histological studies to be performed. **Findings:** In order to better understand the histopathological evaluation, histopathological damage was scored as - (none), + (little damage), ++ (medium damage) and +++ (severe damage) according to the regularity of the gastric mucosa, the depth of the mucosal injury, and the presence of hemorrhage and necrotic cells. Histopathological evaluation was performed based on the gastric mucosa. In Group 1, it was seen that the gastric pits were regular and the mucosal cells were in normal size and shape. In Group 2, it was clearly seen that the gastric pits were irregular. However, it was remarkable that mucosal cells were necrotized in both the superficial and deep layers of the mucosa. In Group 4, 6 and 8, the gastric pits were regular and histological appearance was generally similar to that of the control group. However, the necrotic cells were rarely seen on the mucosal surface. In Group 3, it was seen that the gastric pits were regular but there were the necrotic cells on the mucosal surface and the hemorrhagic areas in the middle portions of the mucosa. In Group 5, it was seen that the gastric pits were partially regular and there were the intensely hemorrhagic areas

on the mucosal surface and the necrotic cells in the deep mucosal layer. In Group 7, it was seen that the gastric pits were regular and the mucosa was generally similar to that of the control group but there were occasionally the hemorrhagic areas and necrotic cells on the mucosal surface. In immunohistochemical evaluation, NF- κ B and caspase-3 immunopositivity was scored as - (none), + (little damage), ++ (medium damage) and +++ (severe damage). In immunohistochemical staining performed with NF- κ B and Caspase-3 antibody, Group 2 showed severe immunopositivity and Group 1, 3, 6, 7 and 8 showed mild immunopositivity. Group 4 and 5 did not show immunopositivity. Result: Histological results indicate that oral administration of apple extracts prior to ethanol-induced gastric ulcer reduces gastric mucosal injury. Apples may play an antiulcerative role by reducing NF- κ B and caspase-3 levels. This study was supported by Atatürk University SRP (Project no: 2016/051).

LC-MS/MS ANALYSES AND ANTIMICROBIAL ACTIVITY OF THREE ALLIUM SPECIES

NESRİN HAŞİMİ¹, ABDULSELAM ERTAŞ², HAMDI TEMEL², MUSTAFA ABDULLAH YILMAZ², EBUBEKİR İZOL², İSMAIL YENER², MEHMET ÖZTÜRK³

ABSTRACT

The genus *Allium* is one of the largest species of the Turkish Flora and belongs to the Alliaceae. Onion, garlic and leek varieties are member of this genus. *Allium shatakiense*, *Allium kharputense* and *Allium vineale* are perennial herbaceous plants which are subjected to this study. The aim of this study is to determine the chemical composition and antimicrobial activity of these three *Allium* species. The ethanol extracts of the aerial part and roots of the plants analyzed by LC-MS/MS. Malic acid was determined to be the the most abundant compound in the extracts. A highest amount of malic acid was detected in roots and aerial parts of *Allium vineale* extracts (3303 µg/g extract and 3358.81 µg/g extract, respectively). Vanillin, apigenin and p-coumaric acid are also found to be in chemical constituent of the plants with higher ratio than others. The antimicrobial activity of the extracts was evaluated by minimum inhibitory concentration (MIC) against Gram positive (*Streptococcus pyogenes* ATCC19615, *Staphylococcus aureus* ATCC 25923) and Gram negative (*Pseudomonas aeruginosa* ATCC 27853, *Escherichia coli* ATCC 25922) bacteria and yeast (*Candida albicans* ATCC10231). All the extracts exhibited antimicrobial activity in different power. The strongest antimicrobial activity was recorded by aerial parts of *A. shatakiense* against *S. aureus* (75±0.2 µg/ml MIC value) and *A. vineale* against *E. coli* (75±0.5 µg/ml MIC value). Generally, we have detected that the antimicrobial activity of aerial parts extracts better than the root extracts.

ASSESSMENT OF SHIKIMIC ACID WITH DIFFERENT POLARITY SOLVENTS FROM EXTERNAL RED CRUST OF PISTACIA VERA FRUITS BY HPLC

EYYÜP KARAOĞUL¹, M. HAKKI ALMA², AHMET ÇAKIR³

ABSTRACT

The aim of the present work was to determine the extractable shikimic acid compounds in External Red Crust (ERC) of Pistacia vera Fruits. The ERC samples were obtained from Gaziantep province of Turkey. The samples were extracted by using conventional extraction method with different polarity solvent. For this purpose, water (Polarity indeks (PI) 9), methanol (PI, 6.6), ethanol (PI, 5.2), ethylacetate (PI, 4.3), dichloromethane (PI, 3.4) were preferred by varying polarities for solvent use. The concentration of shikimic acid in ERC were determined both $\mu\text{g/ml}$ and percent amount by using high performance liquid chromatography and ultraviolet detector (HPLC-UV). Consequently, it was found that the concentration of shikimic acid in the ERC were determined for water as %18 and 88 $\mu\text{g/ml}$, methanol as %11 and 64.78 $\mu\text{g/ml}$, ethanol as %17 and 61.77 $\mu\text{g/ml}$, ethylacetate as %13 and 48.23 $\mu\text{g/ml}$, and dichloromethane as 12,88 $\mu\text{g/ml}$, respectively. The results showed that the concentration yields of shikimic acid in the ERC showed differences because of changing polarity. When the polarity of solvents were decreased, concentration yields of shikimic acid also diminished.

A COMPREHENSIVE LC-MS/MS METHOD VALIDATION FOR DETERMINATION OF 19 PHYTOCHEMICALS IN SALVIA SPECIES

MUSTAFA ABDULLAH YILMAZ¹, ABDULSELAM ERTAŞ¹, ESRA YARIŞ¹, HILAL SARUHAN FİDAN¹, EVİN AYGÜN
TUNCAY¹, HAMDİ TEMEL¹, UFUK KOLAK²

ABSTRACT

In this study, a comprehensive LC-MS/MS method is developed for the qualitative and quantitative determination of fingerprint phytochemicals including 7 natural diterpenes, 2 phenolic acids and 10 flavonoids in *Salvia* species which are commonly consumed as tea in public and have industrial value. Additionally, the LC-MS/MS method validation study was also performed to prove the accuracy and precision of the method within the scope of phytochemical screening. The analytes were quantified by a triple quadrupole mass spectrometer working in Multiple Reaction Monitoring (MRM) mode. The fragmentation patterns of the studied compounds using ESI and Collision Induced Dissociation (CID) techniques are reported. The performance properties of the analytical method were determined by using standard solutions, spiked and non-spiked samples. Within the context of method validation, linearity, trueness (recovery), precision (repeatability and reproducibility, LOD and LOQ and expanded uncertainty (at 95% confidence level (k=2)) were determined. Afterwards, fingerprint phytochemical profile of chloroform and ethanol extracts of 6 *Salvia* species (*S. cerino-pruinosa* var. *cerino-pruinosa* [SCC], *S. cerino-pruinosa* var. *Elazigensis* [SCE], *S. pseudoeuphratica* [SP], *S. siirtica* [SS], *S. rosifolia* [SR], *Salvia* *Kurdica* [SK]) were determined using the developed LC-MS/MS method. According to the quantification results; ethanol extracts of the studied species were rich in terms of rosmarinic acid (45911.0 mg/kg extract in SCC), cosmosiin (15406.6 mg/kg extract in SCE), Luteolin-7-glucoside (9049.9mg/kg extract in SK), caffeic acid (11870.1 mg/kg extract in SCE), Astragalin (5112.7 mg/kg extract in SK), apigenin (3900.5 mg/kg extract in SK) and salvianolic acid B (4220.4 mg/kg extract in SCE). Chloroform extract of SP was rich in terms of 6,7-dehdoroyleanone (8215.6 mg/kg extract) and salvianolic acid A (984.2 mg/kg extract).

DEVELOPMENT AND APPLICATION OF A NEW CUPRAC ANTIOXIDANT DETERMINATION METHOD WITHOUT SPECTROPHOTOMETER

ZEYNEP AKAR¹, NESİBE ARSLAN BURNAZ²

ABSTRACT

A number of methods have been developed for the determination of the antioxidant capacity of standards having various antioxidant properties and natural and synthetic materials. One of these methods is CUPRAC (copper (II) reducing antioxidant capacity) method, which is becoming increasingly widespread. In recent times, to increase usability of antioxidant assays and to reduce costs of bioactivity studies different materials have been started to be used. For this purpose, in the current study, a modified CUPRAC antioxidant method (based on color measurement without using spectrophotometer) was developed for lower cost and applicability in all places. In new method, drops of reaction mixtures were applied onto a plate and the antioxidant activity value based on the color value was determined by using TLC plate and a free colour measurement program (Image J) was used to obtain a color value. In the study, to compare the two methods (spectrophotometric and dropping), some antioxidant standards (caffeic acid, quercetin, gallic acid, protocatechuic acid, rutin, catechin, ferulic acid, syringic acid, vanillin, benzoic acid and BHT) and plant extracts with different antioxidant activities in the literature (green tea, mint, rosemary, tilia, ginger, ligarba, h. perforatum, rosehip, turmeric, dudihindi, nigella, goji berry and mulberry) were used, and the activity values determined were compared. In the spectrophotometric and dropping methods the μM (C) TEAC value for each sample was calculated by using the standard Trolox graphic. The highest and lowest values of (C) TEAC in spectrophotometric and dropping measurement for the standards were determined in caffeic acid (0.663 and 0.516) and benzoic acid (0.014 and 0.015) respectively. However the highest values of plant extracts were determined in green tea extract (0.737 and 0.538) while the lowest values were measured in mulberry extract (0.021 and 0.037) respectively. In the study, it was determined that the compatibility between the two methods was high ($R^2=0,93$). This result indicate that the CUPRAC antioxidant method can be used safely in determining activities of both pure substances and mixtures without a spectrophotometer in all places. The new method is especially suitable for in situ applications. This work was supported by the Scientific Research Projects Unit of Gümüşhane University (15.F5119.02.01).

BETALAINS IN FOOD INDUSTRY

NIZAM MUSTAFA NIZAMLIOĞLU¹, AHMET ÜNVER²

ABSTRACT

Betalains are plant derived natural pigments that are presently gaining popularity for use as natural colorants in the food industry. Betalains are vacuolar pigments composed and water-soluble of a nitrogenous core structure, betalamic acid. Betalains have betalamic acid as chromophore and they can be divided into two major structural groups, the red to red-violet betacyanins and the yellow betaxanthins. Betalamic acid condenses with imino compounds or amino acids/derivates. To date, about 78 betalains have been identified from plants of about 17 families under the order Caryophyllales. They are also found in some species of the fungal genera Amanita and Hygrocybe. Betalains were erroneously named in the past «nitrogenous anthocyanins». The search for natural pigments has been driven by growing evidence indicating that synthetic colorants can cause deleterious health effects. Betalains, in addition to anthocyanins, have been proposed as an alternative to address this need. Betalains are relatively more stable at pH 4-6 range and storage at 4 °C significantly reduces pigment loss. Therefore, betalain pigments can be used as colorant in frozen foods, low temperature and short-shelf life foods. Owing to poor stability, its usage is limited to low acidic short shelf-life, and frozen foods. The growing interest of consumers in the aesthetic, nutritional and safety aspects of food has increased the demand for natural pigments such as betalains to be used as alternative colorants in food products.

BOTANICAL ORIGIN AUTHENTICATION IN PROCESSED SPICES BY BARCODE - DNA GENOTYPING

AYŞE ÖZGÜR UNCU¹, EMRAH TORLAK², ALI TEVFIK UNCU²

ABSTRACT

All culinary cultures involve recipes with spice seasonings that reflect the common aroma/taste preferences of the society. In addition to the distinctive taste and aroma, several herbal species have been used as remedies since ancient times due to their claimed health benefits. Indeed, scientific evidence supports health promoting properties of spices, raising interest in their consumption, especially in developed countries. As it is the case for other food products, spices are also vulnerable to fraud. Because they are mainly sold in the market in ground or finely fragmented forms, product appearance can be quite deceptive, making spices an attractive target for adulteration. As a result, ground weed seeds and nut shells, economically less valuable plant tissues and waste (such as pericarp tissue) from industrial processing of fruits are commonly used as adulterants in economically valuable spice products. Such fraudulent products not only violate consumer rights but also pose a health threat due to the probable toxicity or allergenicity of the undeclared plant material. Analytical methods that rely on compositional differences are extensively utilized for the authentication of processed plant-based food products. However, compositional traits are under the direct influence of genetic background and environmental conditions. Moreover, the chemical composition of an admixture does not necessarily deviate from that of a genuine product. Because genomic approaches allow the analysis of remnant DNA in a processed product, species composition can accurately be identified independent from seasonal differences and, cultivation, packaging and storage conditions. Barcode DNA sequencing is a commonly utilized food genomics approach for authenticity testing. However, while it works well with single-species products, barcode sequencing often fails with species admixtures. Nevertheless, universal plant barcodes that display interspecific length polymorphisms enable the accurate discrimination of all participant species in an admixture through the detection of amplified fragment length polymorphisms. A total of six commonly used spice species [Black pepper (*Piper nigrum*), rosemary (*Rosmarinus officinalis*), red hot pepper (*Capsicum annuum*), cumin (*Cuminum cyminum*), common thyme (*Thymus vulgaris*), mint (*Mentha piperita*)] were included in this work toward standardizing a DNA-barcode assay that detects adulteration in processed spice products. Olive (*Olea europaea*) and tomato (*Solanum lycopersicum*) samples were also included in analyses as olive leaves and tomato waste are common adulterants in processed thyme and red hot pepper products, respectively. The intergenic spacer between the *trnL* (UAA) 3' exon and *trnF* (GAA) genes in the plastid genome was used as the DNA barcode in order to discriminate the plant species. Barcode choice relies on the fact that the rate of insertions/deletions (indels) in the intergenic spacer is at least as high as that of substitutions, and the indels allow species discrimination even at the intragenetic level. The plastid barcode was amplified from DNA samples of processed spice products and corresponding reference tissue. PCR products were run on a high resolution capillary electrophoresis system in order to determine species-specific barcode profiles.

²NECMETTİN ERBAKAN ÜNİVERSİTESİ, MOLEKÜLER BİYOLOJİ VE GENETİK BÖLÜMÜ

While all eight plant species included in the study yielded distinctive barcode profiles, barcode sizes obtained from processed spices matched those of reference samples, indicating the reliability of the methodology. Moreover, the barcode assay proved successful in identifying the species composition when applied on in-house admixtures of different processed spices and admixtures with common adulterants. Our results displayed that it is feasible to detect undeclared plant material in processed spice samples based on plastid barcode DNA length polymorphisms. In practice, any deviation from the reference barcode profile, including barcode size differential and/or alien bands, reveal adulteration with an undeclared plant material in a spice sample. Furthermore, while optional since identification of an alien band in the barcode profile of a sample directly indicates adulteration, precise identity of the adulterant can simply be determined by coupling a sequencing protocol to barcode fragment size profiling.

DETERMINATION OF GENETIC DIVERSITY OF SAME THYME SPECIES

ŞEYMA ALĞAÇ¹, ADEM BARDAK², MUZAFFER ÖZDEMİR³

ABSTRACT

Origanum (*Origanum spp*) is one of the most prominent endemic plants because of its commercial and medical importance. In our country, these species are reached to the market directly after being picked from the wild. However, since these collections are usually performed without care and knowledge, the species face the danger of becoming extinct. Therefore, in order to avoid their disappearance from the nature, local thyme species need to be compiled and be taken under the protection. For this purpose, in our study, we determined genetic characteristics of native gene sources of the plant through detecting the genetic variations between 28 different thyme genotypes collected from Eastern Mediterranean Region by scanning them with 15 SRAP and 10 ISSR primers. A total of 138 bands were obtained at the end of the study. 131 of these bands were found to be polymorphic bands. In addition to the fact that all markers used in the study showed a polymorphism, thereby presenting the mean polymorphic value as 94.93%, the most allele-producing primer combination was determined as EM17-ME11 with 14 bands, whose average allele number was 4.9. The polymorphism information content (PIC) ranged from 0.04 to 0.99, with a mean PIC value of 0.53. The highest genetic variation among all genotypes (72%) was observed between the species of *Origanum vulgare* ssp. *hirtum* and *O. Majorana* whereas the least genetic variation (13%) was detected between *Origanum syriacum* genotypes. The average genetic difference value of the thyme genotypes was found to be 48%. Moreover, it has been demonstrated that the SRAP and ISSR marker techniques can be used safely in the genetic characterization of the materials collected from nature.

THE MEDICINAL PLANT OF GENUS PARONYCHIA AND THE KARYOTYPE ANALYSIS OF P. ADALIA

HALİL ERHAN EROĐLU¹, HÜLYA DOĐAN², DERYA ALTAY³, ÜMIT BUDAK¹

ABSTRACT

The genus *Paronychia* Miller is placed in the family Caryophyllaceae. It contains approximately 110 species of annual or perennial found all over the world except Southern Africa, Southeast Asia. Genus *Paronychia* is known as Algerian tea in the world. In our country, the genus commonly known as et yaran, kepek otu and dolama otu is used as medicinal tea because of relieving inflammation between the hands and toes, aphrodisiac, diuretic and blood purifier. Antimicrobial and antioxidant properties of the genus are known. The chromosome number is $2n = 36$ in many species of *Paronychia*. But there are various chromosome numbers as $2n = 10, 14, 16, 18$ and 28 . In this study, the chromosome number of *P. adalia* Chaudhri was reported for the first time. The chromosome number and karyotype formula are $2n = 2x = 36 = 34m + 2sm$. Total haploid length, centromeric index and karyotype asymmetry were calculated with detailed chromosomal measurements.

THE EFFECT OF GRAPEVINE (VITIS VINIFERA) TENDRIL EXTRACT ON THE PREVENTION OF OXIDATIVE DNA DAMAGE

ÖNDER AYBASTIER¹, SAM DAWBAA², CEVDET DEMİR¹

ABSTRACT

Reactive oxygen species (ROS), which are involved in several biological functions and alterations, may damage cellular constituents. The result of increase of reactive oxygen species is oxidative stress. The oxidative stress is considered as one of the significant causes of DNA damage which in turn contributes to cell death through a series of intermediate processes such as cancer formation, mutation, and aging. Natural sources such as plant and fruit products have provided us with interesting substances of antioxidant activity that could be recruited in protecting the genetic materials of the cells. Grapevine (*Vitis vinifera*) is a perennial plant that uses tendrils to climb and distribute its shoots over a support; tendrils arise from lateral meristems which are growth regions with proliferating cells. Inflorescence may arise from the same meristems instead of tendrils if a flowering stimulation occurs and according to this the lateral meristem can develop either as a tendril or inflorescence organ. *Vitis vinifera* fruit is mostly used for nutrition purposes, while seeds and leaves have applications in herbal medicine and food supplements. Tendrils are negligible parts of the *Vitis vinifera*, however it is informally reported that tendrils are consumed by eating in some traditions. In this study, antioxidant abilities of two flavonoids, rutin and isoquercitrin as standards and as found in the tendrils of *Vitis vinifera* (var. alphonse) were examined and investigated for the prevention of oxidation of calf thymus DNA in Fenton reaction medium. A total phenolic content of 11.39 ± 0.30 mg Gallic Acid Equivalent (GAE)/g of the plant's fresh weight (FW) by Folin-Ciocalteu and 8.17 ± 0.49 mg Trolox Equivalent (TE)/g FW by CHROMAC assays were reported. Two flavonoid glycosides rutin and isoquercitrin in addition to chlorogenic acid were found in the extract by the HPLC–DAD system analysis. DNA base oxidation products were analyzed using GC–MS/MS by performing separation and quantitative determination. The experiments proved a significant decrease in the concentration of the DNA oxidation products when the extract was used as a protectant against the oxidative stress and by rutin and isoquercitrin standards, apparently with different antioxidant powers. It is believed by conclusion that the extract of *V. vinifera*'s (var. alphonse) tendrils has a good antioxidant activity; hence it is recommended to be used as a part of the daily healthy food list if possible. On the other hand, since the results proved promising benefits of the tendrils, we recommend further studies on the plant part regarding food industries.

EFFECTS ON ANTIBACTERIAL AND DNA PROTECTION OF DYESTUFFS OBTAINED FROM HAZELNUT NUT HUSK

SİBEL BAYIL OđUZKAN¹, BORA KARAGÜL², ESRA KÜTÜK², İBRAHİM HALİL KILIC¹, HALİL İBRAHİM UđRAŞ²

ABSTRACT

Hazelnut is of great important in agricultural export of our country. It has an annual export of one and a half billion dollars. Every new product that will increase the value of the nut is very important. For this purpose we have made a natural dye substance from hazelnut nuthusk. In recent years, natural dye materials used especially in textile materials are important and those of plant origin are preferred. For this purpose, various activities have been carried out showing the suitability for industrial use of the dye extracts obtained at different temperatures in different solvents than the collected, dried and grinded hazelnut nuthusk samples. Within the scope of our study, the effect of extracts obtained by 50 °C and reflux for 4 hours in acetone, water, ethanol and acetic acid solvent from the hazelnut nut husk of the Düzce region was evaluated on antibacterial and DNA protection. From the extracts obtained, antibacterial activity tests were analyzed by disk diffusion method using 3 different standard bacterial strains. It has been determined that some of the samples show antibacterial properties. It has been determined that the dyestuffs obtained from the hazelnut nuthusk have potential for protection against the effects of UV-C and H₂O₂ on DNA.

MOLECULAR AND CHEMICAL CHARACTERIZATION OF SOME LOCAL AND HYBRIDE MATERIAL OF ORIGANUM SP. IN TURKEY

REYHAN BAHTIYARCA BAGDAT¹, FATMA GUL MARAS VANLIOGLU¹, BULENT SENGUL², TUGCE USLU³, NURETTIN CINKAYA², CIGDEM BOZDEMIR², MEHMET ARSLAN³

ABSTRACT

Turkey is a gene center with an endemism rate of 44.2% Lamiace and 65.2% Origanum sp. That considered to be one of the largest oregano exporter in the World and supply 80% of the World demand alone. By means of this research, a number of local and hybride genotypes of Oregano sp. were evaluated to determine the similarities of the genotypes from the plantation established in Haymana İkizce Research and Experimental Farm in 2015 and 2016 growing seasons. Essential oil extraction was performed by hydro distillation. Identification of the essential oil components was made by GC and GC/MS. Essential oil contents varied between 2-4.5% among the tested oregano genotypes. Carvacrol, γ -terpinene and p-cymene were the major essential oil components. Eighty-one universal ISSR primers achieved by University of British Columbia were used to choose the primers which gave polymorphic bands. According to the polymorphic pattern, seven primers were chosen out of eighty-one. The band patterns of the population were scored as present=1 and absent=0 regarding the fragment sizes. Then, the scores were interpreted for clustering by using NTSYS-PC statistical program. A genetic relationship among the genotypes was established by means of the cluster diagram. Significant differences in genetic diversity were found among oregano genotypes. Such differences in genetic diversity of genotypes can be used in breeding programs and crossing works for oregano improvement.

THE PLACE AND IMPORTANCE OF MEDICINAL AND AROMATIC PLANTS IN PHARMACY FACULTIES' CURRICULA

MIRAY ARSLAN¹, NILAY TARHAN¹, SEVGI ŞAR¹

ABSTRACT

From the past to today, mankind frequently benefits from plants in the treatment of diseases. Throughout history plants, which are widely consumed due to their properties such as flavor, appetite, odor and flavor besides treatment, have an important place in the pharmaceutical, cosmetic and food industries. Today, demand for medicinal and aromatic plants used to maintain health and prevent or treat diseases is increasing day by day. In this increasing demand, it is directly related to the pharmacy profession to produce medicinal and aromatic plants in the desired quantity and quality, to make the analysis, to storage and use them correctly at the appropriate doses. In this context, it is also important to include these subjects in pharmacy faculties' curricula. Many different disciplines from analytical chemistry to botanic, from pharmaceutical technology to pharmacy management are considered as a whole in pharmacy education, which has a multidisciplinary structure. A global trend towards natural herbal based products from synthetic-based products increases the importance of medical and aromatic plants. In this respect, these topics have started to be given more place in pharmacy education. When the course contents of pharmacy faculties are examined, it is observed that many elective courses about the profession as well as compulsory courses such as pharmaceutical botanic and pharmacognosy are related to medicinal and aromatic plants. Within the scope of this study, curriculums and course contents of 28 pharmacy faculties in Turkey were examined and courses on medicinal and aromatic plants were determined. In general, it has been determined that the courses related to the subject are in the elective course status and these courses are especially included in the fifth class curriculum. In the study, by taking the distribution of the courses on medicinal and aromatic plants in the curriculums of pharmacy faculties into consideration, various aspects of the subject have been discussed.

DIRECT MARKETING STRATEGIES IN MEDICAL AND AROMATIC PLANTS

EMRE GÖKSU¹, HAKAN ADANACIOĞLU²

ABSTRACT

Medical and aromatic plants have a serious commitment in the forestry economy to create a market for employment and other industries, with a high added value to supply raw materials to the pharmaceutical, chemical, food, additives and cosmetic sectors that make up their sub sectors. These plants, which are usually collected from nature, are the source of products that consumers make special efforts to buy because of their unique qualities. This has led to an increase in direct marketing initiatives to provide price advantage. It is possible to observe important applications in direct marketing of medicinal and aromatic plants, especially in Europe and USA. On the other hand, it seems that direct marketing strategies for medical and aromatic plants in Turkey have not be effectively used. In this study, it is aimed to discuss some suggestions in terms of examining the direct marketing strategies widely used in medical and aromatic plants in the world with samples and directing direct marketing initiatives in Turkey.

PHYTOTHERAPY FROM PAST TO PRESENT

SEMRA KOYUNOđLU¹, ASLI CAN AđCA¹, ALI ALKAN¹, HAKKI GÜRSÖZ¹

ABSTRACT

Phytotherapy From Past to Present Semra Koyunođlu, Aslı Can Ađca, Ali Alkan, Hakkı Gürsöz Turkish Medicines and Medical Devices Agency (TMMDA), Vice Presidency of Medicines and Pharmacy, Department of Herbal Supportive and Advanced Therapy Medicines Söđütözü, Ankara-TURKEY. semra.koyunoglu@titck.gov.tr The history of medical use of plants is as ancient as human history in the last 5000 years. The pieces left by many civilized people indicate that plants were used in the treatment of different diseases. Today it is estimated that the number of plant species in the earth range from 250,000 to 500,000. According to World Health Organization (WHO) records, most of the world's population (80-70%) have been preferred traditional medicine for treatment and prevention and also 21000 plant species could be used for their therapeutic properties. In order to safeguard the public health, demonstrating safety, efficacy and quality of the herbal products should be designed by scientific approach and besides reports on side effects, interaction with drugs and posology should be evaluated. Herbal products are classified differently by national authorities. Since there is no global harmonized regulation, many herbal raw materials which have therapeutic effects, are supplied to the market as food supplement. At present, in order to reach the suitable product on the market, the classification of the products on the basis of unit formula and indication is the main topic of authorities. LEGAL STATUS OF TREATMENT WITH HERBAL MEDICINES

KEMAL MACİT HISAR (YRD. DOÇ. DR.)¹, FILİZ HISAR (DOÇ. DR.)²

ABSTRACT

Law, individual, society and state movements, relations with each other; Is a normative science that is duly issued by the competent organs, is supported by public power, shows how the public should behave in general or not, and regulates all the possibilities for it by the norms in force. Law observes common good and common interest in individual-society-state relations. Legislation is the whole of the existing rules of law. The Turkish legislation system consists of constitution, law, statute, regulation, directive, circular and communiqué from top to bottom. Phytotherapy means treatment with plants. The term was originally used by the French physician Henri Lenclerc (1870-1953) in a medical journal La Presse Medical. To treat diseases, mankind has been benefiting from the plants since ancient times and has also received the countermeasures. Today phytotherapy Pharmacognosy of pharmacy is covered by main science. The biggest difference between phytotherapy applications in the past and today is that the useful parts of plants are now used for therapeutic purposes, not entirely. For example, in order to make use of the essential oil of a plant, once its tea is made and drunk, it is now used alone by extracting essential oil from that plant. This also keeps the patient away from the parts of the plant that may be other useless but side effects. Today, phytotherapy is the most developed country in Germany. Method: The purpose of this declaration is to evaluate the legal status of herbal treatment in our country in the context of legislation. Findings: The legal regulations of herbal products in our country are carried out by the Ministry of Food and Livestock. Legal applications for herbal medicines differ from country to country. For example, in the European Union (EU) countries, plant products are regarded as herbal medicines and are sold as prescription or non-prescription medicines in pharmacies. In the European Union member countries, it is necessary to comply with the pharmacoponografographies of herbal drug or drug preparations which are included in herbal remedies. The circulation of pharmaceutical products in the EU countries is monitored by various legal regulations. Member States of the European Union are based on the European Pharmacopoeia (EP) in their work towards plant products; When necessary, ESCOP and WHO Monographs. The first legislation on treatment in our country is "Regulation on Traditional and Complementary Medical Practices" issued on the Official Gazette on 27 October 2014. It is stated in this regulation that a certified doctor or dentist may apply such treatment. In the same regulation, it is stated that the issues related to licensing and sales of medicinal and herbal medicines to be used in the practice of phytotherapy will be regulated by Turkish Medicines and Medical Devices Authority. The registration procedures for traditional herbal medicinal products in this institution are made according to the provisions of "Regulation Regarding Regulation of Traditional Herbal Medicinal Products" dated 06.10.2010 and numbered 27721. According to a survey, 44 phytomedicines licensed by the Ministry of Health were identified in Turkish pharmacies in 2012. On the other hand, there are no general provisions in the Turkish Criminal Code regarding

¹S.Ü. TIP FAK. HALK SAĐLIĐI AD.

²N.E. SAĐLIK BİLİMLERİ FAKÜLTESİ

herbal product and / or herbal drug exploitation, but there are general criminal sanctions. For example, in the Turkish Criminal Code numbered 5237, the crime of making or selling drugs in a way that puts the lives and health of the people at risk is organized in the third section titled "Crimes Against Toplumlar" in the third section titled "Crimes Against Public Health". According to this provision; "(1) Up to five years in prison and forensic punishment shall be granted to any person who produces or sells medicines in such a way as to endanger the lives and health of persons. / (2) If this crime is committed by a physician or pharmacist or within the scope of a profession and art performed on the basis of official script, the punishment to be imposed shall be increased by one third ". Conclusions: Treatment of herbal products or herbal medicines is a new issue in our country. There are not enough certified physicians and licensed products of the Ministry of Health. There is no provision in the Turkish Penal Code concerning the abuse of this matter. With the increase in the number of certified physicians and licensed medicines in the process, it is expected that the relevant legislation will be developed.

EVALUATION OF ACTIVITIES RELATED TO MEDICINAL AROMATIC PLANTS ABOUT CRIMINAL LAW

MEHMET AYKANAT¹, BEKİR BOĐA¹

ABSTRACT

Activities related to medicinal aromatic plants are concerned with multitude of areas of law. There isn't enough regulations in Turkish legal system. For this reason, general provisions are used in legal evaluations. There isn't direct regulations about medicinal aromatic plants in Turkish criminal law. But some activities related to criminal law. First activity is cultivation of some plants. The cultivation of some plants is limited. Penal sanctions are envisaged for those who don't comply with this limitation. Another prohibition is related to plant smuggling which is called bio-smuggling. The use of plants for therapeutic purposes also goes into the topic of medical criminal law. Using people as a test subject in research prohibited. This prohibition also applies to research on plants.

THE JUDICIAL REVIEW OF PRODUCTION, IMPORT, EXPORT AND MARKETING OF MEDICINAL AND AROMATIC PLANTS

MEHMET AYKANAT¹, MUSTAFA YASİR AKTEKE¹

ABSTRACT

There are few legal regulations directly related to medicinal aromatic plants. For this reason, legal gaps can be mentioned about issues such as production, import, export and marketing. The legal framework for medicinal aromatic plants has been regulated by by-laws. Nearly all of these by-laws have been legislated by the Ministry of Food, Agriculture and Livestock, the Ministry of Health and the Ministry of Forestry and Water Affairs. Circulars are being prepared for issues that need to be updated. General regulations concerning the subject may also apply. There are also regulations about a single plant, like hemp. The legislation on the issue is disorganized.

AN ENDEMIC MEDICAL PLANT OF TAURUS MOUNTAINS, FRITILLARIA, IS IT POSSIBLE MAKING CONTRIBUTION TO LOCAL ECONOMY?

FULYA OZTAS¹, HAYDAR HAYDAR OZTAS²

ABSTRACT

Turkey shows a notable diversity of plants, which is reflected in its richness of plant life. In this study, a brief property of *Fritillaria* sp. Taurus Mountains (Mostly Ermenek Region) Southern Anatolia (Turkey) is presented. The Turkish flora includes about 3000 endemic plants and their 1000 are used as medicine and spice. These plants are very important from both economic and environmental view point that some of them are used as flavoring agents, spices, perfumes, cosmetics, and pharmaceutical and biological agents. One of these plant is *Fritillaria* sp. which wildy grows in highland areas of Taşeli area (Ermenek, Sarıveliler, Başyayla and Taşkent). It is well known that the traditional Chinese medieval some sort of *Fritillaria* sp. the most important herbs that relieve cough and reduce sputum. The cultivation is *Fritillaria* sp. is expensive and difficult because their growth pretty. They used to grows slowly and needs a long production cycle. But *Fritillaria* sp. extracts are used in traditional Chinese medicine under the name chuan bei mu, and in Latin, *bulbus fritillariae cirrhosae*. Especially *F. cirrhosa* and *F. verticillata* are used in cough remedies. It reduces airway inflammation by suppressing cytokines, histamines, and other compounds of inflammatory response. Also, the *Fritillaria* sp. bulbs are known for their remarkable efficacy on moistening lung to arrest cough. So far in practice there are total 5 different *Fritillaria* species that in use for remedies. The *Fritillaria* sp. contains chemically fritimine, sipeimine, songbeisine, sonbeinine, sucrose, stearicacid, palmiticacid, and β -sitosterol, dela-vlne, delavinone, chuanbeinone, delafrine, delafrinone, peimisine, imperialine, and fritiminine. In this study, in the sight of the known properties of *Fritillaria* sp., it is going to discuss "how the *Fritillaria* sp. could use for economically and medically proposes, in order to supply more income to local people?" The local people mostly not know about their endemic *Fritillaria* sp., and their usage for medical and other aims.

CONSUMPTION AND USAGE OBJECTIVES OF MEDICINAL AND AROMATIC PLANTS

EMINE İKİKAT TÜMER¹, CUMA AKBAY¹, MUHAMMED ALİ PALABIÇAK¹, DEMET KUŞTEPE¹

ABSTRACT

Medicinal and aromatic plants are used in many areas such as food, health, perfumery, paint, cosmetics and body care. While the usage areas of medicinal and aromatic plants are expanding day by day, the cultivation, harvesting, storage, marketing and consumption of these plants are made unconsciously. In addition, consumers do not pay attention when buying medicinal and aromatic plants, to the packaging of these products and the way they are kept until the expiration date. In this study, it was aimed to determine the factors which are effective in the consumption and use of medicinal and aromatic plants in Kayseri province and the primary data were obtained by face-to-face survey with 384 consumers determined by proportional sampling method. Different statistical analysis techniques were used for the purposes of studying the data obtained from the surveys. In the study, descriptive statistics are expressed in terms of averages, frequency and percentage values. The t-test is used to determine whether there is a difference between the two sample groups in terms of averages. In this study, the t-test was applied to the comparison of medicinal and aromatic plants' packaging preferences and ages of individuals and consumption expenditures. As a result of the analyzes made, aromatic plants used for consumption purposes in the region; 82.2% red pepper, 81.5% black pepper, 49.6% mint and medicinal plants; 64.2% peppermint, 61.4% sage, 51.1% lime. It has been determined that most of the medicinal and aromatic plants in the region are consumed in the winter months. The t-test was applied between the ages of the people and the type of packaging they preferred to provide medicinal and aromatic plants. As a result of the test made, the ages of the people and packaging preferences were statistically significant ($p < 0,05$) and as the average age of the people increased, the preferences of the glass jars and paper bag packaging types which are expressed as healthy are increasing. As a result of the t-test between the monthly food expenditures of the people and the package type preferences, as the monthly food expenditures increase, the healthy packaging type preference also increases ($p < 0,05$). Consumers while purchasing spices pay more attention to variables such as product cleanliness, smell, quality and reliability.

**THE EFFECT OF PLANT AGE ON GERMINATION IN STEVIA
(STEVIA REBAUDIANA BERT.) PLANT**

YAŞAR ÖZYİĞİT¹, ESRA UÇAR², KENAN TURGUT¹

ABSTRACT

The aim of this study was to determine germination performance of stevia seeds. In study, two different seeds groups (one was harvested from one-year plants and the other one was harvested from two-year plants) were used as material. The experiment was conducted as a randomized complete design method with five replicates. For each treatment 100 seeds were counted and placed into petri dishes. After that, petri dishes were placed in an incubator with the temperature of 24oC and light. According to results; while first germination (3-4 days) was being observed in seeds harvested from two-year plants. On the other hand, the highest germination rate (45.6%) was recorded in two-year plant's seeds. Results of this study show that plant age is effective on the germination abilities of stevia seeds.

MEDICINAL PLANT POTENTIAL OF KÜTAHYA PROVINCE

SELAMI SELVİ¹, FATİH SATIL¹, GÜLENDAM TÜMEN¹

ABSTRACT

This study carried out between 2014 and 2016 was done to identify the medicinal plants spreading at flora of Kütahya and were revealed species that is to the medicinal value. In the determination of medicinal plants; both Commission E, Pharmacopoeia and various monographs were used, as well as species used local people with field studies were identified. As a result of the research; 137 genera and 161 taxa belonging to 56 families could be seen included in the potential medicinal plant class. The families to be the highest number of taxa are; Lamiaceae (22 taxa), Asteraceae (20 taxa) and Rosaceae (16 taxa), respectively. According to the results obtained in the study, it were determined that the plants were mostly used for gastro-intestinale, diuretic and influenza. As using, It has been observed that infusion and decoction methods are the most used method. With this study, plants that have to medical values and spreading in Kütahya were identified. These plants seen contributed to the pharmaceutical sector by making a significant contribution to the country's economy.

CONSUMED NATURAL PLANTS FOR PEOPLE TO SURVIVE IN SEYDİŞEHİR AND SURROUNDING VILLAGES DURING WORLD WAR II

MEHMET BAKANLAR¹, SÜLEYMAN DOĐU², TURAN AKDAĐ³, BUKET BAŞAR³, MUHİTTİN DİNÇ⁴

ABSTRACT

The aim of the study is to determine the natural plants used as a nutrient for people who lived in Seydisehir and its villages following the days of difficulties and famine brought by the World War II. The research was conducted in the center of Seydişehir and its 26 villages in 2016. In the study, face to face interviews were made with 103 people living in the studying area. As a result of the study, 23 natural plants which grow in Seydişehir have been obtained. Especially the use of the different parts of the three types belonging to the genus *Quercus* L. is very common. The flour obtained from the fruits of the species called "Fink" (*Vicia sativa* L.) and *Pyrus* is the most important nutrient survivor for local people.

ABSTRACT

Regarding biodiversity the Black Sea region belongs to one of the richest regions of Turkey. Totally 2239 species are present in the East Black Sea region, 514 of them are endemic and the endemism ratio is ca. 23 %. More than half of the plants distributed at the East Black Sea region are present in the Rize province. 70 % of the plants are of medicinal and aromatic value. 4 *Mentha* species, 3 *Origanum* species, 3 *Thymus* species, 2 *Salvia* species, 2 *Stachys* species and 1 *Calamintha* species were collected from 19 different localities in Rize during 2015. A field nursery was established using collected material. Traits like plant height, number of branches, stem diameter, leaf area, dry drog weight, fresh drog weight, dry drog yield, fresh drog yield, seed weight and essential oil yield were determined. Principal Component Analysis was performed to assess the diversity regarding with the investigation of characters. Based on obtained data large diversity could be determined. Collected materials can be used as genetic resources for further investigations.

TRANSCRIPTOMICS AND METABOLOMICS ANALYSIS OF TWO MEDICINALLY IMPORTANT PLANTS BRASSICA NIGRA AND BRASSICA JUNCEA

ABDÜLREZZAK MEMON¹

ABSTRACT

Several Brassica species are not only being used as a vegetable, oil or herbal spices but many of them are used as medicinal plants for treatment of rheumatism, neuralgia and spasms. Hot water poured on bruised seeds makes a stimulant foot bath, good for colds and headaches. Brassica nigra and Brassica juncea are two well-known species in Brassicaceae which are not only being used for oil production but also reported to be good medicinal and heavy metal accumulator plants. In the last decade, the tremendous developments in molecular biology and the success of genomics have highly encouraged studies in molecular genetics, mainly transcriptomics, for the identification of the functional genes implied in metal tolerance in plants. These studies have already succeeded in the identification of hundreds of genes that largely belong to the metal-homeostasis network. In this presentation I will describe recent advances in understanding the genetic and molecular basis of the metal induced gene expression in Brassica species. The heavy metal accumulating species Brassica nigra has received attention due to its possible use for phytoremediation in heavy metal-polluted soils. Our data showed that ~ 20000 µg Cu g⁻¹ DW was accumulated in the shoots of B. nigra when grown at 500 µM Cu. The expression γ-ECs and PCS was also increased 11 and 6 fold respectively in shoots when plants were subjected to high Cu concentration. Microarray analysis showed several hundred fold up regulation of metal related genes including the genes involved in glutathione pathway, metal ATPase and ABC transporters in B. nigra when treated with 500 µM Cu. We also carried out metabolomic studies with metal treated accumulator and non- accumulator ecotypes of B. nigra by using HPLC-MS-MS in order to identify metabolomic pattern in accumulator and non-accumulator ecotypes. Our aim is to identify the metabolites which are upregulated and/or down regulated with Cu treatment in both ecotypes. In this communication I will discuss the strategies for exploring these immense and valuable genetic and biological resources for phytoremediation of heavy metal pollutants from the environment and the use of these plants for medicinal purpose.

SPECTROPHOTOMETRIC INVESTIGATION OF INTERACTIONS OF SOME PLANT-DERIVED NATURAL FLAVONS WITH HUMAN SERUM ALBUMIN PROTEIN

*İBRAHİM HALİL GEÇİBESLER*¹, *MURAT AYDIN*², *MAHMUT TOPRAK*², *SEDA KARABULUT*², *İBRAHİM DEMİRTAŞ*³

ABSTRACT

Plant-derived natural bioactive compounds and their semisynthetic derivatives are the most consistent sources to be benefit for the treatment of diseases. It is important to quantitatively determine the interaction of these natural and semi-synthetic molecules with the human serum albumin protein (HSA), which is present in many tissues, organs, blood plasma and body fluids of the human body and which is actively involved in the transport of drug substances, and it is important that these processes be determined before in vivo clinical trials. Interactions of some rare and new natural flavon compounds such as eriodictyol 7,4'-dimethylether, isoorientin, genkwanin, homoorientin-6''-4-O-methyl-myo-inositol, dihydrokempferol 7,4'-dimethylether and 7,5'-dimethoxyisoethyne, which is medicinal aromatic plant origin, with human serum albumin (HSA) proteins were investigated by two-dimensional (2D) and three-dimensional (3D) fluorescence spectrophotometry. For fluorescence measurements were selected as the pH value 7,4 and the working temperature 25°C. In these parameters, the binding constants of target molecules to human serum albumin protein were calculated as 4,798x10³ M⁻¹ (eriodictyol 7,4'-dimethylether), 24,694x10³ M⁻¹ (isoorientin), 0,636x10³ M⁻¹ (genkwanin), 59,979x10³ M⁻¹ (homoorientin-6''-4-O-methyl-myo-inositol), 5,461x10³ M⁻¹ (dihydrokaempferol 7,4'-dimethylether) ve 38,124x10³ M⁻¹ (7,5'-dimethoxyisoetin). In addition, 3D fluorescence measurements showing the interactions of flavon compounds with human serum albumin protein were also compared. Analysis results of fluorescence studies have shown that flavon compounds, especially containing quantitatively excess hydroxyl group, interact better with human serum albumin protein.

EVALUATION OF VAUCHERIA BORIALIS IN TERMS OF FOOD AND DIET

KÖKSAL PABUÇCU¹, CEYHUN UZUNÖZ, TUĞBA DEMİRİZ YÜCER³

ABSTRACT

Algae are natural nutrients that live in aquatic environments and have high biological activity. There are many bioactive components in the structure of these organisms. In this study, the potential use of *Vaucheria borealis* in nutrition and diet was investigated. GC analysis showed that it has a very rich potential for palmitoleic acid (C16: 1) and total unsaturated fatty acid (UFA). Palmitoleic acid causes the regulation of fat and glucose metabolisms in the body. In addition, it was observed that HDL-cholesterol enhancer effect. It is a natural source of skin health, ease of digestion, weight control and protection from diabetes. As a result of the study, it has been concluded that *Vaucheria borealis* may be a natural source of nutrition and diet. Reference: 1. Chirag A. Patel, Kalyani Divakar, Devdas Santani, Himanshu K. ANTICHOLINESTERASE ACTIVITIES FROM AQUEOUS EXTRACT OF DIFFERENT PLANT PARTS OF ERICA MANIPULIFLORA

ÇİĞDEM KUŞ¹, MEHMET EMİN DURU¹, MELTEM TAŞ¹, SELÇUK KÜÇÜKAYDIN¹

ABSTRACT

Erica species are generally spread along the coasts of Turkey. There are five Erica species in these regions, namely; *E. arborea*, *E. manipuliflora*, *E. bocquetii*, *E. sicula* subsp. *Libanotica* and *E. spiculifolia* salisb. Among these species, *E. manipuliflora* is commonly found in Muđla and southwest part of Turkey. Erica species are called as "funda", "püren" or "tree heath" locally in Turkey and contain biologically active compounds such as flavonoids, coumarins and triterpenoids. Since ancient times, these species have been used as herbal tea and folk medicine by local people in Turkey. In folk medicine, they are used for a diuretic, antiseptic and anti-inflammatory purposes. Inhibitions of Acetylcholinesterase and butyrylcholinesterase related with Alzheimer's disease. In this study anticholinesterase activity of aqueous extracts of leaves, flowers and aerial parts of *E. manipuliflora* have been investigated spectrophotometrically. The aerial parts extract of *E. manipuliflora* among the extracts (70.10%) showed the best inhibitory activity against AChE enzyme at 200 µg/mL concentrations. The extracts of leaves and flowers showed 44.42%, 49.91% inhibitions against acetylcholinesterase enzyme at 200 µg/mL concentrations respectively. The flowers extract of *E. manipuliflora* (80.41%) exhibited the best BChE inhibitory activity at 200 µg/mL concentrations. At the same concentration, the galantamine showed 82.23% inhibitory activity. Leaves and aerial parts extracts showed 15,75%, 31.62% inhibitory activity against BChE respectively. Hence, aerial parts of *E. manipuliflora* may be useful as a moderate anticholinesterase agent, and flowers of *E. manipuliflora* may be useful as the butyrylcholinesterase agent.

EFFECTS OF RED PEPPER (CAPSICUM ANNUUM L.) ON EGG YOLK COLOUR

SUZAN YALÇIN¹, SAKİNE YALÇIN², İLYAS ONBAŞILAR³

ABSTRACT

Egg yolk colour is an important criteria for consumers. The desired colour varies among and within countries. Carotenoids are sources of red and yellow pigments which are important in egg yolk colour. Birds can't synthesize these carotenoids and therefore natural ingredients such as corn, alfalfa meal, red pepper or synthetic pigments must be found in poultry. Diets based on cereals other than corn require natural or synthetic pigments to achieve desired yolk colour. The red pepper as a good egg yolk colorant contains small amounts of red pigments and large amounts of yellow carotenoids. Red pepper (*Capsicum annuum* L.) is abundant in Turkey. Red pepper contains 1500-2500 mg/kg total carotenoids. Most of the carotenoids in total carotenoids are keto-carotenoids, such as capsanthin and capsorubin. Besides main role of keto-carotenoids as a pigment, they are also recognized as antioxidants and inhibitors of cancer cells. Yolk pigments are relatively stable and normally are not changed or lost with cooking. Although egg yolk color suitable for consumers is obtained by using corn at 60% level in laying hen diets, dark yellow eggs are also obtained by adding red pepper to the diets.

EFFECT OF SYZYGIUM AROMATICUM L. EXTRACT ON THE MODULATION OF GABAERGIC SYSTEM AND DETERMINATION OF ITS GABAERGIC ACTIVE COMPOUNDS

SÜMEYYE ŞAHİN¹, MONIKA PISCHETSRIEDER²

ABSTRACT

γ -Amino butyric acid (GABA), a physiologically important amino acid acting as major neurotransmitter in the brain, plays an important role in regulating activity of the excitatory neurotransmission. GABA, which binds as a ligand to GABAA/B/C-receptors, is formed by glutamat decarboxylase from glutamate and metabolized by the GABA-transaminase (GABA-T) and succinat semialdehyde dehydrogenase (SSADH). The GABAergic system is of great importance in the treatment of neurophysiological disorders and a target for various groups of medications, among others for sedatives, anxiolytics, muscle relaxants, antidepressants and antiepileptics (anticonvulsants). Because of adverse effects associated with some of these drugs, there is a great interest in natural products which can exhibit the corresponding neurophysiological effect in the organism by interacting with the GABAergic neurotransmission. Thus, several foods or food ingredients are able to modulate the GABAergic system in different ways such as the inhibition of the GABA-degrading enzymes (GABA-AT and SSA-DH) and the enhancement of GABAA receptor activity. It has been shown that *Syzygium aromaticum* L. (clove buds) is a potent inhibitor for GABA-degrading enzymes [1] and a potent specific GABAA-receptor modulator [2]. In this study, effect of *Syzygium aromaticum* L. extract on GABAergic system and its GABAergic active compounds were investigated. The aqueous clove extract was fractionated by semi-preparative high performance liquid chromatographic (RP-HPLC) with UV/Vis detector and obtained fractions were examined electrophysiologically for possible GABAA receptor-modulatory effects. To analyze electrophysiologically the effect of the extract and its fractions on GABAA receptors, GABA-mediated chloride ion currents via the human GABAA $\alpha 1\beta 2$ heteropentameric receptor expressed in *Xenopus leavis* oocytes were measured using two-electrode voltage-clamp (TEVC). To further characterize the components in the most active fraction, ultra-high performance liquid chromatographic with diode array detector (UHPLC-DAD) and gas chromatography-mass spectrometry (GC-MS) were applied. Based on UV/Vis-spectra, mass spectra and TEVC, eugenol was detected in the aqueous clove extract and identified as GABAergic compound. **A MACRO FUNGUS IN THE TRADITIONAL MEDICINE:
GANODERMA LUCIDUM (CURTIS) P. KARST.**

AYHAN KARAKAYA¹

ABSTRACT

Ganoderma lucidum is in the family of Ganodermataceae (Polyporaceae) of the class of Basidiomycetes of the fungi kingdom. It takes its name after, lucid/us in the Latin, meaning bright and clear due to the brightness of the upper part of its mantle. *Ganoderma lucidum* is a macro fungus species that has a high commercial potential in the world, used intensively especially in alternative (folk) medicine. However, there are issues related to the alternative use of *Ganoderma lucidum*. The macro fungus was identified in our study entitled "Determination of Macrofungi of Kocaeli Region" within the boundaries of Kocaeli province between 2006 and 2008. As members of same genus and members of the Ganodermataceae family; *Ganoderma adspersum* (Schulz.) Donk and *Ganoderma applanatum* (Pers. Ex Wallr.) Pat. macro fungi species were also identified during field observations of the study.

**PLANTS USED IN TRADITIONAL TREATMENT IN PAZAR
DISTRICT (TOKAT-TURKEY) AND THEIR PROPERTIES**

SİBEL ULCA¹, GÜLCAN ŞENEL¹

ABSTRACT

The aim was to reveal the local names of the plants spreading around Pazar (Tokat, Turkey) and its surroundings, the purpose for which they were used in the region, the ones used in local therapy and their usage patterns. During this period, 128 plant species were examined. Field study was carried out over a period of approximately two years (2015-2017). In addition, the relative importance value of the species was determined and informant consensus factor (FIC) was calculated for medicinal plants included in the study. In our study, a structured and semi-structured interview method was used and interviewed with 265 people. As a result of the surveys; Demographic characteristics of the participants, types of medicinal plant used by the people of the region, preparation techniques, usage patterns and frequency were determined. It has been determined that local people benefited from 38 families and that family members such as Asteraceae Brassicaceae, Rosaceae, Lamiaceae, Fabaceae and Cucurbitaceae were more beneficial in local treatment.

SYNERGISTIC EFFECT OF CARTHAMI FLOS AND PERSICAE SEMEN AS A HERBAL PAIR IN EAST-ASIAN MEDICINE

SU HYE LIM¹, EUN SANG JEON²

ABSTRACT

East-Asian medicine (EAM) is defined as a traditional medicine, used for health maintenance and treatment of various diseases using acupuncture, moxibustion, cupping and herbal medicines with a long history. The concept of herbal pair is one of fundamental principles in prescription composition. Herbal pair is a mixture of two herbs and plays an important role in clinical treatment efficacy. There are six patterns of herbal pair; mutual reinforcement, assistance, mutual detoxication, mutual inhibition, mutual antagonism and incompatibility. Carthami flos and Persicae semen have been used as a herbal pair to improve blood circulation in EAM for a long time. They belong to a pattern of mutual reinforcement among six patterns. Carthami flos exhibits vasodilator, anticoagulant, antithrombotic, hypolipidemic, emmenagogue and stimulant properties and its main components are carthamin, safflower yellow and hydroxysafflor yellow A. Persicae semen has vasodilating, anticoagulant, antithrombotic, laxative, antitussive and expectorant effects and its major compound is amygdalin. Previous studies proved that two herbs as a pair exert synergistic effect on cardiovascular diseases when they are used together, compared with the effect of a single herb. Two classic formulas, Silsosangami and Dohongsamultang, used as antithrombotic therapeutic agents, contain Carthami flos and Persicae semen as active ingredients. However, their biochemical mechanism of synergistic effect is unknown yet. This study aims to provide a foundation for understanding of herbal pairs and synergistic effect of Carthami flos and Persicae semen as a herbal pair, which are frequently used together in EAM.

**DETERMINING THE FACTORS AFFECTING THE MEDICINAL-
AROMATIC PLANT CONSUMPTION OF INDIVIDUALS (THE CASE
OF ERZURUM CENTRAL COUNTIES)**

RÜVEYDA KIZILOĐLU¹

ABSTRACT

Medicinal and aromatic plants are used as medicines to prevent diseases, maintain health, or improve diseases. Demand for these plants in world markets is increasing every other day. Especially, the emergence of side effects of synthetic and chemical medicines has increased the use of medicinal plants. This study aimed to determine the medicinal and aromatic plant consumption of individuals living in the urban areas in the central counties of Erzurum city (Aziziye, Palandöken, and Yakutiye) and the factors affecting the consumption. In the study, proportional sampling method, 95 % confidence interval, and 5 % error margin were employed. According to 2016 TURKSTAT data, the total population of Erzurum central counties was 417.385 people. The sampling of the study consisted of 384 individuals, which was found by calculating the proportion of the central counties within the total and homogeneously distributing it to the districts. The data of the study were collected through a questionnaire. The mean age of the interviewed individuals was found to be 35.19. 63.80 % were male, 73.70% were married, and 58.85% had children. In the study, the factors affecting the consumption of medicinal aromatic plants were determined using binary logit analysis. A number of questions were asked to determine the level of awareness and demonstrate the likelihood of consumption by conscious individuals (with the help of statements defining the medicinal aromatic plants correctly or incorrectly) by assuming that individuals will consume at least one of the medicinal aromatic products which are already found abundantly. Thus, conscious individuals (responding correctly) and individuals with low consciousness level (responding incorrectly), which is the dependent variable of the model, were identified. That is, 61.20 % of the individuals were determined to be conscious. The age, gender, marital status, and educational level of the individuals, employment of the spouse, monthly income, number of households, having children, the existence of heart disease, blood pressure disorders, cholesterol, diabetes, kidney disorders, and using medicinal aromatic plants for any disorder instead of medical medicines were all used as explanatory variable. As a result of the analysis, while individuals' gender and having children were found to have a negative effect at 1 % significance level, the marital status and the number of households had a positive effect. That is, women were 16 % more likely to consume medicinal aromatic products than men. On the other hand, single individuals were 24 % more likely to consume medicinal aromatic products than married individuals. Individuals with children were expected to consume such products 24 % more than those with no children at all. The employment status of spouses of individuals who were found to be significant at 5 % level was found to be negatively correlated with consciousness level in terms of medicinal aromatic plant consumption. So it can be said that the individuals whose spouses were unemployed were 13 % more conscious in terms of medicinal aromatic plant consumption than those

Corresponding Author: RÜVEYDA KIZILOĐLU, ruveyda.kiziloglu@gop.edu.tr

¹GAZİOSMANPAŞA ÜNİVERSİTESİ

whose spouses were employed. As a result of the research, it can be stated that while the consciousness level of individuals in the region was not very low in terms consumption of medicinal aromatic plants, women, and individuals living alone tended to consume these products more. The study also found that income and education level were not statistically significant in the consumption of the products in question.

AWARENESS OF MEDICINAL PLANT AND AROMATIC OIL BY THE HOUSEWIVES: A MODEL OF BOLU CITY

AYŞE NERİMAN NARİN¹, ECE ACAR², MAHMUT BEŞLİ³, FERDİ GÖKHAN CAN³

ABSTRACT

Introduction: Housewives often use medicinal and aromatic plants during their daily lives. In retrospect, medicinal and aromatic plants, which have become indispensable even for dinner tables, are applied as the primary way of improving health. Medicinal and aromatic plants which take place in every individual's life, occasionally are used by infusion, ointment or other methods. **Purpose:**The aim of the study is determine the housewives knowledge on about medicinal and aromatic plants, who are used frequently in daily life. **Method:**The study was carried out with community dweller housewives in the city center of Bolu. As a data collection tool, a questionnaire form was used which investigated the individual's status and usage of medicinal and aromatic plants. The 10 medicinal and aromatic plants which were the subject to the questionnaire are selected randomly out of 84 medicinal and aromatic plants that are commonly used in Turkey. **Results:** 78 women 47.76 (range 18-78 years) was involved in the study . Five of the ten medicinal and aromatic plants the effects of which are well known by the housewives are pomegranate juice (77.6%), lavender (70.1%), daphne (68.7%), turmeric (68.7%) and fennel (67.2%) plants. Two herbs that are least-known by the housewives are quassie amara (17.9%) and olibanum (22.4%) plants. The correct response rates for the medicinal effect among the medicinal and aromatic plants ,as are indicated to be known by the housewives for their effects, are senna (67.6%), anise (61.4%) and olibanum (46.7%) plants are found to be correct. 43.3% of the participants stated that they used medicinal and aromatic plants occasionally; 83.6% of them stated that they used the medicinal plants in brewed form, and 49.3% of them used medicinal plants together with food. Medicinal and aromatic plants are mostly used for influenza (82.1%), disease prevention (56.7%) and pain (53.7%). They usually prefer to use them consulting the herbalist (62.7%) or health staff (44.8%); whereas they expressed their knowledge of medicinal and aromatic plants via television (61.2%), neighbor / friend environment (52.2%), internet (50.7%) or family elders (43.3%). **Discussion:**Although housewives often state that they use medicinal and aromatic plants, they are not aware of the efficacy of medicinal and aromatic plants as well as showing the correct response rate is low. Especially when it is thought that they are used for influenza, pain or prevention of disease , the possibility of the wrong treatment has become remarkable . Considering the main reason for this is the matter of getting misinformed about medicinal and aromatic plants, which is provided via television, friend/neighbor or the elders of the family, it is suggested that those who are professional on medicinal and aromatic plants convey proper information on television programs and design the websites where the proper information sources can be accessed .

MEDICINAL AND AROMATIC PLANTS SOLD IN ARTVIN HERBALISTS

ÖZGÜR EMİNAĞAOĞLU¹, HAYAL AKYILDIRIM BEĞEN¹, GİZEM ALKAN¹, SELMA YILDIRIM¹

ABSTRACT

Artvin has rich flora thanks to its geographical location, geomorphologic structure and influence of various climate types. The vascular plant flora of Artvin is represented by 2727 taxa, 2616 species, 397 subspecies, and 144 varieties belonging to 761 genera and 137 families. The diversity in flora provides a rich sources of medicinal plants. Majority of people living in Artvin traditionally use plants. In this study, the rates of herbalist utilization from local people, medicinal and aromatic plants they bought and purpose of using medicinal and aromatic plants were aimed to determined. Surveys were conducted on the medical and aromatic plants sold in 3 herbalists located in Artvin. The rates of plant utilization, the plants they use and the problems they have encountered and their suggestions were determined. Information regarding latin name, public name, medicinal and other uses, opinion and problems were collected with this questionnaires. Demographic characteristics of participants also recorded. The plants with the most sales are ginger, linden, rosehip, daisy, cinnamon, cherry stalk, celery seed, carob and sage It was determined that local people use more medicines and they prepare their herbal medicines by themselves, others sell them from herbalists. Native people used medicinal plants most frequently for the treatment of respiratory tract problem, intestinal disorders, dental diseases, ache, urinary disorders and blood pressure disorders, especially used as an attenuator products. Many participants stated that herbal medicines are natural and useful however, complained about the unsupervised people working in herbalists, unlabelled and not fresh products. it appears that most herbalists do not have sufficient knowledge about the properties of these medicinal and aromatic plants in Artvin.

BRASSINOSTEROID MODIFIES GROWTH AND SECONDARY METABOLITE PRODUCTION IN LAVANDIN (LAVANDULA INTERMEDIA)

ÖZLEM ARAS AŞCI¹, HIKMET DEVECİ¹, ALICAN ERDEĞER¹, KÜBRA NUR ÖZDEMİR¹, TUNHAN DEMİRCİ¹, NILGÜN GÖKTÜRK BAYDAR¹

ABSTRACT

Lavandula is a plant species belonging to the family Lamiacea and has 39 different species originating from the Mediterranean. It is one of the most popular plants used since ancient times as medicinal, aromatic and ornamental plant in the world. In addition to being a valuable ornamental plant with scented and decorative flowers, its essential oil obtained from flowers is an important oil for aromatherapy, cleaning products, perfumes, massage oils and cosmetics due to their antiseptic and antifungal properties. Lavandula oil has also antimicrobial, antibacterial, anti-depressive, sedative and dermatologic activities. To get secondary metabolites with high quality and quantity, some exogenous treatments could be applied successfully in plants. Brassinosteroids (BRs), new generation steroid phytohormones, play significant roles in increasing different secondary metabolites. The objective of this study was to determine the effect of foliar application of 24-epibrassinolide (24-eBL), a brassinosteroid analogue, on growth and secondary metabolite production in Super A lavandin cultivar (*Lavandula intermedia*). For this aim, 24-eBL at four different concentrations (0, 0.75, 1.5 and 2.25 mg l⁻¹) was applied to six- year old lavandin plants twice. The first application was done at the beginning of the budding phase and the second application was done 10 days after the first application. As a result of this study, 24-eBL significantly increased fresh and dry stem flower weights, dry stemless flower weight, essential oil and total phenolic contents compared to the control plants. 24-eBL modified also essential oil composition. Linalool, linalyl acetate, camphor, borneol, 1,8 cineol, geraniol and lavandulyl acetate were determined as main components of lavandin oil. 24-eBL applications were not effective on linalool accumulation. Linalyl acetate and 1,8 cineol increased with 24-eBL application while the highest contents of camphor, borneol, geraniol and lavandulyl acetate were obtained from the control oil. It was determined that 1.5 mg l⁻¹ of 24-eBL was the most suitable concentration providing the highest dry stemless flower weight, essential oil, phenolic content and linalyl acetate content. To conclude, 24-eBL may be promising compound for use in lavandin cultivation.

CHEMICAL COMPOSITION OF SOME MEDICINAL AND AROMATIC PLANTS

YESİM ÖZOGUL¹, FETHİYE TAKADAS¹, FATİH ÖZOGUL¹

ABSTRACT

Medicinal and Aromatic plants participating remarkable role in primary health care of the peoples over the world. Forest is a main source for collection of the traditional medicinal plants. Uses of medicinal and aromatic plants as a traditional medicine are followed by around 80% peoples in the World. The occurrence of essential oils, or volatile oils, is very widespread in the plant kingdom. As their second name implies, they are volatile in steam. They are accumulated in oil cells, in secretion ducts or cavities or in grandular hairs of plants.. An essential oil is a mixture of chemical compounds, commonly containing 40 to 80 monoterpenoids, sesquiterpenoids and diterpenoids, and many in relative small proportions. In this study, volatile chemical constituents of juniper (*Juniperus communis*), pine oil (*Pinaceae*), myrtle (*Myrica minor*), orange (*Citrus sinensis*), thyme (*Thymus vulgaris*), lavender (*Stoechas lavender*), sage tea (*Salvia officinalis*), lemon (*Citrus*), rosemary (*Rosmarinus officinalis*), French lavender (*Lavandula stoechas*), eucalyptus (*Eucalyptus globulus*), and laurel (*Laurus nobilis*) have been investigated and analyzed by GC/MS. The result showed that, the major components in essential oils were monoterpenes hydrocarbons, α -pinene (1,62 – 90,09%), limonene (71,7 - 95,7%), monoterpene phenol, carvacrol (71,5%) and oxygenated monoterpenes, camphor (4,85 – 57,25%), 1,8-cineole (3,9 52,17%), eucalyptol (48,68 – 59,28%), linalool (43,37%) and linalyl acetate (33,6%).

ANTIOXIDANT ACTIVITY AND ESSENTIAL OIL COMPOSITION OF SIDERITIS STRICTA BOISS. & HELDR

EBRU DEVECİ¹, GÜLSEN TEL ÇAYAN², MEHMET EMİN DURU²

ABSTRACT

The *Sideritis* genus, a member of the Lamiaceae family, consists of more than 150 species in the world. This species is mainly grown in temperate and tropical regions of the Northern Hemisphere and Turkey and Spain which have the highest number of different species [1, 2]. *Sideritis* species are known as ‘dağ çayı’ and ‘yayla çayı’ and the aerial parts of these species are consumed as herbal and traditional tea in Turkey. This tea is known for its special taste and aroma and usually preferred with honey and lemon to treat stomach ache, indigestion, flatulence, common colds, fever, flu, sore throat, and bronchitis [3]. Nowadays, using of essential oils and extracts obtained from various parts of plants in pharmaceutical, food, and cosmetic industries are increasing. For this reason, in this study, we investigated the chemical composition and antioxidant activity of the essential oil and the hexane, acetone, methanol and water extracts of *S. stricta*. GC and GC-MS were used to analyze the chemical composition of the essential oil of *S. stricta*. In order to determine the antioxidant activity of the essential oil and the extracts of *S. stricta*, lipid peroxidation inhibition by β -carotene-linoleic acid, radical scavenging by DPPH• and ABTS•+, CUPRAC and metal chelating assays were used. A total of twenty-seven compounds were identified in the essential oil and δ -cadinene (18.33 %), cubenol (17.63 %), β -caryophyllene (14.34 %) and caryophyllene oxide (10.46 %) were found to be major compounds, respectively. Acetone extract exhibited the highest antioxidant activity in all tests, excluding metal chelating assay. In addition, acetone, methanol and water extracts indicated higher antioxidant activity than standards in β -carotene-linoleic acid and CUPRAC assays. ROSMARINIC ACID CONTENTS AND ANTIOXIDANT PROPERTIES OF DIFFERENT OREGANO / THYME SPECIES

ZEHRA KASIMOĞLU¹, HILAL ŞAHİN NADEEM², AYHAN TOPUZ¹

ABSTRACT

Chemically, rosmarinic acid is an ester of caffeic and 3,4-dihydroxyphenyllactic acids and pointed out due to its antioxidative effects and medicinal properties. Rosmarinic acid can be found in many plants but usually rosemary plant is used as the major source. From this point of view, Origanum and Thymus species under Lamiaceae family have special attention for their rich rosmarinic acid contents. In this study, five different commercially important oregano/thyme species, which are grown in Turkey and locally named as “İzmir kekiği” (Origanum onites), “Antalya kekiği” (Origanum bilgeri), “Sütçüler kekiği” (Origanum minutiflorum), “dallı kekik” (Thymus bracteosus) and “tomurcuk kekik” (Thymus vulgaris), have been compared in terms of their rosmarinic acid contents and antioxidative properties. Under the study, oregano/thyme samples were extracted at 40°C by using 3 different solvents (distilled water, ethanol, and methanol). These extracts were subjected to the analyses of total phenolic contents (spectrophotometric by using Folin Ciocalteu assay), antioxidant activity (spectrophotometric by using DPPH radical scavenging assay) and rosmarinic acid contents (chromatographic by using HPLC method). Extraction with different solvents significantly ($P < 0.05$) affected the rosmarinic acid contents of the samples. In all samples, water extracts had the lowest rosmarinic acid contents while the methanol extraction provided the highest values. In methanol extracted samples, Origanum minutiflorum had the highest rosmarinic acid content (70.97 mg/g), followed by Thymus bracteosus (64.99 mg/g), Thymus vulgaris (56.56 mg/g), Origanum bilgeri (41.32 mg/g) and Origanum onites (32.98 mg/g). Total phenolic contents and antioxidant activities of all samples, extracted by distilled water, were found to be minimum while the methanolic extracts of the samples had the highest total phenolic contents and antioxidant activities. In methanol extracted samples, Thymus vulgaris had the highest total phenolic content with the value of 59.97 mg/g dry matter while Origanum minutiflorum had the lowest value of 34.29 mg/g dry matter. Methanolic extract of Thymus vulgaris had also maximum antioxidant activity with the value of 0.19 g/mg DPPH whereas water extract of Origanum minutiflorum had the minimum antioxidant activity by 0.34 g/mg DPPH.

MORPHOGENETIC, ONTOGENETIC AND DIURNAL VARIABILITY IN ANTIMICROBIAL ACTIVITY OF PURPLE CONEFLOWER ESSENTIAL OIL

M. AKIF AÇIKGÖZ¹, Ş. METİN KARA¹, ÖZGÜR CEYLAN², MELEK KAYACI¹

ABSTRACT

This study was conducted to designate morphogenetic, ontogenetic and diurnal variability in antimicrobial activity of purple coneflower essential oil in a two-year study. The samples of leaf, root-bulb-stalk, flower and seed were used to specify morphogenetic variability. The leaf and root-bulb-stalk samples were taken at three stages (pre-, full and post-flowering), while the flower samples were picked up at full flowering and the seed samples were gathered at harvest maturity. To clarify ontogenetic and diurnal (9:00 am, 1:00 pm and 5:00 pm) variability, whole plant samples were taken at pre-, full and post-flowering stages. A total of 10 microorganisms, including 7 bacteria, 1 fungus and 2 yeast species, have been studied to determine antimicrobial activity of essential oils using disc-diffusion and minimal inhibition concentration methods. The highest inhibitory effect of leaf and root-bulb-stalk essential oil was observed from pre-flowering samples. In terms of ontogenetic variability, essential oils of pre-flowering samples generally produced higher antimicrobial activity compared to post-and full flowering. There were no significant differences among antimicrobial activities most of the essential oils extracted from whole plant samples taken three times a day. None of the essential oil extracted from different plant parts at different growth stages and sampling hours showed antimicrobial activity against *Aspergillus niger*. The present study reveal that antimicrobial activity of purple coneflower oil significantly vary based on plant parts and growth stages.

TRITERPENOID SAPONINS FROM CEPHALARIA TAURICA AND THEIR BIOLOGICAL PROPERTIES

ÖZGÜR ÖZER¹, NAZLI SARIKAHYA¹, SUHEYL KIRMIZIGÜL¹

ABSTRACT

Cephalaria taurica Szabo. narrow spreaded endemic plant [1], which is belong to Caprifoliaceae family, lives along the Mediterranean region of Turkey. Many scientific researches about isolation and structural determination procedures on these species showed that they have different types of molecules such as triterpenoid, flavonoid, iridoid and alkaloid glycosides. Because of this wide range of chemical composition *Cephalaria* species have many important biological activities [2-4]. In this study, we aimed to investigate pure triterpenoid saponins from *C. taurica* and their biological properties. Our researches started with the extraction procedures. For that reason, methanol, n-butanol, water and n-hexane were used as extraction solvents. Vacuum Liquid Chromatography (VLC) on n-butanol fraction followed by a two-step silica gel Medium Pressure Liquid Chromatography (MPLC) separation procedures and many open column chromatograph (CC) applications were carried out. Totally ten triterpenoid saponins were isolated from the aerial parts of *Cephalaria taurica*. According to our literature findings, two of them are new saponins and other eight compounds are known triterpenoid saponins which have hederagenin aglycone. The compounds were characterized using NMR spectroscopy (1D and 2D), mass spectrometry (HRESIMS) and chemical methods. Our future plan is to investigate possible cytotoxic and immunomodulatory activities of these two new saponins. References 1. Davis, P.H. IN VITRO ANTIOXIDANT AND ANTIVIRAL ACTIVITIES OF SILYMARIN AGAINST BOVINE EPHEMERAL FEVER AND BLUE TONGUE VIRUS

BURAK DİK¹, IRMAK DİK¹, OđUZHAN AVCI¹

ABSTRACT

The primary aim of this study was to evaluate the effects of Silymarin on thiobarbituric acid reactive substances (TBARS) and antioxidant activity levels using Vero cell lines infected by Bovine Ephemeral Fever Virus (BEFV) and Blue Tongue Virus (BTV). It was also determined the antiviral against both viruses and cytotoxic effects of Silymarin. Silymarin is a member of the flavonolignans, which are natural phenols composed of flavonoid and lignan. Silymarin is being used as a general medicinal herb and has been described as anti-inflammatory, immunomodulatory, anti-lipid peroxidative, anti-bacterial, antioxidant and antiviral. BTV is an orbivirus of the Reoviridae family and affects all ruminants. The clinical signs of the disease vary with the viral strain, animal species and breed. It also causes thrombo-hemorrhagic fevers mainly in sheep and occasionally in cattle. BEF is a vector borne viral disease of cattle and the pathogenesis of the disease is complex. It causes high morbidity, economic losses and a variety of complications resulting from the disease. A stock solution containing 20 mg of silymarin was dissolved in 1 mL distilled water. Silymarin (400 µg/mL) was prepared by diluting the stock solution. Several concentrations of Silymarin were placed in contact with the Vero cell lines, which were then incubated in 5% CO₂ at 37°C for 48 h. After the incubation period, Silymarin was tested for cytotoxic activity. Its cytotoxic dose was determined at 100 µg /mL concentrations. The CPE inhibition assay demonstrated that 25 and 50 µg/mL of Silymarin significantly inhibited BEFV. In contrast, different concentrations of Silymarin didn't show CPE inhibitory activity on BTV. Silymarin's total antioxidant activity and the oxidative stress marker TBARS were determined by commercial ELISA kits after Vero cells had been infected with BEFV and BTV. Silymarin was found to be an effective antioxidant in different doses as [25 and 50 µg/mL, (P <0.05)], but at these doses, it only caused a decreased in level of TBARS levels (P >0.05). In conclusion, Silymarin can be used for preventing lipid oxidation in pharmaceutical products and retarding the formation of reactive oxygen species. It can be evaluated as an antiviral and antioxidant in the in vivo treatment of BEFV in the future.

EFFECT OF THYMOQUINONE ON PROLIFERATION OF BOVINE PERIPHERAL BLOOD MONONUCLEAR CELLS*

UÇKUN SAIT UÇAN¹, ZAFER SAYIN¹, ASLI SAKMANOĐLU¹, ALI USLU¹

ABSTRACT

Nigella sativa is a medicinal plant that is widely used and known with its various therapeutic effects all around the World. Thymoquinone (Tq) is the most important component of this plant and has positive biological effects on various cells of the mammals. Among these effects, immune modulator effects are considered to be promising potentials for future adjuvant design. In this study, the effect of Tq on the large ruminat immune system was investigated in vitro. The effects of different Tq concentrations on survival and proliferation of bovine peripheral blood mononuclear cells were investigated by cell culture and ELISA methods in the presence of various mitogens (Con A and PWM). Tq showed a blastogenic effect on peripheral mononuclear cells of cows when added to culture medium at a concentration of 50 µg/mL, just like known mitogens do. For 5 days proliferation with 107 cell/mL density in presence of 50 µg/mL Tq in the cell cultures caused a degree of blastogenetic response of 0.485 ± 0.06 ($P < 0.01$). The mitogenic responses for Con A and PWM were $0,399 \pm 0,084$ and $0,397 \pm 0,049$, respectively. The combination of Tq with either of both mitogens (Con A or PWM) did not lead to further increases in the blastogenetic responses. The mechanism of Tq's mitogenic effect on the immune cells is completely in dark at present. These results support our hypothesis that Tq would be a candidate for being as a component of a novel adjuvant or even a promising immunostimulant for therapeutic purposes in future. *This research was supported by Selçuk University (BAP No: 16401107).

EFFECTS OF PUNICA GRANATUM PEEL POWDER ON PERFORMANCE OF LAYER HENS

TAHIR BALEVİ¹, UÇKUN SAIT UÇAN², UĞUR USLU³, OĞUZHAN KAHRAMAN¹, ABDULLAH ÖZBİLGİN¹

ABSTRACT

Egg productivity, daily feed consumption, feed intake ratio, damaged egg ratio, some parameters on egg quality, mortality and effect on immune humoral response measured during feeding layers with ratios containing different amounts of Punica granatum. A number of 60 Hy-line layers aged 28 week used in the study. The trial will be conducted at the Hümeyra Özgen Research and Practice Farm, Faculty of Veterinary Medicine, Selçuk University. Firstly, Punica granatum was provided from local market and peel of the fruit was dried using an oven following depeeling. Dried peel was then powdered using a grinder and added to the ratios. The trial conducted at the cages each of which will be placed 3 layers at the Hümeyra Özgen Research and Practice Farm, Faculty of Veterinary Medicine, Selçuk University. At the beginning of the trial layers weighted and divided into 4 groups that each include 15 layer with similar body weights. Each group was composed of 5 subgroup including 3 animals per subgroup. Except control group, the layers in the groups fed ratios with 0.5, 1 and 1,5 % peel of Punica granatum. The study last 70 days, first 10 days of that was the prior period to the trial and following 60 days for experimental trial. Egg productivity was determined by noting the egg production records at the same hours of every day. The eggs were evaluated by classification on being either of intact, broken, cracked or abnormal. Feed and water were provided ad libitum in the study. During the trial, remained feed by chickens collected in every 15 days to calculate daily feed consumption and feed conversion ratios for the corresponding period. Additionally, At the beginning and the end of the trial, changes on hens' live weight determined by weighting at these two times of trail period. At the end of the trial, no differences were observed between the groups in terms of some performance values ($p>0.05$). It is concluded that more detailed studies on this particular subject were needed. This study includes a part of the project no:15401148 supported by BAP (Selçuk University)

USE OF MEDICINAL AND AROMATIC PLANTS IN AQUACULTURE

ÖZNR DILER¹, İBRAHİM İBRAHİM DILER¹, HALİT BAYRAK¹, ÖZNR GÖRMEZ¹, SEDA NUR ERGÜL¹, KAMIL ATSATAN¹

ABSTRACT

In terms of aquaculture sector in our country, production of fish and other aquatic products is an important resource that meets the protein requirement in human nutrition and has been growing worldwide for the last 20 years for aquaculture. At present, the most important problems in fish farms are economic losses due to infectious diseases and decrease of feed value due to health problems caused by them. Because of antibiotics used for treatment cause undesirable side effects, that's way addition of antibiotics to feeds for prophylactic purposes after 2006 is prohibited in the EU. In recent years, the use of medicinal plants is an agenda because they are natural and cheap for animal production. The use of herbal products in mention; they can be easily available, they are cheap, minimal side effects, usually in low doses to be effective and affecting the biochemical processes of the cells against pathogens, broad spectrum (bacterial, viral, fungal, parasitic) can be the choice today due to the effects of increased opportunities. For this purpose, the aquaculture industry, the use of a medicinal plant and addition to feed. These products have got such as consists of fish diseases, provide antioxidant property of resistance, general physiological status of fish healing, activate the enzymes, stress prevention, feed conversion and growth performance lead to an increase in features. Our country have got very rich in terms of medicinal and aromatic plants. There are lots of herbal and aromatic flavors our country's various geographical regions, naturally, green tea, rosemary, thyme, sage, St. John's Wort and melissa grass, such as plants, essential oil or extract has been used in the aquaculture industry. In this study, reviewed in this field works in the world and especially in our country.

EFFECT OF IMMERSION TREATMENT OF SOY EXTRACT ON SEX REVERSAL IN THE RAINBOW TROUT (*ONCORHYNCHUS MYKISS*, WALBAUM, 1792)

FUNDA TURAN¹, KIYMET DAMLA YIĐİTARSLAN¹

ABSTRACT

This study explores the possible utilization of soy extract as phytoestrogen on sex reversal in the Rainbow trout (*Oncorhynchus mykiss*, Walbaum, 1792) with immersion treatment. Different concentrations (0.0, 0.10 and 0.20 g/L) of soy extract were tested for their effect on sex reversal in rainbow trout by immersing newly hatched offspring once weekly for 1 months. The experiment was carried out in Kahramanmaraş trout farm of Kılıc Holding Co. in Turkey. The 14 days-old rainbow trout larvae (mean weight 0.123±0.03 g) were randomly removed from the hatching tank, and placed in 1000-l fiberglass tanks (200x100x75 cm). Each tanks comprised 1500 larvae and a total 6000 larvae were used for the experiment. When the fish reached four months, 50 randomly sampled fish from each group were sacrificed. For histological examination, the gonads were fixed in 10% neutral formalin and processed by routine dehydration and paraffin embedding procedures. Cross-sections (4-6 µ thick) were stained with Mayer's hematoxylin and eosin phloxine B solution, examined, and microphotography. At the end of experiment, the highest feminization (69%) was observed at 0.20 g/L soy extract treatment group. Morphological and histological examinations of the gonads in all groups revealed no intersex fish. Histological examination of fish treated with soy extract revealed no damage to the testes or ovaries. In conclusion, these result indicate that the use of higher doses of soy extract are more effective for all-female production of the rainbow trout population.

THE INFLUENCE OF LICORICE ROOT (*GLYCYRRHIZA GLABRA*) ON SEX REVERSAL IN GUPPY *POECILIA RETICULATA*

FUNDA TURAN¹

ABSTRACT

The roots and rhizomes of licorice (*Glycyrrhiza*) species have long been used worldwide as a herbal medicine and natural sweetener. Licorice is commonly present in menopausal botanical supplements in the United States. The estrogenic activities of different licorice species are variable and likely depend on the type and amounts of bioactive compounds. This study examined the effects of Licorice root on sex reversal in guppy, *Poecilia reticulata*. Newly born guppy fry (0.014 ± 0.001 mean weight), were randomly distributed into 30 L aquaria at a density of 80 fish per aquarium and subjected to a sex-reversal treatment by immersion of licorise root for 30 days. The licorise root was incorporated into the aquarium water as follows: 0 (control), 0.25 and 0.5 g/ L licorice root. Each of the treatment group was randomly assigned to triplicate groups of fish. The treatment was repeated twice (in the beginning and half way through the experiment) during 30 days. The water of the aquaria was changed entirely every 15 days. A control group was also included in this experiment. Hatchlings were fed ad-libitum three times a day until satiation. After completion of the treatment, they were transferred to larger aquaria. When individuals were 2 months old, the sex of each was determined by external examination, with gonopodium and other morphological characters. In addition, for histological examination of gonads, guppy were fixed in 10% neutral formalin. After fixing the samples, specimens, excluding head and caudal regions were processed for histology using routine dehydration and parafin-embedding procedures. Cross-sections of thickness 4-6 mm, were stained with Mayer's haematoxylin and eosin phloxine B solution examined, and microphotography. At the end of experiment, highest feminization (88%) was observed at 0.5 g/L licorise root group. Morphological and histological examinations of the gonads in all groups revealed no intersex fish. Histological examination of fish treated with licorise root revealed no damage to the testes or ovaries. This study demonstrated successful sex reversal with treatment of licorise root on new-born progenies of *P. reticulata*.

ANTI-INFLAMMATORY EFFECTS OF MORUS NIGRA ON EXPERIMENTAL PERIODONTITIS IN RATS

TUBA TALO YILDIRIM¹, GONCA OZAN², SERKAN DUNDAR¹, ALIHAN BOZOGLAN¹, TAHİR KARAMAN³, NEVAL DILDES⁴, NALAN KAYA⁵, ELİF ERDEM⁵, CAN AYHAN KAYA⁶

ABSTRACT

Background: *Morus nigra* (Urticales Moraceae), usually known as the black mulberry and it is also used in the treatment of various disorders including inflammatory diseases. However, there has been no report on the effect of *morus nigra* on alveolar bone loss in periodontitis. Here, we examined the effects of *morus nigra* on the ligature induced periodontitis in a rat model. Material and Methods: Twenty-four Wistar rats were separated into three groups: control group (C, n=8), experimental periodontitis (PER, n=8), and experimental periodontitis and treated with *morus nigra* (MN+PER, n=8) (50 mg/kg per day for 21 days). A 3/0 silk suture was placed around the mandibular right and left first molars subgingivally; after 21 days, the rats were sacrificed. The detection of the receptor activation of nuclear factor κ B (RANKL) and osteoprotegerin (OPG) were immunohistochemically performed. Results: Immuno-histochemical staining of RANKL activity were found significantly lower and OPG activity were found significantly higher in MN+PER group compared to PER group ($p<0.05$). Conclusions: The present study revealed that systemic administration of *morus nigra* significantly inhibited the regional alveolar bone resorption and contributes to periodontal healing in ligature induced periodontitis rat models.

EFFECTS OF UKRAIN IN RATS WITH NECROTIZING ENTEROCOLITIS

YASIN TUĐRUL KARAKUŐ¹, BIRCAN SAVRAN¹, RAZIYE AKÇILAR¹, SAIME ERGEN DİBEKLİOĐLU¹, AYNUR GÜLCAN¹, CENGİZ KOÇAK², FATMA EMEL KOÇAK², AHMET KOÇAK¹, HARUN KAÇAR¹, GÜL DURMAZ²

ABSTRACT

Objective: Necrotizing enterocolitis (NEC) is a common clinical emergency of gastrointestinal system in the neonatal period. Pathological findings are characterized by inflammation and coagulation necrosis. Ucrain (NSC 631570) is a synthetic thiophosphate derivative of alkaloids from the extract of the celandine (*Chelidonium majus* L.) plant. Ucrain is a drug used in treatment of various cancers, however, anti-inflammatory properties are also known. We aimed to evaluate the effects of ucrain on experimental neonatal NEC model. **Material and Methods:** 30 Sprague-Dawley rats pups aged 1-8 hours were separated into three groups. Group I (control group) was not stressed with any factor. Group II was stressed with hypoxia by breathing of 100 % CO₂ for 5 minutes and with exposure to cold at +4°C for 10 minutes. This protocol was performed twice daily for 4 days. Ucrain was used (5mg/kg intraperitoneally) in group III at the end of the each hypoxic and cold stress. Samples from the blood, hepatic and splenic tissue for microbiological and biochemical and histological PCR studies and terminal ileum biopsy for histopathological evaluation were obtained at the end of the 4th day. **Results:** No bacterial growth was detected in the blood, hepatic and splenic tissue cultures in the control group. Bacterial reproduction was detected in 7 rats in group II and in 2 rats in group III. Most of the isolated micro-organism was *Pasteurella aerogenes*. Terminal ileum biopsies were normal in the control group. In group II, histopathologic findings were grade 3 NEC in six rats, grade 2 NEC three rats and grade 1 NEC one rat. In group III, six rats had grade 1 NEC, four rats had a normal histopathological findings. Group 2, TNF- α , IL-6, IL-1 β , i-NOS, PAFR levels were significantly higher than other groups, while the EGFR levels were significantly lower compared to other groups. When evaluating the level of e-NOS was no differences between the groups. **Conclusion:** Data established from the current study suggest that ucrain may exhibit protective effect against NEC and that antioxidant activity primarily modulates this effect. **Discussion:** We believe that ucrain may be protective against necrotizing enterocolitis reducing the inflammatory mediators.

INVESTIGATION OF THE EFFECTS OF OLEUROPEIN-RICH DIET ON THE NUMBER OF LIVER MAST CELLS IN RABBITS GIVEN ROCURONIUM

TUNCER ŐİMŐEK¹, MESUT ERBAŐ¹, BAŐAK BÜYÜK¹, ŐİĐDEM UYSAL PALA¹, HASAN ŐAHIN¹, HATICE BETÜL
ALTINIŐIK¹

ABSTRACT

Objective: Rocuronium is a steroidal neuromuscular muscle relaxant that is used to relieve endotracheal intubation and mechanical ventilation while maintaining skeletal muscle relaxation during anesthesia. Oleuropein is a phenolic compound derived from green olive leaf and responsible for olive bitter-harsh taste. In different studies it has been shown that; oleuropein have antihistaminic effects and can prevent mast cell discharge. From these studies, when diet principle which based on consumption of phenolic compounds, such as oleuropein, is proven to reduce the anaphylactic mortality and morbidity caused by steroid structured muscle relaxants used in anesthesia, it can be shown that these phenolic compounds may enter into anesthesia procedures as a prophylactic diet and resulting in a more healthy anesthetic process for patients. This substance, which is very common in our country, will contribute to our country in terms of health as well as contribution to economic development. Method: The 14 rabbits used in the study were randomly divided into 2 groups. The rabbits in control group were given standard diet for 15 days. The rabbits in the oleuropein group were given oleuropein-rich green olive leaf extract with the addition of animal water as oleuropein 20mg / kg for 15 days orally. The specially produced extract obtained for study was subjected to standardization in terms of mg / ml oleuropein amount by high performance liquid chromatography (HPLC) method. After 15 days, all rabbits in two groups were given rocuronium from 1mg / kg. After 1 day, animals were sacrificed under ketamine xsilazine anesthesia and the livers of the animals were removed and taken for light microscopical examination. Sections were stained with routine H & E, toluidine blue and tryptase immunohistochemically. Statistical analysis: The data was analyzed using the SPSS package program version 20.0. Mean, standard deviation, median, minimum, maximum were used in the presentation of descriptive data. The Mann Whitney U test was used to compare the variables. For statistical analysis, $p < 0.05$ was considered. Results: There was no statistically significant difference between ALT, AST and Albumin averages of experiment and control groups ($p > 0.05$). The Triptase average of the control group was higher than the Triptase average of the control group and this difference was statistically significant (1169.6 ± 137.5 vs. 775.1 ± 180.0 , respectively $p = 0.003$). The T.Blue average in the experimental group was higher than the control group (1774.4 ± 336.0 vs. 1673.6 ± 291.4 , respectively). However, there was no statistically significant difference between groups in terms of T-Blue averages ($p = 0.482$). Conclusion: In the literature, it has been shown that rocuronium adverse effects, like hypersensitivity and anaphylaxis may limit routine use of this substance. The use of oleuropein for eliminate these effects reduced the number of inflammatory cells and prevented degranulation.

POSSIBLE PROTECTIVE EFFECTS OF CURCUMIN IN LUNG TISSUE ON SEPSIS-GENERATED RATS

EMEL AKTAŞ¹, HILAL YILDIRAN²

ABSTRACT

Objective: Sepsis is a clinical syndrome that is defined as a systematic response to infection. Lung is the primary target organ in sepsis. Advanced treatment strategies are needed for the treatment of sepsis patients. Because of the protective effects of curcumin, an active component of turmeric, is a powerful candidate for current therapies in sepsis. The objective of the present study was to determine the possible protective effects of curcumin on lung tissue of the sepsis induced rats. Method: The 32 rats used for the study were divided into 4 groups and the rats in group 1 (control group) were subjected to abdominal incision after anesthesia under sterile conditions and abdomen was closed. On the rats in the second group (Cur group), only abdominal incision was conducted after anesthesia under sterile conditions and the abdomen was closed. Cur was administered to this group in a daily dose of 100 mg/kg via oral gavage, dissolved in dimethyl sulfoxide, starting 3 days prior to the operation. On the rats in the third group (CLP group), cecal ligation and puncture (CLP) were performed to induce the sepsis model after anesthesia under sterile conditions and the abdomen was closed. In the fourth group (CLP + Cur group), rats were anesthetized and CLP was conducted under sterile conditions and the abdomen was closed to induce the sepsis model. In this group, Cur was administered to this group in a daily dose of 100 mg/kg via oral gavage, dissolved in dimethyl sulfoxide, starting 3 days prior to the operation. All rats in all groups were sacrificed under anesthesia 24 hours after the operation by opening their abdomen under sterile conditions and blood aspiration from their hearts and then rat lung tissues were removed. In histopathologic examination alveolar wall thickness, inflammatory cell infiltration and edema evaluated, and TUNEL was performed. iNOS activity was examined by immunohistochemical evaluation. Results: The inflammatory cell infiltration, edema and alveolar septal thickness scores of lung injury were significantly higher in the CLP group compared to the control and curcumin groups, and statistically significant decreases were observed with curcumin treatment ($p < 0,001$). The numbers of iNOS positive cells in the alveolar and interstitial areas were significantly higher in the CLP group than in the control and curcumin groups, whereas the number of iNOS positive cells in the CLP + Curcumin group was significantly lower than that of the CLP group ($p < 0,05$). TUNEL staining revealed a significant increase in the number of apoptotic cells in the CLP group and a significant decrease in the number of increased apoptotic cells due to CLP after curcumin treatment ($p < 0,001$). Conclusions: The study results suggested that curcumin supplement in sepsis patients has protective effects on lung tissue by decreasing inflammatory cell infiltration, edema, alveolar wall thickness, apoptosis and iNOS activity.

INVESTIGATION OF THE ANTIFUNGAL AND ANTIOXIDANT PROPERTIES OF THE METHANOL EXTRACT OF CAPPARIS OVATA

HAMIT USLU¹, DİNÇER ERDAĞ², GÖZDE ATİLA³, KEMAL METİNER⁴, BARAN ÇELİK⁴, ASIM KART⁵, OKTAY ÖZKAN⁶

ABSTRACT

In this study, the antioxidant properties of methanol extract of Capparis ovata that belongs to the Capparaceae family was investigated by using various established in vitro such as nitric oxide (NO) radical scavenging activity, reducing power and total phenolic substance analysis. In addition to study was carried out in order to determine the antifungal effect of Capparis ovata, on certain standard fungi strains. To analyze the NO at pH: 7,4 in PBS buffer using 10mM sodium nitroprusside NO radical was produced and added to the medium in various concentrations methanolic Capparis ovata's NO scavenging effect was compared with standart Rutin substance. The inhibit of NO radical by Capparis ovata, depending on the dose, was seen. To investigate the Capparis ovata methanolic's extract capacity of reduction the Fe+3 to Fe+2 which was added to the medium it was compared with Butylated Hydroxytoluene (BHT). Capparis ovata exhibited reduced power activity. The presence of a reducing capacity of a compound is used as a determinant of antioxidant activity. Furthermore, in the study the levels of phenolic compounds of Capparis ovata plant were determined because they were effective on antioxidant parameters. Values of absorbance changes at 760nm were plotted in amounts ranging from 0-100 microgram/ml of pyrocatechol, known as a phenolic standard, were plotted. The amount of phenolic substance in the medium was determined by using the Folin-Ciocalteu reagent. The total phenolic content of the methanol extract of the Capparis ovata was determined as the phenolic substance equivalent to pyrocatechol from the standard pyrocatechol graphic. The value of the curve obtained from the standards was calculated as $r^2 = 0.9995$. As a result, it was determined that 1 mg of Capparis ovata added to the experimental medium contained 19.64 μ gr pirocatechol conjugate. The antimycotic effect of Capparis ovata ethanolic extract against fungus was examined with (MIC) broth macro dilution method with minimum inhibitor concentration. A suspension equal to 0.5 McFarland turbidity in physiological salty water among 48 hour Candida albicans, Candida parapsilosis, Candida krusei and Malassezia pachydermatis strains in SDA medium were prepared in order to prepare the inoculum. RPMI-1640 was used as the medium. Amphotericin B was used as control antimycotic. The results were compared with the control tube and determined with bare eye and

THE RELATIONSHIP BETWEEN GALACTAGOGUE CONSUMPTION STATUS AND BREAST MILK ADIPONECTIN AND LEPTIN LEVELS

BETÜL KOCAADAM¹, EDA KÖKSAL¹, CANAN TÜRKYILMAZ²

ABSTRACT

Background/Objectives: Lactating mothers can use various methods as well as consume specific foods or plants for increasing their breast milk. Galactagogues are substances or medicines believed to stimulate maintenance, and augmentation of breast milk production. Herbal teas and some herbs as well as commercial milk-enhancing teas are frequently preferred by mothers in Turkey and around the world. The aims of this study was to determine galactagogues consumption status of preterm and term infants' mothers and to determine the most frequently preferred herbal galactagogues and their relation with breast milk adiponectin and leptin levels. **Subjects/Methods:** This study was carried out in the province of Ankara between the years 2015-2016. Sixty-five voluntary mothers between the ages of 18-35 and their infants (31 preterms; 34 terms) were included the study. General characteristics of the mothers, galactagogues consumption status were determined through a questionnaire. Milk samples (fore milk) were taken from mothers in the period of between 15th and 30th days after birth (mature milk). Enzyme-linked immunosorbent assay (ELISA) was used for the detection of adiponectin and leptin in breast milk. **Results:** The mean age of the preterm mothers was 28.5 ± 4.84 years and 30.5 ± 4.34 years for the term mothers ($p > 0.05$). 35.6% of the preterm mothers and 41.2% of the term mothers used galactagogues ($p > 0.05$). The product with the highest consumption frequency was 'commercial milk enhancing teas' (preterm 81.8%; term 92.9%) among the galactagogues and the median value of daily consumption was 720 ml in both preterm and term infants' mothers ($p > 0.05$). In the second rank, fennel tea (preterm 18.2% and term 42.9%) was found. When the hormon levels of breastmilk were evaluated, there was no difference in preterm and term mother milk using milk-enhancing teas (adiponectin $p = 0.324$; leptin $p = 0.911$). However, milk adiponectin concentration was higher in term mothers who consumed milk-enhancing teas than those who did not consume ($p = 0.001$). **Discussion/Conclusion:** Mothers often tend to traditional methods and herbal teas for increasing their milk. In this study, it was determined that the mothers commonly consumed 'commercial milk enhancing teas' to increase their milk. It is thought that the suggestions made by health personnels and mothers to each other are effective in this situation. In this study, there was no difference between the adipokines contents in the milk of preterm-term mothers using milk-enhancing tea; however, within the group, the concentration of adiponectin in the term mother's milk consuming milk enhancing teas was higher than who did not consume. Leptin reduces energy intake, increases energy expenditure; on the other hand, adiponectin stimulates food intake and reducing energy expenditure. Therefore, it is crucial to investigate in more detail the effects of the consumption of these products on infants. In addition, the effects of commercial milk-enhancing teas on the mothers and their infants in the long term, and the effectiveness, safety, side effects, duration of consumption

EVALUATION OF HERBAL PRODUCTS USE AMONG ENDOCRINOLOGY PATIENTS IN THE CONCEPT OF RATIONAL USE

EZGİ BELLİKÇİ KOYU¹, BANU PINAR ŞARER YÜREKLİ², SELDA SEÇKİNER², NİLÜFER ÖZDEMİR², ZEHRA BÜYÜKTUNCER³

ABSTRACT

Aim: Therapeutic use of plants is as old as human history, but its scientific use in therapy begins with the 19th and 20th centuries. Evidence based and rational use of herbal products requires that patients receive products appropriate to their clinical needs, in doses that meet their own individual requirements, for an adequate period of time. In this way, safe use of herbal medicines, which reduces the risk of toxicity and drug interactions while supporting conventional therapy, can be ensured. On the other hand, the common idea as “natural is harmless” and marketing strategies through the media leads to unconscious use of these products. The aim of this study is to determine the prevalence of herbal products use among endocrinology patients and to evaluate the preferred products in the concept of rational use of herbal products. **Material and Method:** The study was conducted with 591 individuals who admitted to endocrinology clinic of Ege University in Izmir between June 2015 and September 2016. Socio-demographic status, medical history, information about the herbal product usage were recorded by a data collection form. All statistical analysis was performed using SPSS version 20 (IBM Corp., Armonk, NY, USA). **Results:** The mean age of the participants was 49.6±19.3 and average BMI was 30.9±7.2. It was found that 90% of participants had at least one chronic disease and 79% of them use their medications regularly. Majority of the participants (62%) took a bright view of using herbal products with therapeutic purpose. The frequency of using herbal products was determined as 45.9%. Among these participants, while 23.2% was using the products in the research period, the other 22.7% was reported they used before. The frequency of herbal product use was higher in individuals with chronic diseases (p=0.027). The average BMI was higher among participants who use herbal products than those who do not use. There were no relationship between frequency of herbal medicine use and age, gender, education level and marital status (p>0.05). Herbal products were mostly preferred to control obesity (39%), insulin resistance/diabetes (22%), thyroid disease (8%), hyperlipidemia (6%) and hypertension (5%). The commonly preferred products was mixed products (24.7%), green tea (9.4%), cinnamon (7%), black cumin (4.9%), dill (4.4%), lemon (3.6%), parley (3.4%) and thyme (%2.9). High number of participants reported that they did not consult their doctor about the products (89%) and did not make a research related with products (72%). While 49% of participants started to use products with the advice of neighbor/acquaintance and %32 with media, using herbal products with the advice of health professionals was very low (5.2%).

³HACETTEPE UNIVERSITY, FACULTY OF HEALTH SCIENCES, DEPARTMENT OF NUTRITION AND DIETETICS, ANKARA, TURKEY

Herbalists (50%) and markets (20%) were the most preferred locations to purchase products. Herbal materials were mostly consumed as infusion (71%), followed by decoction (15%). Additionally, 33% and 58% of the respondents think herbal products may be harmful and can interact with medicines, respectively. Conclusion: In conclusion, it was determined that, the frequency of herbal product use is common among endocrinology patients. However, the products were used uncontrollably and unconsciously without consulting health professionals. We suggest that all health professionals should be educated about herbal therapies and able to inform patients about the rational use of herbal medicines to prevent potential risks due to irrational use of herbal products.

THE EFFECTIVENESS OF GINGER IN THE PREVENTION OF NAUSEA AND VOMITING DURING PREGNANCY

HAVVA ARIN¹, BİRSEN YILMAZ², GAMZE AKBULUT²

ABSTRACT

Nausea and vomiting affects a large part of women in early pregnancy. It is thought that about %50-80 of women have nausea and vomiting in pregnancy in some degree during the first trimester of pregnancy, and for the majority of women, symptoms typically solve by 12-14 weeks gestation. Colloquially known as “morning sickness”, this term is clearly a misnomer since symptoms may occur at any time of the day. Nausea and vomiting are more severe and last longer in a small proportion of pregnant women (0.2-5%). This condition leads to weight loss, deterioration of electrolyte and acid-base balance, dehydration and ketosis. Sometimes hepatic and renal insufficiency may also be seen. Therefore, some pregnancies may remain in the hospital during the first half of pregnancy. The disorder, which is often ignored, seriously lowers the quality of life of the pregnant women and causes emotional trauma. Although not exactly known, hormone levels during pregnancy, upper gastrointestinal system dysmotility, immune system dysfunction, nutritional disorders, Helicobacter pylori (H. pylori) infection and psychological factors play an important role. Methods used in the treatment of the disease can be divided into pharmacological and non-pharmacological. In non-pharmacological treatment methods, the use of various plants, especially in medical nutrition therapy, is common, since pregnant women are cautious about drugs, fearing that their fetuses will be harmed. In a multinational study conducted in recent years, the prevalence of herbal medication in pregnancy was reported as 28%, as well as, the most commonly used plants are ginger (23.5%) and blueberries (22.7%). In 1807, ginger was described by the English botanist William Roscoe and was named Chinchilla officinale. When dried ginger rhizomes are distilled in this oven, 2-3% essential oil is obtained. In addition, rhizomes contain 9% protein, 6% fixed fat, 70% carbohydrate, 6% cellulose and 4.5% ash. Clinical trials have been extensively researched over the past 30 years on the efficacy of ginger nausea and vomiting in pregnancy. Since the methodologies of the studies are not homogeneous, it is not possible to conduct a meta-analysis covering all the studies. In a small meta-analysis involving studies conducted between 1991 and 2009, it was concluded that ~1 g/day of ginger consumption for at least 4 days was more effective than placebo in nausea and vomiting of pregnancy. In another meta-analysis, studies from 1991 to 2011 were examined. The common result obtained in studies using ginger capsules at different doses and frequency, ginger is more effective than placebo in relieving nausea vomiting. Studies comparing ginger and vitamin B6 have also shown that ginger is much more effective than vitamin B6. On the other side, there are also studies showing that vitamin B6 and ginger are not different in alleviating symptoms. Ginger is widely used for relieving nausea and vomiting due to vestibulostatic effect. Although the ginger formulation used in the studies and the overall dose distribution throughout the day are different, the reported dose is 1 g/day. As medicines, herbal products can also cause undesired results, side effects, drug interactions, and pregnancy related

²GAZİ ÜNİVERSİTESİ

complications. Based on the evidences, ginger could be a possibly effective option for women with nausea and vomiting in pregnancy, although large standardized trials are necessary.

INVESTIGATION OF PUMPKIN SEED USE IN THE TREATMENT OF BENIGN PROSTATIC HYPERPLASIA

AYTEN DEMIRCI¹, MEHMET MESUT PIŞKIN², ESRA BÜYÜK², MEVRA AL³, AYŞE SAİDE ŞAHİN², BURAK CEM SONER²

ABSTRACT

Investigation of Pumpkin Seed Use in The Treatment of Benign Prostatic Hyperplasia Benign prostatic hyperplasia (BPH) is the main cause of lower urinary tract symptoms (LUTS) in older men. Prevalence of BPH is about 50% in men 51-60 years of age and the ratio increases up to 90% among men in 81-90 years of age. BPH symptoms have negative influences on life quality and restrict daily activities. The recommended medication for BPH treatment is alpha adrenergic receptor blockers which reduces the prostate and bladder neck smooth muscle tone, and 5-alpha reductase inhibitors which reduce prostate volume via epithelial atrophy. Although medicines used for BPH treatment have positive effects on life quality, the adverse effects (including sexual problems) lead patients to herbal medicines with less adverse effects and low cost. In Italy, 50% of the prescribed medications used in BPH is herbal originated. According to a research in USA while 66% of the patients with LUTS related to BPH were using only prescription drugs, 14% of the patients were receiving only phytotherapy and 20% of the patients were using both prescription drug and phytotherapy. In Europe, particularly in Germany, Austria, Italy and France, phytotherapy is often the first-line therapy for the treatment of BPH symptoms. The German commission E monograph reports that pumpkin seed oil is traditionally being used for prostate growth treatment in Europe. Besides pharmacotherapy and surgical treatment, phytotherapeutics are also involved in Canadian, American and European Urology Association guidelines for BPH treatment. According to these guidelines *Serenoa repens*, *Pygeum africanum*, *Urtica dioica* and *Cucurbita pepo* (pumpkin seed) plants can be used for this purpose. In this study, we aimed to evaluate the effect of pumpkin seeds on BPH and LUTS in consideration of current researches. In Europe, pumpkin seeds and pumpkin seed oil have been used for many years in overactive bladder-related micturition disorders and enlargement of prostate gland. The pumpkin seed contains about 50% fatty oil (linoleic acid oleic acid and tocopherol), but it is assumed that active substances of pumpkin seed are Δ^7 -sterols (avenasterol, spinasterol) and Δ^5 -sterols (sitosterol, stigmasterol). In 2014 according to GRANU (The German Research Activities on Natural Urologicals) research, the activities of pumpkin seed, pumpkin seed extract and placebo were evaluated for 12 months in a double-blind, randomized study in 1431 patients with BPH/LUTS. A clinically significant improvement in international prostate symptom score (IPSS) related quality of life (QoL) was observed on pumpkin seed group compared to the placebo group. This study supports the use of pumpkin seed in BPH/LUTS patients. A prospective randomized clinical trial in Iran, published in 2014, compared the efficacy of pumpkin seed oil and prazosin (alpha adrenergic receptor blocker) on 100 patients with symptomatic BPH. In this study, it was stated that pumpkin seed oil reduced IPSS score and increased QoL, but it was emphasized that prazosin was more effective than

the pumpkin seed oil. The use of pumpkin seed in the treatment of BPH/LUTS has been investigated in a limited number of clinical trials. According to our research, pumpkin seed may relieve LUTS related to BPH, but some of these studies have been criticized for carrying out less than a year and including insufficient number of patients. Due to difficulties in pumpkin seed extract standardization, lack of clarification in mechanism of action, limited number of researches and low quality of studies, current urology guidelines do not provide any specific recommendations for pumpkin seed in the treatment of BPH/LUTS. In conclusion, further researches are needed for pumpkin seed recommendation in standard BPH treatment.

THE ANTICANCER ACTIVITY OF PHORMIDIUM PURPURASCENS

TUĐBA DEMİRİZ YÜCER¹, KÖKSAL PABUÇÇU², YAVUZ BEYATLI³

ABSTRACT

In this study, anticancer effects of *Phormidium purpurascens* extracts grown in culture conditions were investigated. Extracts were tested on Vero cells and human uterus carcinoma cells by using the BrdU cell proliferation ELISA method. The antiproliferative effects of *P. purpurascens* were assayed at concentrations of 100, 250 and 500 µg / mL. SPSS® program was used for statistical evaluation of anticancer activity results. The variance analysis results were significant at all concentrations (p <0.01). In the multiple comparison (Duncan) test, *P. purpurascens* showed better antiproliferative effect than DMSO and control group (p <0.01) according to the test results at concentrations of 250 and 500 µg / mL.

ANTI-MICROBIAL ACTIVITY OF ELAEAGNUS ANGUSTIFOLIA

DEMET CELEBİ¹, SABIHA AYDOĞDU², ULKU ALTOPARLAK², ICLAL AGAN², SABAN KORDALI³

ABSTRACT

INTRODUCTION *Elaeagnus angustifolia* L., which is commonly known as oleaster or Russian olive, is a deciduous plant from Elaeagnaceae family. Different parts of *E. angustifolia* plant, especially the fruits, flowers and leaves have been used traditionally in treating a variety of common illnesses such as nausea, cough, asthma, fever, jaundice and diarrhea. According to data, some recent reports have indicated the anti-oxidant, anti-inflammatory, anticancer and some other properties of this plant. This study was performed as to the best of our knowledge; there has been few scientific report on the characterization of antimicrobial effect of *E. angustifolia* extract. The aim of this study was to investigate the in vitro antibacterial and antifungal activity of ethanol and acetone extracts of *E. angustifolia* fruits. **MATERIALS and METHODS** An aqueous ethanol and acetone extracts of *Elaeagnus angustifolia* were prepared and tested for antimicrobial activity against some pathogenic bacteria and fungus *Candida* sp using the broth microdilution technique. The serial dilution was performed as described in the CLSI standards with some modifications. The MIC (Minimal Inhibitory Concentration) was taken as the lowest concentration that inhibited growth after incubation. The test was performed at final concentrations of each extract 12.500; 6.250; 3.125; 1.562; 781; 390; 195; 97; 48.8; 24.4 µg/mL for microdilution. **RESULTS** The MIC values of *Elaeagnus angustifolia* acetone extract for *Proteus mirabilis*, *Candida albicans*, *Enterococcus faecalis*, *Staphylococcus aureus*, *Staphylococcus saprophyticus*, *Escherichia coli* and *Pseudomonas aeruginosa* were 6.250, 3.125, 1.562, 390, 1.562, ≥12.500, ≥12.500 µg/ml and values of ethanol extract for the same strains were ≥12.500, 1.562, 1.562, 3.125, 1.562, ≥ 12.500, ≥ 12.500 µg/ml respectively. According to the results in our study, the highest effect was observed on gram positive bacteria and yeast. **CONCLUSIONS** Result of this study suggests that *Elaeagnus angustifolia* extracts can be effective in all tested microorganisms. Further studies in the effect of different dosages and duration are suggested. Future studies should elucidate the components responsible for antimicrobial activity of these extracts against target cultures.

USE OF HERBAL MATERIALS TO ELIMINATE CONSTIPATION

KEMAL MACİT HISAR (YRD. DOÇ. DR.)¹, FILİZ HISAR (DOÇ. DR.)²

ABSTRACT

Introduction: Constipation is generally defined as defecation of 3 or fewer per week. Constipation is an important preventable health problem that affects the quality of life of individuals, especially in women, children and the elderly. Physical inactivity, sex, age, low educational level, socio-economic status, trait of sexual abuse, presence of symptoms of depression, use of nonsteroidal antiinflammatory drugs, some diseases are risk factors for constipation. According to the work done, contraception is seen more frequently in women, in children, and in older people. Constipation can be caused by a variety of diseases, constipation as a symptom, which may occur due to conditions that prevent the feces from reaching the rectum or cause it to remain in the rectum for a long time. However, very few of the individuals depend on organic causes. The pathophysiology of constipation is not fully understood and many mechanisms play a role in the development of the disease. The causes of constipation in individuals are multifactorial. Basically constipation is divided into organic and functional causes. Functional constipation constitutes 95% of cases and organic constipation constitutes 5%. For the constipation diagnosis, criteria for defecation, fecal incontinence, presence of fecal mass in the rectum and fecal shape were investigated. Rome I, Roma II and Roma III criteria were developed. It is also possible to use the Bristol scale, which is a question of visual stool. At least two of the Roma III criteria used in the individual may have a presence of functional constipation for a month. These criteria are; 2 or fewer stools a week, stool excretion at least once a week, excessive stool retention, painful and hard stools, stool mass in the rectum, and a mass of stools large enough to block the toilet and an organic cause that can explain all this clinic. Constipation is a frequent problem in the society and clinics and increasing in frequency. However, since they are not usually seen as serious problems, the families do not apply to the health institutions. Individuals seem to have an increase in constipation for reasons such as chronic inactivity, poor fluid intake, inadequate / inappropriate diet, side effects of medications. This increase also shows differences among countries. Cetinkaya and colleagues (2000) found that the rate of women's perceptions of women working in different parts of Ankara is 30.5%, while those over 50 are 39.2%. The incidence of constipation in America is 34% for women and 26% for men. And 42% in the United Kingdom. In the work done in Greece; According to Roma III criteria, the rate of constipation in women was found to be 21% higher than that of males (11%). For adults, fiber diet, fluid intake, physical exercise, regular discharge habits are recommended to relieve constipation. In 2016, 35% of participants stated that they did not consume fruits and vegetables in the study titled "Determination of constipation status of university students living in female student residences" of Arslan and Hisar in 2016. In Ayaz and Hisar's study in 2014, 17% of the women consume fruits and vegetables in order to make constipation. There are a few publications about constipation in our country. The studies conducted are mostly intended to determine the frequency of constipation; It is noteworthy that women who are in risk groups and their

²N.E. SAĞLIK BİLİMLERİ FAKÜLTESİ

problems are not addressed. For this reason, the application of plants in the prevention of constipation gains importance. Individuals are thought to be able to avoid the problem of constipation by providing them with plant-based poultry food and taking adequate fluids, being mobile and acquiring regular discharge habits.

**SOME PLANTS AND THEIR EFFECTS USED IN TRADITIONAL
TREATMENT OF DISEASES AT ÇORUM PROVINCE IN TURKEY**

SEFA AKBULUT¹, ZAFER CEMAL ÖZKAN¹, GÖKÇE KALANKAN¹

ABSTRACT

With this study, it was aimed to determine some plants used in the traditional treatment of diseases by local people in Çorum and to determine their purpose of use and how they are used. To determine this, totally 45 people were interviewed face to face Derinöz, Ađaççamı, Şaphane villages at Oğuzlar province, Kuyucak village at Sidings province, Kutluözü village at Iskilip province, Durucasu and Güvercinlik villages at Osmancık province, in Çorum city. The people, who participated in the survey, were asked to show the plants used in traditional treatment of diseases at the territory; for which diseases and how they are used. Field studies includes June- October months of the year 2016. As a result of this study, 14 families and 18 taxa data are summarized. These are; *Elaeagnus angustifolia* (Elaeagnaceae), *Equisetum ramosissimum* (Equisetaceae), *Carlina oligocephala* var. *oligocephala* (Asteraceae), *Chondrilla juncea* (Asteraceae), *Aesculus hippocastanum* (Sapindaceae), *Prunus spinosa* (Rosaceae), *Pyrus elaeagnifolia* (Rosaceae), *Rubus canescens* var. *canescens* (Rosaceae), *Pinus nigra* (Pinaceae), *Brassica oleracea* (Brassicaceae), *Malva sylvestris* (Malvaceae), *Astragalus* sp. (Fabaceae), *Colutea cilicica* (Fabaceae), *Cucumis sativus* (Cucurbitaceae), *Allium cepa* (Amaryllidaceae), *Juglans regia* (Juglandaceae), *Vitis vinifera* (Vitaceae), *Quercus robur* (Fagaceae).

THE EFFECT OF TARAXACUM OFFICINALE (ASTERACEAE) ON DROSOPHILA MELANOGASTER'S DEVELOPMENT BIOLOGY

EDA GÜNEŞ¹, ÜMIT SORMAZ¹, H. FERHAN NIZAMLIOĞLU¹

ABSTRACT

Taraxacum officinale G. is rich in vitamins and minerals and its used in various food (such as plants, salads and coffee) and alternative medicine. In our study, it was conducted to observe the effect of taraxacum on the survival and development of Drosophila melanogaster Meigen (Diptera: Drosophilidae). In this respect, commercial dry and fresh plants at different concentrations (0.025 to 0.2 g/L) were added to insect diet. The insects survival and development were determined by feeding these phytonutrients. It was determined that development of insects was adversely affected from increasing concentrations prepared with the dry sample. It was observed that dry and fresh samples prepared by brewing had similar effect to the control. According to these results, taraxacum will be used as an adjunct to adult nutrients, and it is necessary to pay attention to the amount of usage by storing conditions

SOME PLANTS USED AMONG LOCAL PEOPLE IN THE ORTACA (MUĐLA) REGION

HASAN AKAN¹, AYDIN ÖZ¹

ABSTRACT

This study was carried out between 2005-2007 in order to determine some plants used in the province of Ortaca (Muđla). The study area is located at C2 in Davis Grid system and faces people who have different age and education groups in order to determine the plants used among the people. Were interviewed using participatory observation techniques. During the three-year period, plants were routinely visited at regular intervals and photos of naturally grown plant specimens were taken. It was determined that 38 taxa belonging to 28 families naturally grown in the study area were used by the public. 23 of them are used for medicinal purposes, 19 for food, 3 for spice, 3 for ornament, 2 for food, 2 for religion and 2 for other (spoon-making, agrochemical) purposes. It has sometimes been found that it makes use of a base for several different purposes.

DETERMINATION OF THE PHYTOCHEMICAL CHARACTERISTICS OF SOME ENDEMIC AND NON-ENDEMIC ASTRAGALUS L. SPECIES

MELDA DÖLARSLAN¹, EBRU GÜL¹

ABSTRACT

Soil and vegetation characteristics vary depending on climate and climatic conditions in arid, semiarid, and humid areas. Especially in the mountainous areas, the changes of slope and aspect observed in short distances affect the soil properties and also cause differentiation of vegetation forms. Arid and semiarid areas generally have step vegetation, different vegetation types are found in moist areas, soil characteristics, plant species richness-diversity, and the morphological characteristics of the species are differentiated. Astragalus L. species, which generally have high prevalence in high mountain ranges and spreading on steeps and medical use in the national flora, spread in the northern hemisphere and have 2500 species. There are 455 species in our country and about 222 species of these species are endemic and grow only naturally in our country. Different habitat conditions (climate, soil, topography, etc.) that species have, are caused the morphological characteristics of species to change. This study was carried out in Çankırı province and districts of Middle Kızılırmak section of Central Anatolia region and in Ayancık district of Sinop province and it was prepared to determine the change between phytochemical (morphological property, soil) properties of Astragalus L. species which spread in these areas. In the study areas, vegetation sampling was carried out from April to the end of September in the vegetation period of 2016 and soil sampling was carried out in September, the end of the vegetation period. Soil sampling was performed at a depth of 0-30 cm in order to determine the physical and chemical properties (clay-silt-sand content, pH, electrical conductivity (EC), lime content (CaCO₃), bulk density (BD) and soil organic matter content (SOM)). The morphological characteristics of the plant samples were plant height (cm), stem state, stipule length (mm), stipule shape, stipule hair state, leaf length (cm), leaf hair state, leaflet pairs number (piece), leaflet shape, leaflet hair state, inflorescence, peduncle state, peduncle length (cm), bract length (mm), bract shape, bracteole state, calyx type, calyx length (mm), calyx hair state, calyx teeth length (mm), corolla color, pod shape, pod hair state, black hair on pod, hair compression on pod adpressed or pilose and beak state were measured. As a result of evaluating the soil characteristics of the areas where plant taxa were found, the pH, lime content and organic matter content of Astragalus L. species, especially in Çankırı province, varied compared to those in Sinop province. This suggests that the demands of the growing environment are different even in areas where the climate characteristics of the same type of plants are the same. The species found in the province of Sinop show spread on the soil with slightly acidic, moderate calcification and high organic matter contents in the province of Sinop, whereas the species found in the Çankırı province spread on the medium soil with low or very high organic matter content. When we look at the climate characteristics of both areas, Çankırı is included in arid and semi-arid areas with a low average annual precipitation (400-500 mm), while Sinop province is in wet and rainy areas with an average annual rainfall 972 mm. This

Corresponding Author: MELDA DÖLARSLAN, mld@karatekin.edu.tr
¹ÇANKIRI KARATEKİN ÜNİVERSİTESİ

situation naturally creates differences both in vegetation and soil properties. When we evaluate the *Astragalus* L. taxa which are distributed in both areas, we observed differences in the morphological measurements such as plant height (cm), inflorescence (piece), stipule length (mm) and peduncle length (cm) of the taxa spreading in Sinop province. This is due to differences in the development and morphology of *Astragalus* L. species can be explained as the effect of climate characteristics on the soil properties and accordingly the improvement of the conditions of the growing environment.

POISONOUS PLANTS IN ABANDONED RED CHALK, CHROME AND MARBLE MINE QUARRY

MELDA DÖLARSLAN¹, EBRU GÜL¹, SABİT ERŞAHİN¹

ABSTRACT

The plants that cover the earth have a great prescription in human life in terms of oxygen availability, nutritional needs and health for survival. In our environment, plant species are grown in different structures and forms. This change in plant species causes the areas of use to vary. Human beings have benefited from their roots, hulls, leaves, flowers, fruits and seeds of natural plants found in the vicinity of this sun for their many purposes in terms of food use, disease treatment, construction and production of tools and equipment's. All these useful purposes have brought economic value to plants. However, in addition to beneficial use of plants, there are poisonous plants in the nature that can harm people and animals. In this context, in Çankırı province of Eldivan province, previously used as a mining quarry, but now in the form of grassland, Plants were sampled in the quarries of 25 m² in 34 different points determined in the red chalk, chrome and marble mines and during the 2014 vegetation period. The study area is located within the A4 square of the Grid system of Davis (1965) in the Iran-Turanion phytogeographic region. As a result of the evaluation of the collected plant samples, 34 genus, 38 species belonging to 15 families of chromium parent material, 58 genus, 72 species belonging to 20 families in marble parent material and 56 genus and 73 species belonging to 22 families constitute the floristic composition of red chalk parent material. As a result of the literature searches, 25 genera and 26 species belonging to 13 families were found to be toxic to the inland people and animals. *This study was supported by Scientific and Technological Research Council of Turkey (TUBITAK) (Project No: 114O707)

SPICES USED IN MEVLEVI CUISINE AND THEIR FUNCTIONAL FEATURES

ÜMIT SORMAZ¹

ABSTRACT

Mevlevi period is one of the periods that have been influential on the Turkish cuisine culture, which, in turn, has a significant place for traditional and local foods and beverages, types of foods and culinary culture. In this period when religious themes and motifs were abundant, food, eating, customs and manners of eating were accepted as a form of worshipping as they entailed being thankful and grateful. Since types of foods used domestically and industrially at the present to enrich or season were not available or accessible back then, spices were used frequently when cooking especially for cooking. For this reason keeping and using spices at Mevlevi lodges's crucial. This is a compilation study prepared to define types and functional features of spices used in Mevlevi cuisine in order to comprehend the importance of using them, and to ensure they become widespread. Key Words: Tourism, gastronomy, Turkish cuisine, Mevlevi cuisine, spices.

**THE EFFECT OF SUGAR AND OLIVE (OLEA EUROPAEA L.)
PHENOLICS ON DROSOPHILA MELANOGASTER 'S
DEVELOPMENT BIOLOGY**

EDA GÜNEŞ¹, DERYA ARSLAN DANACIOĞLU¹

ABSTRACT

Olive leaves-including medical values- are among the plants used in alternative medicine. In our study, it was aimed to observe the effects of olive (*Olea europaea* L.) phenolics on the survival and development of *Drosophila melanogaster* (Meigen) (Diptera: Drosophilidae) fed with sugar and sugar free diet. For this purpose, the dried olive fruits and leaf extracts (0.8-12 mg/L) at different concentrations were added to the insect sugary diets (0.15-4 M sucrose). Larvae fed with different concentrations of sugar and plant extracts to adult stage was determined the effect on survival and development. It was determined that 12 mg/L phenolic fruit extract and 4 M sucrose are negative impact on the development and survival of insect. It was also found that phenolic fruit-leaf and low sugar concentrations decreased the female sex ratio and increased the male sex ratio. These results demonstrate that low amounts of sugar and olive phenolics may be used as an adjunct to adult nutrients to improve adult characteristics of the insects.

CULTIVATION OF ONE OF THE IMPORTANT GEOFITTS IN CENTRAL ANATOLIA

AYŞE SERMİN ÖZER¹, RAGIP AKDEMİR², NEŞET ARSLAN³

ABSTRACT

Cultivation of one of the Important Geofitts in Central Anatolia (ÇANKIRI-ELDİVAN example) Sternbergia Geofitts have also an important place in biological variety richness of our country. Bulbous, tuber and rhizome plants are referred to “geofitts” in the general sense. Approximate 800 geofitts, 162 of which is endemic are naturally available in our country. Some geofitts are collected and their domestic and foreign trade are done. In spite of providing foreign currency inflow to country economy with these activities, some species have entered under threat, faced with the danger of extinction because of excess and wrong collections. As a result, mostly irrevocable losses have occurred in the ecosystems where they show natural spreading. Nature protection at global scale and ensuring continuity of these species is basic principle in geofitt trade. In this sense, collection from nature of geofitts should be taken under control and produced. Benefiting from Nature and control of export are fulfilled by “Natural Flower Bulbs Committee” formed in pursuance of related article of the “Regulation on Collection from Nature, Production and Export of Flower Bulbs” which is prepared by Ministry of Food Agriculture and Livestock. Permission for benefiting from nature is given or benefiting from nature is prohibited for some species within the framework of the quota set each year by the Committee. These decisions come into force after publishing in the Official Gazette. Sternbergia candida Mathew Et T. Baytop subject to this Project study is one of the endemics of Baba Mountain where it displays spreading; collection from nature and export of Sternbergia candida is forbidden pursuant to the Regulation on Bulbous Plants in Turkey. Sternbergia being a rare species takes place under endangered species in wild life: END-E (endangered) according to CITES. Globally endangered plant is found in Annex List I of Bern Convention, Annex list 2 of CITES. At first, growing in the different ecosystems having similar properties and the ecosystems of the geofitts, source of income of our country and the conditions of growing should be established. Central Anatolia Region has remained weak in terms of medicinal-aromatic plants and production and evaluation of geofitts. Today, it is known that, contribution of income of forest products on subsistence of forest villagers is insufficient. With growing in the region of the geofitts appropriate to be grown in Central Anatolia Region, it would be possible to mobilize this region which has remained weak from the aspect of herbal product manufacturing and trade. Side income possibility will be provided to locals, so benefit will be maintained for their development. This plant under the group “Bulb Flowers whose export by collecting from natures is forbidden in Export List of Natural Flower Bulbs” was cultivated in open space of Eldivan Nursery in 2004. In the parcels on which control (C), sheep- goat (KB) and cattle-ruminant (BB) fertilizer is applied, bulb development, number of baby bulb, flowering, status of fruit and seed set are established and recorded by years. Productivity is sorted as C, L and S parcels. In

the observation performed by years, it is seen that vitality of the plant keeps on, its development is very well, gives baby bulb and shoot, form diameter, runs to seed substantially. Test field was emptied completely in 2011, soil was taken to rest. On the bulbs brought to Research Directorate, later diameter measurements are made, taken to rest and following classification as per sizes, made ready for second cultivation. The bulbs cultivated in the area prepared later have also commenced to develop at the ends of 1 year delay. All these data specifies that adaptation to field of the plant is good, may be a source of income for the region in the future.

EVALUATION OF EFFECTIVENESS OF NIGELLA SATIVA AGAINST CLINICAL ENDOMETRITIS IN COWS

AYŞE KILIÇ¹, ATILLA YILDIZ¹, ENGIN BALIĞI¹

ABSTRACT

The aim of this study was to evaluate the cure effectiveness for the intrauterine infusion of *Nigella sativa* (NS) in clinically endometritic cows. Clinical endometritis diagnosis was based on the presence of white flakes in cervicovaginal mucus, pH and colour reaction of cervicovaginal mucus to white side test. A total of 20 clinically endometritic cows (10 cows in each group) were randomly divided into 2 treatment groups: an i.u. infusion of 100 mL of methanol extract of NS was given once a day during 3 days in group NS; cows with no treatment belonged to group C. Blood samples were taken from the jugular vein with 10 mL heparinized test tube and silicone (for serum) vacutainer tubes to detect the anti-inflammatory and the antioxidant activity of NS before treatment and one week after treatment. Sampling for bacteriological examination was performed immediately after diagnosis of clinical endometritis and on day 14 after the treatment. After the treatment, there were slight vaginal discharges in 3/10 animals in group NS. *S. aureus*, *E. coli*, *A. pyogenes*, *Streptococcus* spp., *Pasteurella* spp., *Pseudomonas* spp., *Corynebacterium* spp., *Acinetobacter* spp. and *Bacillus* spp. were identified from vaginal swab samples in all cows before treatment and *E. coli* was identified only from two cows in NS group after treatment on day 14. High counts of the bacterial types were noticed in group C in contrast to the rapid reduction of bacterial counts in groups NS after treatment on day 14. Glutathione peroxidase and superoxide dismutase levels increased ($P < 0.05$) and malondialdehyde concentration decreased significantly ($P < 0.05$) in groups NS after treatment when compared to pre-treatment ones. Haptoglobin and serum amyloid A levels of groups NS decreased significantly ($P < 0.05$) after treatment when compared to group C. NS had antimicrobial, antioxidant and antiinflammatory effects in clinical endometritic cows. This study indicates a therapeutic value of NS in clinically endometritic cows. Intrauterine administration of NS might be a promising cure for cows with clinical endometritis in the future. Keywords: *Nigella sativa*, cow, clinical endometritis, treatment

POSSIBILITIES OF USING AROMATIC PLANTS FOR MITIGATING METHANE PRODUCTION IN DIGESTIVE SYSTEMS OF RUMINANTS

ALI VAIZ GARİPOĐLU¹, OGOUKAYODE A EULOGE OLOMONCHI¹, RECEP MERHAP¹

ABSTRACT

POSSIBILITIES OF USING AROMATIC PLANTS FOR MITIGATING METHANE PRODUCTION IN DIGESTIVE SYSTEMS OF RUMINANTS. Euloge OLOMONCHİ, Ali Vaiz GARİPOĐLU, Recep MERHAP olomonchi@yahoo.fr, alivaizg@omu.edu.tr, recep_merhap_93@hotmail.com Abstract The production of methane by ruminants is the basis of an estimated loss of energy between 10-16% of the total energy. This production contributes in the destruction of ozone. Several methods are used to prevent or to block the production of methane. Among these methods are use of essential oils, halogenated methane analogues, aromatic plants and lipid-rich materials, defaunation of rumen and addition of acetogenic bacteria to the rumen fluid. Polyphenolics are biological compounds contained in aromatic plants. These compounds have antimicrobial (*Eucalyptus camadulens*), antioxidant (*Origanum majorana*), antiparasitic (*Sericea lespedeza*), antiprotozoal (*Cinnamosma fragrans*), antifungal (*Thymus vulgaris*), and anti-inflammatory (*Aucoumea klaineana* Pierre) properties. Thanks to these properties, aromatic plants are able to inhibit the action of methanogenic bacteria, contributing to the prevention of methane production in the rumen. This represents an important step forward in the nutrition of ruminants and in the inhibition of methane production. The purpose of this review is to provide an overview of possibilities of using aromatic plants with the aim of mitigating methane production in rumen.

MEDICINE WITH VARROA PARASITIS IN ORGANIC BEES USE OF PLANTS

NURAY ŐAHİNLER¹, SIBEL ALAPALA DEMİRHAN¹, SUAT ŐAHİNLER¹, MAHMUT İSLAMOđLU¹, AYŐEN MELDA ŐOLAK¹, M.UYGAR TÜRK¹, ERCÜMENT SARIHAN¹

ABSTRACT

Organic production, protecting the ecological balance in nature, not the amount of production with the optimum use of natural resources and energy that keeps quality in the foreground is an alternative farming systems aiming to be healthy and reliable products. Today excessively and unconsciously that food produced with the use of synthetic chemicals used view that threaten human health and the findings are increasing. Therefore; Unwanted residual matter content in the export of honey produced in Turkey is becoming an increasingly problem. Beekeepers in the production of our bee products against diseases and pests, bees release chemical additives in the product with the use of natural products and their negative effects on humans will be eliminated (Őahinler, 1996). Honey bees; honey, beeswax, royal jelly, bee venom, pollen and have a vital role in the natural balance and agricultural production and human health and to produce highly valuable products in terms of nutrition and collection alongside natural and pollination services provided by agriculture made in plants such as propolis (Young, 1996). Therefore, both honey bees and valuable products listed above in order to increase the quantity and quality of crop production products are used all over the world, and obtained significant benefits. However, as in all other agricultural activities, the honey bee pest and disease problems are being experienced. These drugs are used to overcome the problem of honey and poses a threat to human health, leaving residue in the wax (Kaftanođlu and Free, 2000; Salter, R, 2003; Maver, L. and Pokluda, Jr. 2003; Dspni, D et al 1999; Castle, LA et al 2004.; Sabatini, AG et al 1999; Fernandez, MA et al, 1997). Varroa destructor in honey bee (*Apis mellifera* L.) larvae is a dangerous blood sucking parasites that live on the pupa and adult. Main host is known as India bee *Apis Cerena*. More stroller bee honey production order made unconscious *Apis mellifera* has been infected with this parasite (Kaftanođlu, 2000). Previously, Russia and from there spread to Eastern Europe to the Varroa destructor then all continents and has led to the extinction of hundreds of thousands of colonies. The first time Turkey had made in 1977 and soon spread all over the country. Despite taking a lot of measures are still poses a great threat to the colony (KAFTANOđLU et al., 1990; KAFTANOđLU et al., 1992; Kaftanođlu et al., 1995; Enthusiast and Pearl, 1992). In this study, the spring and autumn months in honey bee colonies to great dangers that pose varroa mites struggle with chemical drugs of natural products could be an alternative (tobacco leaf, bay yađrag, Thyme leaves or oil) have been conducted to determine its effectiveness. According to the results of the study, it was determined that the activities performed in autumn in general are higher than those in spring. In addition, it was determined that tobacco application was more effective than other applications in the autumn and spring seasons. THE EFFECTS OF SOME ESSENTIAL OILS ON CALLOSOBRUCHUS CHINENSIS L. (COLEOPTERA: BRUCHIDAE)

İSLAM SARUHAN¹, İSMAIL ERPER¹, ŐEYMA TOKSÖZ¹, CELAL TUNCER¹, İZZET AKÇA¹

ABSTRACT

Legumes are one of our main food sources and have an important role in nutrition. During storage, they are exposed to the attacks of some pests and their damage can reach 100%. Besides the commonly used control methods, recently, studies on the use of essential oils of plant origin as an alternative have become very important in the world and in Turkey. It is known that many spices, weeds and their components have insecticidal effects. In this study, fumigant and repellent effects of commercially available (Talya Plant Products) essential oils of mint (*Mentha piperita*), thyme (*Thymus vulgaris*), laurel (*Laurel nobilis*), rosemary (*Rosmarinus officinalis*), myrtle (*Myrtus communis*) and lavender (*Lavandula angustifolia*) on azuki bean beetle (*Callosobruchus chinensis*) that is one of the major pulse bruchids, were investigated. In the study, 100, 150 and 200 µl/l doses of essential oils were used. To determine the fumigant effects in the study, 10 g chickpea were placed in plastic tubes (100 ml) with filter paper impregnated with essential oil at different doses on their caps and 10 azuki bean beetle adults were placed in each tube. For the determination of repellent effects, 1 kg plastic containers (20x30x10 cm) were used. Accordingly, 20 g food coated with 200 µl/l essential oil was placed on one side of each container while the same amount of uncoated food was placed on the other side. Then 10 azuki bean beetle were placed in the middle of the container. Trials were carried out in three replicates, at a temperature of 22±2° C and 60-70% humidity. The trials were carried out in a completely randomized design with four replicates. As a result, differences in the effects of essential oils and their doses on *C. chinensis* were found to be significant ($P < 0.05$). The fumigant effect test results showed that the mint essential oil was the most effective; especially the highest dose (200 µl/l) exhibited 100% effect after 72 hours, which was followed by thyme (87.5%), lavender (75.5%), myrtle (71.88%), laurel (68.75%) and rosemary (65.63%) essential oils. In the repellent effect studies on azuki bean beetles, 100% repellent effect was observed in lavender, myrtle, laurel and rosemary essential oils at the dose of 200 µl/l at 48 hours while 93% repellent effect was observed in mint essential oil and 90% repellent effect was determined in thyme essential oil. In conclusion, essential oils of six different plants used in our study showed a fumigant effect on *C. chinensis* and these essential oils can be considered as an alternative control method against *C. chinensis* and other stored beetles. In addition, essential oils used in the study were found to have repellent effects.

**EFFECT OF FERULA HALOPHILA EXTRACTS ON CATALASE
ACTIVITY OF GALLERIA MELLONELLA L. (LEPIDOPTERA:
PYRALIDAE)**

RAHİLE ÖZTÜRK¹, OSMAN TUGAY¹

ABSTRACT

Lepidoptera orders belonging to the *Galleria mellonella* L., damaging honeycomb in beekeeping, is an insect pest holometabol economically. Confidence larvae, pollen and great harm to the feeding combs, beehives. *G. mellonella*, and to have a short life cycle and high efficiency, and also to be recognized as an important insect species because it can grow well on a variety of biological and chemical control studies on artificial food. Tuz çakşırı known as *Ferula halophila* Peşmen; Apiaceae belonging to the family, many years, is an endemic plants spread around 60- 90 cm in length and Salt Lake. This species of this plant is a plant halophytes danger category VU (damage), respectively. In this study, grown in laboratory conditions *G. mellonella*'s applied to the larval extracts of *F. halophila*, its effects on catalase activity were investigated. For experimental groups, egg extracts from stock cultures were plunged into mixed nutrient at different doses (20, 40 and 60 ppm) and eggs were fed to the larvae. At the same plant extract ratios, bovine protein isolation was performed to investigate changes in homogeneous protein quantities. The total amount of protein in the homogenates was determined by the Bradford method and protein profiles were extracted by SDS-PAGE analysis of the extracts. The obtained extracts were used for enzyme activity analysis. Catalase enzyme activity, which is particularly effective in the defense mechanism, has been measured in the study. When the results are examined; It has been found that catalase activity is also increased in larvae fed with food containing 20, 40 and 60 ppm extract due to the increase in the concentration of *F. halophila* extract. Last year in pesticides used in pest control, insect physiology and biochemistry on the mechanisms of action are being investigated. In this study, the aphrodisiac effect of some species of the genus known *Ferula F. halophila*'s to assess the effects of insect physiology *G. mellonella* was used as a live model.

GREEN BLOOD: "WHEATGRASS JUICE"

MUHAMMET KARSAHİN¹, ZELİHA ÜSTÜN ARGON¹

ABSTRACT

The purpose of this study is; to summarize the literature on wheat grass juice produced from young shoots obtained by germination of wheat (*Triticum aestivum* L.) seeds of the Gramineae family in relation to its chemical content, a healthy life and their treatment potential. The naming of wheat grass juice as "green blood" is related to the high chlorophyll content and it is chemically almost hemoglobin-identical. Wheatgrass is described as full food because it contains almost all the nutrients the body needs. The researches on the chemical content of wheatgrass juice have shown that, in high concentrations, chlorophyll and pharmacological enzymes such as protease, amylase, lipase, cytochrome, oxidase, transhydrogenase and superoxide dismutase, bioflavonoids such as apigenin, quercetin, luteolin and with important phenolics such as abscisic acid, ferulic acid, gallic acid, caffeic acid, p-fumaric acid, ellagic acid, benzoic acid, p-hydroxybenzoic acid, syringic acid, quercetin and butylhydroxyanisole and terpenoids and phytochemical compounds such as gamma sitosterol, squalene, caryophyllene, amarines, saponin, tannin, kumarin and which is rich in biotin, choline, folacin, vitamins A, B1, B2, B3, B5, B6, B12, C, E and K and contains calcium, phosphorus, potassium, iron, magnesium, sodium, sulphur, zinc, boron, manganese, molybdenum, selenium and 17 different amino acids. It has been reported that wheatgrass juice can be used for the treatment of thalassemia, leukemia and other cancers and to reduce the destructive effect of chemotherapy, immune system strengthening, antioxidant, antimutagenic effects. Wheatgrass juice can be considered safe in the treatment of skin diseases with the antioxidant effects. Toxins purifying, cholesterol lowering, preventing high blood pressure and cardiovascular system supportive effects are other functions of the wheatgrass. It is recommended as supportive treatment for ulcers, colitis, digestive system disorders, wound and inflammation. It has been determined through studies that wheatgrass can prevent liver and colon cancer by reducing the absorption of aflatoxin, balance blood sugar level, improve reproductive functions and delay aging effects. According to the research it can be said that the wheat grass juice obtained from 6-10 day old shoots is recommended for healthy life with 30 ml daily as a food supplement and 90 ml as a daily dosage for treatment.

GREEN SYNTHESIS OF SILVER NANOPARTICLES USING CLOVE EXTRACT AND THEIR ANTIBACTERIAL APPLICATION

MEHMET AKİF DÜNDAR¹, MASOOD HUSSAIN², METİN DOĞAN³, AHMET AVCI³, EROL PEHLIVAN⁴, SIRAJUDDİN⁵, SYED TUFAIL HUSSAIN SHERAZI⁶

ABSTRACT

In the present study, Green synthetic protocol was developed for fabrication of silver nanoparticles using clove extract as reducing/protecting agent. The synthesized silver nanoparticles were characterized by several spectroscopic and optical techniques. UV-Visible spectroscopy was used to confirm the formation of clove extract capped silver nanoparticles (clove-AgNPs) by optimizing various reaction parameters such as concentration of precursor salt, volume of clove extract, pH and temperature. FT-IR study was conducted to confirm the interactions of clove with silver nanoparticles. In order to study the crystalline nature of silver nanoparticles XRD study was carried out and results indicated the crystalline nature of silver nanoparticles. AFM study showed the topography and surface roughness of the biologically synthesized silver nanoparticles. Dimensional analysis was performed using TEM and it confirmed that the synthesized nanoparticles have an average diameter of 12.2 ± 2 nm within size scale range of 8-17 nm. Further, the biologically synthesized silver nanoparticles were tested against Gram (-) and Gram (+) pathogenic bacterial strains. The fabricated silver nanoparticles explored prominent antibacterial effects against all tested bacteria and improvement in activity was found to be dependent on increasing quantity of nanoparticles dosage.

THE USAGE POTENTIAL OF DIFFERENT MEDICINAL PLANTS AS ANTIFUNGAL PRESERVATIVE IN FRUIT DRYING

KADIR GÜRBÜZ GÜNER¹, ORHAN DAĞLIOĞLU¹

ABSTRACT

In this research the potential usage of various aromatic plants as antifungal preservatives on dried fruits was investigated. Therefore, dried nectarine (Bayramiç beyazı), golden delicious apple, sweet cherry, Stanley plum were treated with *Ocimum basilicum* L., *Origanum majorana* L., *Origanum vulgare* L. subsp. *hirtum* (LINK) IETSWAART and *Rosmarinus officinalis* L. Dried fruits were soaked into 80°C hot water which had been treated with aromatic plants for 15 min previously and then dried again. After treatments, dried fruits were inoculated with *Aspergillus parasiticus* DSM 5771 and *Zygosaccharomyces rouxii* ATCC 28253 and the change in fungal load was followed during storage time. In addition to antifungal activity, effects of aromatic plant process on the total antioxidant capacity and total phenolic content, also the textural and sensory properties of the dried fruits were examined. As a result of this study, *Origanum vulgare* L. subsp. *hirtum* has been determined as most effective natural preservative against fungal infections for dried fruits during shelf life. As well, *Ocimum basilicum* and *Origanum majorana* have potential as antifungal preservatives on dried fruits; however they are not as effective as *Origanum vulgare* L. subsp. *hirtum*. However *Rosmarinus officinalis* had limited effects on dried fruits. *Zygosaccharomyces rouxii* known as high tolerable against osmotic stress, led to highest infection rate. Total phenolic content and total antioxidant capacity analyzes showed that immersion of dried fruits in hot water impaired the functional food components. Nevertheless, aromatic plants in immersion process caused the improvement of phenolic content and total antioxidant capacity. *O. vulgare* L. subsp. *hirtum*, *O. basilicum*, *R. officinalis* and *O. majorana* had decreasing effects on phenolic content and total antioxidant capacity respectively. As stated by sensory evaluation, aromatic plants especially *O. vulgare* L. subsp. *hirtum* promoted taste and aroma profile.

ENDANGERED GALANTHUS SPECIES OF TURKEY AND CONSERVATION STUDIES

SEVİM DEMİR¹, FISUN GÜRSEL ÇELİKEL¹

ABSTRACT

Turkey, which is among the major gene centers of the world and has a special place in plant genetic diversity, has rich genetic resources of geophytes. However, many plant genetic resources, including geophytes, are under genetic erosion because of the environmental and other problems and therefore face with the danger of extinction. IUCN (International Union for Conservation of Nature and Natural Resources) Red List categories are EX (Extinct), EW (Extinct in the Wild), CR (Critically Endangered), EN (Endangered), VU (Vulnerable), NT (Near Threatened), LC (Least Concern), DD (Data Deficient) and NE (Not Evaluated). There are 6 Galanthus species (Galanthus elwesii, Galanthus gracilis, Galanthus koenenianus, Galanthus peshmenii, Galanthus plicatus, Galanthus trojanus) in our country in various categories of IUCN Red List. Some of these species are endemic to Turkey. Lost of these endemic species from our country means that their lost from the world. In addition to their potential usage as ornamental plants, their usage in pharmacology due to the medical properties of the modified stems and in other related industries increase their importance. Therefore, it is very important to protect these genetic resources in the World and to prevent their destruction. In this review, some information about the conservation studies on Galanthus species in our flora that are IUCN Red List categories due to the danger of extinction by various reasons were given and discussed.

HERBAL PREPARATIONS AND MENTAL HEALTH : RISK OF DRUG INTERACTION.

YESİM TANELİ (MD, PHD)¹

ABSTRACT

Mental health problems are seen all across the globe, comprise children, adolescents and adults and are increasing in frequency. Psychiatry is unique in medicine, as not only genetics, biology and the environment play a role, but also cultural factors influence onset, progression and therapeutical approaches to disorders. Cultural factors are reflected in diagnostical systems like DSM-V and ICD-10. Medical treatments and psychotherapies have been developed and proven effective for most psychiatric disorders, but unfortunately causative therapies are still lacking for some disorders. On the other hand, cultural habits and traditional healing methods for mental health problems exist and include some herbal preparations. Last but not least, scientific approaches linking herbal action with pathophysiology of psychiatric disorders are under way. Herbal preparations may be administered simultaneously with psychotropic drugs by the medical profession or may be used self-initiated by patients with or without informing their doctor. As with drug-drug interactions, drug-herbal interactions may pose an increased risk for the patient. Therefore the medical interview should include asking the patient about herbal applications and informing the patient about potential risks of common drug-herb combinations. Some drug-herb combinations with heightened risk of unfavourable interaction include: - Cardiovascular risk (venlafaxine + caffeine). - Decreased effect of drug (haloperidol + caffeine/nutmeg). - Drug toxicity if caffeine is stopped (lithium + caffeine). - Drug toxicity if smoking is stopped (clozapine + nicotine). - Epileptic seizure (carbamazepine + sage; methylphenidate + sage; amitriptylin + ginkgo/St.John's wort/sage). - Photosensitivity, severe sunburn (nortriptyline/ phenytoin sodium /risperidone + St.John's wort). - Sedation, impaired driving and workplace safety (benzodiazepines + linden/passion flower; risperidone + lemon balm/passion flower/valerian root). - Serotonin Syndrome, may be lethal (SSRI's like citalopram/fluoxetine/sertraline + ginkgo/St.John's wort). In the process of developing new drugs and herbal preparations, knowledge about interaction principles may help avoid major risk factors by adapting pharmaceutical methods according to medical and cultural requirements. This presentation will start with the principles of drug interaction including pharmacokinetic and pharmacodynamic essentials, which will be followed by information on certain drug-herb combinations, and conclude with suggestions for pharmacovigilance.

ENZYME INHIBITORY ACTIVITY OF EXTRACTS AND ESSENTIAL OILS OF SOME MEDICINAL PLANTS

GÜLSEN TEL ÇAYAN¹, EBRU DEVECİ², FATİH ÇAYAN¹, MEHMET EMİN DURU²

ABSTRACT

Plants have been used for medicinal treatments for thousands of years. Hence, the plants are attracted attention by the researchers to find out new and effective agents for different diseases. Alzheimer's disease (AD) is the most common type of dementia. The valid hypothesis being accepted has been the lack of in amount of acetylcholine which is a neuromediator [1]. Inhibition of acetylcholinesterase which is the key enzyme hydrolyses the acetylcholine to choline and acetic acid is used to treatment for the AD. Tyrosinase is a copper-containing enzyme mostly found in plants and animals. Tyrosinase inhibitors are used in the treatment of dermatological diseases related to melanin hyperpigmentation and also have a significant role in cosmetics for whitening and pigmentation after sunburn [2]. Herein, we studied five medicinal plant species namely; *Sideritis albiflora*, *Sideritis leptoclada*, *Sideritis pisidica*, *Sideritis stricta* and *Ferula elaeochytris*. For this purpose, plant species were extracted with hexane, acetone and methanol, respectively at room temperature and essential oils were obtained by a Clevenger apparatus. The in vitro anticholinesterase activity of the extracts from five plants was tested against acetylcholinesterase (AChE) and butyrylcholinesterase (BChE) known as the chief enzymes of AD using Ellman method [3]. Tyrosinase enzyme inhibitory activity was tested by the spectrophotometric method as described by Masuda et al. [4]. The activity results were compared with those of galantamine and kojic acid which are used as standard. Among the all extracts and essential oils, hexane extracts showed high enzyme inhibitory activity against AChE. The hexane extract of *F. elaeochytris* (70.66±1.33 %) exhibited the best activity followed by *S. pisidica* (62.54±0.88 %) and *S. stricta* (58.59±0.25 %). Against BChE, the acetone extract of *F. elaeochytris* and the hexane extract of *S. stricta* indicated the highest enzyme inhibitory activity with percentage inhibition values of 67.70±0.63 and 62.07±0.35 % at 200 µg/mL, respectively. As for tyrosinase inhibitory activity, the methanol extracts of plant species exhibited high activity than other extracts. The methanol extract of *S. albiflora* (42.52±0.74 %), followed by *S. leptoclada* (28.77±1.33 %) showed mild tyrosinase enzyme inhibitory activity. References [1] Grossberg, G.T. ABSTRACT

Flavonoids that contain flavonones contribute to anticancer activity beyond their antioxidation effect. Among flavanone, naringenin is regarded as a phytoestrogen with weak estrogenic and antiestrogenic activities that inhibits proliferation of colon cancer cells and melanoma cells. Naringenin, found in grape and citrus fruits exhibits an extensive range of pharmacological activities with low or no intrinsic toxicity such as anti-mutagenic, anti-inflammatory, anti-atherogenic, anti-cancer and hepatoprotective. Despite the excellent therapeutic, the poor water solubility and instability in physiological medium hampered its clinical development. In this work we have made an attempt to increase its bioavailability by forming water soluble inclusion complex using water soluble p-sulphonatocalix[4]arene (p-SCX4) at physiological pH and subsequent release at lower pH values. The inclusion complexation behavior, characterization and binding ability of naringenin with p-SCX4 was investigated by means of UV-Vis spectroscopy, FTIR spectroscopy and HPLC. Job's plot method and Benesi-Hildebrand equation was used to find the stoichiometry of complex. Results show that there is 1:1 stoichiometry between drug and p-SCX4 with binding constant value $K = 7.14 \times 10^3 \text{ M}^{-1}$. The solubility factor was increase upto 11 fold while pH dependent release suggest 60 % release at pH 3.5 value.

NITROGENIZED COMPOUNDS FROM CYTOTOXIC EXTRACT OF GYROMITRA ESCULENTA

KÜBRA ELİK¹, MEHMET ÖZTÜRK¹

ABSTRACT

The main constituents of medicinal mushrooms are polysaccharides, and lanostane-type triterpenoids and steroids. These class of compounds exhibit cytotoxic activity against cancer cell lines. They also strengthen immune system (immunomodulators). Therefore, the scientist considered mushrooms as sources of medicines. Up to date, various polysaccharide-protein complexes, lanostan-type triterpenoids, steroids, and phenolic compounds indicating anticancer, antioxidant, antiviral, antibacterial, antifungal, anti-inflammatory, immunomodulatory and cholesterol-decreasing activity have been isolated from medicinal mushrooms [1]. *Gyromitra esculenta* (Pers.) Fr. locally known as false moral and eaten by the local people was purchased from local market in Muđla. It was baked in an oven at 200°C for 30 minutes. Then the baked mushroom was air dried under shadow. The dried baked mushroom was extracted with petroleum ether, acetone, and methanol, successively. The obtained extracts were tested against human cervical epithelioid carcinoma (HeLa) and human breast cancer cell lines (MCF-7). Against HeLa cell lines methanol extract (IC₅₀: 37.5 µg/ml) exhibited the best cytotoxic activity followed by acetone (IC₅₀: 48.3 µg/ml) and petroleum extracts (IC₅₀: 50.1 µg/ml). Against MCF-7, however, the methanol extract also exhibited the best activity (IC₅₀: 18.7 µg/ml). IC₅₀ values of remaining extracts were higher than 75 µg/ml. The cytotoxic extract methanol was fractionated to isolate the compounds. The silica gel column chromatography was used for coarse separations while recycle preparative HPLC-UV-RI coupled with C18 column was used further isolation. Thin layer chromatography was used for visualization. Totally 3 nitrogenized compounds (1-3) were isolated and elucidated using 1D, 2D NMR, and MS techniques. EFFECT OF SOLVENT TYPE ON CARBONIC ANHYDRASE INHIBITORY ACTIVITY OF PLANT EXTRACTS*

DERYA CANSIZ¹, MURAT KÜÇÜK², SEMRA ALKAN TÜRKÜÇAR², UĞUR KARDİL³

ABSTRACT

Carbonic anhydrase (CA), is a very important enzyme which regulates CO₂ levels in living organisms. Today, inhibitors of CA are either used in the treatment of various disorders such as cancer, epilepsy, obesity, glaucoma, neurological disorders or under investigation as pharmaceutical active ingredients. In this study 12 plants were extracted using three different solvents (water, %40 acetonitrile and %40 methanol in water) to see the effect of solvent type on the extractable components with possible CA modulating activity, and carbonic anhydrase inhibitory activities of these extracts were determined by using both physiological hydratase activity and non-physiological esterase activity assays. % Inhibition values were determined, and the inhibitory activities of plant extracts obtained with three solvents were comparatively evaluated. The correlation between the two assay methods was low (R² values between 0.48 and 0.725). The overall trend was such that methanol extracts showed the highest CA inhibition (mean %inhibition: 33.80; highest %inhibition: 79.28), while the aqueous extracts the lowest (mean %inhibition: 19.76; highest %inhibition: 38.89). 40% Methanol extracts showed in-between values (mean %inhibition: 24.10; highest %inhibition: 63.01). In conclusion, solvent type affects not only the extraction performance of CA inhibitory plant components, but also the mode of action of inhibitor types with respect to the difference in esterase and hydratase inhibitions. Figure 1. Correlation of %inhibitory activities of plant extracts based on esterase and hydratase methods for three extraction solvents (water, acetonitrile and methanol from left to right). *This study is supported by 2210-C Priority Areas Domestic Master Scholarship Programme of TUBITAK-BİDEB.

STUDIES ON PHYTOSOME FORMULATIONS CONTAINING ALCOHOL-FREE UMCKALIN (PELARGONIUM SIDOIDES)

İSMAIL ASLAN¹, BEKİR ÇAKICI¹, BULENT ELİTOK², ÖZGÜL MUKADDES ELİTOK³

ABSTRACT

Pelargonium sidoides has a long-standing tradition in the treatment of diseases, starting with ethnobotanical records from the mid 19th century and followed by the enthusiastic perseverance of Charles Henry Stevens and Adrien Secheyaye in the first half of the 20th century. In this research, different types of phytosome containing alcohol-free umckalin were investigated. For this purpose, 4 different phytosome formulations were prepared by thin film technique using umckalin in various types of phospholipids; Phospholipon 85 G (P 85 G) and phospholipon 100H (PL 100H). The phytosomes were characterized by various methods e.g., determination of zeta-potential and size distribution. Imaging of vesicles by polarized light microscopy (PLM) studies for the characterization of phytosome formulations of umckalin was examined. The optimum phytosome formulation was selected as PL 100H: DCP:CHOL (10: 1: 4) containing umckalin (UP 4) because of its ideal size distribution (<1000 nm) and zeta potential (<-25 mV) . As a part of our future work, we are planning to determine mechanism of actions in animal studies.

CARBONIC ANHYDRASE HYDRATASE AND ESTERASE INHIBITORY ACTIVITY OF PLANT EXTRACTS CORRELATED WELL

SEMRA ALKAN TÜRKUÇAR¹, MURAT KÜÇÜK¹, DERYA CANSIZ¹, UĞUR KARDİL²

ABSTRACT

Carbonic anhydrase (CA, EC 4.2.1.1.) catalyzes the reversible hydration/dehydration of CO₂/HCO₃⁻. CA isoforms are involved in many physiological processes such as acid-base balance, respiration, bone resorption, carbon dioxide and ion transport. CA isozymes are important remedial targets to be inhibited/activated for the treatment of disorders such as glaucoma, obesity, cancer, epilepsy and osteoporosis. Clinically used CA inhibitors are usually synthetic compounds and have side effects in humans. So, potent CA inhibitors based on natural products have been sought for. In this study seventeen plant extracts were prepared with three solvents (water, %40 acetonitrile and %40 methanol in water). CA inhibitory activities of plant extracts were determined by using esterase and hydratase activity determinations that are commonly used in the carbonic anhydrase modulators research. Hydratase and esterase inhibitory activities that plant extracts in different solvents exerted correlated very well (Figure 1-3), with R² values of 0.9639, 0.9928 and 0.9689 for water, acetonitrile and methanol extraction solvents, respectively. Results clearly indicate that correlation between CA hydratase and esterase inhibitory activity is very high in all three solvents, giving a clue of the fact that the inhibition mechanism of these extracts are similarly affective for the two activities. This study is supported by 2211-C Priority Areas Domestic PhD Scholarship Programme for TUBITAK-BIDEB.

OPTIMIZATION OF TOTAL FLAVONOID PRODUCTION FROM CINNAMONUM ZEYLANICUM BY ULTRASONIC EXTRACTION

ŞEYMA BALCI¹, SİBEL YİĞİTARSLAN¹

ABSTRACT

Cinnamon (*Cinnamomum zeylanicum*) is a genus of evergreen aromatic tree species with Lauracea family, native to southern and southeastern Asia. Cinnamon is a rich source of vitamins and minerals and is a source of nutrients with high antioxidant power. Polyphenols, which are usually found in fruits, vegetables and spices such as cinnamon, are components that impart antioxidant properties to the material. In particular, gallic acid and quercetin have been noted in recent years for their usefulness in the treatment of cancer diseases. The ability of quercetin to bind free radicals in the cancerous cell without harming healthy cells is the main reason for preferring cancer treatment and elimination of side effects of chemotherapy. Extraction, which is the separation process, is used to obtain these important antioxidants in a pure form. Extraction is the process of separating the desired material from a source by diffusion into a suitable solvent. Optimization must be performed in order to achieve extraction having the highest efficiency as soon as possible. The purpose of optimization is, by applying the minimum number of experiments, to determine the conditions resulting the maximum yield of extraction within the possible shortest time. Optimization are performed in two ways, namely multiple and single optimization. In single optimization; while the other parameters are kept constant at the determined values, the effect on the extraction efficiency is examined by changing the value of a single parameter. In the multiple optimization, the values of the parameters are changed simultaneously and the interactive effects on the efficiency are evaluated. In multi-optimization, Response Surface Method, which is the most widely accepted method of today, is used. A "surface function" can be obtained with this method, and this function can be transferred to the industry directly and is used to determine optimum conditions to achieve maximum extraction efficiency. In this study, the optimal ultrasonic extraction conditions of quercetin equivalent of total flavonoids from cinnamon were determined. Selected parameters for this extraction process were extraction temperature and time, and solid-to-liquid ratio. The batch extraction experiments were carried out in an ultrasonic water bath and the amount of quercetin equivalent total flavonoids in the samples obtained after filtration was determined spectrophotometrically. The quercetin in the samples was analyzed by measuring the color produced at the 415 nm wavelength of the reaction between aluminum chloride and acetic acid-sodium acetate buffer (pH = 4). The total quantities of quercetin equivalent obtained by the calibration curve are optimized by using the Response Surface Method with the aid of Design-Expert program. As a result of this study; it was determined that 12.34 mg of total flavonoid was obtained in a "sweep" mode ultrasonic extraction at 30 ° C for 15 minutes with 1/10 g/ml solid-to-liquid ratio.

**ENZYMATIC AND NON-ENZYMATIC ANTIOXIDANT ACTIVITIES,
TOTAL PHENOLIC AND FLAVONOID CONTENTS AND
TYROSINASE İNHIBITION POTENTIAL OF ARTEMISIA ARGYI
FROM ORDU PROVINCE OF TURKEY**

MELEK ÇOL AYVAZ¹, ZEYNEP KOLÖREN¹, ONUR KOLÖREN¹

ABSTRACT

The genus *Artemisia*, one of the largest genera belonging to the family Asteraceae, is widely distributed in Europe, North America, Asia and South Africa. In spite of the harmful effects of some of its species, it has a wide area of usage in different fields, including pharmaceuticals, landscape architecture and agriculture. Some species of this genus are used as famous traditional Chinese medicines for the treatment of malaria, hepatitis, cancer, inflammation and infections by fungi, bacteria, and viruses. *Artemisia argyi*, also known as medical grass, perennial herbaceous plants of Compositae *artemisia*, contains many kinds of bioactive composition such as volatile oil, flavonoids, phenolics, eudesmane, triterpene, polyunsaturated fatty acid, vitamin C and essential amino acids. In previous studies, *Artemisia* species has been reported to exhibit antimalarial, anticancer, antidiabetic, antihepatitis, antiinflammatory, antihypertensive, antibacterial, antioxidant, antimelanogenic and antiviral effects. Kolören et al. firstly reported that the genetic diversity of *Artemisia* species in Ordu province of Turkey in an attempt to validate the formerly reported species from this area, using molecular techniques. Following this study, we aimed to investigate the total phenolic, flavonoid and antioxidant contents, enzymatic and nonenzymatic antioxidant activities based on several different methods (catalase, peroxidase and superoxide dismutase (SOD) activities, DPPH and ABTS+ radical scavenging activities, ferric reducing antioxidant power (FRAP), ferric ion chelating activity, reducing power) and antimelanogenic effect (inhibition potential on tyrosinase activity) of the methanolic extract of *A. argyi* leaves collected from Ordu province by using spectrophotometric analysis. Total phenolic and flavonoid contents of the extract were calculated as 261 mg gallic acid/g dry extract and 29 mg quercetin/ g dry extract, respectively. Total antioxidant activity was also calculated as 367 mg ascorbic acid/g dry extract. Other results (SC50 values for DPPH scavenging and chelating activities were 0.030 and 0.648 mg/mL respectively. ABTS+ scavenging activity and FRAP values were calculated as 1754 and 1650 µmol Trolox/g dry extract respectively. Furthermore IC50 value for SOD activity was 0.053 mg/mL and 0.01 mg/mL concentration of the extract had the 0.108 U catalase activity) showed that the methanolic extract of the *A. argyi* leaves had the considerable antioxidative activity and tyrosinase inhibitor potential (IC50 = 0.49 mg/mL). In addition to these reducing power of the extract was as strong as ascorbic acid. Therefore it is worth to investigate the chemical composition analysis by GC-MS or phytochemical analysis by HPLC for further studies. Furthermore, the study is the first investigation in terms of antioxidative potential of an *Artemisia* species from Turkey.

THE EFFECT OF SUGAR CONTENT OF KOMBUCHA FUNGUS TEA ON THE DEGREE OF POLYPHENOL AND ACIDITY

NURŞAH KÜTÜK¹, SEVİL ÇETİNKAYA¹

ABSTRACT

Kombucha is a slightly sweet, carbonated, acidic drink, produced by fermentation in the medium created from sugar and tea of the mushroom formed with the symbiotic relationship of yeast and bacteria. Mushrooms are the most important content of the tea, known as Kombucha, which is formed from bacteria and yeast. They originated in East Asia and reached Germany via Russia in the early 19th century. The mushroom is formed from a gelatin-like membrane. Kombucha mushroom lives in a nutritional solution of tea and sugar and continuously reproduces within this liquid. The mushroom layer spreads across the whole surface of the tea and has a predisposition for continuous reproduction. Basic metabolites in the fermented drink are known to be acetic, lactic, gluconic, glucaric, glucuronic and usnic acids, and ethanol, glycerol. The tea has a phenolic content of the mushroom of orcinol, antranorin, orsellinic, salazinic, lecaronic acids, butyric acid, malic acid, folic acid, oxalic acid, hyaluronic acid, Vitamins B and C, polyphenol, quercetin, various enzymes and ethyl alcohol. Previous studies have shown that these components are produced by the Kombucha mushroom. Following 9 days fermentation at 25°C, approximately 3,3% total acid, 0,7% acetic acid, 4,8% glucose and 0,6% ethanol have been determined in Kombucha colonies but the production of lactic acid has not been determined. The mean pH has been determined as 2,5-3. Due to several useful substances and antioxidants contained in Kombucha tea, there has been research on its use in the treatment of several diseases. However, no study has been conducted on the effect of sugar content of Kombucha fungus tea on the degree of polyphenol and acidity. In the study, the effect of the amount of sugar in Kombucha tea on the acetic acid, pH and total phenolic substance content was investigated. The acidity level was determined by measuring pH of the tea having different sugar content in the range of 85-755 grams for days 1, 3, 5, 8, 15 and 21 from the starting date of the incubation of the mushroom. The amount of polyphenol by Folin-Ciocalteu method for the same periods and the effect of the amount of sugar on them was examined.

AN INVESTIGATION OF CAROB FLOUR USAGE AS A FUNCTIONAL COMPONENT IN CAKE PRODUCTION

KAMIL EMRE GERÇEKASLAN¹, HÜSEYİN BOZ²

ABSTRACT

Carob which is known to be grown in the Mediterranean climate, is grown in the southern coastal areas of our country. Carob fruit, which is often used in the production of molasses, can also be consumed directly. In addition to that, it has been reported that Carob, which is formed into flour by milling, can be widely used especially in bakery products, pastry and confectionery products, and low-calorie snack products instead of chocolate. Since the remaining residue of carob, which was used in molasses production, is rich in cellulose content, and it can also be regarded as animal feed. It has been emphasized that the carob fruits, which was reported to contain high level dietary fiber, sugar and protein content, have high level of vitamin A, B1, B2, B3 and D vitamins, calcium, phosphorus, potassium and magnesium minerals. In this study, it was examined that the effect of using carob flour instead of cacao on the quality characteristics of the cacao cake. For this aim, the carob flour was replaced at different levels (0, 20, 40, 60, 80%) with cacao. The color, ash, volume, weight, specific volume, baking loss, texture and sensorial analysis were performed on the products. In general, it was observed that using the carob flour had statistically significant ($p<0.05$) effect on the investigated parameters. It was determined that the ash content and weigh values of cakes decreased, while the volume, specific volume, baking loss and moisture content values increased with increasing carob flour level in cakes. In addition to this, the hardness, chewiness and gumminess values of cakes decreased with the usage of carob flour, while the cohesiveness value increased. Also the crumb and crust L, a, b colour values of the cakes increased. Colour is one of the most important parameters used by consumers to evaluate the quality of a food product. The L value indicates darkness or lightness of color and ranges from black (0) to white (100). It was determined that the colour of cake crust and crumb became lighter ($p<0.01$) with addition of carob flour instead of cacao. Control cake group had the lowest L values of crust and crumb ($22,71\pm1,25$ and $21,97\pm0,40$ respectively), while the cakes made with 80% carob flour instead of cacao had the highest L values of crust and crumb ($30,99\pm0,49$ and $35,86\pm1,46$ respectively). On the other hand, sensorial analysis showed that this color difference could not be felt in the usage of 20% carob flour. In the light of the data that was obtained from study, carob flour can be used without changing the characteristics of the cacao cakes at a rate of 20-40%.

COMPARISON OF TOTAL PHENOLIC, FLAVONOIDS CONTENTS AND ANTIOXIDANT CAPACITY OF FOUR ALGAE SPECIES COLLECTED FROM MOROCCAN COAST

FATIHA GRINA¹, ZAIN ULLAH², ERHAN KAPLANER², BOUBKER NASSER¹, ABDERRAHMAN MOUJAHID¹, ABDEL KHALID ESSAMADI¹, MEHMET ÖZTÜRK²

ABSTRACT

Comparison of total phenolic, flavonoids contents and antioxidant capacity of four algae species collected from Moroccan coast Fatiha GRINA¹, Zain ULLAH², Erhan KAPLANER², Boubker NASSER¹, Abderrahman MOUJAHID¹, Abdel Khalid ESSAMADI¹, and Mehmet ÖZTÜRK² 1Laboratory of Biochemistry and Neuroscience-Applied Biochemistry and Toxicology Team, Faculty of Sciences and Technology, Hassan 1st University, Settat. BP 577 Settat-Morocco 2Department of Chemistry, Faculty of Sciences, Muğla Sıtkı Koçman University, Kötekli-48000, Muğla, Turkey fatihagrina@yahoo.fr Phenolic compounds are a group of above 8,000 phytochemicals that received considerable attention for being potentially protective factors against degenerative diseases, mostly because of their potent antioxidative properties and their omnipresence in consumed foods of plant origin. Marine algae are known to contain a wide variety of bioactive compounds, many of which have commercial applications. Natural antioxidants, found in many algae, are important bioactive compounds that play an important role against various diseases and ageing processes through protection of cells from oxidative damage. In this respect, relatively little is known about the bioactivity of Moroccan algae that could be a potential natural source of such antioxidants. So, the purpose of this research is to evaluate the antioxidant activities of four different seaweeds; *C. stricta*, *C. humilis*, *B. bifurcata* and *G. sesquipedal* Collected from Moroccan Atlantic coast. The extracts, obtained by ethanol extraction technique, were subjected to DPPH, ABTS, CUPRAC, β -carotene-linoleic acid and metal chelating activities. Total flavonoid and phenolic contents were determined as quercetin and pyrocatechol equivalents. From the results it was revealed that all extracts have good activities in the following order: *C. stricta*, *C. humilis*, *B. bifurcata* and *G. sesquipedal* in DPPH, ABTS, CUPRAC and β -carotene-linoleic acid assays. In metal chelating assay, however, *Gelidium S* indicated good activity. Although *C. stricta* showed the highest polyphenols contents and *C. humilis* the highest total flavonoid content than the other species. EVALUATION OF SOME QUALITY PARAMETERS OF ORIGANUM ONITES L. AROMATIC WATER OBTAINED FROM DIFFERENT TIMES IN DISTILLATION DURATION AND THE EFFECT OF THESE AROMATIC WATERS ON SOME QUALITY PARAMETERS OF MINCED MEAT DURING STORAGE

HASAN İBRAHİM KOZAN¹, AHMET ÜNVER¹, SELMAN TÜRKER¹

ABSTRACT

Aromatic water in markets are produced from different plant sources called 'kekik' in Turkey. *Origanum onites* L. is called as 'Bilyalı kekik' or 'İzmir kekiği' and is belong to Labiatae family. It is one of the most commercial plant in Turkey. *Origanum onites* L. was distilled with a pilot scale distillation unit. 3 hours distillation is the most applied process duration. But in this study the distillation process was prolonged from 3 hours to 24 hours. The quality change of the aromatic water was analysed from the beginning to the end of the 24 hours process in time intervals as 1 st, 2 nd, 3 rd, 5 th, 8 th, 12 th, 16 th, 20 th and 24 th hours. Free radical scavenging activity (DPPH), pH, oxidation reduction (OR) potential, electric conductivity, and Hunter L*,a* and b* values were measured. Also, sensory evaluation test was applied to detect the correleation possibilities. Thyme waters showing maximum antioxidant activity were observed in 3 hours distillation. The lowest pH, highest OR and EC values were observed at 12 hours. The aromatic water samples obtained from different time periods of distillation were added to minced meat in 0, 5 and 10 percentages in weight basis. Aromatic water added minced meat samples were stored at +4 C0 during storage. The storage time period for these minced meat samples were up to 7 days (beginning, 1 st day, 3 rd day and 7 th day). pH, TBA, moisture content, aW and colour analysis were performed during storage in minced meat samples. Total bacterial load, total mold/yeast load and total coliform bacteria load were counted to evaluate the microbial growth as log CFU/gr. 3 hours of distillation found to have the maximum antioxidant activity, therefore prolongation of the distillation period over 3 hours is not recommended. pH value decreased from 4,43 to very low values as 2.72, till the end of 24 hours of distillation. Acidic taste was also reported by panelists. In addition, the extremely low pH makes it clear that the metals used in production of aromatic waters must be selected carefully. The optimal duration of distillation, rate of addition and storage of minced meat have been optimized to obtain the best antioxidant effect. It has been determined that the most optimal antioxidant effect was achieved by adding 7.16% aromatic water in minced meat by the initial day of storage. The antibacterial activity was increased by the increase of the percentage of the aromatic water in minced meat. Also, addition of distillat from the prolonged distillation was also found to be effective on reduction of total bacterial load and total mold/yeast load in minced meat. The aromatic water addition was not effecive on total coliform bacteria load. As a result, 3 hours of distillat was found to be most effective aromatic water as an antioxidant source on minced meat. Aromatic water addition may be referred to preserve minced meat for reduction of total bacterial load in storage.

PROTEIN CONTENTS AND ANTIOXIDANT PROPERTIES OF PLEUROTUS OSTREATUS CULTIVATED IN TEA AND ESPRESSO WASTES

AYŞENUR YILMAZ¹, SIBEL YILDIZ¹, CEYHUN KILIÇ², ZEHRA CAN³

ABSTRACT

In this study, *Pleurotus ostreatus* was cultivated on tea (*Camellia sinensis*) and espresso wastes. Tea wastes were used in two forms; sterilized or non-sterilized. Then, total phenolic, flavonoid, condensed tannin contents, ferric reducing/antioxidant capacity (FRAP) and 2,2-diphenyl-1-picrylhydrazyl (DPPH) free radical scavenging were used as antioxidant determinants and also protein content were investigated in these mushrooms' methanolic extracts. Same measurements were determined in mushrooms' growing media except protein content. The highest protein content (20.89%) was found in non-sterilized tea wastes. The highest total phenolic (1.460 ± 0.012 mg GAE/g), total flavonoid (0.120 ± 0.005 mg QE/g), condensed tannin (0.877 ± 0.011 CE mg/g) scavenging activity of and the lowest free radical DPPH (17.190 ± 0.001 mg/mL) were determined in sterilized tea wastes. Ferric reducing antioxidant power (8.498 ± 0.089 $\mu\text{molFeSO}_4 \cdot 7\text{H}_2\text{O/g}$) were determined in espresso wastes. Additionally, there was no statistically significant difference between the sterilized and non-sterilized substrates for the total yield and biological efficiencies. In this case, it can be said that the kinds of substrates and their usage forms are very important in terms of energy savings especially does not require sterilization like tea wastes. Consequently, tea and espresso wastes can be used as a beneficial source of substrate material for *Pleurotus ostreatus* mushroom cultivation.

ABSTRACT

Cinnamon (cinnamomum) is the dried crust of some Cinnamomum (Lauraceae) species. There are two main varieties of cinnamon bark, including Chinese Cinnamon (Cortex Cinnamomi cassiae) and Ceylon Cinnamon (Cortex Cinnamomi Olfactory). It has cinnamon, antiperspirant, gas expectorant and antiseptic properties. Apart from that, it is also used as a spice and fragrance. The cinnamon oil obtained by distillation from its shells also has a pleasant odor and taste, in its composition, contains cinnamic aldehyde and ogenol. In our work, we obtained cinnamon oil from cinnamon which we obtained commercially with the water vapor method of distillation. Antibacterial and antimicrobial resistance against bacteria and fungi of *S. aureus* (ATCC 25923), *E. coli* (ATCC 25922), *C. albicans* (ATCC 90028), *C. Krusei* (ATCC 1424) Activity studies were carried out. Cinnamon oil was found to be highly active against bacteria and fungi used.

RAPID DISCRIMINATION OF EXTRA VIRGIN OLIVE OILS BY SB-ATR-FTIR AND PORTABLE ATR-IR SPECTROSCOPY

İSMAIL TARHAN¹, HÜSEYİN KARA¹

ABSTRACT

The importance of extra virgin olive oil (EVOO) is mainly attributed to its high content of oleic acid and its richness in phenolic compounds, which act as natural antioxidants (Bendini, et al. 2006:54). On the other hand, EVOO is expensive owing to the hard and time-consuming tasks involved in the cultivation of olive trees, the harvesting of the fruits, and the extraction of the oil. For these reasons, adulterations of EVOOs with olive oils of lower quality or with oils of a different botanical origin are occasionally detected. In this study, single-bounce attenuated total reflectance-Fourier transform infrared (SB-ATR-FTIR) spectroscopy and portable attenuated total reflectance-infrared (pATR-IR) have been developed for discrimination analysis of EVOO from other ordinary olive oil (refined and deodorized olive oil) and vegetable oils (avocado, canola, corn, peanut, soya, and safflower). The partial least squares-discriminant analysis (PLS-DA) was used for classification analysis between EVOO and the other vegetable oils using the wavenumbers of 3000-700 cm⁻¹ for SB-ATR-FTIR and 1780-930 cm⁻¹ for pATR-IR. The results showed that DA was able to classify EVOO and the other vegetable oils on the basis of their IR spectra with no misclassified group obtained. According to the results, SB-ATR-FTIR method discriminated all of EVOOs but including ELOO and Peanut oil. It was seen that ELOO and peanut oil have similar vibrational spectroscopic properties with EVOOs in the infrared region employed by SB-ATR-FTIR. Although this handicap, the method successfully distinguished other vegetable oils from EVOOs. pATR-IR method discriminated all of EVOOs except EVOODan and including ELOO. According to the results, it was seen that limited scan region of the pATR-IR device did not have enough spectroscopic data for discrimination of all EVOOs. Although it's limited scan region, it has shown a good discrimination performance.

BELIEFS ABOUT THE HEALING EFFECTS OF HERBAL TEAS IN ANKARA

FAZILA DERYA AGİŞ¹

ABSTRACT

In this study, interviews and surveys were completed with the workers of five "herbal doctor" shops as recognized by the general public. It was aimed at discovering which herbal teas the general public believed to be drunk against respiratory diseases, such as flu, and common cold, alongside menstrual irregularities, sleep deprivation, and emotional problems, such as anger in terms of environmental cultural anthropology. The teas are divided into two as those healing physical and mental diseases. The usefulness of the plants of ginger, turmeric, and thyme are also mentioned. Moreover, the interviews are supported by Turkish popular and folk songs. Teas are regarded as cultural treasures to be protected within the framework of environmental humanities.

A COMPARISON OF THE AMERICAN AND TURKISH TEA CULTURES

FAZILA DERYA AGİŞ¹

ABSTRACT

In this study, the herbal teas sold in the United States of America and Turkey will be analyzed in terms of their healing and soothing effects. Herbal teas sold in American tea shops called Teavana and David's Tea will be analyzed in relation with their healing and soothing effects and compared to those sold in Turkish markets, including the herbal tea products of Doğadan, Doğuş Çay, and Lipton. The discourse of their ads will be analyzed. The effects of the herbal teas and the boxes in which they are sold are also compared in terms of the illnesses they cure and the colors and shapes of their boxes that attract customers from cultural perspectives. Briefly, this study will present the folkloric beliefs and cultural herbal tea presentation techniques in the United States of America and Turkey within the framework of environmental social sciences. Anthropological linguistic analyses of the tea advertisements of American and Turkish tea companies will be made in relation with the illnesses these tea types are believed to cure.

DETERMINATION OF ESSENTIAL OILS COMPONENTS OF MACLURA POMIFERA (OSAGE ORANGE) FRUIT FROM TURKEY

RIFAT BATTALOĐLU¹, FILİZ YAĐIZ

ABSTRACT

In order to determine the essential oil components of *Maclura Pomifera*, which is the mother country of North America, or pseudo-orange fruit juice, volatile oil components were determined by GC / MS method after the essential oil isolation of the fruit sample was completed. The relative abundances of the chromatograms obtained as a result of the analyzes were compared with the similarity indices of the probable results in the library of the GC / MS for the highest peaks and retention index calculations were made from the retention time. As a result of the analyzes, the structure of 28 volatile oil components in the fruit was clarified. When the components were examined, dodecanal (9.02%), Eugenol (8.36%) and α -humulene (7.84%) emerged as the first three major components. Other compounds are less common than these three compounds.

LEGAL STATUS OF MEDICINAL AROMATIC PLANTS

SELÇUK MUSTAFA SEÇEN¹

ABSTRACT

Medicinal and aromatic plants have been used for centuries as food, seasoning, medicine, and healing substance. For this reason, the agriculture of some plants such as cumin, poppy and anise has been going on since prehistoric times. Despite the fact that more than 40% of the medicines listed at the beginning of the 20th century were of herbal origin, this proportion decreased to less than 5% in the mid-1970s. The discovery of new uses of medicinal and aromatic plants, and the increase in demand for natural products, particularly since the 1990s, has increased the utilization volume of these plants steadily. According to the World Health Organization (WHO), about 20,000 plants are used for medical purposes. The main commercial centers for herbal drugs in the world are Germany (Hamburg), the US (New York) and Hong Kong (Başer, 1997; Lange, 2006). Due to its geographical location, climate and plant diversity, agricultural potential and large surface, Turkey is one of the leading countries in the trade of medicinal and aromatic plants. That the plants which are the raw material of many herbal products of herbal drugs, phytochemistry, food and additives, cosmetics and perfumery industries located in developed countries are present in the flora of our country, Turkey, is important in this respect. Therefore, these plants are mostly collected in nature and are marketed. Medicinal and aromatic plants are mainly collected in their habitats in Aegean, Marmara, Mediterranean, Eastern Black Sea and Southeastern Anatolia Regions. Collected plants are mostly daphne, sage, rosemary, rosehip and lime. There are many definitions for medicinal and aromatic plants. "Herbal medicines are, substances or products comprising of either processed or unprocessed compounds from one or more plants that have therapeutic properties or that are beneficial to human health." According to this definition, there are 3 types; unprocessed herbal materials, processed herbal materials and medical herbal products. The World Health Organization (WHO), the United Nations Food and Agriculture Organization (FAO), the International Union for Conservation of Nature (IUCN), the European Medicines Agency (EMA), the Global Federation of Medicinal and Aromatic Plants (GOFMAP), the European Herbal Infusions Association (EHIA), The International Trade Center, the European Food Safety Authority (EFSA), the European System of Cooperative Research Networks in Agriculture (ESCORENA Network), the World Wildlife Fund (WWF), the Central Institute of Medicinal and Aromatic Plants-India (CSIR-CMAP), The National Medicinal Plants Board-India (NMPB) are among the main institutions and organizations operating abroad on medicinal and aromatic plants. Although many institutions are involved in the issue of medicinal and aromatic plants in Turkey, the authority in these studies in our country is the Ministry of Food, Agriculture and Livestock. Apart from the Ministry of Food, Agriculture and Livestock, the Ministry of Health and the Ministry of Forestry and Water Affairs are among the institutions which are included in this field the most. Within the Ministry of Food, Agriculture and Livestock, the central (General Directorate of Crop Production, General Directorate of Food and Control, General Directorate of Agricultural Researches and Politics) and provincial organizations (Provincial and District Directorates), related

institutions (Agriculture and Rural Development Support Institution and Provincial Coordination Offices) and other organizations (National Botanic Garden) are among the institutions that carry out the most of the studies on this issue. The General Directorate of Crop Production, which is in the Ministry of Food, Agriculture and Livestock, is responsible for preparing, having prepared and implementing the application projects related to the increase of the production of medicinal and aromatic plants, diversification of products, and improvement of quality (www.tarim.gov.tr). Under this General Directorate, the Department of Field and Horticultural Crops and the Department of Seed and Seedling are involved in this issue. The Seed Registration and Certification Center operates in relation with Department of Seed and Seedling. The Seed Registration and Certification Center, carries out the registration procedures of newly improved and imported varieties, field and laboratory tests of seeds, certification procedures and cataloging of varieties in accordance with the Seed Act No. 5553 and the Law No. 5042 on the Protection of Breeder's Right to New Plant Varieties, the regulations, written notices, and instructions. On this issue, the Aromatic, Medicinal and Ornamental Plants Unit operates under the Variety Registration Section of the Seed Registration and Certification Center.

THE EXAMINATION OF THE CHANGE IN THE COMPONENTS OF VOLATILE OIL OF THE ETHIOPIAN SAGE (*SALVIA AETHIOPIS* L.) WHICH IS GROWN IN DIFFERENT LOCATIONS

HASAN BASRI KARAYEL¹, MEVLUT AKÇURA², YALÇIN COŞKUN³, YAKUP BUDAK⁴

ABSTRACT

THE EXAMINATION OF THE CHANGE IN THE COMPONENTS OF VOLATILE OIL OF THE ETHIOPIAN SAGE (*Salvia aethiopis* L.) WHICH IS GROWN IN DIFFERENT LOCATIONS
Abstract This study was conducted simultaneously in Çanakkale, Balıkesir and Kütahya locations in order to define the effect of location on the volatile oil components, volatile oil rate and volatile oil quality in Ethiopian Sage (*Salvia aethiopis* L.) plant in 2015 growing season. Field experiments were repeated 3 replications according to randomized block design. The seedlings were planted by a horizontal distance of 30 cm and vertical distance of 50 cm. The volatile oils of the parts of *Salvia aethiopis* L. which are over the soil were examined. These plants' volatile oils were gathered by hydrodistillation method (GC-MS/FID) and the volatile oil rates in three different locations were measured as % 0.53, % 0.21, % 0.20 respectively. The basic components of the volatile oil were determined as follows; β -caryophyllene % 36.22, % 30.46, % 35.96, α -copaene % 15.06, % 16.4, % 6, % 16.58, Germacrene-D % 13.23, % 20.01, % 15.20, β -cubebene % 5.62, % 7.04, % 6.93, α -humulene % 8.68, % 7.40, % 8.54, Caryophyllene oxide % 7.40, % 1.82, % 3.53. The highest volatile oil rate of the Ethiopian Sage was reached in Çanakkale location by a % 0.53 rate. As a result of the study it was found out that volatile oil components are comparatively richer in terpenes and the amount of volatile oil differs according to the ecological factors. Keywords : *Salvia aethiopis* L., volatile oil, β -caryophyllene, GC-MS/FID

INVESTIGATION ON ANTIMICROBIAL RESPONSES OF SALVIA VERTICILLATA L. SUBSP. AMACIACA AND SALVIA FORSKAHLEI L.

ÖZLEM AYAN¹, ERGİN MURAT ALTUNER², SEZGİN AYAN³

ABSTRACT

The two species that distribute widely and naturally in the Kastamonu province, Turkey and stand out in the ethnobotany of the region are, *Salvia verticillata* L. subsp. *amaciacca* known as the "müsellim" and *Salvia forskahlei* L. known as the "Şalpa", was chosen as the material of this research. In this research; The effect of antimicrobial activity of the flowers and leaves of *S. verticillata* L. subsp. *amaciacca* and *S. forskahlei* L. on different yeasts and bacteria (*Pichia membranifaciens*, *Candida albicans*, *Enterococcus faecium*, *Salmonella kentucky*, *Salmonella typhimurium*, *Staphylococcus aureus*, *Enterococcus durans*, *Listeria monocytogenes*, *Echerichia coli* and *Klebsiella pneumoniae*) has been investigated for different concentrations (250, 300 and 350 ml doses) of solvent (Ethyl alcohol, acetone, ethyl acetate and distilled water). As a result of the research; Anti-microbial activity of *S. forskahlei* were not observed on the yeast of *Candida albicans* and the bacteria of *Salmonella kentucky*, *Escherichia coli* and *Klebsiella pneumoniae*. The antimicrobial activities seen in all other bacteria were affected by solvent differences. In addition, the bacteria of *Enterococcus durans* affected by concentration differences. For the species of *Salvia verticillata* subsp. *amaciacca*; the antimicrobial activities seen in all bacteria except *Salmonella kentucky* and *Staphylococcus aureus* and yeasts were affected by solvent differences.

OREGANO SPP. ESSENTIAL OIL AS A NATURAL ANTIOXIDANT SOURCE

MUSTAFA KIRALAN¹, HASAN HÜSEYİN KARA²

ABSTRACT

Natural food sources could be used to assure food safety and quality. The preference of natural sources for preservatives is the fact that some preservatives produced from synthetic sources result in some toxic compounds and further health problems. Among the natural sources, the spices, herbs and medicinal plants take the important places. Even, the substances have already been used in the most of foods for ancient years. Of the plants, the oregano takes first place as the plant surveyed by the greatest number of researchers. In the present work, we reviewed the several studies including the natural food antioxidants of essential oils extracted from *Oregano* spp, in which the characteristic active compounds are thymol and carvacrol. In other words, the thymol and carvacrol compounds, the amount of which is strongly dependent upon the species, harvesting season and geographic conditions, are responsible for antioxidant activity of *Oregano* spp. essential oil.

MORUS NIGRA RESTORES EXPERIMENTALLY INDUCED NEUROTOXICITY IN SPRAQUE DAWLEY RATS

GÜLŞAH YILDIZ DENİZ¹, ESRA LALOĞLU¹, FATİME GEYİKOĞLU¹, KÜBRA KOÇ¹, SALİM CERİG¹

ABSTRACT

Black mulberry (*Morus nigra*) is a common fruit used all over the world. In folk medicine it is used in hypertension, fever and sore throat. We used the carbon tetrachloride (CCl₄) experimental model of reactive oxygen species (ROS)-induced lipid peroxidation and evaluated the antioxidant effect of *Morus nigra* (MN). Over the years CCl₄ has been used as an excellent model for studying experimentally induced neurotoxicity in murine models. In this study, 49 Spraque-Dawley male rats were randomly divided into 7 groups of 7 rats each. Group I: control, group II: CCl₄ dissolved in soybean oil (1 mL/kg/twice a week, ip), group III and group IV: CCl₄+150 and 300 mg/kg MN, group V and group VI: only MN (150 and 300 mg/kg). CCl₄ was administered twice a week to group II, III and IV during the experimental period. CCl₄-treated rats caused a significant increase in serum enzyme levels, such as aspartate aminotransferase, alanine aminotransferase and total bilirubin, and decrease in albumin, when compared with control. Superoxide dismutase (SOD) and glutathione peroxidase (GPx) were measured in the brain. *Morus nigra* pretreated groups restored the biochemical parameters significantly in a dose-dependent manner. Histopathology, haematoxylin-Eosin (H&E), cysteine-dependent aspartate-directed proteases 3 (Caspase-3) and 8-hydroxydeoxyguanosine (8-OHdG) immunohistochemistry were also performed. Caspase-3 activities, and 8-OHdG levels were significantly increased in CCl₄ group. These increases were significantly reversed by *Morus nigra* treatment. While CCl₄ increased the number of apoptotic cells, this increase was prevented in CCl₄+150 mg/kg MN and 300 mg/kg MN groups. Morphometric examination showed that the mean diameter of apoptotic cells was increased with CCl₄ administration while this increase was reduced by both dosages (150 and 300 mg/kg) of MN treatments. Intraperitoneal administration of MN significantly attenuated oxidative stress, prevented apoptosis, and increased antioxidant defense mechanism activity in the tissues versus the control group (P<0.05). Comet assay also postulates that MN treated rats brain shows less DNA damage than CCl₄ treatment rats. Present study concludes the neuroprotective effect of MN in CCl₄ treatment rats by its antioxidant, anti apoptotic and anti-inflammatory activity.

DETERMINATION OF VOLATILE COMPONENTS AND FATTY ACIDS OF BLACK CUMIN OIL WITH GC MS SPME AND GC-FID

MUSTAFA YILMAZER¹, SERMIN GÖKSU KARAGÖZ¹

ABSTRACT

Black cumin is widely cultivated in Mediterranean countries, middle Europe and western Asia. The ancient Egyptians, Greeks and Romans were already aware of the therapeutic properties of *N. Sativa* edible oil and seeds of which are still used in folk medicine, as a spice in various kinds of food. Edible oil also has got volatile compounds. In this study volatiles and fatty acid methyl ester quantitated by Shimadzu (Tokyo, JAPAN) SE 2010 plus, GC MS equipment, for fatty acids PERKIN ELMER autosystem XL (CA, USA) with Varian CP SIL 88 (50 m x 0,25 mm i.d. 0,25 µm film thickness) column. SPME fiber is used (CAR/PDMS) and a holder obtained from Supelco (Bellefonte, PA, USA) were used. The fiber was first conditioned 2 hours at 300 °C. SPME extraction was performed in 20 ml glass vials containing 2 g commercial black cumin cold pressed oil. The sample was kept for 15 min in a 60 °C hot plate for equilibrium between the sample and the air in the vial. Next, the SPME fiber was exposed to the in the vial to adsorb the analytes. After 30 min exposure time, the fibre was retracted into the needle into the GC-MS injector for desorption and analysis of the volatiles. Important volatiles are p-cymene, gamma-terpinene, Thymoquinone and the other volatiles identified. GC MS temperature programme used for was in the range 40–250 °C (59,5min), rising at 4 °C/min, with both injector and detector temperatures 250 °C. Helium at a flow rate of 1.5 ml/min was used as carrier gas for GC MS analyses. GC-MS recordings at EI, 70 eV. Fatty acid methyl esters derivatized with Sodium methoxide 0,5 g in 100 mL methanol. 50 microliter edible oil is added on 750 microliter derivatisation solution for 24 hours at room temperature. After derivatisation 1 mL hexane is used for extraction, upper phase injected to GC-FID. Supelco 18919 37 fatty acid mix is used to determine with retention time. C18:2n6 Linoleic acid, C18:1n9c (Oleic acid), C16:0 (palmitic acid), C21:0 (Heneicosenoic) were determined % 50,92 and % 29,36, % 11,60, % 2,60 also trace amounts of other fatty acids determined. As a result Black Cumin commercial edible oil, has rich unsaturated fatty acids and medicinal volatile components.

DOĐAL ANTIMİKROBİYAL KATKILARIN UNLU MAMÜLLERDE KULLANIMI

NILGÜN ERTAŞ¹, SELMAN TÜRKER¹

ABSTRACT

Gıdalarda bozulmayı önlemek ve mikroorganizmaları inhibe etmek amacıyla ısı ve ısı olmayan işlemler, ışınlama, dondurma, kurutma gibi prosesler kullanılmaktadır. Uygulanan bu prosesler gıdalarda besinsel özelliklerini ve fiziksel özelliklerinde kayıplara sebep olmaktadır. Natural and gıda endüstrisinde doğal ve sentetik gıda katkı maddeleri kullanılmaktadır. Kullanılan bu katkı maddeleri ile gıdalar fiziksel kimyasal yada besinsel özelliklerini uzun süre koruyabilmektedir. Gıdalarda mikroorganizmalardan kaynaklanan bozulmaları önlemek ve raf ömrünü artırmak amacıyla koruyucu olarak sorbatlar, propiyonatlar, benzoatlar, nitrit ve nitrat bileşikleri, sülfidler kullanılmaktadır. Fakat bu kimyasal katkı maddelerinin az miktarlarda kullanımı bile insanlarda değişik problemlere yol açmakta, baş ağrısı, nefes problemleri, kaşıntı oluşturabilmekte ve başta kolon ve pancreas kanseri olmak üzere her çeşit kanseri tetiklemektedir. Hatta bazı koruyucu katkı maddelerinin dünyada kullanımı yasaklanmıştır. Koruyucu katkı maddelerinin başka maddeler ile etkileşimi de söz konusu kanserojenik maddelerin oluşumuna sebep olabilmektedir. Özellikle sodyum benzoatın gazlı alkolsüz içeceklerde kullanılması, içecek içerisinde bulunan c vitamini ile etkileşime girmekte ve kanserojenik benzen adı verilen bir madde oluşmaktadır. Bu sebeple doğal olarak üretilen tıbbi aromatik bitkilerin gıda maddelerinde koruyucu madde olarak kullanımının artırılması, bu bitkilerden elde edilecek ekstraktların gıdalarda koruyucu olarak kullanılmasının araştırılması gerekmektedir. Gıdalarda koruyucu kimyasal katkı maddeleri yerine kullanılacakları arasında bitkilerin yaprak, çiçek, tomurcuk, kök, tohum, ve meyve gibi kısımlarında elde edilen bitki ekstraktları ve uçucu yağları, gelmektedir. Kekik, defne, nane, semizotu, dereotu ve roka yapraklarının gibi bitkilerin de güçlü bir antimikrobiyal etkisinin bulunduğu, biberiyenin ise mayalara daha fazla etki ettiği bildirilmiştir. Kafein içeren kakao ve kahve bitkilerinin de antibakteriyel özellik gösterdiği bilinmektedir. Rezene ve adaçayı uçucu yağlarının da gram pozitif ve gram negative bakteriler üzerinde antimikrobiyal etkileri yapılan çalışmalarda tespit edilmiştir. Yapılan bir çalışmada biber ekstraktlarının *Listeria monocytogenes*'in gelişimini önemli ölçüde inhibe ettiği belirlenmiştir. Tarçından elde edilen uçucu yağın antifungal etkiye sahip olduğu bildirilmiştir. Endüstriyel olarak üretilecek ve uzun süre depolanması planlanan unlu mamüller üretiminde kimyasal koruyucuların kullanılmaması amacıyla daha ileri çalışmaların yapılması gerekliliği ortaya çıkmaktadır. Özellikle sodyum benzoat ve potasyum sorbat unlu mamüller endüstrisinde en fazla kullanılan koruyucu katkı maddeleri olup, bu katkıların yerine tıbbi ve aromatik bitkilerin kullanım olanaklarının araştırılması gerekmektedir. Özellikle mayalı unlu mamüllerde kullanılan *Saccharomyces cerevisiae* mayasını kötü yönde etkilemeyecek şekilde olmasını da göz ardı etmemek gerekir.

QUANTITATIVE DETERMINATION OF COMPONENTS IN THYME AND ROSE AROMATIC WATER WITH GC- MS METHOD

MUSTAFA YILMAZER¹, SERMIN GÖKSU KARAGÖZ¹

ABSTRACT

There are several methods that are used to extract and concentrate the aromatic components from plant materials. Steam distillation is one of these methods ,distillation is a method of separating componenets based on differences between boiling point of molecules. With steam distillation we can get the essential oil and some water soluble components ;this called is aromatic water . In Isparta region, Oregano and Rose aromatic waters are most produced by companies. This waters are useful for health ,if the active ingredient quantity is enough. Oregano water most common components' are Carvacrol, Thymol , Cymene , Rose water most common components' Phenethyl alcohol , citronellol and the others. In this study some aromatic waters quantitated by Shimadzu (Tokyo, JAPAN) SE 2010 plus, GC MS equipment, with Restek 5 MS (30 mx 0,25 mm i.d. 0,25 µm column .Carvacrol and Phenethyl alcohol standarts of calibration curves' R2 values at least 0,998 with this method the quantitation of carvacrol and phenethyl alcohol mg/L is analytical sufficiency is obtained. We can analyse the of commercial aromatic waters if the diluted or not . In the most of literature, it is seen that the results are mostly given as percent of volatiles of total volatiles, which have not been studied quantitatively.

INVESTIGATION OF CHANGES IN ESSENTIAL OIL COMPONENTS OF TWO SAGE (*SALVIA OFFICINALIS* L., *SALVIA FRUTICOSA* MILL.) CULTIVATED IN DIFFERENT LOCATIONS

HASAN BASRI KARAYEL¹, YALÇIN COŞKUN², MEVLUT AKÇURA², YAKUP BUDAK³

ABSTRACT

INVESTIGATION OF CHANGES IN ESSENTIAL OIL COMPONENTS OF TWO SAGE (*Salvia officinalis* L., *Salvia fruticosa* Mill.) CULTIVATED IN DIFFERENT LOCATIONS Abstract This study was conducted simultaneously in Canakkale, Balıkesir and Kütahya locations in 2015 to determine the effect of different locations on the essential oil components, volatile oil ratio and quality of two island tea species (Common sage: *Salvia officinalis* L. and Anatolian sage/Greek sage: *Salvia fruticosa* Mill). The field experiments were set up in 3 replications, according to the design of randomized blocks. The seedlings were spaced 50 cm apart and 30 cm apart. Volatile oil analyses of *Salvia officinalis* L. and *Salvia fruticosa* Mill. was carried out in the herbal material. Volatil oils of these plants were obtained by hydro-destination (GC_MS / FID) and the volatile oil ratios at approximately three loci were *Salvia officinalis* L. %0.99, %1.23, %1.85 and *Salvia fruticosa* Mill. % 4.10, %2.72 and %1.9 respectively. The main constituents in the volatil oil were determined as α -thujone %26.35, %38.39, 29.84%, β -thujone %29.20, %12.26, % 9.07, Camphor %5.60, %13.90, %23.24, 1,8-cineole %7.75, %7.81, %6.57, Viridiflorol %5.55, %4.38, %2.65, Thujone, %2.42, %5.38, %1.48, [beta]-thujone, %1.43, [beta]-hydroxystearin of *Salvia officinalis* L., 1,8-cineole %49.60, %33.36, %56.05, Camphor, %22.21, %17.51, %6.62, %3.47, %2.57, Borneol, %1.19, %1.65, %1.39 of *Salvia fruticosa* Mill. *Salvia officinalis* L. and *Salvia fruticosa* Mill. the best volatile oils were obtained at %1.85 Kütahya and %4.10 at Çanakkale locations. At the end of the study; it was found that the volatile oil components were richer in terpenes and the amount of volatile oil varied depending on the ecological factors. Keywords: *Salvia officinalis* L., *Salvia fruticosa* Mill., Essential oil, GC-MS/FID

THE LYCOPENE AS A NUTRACEUTICAL COMPONENT

EMİNE NAKİLCİOđLU-TAŞ¹, SEMİH ÖTLEŞ¹

ABSTRACT

Lycopene, is found naturally in ripe tomato fruit and tomato-based products, watermelon, rosehip and pink grapefruit, is one of the carotenoid compounds and gives them a characteristic red pigmentation (Dündar ve Okcu, 2014:241; Bramley, 2000:233). Tomatoes and tomato-based products are the best source of lycopene in the human diet (Stahl ve Sies, 1996:4). In ripe tomatoes, lycopene is the most abundant carotenoid, comprising approximately 80 to 90% of those pigments present, while other carotenoids (α -carotene, β -carotene, lutein, and β -cryptoxanthin) are found negligible amount (Shi ve Le Maguer, 2000:3). Nevertheless, the lycopene content of the concentrated tomato products is generally lower than expected because of losses during food processing (Stahl ve Sies, 1996:4). The bioavailability of lycopene differs according to product. Lycopene from processed tomato products seems to be more bioavailable than from raw tomatoes. For examples, lycopene from tomato paste are shown to be more bioavailable than from fresh tomatoes. Additionally, the release of lycopene from the food matrix increases due to processing, presence of dietary lipids and heat induced isomerization from all trans to cis conformation and so, lycopene bioavailability also increases (Rao ve Agarwal, 2000:564). A diet rich in carotenoid-containing foods is connected with a number of health benefits (Clinton, 1998:35). The high antioxidant activity of lycopene is mostly responsible for its beneficial properties. However, previous studies are reported that other mechanisms such as intercellular gap junction communication, hormonal and immune system modulation and metabolic pathways may also be affected on health effect of lycopene (Rao ve Agarwal, 1999:305). A direct benefit of lycopene has not been proven yet, but the interaction between lycopene with other compounds found in lycopene-rich food is very important (Giovannucci, 1999:328). The epidemiological studies showed that the consumption of lycopene-rich products in diet is beneficial for many diseases such as cardiovascular diseases and several human cancers (prostate, lung, stomach, pancreas, colon and rectum, esophagus, oral cavity, breast, and cervix) (Dündar ve Okcu, 2014:241; Giovannucci, 1999:317). The complex interactions among multiple components in lycopene-rich products are thought to contributing these health effects (Giovannucci, 1999:317).

GARLIC (*ALLIUM SATIVUM*) AS AN ALTERNATIVE TO ANTIBIOTICS IN FISH CULTURE

SUAT DİKEL¹

ABSTRACT

Abstract: The wide-ranging use of antibiotics and medicaments has resulted in chemical residue and resistant pathogens in cured fish. Chemical residue not only pollutes the environment, but also threatens consumer's health. In contrast, garlic as a recognized natural antibiotic that causes no environmental or physical side effects has shown to be effective for the treatment of many diseases in humans and animals. In fish culture operations, garlic promotes growth, improves the immune system, stimulates appetite, and reinforces the control of fungal and bacterial pathogens. In addition to this, garlic used as an aromatics and lengthener of shelf life of fish meat. This article emphasis on the application of garlic in prevents of fish and the expectations of using garlic preparations in fish culture.

EFFECTS OF DIETARY GARLIC (*ALLIUM SATIVUM*) POWDER ON GROWTH, FEED UTILIZATION AND IN SURVIVAL OF HYBRID TILAPIA FINGERLING UNDER GREENHOUSE CONDITIONS

ALP ÖZGÜVEN¹, SUAT DİKEL²

ABSTRACT

The effect of different concentrations of garlic (*Allium sativum*) supplement in fish diet on growth parameters of hybrid tilapia (*Oreochromis niloticus* x *O. aureus*) fingerlings was investigated. Fish (2.57 ± 0.01 g) were separated into three experimental groups of 0% (controls), 1.0%, and 2% concentrations of garlic in diet and fed at 2% body weight per day. At the end of the experimental feeding period, it was observed that garlic supplemented diet did not have any significant effect on weight gain of hybrid tilapia fingerlings when compared to fish in the control diet. However, final fish weight of high level garlic added group was higher ($8,09 \pm 0,84$ g) than the others ($7,41 \pm 0,64$ and $7,30 \pm 0,54$ g) respectively ($P > 0.01$). But Fish fed different higher concentrations of garlic in diet showed significantly differences in FCR of among the groups ($P < 0.01$). In conclusion %2 dietary supplementation of garlic in diet can be recommended for getting to better FCR in overwintering of hybrid tilapia fry under the greenhouse conditions.

DIFFERENT EVALUATION OPPORTUNITIES; TESBI (STYRAX OFFICINALIS L) SHRUP

CÜNEYT CESUR¹, BELGİN COŞGE ŞENKAL¹, TANSU USKUTOĞLU¹

ABSTRACT

Humans have benefitted from plant and living creatures in nature for protection or curation from disease and harmful before industrial revolution. Medicine and pharmacy sectors intensively started to use artificial products for reason with industrialization of sciences. But, because it is recognize that this side effect of usage of artificial products and again, people start to searching ways which is back to nature. Intensively it has been worked on good farming and organic farming to nutrition; medicinal and aromatic plants for therapies and diseases, personal care products, nutritional support foods. Before modern era , plant of medicinal and aromatic uses is almost 100%, this percentage is decrease to 5% with modernization. Nowadays, this percentage again is oncoming to 30% for the good of medicine and aromatic plants. At the point of continue of the process, it is not prophecy that this percentage's will increase to declare. Scientifically it is known as "Ayı fındığı" but its name is "tesbi" in east Mediterranean district. It commemorated as medicine and aromatic plant in history, it has many potential which can benefit in the different areas. Tesbi plant which is unappreciated as forestry industry danger of extinction because of extreme cutting and animal feeding. Tesbi is a perennial shrub. Its seed has 47% oil. Tesbi can use lots of area such as plant leaf can use for feeding goat, bee forage due to honewort, landscape gardening due to beautiful flowers, renewable energy due to high oil rate , erosion control works due to plant can easily grow in dry zone and if plant is grow in massive forestry area, It can create seriously employment .Cultivation and breeding of plant which is believed to cure against prostate diseases can contribute to protect of biodiversity.

QUANTITATIVE DETERMINATION OF HEAVY METALS IN SOME COMMONLY CONSUMED HERBAL MEDICINES IN KANO STATE, NIGERIA

ALIYU UMAR¹, MOHAMMED YAU²

ABSTRACT

Evaluation of heavy metals in twelve commonly consumed herbal medicines/preparations in Kano State, Nigeria was carried out. The samples comprised of five unregistered powdered medicines, namely, Zuwo, (ZW); Rai Dorai, (RD); Miyar Tsanya, (MTS); Bagaruwar Makka, (BM); and Madobiya, (M); five unregistered liquid herbal medicinal concoctions for pile (MB), yellow fever (MS), typhoid (MT), stomach pain (MC), sexually transmitted diseases (STDs); and two registered herbal medicines; Alif Powder (AP) and Champion Leaf (CL). The heavy metals evaluation was carried out using Atomic Absorption Spectroscopy (AAS) and the result revealed the concentrations (ppm) ranges of the heavy metals as follows: Cadmium (0.0045 – 0.1601), Chromium (0.0418 – 0.2092), Cobalt (0.0038 – 0.0760), Copper (0.0547 – 0.2465), Iron (0.1197 – 0.3592), Manganese (0.0123 – 1.4462), Nickel (0.0073 – 0.0960), Lead (0.185 – 0.0927) and Zinc (0.0244 – 0.2444). Comparing the results obtained in this work with the standards of the World Health Organization (WHO), the Food and Agricultural Organization (FAO) and permissible limits of other countries, the concentrations of heavy metals in the herbal medicine/preparations are within the allowed permissible limits range in herbal medicines and their use could be safe.

EFFECTS OF USING AROMATIC AND MEDICINAL PLANTS ON THE DEVELOPMENT, WELFARE AND PRODUCTION OF ANIMAL

MEHMET AKIF ÇAM¹, KORAY KIRIKÇI²

ABSTRACT

Along with the increasing world population and developing technologies, the use of synthetic chemical substances has become widespread in plant and animal production, which is the basis of food products production, in the fight against diseases and increasing productivity. However, it is becoming increasingly important to raise the level of prosperity in society, to increase sensitivity towards the environment, to maintain a healthy and sustainable production and a comfortable life without damaging the nature of mankind. There is an increasing tendency to use medicinal and aromatic plants instead of antibiotics and growth regulators which are used in crops and animal products, risks of leaving waste products in products and health problems in users, instead of these additives. The use of plant-based materials that lasted until 4000 BC gained importance and became increasingly widespread, with increased sensitivity to both humans and animals and even plants. Especially after the prohibition of the use of chemical antibiotics and additives in animal breeding, many studies on the use of increasingly plant-derived substances have a lot of information on both positive and negative aspects. In this study, the use of medicinal and aromatic plants or their extracts in livestock, the main source of quality nutrient production, will examine the development of animals, their health and the effects on yield.

ECONOMIC, SOCIAL AND ECOLOGICAL PROPERTIES OF SOME WILD PLANTS WITH MEDICAL AND AROMATIC POTENTIAL

TANSU USKUTOĐLU¹, CÜNEYT CESUR¹, BELGİN COŐGE ŐENKAL¹, DUYGU AĐAR²

ABSTRACT

Unless extraordinary events happen, world population will continue to rising. Growth which is bring urbanization and industrialization pressure on fertile land and this lands are declining steadily. 795 million people can't even take essential nutrients in the current situation. Not only growing population but also environmental degradation is restrict people living space and needs. Because of decreasing water source and cultivated area, creating crop pattern is getting more important under this circumstance. There are 12,476 plant taxon in our country, 4,080 of them are endemically grow in Turkey. The number of trading medicinal plants in our country is approximately 400. Especially plants growing in arid areas such as Cocklebur (*Xanthium strumarium* L.), Prangos (*Prangos ferulacea* (L.)), Poppy (*Papaver rhoeas*), Tesbi (*Styrax officinalis*) and Myrtus (*Myrtus communis*) can use in different areas (herbal medicine, plant chemicals, food and additives, cosmetics and perfumery etc.). In studies on Cocklebur (*Xanthium strumarium* L.) plant shows antitumor, antibacterial, antifungal, antitussive, anti-inflammatory, hypoglycemic, antimitotic, antioxidant and insecticide effects. Prangos (*Prangos ferulacea* (L.)) containing coumarin, flavonoids, alkaloids and monoterpenes. Because of the compounds, plant is using in traditional medicine in many years. Poppy (*Papaver rhoeas*) is a mild sedative. Especially the petals have rhoeadic and papaveric acids and all parts of plant contains rhoeadine alkaloids. Extracts obtained from various components of Tesbi (*Styrax officinalis*) have been found to have antioxidant, antimicrobial, hemorrhoid and antifungal effects. While the Myrtus (*Myrtus communis*) foliage contains tannin, volatile oil and bitter substances, the fruit of the plant contains tannin, essential oil, sugar and organic acids (malic and citric acid). In this study, information will be given herbal and economic characteristics of these plants as well as their medical properties.

**PROPERTIES OF ANTIOXIDANT AND ANTI-INFLAMMATORY
ACTIVITY OF ŐEVKETİ BOSTAN (CNICUS BENEDICTUS L.)
CULTIVATED IN AEGEAN REGION FROM TURKEY**

ZEHRA CAN¹, NİMET BALTAS², HİLAL EBRU AKIR³, SEVGİ KOLAYLI³

ABSTRACT

The aim of this work was to evaluate the anti-inflammatory, antioxidant and gastro-protective activities of *Cnicus benedictus* L., a type of milk thistle cultivated in Turkey. The total phenolic content (TPC), total flavonoid content (TFC), ferric reducing antioxidant power (FRAP) and the 2,2-diphenyl-1-picrylhydrazyl (DPPH) free radical scavenging activity was measured to determine antioxidant capacity. The anti-urease and anti-xanthine oxidase activities were used to determine the gastro-protective and anti-inflammatory potential of the plant extracts, respectively. The TPC was 337.40- 635.10 mg of gallic acid equivalents (GAE)/100 g and TFC was 41.05 -119.12 mg of quercetin equivalents (QE)/100 g in the root and leaf extracts, respectively. The root and leaf extracts of *Cnicus benedictus* L., were exhibited different inhibition values against both of the enzymes. The inhibition effect of the both enzymes were calculated as IC₅₀ (mg/mL) in terms of 50% inhibition of the enzymes. The xanthine oxidase activity of the leaf and root was 18.53 and 19.75 mg/mL and the urease activity were 2.29 mg/mL and 11.53 mg/mL, respectively.

CAROB FLOUR AND INVESTIGATION OF CHEMICAL AND FUNCTIONAL PROPERTIES

ŞEYMA HALLAÇ¹, DİLEK DÜLGER ALTINER²

ABSTRACT

Carob (*Ceratonia siliqua* L.) is a perennial plant belonging to the Fabaceae family. It is referred by different names in many countries. In Turkey, it is referred by carob and horn names. Carob is grown in Mediterranean countries like Spain, Portugal, Italy, Morocco, Greece, Turkey, Algeria, Syria and Palestine. Carob is a valuable food item used in food industry, in the production of molasses and various provender as well as direct consumption. Amounts of components of carob vary due to the climate and harvesting condition of the location where it is grown. In general, carob contains 4-6% protein, 0.2-0.4% fat, 2-3% ash, 5-6% cellulose and 62-67% total sugar. Carob flour is obtained by the following steps; classification of carob, washing, drying, rough grinding, roasting the pulp, peeling and sieving. In this study, in the obtained flour, it is determined that 32.87% is total dietary fiber, 83.03% is total carbohydrate, 3.09% is ash, 0.31% is fat and 6.03% is protein. It is aimed to make use of carob flour, which is rich in mineral material and total dietary fiber and has low fat content, in the production of various functional foods. Carob flour with different usage areas is economically important and has a very important position in both food industry and other industrial areas. Grinded and floured form of it can be used in the production of functional food items and ice-cream, cakes and sugary foods. It is predicted that if carob flour is used in grain products instead of wheat flour in different portions, it will contribute to functional product diversity and can be used as food additive. In addition, since carob flour has high total dietary fiber will help human body, nourished by foods containing this flour, feel full and will help to reduce the speed of digestion and prevent constipation, will help digestive system function healthy and properly.

DETERMINATION OF ANTIOXIDANT ACTIVITY OF THE BEECH MUSHROOM (PLEUROTUS SP.)

ZEHRA CAN¹, SENGÜL ALPAY KARAOĞLU², HILAL EBRU ÇAKIR³

ABSTRACT

This study was investigated the total phenolic substance content and the content of antioxidants in the fungi obtained from 15 growing media prepared by adding Pleurotus ostreatus fungi with various additives (poplar, beech, oak, linden and alder) of 5 different tree species (20% tea wort and 20%). Total polyphenol content of total phenolic substance content and FRAP and DPPH tests for antioxidant activity were performed. The total amount of phenolic substance was determined to be in the range of 1.016-4.772 mg / g. When the FRAP value of the extracts was examined, the value of 2.245-8.902 $\mu\text{mol FeSO}_4 \cdot 7\text{H}_2\text{O}$ / g DPPH was found to be 4.650-22.922 mg / mL. According to the results, it has been confirmed by studies that fungi have antioxidant activity that is not just a food source. These results suggest that tea waste is an important industrial waste that can be used in mushroom cultivation and that the produced mushroom is similar in quality and quantity to alternative crops.

THE FLOUR OBTAINED FROM SOY PLANT AND ITS PROPERTIES

ŞEYMA HALLAÇ¹, DİLEK DÜLGER ALTINER²

ABSTRACT

Grain pieces include many nutrients in them. The flour obtained from these is a product consumed by majority of the world. However, during the processing of the grains there become some nutritional element are lost. For this reason, flours of different plants are started to be added as additives as alternative to flours of grains like wheat, barley, oat etc. Developmnet of various nutritious and functional products by mixing different flour additives has been started. In this study, the steps of flour production from soybean and properties of soy flour are mentioned. Soybean is a member of "Leguminosae" family and cultivated form *Glycine max L.* is grown every year. Generally being yellow, soybean can also be purplish, black, green and dark brown. The seeds of soybean can have a spherical shape or oval. Soybean is rich in vitamin, mineral and nutrient values. It includes protein, fiber, magnesium and calcium in high amounts. Soybean seeds contain 35-45% protein, 30% carbohydrate, 18-24% oil, 5% mineral (280 mg/100g Mg-15,7 mg/100 g Fe), vitamin and significant amino acids. Soy flour is obtained by the following steps; cleaning of soybeans, separation of shells, aparting beans, extraction of oil by hexane and removing from their systems, roasting and pulverization. Soy flour is a rich food source in protein (59.16%). Soy flour is used to decrease the cost in many foods, to provide food supplement and to extend shelf life. In bakery products, soy flour has effects like humidity adsorption, decreasing cooking time and oil absorption. Havin high amounts of protein, soy flour can be used also in meat and meat products. In accordance with this, nutritional and functional properties of foods can be increased by supplements of flours obtained from plants that are deficient in foods. Therefore, it is considered that different plants used in food industry can provide products with added value in terms of economy as well as preventing the diseases caused by malnutrition.

A VIEW TO AROMATHERAPY COURSES IN TURKEY IN ETHICAL ASPECT

ELIF GÜLTEKİN¹

ABSTRACT

Aromatherapy is a therapeutic use of fragrant plants containing essential oils. Essential oils have spasmolytic, irritant, antiseptic, antifungal, antiviral and antimicrobial properties. Because of this wide range of curative treatments aromatherapy is a part of the complementary medical practices. In our country, the "Legislation of Traditional and Complementary Medical Practices" published in 2014 allowed doctors to be legally enforced. However, the Ministry of Health does not yet implement an independent training program for doctors authorized for the application of aromatherapy. The physicians must learn aromatherapy in aromatherapy lessons of phytotherapy-courses. Essential oils, which are the main element of aromatherapy, can have toxic effects if not used carefully. For this reason, it is very important for physicians to be educated enough about which diseases they use for which volatile oil, which doze, how long. On the other hand, there is some private institutions, who provide aromatherapy trainings to non-health workers, although the regulation give the authority of treatment with aromatherapy only to doctors and dentists. According to principles of medical ethics, the first responsibilities of the therapists to their patients is "do not harm". It is certain that the Ministry of Health approved training, which both doctors do not include as much detail as possible, and the people who are going to try aromatherapy training and maybe even treat the patient when it is not a physician will cause harm to the patient. This study aims to evaluate the aromatherapy education in our country in terms of medical ethics.

THE RED ELIXIR OF THE TURKS "HARDALIYE"

SELÇUK MUSTAFA SEÇEN¹

ABSTRACT

Fruits are known to be effective especially in the prevention of some diseases by the influence of antioxidant nutrients such as polyphenol. Grape is also contains biologically active antioxidant polyphenols in its composition. Flavonoids such as catechin, quercetin and anthocyanins, or resveratrol are the most commonly detected polyphenols in the structure of grape and grape products. Many clinical trials on humans have found that grape drinks have antioxidant properties, suggesting that this effect is due to polyphenols in the composition of the grape. Hardaliye is a fermented, non-alcoholic drink which is the main raw material is grape. Hardaliye basically obtained by fermentation of grape, cherry leaves and mustard seeds about 5-10 days. Allyl isothiocyanates present in mustard seeds are produced by the enzymatic cleavage of glucosinolates, which are a group of sulfur compounds, and produce large quantities of mustard own flavor. Allyl isothiocyanates found in mustard seeds can reduce the formation of alcohol by inhibiting yeast activity. Therefore, mustard used in Hardaliye production is known to be effective in reducing the formation of alcohol. It is assumed that the production of Hardaliye in Kırklareli and Trakya region is approximately one and a half century old. . In our country, the production of Hardaliye is limited only to the people of the Trakya region. It is known that Hardaliye is obtained from fresh grapes and has phenolic compounds such as resveratrol because of its fermentation process, and therefore has antioxidant properties. Some properties of the Hardaliye allow for consumption by larger masses as a functional beverage. When compared to other fermented beverages in the food market; Hardaliye is suitable to be consumed by children because it does not contain alcohol. It is suitable to be consumed by hyperlipidemic individuals because of the lack of oil. It is suitable to be consumed by individuals with lactose intolerance due to the lack of milk. It is suitable to be consumed by blood pressure patients because it does not contain salt and also it is suitable for vegetarians. It is thought that Hardaliye may have hypolipidemic and hypotensive properties due to the influence of grape polyphenols in its structure and thus may positively affect cardiovascular risk parameters. The presence of high levels of potassium, calcium, magnesium and iron minerals in the grape bark suggests that the Hardaliye may have an effect on the serum mineral levels of humans. Based on various research results on grape drinks, it is expected that Hardaliye will not cause an anthropometric measurement such as body weight or a negative change in other biochemical parameters such as fasting blood sugar and insulin.

DETERMINATION OF SOME BIOTECHNICAL PROPERTIES OF CHERRY LAUREL FRUITS

HALİL İBRAHİM KALYONCU¹, EBUBEKİR ALTUNTAS¹, BURHAN ÖZTÜRK²

ABSTRACT

The physical, chemical and mechanical properties of cherry laurel (*Prunus laurocerasus*) were determined in this study. The biotechnical properties of the cherry laurel fruits should be known in the design and development of machines for harvesting and post-harvest applications, especially for classification, transportation, storage and processing etc. The fruit mass, geometric mean diameter, surface area, volume and fruit densities, puncture and compression tests and friction coefficients, total soluble solid content, pH and titratable acidity of cherry laurel fruits were determined. The geometric mean diameter and surface area values of cherry laurel fruits were as 18.8 mm and 16.7 mm², whereas, the puncture and compression forces were as 0.32 N, 27.5 N; static friction coefficient for rubber friction surface was as 0.91, respectively. The total soluble solid content and pH were as 15% and 3.9, respectively. The colour characteristics values (L, a, b) were as 15.6, 18.9, and 26.9, respectively. Measurement data of the physical, mechanical and chemical properties of cherry laurel fruits will be important engineering data for the design and development of the machines and systems to be used in harvest and post harvest technological applications.

THE EFFECTS OF LAVENDER ON ANXIETY

HAYRİYE ALP¹

ABSTRACT

The genus *Lavandula* is native to the lands surrounding the Mediterranean Sea and southern Europe through northern and eastern Africa and Middle Eastern countries to southwest Asia and southeast India. It includes more than 30 species, dozens of subspecies, and hundreds of hybrids and selected cultivars. The main constituents of lavender are linalool, linalyl acetate, 1,8-cineole B-ocimene, terpinen-4-ol, and camphor. However, the relative level of each of these constituents varies in different species [1, 2]. Lavender oil, obtained from the flowers of *Lavandula angustifolia* (Family: Lamiaceae) by steam distillation, is chiefly composed of linalyl acetate (3,7-dimethyl-1,6-octadien-3-yl acetate), linalool (3,7-dimethylocta-1,6-dien-3-ol), lavandulol, 1,8-cineole, lavandulyl acetate, and camphor. Whole lavender oil and its major components linalool and linalyl acetate are used in aromatherapy. The major components of lavender oil were identified as 51% linalyl acetate and 35% linalool measured by gas chromatography and gas chromatography-linked Fourier Transform Infrared analysis(1,3) . Most commonly lavender is recommended for oral administration. However, it is also being employed in aromatherapy (inhalation of lavender; [4, 5]), aromatherapy massage, dripping oil [6], and bathing [7]. Unlike many other essential oils used in aromatherapy, lavender oil is often applied undiluted to the skin. The study of Jager et al. [8] suggested that essential oils and their components are rapidly absorbed through the skin. Several animal experiments suggest anxiolytic, sedative, analgesic, and anticonvulsive and neuroprotective properties for lavender (9). It was shown that lavender possesses an anticonflict effect in mice . Continuous exposures to lavender essential oils for 7 days significantly inhibited anxiety- and depression-like behaviors tested by elevated plus-maze and forced swimming tests in rats . Lavender oil produced significant antianxiety effects in the Geller conflict and the Vogel conflict tests in mice. Linalool, a major constituent of lavender oil, produced significant anticonflict effects in the Geller and Vogel tests; findings that were similar to those of lavender oil . Effects of lavender oil were compared with chlordiazepoxide, as a reference anxiolytic, on open-field behavior in rats. Lavender oil exhibited antianxiety properties similar to those of chlordiazepoxide . Anxiolytic effect of lavender was also compared with diazepam in elevated plus-maze test in the Mongolian gerbil. Exposure to lavender odor showed an anxiolytic profile similar to diazepam in female gerbils .

USE OF ANTIOXIDANT PLANT EXTRACTS DURING CANCER TREATMENT

HAYRIYE BALTAOđLU ALP¹

ABSTRACT

Our country is very rich in terms of antioxidant plant variety. Antioxidants are the agents for removing organ and tissue damages in the body. (1) Carotenoid content of plants is closely related to plant species, amount of light and nitrogen (N) it receives, structure of soil and applied agricultural processes, genotypes of plants and fruit maturity (2) Carotenoids; 1. Terpenoids a) Orange carotenoids; Alpha carotenoids and beta carotenoids in fruits and vegetables. B) Red carotenoids, astaxanthin with lycopene salmon and carrots in tomatoes and grapefruit. C) Yellow carotenoids; Avocados, spinach, eggs, mayonnaise, citrus fruits. Carotenoids neutralize free radicals. Antioxidants (phytochemicals) are technologically formulated and presented for use in lycopene, elagic acid, polyphenols, flavonoids, isoflavin, anthocyanins, glucosinates, ginkgo biloba, dietary fiber, olive leaf, black grape seed extract, green tea, blueberry, camel . It is thought that grape seed extract and raspberry and black water are effective in increasing the antioxidant capacity of cancer patients receiving chemotherapy. It is stated that chemotherapy is effective in the treatment of mouth injuries (aft) during periods of immunosuppression and immunosuppression. Case A 54-year-old male received lymphoproliferative cancer at the lymph node biopsy in the right neck region of the ear, nose and throat specialist who applied to the right eyelid after falling. There was an anterolateral myocardial infarction at history. Nazofaenks cancer stage 4 was diagnosed in the 3rd health care establishment. On physical examination diplopia and 3rd cranial nerve paralysis were present. In the magnetic resonance imaging study, there was a tumoral formation covering the skull base. Decision of the medical oncology council decision and the application of 6 cycles of chemotherapy and radiotherapy were taken. During the chemotherapy and radiotherapy sessions, he lost about 20 kg because his mucositis formed in the mouth deteriorated. Only grape juice, grape seed extract, blackcurrant extract, ginkgo biloba capsules have been started. Gideal supplements have been used throughout the chemotherapy process. The patient's mouth wounds improved in a short time as the antioxidant capacity was increased. After epithelialization, the feeding was regulated. Result The patient was exposed to oxidant stress during heavy chemotherapy and radiotherapy applications. Regulation of feeding in cancer patients is very important. The ways of coping with the complications of chemotherapy and radiotherapy are affecting the treatment process of the disease positively. The patient has successfully completed the treatment for approximately 12 years without recurrence. The remission period is ongoing.

DETERMINATION OF SOME PHYSICAL PROPERTIES OF ALLSPICE (PIMENTA DIOICA) FRUIT

EBUBEKİR ALTUNTAŞ¹, MÜBERRA ERDOĞAN¹

ABSTRACT

Allspice is the dried fruit of the *Pimenta dioica* plant. In this study, some physical properties of Allspice were determined. The physical properties of allspice fruit are to be known for design and improve relevant machines and systems for harvesting and post harvest treatments (transporting, storing, handling and processing). The geometric mean diameter, surface area, volume, true and bulk densities and static friction coefficient values of allspice fruit and seed were determined. The geometric mean diameter values of the fruit and seed of allspices were as 7.97 mm ve 4.18 mm, whereas, the surface area values were as 2.11 cm² ve 0.553 cm², respectively. The fruit masses of fruit and seed of the allspices were as 0.18 g and 0.065 g, whereas, the true densities of fruit and seed of the allspice fruit were as 897.72 kg/m³ ve 1892.3 kg/m³, respectively. The measured physical properties of allspice fruit will serve to design and improve the relevant machines and systems used in harvest and postharvest treatments.

PHYTOTHERAPHIC PLANTS IN THE MERSIN-ADANA HERBALMARKETS

AYŞE EVEREST¹, ELİF AYŞE ERDOĞAN ELİUZ²

ABSTRACT

This study presents the result of a second research on the popular medicinal plant species in the traditional markets in Mersin and Adana. This work done for the first time in 2005 was carried out again in 2012-2015. The purpose of our study is to underline the ethnobotanical richness of the region and compare with other cities of Turkey and international literature. The informants were collected by interview with herbalists and customers in herbalmarkets. A total of 175 species belonging to 57 families were reported and the plants were listed with their local and latin names. As a result, local people have used various plant species to treat many ailments and the data indicated that these herbs have used especially for disorders of immune system (18.96 %), gastrointestinal-digestive (18.10 %), analgesic-anodyne-emollient-sedative (15.05 %), urinary system (10.04 %), heart-blood (9.06 %), disorders of arthritis (6.62 %), respiratory system (5.19 %), skin disorders (4.25 %), cancer (4.05 %), gynecological (3.59 %), mental and neurological disorders (1.76 %). We documented the traditional ethnobotanical data inherited by local people living in Adana-Mersin region. These plants were widely preferred by local people to use treatment of many ailments.

USE OF DIZAZONIUM SALT MODIFIED GLASSY CARBON SENSOR ELECTRODE IN APIGENIN DETERMINATION

BEDRETTİN MERCİMEK¹, AYŞEN DEMİR MÜLAZIMOĐLU¹, İBRAHİM ENDER MÜLAZIMOĐLU¹

ABSTRACT

Nutraceuticals and functional foods are used to describe food or food compounds that provide health benefits over basic nutrition. While nutraceutical describes both food and food ingredients, both conventional and different (tablets, capsules, etc.), functional food refers to traditional food forms [1, 2]. The concept of functional food describes the foods which provide health benefits. The foods we eat should be nutritious for qualified and a longer life. Functional foods are obtained by adding some functional ingredients to food such as phenolics, antioxidants, dietary fiber, oligosaccharides, probiotics, prebiotics, vitamins, polyunsaturated fatty acids, sulfur-containing compounds, phytoestrogens and plant sterols [3]. When functional compounds are classified according to their chemical structure, phenolic substances are also included in this group. Phenolic substances are very important secondary metabolites found in plants. Some of the important substances in this group are anthocyanins, coumarins, flavonoids, tannins and lignin. Flavonoids and derivatives are large polyphenol compounds which are found in many fruits, vegetables, and certain beverages that have various healthy biochemical and antioxidant effects. Apigenin, which is abundant in chamomile tea, is the most important flavonoid derivatives found in parsley. Apigenin, like in other antioxidant species, is found in colorful fruits and vegetables. Apigenin is a very potent anti-cancer compound. This advantage has a high selectivity for cancer cells that are opposite to non-cancerous cells and provides protection against cancerous cells [4, 5]. In many studies Apigenin has been shown to have a preventive or slowing effect on many types of cancer, including colon cancer, leukemia, lung cancer, prostate, skin and stomach cancer [6]. Flavonoids which are found in many fruits and vegetables are very essential for human health due to their activity as free radical acceptors. In this study, the sensor electrode was developed for the determination of Apigenin which is one of the flavonoid derivatives has anticancer properties. The surface modifications of glassy carbon (GC) electrode were performed with diazonium salt using cyclic voltammetry (CV), whereas the characterization of these sensor electrodes were performed using CV, electrochemical impedance spectroscopy (EIS) and scanning electron microscopy (SEM). Following the modification and characterization process, the sensitivity of sensor electrode was tested against Apigenin using square wave voltammetry (SWV). Calibration curve was drawn at different concentrations. Based on the sensitivity tests, the sensor electrode can be used in the determination of Apigenin using SWV in real samples. References 1. J. INVESTIGATION OF ELECTROCHEMICAL BEHAVIORS OF QUERCETIN ONTO THE MODIFIED GLASSY CARBON NANOSENSOR ELECTRODE SURFACE

AYŞEN DEMİR MÜLAZIMOĞLU¹, İBRAHİM ENDER MÜLAZIMOĞLU¹, BEDRETTİN MERCİMEK¹

ABSTRACT

Electrochemical studies revealed general trends in the electron-donating abilities of flavonoids [1]. The reduction potentials of flavonoids depend strongly on the electron donating properties of the substituents in the ring B [2], and on the ring B, the most oxidizable phenolic group is the more basic site [1]. The pKa values were assigned to ring A and ring B following reference [3]. The mechanism of phenolic compound action as antioxidants seems to involve the ability of phenols to scavenge radicals by an H-atom or electron transfer process by which the phenol is converted into a phenoxyl radical. The ease of oxidation of the phenol is of importance for its effectiveness as an antioxidant [4]. Quercetin is one of the most abundant plant-derived polyphenols and is widely consumed with a human diet [5]. Most flavonoid molecules have the same structure as quercetin, except that they have a specific sugar molecule in place of one of quercetin hydroxyl groups on the C ring, which dramatically changes the activity of the molecule. Quercetin is the 3,3',4',5,7-pentahydroxyflavone and the corresponding chemical structure is shown in Figure 1(B). The literature on the electrochemistry of quercetin is limited [6–9]. However, Zhu et al. [10] investigated the electrochemical behavior of the interaction of quercetin with DNA. Nematollahi and Malakzadeh [9] described the electrooxidation of quercetin in the absence and presence of benzenesulfonic acid and 4-toluenesulfonic acid as nucleophiles. Liu and Guo [11] studied the interaction of flavonoid, quercetin with organized molecular assemblies of nonionic surfactant. On account of these properties it is widely used as beneficial food supplement that is recommended for prevention and suppression of many diseases associated with oxidative stress. It has also become evident that antioxidant therapy may lead to adverse effects, as the ability of quercetin and other flavonoids to cause damage to cellular macromolecules and induce formation of reactive oxygen species has been discovered [12–14]. The most accepted explanation of the adverse effects is the formation of flavonoid oxidation products [15, 16]. The main intermediates formed during oxidation are semiquinone and reactive electrophilic o-quinones. Electrochemical oxidation of quercetin, as an important biological molecule, has been studied in non-aqueous media using cyclic voltammetry (CV), electrochemical impedance spectroscopy (EIS) and scanning electron microscopy (SEM). To investigate the electrochemical properties of quercetin, an important flavonoid derivative, on a different surface, a new glassy carbon electrode has been developed in non-aqueous media. APOPTOTIC EFFECT OF GINGER (*ZINGIBER OFFICINALE*) ON K562 LEUKEMIA CELL LINES

SEVGİ KOÇYİĞİT SEVİNÇ¹, PINAR MEGA TİBER¹, OYA ORUN¹

ABSTRACT

INTRODUCTION Ginger (*Zingiber officinale*) is widely used as a traditional medicinal herb as well as a flavoring agent. For centuries, it has been an important ingredient for the treatment of cold, catarrh, rheumatism, neural diseases, gingivitis, toothache, asthma, stroke and diabetes. Ginger has various bioactive components such as gingerols, paradols, shogaols and zingerone, showing the pharmacological roles in mediating anti-bacterial, anti-inflammatory and anti-tumor activities. Among the bioactive ingredients from ginger, gingerols with various chain lengths (n6 to n10) and 6- shogaol have been reported to exert antitumor activities in a variety of cancers by inhibition of cell proliferation, migration and invasion or induction of apoptosis. 10- gingerol, one of the main phenolic compounds has been reported to possess antitumor activity against ovarian, colon, lung, breast cancer and prostate cancer cells by inhibition of cell proliferation or induction of apoptosis. Here, we studied anti-proliferative and apoptotic effects of ginger plant in different concentrations on K562 human chronic myeloid leukemia cell lines. **METHODS** Cell Culture: K562 cell line was maintained in RPMI medium, supplemented with 10% FBS, 1% glutamine and penicillin/ streptomycin at 37 °C with 5% CO₂ in atmosphere. MTT Assay: Using the MTT colorimetric method, the ginger was evaluated in vitro against the K562 cell lines, for cell viability and growth inhibition at different doses (10, 25, 50, 75 and 100 µM) following 24 hours incubation (Roche 11 465 007 001). Tali Apoptosis Assay: Cells were stained with Annexin-V/PI and analyzed using the Tali image-based cytometer. The Annexin-V positive / PI negative cells were recognized as apoptotic / dead cells, respectively (Molecular Probes A10788). Mitochondrial Membrane Potential Assay: Apoptosis was evaluated by mitochondrial membrane potential changes. Cells were stained with JC-1 probe according to the protocol of JC-1 mitochondrial membrane potential kit. JC-1 was used to detect mitochondrial membrane potential changes (Abnova KA1324). **RESULTS** There was a dose-dependent decrease in proliferation detected by MTT assay at the end of 24 hour incubation. IC₅₀ value was determined as 67µM. Apoptosis was found to be approximately 15% at concentration corresponding to the IC₅₀ value (67 µM). K562 cells treated with 100 µM ginger showed a decrease 44.7% relative to the control group (cells not treated with ginger) in mitochondrial membrane potential. In conclusion, current results indicate that the ginger has anti-proliferative and apoptotic effects in a dose-dependent manner on K562 leukemia cell line.

INDEPENDENT AND SIMULTANEOUSLY DETERMINATION OF QUERCETIN, MORIN AND RUTIN USING AMINOPHENYL MODIFIED GLASSY CARBON NANOSENSOR ELECTRODE

AYŞEN DEMİR MÜLAZIMOĞLU¹, İBRAHİM ENDER MÜLAZIMOĞLU¹, BEDRETTİN MERCİMEK¹

ABSTRACT

Polyphenols or Phenolic compounds are one of the most important groups of compounds occurring in plants, in which they are widely distributed. Polyphenols are also products of the secondary metabolism of plants. Flavonoids and phenolic acids (both benzoic and cinnamic-acid derivatives) constitute the most important classes of polyphenol, with more than 5000 compounds already described [1, 2]. Flavonoids of dietary significance can be categorized as flavonols, flavanones, flavones, anthocyanidins and isoflavones. They exhibit a wide range of biological effects, including antibacterial, anti-inflammatory, antioxidant, anti-allergic and anti-thrombotic activities [3, 5]. Epidemiological studies point to their possible role in preventing cardiovascular diseases and cancer. Flavonoids behave as antioxidants in a variety of ways, including direct trapping of reactive oxygen species, inhibition of enzymes responsible for producing superoxide anions, chelation of transition metals involved in processes forming radicals and prevention of the peroxidation process by reducing alkoxy and peroxy radicals [6, 7]. Some of the structural features and nature of substitutions on rings B and C which determine the antioxidant activity of flavonoids include the following: a) the degree of hydroxylation and the positions of the –OH groups in the B ring, in particular an orthodihydroxyl structure of ring B (catechol group) results in a higher activity; b) a double bond between C-2 and C-3, combined with a 3-OH, in ring C, enhances the active radical scavenging capacity of flavonoids; c) substitution of the 3-OH in ring C results in increase in torsion angle and loss of coplanarity, which subsequently reduces antioxidant activity and d) a double bond between C-2 and C-3, conjugated with the 4-oxo group in ring C also enhances the radical scavenging capacity of flavonoids [8]. Since the chemical activities of flavonoids in terms of their reducing properties as hydrogen or electron-donating agents could predict their potential to act as antioxidants (lower oxidation potential points to a higher antioxidant activity) [9], studying of electrochemical and antioxidant properties could help to better understand the mentioned group of compounds. The aim of this work were: i) to electrochemically modified glassy carbon (GC) electrode in non-aqueous media, ii) to characterize modified GC electrodes and flavonoid grafted modified GC sensor electrodes in various medium by cyclic voltammetry (CV), electrochemical impedance spectroscopy (EIS) and scanning electron microscopy (SEM), iii) to investigate the effect of sweeping rate and iv) to investigate the interaction of this modified electrode with some flavonoid derivatives by CV. Modified GC sensor electrode has been used to examine its sensitivity against quercetin, morin and rutin by using CV technique. As a result of, it was examined for the first time whether modified GC sensor electrode prepared by reduction and modification of diazonium salt could be used in the determination of total antioxidant capacity after modification in non-aqueous media. The sequence of antioxidant activity has been given for these flavonoid derivatives at the end. Originating from this study, we are

EFFECT OF DIFFERENT HYDROCOLLOIDS ON THE PASTING PROPERTIES OF TARO (*COLOCASIA ESCULENTA* L. SCHOTT) FLOUR

MUHAMMET ARICI¹, BURCU YASAR², OMER SAID TOKER¹

ABSTRACT

Taro (*Colocasia esculenta* L. Schott) is grown in the tropical and sub-tropical regions of the world and corms of taro are consumed in many countries owing to its high nutritional value. In this study, taro flour was produced from corms and the influence of different hydrocolloids (xanthan gum, guar gum and gum arabic) at different concentrations (0.5 and 1 %) on the pasting properties of the flour was investigated since hydrocolloids are used to improve technological properties of gluten-free flours. Raw taro corms were obtained from Anamur region of Mersin in Turkey and dried at 50°C and air flow rate of 2 m/s in drying oven. Addition of hydrocolloids significantly affected the pasting characteristics of the taro flour. As the increase in xanthan and guar gum concentrations significantly increased the peak viscosity, holding strength, final viscosity, breakdown viscosity and trough viscosity parameters, the increase in gum arabic resulted in decrease in magnitude of these parameters. Guar gum had more dominant effect when compared with the xanthan gum. As the 1 % guar gum added the peak, final, breakdown and setback viscosity values increased from 1469 cP to 4234 cP, from 1354 cP to 3968 cP, from 512 cP to 2068 cP and from 397 cP to 1803 cP, respectively. The results highlighted that taro flour was used with xanthan and guar gum in the formulations of gluten-free products. *This work is supported by TUBITAK (Project number: 114O391).

DETERMINATION OF VOLATILE OIL CONTENT AND COMPONENTS OF DIFFERENT ORIGINATED BASIL LINES

YASİN ÖZGEN¹, NEŞET ARSLAN¹

ABSTRACT

This study was carried out in order to determine the essential oil ratios and components of the leaves of 14 different Basil (*Ocimum basilicum* L.) lines in 2013 in Ankara University Faculty of Agriculture Field Crops Department experimental field. The seeds of the Basil lines used in the study were planted in the plastic seedling trays and reached to a height of 10 cm and kept in the greenhouse environment. Before transplanting of seedlings, it was left outside the greenhouse for a few days in order to adjust to the field conditions. Then the seedlings were planted with 3 replications in the experiment as a randomized complete block design and plant density 20x40 cm. During the full bloom period, the lines were cut 10 cm above the soil level, the leaves were separated and then dried at room temperature in a shade environment. The harvest of the lines was made in July and August and two cuts were taken from each. The rate of essential oil in dry leaves of harvested plants ranged from 0.28-1.18% in the first harvest and from 0.33-1.25% in the second harvest. A statistical difference of 1% was found between the lines in terms of essential oil ratios. Component determinations of essential oils were made on GC-MS. These essential oils have been defined as 81.36-95.1% in the first harvest and 76.43-89.86% in the second harvest. Essential oil components in lines; α -cadinol, ϵ -cadinen, germacrene-d, α -bergamotene, methyleugenol, β -elemene, methyl cinnamate, methyleugenol, linalool and eucalyptole. Among these components; linalool, methyl cinnamate and methyleugenol lines were found to be the main constituents in essential oils in both harvests.

STUDIES ON SAMSUN SALEP ORCHID DIVERSITY

ÖMER ÇALIŞKAN¹, DURSUN KURT¹, HASAN KORKMAZ¹

ABSTRACT

With the advantages of geographical features, our country has a very rich flora. A similar situation can be said in Samsun. Within this diversity, the Orchidaceae family has a distinct place. The richest variety of aromatic plant variety belongs to the Orchidaceae family in Samsun. The previous results revealed the existence of 44 orchid taxa. It is possible to see about 1/3 of our orchids in our province, and many of them are able to produce salep. Depending on the richness of species, it is understood that 25-30 tons salep tuber were collected in Samsun annually. Collection without farming increases destruction of natural flora. The species that produce tubers and are used to obtain salep have not been studied in Samsun. In this study, land trips were made in Samsun province and the types of salep collected for tuber were determined. Various measures to be taken in order to reduce the collection pressure have been emphasized.

FLOWER YIELDS ACCORDING TO FLOWERING PERIOD AND HARVESTS IN POT MARIGOLD (*CALENDULA OFFICINALIS* L.)

ÖMER ÇALIŞKAN¹, DURSUN KURT¹

ABSTRACT

Pot Marigold (*Calendula officinalis* L.) is a medical plant used for pharmaceutical and cosmetic purposes since ancient times. Today, as well as folk medicine, it continues to be widely used in the field of natural medicine and the pharmaceutical industry. It is the active ingredients in the flowers that make him a feature and the flowers are the parts that are used. Pot marigold is available in the climate which is quite capable of constantly blooming. In this study, flowering yield and floral yields were discussed. In the survey conducted under the ecological conditions of Samsun province, flowering continued for about 4 months from the beginning of July to the end of October. 24 times the flower harvest was made. From the first harvest, the flower yield has continued to increase. After the 10th harvest, it tended to decrease. A total of 328.6 kg / da fresh and 56.68 kg / da dry flower yield values were reached. An average of 49.11 flowers per plant was collected.

INVESTIGATION OF ANTI- ACETYLCHOLINESTERASE, ANTI- UREASE, ANTI-XANTHINE OXIDASE AND ANTIOXIDANT PROPERTIES OF POLLEN SAMPLES

NİMET BALTAŞ¹, ZEHRA CAN², SEVGİ KOLAYLI³

ABSTRACT

It was investigated clinically important enzymes such as anti- acetylcholinesterase, anti-urease, anti-xanthine oxidase and antioxidant properties of pollen samples, in this study. Total phenolic content, total flavonoid content and DPPH radical scavenging activities of the pollen samples were determined. Acetohydroxamic acid, donepezil and allopurinol were used as a standard inhibitor for urease, acetylcholinesterase and xanthine oxidase enzymes. Results of inhibition were calculated as mg/mL or µg/mL. It was found that pollen samples showed very effective inhibition on acetylcholinesterase (IC₅₀= 1.074 – 3.455 mg/mL), urease (IC₅₀= 0.984 – 2.455 mg/mL) and xanthine oxidase (IC₅₀= 0.995 - 2.111 mg/mL) enzymes. Also, it was determined, pollen samples with higher total phenolic (55.546-95.560 mg GAE/g) and flavonoid content (22.325-45.658 mgQ/100 g) showed more effective enzyme inhibition. When deal with results of radical scavenging activity, SC₅₀ values of pollen samples were found to be between 67.312 and 112.124 mg/mL.

SOME MORPHOLOGIC PROPERTIES OF AROMATIC ZIZIPHORA L. SPECIES FROM TURKEY

ÖMER KILIÇ¹, EYÜP BAĞCI²

ABSTRACT

In Turkish folk medicine, aromatic and medicinal *Ziziphora* L. (Lamiaceae) species have been used as infusion for various purposes such as sedative, stomachache, carminative and in cold and cough treatments. The genus *Ziziphora* including annual herbs, except *Ziziphora clinopodioides* Lam., and is represented by six taxa in the Flora of Turkey: *Ziziphora capitata* L., *Z. clinopodioides*, *Ziziphora tenuior* L., *Ziziphora persica* Bunge, *Ziziphora taurica* subsp. *cleonioides* and *Ziziphora taurica* Bieb. subsp. *taurica*. In this research, nutlet, leaf, stem and pollen morphology of *Z. persica*, *Z. clinopodioides* and *Z. capitata* were studied with a Hitachi SU-1500 scanning electron microscope (SEM) in Wilfrid Laurier University (Canada) Herbarium. Description of nutlet, leaf, stem and pollen morphological features examined these species is provided and illustrated. *Z. persica*: nutlet shape is elliptic to oblong, 1.8-2x0.7-0.9 mm, surface is glabrous and ornamentation is reticulate; leaves, lineare-lanceolate, 8-30x1.5-4 mm, light green, pilose, margins entire; polar shape of pollen is elliptic, ornamentation is microreticulate; stem usually branched at each node, with scarce pilose. *Z. clinopodioides*: leaves narrowly elliptic, 9-35x1.5-5 mm, light green, dense velutinous, entire margin; polar shape of pollen is oblate spheroidal, ornamentation is reticulate; stem prostrate to erect, branched from base, with scarce hirsute hairs. *Z. capitata*: nutlet, 1.5-2x0.6-0.8 mm, shape is ovate to oblong, surface is glabrous and ornamentation is reticulate; leaves, lineare-lanceolate to elliptic, 7-35x1.5-10 mm, light green, scarce hirsute, margins entire; stem 7-21 cm, usually branched at each node, with short densely hirsute hairs; polar shape of pollen is elliptic, ornamentation is microreticulate. With this study basic datas obtained to contribute systematic and morphologic studies with *Ziziphora* taxa. Acknowledgements The authors thanks to Dr. Mihai Costea from Wilfrid Laurier University (Canada) for guidance and allow to use SEM.

SOME AROMATIC AND MEDICINAL PLANTS FROM BİNGÖL (TURKEY)

ÖMER KILIÇ¹, ŞİNASI YILDIRIMLI², FETHİ AHMET ÖZDEMİR³

ABSTRACT

The use of aromatic and medicinal plants in developing countries has been widely observed. The increasing human population and demands in the late decades has led to over exploitation of land in many areas thus reducing the biodiversity of medicinal plants. Aromatic and medicinal plants possess odorous volatile substances and the characteristic aroma is due to a variety of complex chemical compounds. This study was carried out in order to contribute aromatic and medicinal plants knowledge of Eastern Anatolia Region of Turkey. This investigation included twentyfive medicinal or aromatic plant specimens collected and photographed from Bingöl provinces during the vegetation seasons 2016. Plant samples was collected contents of Project (BAP -TBMYO.2016.00.001). Specimens were identified by taxonomists O.Kılıç and Ş. Yıldırımli, with the Flora of Turkey. The plant taxa are deposited Yıld. Herbarium (Ankara) and Department Garden-Park Plants of Bingol University. With this study some medicinal and aromatic plants recorded and photographed; that might be useful for health-care programme, aromatic and medicinal plants knowledge, aromateraphy, phytoteraphy, economic agricultural policy development, alternative food programme, ethnobotany and development of drug sector. Acknowledgements The authors acknowledge the Scientific and Research Council of Bingol University (BAP -TBMYO.2016.00.001) for support this study.

**ESSENTIAL OIL COMPOSITION OF CLINOPODIUM VULGARE L.
SUBSP. ARUNDANUM (BOISS.) NYMAN (LAMIACEAE) COLLECTED
FROM BİNGÖL (TURKEY)**

MEHMET ALİ KUTLU¹, ÖMER KILIÇ², FETHİ AHMET ÖZDEMİR³

ABSTRACT

Many of the Lamiaceae species are used as the ornamentals and can potentially be used as the medicinal or aromatic herbs in the industries such as the cosmetics, foods, hygienic products and perfumery. Clinopodium L. genus is belong to Lamiaceae family. Some Clinopodium species have been used in folk medicine for the treatment of haemorrhagic disease and as a salve for bruises and swelling. Clinopodium vulgare L. is also used in folk medicine and it's oil has cytotoxic and anti-tumour effects. C. vulgare is one of the two Clinopodium spp. growing wild in Turkey. In The Flora of Turkey, two subspecies are defined: vulgare and arundanum. Plant sample was collected contents of Project (BAP -TBMYO.2016.00.001). In this study aerial parts essential oil of Clinopodium vulgare subsp. arundanum was analyzed by HS-SPME/GC-MS. As a result thirty two components were identified. α -caryophyllene (29.2%), germacrene D (19.1%) and caryophyllene oxide (14.6%) were found to be the major constituents of the plant. With this study, chemotypes of studied taxa were detected α -caryophyllene, germacrene D and caryophyllene oxide. In addition studied plant samples were found to be rich in respect to essential oils and the results discussed natural product, renewable resources and chemotaxonomy. Acknowledgements: The authors acknowledge the Scientific and Research Council of Bingol University (BAP -TBMYO.2016.00.001) for support this study.

BULBS SURFACE-STERILIZATION PROTOCOL FOR TULIPA JULIA K. KOCH FROM TURKEY

FETHİ AHMET ÖZDEMİR¹, ÖMER KILIÇ², MEHMET ALİ KUTLU³

ABSTRACT

Soğanlı bitkiler (Tulipa türleri gibi), tıbbi ve aromatik özellikleri ve gerekse de güzellikleri nedeniyle çok eski zamanlardan beri insanların yararlandığı ve halk tıbbında sıkça kullandıkları bitkiler arasında yer almıştır. Tulipa julia K.Koch is a high valuable economic plant and a wide geographical distribution eastern of Turkey. However, due to habitat loss and illegal over collection in the wild it is included as a vulnerable species. The development of a protocol for Tulipa julia bulblet propagation in vitro may be useful for reintroducing plants in their natural habitats, and for germplasm conservation. A difficult problem encountered during the establishment of an in vitro culture is explants disinfection, especially when working with endangered species, from which explant availability is restricted. Thus, the establishment of a sterilization protocol is crucial for the initiation and success of bulblets micropropagation system for Tulipa julia. This study was to evaluate the effect of sodium hypochlorite concentrations and treatments time in bulbs surface disinfection, tissue sensitivity and development. Sodium hypochlorite solutions (2.5 or 3%, 20 or 25 min; 4 or 5%, 30 or 35 min) were effective in eliminating bulbs superficial contaminants. There was significant difference among the effective sterilization sodium hypochlorite concentrations and treatments time in relation to surface sterilization bulbs of Tulipa julia. Also, no damage to bulbs tissues were observed. Surface sterilization of bulbs, for initiation of an in vitro culture, required higher concentrations of sodium hypochlorite (4 or 5% NaOCl, 30 or 35 min) for controlling fungal and yeast contamination, compared to bulbs sterilization. Acknowledgements The authors acknowledge the Scientific and Research Council of Bingol University (BAP -TBMYO.2016.00.001) for support this study.

**IN VITRO BULB REGENERATION FROM STEM EXPLANTS OF
ENDEMIC AND MEDICINAL GEOPHYT MUSCARI AUCHERI
(BOISS.) BAKER**

FETHİ AHMET ÖZDEMİR¹, ÖMER KILIÇ², EYÜP BAĞCI³

ABSTRACT

Majority of Muscari species bulbs have medicinal properties and contains high percentages of homoisoflavonoids, this chemical matter possesses antimutagenic and anticlastogenic properties, and may be included among effective natural antimutagens to prevention of cancer. Bulbous plants (like Muscari taxa) are among the plants that people used in folk medicine due to their medicinal and aromatic properties and their beauty. Muscari aucheri (Boiss.) Baker bears beautiful and attractive purplish blue flowers bloom between May and June; it grows stony slopes, mountain pastures an altitude of 1000-3000 meters. The natural populations of Muscari aucheri, is seriously affected by increased environmental pollution, urbanization and grazing. Therefore, this study aimed to accelerate multiplication by devising a strategy for an efficient in vitro bulblet regeneration system of Muscari aucheri using stem explants on MS medium containing 1, 3, 5 mg/l TDZ plus 0, 0.1, 0.2, 0.4 mg/l NAA (12 combinations). The stem explants induced direct bulblet regeneration on explants. Maximum mean number of bulblets per explant was noted on MS medium containing 3.00 mg/l TDZ + 0.4 mg/l NAA and maximum mean number of bulb diameter was noted on MS medium containing 5.00 mg/l TDZ + 0.2 mg/l NAA. The regenerated bulblets were isolated from peduncle explants and cultured on MS medium containing 40 g/l sucrose; where they gained diameter and rooted. Acknowledgements The authors acknowledge the Scientific and Research Council of Bingol University (BAP - TBMYO.2016.00.001) for support this study.

OPTIMIZATION OF TISSUE CULTURE CONDITIONS AND CALLUS INDUCTION IN SMALL FLOWERED WILLOW HERB (*EPILOBIUM PARVIFLORUM* SCHREB)

M. AYDIN AKBUDAK¹, MEHMET BABAĞLU²

ABSTRACT

Small flowered willow herb (*Epilobium parviflorum* Schreb) has been frequently used as a folk medicine to cure prostate diseases, especially Bening Prostatic Hyperplasia (BPH). It has been reported that one of its substances, Oenothien B is a strong inhibitor of Herpes Simplex Virus (HSV-1) and Human Immunodeficiency Virus (HIV). Determining optimum tissue culture conditions is essential to increase pharmacologic substances, genetic manipulation and in vitro production of *E. parviflorum*. In this study, various explants of *E. parviflorum* were cultured on semi-solid MS media containing factorial combinations of plant growth regulators. Callus induction from hypocotyl, cotyledon, petiole and leaf explants was achieved on media containing 2,4-dichlorophenoxy acetic acid (2,4-D) and kinetin (KIN). All other growth regulator combinations [α -naphthalene acetic acid (NAA) \pm benzylaminopurine (BAP), NAA \pm thidiazuron (TDZ), indol acetic acid (IAA) \pm Zeatin (ZEA)] tested failed to respond. The best results with cotyledon- and petiole- derived callus were obtained from MS medium supplemented with 1.0 mg/l 2,4-D + 0.1 mg/l KIN and 2.0 mg/l 2,4-D + 0.2 mg/l KIN. It was observed that B5 basal medium was more effective than MS basal medium for producing seedling and the most effective seed sterilizing solution was 25% (v/v) sodium hypochlorite (NaOCl). No plant regeneration was observed in either callus induction or during the sub-culturing stage. This is the first report on in vitro tissue culture study within the genus *Epilobium*.

**ESSENTIAL OIL COMPOSITION OF TORILIS LEPTOCARPA
(HOCHST.) TOWNSEND (APIACEAE) COLLECTED FROM BINGÖL
(TURKEY)**

MEHMET ALİ KUTLU¹, ÖMER KILIÇ², FETHİ AHMET ÖZDEMİR³, ŞİNASI YILDIRIMLI⁴

ABSTRACT

Many of the medicinal and aromatic plants from Apiaceae taxa are uses presumed to be connected to the terpenic constituents of the essential oils. *Torilis leptocarpa* belonging to the Apiaceae family and mainly distributed in the world in Asia, Europe and North Africa. Some *Torilis* species from Turkey have antioxidant, antimicrobial and antibacterial effects. In addition, the plant is highly effective against some pathogens thus confirming its use as disinfectant or antiseptic. Plant sample was collected contents of Project (BAP -TBMYO.2016.00.001). In this study aerial parts essential oil of *Torilis leptocarpa* was analyzed by HS-SPME/GC-MS. As a result thirty four components were identified. Spathulenol (29.2%), beta-farnesene (18.5%) and beta-caryophyllene (10.2%) were detected the major constituents of the plant. With this study, chemotypes of studied taxa were detected spathulenol, beta-farnesene and beta-caryophyllene. In addition studied plant samples were found to be rich in respect to essential oils and the results discussed natural product, renewable resources and chemotaxonomy. Acknowledgements The authors acknowledge the Scientific and Research Council of Bingol University (BAP -TBMYO.2016.00.001) for support this study.

INVESTIGATION OF EFFECT OF 1,8-CINEOLE ON ANTIMICROBIAL ACTIVITY OF CHLORHEXIDINE GLUCONATE

MERİH ŞİMŞEK¹, REŞAT DUMAN²

ABSTRACT

Aims: Chlorhexidine gluconate is commonly used for the care and clean off the skin, hands, and wounds. In recent years, medicinal and aromatic plants have been used for prevention of disease, maintaining health, and improving disease in traditional and modern medicine as a medicament. According to recent research, cineole is the isolated active agent of eucalyptus oil and possesses antimicrobial activity. It was demonstrated that cineole could enhance the antimicrobial effects of the other antiseptics. The aim of this study was to investigate the effect of 1,8 cineole on antimicrobial activity of chlorhexidine gluconate against some microorganisms. **Methods:** The effect of 1,8 cineole on antimicrobial activity of chlorhexidine gluconate was tested using seven different microorganisms. In this study, chlorhexidine gluconate (128–0.125 mg/l) and cineole (512–2 g/l) were analyzed together and separately using checkerboard assay. Interactions between chlorhexidine gluconate and 1,8 cineole have been identified as synergistic, indifferent or antagonistic. **Results:** Synergistic activity was demonstrated between chlorhexidine gluconate and 1,8 cineole against *Staphylococcus aureus*, methicillin resistant *S. aureus*, *Escherichia coli*, *Klebsiella pneumoniae*, *Enterococcus faecalis*, and *Candida albicans*. Indifferent interactions for these compounds were demonstrated against *Pseudomonas aeruginosa*. (Table.1) **Conclusions:** Chlorhexidine gluconate antiseptic properties were found to be increased when chlorhexidine gluconate was used in combination with 1,8 cineole. Cineole has increased the antimicrobial activity of chlorhexidine gluconate against all microorganisms except *Pseudomonas aeruginosa*. In this way, chlorhexidine gluconate will reveal stronger effect against microorganisms. In topical application, using cineole in combination with chlorhexidine gluconate may be easier, eradicate certain resistant bacteria by increasing the antimicrobial efficacy of chlorhexidine gluconate. Table.1 Antimicrobial activities of CHG alone and in combination with 1,8-cineole against *S. aureus*, MRSA, *P. aeruginosa*, *E.coli*, *K. pneumoniae*, *E. faecalis* and *C.albicans*

Microorganisms	In combination/Alone	FIC of C	and CHG FICI	Results (MIC of *C (g/l)-CHG (mg/l))
<i>S. aureus</i>	C+CHG	8/128-0.25/4	0.062-0.062	0.125 Synergy
MRSA	C+CHG	8/128-0.125/4	0.062-0.031	0.053 Synergy
<i>P. aeruginosa</i>	C+CHG	8/256-2/4	0.031-0.500	0.531 Indifference
<i>E. coli</i>	C+CHG	4/32-0.125/2	0.125-0.062	0.187 Synergy
<i>K. pneumoniae</i>	C+CHG	8/64-1/8	0.125-0.125	0.250 Synergy
<i>E. faecalis</i>	C+CHG	32/128-0.125/4	0.250-0.125	0.375 Synergy
<i>C. albicans</i>	C+CHG	4/32-0.5/2	0.125-0.250	0.375 Synergy

*1,8 cineole. CHG: Chlorhexidine gluconate; MRSA: Methicillin resistant *Staphylococcus aureus*; FICI: FIC index; FIC: Fractional inhibitory concentration; MIC: Minimum inhibitory concentration

**DETERMINATION OF ALKALOIDS AND OIL RATES OF SOME
POPPY (PAPAVER SOMNIFERUM L.) VARIETIES CULTIVATED AS
WINTER AND SUMMER**

LEVENT YAZICI¹, GÜNGÖR YILMAZ²

ABSTRACT

The aim of this study is to determine the alkaloid and oil rates contents of some poppy (*Papaver somniferum L.*) varieties, such as Morphine, Codeine, Oripavine, Thebaine, Noscapine and Papaverine, which are planted as winter and summer. Five varieties of poppy (Zaferyolu, TMO 2, Ofis NP, Ofis 4, Anayurt) registered in different organizations were used in the research. The study was carried out in the trial field belonging to Tokat Middle Black Sea Crossing Belt Agricultural Research Institute Directorate in 2015 and 2016. Alkaloid analyzes were carried out on an HPLC device in the Bolvadin Alkaloid Plant Laboratory. The study was carried out in three replications according to randomized block trial design. As a result; Varieties of poppy the cultivated as summer, mean morphine value 0.61-1.19 %, the codeine 0.07-0.25 %, the Oripavine 0.01-0.02 %, Thebaine 0.02-0,11 %, Noscapine, 0,04-0,49 %, Papaverine , 0,03-0,18 and oil ratio values varied between 41,6-48,8 %. Varieties of poppy the cultivated as winter; mean morphine value 0.29-0.56 %, the codeine 0.04-0.09 %, the Oripavine 0.0002-0.007 %, Thebaine 0.01-0.06 %, Noscapine, 0.009-0.93 %, Papaverine , 0.00-0.06 %, and oil ratio values varied between 45.3-54.3 %. Poppy varieties cultivated as summer, according to winter sown; Alkaloid ratios are higher and oil ratios are lower.

ALLELOPATHIC EFFECT ON PLANT GROWTH OF AROMATIC PLANT EXTRACTS AND ESSENTIAL OILS

CENNET YAMAN¹, BELGIN COŞGE ŞENKAL¹, CÜNEYT CESUR¹, TANSU USKUTOĞLU¹

ABSTRACT

Plants to rich in essential oil are known as aromatic plants that generally contain between 0.5 and 5% essential oil. Essential oils are industrially important natural products of aromatic plants. Essential oils are secondary metabolites that are biosynthesized and accumulated in specialized and accumulated cells types, such as osmophores, glandular trichomes, and ducts and cavities, present in different secretory cells and tissues of aromatic plants. Essential oils, components, and extracts of some aromatic plants have allelopathic effects. Allelopathy is a biological phenomenon by which an organism produces one or more biochemicals that influence the germination, growth, survival, and reproduction of other organisms. These biochemicals are known as allelochemicals. Effects of allelochemicals can be beneficial (positive allelopathy) or detrimental (negative allelopathy). Essential oils or plant parts obtained from aromatic plants show an inhibitory effect (negative allelopathic effect) on germination, radicle and shoot growth of some wild and cultivated plants. In addition, essential oils and extracts obtained from different harvesting times and different parts of aromatic plants have different effects. Essential oils of leaf and fruit parts of *Ecballium elaterium* have exhibited negative allelopathic effect on germination, radicle and shoot growth of lettuce seeds, leaf essential oil has observed to have more allelopathic activity than fruit essential oil. Essential oil and leaf extract of *Ageratum conyzoides* have decreased fresh weight, root and shoot length of cultivated seeds such as cucumber (*Cucumis sativus* L.), ryegrass (*Lolium ultiforum* L.), radish (*Raphanus sativus* L.), mungbean (*Phaseolus aureus*), wheat (*Triticum aestivum* L.), and tomato (*Lycapesicon*). And essential oil applications have demonstrated more inhibitory activity than leaf extract application. Essential oil of *Tagetes minuta* has showed more inhibitory effect on root development of corn than essential oil of *Schinus areira*. Although essential oils of *Carum carvi*, *Mentha spicata*, *Origanum onites* and *Thymbra spicata* have found strong inhibitory effect on germination of wild seeds such as *Amaranthus retroflexus* L., *Centaurea salsotitialis* L., *Raphanus raphanistrum* L., *Rumex nepalensis* Spreng., *Sinapis arvensis* L. and *Sonchus oleraceus* L., seeds of *Alcea pallida* have exhibited resistance. The allelopathic effects may have different in different habitats, strongly coupled with stresses in environment. In this study, it has investigated allelopathic effects of some aromatic plants on germination, radicle and shoot growth of some wild and cultivated plants.

USING SOME FRUITS AS NATURAL ANTIOXIDANT SOURCES IN MEAT AND MEAT PRODUCTS

SENA ÖZBAY¹, CEMALETTİN SARIÇOBAN²

ABSTRACT

Meat and meat products are an important part of a healthy diet. However, lipid oxidation in meat products causes to decrease the shelf life of the product. In addition, oxidation results with negative change of quality parameters such as colour, odour and aroma. Antioxidants are frequently used to prevent such spoilage, to extend the shelf life of meat products and to maintain their sensory qualities. The discussions on the toxic effects of synthetic antioxidants are still continued. Moreover, nowadays the demand of consumers for natural and healthy products increases the number of such products and researches on natural antioxidants. Fruits are also known to be one of the main elements of a healthy diet. Moreover fruits are also considered as one of the most important natural antioxidant sources. The use of this source in meat and meat products is important both for the protection of shelf life and the quality and production natural meat products. Positive results have been obtained in studies on meat products produced by utilizing the antioxidative effect of different fruits. The use of these fruits which have positive effects on metabolism (immune system, cardiovascular system etc.) instead of synthetic antioxidants has positive effects on health in two different directions. Some studies have reported that fruits such as plum (Nunez de Gonzalez et al., 2008), grape (Jia et al., 2012), cranberry (Raghavan and Richards, 2006), bearberry (Carpenter et al., 2007), pomegranate (Çam et al., 2009), citrus fruits (Fernandez-Lopez et al., 2004), carob fruit (Bastida et al., 2009) and tropical fruits (Ahmad et al., 2015) have antioxidative effects on meat products. In these studies, meat groups with different characteristics such as sausage, turkey meat, beef and poultry meat were used and positive results were obtained in all these different products. Moreover, the packaging systems using fruit-based natural antioxidants were obtained give positive results. Studies on natural antioxidants are increasing with interest and demand for natural additives and natural food products. Considering the antioxidative effects and natural structures of fruit-based antioxidants, their importance is increasing. In this review, different antioxidative fruit extracts used in meat products consumed in the world were investigated. In addition, the effects of these antioxidants on meat products have been studied under varying conditions through in-depth literature studies. Keywords: Natural antioxidants, meat products, fruit

INDEPENDENT AND SIMULTANEOUSLY DETERMINATION OF QUERCETIN AND KAEMPFEROL USING ELECTROCHEMICAL PULSE TECHNIQUES

BEDRETTİN MERCİMEK¹, AYŞEN DEMİR MÜLAZİMOĞLU¹, İBRAHİM ENDER MÜLAZİMOĞLU¹

ABSTRACT

Polyphenolic molecules represent a large group of biological molecules with a variety of functions in plant growth, development, and defence. Phenolic molecules are a class of chemical compounds consisting of a hydroxyl functional group (–OH) attached to an aromatic hydrocarbon group, with a ring structure like that of benzene. They are also related to the groups of hormones, vitamins, amino acids and antioxidants [1]. Antioxidants are of interest to the food industry, because they prevent rancidity and are as well of interest to biologists and clinicians, because they may help to protect the human body against damage by reactive oxygen species (ROS) [2, 3]. Extensive research on natural antioxidants such as flavonoids is currently in progress [4]. These compounds are natural vegetable dyes, synthesized from phenylalanine, which impart colour to the blooming portions of plants [5-7]. In addition to their significant role in plants, they are of importance to human health due to their activity as free radical acceptors. Flavonoids can protect against cancer by inhibiting the damages caused by oxidation processes. They are specified by their capability to scavenge free radicals and active oxygen groups [8, 9]. It is a very well known fact that flavonoids are essential molecules is human life due to their antioxidant capacity. For this reason, the quantification of those molecules (belong to polyphenol group) recently is becoming more important. Spectrophotometric, a classical method, has been performed for the antioxidant activity determination for many years. However the antioxidant activity determination has been done using chemically modified electrodes for the last two decades. Electrochemical methods have been often utilized for this cause due to low cost, reliable results and small amounts of sample. Electroanalytical techniques are based on the direct oxidation or reduction of substrate onto the electrode surface. Electrode reactions are very suitable for analytical applications due to their requirements of high potential. Moreover, these surfaces can be modified by a reductive substrate for analytical applications [10-12]. Chemically modified electrodes (CMEs), generally based on the incorporation of a catalyst or a redox mediator, have extended the applicability of electrochemical detection. CMEs have received increasing attentions in the last two decades, which enhance the sensitivity, selectivity and reproducibility of electrochemical analysis techniques [11-15]. Recently, application of CMEs in chemistry and biochemistry has been paid more and more attention. In this study, electrochemical modification of a glassy carbon (GC) electrode with modifier molecule was carried out and the modified electrode was investigated separately and simultaneously for the availability in determination of quercetin (Que) and kaempferol (Kae). The surface modification of GC electrode was performed with modifier molecule using cyclic voltammetry (CV), whereas the characterization of this sensor electrode was performed using CV, electrochemical impedance spectroscopy (EIS) and scanning electron microscopy (SEM). The usability of the modified electrode has been examined in determination of Que and Kae using CV, differential pulse

Corresponding Author: AYŞEN DEMİR MÜLAZİMOĞLU, admulazimoglu@konya.edu.tr
¹NECMEETTİN ERBAKAN ÜNİVERSİTESİ

voltammetry (DPV) and square wave voltammetry (SWV). Consequently, Que and Kae can easily be determined as independent and simultaneously by using modifier molecule modified GC sensor electrode. Following step of this study will focus on the quantitative determination of those flavonoid derivatives in natural sample. References 1. E. T. Denisov, and I. B. INFLUENCES OF *PHYSALIS PERUVIANA* L.(GOLDENBERRY) AND *LUPINUS ALBUS* L.(LUPIN) FRUITS EXTRACTS ON THE LEVELS OF SOME BIOCHEMICAL PARAMETERS IN MUSCLE TISSUE OF TYPE II DIABETIC RATS

OĐUZ AYHAN KİRECCİ¹, ÖKKEŐ YILMAZ², TUBAY KAYA², ORHAN ERMAN²

ABSTRACT

Medical plants are increasingly sought to improve the treatment of diseases related to glucose and lipid metabolism. The present study was designed to investigate the possible antidiabetic and antioxidant effects of goldenberry and lupin on muscle tissue of streptozotocin-induced type II diabetic rats. Type II diabetes was produced in albino rats by the streptozotocin injection. Wistar albino rats were divided into four groups, each one containing 10 rats: non-diabetic control group, STZ- type II Diabetes group, STZ- type II Diabetes+goldenberry group, and STZ- type II Diabetes+lupin group. After one week from the injection, goldenberry and lupin were injected to rats for 2 months. Malondialdehyde, glutathione, cholesterol, and fatty acid levels, which are signs of lipid peroxidation, were measured in muscle tissue. In type II diabetes, malondialdehyde increased compared to the control group. Glutathione decreased in the both tissues and all of the streptozotocin-induced diabetic groups. Treatment with similar doses of goldenberry and lupin significantly reduced oxidative stress, augments antioxidant system and altered fatty acid metabolism in these tissues, thereby maintaining favourable fatty acid distribution affected by diabetic complications. These results validate the use of goldenberry and lupin fruits as a treatment against diabetes mellitus and its complications and suggest it is suitable to continue studies for its safe therapeutic use.

ANTIOXIDANT PROPERTIES OF ETHANOLIC EXTRACT OF PLEUROTUS OSTREATUS MUSHROOM

NAZNOOSH SHOMALI¹, ILGAZ AKATA¹, ÖZLEM YILDIRIM¹

ABSTRACT

Mushrooms have been valued as edible and medicinal resources. Laboratory studies confirm that extracts of fungi contain many secondary compounds which have specific biological effects. These compounds which, could be found in fruit bodies, mycelium and broth, are verified to be phenolics, flavonoides, glycosides, polysaccharides, tocopherols, carotenoids and ascorbic acid. Some of the most recently isolated and identified compounds originating from the medicinal mushrooms have shown promising antiviral, antibacterial, antioxidant, antidiabetic, immunomodulatory, antitumor and hepatoprotective properties. Various studies demonstrate that mushrooms were remarkable source of antioxidants. They might be used directly in promotion of antioxidant defenses through dietary supplementation to reduce the level of oxidative stress. Studies carried out in recent years showed that antioxidant properties of mushrooms were mainly related to their phenolic compounds such as phenolic acids and flavonoids. In this study, the ethanol extracts of *Pleurotus ostreatus* was studied for the polyphenolic contents using spectrophotometric method. The free radical scavenging activity of extract was evaluated by 2,2-Diphenyl-1-(2,4,6-trinitrophenyl) (DPPH) assay. Furthermore, the mushroom extract effect was examined on the glutathione peroxidase (GPx) and catalase (CAT) enzymes activities by kinetic assays. Total phenolic contents were determined by using the Folin-Ciocalteu's method. According to the method, the total phenolic contents of extracts were calculated using the equation obtained from the standard curve of gallic acid graphic. The amount of total phenolic compounds found in the ethanol extract of *P.ostreatus* was 12.945 ± 0.0021 mg GAE/g dry sample. The total concentration of flavonoids in extracts were determined by employing the aluminium chloride colorimetric method. The total flavonoid contents of extracts were calculated using the equation got from the standard curve of quercetin graphic. Total amount of the flavonoid contents found in the ethanol extracts of *P.ostreatus* was 1.108 ± 0.0042 mg QE/g dry sample. The scavenging effect of *P.ostreatus* on DPPH radicals was measured as 67.33% at 10 mg/mL concentration. Also, ethanol extract of *P.ostreatus* showed good GPx and CAT enzymes activities at 0.625 and 10 mg/mL concentrations, respectively.

SCREENING EFFECTS OF METHANOL EXTRACTS OF THE DIPLLOTAXIS TENUIFOLIA AND RESEDA LUTEA ON THE GLUTATHIONE-S-TRANSFERASE ENZYME ACTIVITY

NAZNOOSH SHOMALI¹, ÖZLEM YILDIRIM¹

ABSTRACT

Glutathione-S-transferase (GSTs), comprise a family of eukaryotic and prokaryotic phase II metabolic isozymes best known for their ability to catalyse the conjugation of the reduced form of glutathione (GSH) to xenobiotic substrates for the purpose of detoxification. Every member of the eukaryotic species has multiple GST isoenzymes that are bounded by cytosolic and membranes. They catalyse the process of glutathione conjugation in electrophilic regions using sulfhydryl group which will increase solubility of xenobiotic and endogenous compounds. During this process, endogenous compounds like peroxidase lipids are detoxified together with the disintegration of compounds and xenobiotics. In this study, the methanol extracts of *Dipllotaxis tenuifolia* and *Reseda lutea* were studied for the polyphenolic contents using spectrophotometric method. Furthermore, the plant extract effects were examined on the glutathione-S-transferase (GST) enzyme activity by kinetic assay. Total phenolic contents were determined by using the Folin-Ciocalteu's method. Also, the total concentration of flavonoids in extracts were determined by employing the aluminium chloride colorimetric method. According to the results, the highest phenolic and flavonoid contents were detected in the methanol extract of *D. tenuifolia* leaves, with 144.49±0.29 mg gallic acid equivalent/L and 250.485±0.002 quercetin equivalent/L respectively. The best activity profile for GST was observed in the extract of leaves belonging to *D. tenuifolia* with IC₅₀ values of 121±0.05 ng/mL. Results indicated that leaves of *D. tenuifolia* have good effect on the GST activity. Therefore it is considered as a good source of food for the detoxification systems.

AN IMPORTANT IMPLEMENTATION FOR THE DEVELOPMENT OF BIOACTIVES OF MEDICAL PLANTS: FERMENTATION

ECEM AKAN¹, OKTAY YERLIKAYA², ÖZER KINIK³

ABSTRACT

Fermentation is a microorganism-based technological process that enables obtaining high-value products from raw or low-quality substrates. Specially selected fermentations provide the ability to improve substrate properties or bioactive components properties by the action of microbial enzymes in undesired substrates. In addition, fermentations improve the nutritional properties of foods, while at the same time, they make the foods easily digestible and better metabolizable. Medical plants have been used as medicines for thousands of years. Herbal medicines/herbs include medical plants, plant materials and herbal products with the medical properties that are made into the product. They also contain the plant materials of the plants or their combinations as the active ingredients. Raw plant materials such as leaf, flower, fruit, seed, stems, stem, stem, branch and other plant organelles of medical plants are used, separated or powdered. In addition, water extracts, gums, oils, essential oils, resins and dry powders of medical plants are also used for different purposes. Therefore, medical plant-based medicines have a very large plant-based area with some digestible properties. Due to the legal obligations regarding the medical plants which change from country to country, there are no internationally homogenous standards and restrictions have been introduced to the regulations on the use of these products in the food and cosmetics field. Based on the determinations, World Health Organization reports that more than three quarters of the population in developing countries use medical plants due to health concerns. Numerous components of medical plants have now been researched and biological activities have been detected. Based on the date obtained in different ways, it was revealed that these components are beneficial against a large number of diseases and disorders. Since the beneficial effects of probiotic and other fermented foods on human health have been determined in detail, studies on the use of fermented medical herbs have begun to intensify. The transformation of traditional medical plants and the essence of microbial fermentations cover the following basic topics. In the logarithmic development phase of microorganisms, a large number of active molecules in the group of synthetases and hydrolytic enzymes such as protease, amylase, cellulase, esterase, amidase are produced. These enzymes play a key role in the fermentation reactions of medical plants. In these reactions; 1. The structures of medical based substances are changed into new component. 2. A large number of microorganisms can actively use the components of active medical plants as substrates and medicines obtained from secondary metabolites of these microorganisms and medical plants may interact with the resulting new components. 3. Medical plant mixtures can be used in the metabolic activities of microorganisms to produce new compounds. 4. Herbal medicines can be concentrated since the microorganisms consume non-medical components such as proteins, sugars and other components during development phases. In addition, medical plant fermentations are known to be associated with chemical reactions that alter the proportions of nutritive and non-nutritive components of plants. These changes also affect the properties of the products such as bioactivity and digestibility. Bioactivation of medical herbal medicines through fermentation

increases their therapeutic potential and reduces their toxicity. The fermentation process improves the pharmacological properties of medical herbal medicines, such as isoflavones, saponins, phytosterols, phenols, and increases the naturally occurring molecules that increase the positive and disease-preventing effects on health. This article will focus on new technological areas applied in the production of microbial fermentation technologies, transformations and other new active ingredients of potential medical products.

MORPHOLOGICAL AND ANATOMICAL CHARACTERISTICS OF CLINOPODIUM ALPINUM (LAMIACEAE)

AYLA KAYA¹

ABSTRACT

Clinopodium alpinum (L.) Kuntze is a decumbent, rarely ascending perennial herb which grows in 900-2200 m in western Turkey. *C. alpinum* is an aromatic plant and used for coughs and gastrointestinal disorders in folk medicine. In the current study, morphology and anatomical characteristics of *C. alpinum* previously treated as *Acinos alpinus* (L.) Moench in Flora of Turkey, is studied for the first time and detailed descriptions and illustrations of general appearance of plants and their leaf, bract, calyx, corolla and fruit shapes and anatomical descriptions and illustrations of root, stem and leaf are described and illustrated. The plant is 4.5-40 cm. Leaves are ovate, orbicular or elliptic shaped. Corolla is purple-violet coloured. The root is orbicular in outline in cross-section. The secondary tissues are only observed in root anatomy of species. The stem is almost square in shape and contains non-glandular and glandular hairs in transverse sections. The vascular bundles are well-developed at the corners of the stem. Leaf is bifacial and bears on their surfaces non-glandular and glandular trichomes.

INFLUENCES OF *PHYSALIS PERUVIANA* L. AND *LUPINUS ALBUS* L. EXTRACTS ON THE LEVELS OF SOME BIOCHEMICAL PARAMETERS IN ERYTHROCYTES AND SERUM OF STREPTOZOTOCIN INDUCED DIABETIC MALE RATS

AYŞE DİLEK ÖZŞAHİN¹, ÖKKEŞ YILMAZ², TUBAY KAYA², ORHAN ERMAN²

ABSTRACT

In this study, the effects of goldenberry and lupin on lipid peroxidation antioxidant system parameters in erythrocytes and serum of streptozotocin-induced diabetic rats were investigated. Type II diabetes was produced in rats by the streptozotocin injection. Albino rats were divided into four groups, each one containing 10 rats: non-diabetic control group, STZ-Diabetes type II group, STZ-Diabetes+goldenberry type II group, and STZ-Diabetes+lupin type II group. After one week from the injection, goldenberry and lupin were injected to rats for 2 months. Malondialdehyde, glutathione, cholesterol, and fatty acid levels, which are signs of lipid peroxidation, were measured in these tissues. In type II diabetes, malondialdehyde have increased when it have compared with control group. Glutathione has decreased in the other tissues and all of the streptozotocin-induced diabetic groups. When blood samples controlled, they have been shown that malondialdehyde, cholesterol values have been decreased and glutathione levels have been increased by goldenberry and lupin. The results of the present study showed that the herb suspensions exerted anti-hyperglycemic effects and consequently may alleviative tissue damage caused by streptozotocin-induced diabetes.

AN ENDEMIC PLANT OF ERMENEK REGION, MUSCARI MUSCARIMI, ECONOMIC IMPORTANCE, AND IS THERE ANY USEFUL WAY OUT CULTIVATION IN ITS NATURAL HABITATS

HAYDAR OZTAŞ¹, FULYA OZTAS²

ABSTRACT

Turkey is one of the most floristically rich countries in the world with endemic plants. The approximately one third of its flora is endemic. The *Muscari muscarimi* which belongs to the Liliaceae family is one of its most prominent endemic geophyte plants which originates in southwestern of Turkey where it is found in rocky places like Ermenek, Başıyayla (Büyükkarapınar village), Sarıveliler. This species is the most sweetly scented member of the Liliaceae family, having something of the musk scent. Also, this plant locally is used in traditional medicine as antirheumatic, stomachic, diuretic and expectorant. In addition to this, it has also been used as food for humans and animals, ornamental plants in gardens. Morphologically, it has 3–6 linear-lanceolate, grayish-green leaves per plant and bulbs of 2–4 cm in diameter with thick fleshy perennial roots which delve down into the rocky ground of their natural habitats. The chemically it is composed of polysaccharides, homoisoflavanons, glycosides and...Main components of *M. muscarimi* were identified as (E)- β -ocimene (t-36%), methyl salicylate (1–21%), E-methyl isoeugenol (4–22%) and benzyl benzoate (7–56%). The picking up of the plant bulbs from their natural habitats is prohibited, in accordance with international agreements for the protection of endangered geophytes. The overly habitat destruction in native growing area threatened the existence of the species categories. It known that in vitro bulblet production in *Muscari muscarimi* is low. This is difficulty of its cultivation in native Ermenek area districts. Recent works shown that the culturing immature *Muscari muscarimi* embryos on different growth media could consider an useful method for in vitro propagation. As a result, the geophytes, such as *M. muscarimi* is eligible widely for perfume production and in the pharmaceutical industry as well as for ornamental flowers. Because of this plant economic importance, bulbs growing and cultivation in their natural habitats could discuss in this study.

**IDENTIFICATION OF HARVEST TIME AND NEW
DETERMINATIONS OF WILD CAROB (CERATONIA SILIQUA L.) IN
MERSİN**

DR. HAKAN KELEŞ¹

ABSTRACT

Wild Carob (*Ceratonia siliqua* L.), which shows limited spread on east Mediterranean, west Mediterranean and Aegean region in Turkey, is one of our important minor forest products especially because its commercial value of its seed and fruit. Besides this economic value; as it is resistant to drought and fire, natural carob comes at the beginning of species which has potential value at our forestry sector. Early picking of blacken fruits causes early decaying, deformation of fruits and bug-infested. In this study, some phenological aspects and determinations works were made on total 60 pcs tree with the aim of identification of harvest time for 3 different natural (Wild) carob species in Tarsus, Erdemli and Silifke, Mersin. Blacken and drying of fruit stalk is observed as the best suitable harvest time for criterion. Also some determinations are identified on these subjects; Classification according to being vaccinated and wild, New natural spread areas on most south and north latitude of species, Sits index plant, importance as wild life and side of landscape.

DETERMINATION OF CHEMICAL AND MICROBIOLOGICAL PROPERTIES IN KANLICA MUSHROOM PICKLED

MEHTAP OKUR¹, AYSEL GÜLBANDILAR¹

ABSTRACT

Turkey has a very rich edible macro fungal flora because it possesses favorable environmental conditions for the growth of fungi. Wild or cultivated mushrooms have long been a popular part of the human diet because of their agreeable sensory qualities. In addition to their nutritious value, they have been used in traditional medicine in many countries. Mushrooms have been used as food and food-flavoring material in soups and sauces for centuries due to their unique and suitable flavor. They are healthy foods, poor in calories and in fat, rich in vegetable proteins, iron, zinc, chitin, fibre, vitamins and minerals. Kanlıca mushroom (*Lactarius deliciosus*) is a well-known mushroom which is widely used as a food in Bolu province. *L. deliciosus* is an edible and it can be eaten fresh, dry or pickled. The pickled mushroom is one of the traditional fermented vegetables in Turkey, especially in Bolu. The process is that boiled mushrooms, garlic, vinegar, salt, parsley, olive oil and water are mixed in a suitable manner and filled in the jar. Finally, the mouth of the jar is sealed and allowed to ferment for a period of time. In this study was conducted to determine chemical and microbiological properties of kanlıca mushrooms.

KEYWORDS

Kanlıca, mushroom, pickled, Lactarius deliciosus.

A NEW FUNCTIONAL ADDITIVE OBTAINED BY USING JET PULSE FILTERS: PUMPKIN SEED MEMBRANE

NIHAT ÇANKAYA¹, MUCİZ ÖZCAN¹, SELMAN TÜRKER¹

ABSTRACT

Jet Pulse Filters (JPF) are the most widely used filters in industry which are used to prevent dust emissions and to separate air-dust mixtures. JPF are one of the important equipment of production processes with its these features. JPF can be used as the main element to obtain some products. Some of these products are functional food raw materials and medical- aromatic plants that have increased rapidly in recent years. Today, along with the increase in demand for medicinal - aromatic plants and functional food, some products that have not been previously used or evaluated have gained value. In this study, it was investigated that pumpkin seed membrane which is obtained by using JPF in nut packaging facilities. Pumpkin seed membrane is composed of cellulose as content. This very thin membrane layer covering the pumpkin seed shell is wet and slippery before it comes into contact with air. When it contacts with air, it dries up to become a fragile membrane. This thin membrane is composed of cellulose having an ash content of 4%. Cellulose is a very important industrial product with a wide range of uses. At nut packaging plants, this membrane is separated from the shell due to friction during the cleaning of the pumpkin core. This membrane is captured by the JPF together with other dust and foreign substances, thanks to the existing cleaning and aspiration system. At present, this membrane is a very problematic and undesirable waste in terms of environment. This product is discarded with other aspiration and cleaning wastes. Neither can it be used as feed additive nor for any other purpose. Pumpkin seed membrane with high cellulose content can be obtained as a pure product, by using Jet Pulse Filter, by settings made on existing cleaning system and by using automation system. Pumpkin seed membrane can be used in the production of dietary products by joining to food products based on flour. At present, this product which is considered as a waste, can be a food additive material which is used in the production of dietary products and functional foods and it can be obtained by JPF. In addition, due to its physical and chemical properties, the obtained product has the possibility to be utilized in many different areas of the industry. Thanks to its high cellulose content and physical properties such as high water retention capacity, large surface area, fine texture, it can be utilized as an edible dehumidifier, paper and textile raw material, and filter equipment. It can be used as an additive or isolation material for newly developed high-tech materials. It can also be used as an alternative to cotton and sponges in the furniture sector. In this work, the possibilities to convert a problematic waste product into a useful product with high commercial value were reviewed.

CYTOTOXIC POTENTIAL OF ARTEMISIA ARGYI EVALUATED BY THE MTT-CELL CULTURE ASSAY

ZÜLAL ATLI ŞEKEROĞLU¹, ZEYNEP KOLÖREN¹, ONUR KOLÖREN²

ABSTRACT

Cytotoxic potential of *Artemisia argyi* evaluated by the MTT-cell culture assay Zülal ATLI ŞEKEROĞLU¹, Zeynep KOLÖREN¹ and Onur KOLÖREN² 1 Department of Molecular Biology and Genetics, Faculty of Arts and Sciences, Ordu University, Ordu, Turkey 2 Department of Plant Protection, Faculty of Agriculture, Ordu University, Ordu, Turkey (E-mail: zeynep.koloren@yahoo.com) *Artemisia argyi* (Asteraceae) is an important medicinal plants for the treatment of allergi, inflammation and infections by various microorganisms, malaria, cancer, hepatitis. The objective of this study was to determine the cytotoxicity of *A. argyi* leaves on human bronchial cell cultures. The evaluation of the possible cytotoxic activities of the methanolic extracts of *A. argyi* were carried out using the 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT) assay (Mosmann 1983). BEAS-2B, human bronchial epithelial cells (ATCC, CRL-9609), were treated with different concentrations of methanolic extracts of *Artemisia* (1.2, 2.3, 4.7, 9.4, 18.7, 37.4 and 74.8 mg/ml) and incubated for 72 h at 37°C. The 50% inhibitory concentrations (IC₅₀) of *Artemisia* were found approximately 5.5 mg/ml. *Artemisia* showed stronger inhibitory effects at the concentrations of 9.4, 18.7, 37.4 and 74.8 mg/ml in BEAS-2B cells. The methanolic extracts of *Artemisia* reduced cell viability by approximately 31, 27, 12 and 7 % at the concentrations 9.4, 18.7, 37.4 and 74.8 mg/ml.

EFFECTS OF DIFFERENT DRYING METHODS ON THE ANTIOXIDANT CAPACITY OF SMILAX EXCELSA L.

ELIF FEYZA TOPDAS¹, MUHAMMET DEMİRBAŞ², İHSAN GÜNGÖR SAT³, MEMNUNE SENGÜL⁴

ABSTRACT

The genus *Smilax* (family Smilacaceae), native to tropical and temperate parts of the World which is a brambled woody vine with paired tendrils for climbing. *Smilax excelsa* L. widely used in the Black Sea region of Turkey for consumption in the daily diet and in folk medicine for its medicinal properties. In this research, green and reddish stalks and leaves of *Smilax excelsa* L. were used. These two groups were treated with different drying methods such as lyophilization, microwave drying, drying in the shade at room temperature and drying 50 °C in drying cabinet. Then dried samples milled and water extracts were prepared from the obtained powders. In order to evaluate the antioxidant activity of water extracts of green and reddish *Smilax excelsa* L. leaves and stalks which dried by different techniques, various in vitro methods such as total phenolic compounds determination, Fe³⁺ reducing power by FRAP reduction method, 2,2-diphenyl-1-picryl-hydrazyl free radical (DPPH·) scavenging activity, 2,2'-azino-bis(3-ethylbenzthiazoline-6-sulfonic acid) radical (ABTS·+) scavenging activity were performed separately. Total phenolic compounds of dried green and reddish *Smilax excelsa* L. were varied between 15.781 mgGAE/g and 29.781 mgGAE/g. Results showed that highest total phenolic compounds content was found in reddish parts of plant dried with lyophilization. From the effective concentration (IC₅₀) of extracts, it was seen that lyophilized reddish samples (2.24 mg/ml) had the highest DPPH· radical scavenging activity while the samples dried at 50 °C had the least activity (4.12 mg/ml). All the plant extracts exhibited lower ABTS·+ scavenging activity than BHA, BHT and Trolox. Among them, microwave dried reddish sample extract showed better antioxidant activity (IC₅₀=2.73 mg/ml). Ferric ions (Fe³⁺) reducing capabilities of samples ranged from 2.22 to 4.82 mg GAE/g. It was observed that the used lyophilized water extract of reddish stalks and leaves demonstrated effective reducing activities.

ECONOMICS OF THE MEDICINAL AND AROMATIC PLANTS (MAPS) IN DEVELOPING COUNTRIES

ÜSTÜNER BİRBEN¹, HASAN EMRE ÜNAL¹

ABSTRACT

One main objective of economics is to better understand the role of resources in the economy with a view to develop more sustainable methods of managing those resources to ensure their availability to generations to come. Many economists study interactions between economic and scarce resources, with the goal of developing a sustainable and efficient economy. At this point, Mother earth/nature is remarkably rich in biological and ecological diversity and is home to outstanding bio-resources such as a large number of herbs, medicinal, cosmetic and aromatic plants. Medicinal and aromatic plants (MAPs) have been an important part of the health, livelihood and wealth systems throughout the human history and are continue to make important contributions to local, national and international economies. Worldwide trade of the MAPs is about 60 billion dollars annually and growth rate is 5-10%. The main purpose of this paper is to get an insight into economics of MAPs in Developing Countries. The findings are to provide recommendations that might form both the basis of preparing action plans and policy-making process. The research is focus on current areas of utilization, supply chain, demand intensity, and the economic value of the most important MAPs

EXAMINATION OF CULTURAL VALUE AGAINST ECONOMIC DEMAND: JOURNEY OF POPLAR AND WILLOW IN ANATOLIA

SELDA AKGÜL¹, NECAT DEMIRSU¹

ABSTRACT

The interest of mankind with poplar trees remains indispensable since the early history of civilization. The word "Populus" relates to the term "Arbor Populi" meaning "peoples' tree" during the ancient Roman Empire. Poplar tree has been an integral part of Anatolia culture in our country due to expressed in Turkish folk song, stories, name of our living space, used hand and house tools, Black poplar (*Populus nigra* L.), known as the Anatolian poplar has become synonymous with at every stage of life of the Anatolian people for centuries. Traditionally, in the rural of Anatolia, poplar plantations were the first precious gift which was given the children by their families at the a new life cycle such as marriage and birth. In today, poplars and willows, indispensable for the wood processing industry has become one of the important pillars of the economy and ecology. The various species and clones of poplar tree used in industrial plantations are among the most important fast growing tree species due to their relative high growth rate within a shorter period of rotation, and their ability to adapt to a wide range of site conditions around the world in our country as well as all over the world. In today's real, a important proportion of the growing wood demand is met by wood produced from poplars and willows plantations, thereby reducing the demand pressure over natural forest resources significantly, plays a key role in the sustainability of natural forest. In our country, 3.7 million m³ / year level of approximately 5 million m³/year up to the wood raw material deficit are met from poplar wood. There has been a rapid increase in modern poplar cultivation after the inauguration of the "Poplar and Fast Growing Forest Trees Research Institute" in İzmit in 1962 and 9 commercial poplar clones have been developed and selected clones were registered by the International Poplar Commission. The high level of wood yielding capacity of poplar plantations is attracting attention and consequently the study of poplar cultivation is included in the graduate and postgraduate curriculums in forestry education in Turkey. The numerous research studies has been done about the poplar cultivation in our country and in the World and poplar has become a model tree In this paper, the trip of the poplar and willows turned a critical role in the global economy and ecology, industrial industry from the Anatolian culture was studied to explain with scientific data

MULTIPLE SCLEROSİS(MS) AND CAMPARI

FATMA ERDEO¹, ALI ULVI UCA², SERDAR ARSLAN¹

ABSTRACT

Introduction: Multiple sclerosis (MS) is the most common of the central nervous system, inflammatory, demyelinating disease. Along with these symptoms, fatigue, cognitive loss and depression are other symptoms associated with MS symptoms. In 1998, the Multiple Sclerosis Council of Clinical Practice Guidelines, setting the guidelines for clinical practice, made a common definition of fatigue in MS. Fatigue in MS according to this definition; "A subjective physical or mental energy deficiency that is perceived by the individual or caregiver and is determined by the individual's inability to complete the usual activities". Fatigue is a subjective finding and is determined by the patient's feelings, shaped by the individual's perception of fatigue. Acute fatigue is a fatigue that has just started and is experienced in the last six weeks. If it lasts for six weeks, it is defined as chronic fatigue. Fatigue in MS is a symptom that is difficult to distinguish, especially with mental fatigue, emotional-state changes, anxiety, depression, or cognitive impairment. MS patients are known to resort to a variety of complementary or alternative therapies for various symptoms or to stop disease activity. Examples such as exercise, meditation, yoga, relaxation techniques, acupuncture, cannabis, massage, diet changes, vitamins, medicinal plants and mineral supplements. In our study, the effect of the caper plant on fatigue was examined, because some of the MS patients have tried it but have not used it regularly. Campari is very fruitful, with a very high economic impact. Since ancient times; The richness of the pea-sized buds of caper plant used for food and treatment for protein, vitamin, mineral, polyphenolic substances, caparirutin and glucocaparin make it a functional food. Glucocaparin, especially in flower buds of all plants, is distinguished by the effect of glucohydrolases on tissue fragmentation and D-glucose and methyl isothiocyanate which gives unique aroma. An important group of compounds found in caper flower buds and other organs are flavonoid glycosides. One of the most important of these is the routine (kaparirutin) amount, 0.2-0.5% in fresh bud. The routine capillary vessels with P vitamene activity increase resistance and reduce permeability; Hypertension, arteriosclerosis and circulatory disturbances. Case: A 40-year-old female patient was admitted to the doctor due to withdrawal and numbness in the year 2012 and received MS diagnosis. He did not receive any medical treatment after 5 days of cortisone treatment. As of 2012, 15 months have begun to consume the capers vegetable pickles in the morning and 1 cup in the morning. Our patient who initially complained of extreme tiredness, said he felt very fit. When fatigue was assessed retrospectively via Visual Analog Scale (VAS), the capari was specified as 8 before use and 3 after capers. Conclusion: There is no study of how much caper plant is to be used. In this case, what are the effects of the liver enzymes in the containers and the drugs used in MS? In MS patients, medical treatments are only of importance. It is thought to support the treatment of caper use by consulting a doctor.

DETERMINATION OF α -AMYRIN AND β -SITOSTEROL IN CENTRANTHUS LONGIFLORUS BY GC-MS

ŞEYMA BAKIRCI¹, HAKAN AŞKIN¹, ARIF AYAR², BİLAL YILMAZ¹

ABSTRACT

Turkey has an excellent flora and is one of the richest countries in the world in terms of plant diversity. Approximately 10 500 plant species have been recorded in this flora and the endemism rate of plants is approximately 30%. *Centranthus longiflorus*, which belongs to the family Valerianaceae, is known as red valerian in Turkey. The plant is widely distributed in the northern, southern and central Anatolian regions of Turkey (Makki et al. 2015), endemic to the Mediterranean region (Lebanon, Syria, Turkey, Italy and Palestine). The aerial parts and roots of this species is mostly used for sedative, antispasmodic, anthiolitic, familial hypercholesterolemia, coronary artery disease and preventing colon cancer purposes in traditional Turkish medicines (Suleyman et al. 2007). *Centranthus longiflorus* plant was collected from Tortum in the province of Erzurum in April and June 2015 and authenticated by Richardson (1975). The drying process of the plant and all the remaining studies were carried out in Atatürk University Science Faculty Genetics Laboratory. Ethanol extract (CLEE) was prepared from the dried aerial parts (leaves and flowers) of *C. longiflorus*. Extraction of ethanol from our plant was performed according to Kotan et al. (2010). In this study, a simple and specific gas chromatography-mass spectrometry (GC-MS) method was developed for the simultaneous determination of α -amyrin and β -sitosterol in *Centranthus longiflorus* plant. The chromatographic separation was achieved on a HP-5MS (30 m x 0.25 mm i.d., 0.25 μ m film thickness) analytical column. The retention times of α -amyrin and β -sitosterol were found to be 15.1 and 16.0 min, respectively. The validation of the proposed method was carried out for specificity, linearity, accuracy, precision, limit of detection, limit of quantitation and recovery. The linear ranges in this developed method were 1-100 and 5-750 μ g/ml for α -amyrin and β -sitosterol, respectively. The intra- and inter-day precisions, expressed as the relative standard deviation (RSD), were less than 3.44 and 4.13%, determined from quality control samples for α -amyrin and β -sitosterol, and accuracy was within 2.47 and 1.25% in terms of relative error, respectively. The percentage recovery obtained for α -amyrin and β -sitosterol were 99.07 and 99.10%, respectively. Limit of detection and quantification for α -amyrin were 5 and 15 ng/ml, for β -sitosterol 50 and 150 ng/ml, respectively. The application of a simple, rapid and accurate GC-MS method was carried out the quantitation of α -amyrin and β -sitosterol in whole plant powder of *Centranthus longiflorus*. IN VITRO AMOEBICIDAL ACTIVITY OF TURKISH ARTEMISIA ARGYI LEAVES EXTRACT ON ACANTHAMOEBA CASTELLANII

ZEYNEP KOLÖREN¹, ONUR KOLÖREN², ÜLKÜ KARAMAN³, MELEK ÇOL AYVAZ⁴

ABSTRACT

In Vitro Amoebicidal Activity of Turkish *Artemisia argyi* leaves extract on *Acanthamoeba castellanii* Zeynep KOLÖREN¹, Onur KOLÖREN², Ülkü KARAMAN³, Melek ÇÖL AYVAZ⁴, 1 Department of Molecular Biology and Genetics, Faculty of Arts and Sciences, Ordu University, Ordu, Turkey 2 Department of Plant Protection, Faculty of Agriculture, Ordu University, Ordu, Turkey 3 Department of Medical Parasitology, Faculty of Medicine, Ordu University, Ordu, Turkey 4Department of Chemistry, Faculty of Arts and Sciences, Ordu University, Ordu, Turkey (E-mail: zeynep.koloren@yahoo.com) *Artemisia argyi* is mostly used in traditional medicine in China and have been commonly consumed as tea, spices, and food in East Asia. *A. argyi* leaves have flavones and terpenes which are used for antimicrobials and anti-inflammatory and relieving itching and increasing blood circulation of the skin. The present study was aimed to investigate the amoebicidal and amoebistatic effect of *A. argyi* leaf methanolic extracts on the proliferation of *Acanthamoeba castellanii* trophozoites and cysts. *A. argyi* was harvested from different geographic locations in Ordu Province of Turkey. The fresh leaves were subjected to methanolic extraction. One hundred microliters culture of the different concentrations of *A. argyi* methanolic extracts (in the quantity from 1.2 to 74.8mg/ml), and the the same volume of trophozoites/cysts suspension were mixed for the determination of the amoebicidal activity of plant extracts. The amoebicidal activity was time and dose-dependent on the trophozoites and cysts. The trophozoite growth stopped in *A. argyi* methanolic extracts with IC₅₀/8 h at 37.4 mg/ml. All trophozoites were nonviable at 37.4 mg/ml methanolic extract concentration within 72 h. Among the different concentrations of *A. argyi* methanolic extracts used in this study, 74.8 mg/ml extract solution showed the stronger amoebicidal activity on the cysts with IC₅₀/72 h.

EXAMINATION OF LEAD ACCUMULATION IN CAPSELLA BURSA- PASTORIS (L.) MEDIK USED AS MEDICAL PLANT

EMINE EBRU TUNA¹, D.DUYGU KILIÇ², HAMDİ GÜRAY KUTBAY³, BURAK SÜRME³

ABSTRACT

Heavy metals have been increasing rapidly in recent years, with increasing urbanization and consequently, traffic and industrialization, to be toxic to the environment in the wild. Some heavy metals are used at microelement level by plants. However, the amount of heavy metal that goes beyond the acceptable range of soil and air is a danger to all living species. There is a heavy metal transition from the plants consumed by humans through the food chain. This is especially true of other diseases, especially cancer. Medical and aromatic plants have been used for therapeutic purposes since mankind's existence. In particular, care must be taken to ensure that the areas where naturally grown medical plants are collected are free from contamination. However, due to the fact that it is easily accessible by the public, it is seen that plants are collected from inside the city and from the roadsides. In this study, *Capsella bursa-pastoris* (L.) Medik, which is used as a medicinal plant, consumed rustically grown leaves in urban and roadside areas as food. Lead accumulation has been investigated. *Capsella bursa-pastoris* is traditionally used as a medicinal herbal medicine in the treatment of diseases such as kidney diseases, wound healing, hemorrhoid constipation. In the study, 11 different stations were identified in the city of Amasya, where traffic is heavy, and out of city (highway side). As a control group, stations were chosen to be 500m, 1000m, 1500m away from the highway. Five plants were selected from each of these areas and the amount of lead in root, stem and washed-unwashed leaves of plants was measured by Inductively Coupled Plasma-Optical Emission Spectrometry (ICP-OES) method. As a result of the work, it was found that the plants were washed in the city center (43.54 ppm) and in the untreated leaves (61.70 ppm) and the roadside washed (30.47 ppm) and in the unwashed leaves (31.75 ppm) Toxic values. Reduction of lead residue accumulation path distance is seen. Differences in metal accumulation between plant organs and stations were statistically significant ($p < 0.05$). As a result, the amount of lead found in *Capsella bursa-pastoris* plant at the distance of 500 m from the side of the highway and the highway was above the acceptable limit to be found in the food.

INHIBITORY EFFECTS OF VARIOUS PLANT EXTRACTS AND VITAMINS ON COLLAGENASE ACTIVITY

SEVİM TUNALI¹, GİZEM SINANOĞLU¹, REFIYE YANARDAG¹

ABSTRACT

Skin aging is a natural process characterized by structural and physiological changes in the skin. Excessive exposure to sunlight, environmental pollution and smoking accelerate the production of enzymes such as elastase and collagenase in the skin that degrade the main components of the extracellular matrix of derms. Collagenase (EC 3.4.24.3) is the zinc-dependent endoproteinase that specifically cleaves collagen. Inhibition the collagenase enzyme is an important cause of pathological collagenolysis, osteoarthritis, corneal ulcers, diabetes and periodontitis. In our study, we have examined collagenase enzyme inhibitory activities of different plant extracts such as black mulberry, pineapple, white tea, white grape, rosemary and vitamins such as vitamin U, ascorbic acid, α -tocopherol and rutin. The plant extracts were prepared by using 96 % ethanol and refluxed for 8 hours in Soxhlet device. Collagenase inhibitory activities of different plant extracts and vitamins were increasing in a dose dependant manner. As a result, among the studied extracts and vitamins, black mulberry and vitamin U showed the highest inhibitory activities. It can be suggested that all used plant extracts and vitamins with high collagenase inhibitor activity are suitable for use of skin disease in addition to drug treatment.

MYELOPEROXIDASE ENZYME INHIBITION BY VARIOUS PLANT EXTRACTS

SEVİM TUNALI¹, FATMA YASAR¹, REFIYE YANARDAG¹

ABSTRACT

Myeloperoxidase (MPO, EC 1.11.2.2) is a key antimicrobial enzyme, playing a normal role in host defense. It is expressed mainly in human neutrophils and to some extent in monocytes and activates hydrogen peroxide to oxidize a great variety of organic substrates to free radicals. However, interest in MPO exploded when it was found to aggravate tissue damage by oxidation of lipids, (lipo) protein or DNA at sites of inflammation. It has been reported that MPO plays a role in ischemia, and neurodegenerative diseases, as well as sepsis, lung disease, atherosclerosis and atrial fibrillation. Consequently, blocking the activity of MPO is a potential pharmacological strategy for prevention and treatment of a broad range of inflammatory diseases. In our study, we have examined MPO enzyme inhibitory activities of different sulfur contain plant extracts such as black cabbage, brussels sprouts, cauliflower, purple cabbage, white cabbage, and onion. The plant extracts were prepared by using distilled water and refluxed for 8 hours in the flask. As obtained results among the used cabbage species and onion extracts, black cabbage and white cabbage showed the highest inhibitory effects on MPO enzyme activity. It was found that sulfur containing plant extracts inhibited MPO enzyme activity and adding these plants in a controlled diet will contribute to alternative and complementary treatment.

PROPAGATION POSSIBILITIES OF BAY LAUREL (*LAURUS NOBILIS* L.) BY TISSUE CULTURE METHOD

AYSUN BOZA¹, ZEYNEP GÜLÇİN ALTUN¹, SERRA HEPAKSOY²

ABSTRACT

In this study, bay Laurel explants were taken from Kuşadası and Urla's laurel trees. These explants were placed in MS (Murashige&Skoog, 1962) and DKW (Driwer Kuniyuki) media. The propagation material consisted of buds and meristem of shoot of one year old shoots. Explants were taken per two months and placed in media. Two different media were used in this study. Different concentrations of NAA (naphthaleneacetic acid) (0.01-5 mg/l), BA (Benzil Adenin) (0.01-20 mg/l), IBA (Indole Butyric Acid) (0.01-20 mg/l) and Kinetin (0.01-20 mg/l) were added to these media. Effects of hormones on in vitro root regeneration were examined. These explants were not grown up to root regeneration. It was noticed that MS medium was better than DKW medium and calli growth was increased with 0.5-5 mg/l NAA, shoot growth was increased with 0.3-4 mg/l BA.

POSSIBILITES OF USING SOME SOILLESS CULTURE SYSTEMS OF LAUREL (LAURUS NOBILIS L.) CUTTING PROPAGATION

AYSUN BOZA¹, AYŞE GÜL²

ABSTRACT

In this study, effects of taking cuttings in different periods and soilless culture systems on rooting of Karaburun originated Laurel (*Laurus nobilis* L.) cuttings which were taken Kuşadası Dilek peninsula. For this aim, studies had been carried out in different periods as August, October, December, February, April and June. And also, aeroponic, perlite, tufa, sand, forest soil and zeolite were used as rooting media in greenhouse at Ege Forestry Research Institute in Urla. Before planting, cuttings were kept in NAA with the dosage of 5000 ppm for 10 seconds. Rooting rates of cuttings that obtained from different periods did not reach the level of statistical analysis. There were no rooting become in aeroponic system in August, but different rates of rooting from other media were obtained. Rooting rates in perlite, tufa, sand, forest soil and zeolite were respectively 15, 17.5, 12.5, 2.5 and 17.5 % . Results had suggested that there were more needs of physiological and anatomical studies about rooting of Laurel cuttings.

KEYWORDS

EFFECT OF INTRAUTERINE ALLIUM SATIVUM EXTRACT ON RECOVERY IN DAIRY COWS WITH SUBCLINICAL ENDOMETRITIS

AYŞE KILIÇ¹, ATILLA YILDIZ¹

ABSTRACT

Abstract: The current study was designed to investigate the therapeutic effectiveness of garlic extract infusion by intrauterin on recovery in cows with subclinical endometritis. This study was carried out on forty two Holstein cows with subclinical endometritis by based on the presence of > 5% PMN cells in an endometrial cytological examination from 176 clinically healthy cows at week 6–8 post-partum in a commercial dairy farm in Elazig. Bacteriological examination was performed from uterine lavage of subclinical endometritis cows. Cloves of garlic were decorticated, cut in small pieces put in a juice extractor and pressed. The obtained garlic extract was put in sterile screw cap bottles and stored in the refrigerator at 4°C for later use. Forty two cows with subclinical endometritis were randomly divided into 2 equal groups as a treatment group (group T) and a control group (group C). In group T, cows received a single intrauterine administration of 10 ml garlic extract mixed with 40 ml saline. In the cows of group C, no intrauterine treatment was administered. Samples were collected again from the all animals of both groups on day 14 after therapy and the same laboratory tests were repeated. 10 (23.8 %) out of 42 cows had subclinical endometritis without bacteria in the uterus; however majority of cows with subclinical endometritis were positive for bacterial infection (76.2%). 32 out of 42 cows (76.2%) yielded single (9 samples) and mixed type (23 samples) bacterial isolates including E. coli, Staphylococcus spp., Streptococcus spp. and Bacillus spp. in the pre-treatment uterine flushes. In group T, 18 out of 21 (85.7%) cows had sterile uterine flushes on day 14 after garlic treatment. In group C, bacterial isolates at second examination were similar to the first examination. Bacterial load in group T was significantly lower as compared to both pre-treatment and group C. The cure rate for group T and C was 100.0 and 19.0%, respectively. The results of this study demonstrate that intrauterine use of the garlic extract can be successfully used as a treatment option in subclinical endometritis because it reduces uterine infections and endometrial inflammation in subclinical endometritis cases.

**ORNAMENTAL TREES AND SHRUBS WITH MEDICINAL AND
AROMATICAL QUALIFICATIONS OF ÇANAKKALE ONSEKİZ
MART UNIVERSITY DARDANOS CAMPUS**

ÖZGÜR KAHRAMAN¹, ELIF BOZDOĞAN SERT², SEMA GÜLER²

ABSTRACT

University campuses offer important contributions to urban green open spaces. There are units such as faculties, vocational schools, research centers, libraries, gymnasiums, swimming pools, guesthouses, cafés in university campuses. Social and cultural activities together with educational activities are carried out in these units. Plant design in the campus gives possibility and acceleration to social and cultural activities. It is very important to make the plant selection according to the ecological conditions. In this way, sustainable plant design can be realized. This study is carried out between 2016 and 2017 to determine the condition of outdoor ornamental plants in terms of medical and aromatic plant in Dardanos Campus of Çanakkale Onsekiz Mart University. Medicinal and aromatic plants used as ornamental plants in Dardanos Campus were identified. Information about species names, common names, botanical characteristics, used parts and content of these plants was given.

MEDICAL IMPORTANCE AND PRODUCTION OF SPIRULINA PLATENSIS

BETÜL GÜROY¹, DERYA GÜROY¹

ABSTRACT

Spirulina (*Arthrospira*) *platensis* is biotechnologically valuable in its metabolites and is a microalgae of the Cyanobacteria class. With Spirulina biomass, high-value products such as essential amino acids and essential fatty acids as the primary metabolite and phycocyanin as the secondary metabolite are obtained. Among these high-value metabolites, it is known that phycocyanin pigment has nutritional and therapeutic properties. It has been reported in several studies that the phycocyanin from *Spirulina platensis* has positive health benefits that promote immune function, inhibit cancer cell growth and regenerate zooblast. *Spirulina (Arthrospira) platensis* is produced in large scale at Yalova University and various studies are carried out to obtain high purity phycocyanin pigment. In this presentation, it is aimed to emphasize the necessity of producing *Spirulina* widely as a plant-based and healthy organic food, as well as the potential benefits to health and disease.

**CHEMICAL COMPONENTS AND ANTIMICROBIAL AND
ANTIOXIDANT ACTIVITIES OF NEST MATERIALS VESPA CRABRO
GERMANA CHRIST, 1791 (HYMENOPTERA: VESPIDAE) IN TURKEY**

ÖMER ERTÜRK¹, MELEK ÇOL AYVAZ¹, ZEYNEP KOLÖREN¹

ABSTRACT

Social wasp nests serve as a place for rearing brood and the centre for their nesting activities. The wasps belonging to Vespinae use paper pulps that are obtained from a mixture of oral secretions and plant fibers to construct their nests. They collect plant fibers from nearby environment. The oral secretion protect their nest from the effects of rain and weathering. Social wasps build their nests in nature by using various organic and inorganic materials. In this study, the total phenolic content, antioxidant potentials based on ferric reducing antioxidant power (FRAP) and DPPH radical scavenging activity, biochemical composition and antimicrobial activity of the ethanol extract of *Vespa crabro germana* Christ, 1791 nest collected from Trabzon in East Black Sea Region were investigated. Diffusion disk plates method was used for determination of antibacterial and antifungal activity against 8 bacterial and 2 fungi species. The ethanol extract of the investigated nest sample showed maximum antimicrobial activities against *Proteus vulgaris*, *Bacillus subtilis*, *Micrococcus luteus* and *Candida albicans*. On the other hand the minimum activities obtained against *Pseudomonas aeruginosa*, *Yersinia enterocolitica*, *Aspergillus niger* and *Klebsiella pneumoniae*. Obtained values for antimicrobial activity of nest extract was comparable with the values of standard antimicrobials, (Ampicillin, Cefazolin, Nystain). Total phenolic content (TPC) of sample extract was analyzed using Folin–Ciocalteu assay. TPC was calculated as 0.56 mg gallic acid equivalent/g sample. FRAP value was calculated as 1.94 mg trolox/g sample. DPPH radical scavenging activity of the extract was also calculated as 0.88 mg trolox/g sample. GC-MS analysis of the sample was performed using GC-MS (Shimadzu 2010 Series GC- Shimadzu QP 2010 Plus Series MS) equipped with a column (Teknokroma TRB 5-MS, 30 m×0.250 mm i.d.; film thickness 0.25 µm) according to solid phase microextraction (SPME) technique and 44 compounds were identified. As a result of detailed assessment, two peak pointed out with retention times of 25.239 and 45.860 belong to 1,2-Benzenedicarboxylic acid, diethyl ester and 9-Tricosene compounds, respectively. Apart from these, other prominent peaks belong to 1,1,1,5,7,7,7-Heptamethyl-3,3-bis(trimethylsiloxy)tetrasiloxane, Eicosamethylcyclododecasiloxane, Tetracosamethylcyclododecasiloxane, Octadecamethylcyclononasiloxane, Hexacosane, 1H-Purin-6-amine. The presence of these compounds with bioactive potential, add value to investigated sample extract with a pharmaceutical meaning as antifungal, antibacterial, antiviral agents and so on. In other words, the antioxidative and antimicrobial potential of the nest sample could be attributed to presence of these compounds. Thus, the nests used for rearing brood and several activities by social wasps, have a precaution in terms of biological activities.

TOTAL PHENOLIC CONTENT AND ANTIOXIDANT CAPACITY OF CORIANDER

ELIF FEYZA TOPDAS¹, MEMNUNE SENGUL¹

ABSTRACT

The present work aimed to proceed to the total phenolic content and the antioxidant activity of coriander (*Coriandrum sativum* L.) wıch harvested in Erzurum. The coriander was lyophilized and then extracted with water. In order to performed the antioxidant activity of water extracts, various in vitro methods such as β -carotene bleaching, 2,2-diphenyl-1-picryl-hydrazyl free radical (DPPH \cdot) scavenging activity, 2,2'-azino-bis (3-ethylbenzthiazoline-6-sulfonic acid) radical (ABTS \cdot +) scavenging activity were used. Also, total phenolic content was determined by Folin Ciocalteu method. In this method standard graphic calibration curves were obtained using known quantities of standard gallic acid ($y = 0.0009x - 0.0853$, $R^2 = 0.972$). Results indicated that coriander contained remarkable phenolic compounds (277 mg GAE/g). DPPH \cdot and ABTS \cdot + are stable free radicals, which have been widely accepted as a tool for estimating free radical scavenging activities of antioxidants. Water extract of coriander exhibited a radical scavenging activity against both radicals in a concentration-dependent manner. IC₅₀ values for DPPH \cdot and ABTS \cdot + methods were 52.53 mg/ml and 83.10 mg/ml, respectively. The antioxidant activity of coriander water extract was found to be 41.58% with β -carotene bleaching method. The presented results clearly demonstrate that water extract of lyophilized coriander has antioxidant activity and radical-scavenging activity in various antioxidant systems in vitro. These activities of coriander can be attributed to its content of phenolic compounds.

USAGE OF ALOE VERA IN MEAT AND MEAT PRODUCTS

CEMALETTİN SARIÇOBAN¹, SABİRE YERLİKAYA²

ABSTRACT

Fresh meat is rich in terms of protein (18-20%); has enough mineral and carbohydrate for microorganisms; has proper pH value (~5,6) and its moisture content is high. Because of these reasons, meat plays a part in range risky foods that can be spoiled by microorganisms. Nowadays, consumers' numbers who investigate the components of foods they buy has been increased. Conscious consumers go towards to foods minimal processed and doesn't have chemical preservatives. Because of this reason; the attention, for natural preservatives that extend the shelf-life unless putting the food safety in danger increased. So on the one hand the studies different concentration and combinations of spices are carried out, on the other hand the antimicrobial and antioxidant activity of some plants except spices are started to investigate in foods. There are some studies with natural plants as mustard, rosemary, lavender, sage, sumac vb. Researchers found useful effects of these plants for foods. Besides that there are some studies about Aloe vera (L) Burn. fil. extract. Laxative, antienflamatuar, immunostimulant, antiseptic, healers of wound, anti-tumour, antidiabetic activity of Aloe vera are found from these different studies. It is thought that reason of these effects of Aloe vera is its antioxidant activity. Besides antioxidant activity, it is emphasised that reason of these effect can be its antimicrobial activity. But in a study, carrying out with Aloe vera, green tea and amla extract in meat products, it is found that Aloe vera's antimicrobial activity is lower than the others. But besides these, there are some studies that Aloe vera are practised with different chemical substance (glycerol, tween 80 ect.) in foods. It is found that Aloe vera has effects to extend shelf-life at the end of these studies.

INVENTORY AND PRODUCTION PLANNING OF MEDICAL AND AROMATIC PLANTS [ADIYAMAN PROVINCE]

AHMET ÜNVER¹

ABSTRACT

Due to the absent of inventory and planning data of the non-wood forest products within the borders of Adıyaman Forest Management Directorate which subsidiary of Şanlıurfa Regional Directorate of Forestry, inventory of non-wood forest products was made in Adıyaman province center, Çelikhan, Gölbaşı and Kâhta districts. The economic size of the industry has been sought to be determined by amount of products of 10 medicinal and aromatic plant products with economic value, the current production potential and the amount of product to be added to agricultural production. 1- Licorice root, 2-Turpentine, 3-Gall oak, 4-Rosehip 5-Thyme Tymbra, 6-Thyme Thymus, 7-Thyme Satureja, 8-Hawthorn, 9-Sage, 10-Sumac; With the inventory and planning studies; The medical and aromatic plant sector, which is the main raw material of many sectors including food, medicine and cosmetics in the world and in our country, is aiming to reveal, plan and develop the existing potential in Adıyaman province, to mobilize the idle potential for local and national economy. It is expected to contribute to the development of the agro-based industry, to increase the production of organic products, employment in agriculture and industry, to develop new products and to develop marketing opportunities.

ESSENTIAL OIL COMPOSITION OF *TANACETUM ARGENTEUM* SUBSP. *ARGENTUM* (ASTERACEAE) FROM TURKEY

MINE KÜRKCÜOđLU¹, MURAT KURSAT², BELMA KONUKLUGİL³

ABSTRACT

The genus *Tanacetum* is one of the largest genera in the Asteraceae family and this genus is represented by 59 taxa in Flora of Turkey. After the revision of this genus the total number has reached to 60 taxa and 27 taxa are endemic to Turkey. Some members of this genus have traditionally been used in insecticides, cosmetics, balsams, dyes, medicines, and preservatives. Previous phytochemical studies on *Tanacetum* species revealed some secondary metabolites such as essential oils, sesquiterpene lactones, flavonoids. Some species of the genus *Tanacetum* have been also reported for antimicrobial, insecticidal, herbicidal, antihelminthic activities and antioxidant activities. The essential oils of *Tanacetum* species have been the subject of several investigations. Essential oils of this genus have been exhibited bioactivities like, antimicrobial, anti-inflammatory and cytotoxicity etc. The objectives of this study was to determine the essential oil composition of *Tanacetum argenteum* subsp. *argenteum* (an endemic species in Turkey). Dried flowers of *Tanacetum argenteum* subsp. *argenteum* were hydrodistilled to obtain essential oil that was then analysed by GC and GC/MS. 90 compounds were identified representing 89.4% of the oil and Santolinatriene (6.8%), α -Pinene (6.3%) and 1,8-cineole (5.7%) were detected as main constituents.

EFFECTS OF RUTIN AND QUERCETIN ON 5-FU-INDUCED HEPATOTOXICITY IN RATS

VOLKAN GELEN¹, EMİN ŞENGÜL², SEMİN GEDİKLİ³, GÖZDE ATILA¹, HAMİT USLU⁴, MUSTAFA MAKAV¹

ABSTRACT

Introduction and aim: 5-Fluorouracil (5-FU), a anticarcinogenic agent, is widely used in the chemotherapy. At high doses of the 5-FU causes hepatotoxicity. Antioxidants are agents that prevent oxidative stress and oxidative stress mediated tissue damage. Quercetin (Q) and rutin are natural flavonoids and antioxidant in many fruits, herbs, leaves and vegetables. Our aim in this study investigations protective effects of Q and rutin on 5-FU-induced hepatotoxicity. Method: In the present study used weight 200-250 g 48 piece Sprague Dawley male rats. Rats were divided randomly into eight group (n=6). The control group was intragastric (i.g.) corn oil (1 ml) for 21 days. The 5-FU group rats were ig corn oil for 21 days and 18th day injected intraperitoneal (i.p.) a single dose of 5-FU 50 mg/kg. Group Rutin50+5-FU and Rutin100+5-FU were respectively ig 50 mg/kg and 100 mg/kg rutin for 21 days. These groups were single dose of 5-FU (50 mg/kg) in the 18th days of application rutin. The group Rutin100 was rutin (100 mg/kg-i.g.) for 21 days. Group Q50+5-FU and Q100+5-FU were respectively i.g. 50 mg/kg and 100 mg/kg quercetin for 21 days. These groups were single dose of 5-FU (50 mg/kg) in the 18th days of application quercetin. The group Q100 was quercetin (100 mg/kg-i.g) for 21 days. In the end experimental applications, blood was collected from anesthetized rats and rats were scarified. Serum was separated by centrifugation and utilized for the evaluation of various enzymes (AST, ALT, LDH, ALP). The hepatic tissues used for biochemical (oxidative stress) and histopathological analysis. The data were analyzed by Tukey test in the one-way ANOVA. Results: When data are showed compared among groups that in the MDA level was significantly higher in the 5-FU group compared with other groups (P<0.05). GPx and GSH levels were significantly decreased in the 5-FU group compared to the control, Rutin100+5-FU and Q100+5-FU groups. AST, ALT, LDH and ALP levels in the serum were significantly increased in the 5-FU group compared with the other groups (P<0.05). The histopathological examination of hepatic tissue determined in the 5-FU group had significantly degeneration hepatocyte. In the Rutin50+5-FU and Q50+5-FU treatment, hepatocyte degeneration and connective tissue deposition were reduced. In the Rutin100+5-FU group tissues were seen nearly normal hepatic structure. Conclusion: In this study was determined that the of Rutin and Q have protective effects on 5-FU-induced hepatotoxicity.

EFFECTS OF DIFFERENT DOSES OF CINNAMOMUM CASSIA EXTRACT ON OXIDATIVE STRESS INDUCED BY TYPE II DIABETES IN MUSCLE, BRAIN AND EYE TISSUES OF RATS

GÖZDE ATILA¹, HAMIT USLU², VOLKAN GELEN¹, MUSTAFA MAKAV¹

ABSTRACT

Type II diabetes is a metabolic disease characterized by hyperglycemia that occurs due to the inadequacy of carbohydrate metabolism and the development of insulin resistance. Metformin is the only antidiabetic drug that has been used in the treatment of type II diabetes for many years and has been developed and approved from the herbal source. It was obtained from *Galega officinalis*. Surveys has become widespread in this area, assuming that plant sources have less toxic and less side effects than synthetic ones. Chronic complications of diabetes (neuropathy, myopathy, retinopathy, nephropathy...etc) develop due to long-term hyperglycemia and it is thought that increased free radicals are effective in the pathogenesis of these complications. For this reason, the aim of in this study were investigated the effects of different doses of *Cinnamomum cassia* (CN) extract on oxidative stress induced by type II diabetes in muscle, brain and eye tissues of rats. Sixty female Sprague-Dawley female rats were used in the study, all of which were 2-3 months old, was be randomly divided into 6 group of 10 animals in each group. *Cinnamomum cassia* barks were purchased from local market and were powdered finely. 50 gr of the plant material and 250 ml of ethanol were extracted in Soxhlet apparatus for 6 hours. Then, the extract was evaporated to dryness and 9.5 gr of the extract were obtained from 50 gr plant material. Normoglycemic control group (NC), Diabetes control group (DC), Diabetes + cinnamon (500 mg/kg, 1000 mg/kg, 1500 mg/kg groups (D+CN500, D+CN1000, D+CN1500), Diabetes + Metformin group (D+M). Type 2 diabetes was induced in adult rats by a single doses given Nicotinamide (NAD) (230 mg/kg, i.p) 15 min before administration of Streptozotocin (STZ) (65 mg/kg, i.v). We waited for 7 days for steady state of hyperglycemia. Rats were defined as diabetic if their fasting blood glucose levels (FBG) were >200 mg/dl. Afterwards cinnamon extract in different doses, metformin and Dimethyl sulfoxide (DMSO) were administered to 35 days. Also DMSO was administered to the control groups to equalize stress induced by oral application in all groups. Our data show that skeletal muscle NO levels and brain, eye and skeletal muscle MDA levels were significantly higher in DC group compared to NC group ($p<0.001$). Skeletal muscle NO levels were found significantly lower in D+CN500, D+M ($p<0.01$), D+CN1000 and D+CN1500 ($p<0.05$) groups than those of DC group. However, it was found out that no significance had been present in the eye and brain tissues NO levels. Skeletal muscle MDA levels were found significantly lower in D+CN500, D+CN1000 and D+CN1500 groups than those of DC group ($p<0.001$, $p<0.01$ respectively). Moreover, different doses of CN extract and metformin administered significantly decreased MDA levels in eye ($p<0.001$) and brain tissues ($p<0.05$, $p<0.01$, $p<0.001$ respectively). Eye GSH and brain GSH-Px levels were determined significantly lower in DC group with respect to the NC group ($p<0.01$, $p<0.05$ respectively). In conclusion, the data obtained in

STIMULATION OF ANTIOXIDANT SYSTEM BY HUMIC SUBSTANCES TO ALLEVIATE OF DAMAGE INDUCED BY CADMIUM STRESS IN WHEAT (*TRITICUM AESTIVUM*)

CEYDA OZFIDAN-KONAKCI¹, EVREN YILDIZTUGAY², MUSTAFA KUCUKODUK²

ABSTRACT

The use of humic acid (C187H186O89N9; HA) is a promising natural resource to be utilized as an alternative for increasing crop production. It is a naturally occurring polymeric organic compound and is produced by the decay of organic materials and is found in soils. Taking advantage of the complexing properties, various micronutrients are further complexed with HA to form chelates. Cadmium (Cd) is highly toxic to plants, water soluble and therefore promptly adsorbed in tissues and its presence greatly influences the entire plant metabolism. Cd induces a number of changes, such as growth inhibition, the inhibition of photosynthesis, changes in enzyme activities, and the formation of free radicals. HA, which is commonly used as a soil supplement in agriculture, can be alleviate the Cd-induced damage in plants. Moreover, the information is unknown about the effects of HA on alleviating the harmful effect of Cd stress on antioxidant defense system in *Triticum aestivum*. The present study is aimed to study the effects of exogenous HA on water content (RWC), proline content (Pro), hydrogen peroxidase (H₂O₂), activities of some antioxidant enzymes and lipid peroxidation (TBARS) were investigated in leaves of Cd-stressed wheat. For this, three-weeks-old wheat plants were treated with 100 and 200 µM Cd stress with/without HA (750 and 1500 mg L⁻¹) treatments for 7 days. A decrease in RWC and an increase in activities of catalase (CAT) and peroxidase (POX) were observed in response to increasing levels of Cd concentration. These changes were observed more pronounced in 200 µM Cd stress-treated wheat. However, in Cd-stressed wheat, exogenous HA application resulted an alleviation on RWC and a decline in H₂O₂ content. Also, when comparison to the plants treated with stress alone, added HA to Cd-stressed wheat significantly decreased TBARS content and significantly enhanced the activities of superoxide dismutase (SOD), POX and ascorbate peroxidase (APX). It could be concluded that exogenous HA may have the application possibility for a future practical trial of stress reduction leading to mitigated heavy metal toxicity and improved the water content and the antioxidant enzyme activities in wheat leaves.

RADICAL SCAVENGING AND ANTIOXIDANT ACTIVITY OF EXOGENOUS TANNIC ACID IN RICE (*ORYZA SATIVA*) ROOTS EXPOSED TO CADMIUM INDUCED-HEAVY METAL STRESS

ESMA ACIKEL¹, EVREN YILDIZTUGAY¹, CEYDA OZFIDAN-KONAKCI², MUSTAFA KUCUKODUK¹

ABSTRACT

Cadmium (Cd) is a dangerous heavy metal that is toxic to many organisms. This metal can accumulate in the environment as a result of anthropogenic activities and its main sources are herbicides, pesticides, chemical fertilizers, irrigation with contaminated water and pollutants from industrial processes. Although Cd is a nonessential element, it can be easily taken up by plants, causing morphological, structural, biochemical, physiological dysfunctions and alteration of transcript profile. Tannic acid (TA) is a widely distributed plant polyphenol. Tannic acid is composed of a central glucose molecule derivatized at its hydroxyl groups with one or more galloyl residues. Considerable amounts of experimental data on the antioxidant activity of TA have been reported to be effective antioxidant in vitro assay including reducing power, superoxide anion radical scavenging and hydrogen peroxide scavenging. However, our limited knowledge about the alleviation of TA treatment on Cd stress-associated metabolism in plants remains a major gap in our understanding. Therefore, the aim of the present work is to investigate effects of exogenous TA on water content (RWC), proline content (Pro), hydrogen peroxidase (H₂O₂), activities of some antioxidant enzymes and lipid peroxidation (TBARS) were investigated in roots of Cd-stressed rice (*Oryza sativa*) roots. For this, three-weeks-old rice plants were treated with 100 and 200 μ M cadmium (Cd) with/without TA (25 and 50 mM) treatments for 7 days (d). Stress treatment caused a decrease in RWC. Although the activities of catalase (CAT) and peroxidase (POX) increased when rice roots were exposed to Cd-induced oxidative stress, induction of these antioxidant enzyme were inadequate to detoxify extreme levels of radical, as evident by hydrogen peroxide (H₂O₂) and TBARS content. However, in Cd-stressed rice roots, TA application significantly resulted an increase on superoxide dismutase (SOD), POX and ascorbate glutathione (APX). However, compared with the plants treated with stress alone, exogenous TA application markedly decreased H₂O₂ content and TBARS levels. Finally, our data confirm that TA addition to Cd-stressed roots was able to cope stress-induced oxidative damage by protecting the water content and antioxidant defense system in rice roots.

BIOACTIVE AND AROMATIC PROPERTIES OF DIFFERENT LOQUAT VARIETIES

MEHMET FATİH ERKOLENİK¹, AHMET ABDULLAH US¹, OSMAN SAGDİC¹, MUHAMMET ARICI¹

ABSTRACT

The most-produced loquat (*Eriobotrya japonica* Lindl.) as tea in the world is mostly consumed as fresh fruit in Turkey. Loquat has many varieties. There are very few researches in which, the differences of bioactive properties among the loquat varieties are studied. In this research, the amount of bioactive properties (total phenolic content, total flavonoid content, antioxidant capacity) and aromatic properties of dried extracts of the most cultivated and consumed loquat varieties; Yuvarlak Çukur Göbek, Hafif Çukur Göbek, Uzun Çukur Göbek, Gold Nugget and Akko XIII are determined. The purpose of this work is to investigate which type of loquat among 5 types which also known as "Yenidunya" and generally cultivated in Mediterranean area of Turkey is more suitable than the other types of loquat for food industry, by determining bioactive and aromatic properties. The amount of total phenolic, flavonoid, antioxidant and aromatic properties belonging to loquat varieties were determined. In conclusion, dry matter; 87.12-91.00%, total phenolic content; 2954.50-5071.62 mg/kg as gallic acid equivalent (GAE), total flavonoid content; 1189.01-2020.78 mg/L as catechin equivalent, antioxidant capacity with DPPH method; 2506.49-3738.56 mg/L as trolox equivalent, antioxidant capacity with CUPRAC method; 11.79-19.40 mg/L as trolox equivalent, were found in loquat varieties. In all loquat varieties except one (Uzun Çukur Göbek variety), "acetic acid (CAS)" was found as the most dominant flavour component. "l-Limonene" was identified as the most effective aroma component and the second most dominant flavour type is "2-Butanone, 3-hydroxy- (CAS)" in all varieties except for only one variety (Uzun Çukur Göbek variety).

DETERMINATION OF EFFECT OF NITROGEN FERTILIZATION ON SOME QUALITY PROPERTIES OF SAHLEP ORCHID (*ORCHIS SANCTA L.*) CULTIVATED IN FIELD CONDITIONS IN TURKEY

OLCAY ARABACI¹, UđUR TAN¹, ÖZGE YILDIZ², MEHMET TUTAR²

ABSTRACT

Turkey has rich biodiversity because it was located at the inter section of Europe-Siberia, Mediterranean and Iran-Turan flora regions. Orchidaceae family has a distinct place with in rich biodiversity. It has been reported that a total of 204 orchid species belonging to the 24 genera and 49 hybrids are grown in Turkey. Seventeen species of Turkish orchids contain tubers. Excluding six of them (*Coeologlossum*, *Gymnadenia*, *Listera*, *Spiranthes*, *Stenopogon*, *Traunsteinera*), others (*Aceras*, *Anacamptis*, *Barlia*, *Comperia*, *Dactylorhiza*, *Himantoglossum*, *Neotinea*, *Ophrys*, *Orchis*, *Platanthera*, *Serapias*) are benefited from the use of sahlep. Sahlep has been obtained as a result of the natural collection of tubers of Orchidaceae family. The exports of the sahlep orchids were banned in 1974 by the Ministry of Agriculture due to very high destruction of natural distribution areas of the plant. Despite the fact that nowadays the sahlep plants are protected by laws, the tubers of sahlep orchids still have been collected by people. Washing, boiling in water or milk, washing in cold water and drying stages are used to prevent the sahlep tubers to stop its growing activity. After that, by grinding, the tubers are prepared to ready-to-use sahlep powder. Sahlep drinks were prepared in two ways, with milk or plain. According to the conventional method, sahlep powder and starch are put together in water or milk, and it is boiled by mixing slowly. All of the sahlep production is provided by collection of sahlep orchids tubers from nature. For one kilogram of sahlep, 1000-4000 tubers are used. And it is assumed that our country produces 45 tons of tubers per year. Cultivation of highly requested plants is necessary for conservation and sustainable use of natural resources. *Orchis sancta L.* is one of the most commonly collected species from the nature in the Aegean Region. This study was carried out to determine the effect of nitrogen fertilization on some quality characteristics of *Orchis sancta L.* grown in field conditions in order to take in part into agricultural cultivation of sahlep orchids. In the study, the effect of four fertilizer doses (0, 5, 10 and 15 kg/da) was investigated on starch ratio (%), mucilage ratio (%), protein ratio (%), moisture ratio (%), dry matter ratio (%) and ash ratio (%). Mucilage rate (sahlep mannia) was found to vary between 14% and 26% according to nitrogen fertilizer doses.

**EFFECT OF DIFFERENT HARVEST TIMES ON SOME QUALITY
CHARACTERISTICS OF CULTIVATED SALEP ORCHID SERAPIAS
VOMERACE (BURM.FILL.) BRIG.**

OLCAY ARABACI¹, UđUR TAN¹, OZGE YILDIZ², MEHMET TUTAR²

ABSTRACT

Salep orchids are used as medicinal plants in Turkey as a diarrhea stopping, restorative food for ulcers and upper respiratory ailments. Also the main ingredient of traditional Turkish ice cream and sahlepe drinks is obtained from the tubers of wild orchids. It is reported that sahlepe is obtained from 38 different orchid plants belonging to 10 different genera in Turkey. Sahlepe had not standard chemical composition due to obtain from different species of Orchidaceae in different regions. Also sahlepe composition shows a fairly large change depending on the period that collected. In order to protect the Orchidaceae species in Turkey, "Salep" export is prohibited since 1974. Although there was a ban on exports still millions lump removed from nature every year and exported to many countries, especially European countries. Continuously collected tubers were not find any chance the produce seeds and even if it produce seeds these seeds having difficulty to germinate. Many in vitro studies were conducted by the researchers for the culture of orchids and orchid tubers have failed to adapt outdoor conditions. Intense collection of some species of sahlepe orchids made it compulsory to take necessary measures without delay. Aim of this study investigates the effect of different harvest times on some quality characteristics of *Serapias vomerace* (Burm. fill.) Brig. species which one of the most collected species in the Aegean region. In this study, starch content (%), mucilage rate (%), protein content (%), relative humidity (%), dry matter content (%) and ash content (%) was investigated. According to the Harvest time, mucilage rate was found between %16-23.

EVALUATION OF EFFECTS OF OLEUROPEIN AND THYMOL ALONE OR IN COMBINATION AGAINST INDOMETHACIN INDUCED ULCER IN RAT

FATİME GEYİKOĞLU¹, SERAP UCAR¹, KUBRA KOC¹, SALİM CERİG¹, NİHAL SİMSEK ÖZEK¹, HUSEYİN SERKAN EROL², SERKAN YILDIRIM³

ABSTRACT

Oleuropein (Ole), predominant natural constituent of leaves of the olive tree, presents several of pharmacological beneficial properties. We first explored the therapeutic efficacy of oleuropein (250 and 500 mg/kg) in Indomethacin-induced gastric mucosal injury. We also investigated the effects on gastric mucosa of Thymol (Thym), the most abundant constituent of the volatile oil of thyme, with wide dosage range (50-500 mg/kg) and hoped to understand the gastroprotective mechanism of these agents in vivo. Furthermore, we revealed the therapy profiles of overdoses of both herbal products together. Sixty female Sprague-Dawley rats were divided into twelve groups: control, ulcer control (25 mg/kg Indomethacin), Indomethacin + reference standard (50 mg/kg Rantidine hydrochloride), Indomethacin + Ole (50, 100, 250 and 500 mg/kg), Indomethacin + Thym (50, 100, 200 and 500 mg/kg), Indomethacin + Thym (500 mg/kg) + Ole (500 mg/kg). Oleuropein and Thymol was orally administered to rats after 10 minutes from induction of ulcer with Indomethacin. In addition, the highest dose of Thymol was administered with or without Oleuropein. Six hours later, the animals were anesthetized and their stomachs were removed. The histology of stomach was examined via using three different staining methods: Hematoxylin-eosin (H & E), Periodic acid Schiff (PAS), and Amyloid. The mRNA expressions of caspase-3 and TNF- α was quantified by RT-PCR and protein levels of prostaglandin E2 (PGE2) were assessed by ELISA in stomach samples. Total antioxidant status (TAS) and total oxidant status (TOS) levels were measured to determine the level of oxidative stress following the treatments. Indomethacin induced significant increases in mRNA expression of TNF- α and caspase-3, and levels of TOS, while reduced the TAS and PGE2 levels. The high doses of Oleuropein and 200 mg/kg Thymol significantly inhibited mRNA expression of TNF- α and caspase-3, and reduced oxidative stress induced by Indomethacin. In stomach tissue, histopathological observations revealed that mucosal erosions were significantly inhibited with Oleuropein and Thymol treatments. However, unlike oleuropein, the highest dose of Thymol (500 mg/kg) caused inflammation, oxidant/antioxidant imbalance and apoptotic activities. Moreover, combination treatment with Oleuropein did not provide any significant remedy. The results have clearly demonstrated the anti-ulcerogenic potential of Oleuropein and Thymol on Indomethacin-induced gastric ulcer; nevertheless, the gastroprotective activity of oleuropein in the wide dose range was superior to Thymol due to more multi-pathway regulation than Thymol.

ANTIMICROBIAL PROPERTIES OF ESSENTIAL OILS AND EVALUATION OF THESE OILS AS A FUNCTIONAL FOOD COMPONENT

ÜMIT GEÇGEL¹, OSMAN ŞİMŞEK¹, ŞEFİK KURULTAY¹, DEMET APAYDIN¹, GIZEM ÇAĞLA DÜLGER², RECEP GÜNEŞ³, İSMAIL YILMAZ¹

ABSTRACT

Essential oils are aromatic and volatile liquids obtained from plants or various parts of these plants such as, flowers, roots, shells, leaves, seeds and fruits by solvent extraction, pressing, steam or hydro distillation. Since essential oils are subject for pharmacological studies, testing their antimicrobial activity as well as using them in various foods to extend their shelf life have been studied frequently. On the other hand, many adverse effects of synthetic additives with developing technology and the prevalence of antimicrobial drug resistance against synthetic antibiotics increased the interest in essential oils derived from medical and aromatic plants. A great many research articles investigating the antimicrobial activity of essential oils have demonstrated that the results were very encouraging. In these researches antibacterial, antifungal and antiviral properties of essential oils have been proved and it has been reported that the activity of essential oil depends upon the nature, composition, and synergism of its functional groups such as, terpenes, aldehydes, ketones, esters, phenolic, alcohols, and ethers. Because of these properties of essential oils, their use as a flavoring material and antimicrobial agent in many foods and beverages has been suggested. Recently, food technologists and scientists are formulating functional foods containing these aromatic volatile oils in order to improve nutritional quality, prevent microbial spoilage and risk of food borne infections without causing loss of organoleptic properties of the food. Also, it is stated that these oils can be used in packaging films. For these reasons, it is accepted that the use of vegetable essential oils and their specific compounds may be one of the effective and potential solutions for many unhealthy synthetic food additives. Therefore, it is expected that the use of essential oils in the food industry will increase in the near future.

THYME AND THYME ESSENTIAL OIL AND THEIR POTENTIAL USE IN FOODS

ÜMIT GEÇGEL¹, ŞEFİK KURULTAY¹, OSMAN ŞİMŞEK¹, GIZEM ÇAĞLA DÜLGER², DEMET APAYDIN³, RECEP GÜNEŞ⁴, İSMAIL YILMAZ¹

ABSTRACT

Thyme, is broadly used in different countries of the world as folk medicine for its carminative, immunostimulant, digestive-eupeptic, expectorant, antispasmodic, anti-inflammatory, and antitussive-bronchodilator features. Thyme plant includes approximately 100 species, found in Mediterranean countries such as Spain, Italy, Algeria, France, Turkey, Portugal and Morocco. Thyme is cultivated primarily in these countries for the production of fresh and dry herbs, essential oil and oleoresin. On the other hand, it has been generally considered as spice. Many thymus species are used in various regions of the world. There are about 39 species of the genus *Thymus* grown in Turkey. Thyme essential oils have some anti-inflammatory and hepatoprotective properties and thyme oils and extracts are thoroughly used in pharmaceutical, cosmetic, perfume and flavor industries. Thyme essential oil extracted from fresh thyme leaves can be used for antioxidant potential and antimicrobial properties in many different food. High antimicrobial activity of thyme species results from their phenolic components. The chemical composition of the thyme oil is reported as thymol, p-cymene, γ -terpinene, myrcene, carvacrol and α -terpinene. Fatty acid composition was analyzed and nine fatty acids were identified. Among these fatty acids, C18:1 and C18:2 were major fatty acids. Because of high C18:1 and C18:2 levels, thyme oil may be nutritionally valuable. And also this oil can be used in food, cosmetics and pharmaceutical products to restrict microbial activity.

MORPHOGENETIC VARIATION FOR ESSENTIAL OIL CONTENT AND COMPOSITION OF SAGE (*SALVIA OFFICINALIS* L.) IN ÇUKUROVA CONDITION

CEMRE PALA¹, TUNCAY ÇALIŞKAN¹, HASAN MARAL², EBRU KAFKAS³, SALIHA KIRICI⁴

ABSTRACT

In this research were conducted for morphogenetic variation on yield and essential oil content and composition in *Salvia officinalis* L. in 2016 at the Research Area of Department of Field Crops, Faculty of Agriculture, Çukurova University, Adana. Field trial was arranged randomized complete block design, with three replications. Seed of sage was sowing December, 17 at 2015 in the green house. Seedling was transferred to field at March 31, 2016. The plants was harvested on November 29, 2016. After harvest, imminently all plant material were separated in to three part, lower (1/3), middle (1/3) and upper (1/3) for morphogenetic variation and fresh herb weight were determined each part. In the research, it was determined that plant height (37.28 – 52.84 cm), fresh herbage yield (608-822 kg da⁻¹), drug herbage yield (236-259 kg da⁻¹) and essential oil content (1.65 – 2.32 %). The highest essential oil content was obtained as 2.32 % from upper part of plant. The lowest one (1.65%) was obtained from lower parts.

CONE AND SEED CHARACTERISTICS IN THE STONE PINE FOREST IN KOZAK BASIN (BERGAMA)

MEHMET SAYMAN¹, MEHMET GÜVEN¹, GIYASEDDİN AKBIN²

ABSTRACT

In the study; the cones, harvested from production areas of Stone pine (*Pinus pinea* L.) which are considered as less efficient and productive by the producers in Kozak Basin, were used. The samplings were made in different areas of 11 villages in the basin. It was worked with 33 cones (total 66) taken from areas that are considered as less efficient and productive. Diameter, height, weight, quantity and occupancy rates of cones and seed extracted from cones were determined. At the result of evaluation of the data; significant differences were found in terms of fresh cone weight, the amount of seed obtained from the cones, seed weight, occupancy rate and internal peanut weights. There were no significant differences in cone diameter and length, total seed quantity, empty seed quantity, seed diameter and size.

PHYTOCHEMICAL CONTENT AND ANTIOXIDANT CAPACITY OF ALOE VERA

FATMA BÜŞRA ALAN¹, CEMAL KASNAK¹, RECEP PALAMUTOĞLU¹

ABSTRACT

Aloe vera is a perennial watery plant belonging to the family Aloeaceae and subfamily Asphodelaceae. It is found in the arid regions of Africa, Asia, Europe and America and has more than 360 different species. It grows in the Mediterranean, Aegean and Marmara regions in our country and the local name is sarısabır. Aloe vera is considered a healing plant and has been used for centuries to treat injuries. Aloe vera is widely used in alternative treatments for various disease types. Aloe vera used as herbal treatment in skin diseases such as eczema, skin ulser and psoriasis. Many studies reveal the utility of this herb in the treatment and cosmetics, but the study of nutritional properties is scarce. It contains vitamins (E, C and A), minerals, amino acids and enzymes. It has low fat and high fiber content. It also has antioxidative capacity and carries a functional nutritional potential in terms of the phytochemicals it contains. Therefore, we aimed to determine the antioxidant potential and the phytochemicals contained in Aloe vera plant in our research. We performed 2,2-diphenyl-1-picrylhydrazyl (DPPH) analysis showing antioxidant capacity, total phenolic substance determination by spectrophotometric method, total flavanoid content, pH, dry matter, water activity, FRAP (iron reducing power) and color analysis in our study. One gram of whole leaf Aloe vera sample was homogenized in 70% methanol. Centrifuged for 15 minutes at 4000 rpm. The liquid was evaporated at 45 ° C on a rotary evaporator. It was then filtered by adding 25 mL of pure methanol. The total amount of phenolic substance in aloe vera is 318,49 mg / kg, flavanoid amount is 81,30 mg / kg, dry matter is 9,15%, pH is 5,81, color L is 55,85, a is -6,64, b is 26.37, a water activity of 0.955 aw, FRAP 5650 mg trolox equivalent/ kg and an antioxidant capacity of 65 %.

FUNCTIONAL FOOD PROPERTIES OF GARLIC AND CURRENT APPROACHES

SELEN AKAN¹, RUHSAR YANMAZ¹

ABSTRACT

Garlic (*Allium sativum* L.) has been widely used for hundreds of years due to its nutritive and therapeutic properties. Interest and popularity of garlic have been increased by clinical trials in recent years. Besides rich nutritional content, garlic has a health promoting properties with antibacterial, antifungal, antimicrobial, antioxidant, antiviral, anticarcinogenic, hypoglycemic and cholesterol-lowering, digestive, respiratory and immune system strengthening as well as using treatment of gynecological, skin, and cardiovascular diseases. Consumption of garlic is increasing day by day thanks to this medical features. However, although it is known as a miracle food, it can not be consumed in enough quantities in all societies due to its unpleasant odour and bitter. For this reason, alternative ways of consumption of garlic have been researched by scientists and so activities for processed garlic products have been increased rapidly. Nowadays, it is seen that it covers a great deal of space in the canning, vegetable oil, chemistry, cosmetics and pharmaceutical industries besides the food industry thanks to the initiatives and investments made by industrialists in different sectors. In this review, it is aimed to give information about the current research results on the functional use of garlic including processed garlic products and recognize products of garlic visullay on markets.

GARLIC TEA

SELEN AKAN¹

ABSTRACT

Herbal teas have been introduced to my country by Far Eastern Countries and China. The most popular teas along with fruit extracts are green, red, white and black tea as well as 'Ginseng' (Chinese herbal plant tea) and 'Oolong' (black Chinese tea). People have shown interest in medicinal plants and have investigated the functional uses of these plants for centuries. In recent years, garlic is one of the prominent foods with its functional and medical properties. As a result of supporting the therapeutic properties of garlic with clinical studies, the tendency towards consumption of garlic has increased and different ways of using garlic have been sought. For this reason, it has also been discovered that was used as a tea in recent years. It is widely consumed in China and Japan. As a result of the studies, it was determined that garlic tea contains protein, saponin, flavonoid and vitamin A, B2, B6, C. In terms of minerals, it has been shown that it is rich in Ca, Cu, Fe, I, Zn and Se contents as well as sulphur compounds. Thanks to its rich nutritional content, it has a protective and therapeutic effect against many diseases. According to the results of the researches; it is effect to sore throat, coughing, respiratory infections, hoarseness, bronchitis, sinus congestion, digestive system disorders and headache. It has strong antioxidant and antimicrobial effects similar to the green tea. This miracle tea is recommended to drink especially in the winter months in order to strengthen the immune system. The preparation of this tea is simple, practical and is described as follows; crushed 2 or 3 cloves of garlic place in a cup. Then add lemon, honey and boiled water. And then cover top of the cup and let it rest for 20 minutes. Be careful with consumption of garlic tea prepared by this way and it is recommended to drink 1 cup of cold periods a day. However, the researches on this subject are not sufficient and needed more extensive researches in the future.

ICE CREAM PRODUCTION WITH CAROB PEKMEZ (MOLASSES)

DR.ABDULLAH BADEM¹, YRD.DOÇ.DR. ZAFER ALPKENT²

ABSTRACT

Day by day, it is known that people give importance to nutrition diets in terms of health. Whether or not substances used in the production of food are natural, the amount used in production and the effect on human health have become important. In this study, low-fat ice cream was produced with rich compound carob pekmez (molasses), which has a positive contribution to nutrition, and the effect on ice cream was investigated. As a result, it has been concluded that carob pekmez can be used in the production of ice cream and that people can consume it with taste and admiration. It has also been found that low fat ice cream formulation can be achieved by use of suitable stabilizers. For ice cream production, 0,1% carrageenan gum, 0,1% xanthan gum and 0,4% locust bean gum were used in the formulation. pH, dry matter (%), fat (%), protein (%), overrun (%), viscosity values (10-20-50 rpm-cP) of the carob molasses produced were 6,31; 27,23; 3.50; 3.86; 18.99; 11.840; 6.560 and 3.344, respectively.

ANTIMICROBIAL EFFECTS OF MEDICAL AND AROMATIC PLANTS

PINAR ŐANLIBABA¹, MEHMET UFUK KASIM², REZZAN KASIM²

ABSTRACT

The important properties of plants for killer microorganisms and human health have been investigated since 1926. In recent years, it has been found that pathogenic bacteria are resistant to antibiotics because of the random use of antibiotics all over the world. Today, intensive studies are being conducted on the use of medicinal plants as an alternative to antibiotics. Today, nearly 300 plant families approximately 1/3 growing in the forest contain antimicrobial components. According to the chemical structures of the antimicrobial substances of the plant obtained from the root, stem, leaf, seed, flower and fruit, can be classified as phenolics, terpenoids and essential oils, alkaloids, lectins and polypeptides, polyacetylenes. Phenolics are grouped in themselves such as simple phenols, phenolic acids, quinones, flavonoids, flavones, flavonols, tannins and coumarins. These components on microorganisms have bacteriocidal and bacteriostatic effects. Antimicrobial activity changes depending on the type, composition and concentration of the plant, the type and load of the target microorganism. Another approach to the treatment of these rich contents in plants is phytotherapy. Phytotherapy is defined as the treatment of diseases with herbal drugs, which are therapeutic properties, or by products such as tea, drops, capsules, syrups, dragees, tablets obtained by using extraction products. It is very important that the subject specialist is used in doctor's control since these products, which are produced for the purpose of treatment, may have some side effects.

NON-EDIBLE HORSE CHESTNUT SEED OIL: ROLE OF FATTY ACIDS COMPOSITION AND TOCOPHEROL PROFILE FOR HEALTH APPLICATIONS

H. FILİZ AYYILDIZ¹, MUSTAFA TOPKAFA¹, MUHAMMED RASIT BAKIR¹, OKTAY KALKAN¹, HUSEYİN KARA¹

ABSTRACT

Non-conventional cold pressed oils are obtained from different nutty fruits or kernels and the chemical composition of oils determines their health beneficial capacities and their practical application. These oils provide a wide range of bioactive substances, such as tocopherols and tocotrienols, free and esterified sterols, hydrocarbons (squalene), triterpene alcohols, carotenoids and chlorophylls along with colorants being valuable nutrients. They also contain n-3 and n-6 PUFA or sterols having biologically active effects [1]. Horse Chestnut (*Aesculus indica* Caleb.) known as handun is a fast growing tree species mainly found in temperate regions of Asia particularly in India, Nepal, Pakistan and Afghanistan. Although horse chestnut fruit is very similar to sweet chestnut by comparing the carbohydrates, fibers, proteins, lipids, and vitamins content, It is distinguished from it due to its poisonous character of the Aesculin substance in its contents (aesculin, a bitter, poisonous glycoside that breaks down blood proteins). Therefore, taking some cold pressed oils as internally are not recommended such as horse chestnut seed oil. However, horse chestnut seeds have a broad spectrum of pharmacological activities with their rich vitamins and a wide range of active components [2]. The aim of this study was to investigate the chemical composition of locally produced cold-pressed horse chestnut seed oil by taking into account of fatty acid and tocol composition of the oil. The results showed that, cold pressed horse chestnut seed oil was observed to have high level of PUFAs% due to a high content of oleic acid (58.41%), linoleic acid (22.07%) and linolenic acid (5.63%) content. The oil also contained significantly higher amounts of γ -tocopherol as 202.02, while α -tocopherol, β -tocopherol, and δ -tocopherol content were as 63.7, 39.7, 5.00, respectively. As a conclusion, due to its above superior properties, cold pressed horse chestnut seed oil can be regarded as one of the special oils which can be used externally for health without oral intake.

THE USE OF SOME SPICES WITH ANTIOXIDANT CHARACTERISTICS IN MEAT AND MEAT PRODUCTS

AYŞENUR ÖZÇELİK¹, SABIRE YERLİKAYA², CEMALETTİN SARIÇOBAN¹

ABSTRACT

Meat and meat products can be spoiled because of its free radicals and nature rich structure. These spoilages can be more risky for the meat and meat products with mechanical, chemical processes, packaging, and heat processes. The result of oxidation are the colour (brown, grey, green), bad smell, lipid oxidation and rancidity taste that consumers do not like. As a result of these spoilages; deterioration in viscosity, gelatinization, emulsification mistakes and deterioration of hydration properties may occur in meat and meat products. Consumers, especially working mothers lean to ready-to-eat meals nowadays. Because of this reason, consumers demand increased for packaged ready-to-eat meals. Antioxidants are used to delay the deterioration of packaged meat products. Today, there are two types of antioxidants; synthetic and natural. Many studies have shown that synthetic antioxidants are harmful for health. Therefore, there is a trend towards natural antioxidants in meat and meat products. Natural antioxidants can be obtained from many plant products. However, spices are emphasized in this study. It is known that spices are aromatic plants that used in meat marinating for a long time. The antioxidant properties of spices can be used in meat and meat products for preventing the deterioration of meat without harming human health. As a result of oxidation in meat and meat products, the quality of the meat decreases, resulting in the formation of undesirable meat by the consumer and the producers suffer from great losses. The antioxidant properties of rosemary, green tea leaves, grape seed, basil, pimento, thyme, carnosine, carnitine, cinnamon, sage and many other spices have been studied and found to have an effective antioxidant property. In this study, it is aimed to investigate the antioxidant properties of spices in meat and meat products.

THE CONTRIBUTIONS OF SOME SPICES USED IN MARINATION ON PHYSICAL, MICROBIOLOGICAL AND SENSORY PROPERTIES OF MEAT

SABIRE YERLIKAYA¹, AYŞENUR ÖZÇELİK², CEMALETTİN SARIÇOBAN²

ABSTRACT

Marination is a method that has been used all over the world in order to gain some features to food before cooking. There are many functional groups used in marination. One of these functional groups is marinated meat. This marinated meat has been taken consumer's attention and has contributed to health in positive way. Spices make meat has many textural features. Beside these features meat becomes to have more tenderness, aromatic, delicious, juicy and well appearance. In addition, researches about using of natural antioxidants and antimicrobial spices against synthetic preservatives have recently been enhanced. Marined meat can increase the consumer's desire to buy, as well as it prevents forming the toxins during cooking. In this case the marinated meat, with spices that has antimicrobial and antioxidant properties, increases the shelf life. In this study, the effect of certain spices (thyme, ginger, red pepper and rosemary) used during marination on the aroma and structure of meat was investigated.

EFFECTS OF OREGANO ESSENTIAL OIL AND VITAMIN E SUPPLEMENTATION TO DISTILLERS DRIED GRAINS WITH SOLUBLES (DDGS) BASED BROILER DIETS ON PERFORMANCE AND CARCASS QUALITY

YUSUF KONCA¹, MERVE ÖZYÜREK¹, MAHMUT KALİBER¹

ABSTRACT

This study was carried out to determine the effects of Distiller's Dried Grains with Soluble (DDGS), oragano essential oil (KEY) and vitamin E (vit E) on performance and carcass quality of broilers. In the study, a total of 400 broiler chickens were distributed in 5 treatments group with 5 replicate and 16 chicks each. Treatment groups as follows: 1: Control (C, ration based on corn and soybean meal, no contain DDGS), 2: 25% DDGS in diet, 3: 25% DDGS + 300 mg / kg vitamin E, 4: 25% DDGS + 30 mg / Kg KEY and 5: 25% DDGS + 300 mg / kg vitamin E ration + 30 mg / kg KEY groups. The body weight (BW) of chickens were higher than that of DDGS supplemented group, however, KEY and vit E supplementation not affected BW of chickens. In the DDGS and KEY and KEY+Vit E supplemnted groups feed consumption were higher than those of other groups. The feed efficiency ratios were not influenced by the treatments. The DDGS supplementation caused a decrease in carcass yield and breast meat yield however increase in wing and neck yield, however, KEY and vit E addition were not affected these traits. The pH and color of breast and hip meat were not affected by the DDGS addition. The breast meat lightness (L*) were increased by the KEY addition and KEY+vit E supplementation decreased breast and hip meat's redness (a*) and yellowness (b*).

ANTIOXIDANT STORAGE; FAMILY OF SOLANACEAE

REZZAN KASIM¹, MEHMET UFUK KASIM¹, PINAR ŐANLIBABA²

ABSTRACT

Nowadays, eating habits of people changed because of the increase in the importance given to human health. Humans use nutrients not only to satiety but also to protect their health. In addition to the main food sources, carbohydrates, fat and protein-containing foods, there has also been an increase in the consumption of vegetables containing vitamins, minerals, fiber and various phytochemicals. It has recently been found that the consumption of colored vegetables is protective against various types of cancer. Tomatoes, red peppers and aubergines in the Solanaceae family are red and purple vegetables which have considerable effects on human health. Lycopene is a carotenoid found in tomato and has attracted considerable attention due to its antioxidant activity, and the anticancer effect of lycopene has been determined by doing a lot of research. Capsaicin found in pepper including capsaicinoids, which are plant secondary metabolites, is alkaloid structure and caused bitter flavor, also has analgesic, antiretroviral, antiseptic and antidiabetic properties. The antioxidant effect of nasunin, which gives a purplish purple color from the phytochemicals contained in the eggplant and belongs to the anthocyanin group, has been determined and the anticancerogenic properties are being investigated. Therefore, in this study, by examining the studies related to the subject, the antioxidant properties of tomatoes, red peppers and eggplant, which are red and purple vegetables including Solanaceae family, and the effects of these vegetables on the protection of human health have been examined.

USING OF POTTED ORNAMENTAL PLANTS TO CLEAN UP VOLATILE ORGANIC COMPOUND THAT CAUSE AIR POLLUTION INDOOR.

CENGİZ KÖSE¹, REZZAN KASIM¹, MEHMET UFUK KASIM¹

ABSTRACT

Volatile organic compounds (VOCs) are found in indoor air, and many of these can adversely affect human health. Indoor air pollution results from the release of chemical vapors and the suspension in the air of particulates such as dust and microorganisms. In response to increasing energy costs and the need to conserve energy resources, buildings and homes have been designed to be more energy efficient. Thus, many offices and new homes have tighter construction, sealing the building from the outside air. This makes it easier for indoor air pollutants to accumulate to dangerous levels. With people spending up to 70–90 percent of their time indoors, long-term exposure to indoor air pollution can cause various health problems. Poor indoor air quality has been linked to health problems, especially in children. The major sources of indoor air pollutants are combustion byproducts, building materials, household products and chemicals, and bioeffluents. Combustion byproducts include carbon monoxide, nitrogen and sulfur dioxides, formaldehyde, and tobacco smoke. Combustion byproducts are produced by gas ranges, cook tops, water heaters, clothes dryers, smokers, and internal combustion engines turned on in enclosed spaces. NASA had identified 107 VOCs, in the Skylab space station. When those chemicals, like benzene, formaldehyde, trichloroethylene, all potential carcinogens and irritants, are trapped in a closed environment such as Skylab, the inhabitants. Common indoor plants in your office or home are not only decorative, but NASA scientists are finding them to be surprisingly useful in absorbing potentially harmful gases and cleaning the air inside modern buildings. Keeping plants around the home and office purify and renew our stale air by filtering out toxins, pollutants, harmful viruses, mold spores and the carbon dioxide we exhale. With this review study, plants grown and used in the indoors, and the effects of these plants on the holding of volatile organic compounds that air pollutant and the protection of human health are examined.

METAL INDUCED GENE EXPRESSION IN MEDICALLY IMPORTANT CROP PLANTS IN BRASSICA SPS.

NURIYE MERAKLI¹, MERVE ÇETİNDÖĐAN¹, ABDÜLREZZAK MEMON¹

ABSTRACT

Brassica juncea and B. nigra are well known oil producing industrial crops grown in China, India and other south Asian countries. They are also important source of herbal medicine used in these countries including Middle East. These species commercially important in producing valuable products such as vegetable, food, seed oil and sauce-spice. The medicinal drugs produced from these plants have beneficial effect on human health. For example these herbal products reduce cancer risk, prevent cancer cell proliferation, inhibit malignant transformation and carcinogenic mutations, stimulate immune system and activate the enzymes responsible for oxidative stress inhibition. Brassica species are also well known as metal accumulators and some of them are being used for phytoremediation in contaminated soils. The Diyabekir ecotype of B. nigra collected from southeastern part of Turkey was found to be hyperaccumulator of Cu. In this study the detailed expression of the metal ATPase (PAA1 and HMA2) genes were carried out in accumulator and non accumulator B. nigra ecotypes grown at low, medium and high Cu levels using RT-PCR. Our data show that PAA1 and HMA2 play an important role in metal accumulation and detoxification. Further studies will be carried out on the beneficial effects of these plants on human health.

DETERMINATION OF GENETIC DIVERSITY OF SOME SAGE SPECIES

EBRU ÇARDAKLI¹, ADEM BARDAK², MUZAFFER ÖZDEMİR³

ABSTRACT

Sage (*Salvia* ssp.), is the most important and biggest species of Lamiaceae family and it is getting more important in the medicinal plants as they are also getting popular. The future of those species threatened by collecting from the nature and marketing. Those species must be ex situ preserved, domesticated and genetically characterized besides starting breeding programs. For this purposes in the study, 11 sage species collected from East Mediterranean were genotyped by SRAP markers and genetic differences of the species were determined. As the results of the study, average polymorphism content was 90.91%, the average allele number was 4.2, and polymorphism information content (PIC) was 0.91 and PIC values ranked in 0.04 to 0.99. The average differences of the species was 43.15% and the most diverse species was *Salvia aucheri* ssp. *Aucheri* and *Salvia aramiensis* with 61.46%, while the lowest genetic differences was determined in % 22.62 ile *Salvia tomentosa* and *Salvia hypergeia* species. In future breeding programs using the most diverse species could increase the breeding success. In addition it is concluded that the SRAP markers might be successfully used for genetic characterization studies.

DISTRIBUTION AND USES OF BIARUM GENUS AS A NEW ORNAMENTAL AND MEDICINAL PLANT IN TURKEY

SERKAN URANBEY¹, HUSSEIN ABDULLAH AHMED AHMED²

ABSTRACT

Biarumgenus has 21 species in the world and naturally grown in semi-arid and dry areas of southern of Turkey. There are 11 species in Turkey where is gene center for this genus (Biarum species existing in Turkey (B. tenuifolium (L.) Schott subsp.zeleborii(Schott) P.C.Boyce, B. davisiiTurrill, B.carduchorum (Schott) Engler, B. eximium (Schott &Kotschy) Engler, B. bovei Blume, B. ditschianumBogner&P.C.Boyce, B. marmarisense(P.C.Boyce) P.C.Boyce and B. pyrami (Schott) Englervar.pyrami,B.carduchorum (Schott) Engler.Biarum species which are morphologically and taxonomically very similar to Arum and Dracunculusgenus are also used for folk medicine in Turkey. The genera has interesting flowers and contain important medicinal volatile organic compounds together with the striking inflorescence. All species of the genera are thermogenic and the flowers of genus very attractive for many insect species belonging to many families. The plants of the genus start growth at the beginning of autumn and the growth continues until spring. Also, plants of the genus are resistant to heat and drought conditions, because the plants are generally dormant at the start of summer heat and drought. The majority of species blossom in autumn and early winter in Turkey. Horticultural popularity of Biarumspecies among European garden enthusiasts has been recently increasing, therefore, these species may be alternative crop as a new ornamental and medicinal plant in Turkey.

A RESEARCH ON THE SOCIO-ECONOMIC STRUCTURE OF THE ACTORS WHO SELL MEDICAL AROMATIC AND SPICE HERBS (CASE OF TOKAT PROVINCE)

ESRA GÜREL¹, HASAN GÖKHAN DOĞAN², ARSLAN ZAFER GÜRLER¹, HAKAN METE DOĞAN¹

ABSTRACT

Consumption has become difficult to control in the medical drug market as it is in every area. The output of the pharmaceutical sector, which has an important place in economic activities, has had undesirable consequences in recent years due to its chemical composition on human health. This has led people to search for alternative solutions. At the beginning of these solutions are herbal medicine resources and their derivatives. These resources, traditionally collected from the rural area, reach consumers through various channels. As a proposal for modern medicine, the use of medicines, which put people in a large vacuum in relation to quantity and harm, has come back as an economic and natural solution after a long time as a result of awareness. These plant products, which are needed for natural solutions and carry raw material qualities, can be obtained from transporters. Actuaries play an important role in marketing medicinal and aromatic plants. However, when they are not physicians, they are considered within the scope of medical activities when they have knowledge of the information they have and the quality of the products they sell. These activities are shaped by a number of legal regulations. In this study, it is aimed to determine the views and attitudes of Tokat province in terms of structural characteristics, activities and related legislation. The research region constitutes the province center of Tokat. The data set was obtained from the surveys to be made by the full counting method from the transfers in the province center. Various evaluations will be made with the aid of some statistical and econometric methods by using the data set which emerges in this direction.

NATURAL AND AROMATIC PLANTS THAT MAKE NATURAL DISTRIBUTION IN SOME FOREST RECREATION SITES IN ERZURUM PROVINCE

MEHMET ALI BAŞARAN¹, YAŞAR AYHAN¹, CEVDET AĞYÜREK¹, MEHMET ÖNAL², SELAMI ÖKSÜZ¹

ABSTRACT

Within the scope of this study, the floristic composition of 7 forest recreation areas having "C" and "B" type promenade location characteristics that local and local tourists used throughout the year in Erzurum province were determined. The plants which are found among the identified flora elements and have medical and aromatic characteristics constitute the subject of this work. In this context, it was determined that 93 taxa belonging to 42 families and 83 genres showed medical and aromatic characteristics when considering all recreational places. In addition, it has been revealed from the literature that the medical and aromatic plants used at the promenade sites are used by the local people for their purposes. Numerical distribution of the detected medical and aromatic plants according to the recreation areas; Uzundere (Zuvarboğazı): 19, İspir (Hoşutlar): 29, Horasan (Fidanlık): 22, Olur (Akdağ): 20, Narman (Göllü): 40, Oltu (Uzunoluk): 41 and Şenkaya (H. Mehmet Sırma): 25.

HERBAL TELOMERASE INHIBITORS AND ACTIVATORS

AYŞE GÜL MUTLU¹

ABSTRACT

Telomeres are specialized functional complexes that protect the ends of eukaryotic chromosomes. The inability to DNA polymerase to replicate the end of the chromosome during lagging strand synthesis results in the loss of telomeric repeats when cell divides. The majority of the cancer cells depend on the activation of telomerase to gain proliferative immortality. Thus, telomerase is a molecular target for diseases since its discovery. Some of the synthetic and natural telomerase inhibitors were tried on various cancers and there was decrease in the number of cancer cells. But on the other hand, telomere shortening is related with cellular aging. Some evidence suggest that the progressive loss of telomeric repeats of chromosomes may function as a molecular clock that triggers senescence. Because of that, telomerase activators important for anti-aging and telomerase dependent disease treatments. Various chemical compounds that occur naturally in plants like allicin and curcumin have been suggested as telomerase inhibitors. Milk thistle's silymarin and silibinin also have been investigated by some researchers in terms of telomerase inhibition and activation. Major tea catechin epigallocatechin gallate strongly and directly inhibits telomerase. It is suggested that telomerase inhibition could be one of the major mechanisms underlying the anticancer effects of tea. The extract of *Astragalus membranaceus* was licenced as a nutritional supplement. This extract could elongates short telomeres and increases health span of adult mice without increasing cancer incidence. Also this natural based product can elongates short telomeres in human leukocytes. Furthermore certain phytochemicals like resveratrol and genistein have been shown to activate telomerase. Further studies are necessary in herbal telomerase inhibitors and activators, especially for endemic plants of Turkey.

KARYOLOGICAL STUDIES ON SECTION LEIOPETALI OF AROMATIC DIANTHUS (CARYOPHYLLACEAE) FROM TURKEY

ESRA MARTIN¹, ERGIN HAMZAOĞLU², MURAT KOÇ³, ESRA KARAKAŞ¹, FATMA NAGEHAN YAVAŞ¹

ABSTRACT

This study has been focused on determination of chromosome number for seven taxa naturally grow in Turkey belonged to Leiopetali section of Dianthus genus which is a member of Caryophyllaceae family. The main purpose of the study is to cover the lack of cytogenetic studies for Dianthus taxa and make a contribution to the revision of this genus. Chromosome analyses were carried out via the use of an Image Analyses System (Bs200ProP). The chromosome numbers of Dianthus arpadianus, D. micranthus, D. ingoldbyi, D. zederbaueri, D. lactiflorus, D. andronakii and D. robustus taxa from Leiopetali sections were $2n = 30$. All chromosome practices was made by squash preparation technique. Root-tip meristems were provided from seed by germinating them on wet filter paper in Petri dishes at room temperature. Firstly root tips pretreated for 16 h in α -monobromonaphthalene at 4°C, fixed in 3:1 absolute alcohol/glacial acetic acid, then the root tips were hydrolyzed with 1 N HCl for 9 min at room temperature and stained with 2% aceto-orcein for 3 h at room temperature. Stained root tips were squashed in a drop of 45% acetic acid and permanent slides were made by mounting in Depex. The chromosomes were counted by Software Image Analyses (Bs200ProP) loaded on a personal computer.

KARYOLOGICAL STUDIES OF AROMATIC GENUS ORIGANUM (LAMIACEAE) SECTION CHILOCALYX FROM TURKEY

ESRA MARTIN¹, TUNCAY DIRMENCİ²

ABSTRACT

Origanum section Chilocalyx (Briq.) Ietsw. comprises Origanum bilgeri P.H.Davis, Origanum vogelii Greuter & Burdet and Origanum minutiflorum O.Schwarz & P.H.Davis which have been studied. Root-tip meristems were provided from seed by germinating them on wet filter paper in Petri dishes at room temperature. Firstly root tips pretreated for 16 h in α -monobromonaphthalene at 4°C, fixed in 3:1 absolute alcohol/glacial acetic acid, then the root tips were hydrolyzed with 1 N HCl for 12 min at room temperature and stained with 2% aceto-orcein for 3 h at room temperature. Stained root tips were squashed in a drop of 45% acetic acid and permanent slides were made by mounting in Depex. The karyotypes were measured by Software Image Analyses (Bs200ProP) loaded on a personal computer. Ideograms of these taxa were arranged in decreasing length. The samples of O. bilgeri which naturally grow in the province of Antalya numbered as 4343 and 4530 have been studied. The number of diploid chromosome for both samples was detected as $2n=30$. Karyotype analysis of the 4343 sample was made via the Image Analysis System. The average chromosome length for 4343 plant sample was 0.47 μm while its haploid chromosome length was 14.25 μm . Also, the relative length of the 4343 sample changed between 2.66 and 11.08. Additionally, example of O. vogelii numbered as 4332 was studied. Diploid chromosome number of this taxon which naturally grow in the province of Mersin was $2n=30$. Other plant samples numbered as 4348 was studied from O. minutiflorum. These examples also grow naturally in province of Antalya. The diploid number of both plant samples was determined as $2n=30$. Karyotype analysis of both samples was also made by the Image Analysis System. While the relative length was changed between 3.62 and 10.62 for the 4348 sample, the average chromosome and haploid chromosome lengths were 0.63 μm and 19.01 μm for the same example.

GROWING TECHNIQUE PROBLEMS OF EXPORTED EDIBLE, ORNAMENTAL AND MEDICINAL ARUM SPECIES IN TURKEY

HUSSEIN ABDULLAH AHMED AHMED¹, SERKAN URANBEY²

ABSTRACT

Araceae contain about 4000 species currently comprising 117 genera. Aroideae consists of 78 genera and Arum, Dracunculus, Eminiun, Helicodiceros, Biarum, Arisarum and Ambrosinagenera are distributed in the Mediterranean region and also in Turkey. The genus Arum is mainly distributed in the Mediterranean and Arum species have been irregularly cultivated and collected from their natural habitat and exported for food, medicinal and ornamental uses in Turkey. Growing techniques are adequately not known in the production of exported Arum italicum MILLER and Arum dioscoridis SM species. Therefore, there are some problems in the marketing of these crops in Turkey. Regular and advanced agronomic techniques are not used in growing area of Turkey and certified variety for Arum species have not been used. Therefore high tuber yield and standard quality can not be achieved. Also, especially fungal diseases and other pathogens and comparatively low tuber yield cause major problems in the production of these plants. Development of generative and vegetative growing techniques by testing different agronomic applications are necessary for these species.

HISTORICAL IMPORTANCE OF MEDICINAL PLANTS

HÜLYA DOĞAN¹, SELEN ALNIAK SEZER², SELEN AKAN³

ABSTRACT

Since the earliest times in history, people have benefited from plants to keep their lives alive. It is known that these plants used both nutrition and medicine. The earliest written books on medicine by Chinese rulers of the Chinese civilization mention medicinal herbs, and acupuncture treatment is introduced. While it is known that the earliest records belong to the Hittites in history, the information about the medicinal plants was found in the Egyptians and Sumerians. There were found information about 250 medicinal plants in the Mesopotamian civilization period, 600 in the ancient Greek period, 4000 in the Arab-Persian civilization period and 500 in the Roman Empire. It is known that the information about the first medicinal plant used in Anatolia, in which medicinal plant is tablets written on nails for the first time in Hattuşaş. These tablets were found in plants such as garlic, willow, bay, arganu, myrtle tree, hemp, fir, saffron, juniper, thyme, fennel, rose, willow, liquorice, mint, coriander, olive, esfand, poppy, mustard. It is known that nearly 60 medicinal plants were used in Uighurs. Dîvân-ı Lûgâti't-Türk mentions 194 different plant species that can be used medically. Some of those; hawthorn, couch grass, elfdock, fenugreek, woad, coven, calamus, isgun, pennyroyal, esfand. In this study, medicinal plants will be informed about the traditional uses of plants for treatment and nutrition purposes from the prehistoric period to the present day.

SOME CHEMICAL CHARACTERISTIC OF VOLATILE OILS AND EXTRACTION TECHNIQUES TO PRODUCE THESE OILS

NACIYE ÜNVER¹, ŞERAFETTİN ÇELİK¹

ABSTRACT

The use of medicinal and aromatic plants in the form of therapeutic preperates, nutritional supplements, flavouring substances and herbal teas has been a well-known and interesting issue from past to present. Volatile oils which are also known as essential oil and aromatic oil are obtained from the part of these plants such as root, flower, fruit and leaves and they have same appearance with lipids, but they have different chemical structure and characteristics. These oils are generally liquid at room temperature, easily crystallizable, optically active and volatile. Such aromatic taste and odour, anti-inflammatory, antimicrobial, antioxidant, insecticide, sedative (sedative) characteristics of these oils have provide the opportunity to use of the oils in many areas such as medicine, cosmetics, food, cleaning products, agricultural pests. Technique of distillation, extraction and pressing are used to obtain volatile oils from medicinal and aromatic plants. Extraction techniques can be defined as the separation of beneficial compounds in plant tissues by solvent. This method is classified into two categories as traditional (old) and modern (new) methods. Modern methods are developed to shorten the extraction time in conventional methods, to reduce the amount of solvent and to obtain better quality product. Whereas soxhlet and maceration techniques can be classified in traditional extraction techniques; sonication, supercritical fluid extraction, microwave extraction, and pressurized liquid extraction can be classified in modern extraction techniques. In this study, researches and information about the characteristics and extraction methods of essential oils have been compiled.

THE PRESENT STATE OF MEDICINAL PLANTS IN THE NATURAL FLORA OF THE THRACE REGION AND FACILITIES OF UTILIZING THESE PLANTS

BURHAN ARSLAN¹, EMRULLAH CULPAN¹

ABSTRACT

Medicinal plants have been used for medical and other purposes throughout history, and their use is increasing day by day. Because of possessing geographical regions that are different from each other in terms of their topographical features and climate, encompassing three phytogeographical regions, tying the continents of Asia and Europe and being surrounded on three sides by the sea, our country has a considerable worldwide wealth of plant species. Our country involves nearly 10000 plant species, 4000 of which are endemic. However, 500 of these species are known to be used for medical purposes. In our country, nearly 140 plants are registered to codexes. But the number of plants being consumed for medical purposes is much higher. In some publications, it is reported that the number of plants being consumed for medical purposes is at least around 500. It is reported in the list prepared as a result of examining lots of publications about the Thrace Region that there are 2450 plant species that ramify in 145 families. The fact that the Thrace Region involves 2450 plant species is a sign of how rich its flora. There are a large number of medicinal and aromatic plants in this rich flora. In this study, some plants that are part of natural flora, that have commercial importance and that are used in pharmaceutical industry are explored, and their present state and facilities of utilizing them are elaborated. This study was supported by participation programs of Namık Kemal University Scientific Activities

EFFECT OF PROPOLIS ON THE EGG QUALITY DURING STORAGE

GÜLŞEN ÇOPUR AKPINAR¹, ALI AYGÜN²

ABSTRACT

Propolis is a sticky, resinous, dark-colored material that honey bees collect from the young shoots and buds of certain trees and shrubs. Bees use it to cover the inside of the hive and mix it with bees wax during the building of combs to protect the colony and larvae from pathogenic microorganisms such as *Bacillus subtilis*, *B. alvei*, *Proteus vulgaris* and *P. galangin*. Propolis, having strong anti-bacterial, anti-fungal and anti-viral properties, is used for protection of various agricultural products during storage. For example, propolis has been used with alcohol on strawberry to inhibit *Botrytis cinerea* development. It also has been used on mandarin in order to prevent weight loss. Since the egg shell coating limits water losses and gas diffusion through pores, it should be useful to coat table eggs shell with propolis extracts during storage. The egg shell coating with propolis has important effect on the protection of the internal egg quality parameters. Coating eggs with propolis extract, a natural product, may help to ameliorate the decrease in quality during storage. This review focuses the effect of propolis on egg quality decreasing during storage.

OLIVE LEAF TEA

NACIYE ÜNVER¹, ŞERAFETTİN ÇELİK¹

ABSTRACT

The rapid growth of the world population, developing technology and industrialization have increased the consumption of food by making accessibility of food independent than time and place for the consumers. As a result of this situation amount of produced waste has increased, the waste recycling in different areas has gained importance in order to decrease the environmental effect of the waste. Plant waste is categorized in the group of solid waste and they are waste which is not very harmful for the environment but utilization of these wastes both can be profitable for the producers and can be used in various industries as different objects/materials thanks to their rich nutrients. In this context olive leaf is in the group of non-domestic plant waste and it is a raw material which has opportunity of usage in various areas as cosmetic, alternative medicine and food industry. Scientific research indicates that olive leaf contains more than one hundred components, mainly oils, carbohydrates, minerals, phenolic compounds and elements. Researches about antioxidative, antimicrobial and therapeutic effects of these leaves, which are especially rich in phenolic substance content, have lead up for the use of olive leaf in different areas. Consumption of olive leaf as tea is one of these areas. The effect of tea produced in this way on human health depends on the composition and amount of the water soluble substances. These substances in leaf vary depending on the tree type, growing conditions, pretreatments applied to the leaves, packaging material and the preparation method of the tea. Olive leaf tea is mainly prepared by decoction (boiling) or infusion technique and there are scientific studies which indicate that there are many positive effects of olive leaf tea such as antioxidative, antiinflamatuvar, antithrombotic, antidiabetic, antihypertensive, antiseptic, anticancerogenic thanks to the diversity and quantity of phenolic components, especially oleuropein. In this study, information about the chemical composition of olive leaf tea, preparation methods and effects on human health are presented.

KEYWORDS

Infusion, decoction, oleuropein, olive leaf tea, phenolic components.

INVENTORY WORKING OF BURSA REGION OVER EDIBLE AND POISONOUS FUNGİ

ARİF CAN¹, TURGUT KESKİN¹, PROF. DR. HASAN HÜSEYİN DOĞAN², DR. ÖYKÜM ÖZTÜRK³

ABSTRACT

Fungi are incapable of photosynthesis using light and CO₂. Similar to animals, fungi are heterotrophs, which use nutrition available in their environment. Cell structure: mycelium, which consists of filament-like cells (hyphae), generates underground and aboveground tissues. Life forms: Parasitic, saprophytic or symbiotic (mycorrhiza), (n) chromosome: having haploid nuclei, contrary to many other organisms, reproduction: occurs by sexual or asexual spores, eukaryotic: their cells contain a membrane-bound nucleus and other membrane-bound organelles. Currently, the estimated global number of species of fungi is 100.000, of which about 7000 species are edible to various degree and about 3000 species are edible. There are about 100 species of poisonous fungi and more or less 40% of them contain fatal toxins (Prof. Dr. H. Hüseyin DOĞAN). So far in the Bursa Region, 333 taxa of macro fungi have been discovered, 95% of them are edible to various degree and 18% of them have economical value. In the Bursa region 31 taxa are regarded poisonous. In Turkey, 300 fungal taxa are regarded edible.

KEYWORDS

Poisonous and edible fungi.

**STUDIES ABOUT TILIA TOMENTOSA I., LAURUS NOBILIS L.
AND CASTANEA SATIVA MILL. AT BURSA, IN THE VILLAGE OF
KARACABEY-KURŞUNLU**

ARİF CAN¹, TURGUT KESKİN¹

ABSTRACT

Marmara region is quite rich in terms of non wood-forest products. Karacabey-Kurşunlu village is included in this region and at this place is made effort to improve the life standard of forest villagers. In accordance with this purpose Castaneasativa Mill. Is planted in open field or grafted to raise production of Castaneasativa Mill. In 200 hectare coppice forest and this recovering areas were allocated forest villager providing their maintenance by themselves. Apart from, cutting unhealthy trees and grafting new shoots were gained significant achievements. Tiliatomentosa I. is significant aromatic plant and is located in Karacabey-Kurşunlu village as native deployed. Flower product is significant issue and forest villagers gain significant economical value from flower of Tiliatomentosa. Tilia forest occur as pure or mixed stands. If Tilia trees have high density, then canopy will be narrow. This situation cause adverse effects over flower production. We take action to raise flower production in related area. Also Laurusnobilis L. is of significant economical value in Karacabey-Kurşunlu village. It is seen as native distribution. Same Castaneasativa Mill. , also coppice space of Laurusnobilis is allocated to forest villagers to provide rehabilitation by themselves. At the end of rehabilitation work, Laurusnobilis is produced by forest villagers. Produced Laurusnobilis leaves are dried in the facility and sold in the same village. Dryer facility was founded backing loan of ORKÖY at same village. Forest villagers are worked at Laurusnobilis dryer facility and provided income to this people.

USED IN FOLK MEDICINE AND BIOLOGICAL ACTIVITIES OF HELICHRYSUM TAXA IN OUR COUNTRY

HALİL ERHAN EROĐLU¹, HÜLYA DOĐAN², ERGİN HAMZAOĐLU³

ABSTRACT

Helichrysum taxa are used as medicinal tea in the world and our country for about 2000 years due to diuretic, kidney stones reducing, regulating heartbeats, healing wounds and burns, and bile regulating properties. In different regions of our country, both the intended use and local names of Helichrysum taxa are showed the differences. Helichrysum taxa are mostly used to destroy kidney stones and diuretic in our country and these effects of taxa are originated from flavonoids. It has been determined that H. sanguineum, H. stoechas, H. graveolens, H. plicatum ve H. arenarium taxa of the genus Helichrysum have cologne and coleretic activity (stimulating and regulating of bile secretion) and promote gastric fluid secretion. Helichrysum species are commonly used and generally consumed as tea in Turkey. In this study, local names in different regions, usage areas and biological effects of these species will be given.

INVESTIGATION OF IN VITRO ANTIFUNGAL EFFECTS OF ESSENTIAL OILS AGAINST MAJOR SOIL-BORNE FUNGAL DISEASE AGENTS OF STRAWBERRY

MERVE KARA¹, SONER SOYLU¹, EMINE MINE SOYLU¹

ABSTRACT

In this study, in vitro antifungal volatile phase effects of the essential oils, obtained from different plant species such as fennel (*Foeniculum vulgare* Mill.), laurel (*Laurus nobilis* L.) and myrtle (*Myrtus communis* L.) growing in the Eastern Mediterranean Region of Turkey, were investigated against mycelial growth of *Fusarium oxysporum*, *Macrophomina phaseolina* and *Rhizoctonia solani* as major soil-borne fungal pathogens of strawberry. The essential oils at different concentrations showed variable degree of antifungal activities against fungal pathogens. Although all essential oils have a marked antifungal effect against fungal isolates, among the essential oils used in the study, the strongest volatile fungicidal activity was caused by the essential oil of fennel followed by laurel and myrtle essential oils, respectively. Essential oil of fennel completely inhibited mycelial growth at relatively low concentration (5.0 μ l/plate concentration at volatile phase). Amongst the fungal disease agents, *R. solani* was found to be highly sensitive and *F. oxysporum* was highly resistant fungal species to essential oils tested. The essential oil of fennel was the most potent inhibitor with EC50 values 1.38, 1.92 and 2.68 μ l/plate against *M. phaseoli*, *R. solani* and *F. oxysporum*, respectively. Light and SEM observation on pathogen hyphae revealed considerable structural deformations such as cytoplasmic coagulation, vacuolations, hyphal lysis and protoplast leakage in fungal hyphae exposed to essential oils under light microscope. The results indicated that the essential oil of fennel, which exhibited significant antifungal activity, could be used as possible biofungicide alternative to synthetic fungicides against phytopathogenic soil-borne fungal disease agents.

EFFECT OF EXTRUSION ON THE ANTIOXIDANTS IN CAULIFLOWER-BASED SNACKS

SENOL İBANOĐLU¹, VALENTINA STOJCESKA², ESRA İBANOĐLU¹

ABSTRACT

The incorporation of cauliflower trimmings into ready-to-eat expanded products and their effect on the textural and functional properties of extrudates have been studied. Dried and milled cauliflower at levels of 5-20% was added to the formulation mix. The results obtained from the analysis of the extrudates are discussed in terms of the effect of cauliflower co-products on nutritional and textural characteristics, and the effects of processing conditions. The samples were processed in a twin-screw extruder with a combination of parameters . It was found that addition of cauliflower significantly increased the dietary fibre. Extrusion cooking significantly increased the level of phenolic compounds and antioxidants but significantly decreased protein *in vitro* digestibility and fibre content in the extruded products. Sensory test panel indicated that cauliflower could be incorporated into ready-to-eat expanded products up to the level of 10%.

CHEMICAL COMPOSITION AND ANTIBACTERIAL ACTIVITY OF ESSENTIAL OILS ISOLATED FROM MEDICINAL PLANTS AGAINST GALL FORMING PLANT PATHOGENIC BACTERIAL DISEASE AGENTS

İMAM ADEM BOZKURT¹, MERVE KARA¹, SONER SOYLU¹

ABSTRACT

The essential oils from thirteen taxonomically different medicinal plant species belonging to Lamiaceae, Lauraceae and Apiaceae families such as *Thymbra spicata* var. *spicata* L. (Tss), *Thymus serpyllum* L. (Tsrp), *Thymus sipyleus* Boiss. (Tspy), *Origanum syriacum* Ietswaart (Os), *Origanum majarana* L. (Om), *Ocimum basilicum* L. (Ob), *Mentha spicata* L. (Ms), *Melissa officinalis* L. (Mo), *Lavandula stoechas* L. var. *stoechas* (Lss), *Rosmarinus officinalis* L. (Ro), *Salvia officinalis* L. (So), *Laurus nobilis* L. (Ln) and *Foeniculum vulgare* Mill. (Fv), were isolated by hydrodistillation. The chemical compositions of the isolated essential oils were identified by gas chromatograph/mass spectrometer (GC/MS). Carvacrol for Tss and Oss, thymol for Tsrp, geranial for Tspy and Mo, 4-terpineol for Om, linalool for Ob, carvone for Ms, 1,8 cineole for Lss, Ln and Ro, camphor for So and trans-anethole for Fv were identified as the major constituents of the essential oils studied, respectively. The essential oils were tested for their antibacterial activity against the most important gall forming plant pathogenic bacterial disease agents, *Pseudomonas savastanoi* pv. *savastanoi* (Pss), *P. savastanoi* pv. *nerii* (Psn) and *Agrobacterium tumefaciens* (At). The essential oils showed variable degree of antibacterial activity against tested gall forming bacterial species. Based on inhibition zone diameter values, At and Psn were recorded as the most sensitive and resistant bacterial species against the majority of the tested essential oils, respectively. Generally plants belong to Lamiaceae family were found to be more efficient than those belong to Lauraceae and Apiaceae families. The essential oils of Tsrp, Tss and, Osb showed the highest antibacterial activities against all tested bacterial species. The findings of the present study suggest that the isolated oils have a potential to be used as antibacterial agents against gall forming bacterial disease agents.

FOAM STABILITY OF LIQUORICE (GLYCYRRHIZA GLABRA) EXTRACT

SENOL İBANOĞLU¹, ESRA İBANOĞLU¹

ABSTRACT

Liquorice root, also known as sweet root, is known mostly for its use as a sweetener in candies and beverages. However, liquorice root has also been used for centuries for its medicinal benefits. Liquorice is available in many forms, either containing glycyrrhizin or as DGL, deglycyrrhizinated liquorice. Some of the reported positive effects of liquorice are soothing stomach, cleaning respiratory system, reducing stress and protecting skin and teeth. The foaming behaviour of liquorice extract was investigated using response-surface methodology with concentration (0.1-0.3 w/v %) and whipping time (5-25 s) being the independent variables. First-order kinetics was applied for the kinetic analyses of the foam collapse and foam decay rate constants were calculated. Regression equations for predicting overrun (O) and foam decay rate constant (k) were developed. Results suggest that concentration had a significant effect on overrun and foam stability. The overrun increased with concentration and whipping time. However, the effect of whipping time on O was less pronounced. Foam stability was enhanced with the increase in concentration. The foam decay rate was observed to be mainly dependent on the concentration of sample and decreased with the increase in concentration. The effect of whipping time on foam stability was observed to be insignificant compared with concentration. The magnitude of changes with whipping time was observed to be more pronounced for the overrun than for the stability of liquorice extract foam.

EFFECTS OF NaCl APPLICATIONS ON ROOT GROWTH AND SECONDARY METABOLITE PRODUCTION IN MADDER (*RUBIA TINCTORUM*) ROOT CULTURES

ÖZLEM ARAS AŞCI¹, TUNHAN DEMIRCI¹, NILGÜN GÖKTÜRK BAYDAR¹

ABSTRACT

Madder (*Rubia tinctorum* L.) is a perennial plant rich in anthraquinone (AQ) derivatives including alizarin and purpurin in its roots and rhizomes. AQs are important compounds not only in textile and food industries regarding dyeing properties but also in medicine and pharmaceutical industry because of its pharmacological and biological activities. AQs in the madder can be obtained economically from plants that are at least 3 years old, collected from the nature or cultivated. In this case, the number of plants may decrease and cause destruction. Consistently destruction of plants from in nature can also cause this plant to extinction in the future. Commercially, in the short time to maximum production of AQs can be achieved by applications elicitor both callus and roots obtained in vitro. Thus, from the callus and root obtained through tissue culture, existed two fold more AQs can be obtained compared to the normal plant. Phenolic compounds are another unique metabolite group for cosmeceuticals, foods and pharmaceutical industries. Because of their important properties it is necessary to get AQs and phenolics with high quality and quantity. In recent years, there has been an increased interest in in vitro techniques for secondary metabolite production because of their some advantages including no seasonal constraints and more rapid, efficient, reliable, simple and predictable production. In order to increase the metabolite synthesis in in vitro conditions elicitor applications could have been done effectively. Salinity is an important stress factor influencing growth and secondary metabolite metabolism in plants. This study was carried out to determine the effect of sodium chloride (NaCl) on root growth and secondary metabolite accumulation in madder. For this aim, madder roots obtained from stem explants in in vitro conditions were used as plant materials. Roots were cultured in MS medium containing different concentrations of NaCl (0, 1, 2, 3 and 4 g l⁻¹) for 7 days. Then roots were evaluated in terms of root growth index, total AQ, alizarin, purpurin and total phenolic contents. Based on the results, root growth decreased in line with the elevating level of NaCl while secondary metabolite accumulation significantly increased with NaCl applications compared to the controls. It was determined that NaCl at 3 g l⁻¹ concentration was the most effective application in terms of total AQ, alizarin, purpurin and phenolic accumulation.

EFFECT OF DIFFERENT NITROGEN AND PHOSPHORUS DOSES ON SOME ESSENTIAL OIL COMPONENTS OF MENTHA SPICATA L. AND MENTHA VILLOSO-NERVATA L. GENOTYPES

MERYEM YEŞİL¹, KEMALETTİN KARA²

ABSTRACT

Abstract This study was carried out in Erzurum in 2010 and 2011, in order to determine the effects of nitrogen and phosphorus doses on some essential oil components of *Mentha spicata* L. and *Mentha villosa-nervata* L. genotypes. An experiment using three nitrogen (0, 5 and 10 kg/da) and three phosphorous (0, 5, 10 kg/da) genotypes of two *Mentha spicata* (number 2 and 4) and one *Mentha villosa-nervata* (number 4) was carried out with three replications according to the "Randomized Full Blocks Experiment Plan". In the first year of the experiment, the highest α -pinene ratio was obtained at a dose of 5 kg nitrogen and phosphorus, whereas the highest rate in the second year was obtained from the parcels without fertilization. The highest β -plehellandrene ratio was determined in parcels with nitrogen applied at 5 kg / da in 2010, and in 2011 it was determined in parcels without nitrogen fertilization. The β -pinene ratio was found to be highest in nitrogen and phosphorus fertilization at 5 kg / da in the first year of the experiment and in the second year, at 0 kg / da nitrogen and 10 kg / da phosphorus doses. The fertilizer doses with the highest 3-octanol ratio were observed in the first year of the experiment in 5 kg nitrogen and phosphorus applied parcels and in the second year it was observed in the nitrogen-free parcels and 10 kg / da phosphorus applied parcels. The highest p-cymol ratio was obtained from parcels in which 10 kg of nitrogen was applied and no phosphorus was applied in the first year and parcels in which nitrogen was not applied and phosphorus was applied in 10 kg / da in the second year. In terms of α -pinene ratio, the genotype number 4 came to the forefront in the first year, whereas the highest rate was detected in the genotype number 6 in the second year. In terms of β -hellandrene, the highest ratio was detected in the genotype number 6 in both years of the experiment. The highest β -pinene, 3-octanol ratios were found in the genotype number 4 in the first year and in the genotype 2 in the second year, while in terms of p-cymol ratio, genotype number 6 came to the forefront in the first year and genotypes number 2 and 6 came to the forefront in the second year 4

THE EFFECT OF DIFFERENT STORAGE CONDITIONS ON THE WEIGHT AND HEALTH OF TUNCELI GARLIC (*ALLIUM TUNCELIANUM* (KOLMAN) ÖZHATAY, B. MATHEW&ŞİRANECİ)

HÜSEYİN KARATAY¹, ZIYA POLAT², BASRI MUTLU³, NECATİ ÇOK⁴

ABSTRACT

In the World, about 25 million tons of garlic is produced, more than 100 thousand tons are produced in Turkey as dry and fresh. Besides, with the cultivation of Tunceli garlic (*Allium tuncelianum* (Kolman) Özhatay, B. Mathew&Şiraneci), known as the natural species of the Tunceli region, the establishment of storage conditions in which the quality and quantity of the product can be preserved has recently become important. The storage conditions of this product can be further improved by new studies to be carried out using different methods of moisture, temperature, physical conditions and methods which are not harmful to human health. In this study, the effects of storage conditions which created in different pots and occasions on product life and weight loss in Tunceli garlic during a 16-month observation period at room temperature and +4°C cooler were investigated. In the study, garlic weight averages were compared in a total of 13 different storage conditions including polyethylene bag, cloth bag, basket and soil, as well as a plastic bag with airless. When the residual weights of garlic were calculated as a percentage of the initial weight, the remaining weight in the treatments ranged from 21.68% (lowest weight in a glass beaker with room temperature) to 91.82% (the highest weight in a airborne polyethylene bags at the +4°C) of the initial weights. Besides, at the best storage condition, It was observed that all of the garlics were alive and stable for one year. But, after 12 months, 10% of the root tips were very small (about 0,5-1 mm) begun to appear and these developed to 1-3 mm after 16 months. At the end of the experiment, the garlics, stored at +4°C in different conditions, kept their average weights by 45% compared to room temperature conditions. After the measurement made at the end of the 16th month, planting was carried out for viability tests. In the first observations made in the spring, garlics generally has a loss of moisture between 14.4 % and 70.4 % germination rate was carried out between 4% and 40 % rate. The maximum germination rate was 40 % at the +4°C in the Cardboard box process with 32.8 % moisture loss. At the end of the storage period, the rate of germination in garlic is very low in condition of high (above 60%) and low (0-8 %) moisture losses. The highest germination occurred between 15-33% of moisture loss. After a certain level of moisture (15-20%) of garlic has been reduced, storing at the lower temperatures than room temperature or similar external environments has a positive effect on the long-term preservation and vitality of the garlic.

NUTRITION FACTOR IN KIDNEY STONE FORMATION: CRANBERRY FRUIT

MEHMET ARİF İÇER¹, MAKBULE GEZMEN-KARADAĞ¹

ABSTRACT

Cranberrybush fruit (*Viburnum opulus*) which is used as a therapeutic tool by people since the beginning of recorded history, nowadays is widely used due to many positive effects on health (1). The genus *Viburnum*, belongs to the family *Caprifoliaceae*, is comprises of more than 230 species (1). The fruits of *Viburnum opulus* have been used to treat several diseases such as heart disease, coughs and colds, high blood pressure, digestive troubles, duodenal ulcers and kidney stones (1,2). There are four common species in Turkey, *Viburnum opulus* L., *V. orientale* Pallas, *V. lantana* L., and *V. tinus* L., which are common in South America and southeast Asia (2). This plant contains triterpenoids, diterpenoids, coumarins, anthocyanins, phenolic acids and organic acids (2). According to the data obtained from the studies done, there is a relationship between urinary citrate withdrawal and cranberrybush fruit juice consumption (2,3). Studies have shown that citrate and antioxidants significantly reduce the risk of stone recurrence (3,4,5). It is thought that *Viburnum opulus* can reduce the risk of stone formation by its antioxidant properties and citrate contents in the direction of these studies (3,5). In a study comparing the content of lemon juice and cranberrybush fruit which is thought to reduce the risk of stone formation due to citrate and potassium content, the potassium content of cranberrybush was found to be significantly higher than the lemon juice ($p=0.006$), but there was no significant difference between citrate contents (5). It was reported that İlhan and his colleagues evaluated the differences in the urine of rats after the administration of 50 g powdered cranberrybush fruit extracts to rats within 8 hours: reduction of urinary oxalate, uric acid and creatinine levels in the cranberrybush fruit watery group (2). As a result, the consumption of *Viburnum opulus* can be considered as a complementary treatment tool for prevention of kidney stone formation and repetition, provided that it is under physician control. However, it should not be forgotten that the right dose and the optimum duration of use are of utmost importance. REFERENCES 1. Saltan, G., Süntar, I., Özbilgin, S., İlhan, M., Demirel, M. A., Oz, B. CAN BITTER MELON BE USED IN THE TREATMENT OF DIABETES MELLITUS?

MEHMET ARİF İÇER¹, MAKBULE GEZMEN-KARADAĐI¹, HİLAL YILDIRAN¹

ABSTRACT

Since the beginning of written history, medical aromatic plants used by humans as a treatment tool have been used frequently due to many positive effects on health. The use of momordica charantia, known as "Kudret Nararı" in our country, is very common in our country and in the World (1). According to recent studies, consumption of Momordica charantia is found to be directly associated with regulation of blood sugar (2,3). Momordica charantia, also known as bitter melon, is the bitter taste that is caused by the alkaloid substance called 'momordicine' in this name (4). It is thought that bitter melon has many effects on health with the active compounds (charantin, momordicin, cucurbitacin B etc.) contained in it. In addition, bitter melon has phenolic acids such as gallic acid, catechin, and epicatechin which is the antioxidant that provides positive effects on many diseases (5). It is also stated that bitter melon exhibits an insulin-like effect when injected subcutaneously, due to a polypeptide-structured compound known as "p-insulin", "plant insulin" or "polypeptide-P" (2). It has been reported that serum glucose levels are reduced and insulin resistance is reduced as a result of giving bitter melon juice to diabetic rats at 10mL/kg/day for 14 days ($p<0.05$) (6). A study in which the effect of 10mL/kg bitter melon application on rats for nine weeks was evaluated on pancreatic islets, indicates that the level of insulin in the cells is increased significantly ($p<0.004$) (3). In a study conducted by Kasbia et al. on post-OGTT human subjects, it was reported that 50mg / dL and 100mg / dL bitter melon juice reinforcement caused an increase in plasma glucose and insulin levels (7). As a result, bitter melon can be considered as a complementary treatment tool in the treatment of DM with antioxidant properties and p-insulin which is carried. However, in order to reach definite jurisdictions, it is firstly necessary to increase the number of human studies, to reveal the mechanisms fully and to determine effective doses. REFERENCES 1. ANTIOXIDANT ACTIVITY, PHENOLIC CONTENT, FATTY ACID COMPOSITION AND OXIDATIVE STABILITY OF BERRY SEED OILS

EDA ADAL¹, ŐENOL İBANOĐLU¹, ESRA İBANOĐLU¹

ABSTRACT

Specialty oils like berry seed oils are major by-products of the berry processing industry which make them interesting from an economical point of view. Recently, they are gaining attention by consumer owing to their high content of polyunsaturated fatty acids (PUFA), especially essential fatty acids (with a favorable low n-6/n-3 ratio), and antioxidants. The amount of oil in the seeds ranges from 11% to 23% among varieties. In the present study, cold pressed blackberry and raspberry seed oils were evaluated for their antioxidant properties, total phenolic content (TPC), fatty acid composition and oxidative stability. Fatty acid profile of oil samples were analyzed by gas chromatography (GC). The results showed that raspberry seed oil (RSO) contains 31.37% α -linolenic acid and 51.6% linoleic acid whereas blackberry seed oil (BSO) contains 62.3% α -linolenic acid and 16.3% linoleic acid, which are essential fatty acids for human. Depending on its essential fatty acids amounts, the ratio n-6 to n-3 fatty acids was calculated as 1.64 and 3.82 for RSO and BSO, respectively. Total phenolic content was determined using the Folin-Ciocalteu method. The calibration curve was prepared using gallic acid at different concentrations. The antioxidant activity was assessed by diphenyl-1-picrylhydrazyl (DPPH). Both oils directly reacted with and quenched DPPH radicals. The TPC and DPPH were found to be highly correlated. Differential scanning calorimetry (DSC) and Rancimat were applied to evaluate oxidative stability of these seed oils at five different isothermal temperatures (100, 110, 120, 130 and 140°C). Oxidation Induction Time, OIT (min.) was calculated from exothermic DSC curves by extrapolated baseline and the tangent line of the peak. OIT of oil samples which were measured by Rancimat apparatus correlated with DSC results. It can be seen from results that the increasing the isothermal temperature by 10°C results in a decrease in OIT values significantly ($p < 0.05$). Based on results obtained, it can be stated that both oils may serve as good source of essential fatty acids and antioxidant properties with potential beneficial effects toward human health. On the other hand, low oxidative stability of both oil samples shows that care must be taken during packaging and storage of the oils.

INVESTIGATION ON THE EFFECT OF AROMATHERAPY APPLICATION ON PAIN MANAGEMENT

SEHER GÖNEN ŞENTÜRK¹, FIGEN EROL URSAVAŞ²

ABSTRACT

Introduction: Aromatherapy application which is the one of a complementary treatment is increasing to use for the treatment on health field, and coming into prominence day by day. In our country, it is just started to study about to use of essential oils on pain management that is one of the independent role of nurses, and there is no much more study about this subject. That's why the purpose of this review is to investigate the effect of aromatherapy application on pain management and to present of summary of studies that were done. **Method:** It scanned databases of national thesis center, CINALH, Pubmed, EBSCOHOST, Scienedirect, Wiley Online Library, Google Scholar, from December 2016 to February 2017. It online scanned the words that Turkey, nurse, aromatherapy, essential oil, pain, pain management. **Results:** It was reached total 7 experimental researches about aromatherapy application on pain management; three of these are semi experimental and four of these are randomize controlled, in Turkey. It was determined that lavender oil was the most commonly used oil in essential oils. The other essential oils was used are; rose, sesame, rosemary, almond, mandarin, juniper tree and ylang ylang oils. According to studies in our country, it was reported that aromatherapy application is an effective method for dysmenorrhea, hemodialysis induced headache, pain associated with lymphedema, renal colic, rheumatoid arthritis, postoperative pain due to peripheral venous cannulation. The effect of massage and lavender oil on pain was examined in a study of nursing and midwifery undergraduate students who complained of dysmenorrhea and it was determined that massage is more effective than lavender oil, and lavender oil is more effective than control group. In another study with 100 patients who had primary dysmenorrhea; one group of them used an analgesic (diclofenac sodium) and the other group used an analgesic with rose oil. Pain was significantly reduced in both groups. At the end of the study, it was reported that rose oil could be used as a complementary treatment on pain management. According to a study in a group of patients who had hemodialysis induced headache; for 3 weeks, an oil consisting of a mixture of sesame lavender and rosemary was applied to the face area of the patients and It was reported that the pain was reduced significantly and complications did not develop. In the other study for prevention of complications due to lymphedema (pain, limitation of movement) and lymphedema after breast cancer operations; it was used almond and mandarin oil and it was reported that the intervention group's complaints of pain and limitation of movement was diminished on the 2nd and 4th month after surgery, when compared to control group. Another study with 100 patients with a diagnosis of renal colic, first group used analgesic (diclofenac sodium), second group used analgesic with lavender oil. In the second group, it was reported that pain management was more effective and longer. In a study of patients with a diagnosis of rheumatoid arthritis; reflexology and aromatherapy method (juniper tree, lavender, ylang ylang, rosemary) compared in pain management, both methods were found to be very effective on pain. In a randomized controlled study examining the effect of lavender oil on

reducing pain and anxiety during peripheric venous cannulation after surgery and improving patient satisfaction; it was reported that pain and anxiety were reduced in the intervention group compared with control group and patient satisfaction was improved. Conclusions and Recommendations: Studies have shown that aromatherapy application is an effective method on pain management, but studies in our country are very limited. The application of aromatherapy should be tested with experimental studies in different patient groups and different pain types. Aromatherapy application, which is low cost, low side effect and easy to apply compared with medical treatment, is suggested to place in nursing interventions and disseminate to use with the current treatment as an additional application.

PHYTOCHEMICALS, EPIGENOME AND CANCER: EFFECTS ON DNA METHYLATION AND HISTONE ACETYLATION

CANSU ÖZBAYER¹

ABSTRACT

Cancer is a fatal disease caused by the uncontrolled proliferation of tissue cells. In addition to environmental factors, genetic and epigenetic changes are known to cause cancer development. Genes that control important physiological pathways such as cell proliferation, DNA replication, and DNA repair, which play an important role in cancer physiology, are also under the control of epigenetic regulation defined as "gene expression changes that can be inherited as meiotic and / or mitotically without DNA sequence alteration". Epigenetic mechanisms can be classified as DNA methylation, histone modifications and non-coding RNAs. DNA methylation is one of the most important epigenetic alterations and occurs by methylation of cytosines after guanine in CpG dinucleotides and is catalyzed by DNA methyltransferase (DNMT) enzymes. DNA hypomethylation inhibits carcinogenesis through the activation of genes such as tumor suppressors that have been inactivated by methylation. Histone acetylation and methylation are post-translational modifications of histone proteins related to carcinogenesis. Histone acetylation is catalyzed by the histone acetyltransferases (HATs) whereas histone deacetylation is catalyzed by the histone deacetylase (HDACs) enzyme family. HAT activation and HDAC inhibition increase histone acetylation and increase acetylation activities of proteins such as transcription factors and tumor suppressor proteins, and exhibit anti-carcinogenic activity. Phytochemicals are biologically active chemical compounds naturally found in plants. Research on the effects of nutrition and phytochemicals on epigenetic mechanisms (nutri-epigenetic) has gained increasing interest in recent years. It has been determined that some phytochemicals such as epigallocatechin-3-gallate (green-black tea), curcumin (turmeric), sulforaphane (broccoli, brussel sprouts, cabbage), genistein (soybeans), indole-3-carbinol (broccoli, cabbage, cauliflower, mustard and radish), resveratrol (grapes, peanuts and some berries), lycopene (tomato and tomato products) and quercetin (citrus and buckwheat) are responsible for the inhibition of DNMTs involved in DNA methylation. The inhibition of DNMTs also influences the prevention of cancer by causing DNA hypomethylation and subsequent re-expression of tumor suppressor genes. Another epigenetic mechanism by which these phytochemicals act is histone modifications. Histone deacetylation caused by HDACs reduces tumor suppressor function and increases survival of cancer cells. Studies have shown that epigallocatechin-3-gallate, curcumin, sulforaphane, genistein, indole-3-carbinol, resveratrol, lycopene and quercetin have anti-carcinogenic effects by modifying these epigenetic changes in cancer cells via HDAC inhibition. In a conclusion, diet-induced phytochemicals may contribute to the prevention of carcinogenesis by acting on epigenetic mechanisms. However, there is a need for a large number of evidence-based clinical trials for phytochemicals to be accepted as anti-carcinogenic agents in medicine.

CANNABIS, CANNABINOIDS AND CANNABIDIOL: MOLECULAR MECHANISMS IN NEURODEGENERATIVE DISEASES

HÜLYAM KURT¹, EMINE YAĞCI¹

ABSTRACT

In our age, neurodegenerative diseases are increasing day by day and affect the quality of life of those suffering from the disease to a great extent. For this reason, the development of new treatment methods for the disease is gaining importance. Recently, complementary and alternative treatments have gained popularity as well as medical treatments. One of the most preferred of these treatment methods is herbal therapies. Cannabis is one of the plants used for this purpose. Cannabinoids have a long and colorful history, and the public acceptance of this material, which was originally thought to be prohibited even by the efforts of the scientific world, is increasing, even it called as 'medical marijuana' in some literatures. Studies on the use of cannabis for the treatment of neurodegenerative diseases are available. Cannabinoids have been reported to have neuroprotective effects in some neurological diseases including Alzheimer's, Parkinson's, Huntington's, multiple sclerosis and epilepsy. Synthetic cannabinoid receptor agonists / antagonists or compounds may provide control or relief of symptoms in neurological diseases. Cannabinoids can interact with neurotransmitters, neurotrophic factors, and neuropeptides through a number of mechanisms. The endogenous cannabinoid signaling system consists of endocannabinoid molecules (endogenous ligands) which bind and activate cannabinoid receptor type 1 and type 2 (CB1 and CB2) in the brain, 2-arachidonoyl (arachidonol) glycerol and anandamide. CB1 receptor is one of the G protein-bound receptors in the brain and is responsible for a variety of environmental and central processes. The endocannabinoid system also has an important role in physiological functions. Studies show that the endocannabinoid signaling system plays an important role in the pathology of many central nervous system diseases including MS, PD, AD, HD and epilepsy. It has been suggested that cannabinoids may be useful in the treatment of conditions such as spasticity, pain, chills and bladder dysfunction in MS. The neuroprotective mechanisms of the endocannabinoid system and potential therapeutic applications of cannabinoids in the ischemic and neurodegenerative disorders of the nervous system are increasing. Cannabis also has another compound called cannabidiol (CBD), and CBD is a compound thought to have therapeutic potential for schizophrenia, as well as treatment of psychosis, and it possibly better tolerated than current anti-psychotic treatments. Also, It is considered that CBD may have anti-inflammatory and neuroprotective properties. Cannabinoid agonists and endocannabinoid enhancers have been shown to enhance serotonin release in the hippocampus and neurogenic neuronal activity, to support neurogenesis at the same time. Studies have indicated that 30-40% of patients with bipolar disorder do not benefit from traditional medical therapy, and that cannabinoids may be beneficial to rehabilitation symptoms or reduce side effects of lithium in these patients. Despite all these therapeutic effects, an important issue that should not be forgotten when discussing the medical use of cannabinoids is appropriate dosage using. Excessive and unconscious use of this substance, which is also used for drug purposes, can lose its therapeutic character and affect the course of the disease in

the worst way. It is thought that cannabinoids and active ingredients, which are known to be used for a long time and are now widely used, are potential therapeutic values in neurodegenerative diseases as well as in other medical fields. However, there is a need for scientific studies to elucidate the mechanisms of action for introducing these substances into the therapeutic field, and to reveal the potential therapeutic value and side effects.

COMPLEMENTARY AND ALTERNATIVE THERAPIES IN CANCER: BITTER MELON AND ANTI-TUMORAL ACTIVITY

EMİNE YAĐCI¹, HÜLYAM KURT¹

ABSTRACT

Every year around the world, 14 million people are diagnosed with cancer and 8 million of them result in death. Cancer treatment can involve 4 different processes. These are surgery therapy, radiotherapy, chemotherapy, immunotherapy. All these methods are improving day by day, but cancer is still the second most common cause of death after cardiovascular disease. Complementary and alternative medicine (CAM) methods, which have become increasingly accepted around the world differently from traditional medical treatment, have become widespread in cancer patients as well. Many patients use CAM to improve survival and quality after diagnosis, to cope with symptoms and side effects of cancer treatments. It is also known that these treatments are also used because of the lack of side effects and strengthening of the immune system and are especially preferred by women, young people, more educated and socioeconomically advanced individuals. For this purpose, patients apply various herbal mixtures, vitamins, aromatherapy, yoga, meditation, religious practices. Herbal therapies are the most commonly used CAM method. Medical plants, especially nettle herbs, are the most commonly used herbal therapies for cancer patients. Besides, bitter melon, Aloe vera, donut grass, camel stud, ginseng species, Ginko biloba, birch tree, flaxseed, mistletoe, garlic, soybean, green tea, oleander, ginger are most commonly used plants in the treatment of cancer and many other diseases. Momordica charantia, commonly known as bitter melon, is one of these plants known for its biological activities used in the traditional drug system. It has been reported that the plant has anti-oxidant, anti-inflammatory, anti-cancer, anti-diabetic, anti-bacterial, anti-obesity and immunomodulator activities. Plant extract inhibits growth of cancer cells by inhibiting apoptosis, cell cycle arrest, autophagy and cancer stem cells. Crude bitter melon extract (BME) has been reported to have anti-tumor activity. It has been observed that this function realizes by inhibition of cell growth and apoptosis induction. In breast cancer cells, it has been shown that BME treatment inhibits the cell cycle by blocking G2 / M. Thus, it stops cancer cell division and prevents tumor growth. In addition, crude BME therapy has been shown to induce apoptosis in prostate and breast cancer cells. Apoptosis is cell death which realized with the activation of caspases. It has also been shown that BME administration leads to caspase activation in breast cancer cells. Prevention studies of Cancer, one of the biggest problems of our age, continue to evolve with the rapid integration of molecular approaches into research and clinical practice. The use of medicines to manage or stop the carcinogenic process may provide additional therapy with conventional medicine for the treatment of the disease. Studies on bitter melon suggest a promising anti-tumor effect. This natural product may serve as a powerful agent to enhance the therapeutic effects of chemotherapy, radiotherapy or other therapeutics for the treatment of human cancers.

MICROENCAPSULATION OF SEED OIL BY HETEROPROTEIN COMPLEX COACERVATION

EDA ADAL¹, SENOL İBANOĐLU¹, ESRA İBANOĐLU¹

ABSTRACT

Food industry has focused producing and developing novel food products containing health promoting bioactive compounds. Bioactive products (e.g. vitamins, minerals, antioxidants and fatty acids etc.) are usually highly susceptible to environmental, processing or gastrointestinal conditions. Hence, microencapsulation is a very useful tool to delivery of these compounds into foods and protects them from adverse conditions. Microencapsulation is the process of entrapping any active ingredient (core materials) within another substance (wall materials). In this study, red raspberry seed oil with high content of PUFAs and essential fatty acids (EFAs) was encapsulated using lactoferrin (LF) and pea protein isolate (PPI) by complex coacervation. Complex coacervation has gained much interest due to its unique high encapsulation efficiency when compared to other microencapsulation techniques. Optimum conditions for coacervate formation were achieved in our previous work which the heteroprotein complex coacervate forms with maxima at pH 5.4. Therefore, oil samples were mixed with wall materials at pH 5.4 (i.e. optimum pH for coacervation) and 7 to examine stability of emulsions. Initially, oil-in water emulsions stabilized by either LF or PPI at pH 7 to prepare single protein emulsions. Mixed emulsions were prepared at pH 5.4 and 7. The particle size, droplet size and creaming index of emulsions were measured and morphological properties were examined. According to droplet size results, PPI native coated emulsion has higher diameter than LF native coated emulsion which was lower than 1 μ m. For emulsion prepared by complex coacervation, the results were lower than 1 μ m at pH 7 while little higher than 1 μ m at pH 5.4. This might be due to protein aggregation in the pH range studied. Droplet charge of native LF and PPI coated emulsions were 52.3 and -40.7 (mV) at pH 7.0, respectively. For mixed emulsions, charge was negative at high pH value whereas it was positive at low pH value. Visual observation of the samples indicated that all samples were stable to gravitational separation after 1 day. Emulsion prepared with native PPI (1 wt%) and prepared with mixed protein at pH 5.4 were separated after 7 days whereas the emulsions prepared with native LF and prepared mixed protein at pH 7 were stable after 7 days. The emulsion prepared with LF and PPI solution added afterward sample was showed highest phase separation which was confirmed by Confocal fluorescent image. It can be concluded that complex coacervation between two globular proteins LF and PPI can be used to encapsulate seed oils successfully.

MEDICINAL AND AROMATIC PLANTS COMMON USED IN THE CUISINE OF GAZİANTEP

NIHAL DALKILIÇ¹, AHMET SALİH SÖNMEZDAĞ¹

ABSTRACT

Medicinal and aromatic plants are used for the treatment of various ailments for centuries. Since ancient times they have kept the place in areas such as medicine, food, perfumery and cosmetic industry. In recent years, with the prohibition of synthetic preservatives so researches has focused on the natural and additive-free products. In foods spices are mainly used in order to preservatives, to increase shelf life, to prevent oxidation, to reduce the burden of microbial, to give taste and aroma. Spices firstly used in Turkish cuisine after fifteenth centuries. Primarily used in palace for preparing sultan's majoon because of their prices, afterwards they used gradually in public cuisine. Today, spices are used not only for enrichment the flavor of the meal, but also used as antimicrobial, antioxidative, lowering blood pressure, diuretic, to force the transmitter, aphrodisiac, analgesic, sedative. While they are used in food, cosmetic, drug industries and maintaining diet programme because of their lower calorie content. Historical Silkroad reveals great value of Gaziantep city in Spice trade. Throughout the years, Gaziantep cuisine has a privileged place among the cuisines of the world and our country with its traditions and local flavors of meals. Gaziantep is the much-frequented place for the gastro-tourists with its cuisine. The diversity of material with much variety of spices has been used in Gaziantep cuisine for meals. When preparing meals the material is chosen exactly then spices and sauce are used abundantly in Gaziantep cuisine. So that 'hasbir' which is the necessary decor of yogurt meals, tarragon which is a kind of mint, sumac and lemon thyme which are decor of salad for their gastrokinetic effects are widely used in Gaziantep cuisine. In addition juices and herbal teas with local herbs are used abundantly in the cuisine of Gaziantep. In this review, the importance of medicinal and aromatic plants is mentioned and then some common used spices in cuisine of Gaziantep are reviewed.

OPTIMIZATION OF DRYING PROCESS PARAMETERS FOR FRUITS AND VEGETABLES

YELİZ TEKGÜL¹, TANER BAYSAL²

ABSTRACT

OPTIMIZATION OF DRYING PROCESS PARAMETERS FOR FRUITS AND VEGETABLES Yeliz TEKGUL¹, Taner BAYSAL² 1Adnan Menderes University Kosk Vocational School, Department of Food Processing, 91100, Aydın, TURKEY 2Ege University, Faculty of Engineering, Department of Food Engineering, 35080, Izmir, TURKEY Fruit and vegetables are important sources of essential compounds for human consumption. Emissions from processed of waste and wastes are subject to microbial degradation and environmental pollution. Organic wastes can be recovered and can often be upgraded to higher value and useful products. Drying is one of the oldest methods in food preservation technique, used by human and commonly used for preservation of fruits and vegetables. Some important quality factors of the products such as colour, texture and chemical struture can be changed with drying. For this reason, for a production where the nutritional values, flavor and taste are at the highest level, the drying process has to be optimized in terms of controllability and product quality. In this review, studies about drying was investigated. Optimization of drying process parameters that are used for fruits and vegetables mostly were defined. It was determined that temperature, relative humidity, air velocity, initial characteristic of the material, drying time, vitamin contents of food, rehydration ration and enzymatic browning are the process variables that are focused on optimization.

ETHNOBOTANICAL OBSERVATIONS ON FLORA OF KSÜ AVŞAR CAMPUS (KAHRAMANMARAŞ) AND SURROUNDING AREAS

YUSUF ZIYA KOCABAŞ¹, ADEM EROL²

ABSTRACT

Kahramanmaraş is at the point of the intersection of Mediterranean and Irano-Turanian phytogeographical regions which are very important in terms of geographical location and plant geography. This area has a rich and various vegetation structure due to complex physical geographical structure and other environmental factors. It is crucial to protect by determinating this rich biodiversity. The research area is located in the Kahramanmaraş province and on the C6 square in grid system. The campus of KSU and its surrounding area is located in the Ceyhan Valley. The native flora of this area has been extensively destroyed by anthropogenic effects. This study was carried out between 2015 and 2017 and the plants used in medical and aromatic purposes of the native flora were investigated. As a result, it was determined that 56 plant taxa belonging to 34 families for used medically. In terms of species number, the largest families are as following; Labiatae (7), Asteraceae (5), Brassicaceae (4). These plant taxa were alphabetically indicated according to their family names, Latin and local names as well as with their used parts and usage purposes

**RESEARCH ON ECONOMIC CONTRIBUTION OF FOREST VILLAGE
(CASTANEA SATIVA MILL.) BIOLOGICAL AND KASTAMONU
FOREST DIRECTORATE DIRECTORATE (KASTAMONU, SİNOP
PROVINCES)**

HÜSEYİN DİNÇER¹

ABSTRACT

1. Properties of Chestnut It is a family of chestnut tree wisteria whose scientific name is "Castanea" and which grows in all the temperate regions of the northern hemisphere. The homeland of the "Castanea sativa" (European chestnuts) belonging to the highest quality varieties of chestnuts in the world is Anatolia. The species of chestnut that grows in countries in the Mediterranean basin where our country is included is "Castanea sativa mill." Fruits are an important source of income, and their trees make valuable timber in furniture industry. Moreover, due to the rainy and sloping rains such as the Black Sea Region, and therefore the pile roots in erosion-friendly lands, chestnut stands contribute to the country's economy and prevent soil erosion. 2. Summary of the inventory and economic contribution studies: The results of the project made under the protocol signed between the General Directorate of Forestry and the Faculty of Forestry of Kastamonu University in 2016 have been brought down and suggestions have been put forward for benefiting from the results. Turkey has an important potential for biological diversity as a result of its geographical location. Chestnut (Castanea sativa Mill.), Especially in woody species, is one of the important tree species of our country which is used in the production of firewood as well as fruit and honey for the production of honey. The forests in Kestanenin (Castanea sativa) are located within the thermophile leafy forest group in the EUNIS habitat classification system. In this study, it was aimed to investigate the ecological, biologic and economic characteristics of Anatolian Chestnut (Castanea sativa Mill.) At Kastamonu Regional Directorate of Forestry (KOBM). The study was carried out in the areas of pure and other varieties spreading within the boundaries of the CMB and in the anatomical chestnut (Castanea sativa Mill.) Stands. When the edaphic results of the study are examined, it is observed that the amount of rainfall in the area is between the ideal annual precipitation amounts (600 mm - 1000 mm) specified for the most suitable growing environment of the chestnut trees, the light permeability characteristic ideal for chestnut soil (pH 5.04-5.86 and sandy clay Or sandy clay soil characteristics), dead cover amount, soil organic carbon and total nitrogen amounts were found to be above the average values in the literature. Also, in terms of soil macro and micro nutrients, the values were very high in the soil of chestnut forests (Organic Carbon Amount: 2.53% to 6.09% and total nitrogen co The amount of chestnut produced per tree in the study area was directly proportional to the tree diameter (average: 27 kg). But at the same time, it has been observed that diseased chestnut trees are weak in fruit production, even if they are thick. As a result of the calculations made, it was determined that the total potential chestnut amount within the boundaries of the CBD could be approximately 110 thousand tons. (28.5% were large, 54.4% were medium, and 17.1% were small). The economic value

Corresponding Author: **HÜSEYİN DİNÇER**, huseyindincer@ogm.gov.tr

¹ORMAN GENEL MÜDÜRLÜĞÜ

of total potential chestnut has an economic value of 413.009.777 TL. The amount of chestnut made in the field production is 4.282.071 kg, 2.832.952 kg of this amount is sold to earn an economy and 1.449.118 kg is evaluated as a hanelerce. The total economic value of the chestnut sold is 18.421.701 TL. The economical value of chestnut which is used in the potable subsistence economy and written as an input to the hills is 8.891.044 TL. As a result, 6.6% of the total potential economic value is reflected as an input to the economy. While 4,5% of the money is directly input to the market, 2.1% of the houses are evaluated in the subsistence economy of the houses and the dwellings are a plus input. A total of TL 1,880 is input, with the direct cost of TL 1,268 per household and the opportunity cost of the product not sold for TL 612. Seven chestnut honey forests were established in the area of Kastamonu Forestry Directorate between the years of 2011-2017 in 510.8 hectares of area, contributing to the production of chestnut bale of local people. 415 tons of chestnut bale are produced annually in the region and $415 * 120.000 = 49.800.000$ TL are added as economic inputs to the local people by 2017 year valuentent 0.226% to 0.301%). It is important to take protective measures to make effective use of chestnut forests. Chestnut cancer is one of the most important diseases in chestnut forests and is an important fungal disease that is common in chestnut areas in the world and in our country and mostly causes the drying of trees. Fungus, ascospores or conidia and infection on the trunk and branches of the wounds and cracks is realized. Due to the disease, it was determined that necrosis or scarring of the cambium and crust of the trunk and branches of the trunk and branches occurred in the research area and that the crust and sudden death of the cambium resulted in collapses. *Cryphonectria parasitica* is the name of the fungus that causes disease and causes dryness in *Castanea sativa* Mill. (Anatolian chestnut). According to the elevation steps, the active cancer tissues in the body are 800-1000 m. The cancer tissue that heals when it is in the altitude steps is 500-800 m. Was seen among the ascenders. In addition to *Cryphonectria parasitica*, which is a pathogen, *Phytophthora* spp., As a result of examination of the cancer tissues collected from the fields and brought to the laboratory and cultured. And *Fusarium solani* and saprophytic *Aspergillus niger* and *Penicillium* species were also identified. Our forestry directorate has achieved 80% success in the field of sanitation in order to combat cancer and ink disease in the field of chestnut in 747.5 ha between 2006-2017. In these areas, natural hypovirulents have formed and the forest has begun to cure itself. In addition, it was observed that local people complained about wild boar (*Sus scrofa*) especially in the wild animals during the chestnut fruit harvest due to the decrease of the number of chestnuts obtained and the yield. Images obtained from photocopies placed to detect this situation in the field have also been identified in the ending area, wild animals such as foxes (*Vulpes vulpes*), wild bears (*Canis aureus*) and wild cats (*Felis sylvestris*) besides wild boar (*Sus scrofa*).

**DETERMINATION OF BIOLOGICAL ACTIVITY AND ACTIVE
SUBSTANCES OF ENDEMIC SPECIES OF DIANTHUS VANENSIS
(CARYOPHYLLACEAE).**

MEHMET EMRE EREZ¹, SÜLEYMAN MESUT PINAR², MEHMET FİDAN¹, ABDULLAH DALAR², HÜSEYİN EROĞLU²

ABSTRACT

The Caryophyllaceae Juss. is one of the major dicot family of angiosperms and is globally represented by 85 genera and 2.630 species (Mabberley, 2008). The family Caryophyllaceae is widely known for gardening herbs but medicinal importance of its members is sparsely known. Several species of the family Caryophyllaceae are widely used by many ethnic communities as traditional medicine throughout the world. The highest numbers of plants of the family are used in Chinese traditional medicine. The ethnopharmacological studies of this family indicate that plants of the family possess anticancer, antibacterial, antifungal, antiviral, antioxidant, and anti-inflammatory properties (Chandra and Rawat, 2015). The aim of the present study was to examine the biological activity and active substances of aerial part of *Dianthus vanensis* by different solvents and methods. First all the methanol extracts were used and then fractionated extracts (Acetone, Ethanol and water) were studied. The results were compared with each other. For this aim the total phenolic and flavonoid content, DPPH and FRAP activity were determined. Finally the active substances of methanol extract were examined. According to results; the DPPH inhibition percentage was calculated as 35,90 % at 0.1 mg/ml concentration. Total phenolic and flavonoids contents by methanol extracts were found as 20,46±2,01 mg/mg gallic acid and 36,74±5,38 rutin equivalent respectively. Also in fractionated method the total phenolic values were arranged 17,01±0,47 in acetone, 19,07±6,36 in ethanol and 11,89±0,56 in water extracts. For total phenolic contents in fractionated methods the results were calculated as 42,25±1,55 in acetone, 24,26±7,00 in ethanol and 52,55±3,21 in water extracts. FRAP activity of plant extract by methanol was estimated as 146,11±14,89 µmol Fe+2/g and in fractionated method the maximum value was found in acetone extraction with 134,19±0,01 umol Fe+2/g. Evaluation of volatile compound and fatty acid compositions on the plant extract the Octadecane, Hexatricontane, Octadecane, Cyclopentane and also Palmitic Acid, Linolelaidic Acid and γ-Linolenic Acid were detected. According to results the local endemic species of *Dianthus vanensis* can be used for medicinal studies.

THE ANTIFUNGAL AND ANTIPHTHOTOXIC EFFECTS OF THE ESSENTIAL OILS OBTAINED FROM MEDICAL AND AROMATIC PLANTS

MEHMET UFUK KASIM¹, PINAR ŐANLIBABA², REZZAN KASIM¹

ABSTRACT

Mycotoxins; Are low molecular weight, natural toxins of a wide variety of chemical structures resulting from the secondary metabolism of fungal species such as *Aspergillus*, *Penicillium*, *Fusarium*, *Alternaria* and *Claviceps*. They create powerful and various toxic effects on human and animal health. Mycotoxin producing fungi can infect plants pre-harvest and postharvest when appropriate environmental conditions are established, and they can produce mycotoxin production. Commonly known mycotoxins are aflatoxins, trichothecenes, fumonisin, ochratoxins, patulin, zearalenone. Essential oils are natural ingredients that can be used to prevent fungal growth and phytotoxin development in food due to their antifungal and antifitotoxicological properties. Therefore, it will not be a harmful effect in terms of residue and human health. There is also the potential to be active ingredient for organic agriculture and integrated pest management. This study will be aimed to compile studies about the effects of essential oils obtained from medicinal and aromatic plants such as turmeric (*Curcuma longa*), thyme (*Thymus vulgaris*), cumin (*Cuminum cyminum*), cinnamon (*Cinnamomum zeylanicum*), mentha (*Mentha spicata*), clove (*Eugenia caryophyllata*), caraway (*Carum carvi*), rosemary (*Rosmarinus officinalis*), sage (*Salvia officinalis*), lemongrass (*Cymbopogon citratus*), eucalyptus (*Eucalyptus globulus*), oregano (*Origanum vulgare*), rue (*Ruta graveolens*), winter savory (*Satureja montana*) to prevent antifungal, antibacterial and phytotoxins.

THE EFFECT OF DIFFERENT HARVEST TIMES ON LAVENDER (LAVANDULA ANGUSTIFOLIA L.) VOLATILE OIL CONTENT AND QUALITY IN AFYONKARAHISAR CLIMATE CONDITIONS

AMİR SOLTANBEİĞİ¹, HARUN DIRAMAN¹, EMEL YILDIZ²

ABSTRACT

Lavender has been always known as a valuable plant and its volatile oil obtained from flowers has wide application in cosmetics, perfumery, medicine and food industries and especially is used in aromatherapy. This research was carried out to determine the optimum harvesting time (related with the highest volatile oil content and its quality) of lavender (*Lavandula angustifolia* L.) plants grown in Afyonkarahisar Medicinal and Aromatic Plants Center that located in the passage climate zone. To achieve this purpose, the flower samples were taken at the beginin of flowering, full flowering, after flowering and seed set stages and plants were dried in the shade. Volatile oils of the flowers that have been separated from the stems were extracted by hydrodistillation method. The highest and lowest volatile oil contents were obtained in full flowering (7.3%) and the begining of flowering (3.3%) stages, respectively. To determine the quality of the obtained volatile oils, samples were analyzed by GC-MS and the components were separated. According to the results of analyses, linalool in particular, borneol, 4-terpineol, camphor and 1.8-cineole were formed as the major components. Accordingly, linalool ratios were found in full flowering (48.195%) and seed set (22.340%) stages, respectively. On the other, the highest and lowest camphor contents, which affects lavender volatile oil negatively, were identified at the beginning of flowering (26.835%) and after flowering (9.694%) stages, respectively. In the direction of our results, the optimum harvesting time in terms of volatile oil content and its quality should be at full flowering stage and mid-July.

CHANGES IN EXPRESSIONS OF ENZYMES INVOLVED IN METABOLISM OF SOME CHEMOTHERAPEUTIC DRUGS BY SALVIA FRUTICOSA MILL.

AHMET ALTAY¹, DENİZ İRTEM KARTAL², GÖKHAN SADI³, FARUK BOZOĐLU⁴

ABSTRACT

Xenobiotic biotransformation is the principle mechanism for maintaining homeostasis during exposure of organisms to small foreign molecules. Xenobiotic biotransforming enzymes are generally divided into two groups, called as phase I and phase II. While liver is the richest source of enzymes catalyzing biotransformation reactions, these enzymes are widely distributed throughout the body including gastrointestinal tract, lung, kidney, heart and brain. Salvia sages have been used for more than 60 different ailments ranging from aches to epilepsy. There are around 900 species of Salvia in the worldwide, 95 of which are currently represented in Turkey. Salvia fruticosa Mill. spontaneously grows mainly in Western and Southern Anatolia. The leaves of the plant is regularly consumed as herbal tea and to treat some disorders in Anatolian folk medicine. Tamoxifen, a chemotherapeutic prodrug, is metabolized by CYP2D6, CYP2C9 and CYP3A4 enzymes into its active forms N-desmethyltamoxifen and N-desmethyl-4-hydroxytamoxifen. On the other hand, SULT1A1, UGT1A8, UGT1A10 and UGT2B7 are primary enzymes converting tamoxifen metabolites to a form to be excreted. In addition, cyclophosphamide & ifosfamide, chemotherapeutic prodrugs, are metabolized mainly by CYP2B6 and CYP3A4 into their active forms phosphamide mustard. ADH and ALDH enzymes converts aldophosphamide to alcohosphamide and carboxyphosphamide, which are less toxic compounds. In this study our major aim is to observe as in vitro how metabolism of some chemotherapeutic drugs is affected when treated with water extract of Salvia fruticosa on HT-29 colorectal adenocarcinoma cells. Panel assay, a preferred technique to establish differentially expressed genes, was used to elucidate the effects of the extract on gene expression profiles of phase I and phase II enzymes playing notable roles in the metabolisms of chemotherapeutic drugs; tamoxifen, cyclophosphamide and ifosfamide. Web based Kyoto Encyclopedia of Genes and Genomes (KEGG) software was used for analyzing the results of pathway panels. Our results showed that metabolism of chemotherapeutic drugs aforementioned was modified by Salvia extract. The only significant change in gene expression of CYP's involved in tamoxifen metabolism was CYP3A4 (13,5 fold), While a small amount of increase was observed in the expression of CYP2D6 (1,12 fold) and CYP2C9 (1,66 fold). Consequently, treatment of the cells with the extract moderately affects conversion of tamoxifen into active secondary metabolites. However, deactivation of tamoxifen metabolites through conjugation was also affected by the extract treatment. SULT1A1 and UGT2B7 expressions increased up to 4,5 fold and 60 fold in response to treatment. Increase in expression of phase II enzymes at such a high amount would lead to removing of the affects of secondary active metabolites of tamoxifen.

⁴ODTÜ

Similar results were observed in the metabolism of Cyclophosphamide & ifosfamide. As a result, on the light of the observation data, consuming of *salvia fruticosa* together with chemotherapeutic drugs does not cause accumulation of toxic metabolites in the investigated cells due to the much higher expressions of phase II enzymes than phase I enzymes.

ENDEMIC PLANTS CONTAINING ECONOMICAL VALUE IN THE AEGEAN REGION

HADIYE BAŞAR¹, HAFİZE HANDAN ÖNER¹

ABSTRACT

The rich flora of our country, occupies an important place as it is the economic aspect ecological aspect also amongst our national resources. Plants has an important place with medicinal and aromatic properties in different fields as food, medicines, cosmetics, decorative and in addition to their use for cultures. Especially nowadays in the health is observed spreading use in the form of phytotherapy, aromatherapy, life cures. It is growing the volume of the world market because of creasing usage areas with new researches. However, the evaluation of these plants are raw and/or semi-manufactured leads to fail to benefit from obtaining added value by their processing, therefore significant loss of foreign exchange. In recent years environmental degradation because of industrialization and urbanization, wrong land use decisions, increasing energy needs with the increasing load on the ecological system leads to damaged habitats and being threatened a lot of taxa with undiscovered yet. In this study, we identified endemic species which has economic value in the Aegean region and gave information their usage areas.

MASTIC SEEDLING GROWING IN İZMİR REGIONAL DIRECTORATE OF FORESTRY

ŞAHİN AYBAL¹, ZÜLAL TOTAN¹, YAVUZ SELİM SAĞLAM¹, MERVE NEZAHAT DURDAĞI¹

ABSTRACT

Mastic tree whose latin name is *Pistacia lentiscus* var. *chia* grows only in Mastic Island of Greece and Çeşme coasts in Türkiye. This tree has been growing since antic eras and protecting by legal regulations. Mastic gum that is obtained from mastic tree has known since Pharaoh Era, mentioned in holy books, used because of healing feature. Therefore it is important species. Female individuals also secrete mastic but it has unfavorable quality. Therefore male individuals of *Pistacia lentiscus* var. *chia* have been used for mastic producing. Mastic tree starts to secrete mastic on six years old. On years 12-15 it reaches productive time and these years per trees secretes 320 gr mastic gums. In 40-50 years it reaches optimum conditions. Mastic gums obtained by injuring bark of trunk and thick branches in June-July months. There are some regulation in Greece about planting Mastic tree, and Greece is a monopol its production and trade. Annual production is 250 metric tone in Mastic Islands. There is 3-5 kg production that is produced by amateur people in Çeşme and around in Türkiye Mastic tree growing studies have been ongoing since 2003 year, in İzmir Regional Directorate of Forestry. At the end of these studies, Mastic Action Plan has been prepared in Forestry General Directorate. The purpose of these studies is to obtain plants those suitable to produce mastic gums economically. In this case, grafting on *Pistacia atlantica* seedling, grafting on wild *Pistacia lentiscus* individuals, to obtain seedlings by overhead rooting and rooting with dipping by long stick are studies continuous. Different work schedules have been applied in different working days. All applications have been done separately in controlled greenhouse conditions and open air. As a result, the most suitable grafting method and time, the most suitable overhead rooting method and time and the most suitable dipping method and time will identified that has not been studied before. In this paper, the result of mastic seedling production studies which has continued since 2003 will be submit

**THE PRODUCTION TECHNIQUE FROM SEED OF THE
STRAWBERRY TREE (ARBUTUS UNEDO), WILD CRAB APPLE
(MALUS SYLVETRIS) AND CHECKER TREE (SORBUS
TORMINALIS) FROM NATURAL PLANTS OF KOCAELI**

BİRGÜL AYAR UÇUM¹, OKAN KURŞUN², HACER DILAVER³

ABSTRACT

The demand for medicinal and aromatic plants in the world is increasing every day. Our country is different climate and ecological conditions in which it is located, has a rich plant species and diversity. It contains a large number of medicinal and aromatic plants in our rich flora. As in the world in our country, medicinal and aromatic plants are used and are produced for many different purposes. Some of these plants have been used since centuries among the population. The using areas of these plants are very wide. The using areas of medicinal plants; especially spices, as manufacturing medical and relaxing tea, pharmaceuticals, paint, insecticide, veterinary cure, resin, glue, essential oil, beverages, perfumes and cosmetic industry can be classified. Kocaeli city with about 147 thousand hectares of forest is among the greenest cities of our country. Kocaeli vegetation, generally indicates the characteristic of the Marmara region, also has a rich flora, including plant communities unique to the Black Sea and Mediterranean coasts due to significant differences between the coastal and mountainous areas. Among these are many plant species in the form of shrubs, trees collected especially by the people and consumed for healing purposes. Strawberry tree (*Arbutus unedo*), Wild crab apple (*Malus sylvestris*) and Checker tree (*Sorbus torminalis*) also are used as medicinal plants for centuries by the Turkish people. In this study, it is given information about collection by the İzmit Nursey and pre-sowing process, sowing technique of fruits of *Arbutus unedo*, *Malus sylvestris* and *Sorbus torminalis* which naturally occurring in the forest areas within borders of Central and Kandıra sub-district affiliated Sakarya Forest District Directorate, is collected and consumed in various forms as healing by the people living in there.

**DAMAGE AND ECONOMIC IMPACT OF THE MINT APHID,
EUCARAZIA ELEGANS (FERRARI) (HEMIPTERA: APHIDIDAE) ON
COMMON SAGE (SALVIA OFFICINALIS L.) IN IZMIR, TURKEY**

AGUSTIN ZARKANI¹, FERİT TURANLI¹, ÇIĞDEM SÖNMEZ², EMİNE BAYRAM², İŞİL ÖZDEMİR³

ABSTRACT

A survey and experimental simulations of the mint aphid, *Eucarzia elegans* (Hemiptera: Aphididae) were performed to predict incidence rates and its economic impact on *Salvia officinalis* L. The investigations were purposively conducted on conventionally grown sage plants in the experimental form of Field Crops Department, Faculty of Agriculture, Ege University and Aegean Agricultural Research Institute, Menemen, Izmir-Turkey between January to December 2016. Normal-double populations and economic injury level (EIL) experiments were set up at each of the randomized complete design in laboratory. In the normal population treatment was the sage plant was infested by 100-200 aphids, while double population was set up by infesting the plants with 300-400 aphids. The corresponding treatments 0 (no exposure), 2, 4, 6, 8, 10 and 12 weeks (complete exposure) were used for evaluating EIL. In this study, *E. elegans* attacked on old hibernated leaves with incidence rate of 9,5% in the early spring and then migrated to young leaves and blossom at the beginning of the summer with incidence rate of 1,1%. Although the aphid attack revealed no differences on quantity of essential oil, however the oil quality was greatly reduced compared to control. The total fresh and dry weight production in double infestation was about 1/3 and 1/2 for the control and normal aphid infestation, respectively. Aphids feed on sage plants beyond 8-10 weeks resulted in more than 50 % yield loss. The highest benefit-to-cost ratio was obtained at six-weeks of exposure when initiation of insecticide application was most economical. The correlation between aphids attack and dry weight production was described by a linear regression equation: $y = 1,488 - 0,010x$.

VOLATILE COMPOUNDS OF PLANE TREE (PLATANUS ORIENTALIS) LEAVES WITH SOLID PHASE MICROEXTRACTION (SPME) TECHNIQUE

ZEHRA GÜLER¹, AHMET DURSUN¹, DILEK ÖZKAN¹

ABSTRACT

Plane tree, known for its grandeur and longevity, belongs to Platanaceae family. Plane variety growing in Turkey is *Platanus orientalis*. Nowadays, there is a widespread belief that *Platanus orientalis* leaves (POLs) have beneficial effects on joint disorders. Therefore many people consume POLs as tea. The available data in literature on POLs reported that POLs have an anti-nociceptive effect on arthritis and knee pain. To our knowledge, there is no study on volatile compounds (VCs) of POLs. Therefore, we objected to determine the VCs in POLs obtained from *Platanus orientalis* trees grown in Hatay province, Turkey. The VCs were extracted using solid phase micro-extraction (SPME) and analyzed by gas chromatography-mass spectrometry (GC-MS). A total of 140 VCs were found in POLs. Aldehydes, alcohols, ketones, terpenes and alkenes were determined in POLs as major VCs groups, which accounted for 32.40 %, 23.51 %, 18.08 %, 10.24 % and 4.82 % of total VCs identified in leaves, respectively. Trans, trans-2,4-heptadienal (6.62 %), nonanal (6.46 %), benzaldehyde (6.42 %), cis-3-hexen-1-ol (6.32 %), benzenemethanol (6.13 %) were the first most abundant VCs identified in POLs. Trans-2-hexenal (3.46 %), 3-phenyl-2-butanone (2.87 %), trans-3,5-dimethyl-1,6-octadiene (2.80 %), 6-methyl-5-hepten-2-one (2.56 %), octan-1-ol (2.43 %), transgeranyl acetone (2.17 %), trans-4,8-dimethyl-1,3,7-nonatriene (1.98 %), phenyl methyl ketone (1.69 %), 6-methyl-3,5-heptadiene-2-one (1.57 %) were the second most plentiful compounds found in POLs. Additionally, 11H-dibenzo[b,e][1,4]diazepin-11-one, 5,10-dihydro-5-[3-(methylamino)propyl] (1.38 %), benzeneethanol (1.36 %) and β -ionone (1.02 %) were found as the third most abundant VCs. The relative proportions of these VCs were accounted for about 57 % of total VCs identified in POLs. The remaining VCs were below 1.00 %, that is, found at trace levels.

CHEMICAL COMPOSITION OF THE ESSENTIAL OILS OF LAUREL LEAVES GROWN IN HATAY REGION

ALİME EBRU AYDIN¹

ABSTRACT

Medicinal and aromatic plants have a broad market in the world especially in medicine and food industry as raw material. Due to geographical location and climatic characteristics, Hatay city have a wide range of medicinal and aromatic plants variety. There are around 300 registered endemic plants in Hatay province. *Laurus nobilis* L. is a Mediterranean plant which grows wild in coastal provenances of Turkey, and it is also widely used in industry. *Laurus nobilis* L. is a naturally grown plant with significant market potential in the Hatay region. Two major parts of *Laurus nobilis* L are used in industry: one of them is laurel leaf, other part is laurel berry. In spite of the fact that laurel leaf is mainly used in Food Industry, it is also widely used in perfumery and cosmetic. The essential oil content shows variations depending on geographic location, exposure to sun light, age, different parts of tree, drying process, storage and extraction method. The main objective of the present study was to investigate the changes in content and chemical composition of the essential oil from the leaves of *Laurus nobilis* depending on harvesting time. The *Laurus nobilis* leaves were harvested during the August-November period in 2015 in 30 days intervals from the one and the same tree in Antakya. Air-dried leaves were subjected to hydrodistillation using a Clevenger-type apparatus and the essential oil composition and yield of the leaves of *Laurus nobilis* L. were determined. *Laurus nobilis* L. essential oil is very rich in monoterpene hydrocarbons. Monocyclic monoterpenes such as 1,8-cineole (59.87%), α -terpinyl acetate (9.2%), and terpinene-4-ol (4.75%) formed the largest fraction. References: 1. Gül, A., Çelik, A. FIRST TRICKS IN ARCHEOLOGY OF MEDICAL AND AROMATIC PLANTS

FATMA ŐEKER¹, TUĐBA DEMİR¹

ABSTRACT

Archeology knowledge; Almost 99% of human history deals with basic information sources that interest us. Research materials are sometimes made of various tools and weapons made of stone and bone, and sometimes pottery grain remains can be quarry ash. In the most primitive societies, wise women, sorcerers, and shamans have started medical history by discovering the therapeutic aspects of plants growing in their environment through trial and error. In northern Iraq; The excavations carried out at Őanidar Cave are on the server; There are pollen analyzes carried out in a Neanderthal grave, which is referred to literally as "Flowering Burial" dating from 60 thousand years ago. As a result, plants such as Achillea sp., Senecio sp., Alcea sp., Centaurea sp., Ephedra sp., Which are widely known among the public today, And the history of the human-medicinal plant relationship. In recent studies, El Sidron, who was dated to 42-50 thousand years ago in El Sidron Cave in Spain, reported that 1 individual treated tooth acnes using plants such as yarrow (Achillea sp.) And chamomile (Anthemis nabilis). Self-medication and cognitive development. When these plants are compared to current studies, high bioactive contents are important.

MEDICAL AND AROMATIC PLANTS IN ANCIENT EGYPT PERIOD

FATMA ŞEKER¹, TUĞBA DEMİR¹

ABSTRACT

From the beginning of history; Human beings have faced medical problems such as sickness. And initiated attempts to address these issues. B.C. The second half of the year four thousand; In Neopotamia, the Sumerians' written nail-writing tablets reaching elimination with the invention are the first written sources to reach the elimination of the use of medical plants. In Egypt; B.C. 2000; It has been shown that approximately 850 prescriptions in the dated papyrus are used in the treatment of herbal materials. Some of the plants mentioned in the prescriptions are; Juniper, poppy, cigdem, Indian oil plant, fig, pomegranate, onion, garlic and cinnamon. Today's scientific studies; It has been shown that a considerable part of the plants used by the Egyptians in medicine is also medically effective. As a result of our archaeological studies; The obtained papyrus prescriptions are used for consumption of onions and garlic for medical purposes in the workers working on the pyramids in Ancient Egypt. The measures against the risk of infections could be taken at this point; It is a clear indication that these plants are being used for antimicrobial treatment from ancient times. Such that; Many of the plants prescribed in papyrus; Nowadays Antimicrobial, Antioxidant, Antikanser confirm these findings. How long ago the alternative treatment started; Medical and aromatic plants in archeology is a very important place once again revealed.

THE USA OF SPICES AS ANTIMICROBIAL IN FUNCTIONAL MEAT AND MEAT PRODUCTS

CEMALETTİN SARIÇOBAN¹, SABİRE YERLİKAYA²

ABSTRACT

One of the most proper places for microorganisms is meat and meat products. This kind of foods has high moisture content are rich in terms of amount of mineral matter, nutritional elements and has some glycogen too. Because of this reason meat and meat products has characteristic as spoiling easily. This spoilage can be faster because of meat's pH value that convenient for many microorganisms. Consumer tendency can be towards different foods because of this negatively. So demand for meat and meat product decrease. Various modification studies are carried out to prevent demand decreasing. This modification can be made as adding useful components or decreasing the amount of harmful components or destroying the all harmful components. For this purpose, natural extracts which have antioxidant and antimicrobial properties are added to meat and meat products. There are many studies about using the extracts as angelica root, bay, caraway seed, thyme, rosemary, clove, pimento etc. It is found that these extracts have inhibitory effect on pathogen microorganisms as *L. monocytogenes* and *Aeromonas hydrophile* in meat products have shelf life. In another study, it is indicated that rosemary extracts has inhibitory effect on *L. monocytogenes* in some meat products. Besides, the extracts make only lactic acid bacteria numbers decrease in meatball. Rosemary extract decelerate growth rate of *Lactobacillus curvatus* at the same time. Fermented foods are thought as a sample that spices are used in. Lots of chemical, biochemical and microbiological events occur during production of these foods. At the end, characteristic taste, odour, flavour and colour growth are observed. The importance of spices is big in growing these organoleptic properties. In history, the purpose of production fermented meats is to extend the shelf life with using the antimicrobial properties of spices. But now, it is producing the products that consumer demand.

IMPORTANT BIOACTIVE COMPONENTS OF OLIVE OIL AS A FUNCTIONAL FOOD

GİZEM ÇAĞLA DÜLGER¹, ŞEFİK KURULTAY², OSMAN ŞİMŞEK², DEMET APAYDIN², İSMAIL YILMAZ², ÜMIT GEÇGEL²

ABSTRACT

Olive oil is a valuable vegetable oil in Mediterranean diet that obtained by mechanical treatment without any chemical treatment from fruit of olive (*Olea europaea* L.) tree and is regarded as functional food due to its rich bioactive components. Sterols, tocopherols, phospholipids, chlorophylls, carotenoids, phenolic substances and squalene are bioactive compounds in natural olive oil and known as useful compounds for human health. Squalene, the most prominent hydrocarbon in olive oil, is a triterpene and the intermediate product of cholesterol biosynthesis pathway. Extra virgin olive oil contains 400-450 mg squalene per 100 grams, olive oil contains squalene at the highest level compared to other vegetable oils. Polyphenols and tocopherols are phenolic compounds that act as natural antioxidants prevent oxidation in extra virgin olive oil. Olive oil contains α -, β -, γ - and δ -tocopherol in the range of 12-150 ppm, of which 88.5% is α -tocopherol, 9.9% is β - and γ -tocopherol and 1.6% is δ -tocopherol. Tyrosol and hydroxytyrosol are the most characteristic phenolic components of olive oil and they constitute 30% of the phenolic substances in olive oil. Another phenolic substances oleuropein and lignans are %50 of phenolic substances of olive oil. Extra virgin olive oil contains 180-265 mg sterols per 100 g and sterols constitute 20% of the unsaponified fraction of olive oil. Olive oil contains primarily β -sitosterol, Δ 5-avenasterol, campesterol and small amount of stigmasterol, cholesterol, 24methylenecholesterol, Δ 7-campesterol, Δ 5,23-stigmastadienol, Δ 5,24-stigmastadienol, sitostanol, Δ 7-stigmastenol, Δ 7-avenasterol. It is known that some antioxidant substances in olive oil reduce coronary heart disease and some types of cancer. In this study, information was given about the bioactive components that enable the olive oil to be identified as functional food.

SOME ETNOBOTANIC PLANTS IN TRABZON

MÜMIN DÖNGEZ¹, ÖMER SUHA CEYLAN², GÜLCAN MEYDAN AKTURK²

ABSTRACT

Although we have a very rich flora and ethnobotanic studies are carried out in different regions by many researchers in our country, we still do not know how many of the plants are used by our people in our country. With this study, it was aimed to introduce rich diversity of species in terms of ethnobotanic in Trabzon by Trabzon Regional Forest Directorate of Non-wood products and Services Directorate. The study was conducted between December 20, 2016 and January 20, 2017 in the provinces of Trabzon as a result of the face of interviews made with sellers of medicinal herbs and local people. Within the scope of this research, some plant species grown naturally in Trabzon Provided the by sellers of medicinal herbs from other regions were obtained. Also, the plant usage habits of the local people were evaluated. It has been tried to determine the plant usage frequency, plant consumption and utilization habit of local people. In this study, 36 plant taxa which were used for food, treatment and ornamental purposes in Trabzon region were determined by interviews with villagers in 15 central villages and 6 sellers of medicinal herbs in Trabzon. Most of the plants with ethnobotanic characteristics are collected from the nature while some of them are cultured. The cultivation of high economic value ethnobotanic plants, the establishment of policies related to trade, the supply of internal and external market for increasing consumption can be obtained the millions of pounds in every year. Thus, local people will benefit from economic and social direction. It is important that plants are registered in accordance with scientific literature as well as authentic (local, ethnic) names. Due to the different interpretation of scientific names and local names of plant species, It is important that the results come up to the death of the users in the world and in our country. This shows that sellers of medicinal herbs can not be an organization under the stairs, on the contrary, this profession should be done with supervised and expert persons such as a pharmacy.

**THE EFFECTS OF CULTIVATION AREA AND ALTITUDE
VARIATION ON COMPOSITION OF ESSENTIAL OIL OF LAURUS
NOBILIS L. GROWN IN EASTERN, WESTERN AND CENTRAL
KARADENİZ REGION.**

BILGE YILMAZ¹, İLHAN DENİZ¹

ABSTRACT

The Effects of Cultivation Area and Altitude Variation on Composition of Essential Oil of *Laurus nobilis* L. Grown in Eastern, Western and Central Karadeniz Region. *Laurus nobilis* L. is one of the most valuable non-wood forest products on world export market and Turkey is the biggest provider country for *Laurus nobilis* in the world. Because approximately % 80 of *Laurus nobilis* in world is produced in Turkey. Therefore laurel is an important commercial product for our country. *Laurus nobilis* L. belongs to Lauraceae family. It includes 32 genera and about 2,000-2,500 species. Laurel leaf has antiepileptic, anticonvulsive, antimicrobial and antibacterial effects. These effects stem from volatile compounds which are in essential oil. In this study, the effects of cultivation area and altitude variation on essential oil yield and volatile compounds of laurel leaves which grown in Trabzon, Bartın and Samsun, were examined. *Laurus nobilis* L. leaves were collected in three different height ranges. These are 0-100 m, 100-300 m, 300-600 m. Leaves were shade-dried and crushed. A device called "Clevenger" was used for getting volatile oil. After getting volatile oils of leaves, they were stored glass vials at 4 °C until analyzed. The GC-MS analysis of the essential oils were performed with Agilent 5975 GC-MSD system. Innovax FSC column (60 mx0.25mm, 0.25µm film thickness) was used with helium as carrier gas (0.8 ml/min). GC oven temperature was kept at 60 °C for 10 min programmed to 220 at a rate of 4 °C/min, and kept constant at 220 °C for 10 min. and then programmed to 240 °C at a rate of 1 °C/min. The injector temperature was set at 250 °C. Mass spectra were recorded at 70 eV. Mass range was from m/z 35 to 450. The essential oil yield of leaves range between 0.92% and 1.58%. The highest amount of essential oil yield in leaves was obtained in Trabzon (100-300 m). The lowest amount of essential oil yield in leaves was obtained in Bartın (100-300 m). According to GC-MSD results, 1,8- cineole (19.71 % - 35.63%), α -terpinyl acetate (12.86%-21.24%), sabinene (5.98%-8.56%), α - pinene (3.67%-8.45%) and β - pinene (2.91%-5.87%), were the most abundant volatile compounds in the leaves of bay.

GRAPE SEED AND LIFE SPAN IN DROSOPHILA

ZUHAL KARA¹, EMINE MUTLU¹, AYŞE GÜL MUTLU²

ABSTRACT

The free radical theory of aging postulates that the accumulation of macromolecular damage induced by toxic reactive oxygen species plays a central role in the aging process. This process is now the major cause of death in the developed countries. In addition to the protective effects of endogenous enzymatic antioxidant defenses, consumption of dietary antioxidants appears to be of great importance. Adding antioxidants to the diet, which changes the balance between oxidants and antioxidants, may increase longevity. The aim of this study was to investigate the effects of a grape (*Vitis vinifera*) seed rich diet on life span and catalase enzyme activities in the aging process of *Drosophila*. *Drosophila* are useful model organisms because of their small size and short generation time, and are commonly used to facilitate experimental laboratory research. Female reproductive functions may effect some physiological properties, therefore only wild type (Oregon) male flies were used in the experiments. Flies were housed in glass tubes and incubated at 25 °C and 12 hours day–night cycle. Experimental meal medium was 0,7 g grape seed /100 ml corn meal. Catalase activity was measured as recommended by Luck (1963) using H₂O₂ as substrate, based on determination of decreasing on H₂O₂ amounts at 240 nm. Proteins were determined by the Bradford method. There were no differences in catalase activity results between control and grape seed groups. However the life span increased statistically significant in the grape seed feed group. Polyphenols of grape seed extract have long been recognized to possess many properties, including antioxidant, anti-inflammatory, anticarcinogenic and are also known to improve overall human health. These include increased nitric oxide production, down-regulation of vasoactive peptides, lowered levels of oxidized low-density lipoprotein, cyclooxygenase inhibition, breakdown of beta-amyloid, modulation of signal transduction. Grapes have been used for their medicinal and nutritional value for thousands of years. Human ate grapes at least 6000 years ago. Grape seed may have positive effects on human life span.

VIBURNUM L.

HASAN KESKİN¹, SEYFETTİN KİNİŞ¹

ABSTRACT

Viburnum is a species of Caprifoliaceae that grows in the winter as a conifer, 2-4 meters in height. Viburnum's fruits are evaluated in various forms such as dried fruits, pickles and jam. The spreading regions of Viburnum are Turkestan, Europe, North West Africa and Canada. This species has been scattered in the country in both Europe and North Africa. Viburnum breeding in Turkey is not much more than that. Gilaburu 's shells, fruits, flowers and water are used in traditional medicine in various places. There are located 7,81% water soluble dry matter, 5,83% reducing sugar, 6,71% crude protein, 19,86% crude cellulose and 560 mg / kg ascorbic acid, 2473,8 mg / kg potassium, 402,62 mg / kg sodium in the composition of fresh Gilaburu fruit. In this study, it's been tried to detect natural distribution areas of Viburnum that little-known by local people in Bolu. In the region, this plant, which has been shown interest by those suffering from kidney trouble, kidney stone or sand trouble. Viburnum fruit which is sold in herbalist is consumed in the form of water. Viburnum was found in Bolu province. It is usually seen on the edge of the village. Not in the form of large groups or clusters, individual or double or up to 3 shrubs. It is necessary to extensively determine the presence of viburnum within the boundaries of Bolu Forest Regional Directorate. This requires a widespread survey and inventory study. After the widespread detection work within the boundaries of the Bolu Forest Regional Directorate, it will be ensured that Viburnum is brought into the field of medical aromatic plants.

EVALUATION OF ESSENTIAL FATTY ACIDS OF COLD PRESSED FIG AND ROSEHIP OILS AS UNCONVENTIONAL BIO-OILS IN EDIBLE OIL AND PHARMACEUTICAL INDUSTRIES

RAZIYE NUR TENEKECI¹, HUSEYİN KARA¹

ABSTRACT

Industrially, there are different techniques for obtaining edible oil such as screw press, organic solvent extraction and cold press. Cold pressed seed oils have important nutritional and chemical properties. Due to their high nutritional value and health beneficial factors, new and unconventional seeds species have been researched and evaluated as alternative lipid sources for human consumption. Fig and rosehip seeds contain oil about 26.44% and 30.00% in dry matter based, respectively. Fatty acid composition is an important marker used in determining the nutritional value and chemical properties of edible seed oils. Cold pressed figs and rosehip oils have unsaturated fatty acids, omega-3 and omega-6 that reduced risk of cardiovascular disease and the lipid levels in experimental animals have been observed in observational studies. In this study, essential fatty acid properties of cold pressed rosehip and fig seed oils have been evaluated by using gas chromatography (GC) and gas chromatography-mass spectrometry (GC-MS). Obtained results show that the cold pressed fig and rosehip oils are good sources in terms of unsaturated fatty acid as linoleic and linolenic acids. Linolenic acid was found to be dominant (34.05%) followed by linoleic acid (33.74%) and oleic acid (19.60%) in cold pressed fig oil. Linoleic acid (50.18%), linolenic acid (20.44%) and oleic acid (20.65%) were found in cold pressed rosehip oil.

FERULA ELAEOCHYTRIS IN KONYA REGIONAL DIRECTORATE OF FORESTRY

MEHMET VEHBI TEMİRCİ¹, ERDAL TUNÇEZ¹

ABSTRACT

Ferula is a perennial herbaceous plant that grows up to 2 meters in length and yellow-blooming. It contains tannin, resin, starch, alkaloid, saponin and volatile oil. This plant is used as food, as animal feed, and for medical field treatment purposes. This plant which has medical characteristics and economic value is spreading within the boundaries of Göktepe Forest Management Chief of Forest Sub-district Directorate of Ermenek under Konya Regional Directorate of Forestry. On the importance of this plant, Ferula elaeochytris inventory and planning has been completed in addition to ODÜH (Non-Wood Forest Products and Services) MANAGEMENT PLAN which covers the years 2013-2025. In the result of field inventory made in the total area of 50820.5 hectares of Göktepe Forest Management Chief whose management plan was made, this plant shows spread. As a result of the wealth inventory made in these areas where the product is spreading, Annual yield of 668376.00 kilograms was determined. Within the supply-demand balance, rotative production planning is envisaged. The result of overgrazing and unconscious using for years, Ferula areas have been degenerated and have lost their yields. The main aims of Ferula elaeochytris inventory and planning studies are to provide the highest quality and quantitative yield from these sites and to meet the demand for increasing non-wood forest products in recent years. Thus, this studies will contribute to the economy of the local people.

(TRICHOLOMA ANATOLICUM DOĐAN & İNTINI) IN KONYA
REGIONAL DIRECTORATE OF FORESTRY

MEHMET VEHBİ TEMİRCİ¹, ERDAL TUNÇEZ²

ABSTRACT

Tricholoma Anatolicum Dogan & İntini is the first time was determined by Prof. Dr. Hasan Hüseyin DOĐAN Who is Science Faculty Member of Selcuk University when he is doing his doctoral thesis in Karaman-Başıyayla Katranlı village's plateau in 2001. it was published as a new species in a scientific journal abroad in 2003. This mushroom, which has medical characteristics and economic value, shows spread within the working areas of Forest Sub-district Directorate of Beysehir, Ermenek and Konya under Konya Regional Directorate of Forestry. On the importance of this mushroom,, Tricholoma Anatolicum inventory and planning has been completed. In addition, ODÜH (Non-Wood Forest Products and Services) MANAGEMENT PLANS which covers the years 2013-2025 were done. The Product whose Management plans were done shows spread in a total of 10018.6 hectare area within the boundaries of Konya Regional Directorate of Forestry. Total annual yield is 760833,02 Kilogram. The annual utilization (production) amount is 204841,00 Kilogram. Because of tricholoma anatolicum has been unconsciously harvested by peasants and collectors, Tricholoma Anatolicum beds are spoiled. The goat which is common in the region, consumes mushrooms by eating. The result of condensation of soil by crowded collectors, overgrazing and unconscious using for years the mushroom quality has fallen and has lost its yields. The main aims of tricholoma anatolicum inventory and planning studies are to provide the highest quality and quantitative yield from these sites and to meet the demand for increasing non-wood forest products in recent years, without destroying this generation that has economic value, also to make production in accordance with the principle of sustainability and to inform the local people and those who are engaged in this issue.

ETHNOBOTANICAL APPROACH TO ANIMAL DISEASES AND BIOLOGICAL CONTROL IN ANTALYA (SOUTHERN TURKEY)

SÜLEYMAN ARI¹, MUSTAFA KARGIOĞLU¹

ABSTRACT

ABSTRACT The majority of Antalya population originates from nomadic culture ethnically. Therefore, animal husbandry and agriculture are advanced considerably. People who reside in especially areas far from the settlement have commonly used ethnobotanical culture in the treatment of their animal diseases and in the biological control. We conducted a semi-structured questionnaire of 163 informants in the field visits who have maintained this traditional ethnobotanical culture for many years in Alanya and Gazipaşa city centers with 46 villages and towns between 2012 and 2013. Samples of plants used in animal diseases for medicinal purposes and of particularly wild plants used in biological control were collected and usage information were recorded after identifying. The results of study suggest that 31 plants of 19 families and 21 plants of 14 families were used in many different ways by local people in veterinary field and biological control, respectively. Use value (UV) of plants was calculated. We obtained new usage information and methods based on these findings. This study highlights that wild plants are predominantly effective in fighting against animal diseases. Therefore, the promising results from this study provide new insights into further studies that will be conducted to develop new drugs in veterinary field. In addition, this study will be able to add a new and different dimension to biological control, considering to provide a basis for further studies.

NEUROPROTECTIVE EFFECTS OF RUTIN AND QUERCETIN FLAVONOIDS IN GLAUCIUM CORNICULATUM METHANOL AND WATER EXTRACTS

FATMA GONCA KOÇANCI¹, BUKET HAMAMCIOĞLU¹, BELMA ASLIM¹

ABSTRACT

Neurodegenerative diseases (ND); defined as chronic and progressive diseases, are characterized by loss of neurons in motor, sensory or cognitive systems. It is known that approximately 30 million people worldwide are affected by ND and it is estimated that until 2040, casualties caused by ND will only be surpassed by cancer. Although the exact cause(s) of ND is not well-understood, it is known that ND is associated with neuronal loss, triggered by neurodegenerative agents leading to the accumulation of intracellular ROS and the development of inflammation. Inflammation is a series of responses of live tissues to all kinds of living/lifeless foreign influences or internal/external tissue damage. It is known that, many tumor types contain activated fibroblasts and macrophages, in addition to a gene expression profile with an inflammatory signature. According to some research the use of anti-inflammatory agents reduce the risk of NDs development. Existing drugs against these diseases only delay the disease progression by alleviating the symptoms; however, they do not provide a cure. In recent years, the studies for the discovery of novel drugs and biomarkers for the treatment of ND focused on strategies to discover natural products that have the potential of anti-inhibition and anti-radical properties. Flavonoids are plant-derived secondary metabolites, attracts the attention of researchers because they are free radical scavengers and act like anti-inflammatory drugs. The Papaveraceae family members are important for the synthesis of pharmaceutically important compounds such as alkaloids, flavonoids, phenolic acids and proteins, and for their anti-inflammatory effects. In this study, methanol and water extracts of *Glaucium corniculatum*, a member of the Papaveraceae family, were analysed for flavonoid compounds by HPLC method. To determine whether the extracts had neurotoxic effects, the effects of extracts on neuronal PC12 cells viability was determined by MTT method. Furthermore in this study, anti-inflammatory effects of extracts were assessed by measuring the levels of IL-6 and IL-10 cytokines on H₂O₂- stimulated PC12 cells. As a result of our studies, Rutin and Quercetin flavonoids were found as major and the other flavonoid contents were less than a substantial degree. The amount of the Rutin was higher in methanol (45 µg/ml) than in water (41 µg/ml). Quercetin was also better extracted with methanol (12 µg/ml) than with water (10 µg/ml). In our results none of the tested extracts were cytotoxic even at the highest dose and time to PC12 cells (IC₅₀ concentrations 1287 µg/mL for methanol and 1150 µg/mL for water). Whereas both extracts showed the anti-inflammatory effect in dose dependant manner. The water extract showed the maximum anti-inflammatory effect, with IL-6 secretion was decreased 79 fold according to the H₂O₂ treated group and IL-10 secretion was increased to 87 fold according to the control group. According to these results, *G. corniculatum* extracts may have favourable pharmacological profile in the treatment of inflammation without damaging the PC12 cells. Also, this

Corresponding Author: **FATMA GONCA KOÇANCI**, goncaok@gmail.com

¹GAZİ ÜNİVERSİTESİ

study is evidence that the Rutin and Quercetin flavonoids detected in *G. corniculatum* methanol and water extracts have a neuroprotective effect through anti-inflammation.

SILENCING OF MIDKINE POTENTIATES NARINGIN-INDUCED ANTIPROLIFERATIVE EFFECTS THROUGH APOPTOSIS AND CELL CYCLE ARREST IN CD133+/44+ PROSTATE CANCER STEM CELLS

SUAT ERDOGAN¹, OGUZHAN DOGANLAR¹, ZEYNEP BANU DOGANLAR¹, KADER TURKEKUL¹, ILKER DIBIRDIK¹, AYHAN BILIR²

ABSTRACT

Prostate cancer (PCa) represents a major public health problem for men in Western countries, and its incidence is rising in other areas of the world. In the early stages of the disease, most patients respond to the current therapy strategies such as prostatectomy, hormonal therapy, radiotherapy and chemotherapy. However, an androgen-independent stage of malignancy in aggressive and spreading cancer is challenging to treat. Cancer stem cells (CSCs) have been identified as rare cell population within a tumor that is involved in drug resistance, metastasis and recurrence of cancers. Flavonoids are an important group of secondary metabolites and a source of bioactive compounds in plants. Naringin, a bioflavonoid found in grapefruit and other citrus fruits, possesses antioxidant, anti-carcinogenic properties. Midkine (MK) is a heparin-binding growth factor that promotes many tumor-specific functions, such as cell growth, tumor cell survival, cell migrations, and carcinogenesis. However, the possible effect of naringin and MK inhibition on cell survival and apoptosis properties were not extensively analyzed in CSCs. The objectives of this study were to investigate the influence and mechanism(s) of naringin treatment and the functions of MK in prostate cancer stem cells (PCSC). CD133+/44+ PCSCs were isolated from the human prostate cancer PC3 cells using a magnetic-activated cell sorting system. Cell viability was measured by MTT assay. Endogenous MK mRNA expression was knocked down by siRNA. RT-qPCR, Western blot analyses and image-based cytometry were used to investigate apoptosis and cell cycle progression as well as their underlying molecular mechanisms. The cells were treated with different concentrations of naringin for 24, 48 or 72 h. Naringin dose- and time-dependently inhibited PCSCs survival. siRNA-mediated knockdown of MK induced significant growth inhibition. Next our studies sought to verify whether the combination treatment could synergistically increase apoptosis and/or cell death of PCSCs. Indeed, treatment of MK knock-downed cells with the IC₅₀ value of naringin (150 μ M) enhanced cell death to a significantly greater extent than treatment with either agent alone. The combination therapy strengthens the apoptosis and cell cycle arrest at the S and G₂/M transition phases of naringin. Naringin therapy significantly reduces spheroid diameter of three-dimensional (3D) PCSC cell culture, and the combination of MK siRNA with naringin enhanced the therapeutic efficacy of naringin. In conclusion, these results indicate that naringin could inhibit growth potential of PCSCs by encouraging apoptosis and cell cycle arrest, and down-regulation of MK expression could enhance the therapeutic effect of naringin.

THE PLACE AND IMPORTANCE OF MEDICAL AROMATIC PLANTS IN ANIMAL BREEDING

SİBEL ALAPALA DEMİRHAN¹, NURAY ŞAHİNLER¹, AYŞEN MELDA ÇOLAK¹, MAHMUT İSLAMOĞLU¹

ABSTRACT

Today, it is known that medical and aromatic plants and essential oils derived from them have many positive effects on animals such as resistance to environmental conditions; protection against herbal insecticide, pests and pathogens; increasing the taste of feed; increasing utilization rate of feed; stimulation of ingestion and their antiseptic features. Though their effects vary depending on their active ingredients, many essential oils have antimicrobial, carminative, diuretic, antispasmodic effects. Moreover, all the volatile oils derived from plants strengthen the immune system by increasing IgG and IgA production. In the treatment of hoof injuries of the cattle, fomenting with the mixture of chamomile oil, thyme oil and balm oil dissolved in olive oil can be useful. Addition of the mixtures of essential oils of thyme, daphne leaf, sage leaf, gale, fennel seed and citrus skin to their diets; when compared to organic acids and probiotics, leads to more live weight increases, better feed utilization and carcass performance in broilers. Chamomile can be added to their feed to calm horses; in the treatment of wounds in horses, mugwort can be used and in the treatment of their itches, medical peppermint oil can be used. Essential oil of hyssop seems to be a promising ecological tool to be used in the fight against *Varroa destructor* parasite in bees and when used in winter, it decreases the population of *Varroa* in bee colonies. 1-2 drops of citronella oil added to shampoos used to get rid of lice and ticks in cats and dogs force these pests to leave the animals. In addition, cedar oil and pine oil can also be used for the same purpose. In this article, information is provided about the use of various medical and aromatic plants in animal breeding, protection of their feed and improving the quality, in fight against animal parasites and in the treatment of animal diseases.

DETERMINATION OF FACTOR INFLUENCING STUDENTS' MEDICINAL PLANTS USE; CASE STUDY OF ATATURK UNIVERSITY

AHMET SEMİH UZUNDUMLU¹, MEHMET MUHAMMED SARI¹, ZEINAB MOKHTARI

ABSTRACT

It is commonly known that regions and cultural properties significantly impact on individuals' medical plant consumption. As for students, faculties, formal education, consumption habits, social, economic and demographic factors are investigated whether there is any correlation with consumption. 445 students of Ataturk University from 15 different faculties were selected to conduct questionnaires face to face. While being at 3.rd grade, being from TRA sub-region, mint-lemon and rose-hip tea consumption, one or more family members' medical plant consumption, raise of education level of students' father, having health insurance and students' choice of medical plants for health influence positively according to the results of study, residing with family, studying medicinal departments, having formal education, doing sports and consuming fruit juice affect medical plant consumption negatively.

ANTI-OBESITY AND CARDIOVASCULAR PROTECTIVE EFFECT MECHANISMS OF CURCUMIN (ACTIVE INGREDIENT OF TURMERIC)

MERYEM ELIF ÖZTÜRK¹, NURCAN YABANCI AYHAN¹

ABSTRACT

Turmeric (*Curcuma longa*) has been described in the literature of Ayurveda (science of long life), dating from about 3000 BC, for a wide variety of ailments including obesity. Turmeric has been found to contain more than 100 different chemicals. Most research on turmeric has centered on its active ingredient curcumin and curcuminoids. Increasing evidence from numerous *in vitro* and *in vivo* studies have shown that curcumin possesses anti-inflammatory, antioxidant, and hypolipidemic properties. The researches focused on curcumin effect on obesity revealed that; curcumin may suppress preadipocyte differentiation and thus reduce the number of adipocytes and fat content of adipose tissue. Curcumin is making this effect through several mechanisms. Firstly curcumin may stimulate 5' AMP-activated protein kinase (AMPK) activity and down-regulate peroxisome proliferator-activated receptor gamma (PPAR γ). PPAR γ regulates fatty acid storage and glucose metabolism. The genes activated by PPAR γ stimulate lipid uptake and adipogenesis by fat cells. Thus curcumin plays a crucial role for the inhibition of differentiation or growth in both adipocytes. Another part of the effect of curcumin on inhibition of preadipocyte differentiation has been proposed to be through modulation of the canonical Wnt signaling pathway in preadipocytes. The Wnt signaling pathways are a group of signal transduction pathways made of proteins that pass signals into a cell through cell surface receptors. The canonical Wnt signaling system serves as an adipogenic switch: the initiation of adipogenesis requires inactivation of canonical Wnt signaling. When Wnt signaling is on, preadipocyte differentiation is inhibited. Curcumin can make this effect though increasing the mRNA expression of Wnt10b, Fz2 (Wnt direct receptor), and LRP5 (Wnt coreceptor). Curcumin makes cardiovascular protective effects through several mechanisms. The anti-thrombotic, anti-proliferative, and anti-inflammatory effects of curcumin and the effect of curcumin in decreasing the serum cholesterol level may protect against the pathological changes occurring with atherosclerosis. Researches exerted that curcumin shows its antithrombotic effect by inhibiting collagen and adrenaline-induced aggregation of platelets. Aggregation of platelets plays a vital role in initiation of thrombosis. Thus curcumin prevents thrombosis. Curcumin makes antiproliferative effect by inducing Heme oxygenase-1 (HO-1) enzyme. This enzyme possesses important antioxidant and anti-inflammatory functions and acts in concert with other pivotal enzymes in the maintenance of cellular homeostasis. Also it is a down-regulator of growth in vascular smooth muscle cells. Curcumin exerts anti-inflammatory effect via down regulating the nuclear factor- κ B (NF- κ B), resulting in a decrease in the expression of inflammatory markers such as tumor necrotic factor- α (TNF- α), interleukin-1 (IL-1) and interleukin-6 (IL-6) Curcumin also suppress the hepatic enzymes HMG-CoA reductase and Acyl CoA cholesteryl acyl transferase (ACAT), lowers the hepatic cholesterol, total cholesterol. In addition,

Corresponding Author: MERYEM ELİF ÖZTÜRK, merlif-42@windowslive.com

¹ANKARA ÜNİVERSİTESİ

curcumin may influence key enzymes necessary for the proper functioning of the cardiovascular system, such as nitric oxide synthase (NOS). Curcumin down regulates NOS expression. Since nitric oxide-mediated oxidative stress has been associated with chronic diabetes, down regulating NO production could be beneficial in treating cardiovascular complications. The effective reduction in NO by curcumin is thought to be mediated by NF κ B, AP-1, and various vasoactive factors. Although the positive effects of turmeric on obesity and cardiovascular diseases are explained, clinical trials on humans are scarce. However, turmeric can be used as a supplement in the treatment of obesity and prevention of cardiovascular diseases.

CHEMICAL COMPOSITION OF BLACK CUMIN OIL AND USING IT AS A FUNCTIONAL FOOD INGREDIENT

DEMET APAYDIN¹, OSMAN ŞİMŞEK¹, ŞEFİK KURULTAY¹, GIZEM ÇAĞLA DÜLGER², İSMAIL YILMAZ¹, ÜMIT GEÇGEL¹

ABSTRACT

Black cumin (*Nigella sativa* L.), belonging to Ranunculaceae family, is an annual herbaceous plant whose growth area extends from the countries of the southern and eastern-rim of the Mediterranean basin to Iran, Pakistan and India. Black cumin seeds have been used as a supplement to help maintain good health and well-being. Black cumin seeds, on account of their aromatic nature, are used as a spice in cooking. Commonly the seeds are used primarily as a spice and food preservative. Black cumin seeds have a strong and hot peppery taste and have been used in coffee, tea, casseroles, salads, and breads. It is also used as a natural remedy for asthma, hypertension, diabetes, inflammation, cough, bronchitis, headache, eczema, fever, dizziness, and influenza. In folk medicinal practices they are ingested with food or mixed with honey. The seeds have also been used as diuretics, anti-hypertensive, muscle relaxants and as immunity enhancers in immune-compromised people. More studies have reported this seed's proximate contents for moisture, oil, protein, ash and total carbohydrate in the following range 3.8–8.65%, 24.48–40.35%, 20.8–26.7%, 3.7–4.86% and 24.9–40.0%, respectively. The chemical composition of black cumin seeds is rich, and diverse active chemical components have been isolated from them. The seeds contain a fixed oil (>30%, wt/wt) and a volatile oil (0.40–0.45%). The oil is prepared by solvent- or cold press-extraction. The lipid oil from the seed of *Nigella sativa* L. is rich in linoleic and oleic acids. Their unique fatty acid composition, relatively high polyphenol content and quality and hence high protection against oxidative stress, relatively good shelf life, and other desirable physicochemical characteristics lead to more diverse and novel applications of black cumin seed oil in the food, pharmaceutical, cosmetic and other non-food industries.

AN IMPORTANT FUNCTIONAL FOOD INGREDIENT SPECIFIC TO GRAPE SEED AND OIL: RESVERATROL

DEMET APAYDIN¹, OSMAN ŐİMŐEK¹, ŐEFİK KURULTAY¹, GIZEM AĐLA DŐLGER², İSMAIL YILMAZ¹, ÜMIT GEGEL¹

ABSTRACT

Grape is one of the fruit crop grown widely in many areas of the world. Grape seed is a worldwide well known oilseed from the waste residue which is made about 15% of solid waste in the wine industry. It contains approximately 60–70% of total extractable grape phenolic compounds. The grape seed contains about 10-20% of oil. Grape seed oil is composed of average 90% poly- and monounsaturated fatty acids, which are responsible for its value as nutritive edible oil, particularly of linoleic acid (58–78%, 18:2n-6) followed by oleic acid (3–15%, 18:1n-9) and minor amounts of saturated fatty acids (10%). The main phenolic compounds generally present in grape seed and oil are anthocyanins, flavan-3-ols, flavonols, phenolic acids and resveratrol. Resveratrol (3,4',5-trihydroxy-trans-stilbene) is a polyphenol from the stilbene family that is found at relatively high levels in grape skins. Resveratrol, a well-known polyphenolic compound, has been widely explored for its multiple therapeutic activities against a wide variety of diseases. It is known to possess many pharmacological properties including anti-inflammatory activities, cardio protective, antioxidant properties and anticancer effects. It is of interest to the food and pharmaceutical fields due to its potential beneficial effects on human health, including cardio-protective, neuro-protective, antioxidant, anti-inflammatory, anti-carcinogenic, and anti-obesity effects.

INVESTIGATION OF THE EFFECT OF NUTRITION PROGRAMS APPLIED TO PSYCHIATRIC PATIENTS WITH OBESITY ON INDIVIDUAL'S PSYCHOLOGICAL HEALTH: A SYSTEMATIC REVIEW

REYHAN ESKİYURT¹, BİRGÜL ÖZKAN²

ABSTRACT

This study was conducted to gather information on the common results of studies that examine the effects of nutrition programs on psychiatric patients with obesity on the psychiatric health of the individual. Obesity is a risk factor for health and is defined as excess or excess fat accumulation in the body. Obesity is a major risk factor for a number of chronic diseases such as cancer, diabetes and cardiovascular diseases. Treatment options for obesity include obesity surgery and non-surgical treatment of obesity. Non-surgical treatments generally include multi-component methods and include low-calorie diet regimen, physical activity enhancement, behavior modification, psychosocial support and drug treatment. It is reported that the proportion of mood, anxiety, somatoform, depression and eating disorders is high among obese individuals as a result of the studies done. The aim of treatment of obesity behavior change; "lifestyle" by changing undesired behaviors related to eating and physical activity that cause obesity to desired behaviors or reducing unwanted behaviors and reinforcing desired behaviors.

CLASSIFICATION AND USAGE AREAS OF SOME MEDICINAL PLANTS OF TURKISH FLORA ACCORDING TO THEIR SECONDARY METABOLITES

EBRU ATAŞLAR¹

ABSTRACT

Turkey flora is very rich in terms of plant diversity as well as in terms of medical plants. Due to the different climatic conditions and the presence of three floristic regions, the flora that is enriched is home to about 10.000 plant species. It is estimated that about 500 of this number are medical plants. Medical plants have been used for treatment since prehistoric times due to the therapeutic properties of the secondary metabolites their contain. In this study, some medicinal plants distributed in our country are classified according to their secondary metabolites: alkaloids, terpenoids (monoterpenes, sesquiterpenes, diterpenes, triterpenoids), phenolics, resins and mucilages, and their medical use areas are mentioned in general.

SUPER FOOD: GOJI BERRY

MÜNİRE ERGEN¹, CEMAL KASNAK¹, RECEP PALAMUTOĞLU¹

ABSTRACT

Goji Berry or wolfberry are two closely related species of the Solanaceae family, *Lycium barbarum* and *Lycium chinense*. Fruits have orange-red colors. Goji Berry is a fruit of Asian origin and is used in traditional Chinese medicine over 2000 years. With a low calorie, good fiber source and a very high antioxidant capacity, this fruit helps people fighting diseases, improving their weight control and digestive system functions. Versatile goji grapes that can be consumed in raw, dried, liquid or powder form contain phytonutrients, vitamins and trace minerals. It contains the richest and most comprehensive spectrum of antioxidant carotenoids of all known nutrients. Many experts call goji berry super nutrition. Because goji, which are a positive contributor to health, contain very high amounts of antioxidants. Antioxidants eliminate free radicals and reactive oxygen species that form in the human body. Goji's high antioxidant capacity helps strengthen the immune system and prevent inflammation in the body. The awareness of such a valuable fruit in Turkey is not enough. The aim of our study is to increase the consumption of Goji Berry in Turkey by displaying the flavonoid and phenolic amount and antioxidant power. For this purpose in dry fruit were performed DPPH (2,2-diphenyl-1-picrylhydrazyl) radical scavenging capacity, FRAP (iron ion reductive antioxidant power), phenolic compound, flavonoid, acidity, pH, color, sensory and total dry matter analyzes. The results of the analyzes made on the goji berry are as follows: the amount of phenolic compound is 26758 mg catechin equivalent / kg, the flavonoid amount is 11194 mg catechin equivalent / kg, the dry matter content is 92.99 %, pH 5.31, color L is 41.93, a is 29.47, b is 29.50, acidity 0.37 g / 100 ml (in citric acid), DPPH 1900 µg trolox equivalent / g and FRAP 73625 mg / g.

SAFFRON PRODUCTION AND ECONOMIC IMPORTANCE IN AFGHANISTAN

MOHAMMAD MASOUD MORADI¹, ŐULE TURHAN¹

ABSTRACT

Saffron with its general name "Safran" and scientific name "Crocus sativus" (Red Gold) is defined as an agricultural, endemic medical plant. The countries where this important agricultural plant is first known are Greece, Turkey and Iran. Production and trade of saffron plant is done in many countries around the world. Every year, approximately 300 tons of saffron production is taking place in the world. Iran is the world's largest saffron producer with more than 250 tons of production per year. Likewise, trade and export of saffron plant take place in Asia, Europe, Africa and as well as America. It is worth mentioning that Spain is the largest exporter of the plant. This important plant has been known in Afghanistan since very long years ago and is produced even if in small amounts. However, during the Soviet invasion and civil wars in Afghanistan between 1970-2000, production of saffron decreased and instead the poppy cultivation and production of narcotic drugs started to spread very rapidly. As of 2000, saffron production has gained its importance again and production has begun. With the support provided by both the Afghan state and various international institutions and organizations, the production of saffron is increasing rapidly. The saffron plant is now known as an alternative to poppy cultivation. Today saffron production is now taking place in almost every part of the country. In the Herat region of Afghanistan, annual production of saffron taking place is up to 5 tons. Positive developments in production and trade of saffron increase the socio-economic development of producers in the country. In addition, saffron production is seen as a solution to many problems in the country (unemployment, immigration, poverty, etc.). This study mainly focuses on the importance of saffron plant, its uses and production and exports in Afghanistan. In addition, the impacts of saffron production on development of the country will be evaluated.

INVESTIGATION OF HERBICIDE EFFECTS ON CRESS (*LEPIDIUM SATIVUM L.*) SEEDS OF SOME TETRASUBSTITUTED-IMIDAZOLE COMPOUNDS

İSMAIL KAYAĞİL¹, BAŞAK FIDAN¹

ABSTRACT

The good agricultural products are on the agenda recently. The good agricultural products can be farmed with the right pesticide on the right time. The one of the biggest problems in the agriculture is the weed. For this purpose, the compounds called herbicide are used. The development of the herbicides is very important[1]. In this study, the herbicide effect was tested on the previously published 30 compounds. The herbicide effect was studied according to germinate of the cress (*Lepidium sativum L.*) seeds and the results were given as TD50 values. This study was supported by the project numbered 1919B011400419 under the TÜBİTAK 2209-A program. Reference 1. Duke, S.O. (1990). Overview of Herbicide Mechanisms of Action. DETERMINATION OF SOME TRACE ELEMENTS IN APPLE SAMPLES BY ICP-OES

YASIN ARSLAN¹, ERDAL KENDÜZLER², FATMA TOMUL²

ABSTRACT

The excessive trace elements can cause toxic effects. Long-term and excessive biological accumulation of trace elements can result in gradual damage of living organisms. In recent years, metal ionization has become one of the most important issues in environmental and toxicological studies. In general, toxicity depends on the biological and chemical forms of an element [1]. Because of this, it is necessary that the trace elements taken into living organisms, their transport and their effects should be monitored carefully [2]. Hg, Cd, As and Pb are the most dangerous of trace elements. The concentration of the elements required for human body can be determined by some analytical techniques. There have been a series of analytical techniques to accurately determine the rather low concentration of trace elements in biological systems and environment at adequate sensitivity such as electrothermal atomic absorption spectrometry (ET-AAS), inductively coupled plasma optic emission spectrometry (ICP-OES) and inductively coupled plasma mass spectrometry (ICP-MS). In this study, to determine heavy metal in apple samples, ICP-OES technique has been used. For this reason, apple samples taken from Antalya Korkuteli region were dissolved using nitric acid (HNO₃) by dry ashing method and standard addition was also applied to check the accuracy of the method. The results are given as mg/kg. As, Bi, Cd, Co, Mn, Mo, Ni, Pb, Sb and V concentrations in both Apple samples are lower than LOD (limit of detection) as mg/kg. On the other hand, Cu and Zn concentrations in Apple 1 were found as 1.5±0.1 mg/kg and 5.5±0.1, respectively. Cu and Zn concentrations in Apple 2 were found as 2.0±0.8 mg/kg and 5.5±0.1 mg/kg, respectively. REFERENCES 1- Vassileva, E., Becker, A. and Broekaert, J.A.C. DETERMINATION OF SOME HEAVY METALS BY ICP-OES IN THE CORN SAMPLES

ERDAL KENDÜZLER¹, YASIN ARSLAN², FATMA TOMUL¹

ABSTRACT

The environmental pollution caused by human stress factors has reached serious dimensions for many countries that have increased industrial activity in recent years. Industrial enterprises such as food and beverage production, textile, leather, chemical and petrochemical, casting, coating, mining, urban, agricultural and commercial wastes are among the sources causing environmental pollution [1]. Heavy metals are the main sources of pollution of the environment, which disturb the ecological balance, affecting vigorous growth and development in a significant way [2]. Heavy metals are elements whose density is greater than 5 g/mL including transition elements. In this group, there are some heavy metals which are important in ecological issue such as Fe, Mn, Zn, Cu, V, Mo, Co, Ni, Cr, Pb, Be, Cd, Tl, Sb, Se, Hg, Al. In this study, some heavy metals were determined in the corn samples taken from Askeriye district in Burdur, Turkey by Inductively Coupled Plasma Optic Emission Spectrometry (ICP-OES). The corn is identified as wheatgrass family. It is an annual herbaceous plant and may be between 1.5 and 3 meters in height depending on the area in which it is growing. The samples were firstly powdered and then they were held at 105 oC for 12 hours in an oven. Powdered corn samples were weighed to approximately 0.8 g. Afterwards, wet ashing was carried out in two different ways. In the first method, samples were dissolved in 8 mL of aqua regia (HCl: HNO₃, 3:1) and in the second method, nitric acid (3.3 mL), hydrogen peroxide (1.7 mL) and water (1 mL) were used. The heating was carried out after addition of acids in the dissolving processes. The resulting solutions were filtered with black band filter paper. The filtrates were taken up in 50 mL measuring flasks and their final volumes were supplemented with ultrapure water. Heavy metal concentrations in the solutions were determined by ICP-OES Thermo iCap 6500 instrument. The results are given as mg/kg. As, Bi, Cd, Co, Cu, Mn, Mo, Ni, Pb, Sb and V concentrations in both Corn samples are lower than LOD (limit of detection) as mg/kg. On the other hand, Zn concentration in Corn 1 and Corn 2 is found as 43.8±0.3 mg/kg and 43.8±0.6 mg/kg, respectively. SULFORAPHANE AND HEALTH RELATION

EMİNE KOÇYİĞİT¹, EDA KÖKSAL¹

ABSTRACT

Phytochemicals are active compounds in the prevention of chronic diseases and the protection of health naturally found in plants. They act directly on genes and act indirectly as conjugates with various molecules. Sulforaphane, a bioactive component of broccoli, is found in the class of organosulphides among phytochemicals. Sulforaphane is the isothiocyanate present in broccoli. The effect of broccoli and other cruciform vegetables (radish, cabbage, cauliflower, brussel cabbage) on diseases is also affected by isothiocyanate. Isothiocyanates are stored as glucosinolate precursors in plants; harvesting, chewing, cutting, chopping, etc., activity of myrosinase enzyme glucosinolates hydrolyze to isothiocyanates. In the organism, studies have been made on the effect mechanisms such as stimulation of phase II enzymes, inhibition of histone deacetylase enzyme activity with phase I enzymes and increase of thioredoxin reductase enzyme expression and positive results on many diseases such as cancer, diabetes, oxidative stress, helicobacter pylori infection. Research has shown that the toxic effect of sulforafen is not found and is safe. In this study, the metabolism of sulforafen, the mechanisms of action, the effects on health, the bioavailability and the factors affecting it and their effective doses are emphasized.

PLANT INTERACTIONS WITH DRUGS USED IN CARDIOVASCULAR DISEASE

EMİNE KOÇYİĞİT¹, EDA KÖKSAL¹

ABSTRACT

Herbal products have been used from day to day for remedial and protective purposes in traditional medicine. The main causes include belief in the therapeutic property of plants. However, in the treatment of diseases is used with medical treatment applied to herbal products can lead to unexpected adversities by interact. Drugs used in the treatment of cardiovascular diseases are at the forefront of drug-plant / herbal product interactions. In general, herbal products are metabolized by the same pathway as medicines, which affects the bioavailability of the drug and is associated with cardiac side effects such as hypertension, arrhythmia, delayed clotting time. Studies have been carried out on cardiovascular medicines, especially Ginkgo, Ginseng, Garlic, Echinacea, Milk thistle, Motherwort, St. John's wort, Black Cohosh, Licorice root, Nettle, Senna, Aloe vera, Ma-huang (ephedra), interacitons offers evidence of the plant. In order to get in front of these scientific researches and health workers, increasing the level of consumers with information related to the creation of awareness on the importance of the topic.

THE EFFECT OF FRUIT ADDED BEFORE FERMENTATION TO ANTIOXIDANT CAPACITY IN KEFIR PRODUCTION

DERIA CHATZI MOUSTAFA¹, CEMAL KASNAK¹, RECEP PALAMUTOĐLU¹

ABSTRACT

Kefir is a milk drink with a historical background of Caucasian originated ethical alcohol and lactic acid fermentations, which are obtained with kefir grains. Encouragement and alternatives to increase consumption of kefir which regulates digestion and strengthens the immune system is required. We enriched the kefir with banana and blueberries. Three types of kefir were produced, plain, blueberries (5%) and banana (10%). Fruits added milk before fermentation. Analysis of phenolic compounds, antioxidants, flavonoids, pH, acidity, color, sensory and dry matter were carried out in kefir. While the dry matter is 10.90% in plain kefir, it is found as 11.17% in banana kefir and 16.75% in blueberry kefir respectively. The highest acidity and lowest pH were found in the blueberries kefir. The highest value of L was found to be plain kefir with 76.50, the lowest L value of was seen in blueberry kefir with 64.42. The highest phenolic compound 331,42 mg / l, the highest flavonoid 291,12 mg / kg and the highest FRAP value 725 mg / kg was found in plain kefir. The antioxidant power and phytochemical amount of fruit kefir were lower than that of plain kefir. Sensory analysis using five-point Likert was the most appreciated plain kefir in terms of color, smell, taste and consistency. Followed by blueberry and banana kefir, respectively.

COMPARISON OF THE AMINO ACID COMPOSITION OF QUINOA SEED AND CORN AND WHEAT SEED CULTIVATED IN MEDITERRANEAN CLIMATE CONDITIONS

YAKUP ONUR KOCA¹, OSMAN EREKUL¹, ALİ YİĞİT¹, KÜBRA BENLİ

ABSTRACT

Undernourishment is one of the problems faced to human for healthy lifestyle. It is claimed that quinoa seed is stand out with content of groups of essential nutrients in especially to high amino acids rates. And also, claimed that the amino acid balance is better than that of wheat or maize, because some essentials amino acids are present in relatively higher amounts in quinoa seeds. Therefore, the study was set up Adnan Menderes University, Agriculture Faculty's experimental lands in Aydın location west part of Turkey under Mediterranean climate conditions in order to determined differences among amino acid composition of quinoa and corn and wheat seeds. The plants were growth standard conditions as a winter (wheat) and a summer (quinoa and corn) growing periods in 2015. Amino acids values (Histidine, Valine, Methionine, Threonine, Isoleucine, Lösin, Lysine, Phenylalanine, Glycine, Proline, Tyrosine, Arginine and Cysteine) in the plants seeds (quinoa, corn and wheat) were measured with Shimadzu Nexara XR HPLC. Expect for Proline, all amino acid rates measured quinoa seed were higher values than corn and wheat. The highest amino acid values, among the values obtained from the quinoa seed were measured Lysine (1,427), Arginine (1,375) and Lösin (0,891) respectively. Besides highest amino acid values were measured Proline (1,050) and Lösin (0,740) in wheat seed and Lösin (0,731) and Proline (0,646) in corn seed. Some essential amino acid such as Lysine, Cysteine and Arginine rates measured in quinoa were about three times that measured in average of corn and wheat. And the others such as Threonine, İzölösün and Glycine rates measured in quinoa were about twice that measured in average of corn and wheat. The results of the study are showed that quinoa seed cultivated in Mediterranean climate conditions can be used for balanced nutrition. Therefore, we can suggest the quinoa seed to complete the deficiency which is the low levels of some amino acids rates in wheat and corn seed.

EFFECT OF SOIL PROPERTIES ON SEED MORPHOLOGICAL CHARACTERISTICS IN CHESTNUT (CASTANEA SATIVA MILL.)

TUĞBA BOZLAR¹, VILDANE GERÇEK¹, NUR DİKTAŞ BULUT¹, SELVİNİZ YILMAZ²

ABSTRACT

Chestnut (*Castanea sativa* Mill.) is a forest tree that naturally grows in the Black Sea, Marmara and Aegean regions. Chestnut seed is consumed as food with together, it is an extremely important food source in terms of medicine. When the natural growth environment of the Eastern Black Sea Region of Chestnut was screened, it was observed that the seed characteristics were different according to the origin. Studies on chestnut and other species have determined that the percentage of germination and the growth of seedlings change depending on seed size and weight. Seed size can affect the both germination and after germination health and development of the plant. Generally, large size seeds have the advantage of higher seeding rate and stronger seedling than small size seeds. The purpose of this study is to determine the effect of soil characteristics on chestnut seed weight and size. In this study, chestnut fruit (seed) was collected together with green husks from six different growth medium regions (Giresun-Görece, Trabzon-Araklı, Samsun-Salıpazarı, Artvin-Arhavi, Rize-Ardeşen and Rize-Çayeli regions) where chestnut was pure or dominant species. Samples of seeds; seed weight, seed width, height and size were measured. In addition, soil profiles were opened with three replications from 6 different growing environments and soil samples were taken from 0-10cm, 10-20cm, 20-40cm, 40-60cm, 60-100cm levels. Samples of soil; Sand, dust, clay, pH, EC and organic matter analyzes. At the end of the study; There are differences in $p < 0.01$ significance level between seed size, width, height and weight with sand, dust, clay, pH, EC and organic matter.

SALEP ORCHIDS AND SALEP IN KAHRAMANMARAŞ REGION

KEMAL KAAN TEKİNŞEN¹, YUSUF BİÇER¹

ABSTRACT

Orchids are perennial, wire rooted, with some varieties having (e.g. Orchis, Ophrys, Dactylorhiza, Serapias, Platanthera) two tuberous roots, herbaceous plants; In Europe and the Middle East, the most orchid variety is found in Turkey. Also known in native language as dilçikık, dildamak, çam çiçeği, çayır or salep otu, it is known that there are about 154 orchid species in 24 varieties in Turkey. 13% of them (20 species and 1 subspecies) are unique to Turkey. Ovoid- root tuberous species which are common in Turkey, used for obtaining salep, belong to Orchis, Ophrys, Anacamptis, Serapias, Himantoglossum, Barlia, Aceras genus, and species with tubercles belong to genus Dactylorhiza and Platanthera. Turkey's North, South, Southeast and Eastern Anatolia regions especially are richer in terms of wild orchids. There are 25 species belonging to 9 genera in Kahramanmaraş region, with 2 species (Orchis palustris and Dactylorhiza osmanica) being common and other species rare and rarely grown. Salep is obtained by grinding dried tubers of wild orchid species belonging to Orchidaceae family, which are perennial, wire rooted, with some types having two tuberous roots, after a series of treatments. It has been known to be used for centuries as a type of medicine in traditional medicine and in various forms as an additive in the food sector. For example, there are information given on the usage as a medicine in the book *Materia Medica* (Medical Materials) a collection of work of Pedanius Dioscorides (MS 20-79), a physician born in Anazarba, near the Kozan district of Adana in the Romans period, and in the 5th volume of *Kanun fit Tıp* (Canon) book of Ibn Sina (Avicenna) (MS 980-1037). Salep, usage of which is unique to Turkey as a traditional beverage and additive ingredient, is still used in many Balkan and Middle Eastern countries, especially once ruled by the Ottomans, under the influence of Turkish culture. In Turkey, salep is mainly obtained from Kastamonu, Muğla, Antalya, Silifke, Kahramanmaraş and Van regions of North, South, South East and Eastern Anatolia and is generally known for the name of the region in its trade. Commercial saleps are tuber mixtures of different orchid species that grow in the area, but they contain more of the orchids that are common in the region. In Kahramanmaraş region, salep is mostly obtained from the center periphery of the province and the north and west parts. In the Kahramanmaraş region, in order to obtain high quality salep, tubers of rather uncommon species of *Orchis anatolica*, *O. mascula* ssp. *Pinetorum*, *O. spitzelii*, *O. tridentata*, *O. morio*, *Anacamptis pyramidalis*, *Dactylorhiza romana*, *Himantoglossum affine* and *Ophrys holosericea* are used. The salep obtained from the tubers of these orchid species is called Maraş salep. Maraş salep obtained from white, red and purple flowered species is collected from the pine fields especially on the slopes of Amanos Mountain and Helete, Tanır, Tekir, Süleymanlı, Kürtül, Kösurge, Kayışlı, Dönüklü regions. Salep in Maraş obtained from the species *O. palustris* and *O. coriophora* which are considered to be of low quality in the region and of *D. osmanica* with tubercles are called Meadow salep. Salep is used in Kahramanmaraş for the first time in Turkey in making ice cream. It has spread to other regions of the country from Kahramanmaraş. The use of salep in the production of ice cream in the region has

Corresponding Author: **KEMAL KAAN TEKİNŞEN**, kktekinsen@selcuk.edu.tr

¹SELÇUK ÜNİVERSİTESİ VETERİNER FAKÜLTESİ BESİN HİJYENİ VE TEKNOLOJİSİ BÖLÜMÜ

become almost indispensable due to the characteristics it gives to the ice cream. Salep is used in powder form in ice cream production, usually 0.5-1.0% ratio depending on the amount of glycomannan and affects the properties of the ice cream. With the increasing use of Salep in ice cream production, especially since the 1930s, Kahramanmaraş has become an important center of salep trade, and Maraş salep has become very famous due to Maraş ice cream. However, in Kahramanmaraş, which is an important region of the country in terms of the diversity of wild orchids, the area in which salep is obtained is limited.

ABSTRACT

The homeland of Gilaburu plant is known as Turkey and it is a wild plant grows in Kayseri province and its surroundings which show cold climate features and Black Sea region. Gilaburu fruit has been used for various purposes from past to present. Gilaburu consumption has increased due to the rapidly growing population searching for different regional flavors, to offer raw materials opportunity in agriculture-based industry, and the use of medicinal plants as medicines and it has made an important place in the Kayseri province food sector. In this study, it was aimed to determine the factors which are effective in the consumption of Gilaburu and to investigate the level of consciousness about the benefits of Gilaburu fruit. For this purpose, face-to-face survey was conducted with 384 persons determined by proportional sampling method in Kayseri city center. Different statistical analysis techniques were used for the purposes of studying the data obtained from the surveys. In the study, descriptive statistics are expressed in terms of averages, frequency and percentage values. Chi-Square (X²) analysis is used to determine the degree of the relationship between the two intermittent variables (Nonparametric nominal or ordinal scale variable). In this study, chi-square tests were applied between consumers consumption of Gilaburu fruit and settlement status, to know the benefit of the fruit in terms of health, age groups and possession of kidney diseases. As a result of the analyzes made, it was determined that 90% of the consumers had knowledge about the fruit, 93% of them tasted the fruit before and 38% liked the taste of the Gilaburu fruit. Consumers are evaluating Gilaburu as fruit, juice, pickle, jam and pulp. Gilaburu fruit can be difficult to obtain in the country general because of the limited field of growing. As a result of the surveys made, 77% of consumers can easily supply Gilaburu fruit and 23% of consumers cannot supply. Gilaburu fruit is mostly used as a medicinal plant in the region. According to 91% of consumers, it has been determined that Gilaburu can be used as a medicinal plant. It can be said that there is no inconvenience to use because %1 of the consumers are suffering from consumption of Gilaburu for medical use and it is very low in this value. The chi-square test between the consumer's ages and Gilaburu fruit consumption was found to be statistically significant ($p < 0,05$) and Gilaburu consumption is increasing as the ages of the people progresses. The chi-square test between the possession of kidney disease and Gilaburu consumption was also found to be statistically significant ($p < 0,05$) and it was found that people with kidney disease consumed more gilaburu fruit. This fruit is mostly consumed against the kidney disease in the region.

A NOVEL NUTRITIVE GARLIC PRODUCT FOR INCREASING GARLIC CONSUMPTION; BLACK GARLIC

SELİN ALİHANOĐLU¹, HASAN VARDİN¹, MEHMET KARAASLAN¹

ABSTRACT

Garlic (*Allium sativum* L.) is a species of the onion genus and among the oldest cultivated plants. It has been widely used as a spice and also as a medicinal agent for treatment of multiple human diseases and disorders. Garlic has organosulfur compounds and bioactive enzymes in its composition. Garlic has been shown to display anti-bacterial, anti-fungal, anti-atherosclerotic, hypoglycemia, detoxification, and carcinogenic effects due to its bioactive components. Although garlic has been widely used as one of the popular condiment for foods and traditional medicine against various disease, consumption of garlic is very limited due to its unpleasant odor and taste. In recent years various processing methods were applied to obtain new garlic products to eliminate undesirable odor of garlic without damage its health benefits. Black garlic is a heat treated and fermented garlic product at controlled high temperature (60-90 C°) and controlled high humidity (80-90%) for a period of time without any additives. As a result of this fermentation process white-fresh garlic cloves turns to black and get sweet taste, chewy and jelly-like structure. Garlic lose its pungent taste and irritative odor during the ageing process due to the conversion of allicin into water-soluble antioxidant compounds including S-allylcysteine and S-allylmercaptocysteine moreover many sulfur-containing compounds are formed, which contribute to health benefits. Black garlic has stronger antioxidant activity than fresh garlic, and better efficacy in preventing metabolic diseases. Furthermore, non enzymatic browning reactions are take place like Maillard reaction, the chemical oxidation of phenols and caramelisation during aging process. The results of these reactions color of garlic samples turn to dark brown and some antioxidant compounds formation is occur. Process time, process temperature and applied relative humidity effect the black garlic physical, chemical and sensorial properties thus several studies revealed that effect these parameters on black garlic. But all process conditions there was a decrease in moisture content, pH, reducing sugar and increase in browning intensity, antioxidant, SAC content in garlic samples after fermentation. Aim of this study is review the composition, bioactivity, production and applications of black garlic during production process and compare them with fresh garlic at different process conditions.

EFFECTIVENESS OF CALENDULA OIL IN RADIODERMATITIS REHABILITATION

NESLIHAN ALTUNTAS YILMAZ¹, AYŞE MERVE TAT¹, MUHAMMED NECATİ TAT¹

ABSTRACT

After receiving radiotherapy, up to 95% of patients suffer from radiation-induced skin damage, which can lead to dose restriction. In particular, acute radiodermatitis occurs after 90 days of dosing with generalized erythematous bleeding. The National Cancer Institute lists the severity of this dermatitis using a scale of 1 to 4. Acute skin toxicity and moist desquamation tend to occur in skin contact areas such as axilla or skin folds. Management of this important side effect is important because of its high incidence and very negative impact on quality of life. Most patients seek complementary and alternative therapies to provide a solution for this condition. In a particular study, New Zealand regional cancer center found that 49% of 200 patients received radiotherapy use complementary and alternative therapies. A radiation in Queensland uses complementary and alternative therapies in 38% of 101 patients on the oncology clinic. Cancer rehabilitation practices; Restorative, supportive, preventive, palliative. Restorative rehabilitation; Low-level losses and attempts to return to the patient's premorbid functional status when the disorder is anticipated. Restorative rehabilitation is an example of restoring the functional capacity of the exercises to the shoulder joints and exercises to strengthen the upper extremity muscles in patients with breast cancer. Supportive rehabilitation is an attempt to prevent and control the permanent loss of disease or treatment in a patient with cancer. Ambulatory exercises and equilibrium are applied in extremity-preserving surgery in bone and soft-tissue tumors to rehabilitate to support deep sensory rehabilitation. Preventive rehabilitation attempts to reduce the expected functional morbidity with cancer and its treatment. EHA exercises prior to radiotherapy, exercises suitable for extremities with sensory and motor impairments, skin care and orthosis preventive rehabilitation. Exposure to radiation causes DNA damage from direct ionization of radical oxygen species, which promotes dimer formation of water molecules, base changes, and double strand breaks lasting up to 8 hours for repair. Kumar et al. Conducted a meta-analysis of topical treatments in the treatment of radiodermatitis and indicated that most therapies have very limited data. Calendula inhibits oxidative stress, which is theoretically the ideal treatment for radiodermatitis. It is thought to be found in numerous polyphenols found in its extracts. Polyphenols have potentially therapeutic roles as antioxidants on the skin. Calendula affects skin architecture as well as antioxidant potential. Using a cutter, Akhtar et al. Skin hardening and viscoelasticity, which are the direct indicators of the epidermis and water content in the dermis. It is known that Calendula flower, which is known to have antifedematic and anti-inflammatory effects, is effective in removing edema and pain in the tendon. Tissue extracts and massage and tissue renewal were found in tendinitis treatment. Calendula has been shown to improve oral mucositis skin healing compared to a control gel base. Similarly, in a randomized study of 40 head and neck cancer patients receiving radiotherapy, patients with calendula oral wash therapy were found to have significantly lower oropharyngeal mucositis severity at 2, 3, and 6 weeks of treatment compared with placebo.

Calendula appears to be a safe topical therapy in the treatment and prevention of radiation-induced skin toxicity. The lack of controlled studies of radiation-induced skin toxicity limits the interpretation of the effectiveness of topical treatments. In cancer rehabilitation, approach to radiodermatitis, which often limits rehabilitation, is very important. Loss of tissue elasticity and consequent loss of mobility in joints and structures prevents the targeted steps in the rehabilitation steps. We think that calendula plant extract and oil, which will be applied to radiodermatids as a result of the studies done, will support rehabilitation.

USE OF YELLOW KANTARON (*HYPERICUM PERFORATUM L.*) IN LARYNX MOBILIZATION AFTER RADIOTHERAPY

NESLIHAN ALTUNTAS YILMAZ¹, MUHAMMED NECATI TAT¹, AYŞE MERVE TAT¹

ABSTRACT

In 2002, the World Health Organization declared the hypericum perforatum as a medicinal plant. The yellow centaury, formerly known as the wounded good, is a medical herb that has recently proved its antidepressant activity as a result of clinical trials and has become widespread in the world. It is also used for throat infections, colds, antiseptic and wound healing, as well as cancer, diabetes, chronic rheumatism, gastric ulcer, gastrointestinal diseases, diuretic sedative, liver-bile disorders, jaundice, bronchitis, diarrhea and dysentery. It has also been determined that the herbicide, hyperisin, can be used in the treatment of AIDS because it is effective against a large number of viruses. Due to its cell renewal properties, yellow centaury oil is particularly effective in wounds and burns. In addition, centaury oil, antiseptic feature prevents the formation of germs in the wound, anti-inflammatory feature prevents the formation of inflammation in the wound, Shortening the bleeding with a vasoconstrictor effect, allowing the wound to close quickly with its cell renewal feature, and at the same time it relieves the pain and sores caused by the wound. Radiotherapy alone or with chemotherapy is the most preferred method of cancer treatment for the last 20 years. The main goal of the radiotherapy method is to provide organ protection other than treatment. In the treatment of head and neck cancers, radiotherapy is used definitively in the postoperative period. After radiotherapy, changes in muscle tissue occur over the years. After radiotherapy, muscle tissue becomes a collagen reservoir. This leads to scar formation, decreased blood supply and normal tissue oxygenation. Together with hyalin, fibrillar collagen bundles replace muscle cells. Thus, the muscle strength begins to decrease with soft touch hardening. The problem is that we call fibrosis in irradiated tissues arises. Radiation-induced swallowing is a widely accepted comorbid associated with cancer treatment. The swallowing mechanism is extremely complex and not fully understood; However, poor hypolaryngeal excretion and later inadequate opening of the upper esophageal sphincter cause post-radiation treatment dysphagia most often. Fibrosis leads to restriction of tongue, tongue root, pharynx and mobility of the larynx. For this reason, swallowing disorders (dysphagia) are seen after treatment in patients with any of the primary tumors. Patients with oropharynx cancer are expected to develop laryngeal motility problems as well as pharyngeal motility disorders. After laryngeal cancers, there is a decrease in laryngeal elevation after chemoradiotherapy, and difficulties in oral preparation and oral delivery phases, valvular and pyriform sinuses are found. It is important to acquire laryngeal mobility in the dysphagia rehabilitation, which results in diminished morbidity of scar tissue after larynx after head and neck radiotherapy. The use of certain oils in the field of radiation therapy is contraindicated because it may leave a coating that increases the radiation effect on the skin. Lotions containing alcohol and metals; Delays deep recovery. Alcohol can dry the skin and metals such as zinc oxide or aluminum stearate can cause skin rashes. Elevation of the laryngeal elevation is crucial in ensuring loosening of the upper esophageal sphincter. Decreased laryngeal elevation is the primary predictor of

aspiration and is usually associated with radiation-induced dysphagia. It is considered that the special mobilization methods that are applied to increase laryngeal mobility in patients with restricted laryngeal motility, made with yellow corn oil, will accelerate tissue elasticity and skin healing

THE INFLUENCE OF ST. JOHN'S WORT ON MILD AND MODERATE LEVEL DEPRESSION

NESİBE GÜNAY MOLU¹, BİRGÜL ÖZKAN²

ABSTRACT

The Influence of St. John's Wort on Mild and Moderate Level Depression Introduction: In our contemporary period, psychiatric disorders are encountered commonly while depression is the most frequent incident. In depression cases, complementary therapies are administered broadly besides the standard treatment procedures. Herbal treatment method known as aromatherapy is one of the complementary treatments applied frequently. Mild and moderate level depression term is considered as mental problem described by a mood chart described by scales. This term should not be confused with major depression description. Major depression is mental illness that could be diagnosed on the basis of the DSM V diagnosis system. Therefore the present study was conducted in order to determine influence of St. John's Wort on mild and moderate level depressions and to compile basic evidences relevant with this field. Findings: Hypericum Perforatum is usually known as St. John's Wort. In 2002, World Health Organization (WHO) declared St. John's Wort as a medicinal plant licensed as antidepressant medicine in Germany. It is administered in numbers of disorders such as insomnia, anxiety disorders and liver dysfunctions as well as especially for mild and moderate depression. In clinical treatments, 600-900 mg/day dosage is found to be effective. Whereas St. John's Wort treatments yield 56% recovery from depression; placebo treatments yield 35% success rate. With regard to the treatment of mild and moderate level depression disorders, it is reported that St. John's Wort extracts are more effective in treatment in comparison with placebo treatments; and that their adverse effects are more limited. Finally, St. John's Wort utilized in many culture is intensively used in treatment of mild and moderate depression; and the relevant scientific studies on its administration has increased progressively. THE ANTIOXIDANT EFFECTS OF BERRY FRUITS

REZZAN KASIM¹, PINAR ŞANLIBABA², MEHMET UFUK KASIM¹

ABSTRACT

Anthocyanins, which are responsible for the red and blue colors displayed by many vegetables and fruits, belong to secondary plant metabolites. Nowadays, there is an increasing interest on their biological activities as they are claimed to enhance health by protecting against some chronic diseases. In recent years, the developed world has become very aware of the health-promoting properties of the berry fruit group, which has created a strong world market within this fruit sector. The term 'berry fruits' encompasses the so-called 'soft fruits', primarily strawberry, currants, gooseberry, blackberry, raspberry, blueberry and cranberry. Berries constitute a rich dietary source of phenolic antioxidants. Blueberries (*Vaccinium L. species*), blackberries (*Rubus L. Hybrids*) and blackcurrants (*Ribes nigrum L.*) are especially rich sources of dietary anthocyanins and antioxidants. Consumption of small fruits has been associated with diverse health benefits, such as prevention of heart disease, hypertension, certain forms of cancer and other degenerative or age-related diseases. These beneficial health effects of small berry fruits could mostly be due to their particularly high concentrations of natural antioxidants. Antioxidants neutralize free radicals and thus protect the organism from the oxidative damage of lipids, proteins, and nucleic acids. Because of the high contents and wide diversity of health-promoting substances in berries, these fruits are often referred to as natural functional products. The objective of this review is to highlight the nutraceutical value and to summarize the health-promoting effect of berry fruit antioxidants.

SOCIO-ECONOMIC IMPORTANCE OF USING NATURAL GROWING AROMATIC PLANTS AS SUSPENSUS

OKAN YELER¹

ABSTRACT

Medical aromatic plants is quite important in terms of human health. These hydroponic plants, which are widely used in the present day, are often located in different places in the direction of their competence. Some species are naturally grown and some species are being tried to be grown in different environments in order to benefit from visual effects and medical benefits. Every effort has been made to reach these healing plants, which have medicinal benefits in each season. These plants are not able to contribute to socio-economic development, especially because the existing natural medicinal aromatic plants can not be properly transported to marketing channels, and because it is not possible to tell exactly what kind of plant is beneficial. For this reason, it is important to move towards alternative marketing channels. In recent years, some medicinal aromatic plant species have been very important in the sector, especially in the shrubs sector, which creates a great market by entering the country from the western and northern societies and has a serious usage share in social relations, aesthetic and environmental regulation applications. In this study, some medicinal aromatic plants such as Tilia (Ihlamur), Orchis (Salep), Vaccinium myrtillus (Yaban Mersini) and Cassia (Sinamaki) which are included in production and marketing fields of ornamental plants are examined on species basis and put on the importance of visualization and treatment of these plants. In addition, evaluation of these species in social development in production and marketing has tried to reveal both the added value that can be obtained in the economy and the importance of medicinal and aromatic plants on species basis.

THE USE OF ACTIVATED WALNUT SHELL TO REMOVE LEAD IONS WITH BIOSORPTION METHOD

FATMA TOMUL¹, YASIN ARSLAN², ERDAL KENDÜZLER¹

ABSTRACT

The contamination of surface waters with toxic heavy metals such as Pb is one of the major environmental problems and the development of suitable technologies for the effective and economical removal of toxic metals such as Pb from water is needed for environmental and human health. In this context, the biosorption method, which is economical and environmental wastewater treatment method in which significant amounts of by-products used as biosorbents is used to remove toxic metals from the water. In this study, the removal of lead ions from water by biosorption method using walnut shell and sodium hydroxide activated walnut shell biosorbents was investigated. The original and activated walnut shells were characterized by SEM-EDS and FTIR analyzes to determine the effect of activation on the surface structure of the walnut shell. In the SEM photographs, the presence of irregularly shaped and stratified structures was observed before the activation. On the other hand, after the activation with the base, more porous and curved surfaces were formed. The high C and O contents obtained from the EDS analysis confirm the presence of polysaccharides such as cellulose, hemicellulose and lignin. The peak in the FTIR spectrum for the C = O peak observed at 1742 cm⁻¹ was not observed after activation with sodium hydroxide. The effects of various parameters such as adsorbent concentration, pH, temperature and contact time were investigated to determine optimal biosorption conditions. Biosorption experiments have shown that lead removal increases as the biosorbent concentration increases and the highest biosorption efficiency for the biosorbent concentrations is reached at a concentration of 10 g/L biosorbent. It has also been found that base activation is effective for increasing the biosorption yield. It was found that for the adsorbent concentration of 10 g/L, adsorbent yield was 81% with the original walnut shell. However, at same concentration, adsorbent yield was increased to 99% in the case of NaOH-modified walnut shell. It was found that the biosorption efficiency was dependent on the pH and the highest biosorption efficiency was achieved at pH 6. The decrease in biosorption yield with increasing temperature confirms that the biosorption process is exothermic and spontaneous. Furthermore, biosorption experiments have shown that more than 50% of the lead ions are removed within the first 10 min and the equilibrium is reached in 120 min. These results reveal that the biosorption rate can be defined by a pseudo second order kinetic model. According to the results obtained, base activated walnut shell can be used as effective biosorbent to remove lead ions from water. EFFECT OF ACID ACTIVATION ON THE ADSORPTION CAPACITY OF LEMON PEEL

FATMA TOMUL¹, ERDAL KENDÜZLER¹, YASIN ARSLAN²

ABSTRACT

In this study, lemon peel itself and lemon peel activated with nitric acid were used as biosorbent to remove lead ions from water. The effect of activation on biosorbent structure was investigated by SEM-EDS and FTIR analysis techniques. It has been observed that the activation process is effective in pore formation. The FTIR spectrum of the original lemon peel sample was not shown significantly changes after modification with nitric acid but peak intensity for cellulose observed at 1000-1200 cm⁻¹ in the fingerprint region and the peak intensity for free and esterified carboxyl groups and pectins observed at 1600 and 1800 cm⁻¹ were decreased. The effects of various parameters such as adsorbent concentration, pH, temperature and contact time on lead adsorption processes were investigated. It was observed that the adsorption efficiency increased with nitric acid activation and increasing adsorbent concentration and pH and decreased with increasing the temperature. Approximately 99% adsorption yield was obtained using optimum experimental conditions of 20 mg/L lead, T= 25°C, pH = 6 and 10 g/L adsorbent concentration. Acknowledgment: This work was supported by TÜBİTAK BİDEP 2209-A Domestic Project Support Program for University Students (Project application no: 1919B011401094).

EFFECTS OF THE SUPPLEMENTATION OF ESSENTIAL OIL ISOLATED FROM ORANGE PEEL (CITRUS SINENSIS L.) TO BROILER DIETS ON THE PERFORMANCE

AHMET AYDIN¹, AHMET ALÇİÇEK²

ABSTRACT

ABSTRACT: In this study, the effects of essential oil isolated from orange peel (OEO) added to broiler diets on the performance were examined. In the research, 432 broiler chickens were used and the experiment lasted for six weeks. In the experiment, 0 (1st group), 50 (2nd group), 100 (3rd group) and 150 mg/kg (4th group) of OEO (*Citrus sinensis* L.) were added to broiler diets and 4 different diets were used. The effect of OEO added to broiler diets on the live weights were found significant ($P < 0.05$), except for 1st and 5th weeks. The more the doses of the OEO were the more the live weights increased, the dose of 150 mg/kg had the maximum increase. Feed intake was found significant ($P < 0.05$), except for the 2nd week. The addition of 150 mg/kg of OEO improved the feed efficiency ($P < 0.05$). Carcass weight, carcass yield, things, breast, back, wing, abdominal fat and heart weights significantly increased ($P < 0.05$) as OEO dose added to diets increased.

FROM TRADITIONAL TO MODERN; THYME PROCESS IN MEDICAL HISTORY

NURIYE DEĞİRMEN¹

ABSTRACT

The species in Lamiaceae family and containing carvacrol, thymol are considered as "thyme". In Europe and America, Turkish thyme (*Origanum onites* L.), Greek thyme (*Origanum vulgare* L. spp. *viridi* (Boiss) Hayak), Spanish thyme (*Coridothymus capitatus* L. Hoffmann ve Link) and Mexican thyme (*Lippia graveolens* HBK) are important in economic terms. *Origanum*, *Thymus*, *Satureja*, *Thymbra* and *Coridothymus* are important in terms of distribution and economy in Turkey. Approximately 70% of the world's thyme trade is provided from Turkey. Among the thyme species in the Aegean and Mediterranean regions in Turkey are *Origanum onites* (Izmir thyme), *Origanum majorana* (white thyme), *Origanum minutiflorum* (Sutculer tyme, an endemic species), *Origanum syriacum* var. *Bevanii*, *Thymbra spicata* or *T. sintenisii* (Zahter, Black thyme, Pointed thyme), *Coridathymus capitatus* (Spanish thyme). Leaves and flowers of *Origanum onites* are consumed as spices, used in pharmacy and perfumery industry. Main ingredients of the thyme essential oil are carvacrol, cineol, borneol, linalool and γ -terpinen. Today, complementary medicine has popularity due to the increased side effects of modern medicines. Thyme has been widely used in folk medicine for centuries. A new regulation has been issued in Official Gazette of the Republic of Turkey (date: 27.10.2014, number: 29158) to regulate the practices of traditional and complementary medical practices for human health, training and empowerment of persons to apply, regulation of working principles of health institutions to be implemented. The traditional use of plants continues among the population despite the publication of these regulations. There is needed to be informing about the correct use of thyme. In this study, we would like to emphasize the usage of thyme in folk medicine and medicinal plants' books and current studies. In the history of medicine; which thyme species was used is not mentioned. Thyme has been used for therapeutic purposes in Anatolia since the past, thyme tea drinks for the thought of facilitating birth. In Mesopotamia thyme was used as a drog, Sumerians used thyme for wheezing, callus and eczema, 5000 years ago, the Egyptians also used it in the mummification process. Hippocrates used thyme for the treatment of asthma, shortness of breath and poisoning, low and stillbirth women, sore throat (mixed with mustard and drove to the outer surface of the throat), prevent of blood coagulation (mixed with a honey). Dioscorides indicated that thyme can be used as a drug, has curvy branches, thorns are located on branches. This plant use is widespread in Islamic medicine. According to a story; Hz. Muhammad (S.A.V) come across the thyme one day; thyme said that "Prophet, take me, I swear to God who sent you as a truth prophet, I can cure all diseases". Thyme was used in 41 ways in Aegean and South Marmara of Anatolia. Thyme was used in the 3. position among the medicinal plants in Konya in 2009. People used thyme (*Thymus capitatus*) for rheumatism pain in Anatolia. Thyme (*Origanum syriacum*) was used as antiseptic and antibiotic in Cyprus. Specific thyme was used for shortness of breath as also for diarrhea, late walking and paralyzed children. People use flowers and leaves of thyme; raw, spice, infusion, mist, mouthwash,

paste, tea, water, extract, oil and enema, and are applied in different cures; diabetes, stomach discomfort, nausea, abdominal pain, stomach burn, indigestion, cholesterol, headache, rheumatic disorders, sore throat, cough and flu ailments; blood sugar and cholesterol lowering, germicide, digestion facilitator, blood pressure balancer, bile enhancer, pain reliever, body strength enhancer, appetizer, regulating the function of the secretory glands in the liver and pancreas, libido enhancer, immune system strengthening, nerves strengthening, diuretic, menstrual irregularities, astringent, fungus, for healing of skin disorders and antioxidant effects. Thyme is also take place in the books of medicinal plants. In this books it has been indicated that thyme may be used for the curing of menstruation, lung diseases, indigestion, uterine cancer, uterine pain, uterine disease, prostate diseases. Today, many national and international research related to thyme is available. In the national research investigated that 8 different extracts of *Thymus vulgaris* has an antimicrobial activity on *Bacillus subtilis*. In the international research determined that essential oil of *Thymus vulgaris* has a bacteriostatic activity on 9 gram negative bacteria and 8 gram positive bacteria. As a result, thyme agriculture is easy and it has a lot of benefits. There is a need to increase of thyme cultivation, researches, public awareness of the use of plant, inform health workers about the subject and encouraging them to apply, must be applied regulations into practice. Because of the thyme is widely used among the public it is necessary to inform by professionals for the using of correct doses, correct method, in appropriate disease and it is also necessary to explain the correct use in the media and educational institutions in Turkey.

THE POTENTIAL OF MEDICINAL AND AROMATIC PLANTS IN THE CENTRAL ANATOLIAN STEPPE RANGELAND AND THE ACTIONS TO BE TAKEN FOR THESE PLANTS

NUR KOÇ¹, RAMAZAN ACAR¹, SADIYE AYŞE ÇELİK¹

ABSTRACT

The plant formation destroyed by giving way difficult conditions resulted from high evaporation, lack of rainfall in summer season developing depending on spring precipitation is known as steppe. The tree with short plant height or the bush species are run across more or less amount with these steppe sometimes. The steppe of the Turkey have got marvelous biodiversity. But also the areas to have the most genetic erosion and ecocide are these steppe rangelands. These rangelands are worthful and rich areas in terms of medicinal and aromatic plants like *Astragalus* sp., *Tymus* sp., *Salvia* sp., etc. It's have an importance about particularly the preservation of the steppe areas had local endemic plants. The secondary metabolite of medicinal and aromatic plants which are grown in these areas can be have various and richer content. There are a large number of medicinal and aromatic plants within plants which are determined in the vegetation survey. For this reason, these steppe rangeland should be prevented, and the medicinal and aromatic plants in there should be agricultural production.

CYTOTOXIC EFFECTS OF EREMURUS SPECTABILIS BIEB. EXTRACTS ON CANCER CELL LINES

BERTAN BORAN BAYRAK¹, MEDIHA SÜLEYMANOđLU², SERAP ERDEM KURUCA², REFIYE YANARDAđ¹

ABSTRACT

Eremurus spectabilis Bieb., belonging to Liliaceae family, is geographically distributed in the region of central Asia and middle East. *Eremurus spectabilis* Bieb. commonly used as a wild edible vegetable. Its leaves and roots have been traditionally used in folk medicine to treat some ailments such as hemorrhoids, diabetes, pains of eyes, jaundice, pimples, eczema and fungal injection. Natural products and related drugs are used to treat 87% of all categorized human diseases. Recently, traditional herbal drugs are gaining importance in the search for new anticancer drugs due to their low toxicity and combined effects. Although antioxidant and antimicrobial effects of *Eremurus spectabilis* Bieb. are known, there is no study about anticancer effect. In this study, the cytotoxic effects of aqueous extracts of *Eremurus spectabilis* Bieb. were investigated on NIH3T3 (murine fibroblast), HL-60 (human promyelocytic leukemia) and K562 (human chronic myeloid leukemia) by MTT \square 3- (4,5-dimethylthiazol-2-yl) -2,5-diphenyltetrazolium bromide \square assay. Plant materials were washed with distilled water and dried at room temperature. The aqueous extract was prepared by using distilled water and lyophilized. The cytotoxic effects of *Eremurus spectabilis* extract was tested at different concentrations (50-500 μ g/ml) on cell lines. Dose-response curves were performed to calculate IC50 (concentration inhibiting growth of 50% of cells) of the compounds. The efficacy of the extract was compared according to this value. The aqueous extract of *Eremurus spectabilis* Bieb. had cytotoxic activity in the range of 180-400 μ g/ml in all cells. IC50 values of cells were determined NIH3T3> HL-60> K562 respectively. The aqueous extract of *Eremurus spectabilis* Bieb. had cytotoxic activity in higher concentrations compared to leukemia cells (K562 and HL-60) in normal diploid 3T3 fibroblast cells. These results suggested that anticancer molecules present in this plant may be selective antileukemic drug potential.

THE İMPORTANCE OF ESSENTIAL OIL ISOLATED FROM ORANGE PEEL (CITRUS SINENSIS L.)

AHMET AYDIN¹, MEDET KORKUÇ¹, DİLEK ŞENTÜRK DEMİREL², SEVİLAY GÜL³

ABSTRACT

Abstract The essential oils isolated from Orange peel (*Citrus sinensis* L.) as a natural feed additive and have antimicrobial activity interest increased. Many researches have been made for use as natural feed additive in poultry nutrition. In this research, the essential oils improvement in parameters such as live weight gain, feed intake, feed efficiency, egg production and carcass yield significant has been reported. In a particular study, 150 mg / kg of orange peel essential oil had a positive effect on performance compared control group and found positive effects on cholesterol and albumin values of blood parameters. It has also been reported that when the intestinal flora is examined, the *E. coli* ratio is reduced significantly ($P < 0.05$). In another study, it was reported that mixtures containing orange peel essential oil significantly increased body weight gain and feed utilization in broiler chickens ($P < 0.01$) and significantly ($P < 0.05$) against many pathogenic microorganisms that threatening chickens.

HARVEST AMOUNTS AND ETHNOBOTANICAL USES OF THE MUSHROOM (BOLETUS SP.) IN TURKEY

SERHAT URSAVAŞ¹, GAMZE TUTTU¹

ABSTRACT

Mushrooms are organisms without chlorophyll. By creating spores, reproduce themselves as asexual and without spores as sexual. They could be found in particularly humid places all over the world. In a humid environment, after rains, mushrooms easily occurs by germinating spores in the soil. Mushrooms are the small tubes called "huf" in the shape of the spinning organs and the yarns that make up the basic structures. The parts collected and utilized by humans are the sexual reproduction organ formed by the specialization of huf in the form of yarn. People have been using mushrooms for many years, especially as food and medicine. In addition, the poisonous ones are used in the chemical industry because they cause chemical changes, and they also contain antibiotic substances. Of the mushrooms identified on the earth, about 5,000 are edible. Porcini or Penny bun (*Boletus* sp.) which is the edible tasty mushroom; food, pasta sauce, soup making and drying in factories. At the same time, *Boletus* sp., which is exported abroad and contributes to the Turkish economy. According to the data received from General Directorate of Forestry, Department of Non-Wood Products and Services. First record belongs to year 1989 in the period of 1989-2015. In 1989, for the first time, 4.000 kg mushroom collected and gained 2 TL incomes in the territory of The Forest Regional Directorate Bursa. Mushrooms were harvested from The Forest Regional Directorate Bursa, Amasya, Balıkesir, İstanbul, Giresun and Bolu till now. When analyzed 26 years of data; in total, 2.102.737 kg of mushroom harvested and was earned as revenue 451.758 TL. Maximum amount of mushroom harvested while performing from The Forest Regional Directorate İstanbul with 1.225.402 kg, and minimum amount of harvest was carried out from The Forest Regional Directorate Bolu as 700 kg.

CHEMICAL COMPOSITION AND MEDICINAL USE OF THE ESSENTIAL OILS OF BRYOPHYTES

SERHAT URSAVAŞ¹, FIGEN EROL URSAVAŞ²

ABSTRACT

Bryophytes belong to the group of the oldest known land plants, which includes liverworts, hornworts and mosses. More than 22.000 members of the mosses are exist (Bryophyte) in the world. Many studies were done on some bryophyte taxa because of their effective substance as anti-microbial, antibiotic, antifungal, insecticidal, chemical, cosmetic, medicine, antifeedant and biomonitoring usages. Essential oils and their constituents are widely used in cosmetics as fragrances, in medicine as parts of different medical products, and in the food industry as flavoring additives. The essential oils of mosses generate a pleasant, sometimes distinct smell in the fresh state and have been used as traditional medicines. Because of the chemical content, bryophyte usage in various fields as follows; Use of bryophytes as antimicrobial and antifungal agents: Some bryophytes of which were reported active against microbes. Biologically active substances: Some bryophyte in fact manufacture broad-range antibiotics. Their usage in dressing, diapers production, and other human medicinal applications are recognized in various parts of the world. Antiviral Activity: Bryophytes have used to treat venereal ailment by packing Sphagnum on the infected organs. It produces several active humic acids against viruses. Anti-tumor Properties: According to the some study results; anti-cancer action against Sarcoma 37 in mice, using extracts of Polytrichum juniperinum. The peat preparations hold some guarantee against some types of human cancer. Gynecology: Ploytrichum commune moss used as an aid in gynecology. Sphagnum is helpful in speeding up the process of labor. It has also been used as a contraceptive to obstruct the access of sperm, along with grass, sponge and other fiber. Laxatives and Diuretics: Ploytrichum commune used as diuretic and laxative agent. It's also used as detergent and hemostatic agent. Muscle relaxing drugs: Marchantin A (Marchantia sp.) and the associated cyclic bis-bibenzylyls are structurally analogous to bis-bibenzyloquinoline alkaloids such as d-tubocurarine, which are pharmacologically important muscle relaxing active drugs. Cardiotonic and vasopressin antagonist action: Marchantin A (Marchantia sp.) was reported as potent cardiotonic. Mosses also contain polyunsaturated fatty acids that are already known to have important potentials in human medicine, such as preventing atherosclerosis and cardiovascular disease, reducing collagen-induced thrombocyte aggregation, and lowering triacylglycerols and cholesterol in plasma. Lung diseases: Marchantia polymorpha liverwort were used in the treatment of pulmonary tuberculosis. Treatment of skin: Local people of Himalayan regions use a mixture of moss ashes with honey and little fat to heal cuts, burns and injuries. Marchantia polymorpha and Marchantia palmata liverwort are used to treat abscesses and boils. Filters: Species of Anomodon, Entodon, Hypnum, and Scapania wrapped in a cone of Rhodobryum campanulatum leaves, to serve as smoking filters by the natives of Himalayas. Transgenic Pharmaceutical Production: Physcomitrella patens is able to produce human proteins and is

the solitary plant being used to produce the blood-clotting factor IX for pharmaceutical use. Bryophytes are source of many incredibly interesting and useful bioactive compounds. The majority of the compounds reported in the bryophytes are lipophilic terpenoids (mono-, sesqui, and diterpenoids) and fragrant compounds. Few of them are nitrogen- or sulfur-containing compounds. Presently, only about 5 % of the total bryophytes have been studied chemically. Hence, there is an insightful call for their proper assessment regarding their useful chemical constituents and activities. By taking into account the results of those studies carried out in Turkey, randomized controlled studies between health professionals and disciplines is recommended.

HARVEST AMOUNTS AND ETHNOBOTANICAL USES OF THE LAVENDER (*LAVANDULA SP.*) IN TURKEY

*SİMGE ÇİZGEN*¹, *GAMZE TUTTU*², *SERHAT URSAVAŞ*²

ABSTRACT

Medical and aromatic plants are commonly used in Turkey and in the World as an adjunct product for the prevention, treatment and healing of diseases and for the protection of health. In addition to that, it is used as food, herbal tea, spices and seasonings. Increasing demand on the market causes that plant to be faced with extinction of some species in nature. For this reason, cultivation of medicinal and aromatic plants is getting more and more important. Lavender, one of the most important medicinal and aromatic plants in Turkey, has been cultivated since the 1960's, and today's planting areas are increasing day by day. Lavender oil perfume, which is one of the most popular essential oils in the world, is used in cosmetics and pharmaceutical industry. Lavender has also been used for decorative purposes in the past and various industrial branches in the following years. Today, the use of lavender for medical and food purposes has been increasing considerably. Lightly bitter, strong-scented flowers are used in food, jam and tea making; Fresh leaves are used in meat and fish dishes, salads, sweet and syrup. Lavender flowers contain tannins, glycosides, saponins, organic acids and essential oils. Lavender has medically painkiller, antiseptic, antibacterial, antifungal, wound healing, sedative, expectorant, gas remover, muscle spasmolytic, nerve and heart strengthening effects. According to the data received from General Directorate of Forestry, Department of Non-Wood Products and Services. First record belongs to year 2000 in the period of 1989-2015. In 2000, for the first time, 17.100 kg lavender collected and gained 342 TL incomes in the territory of The Forest Regional Directorate Muđla. Lavender was harvested from The Forest Regional Directorate Muđla, Bursa and Balıkesir until now. When analyzed 26 years of data; in total, 80.488 kg of lavender harvested and was earned as revenue 2.674 TL. Maximum amount of lavender harvested while performing from The Forest Regional Directorate Muđla with 71.470 kg, and minimum amount of harvest was carried out from The Forest Regional Directorate Balıkesir as 4.018 kg of lavender harvested and was earned as revenue 141 TL

MEDICINAL AND AROMATIC VALUE OF THE MADONNA LILY

ÖZGÜR KAHRAMAN¹, ELIF BOZDOĞAN SERT², SEMA GÜLER²

ABSTRACT

Turkey has a very good potential for bulbous, tuberous and rhizomous plants. There are about 12000 plant taxa and 3000 endemic species, 800 bulbous, tuberous and rhizomous species of these species. Bulbs, tubers and rhizomes of these plants have been used as medicinal plants for centuries and also their flowers are used as ornamental plants. Turkey incomes approximately 2 million dollar every year from exporting of bulbous, tuberous and rhizomous plants. The collection, cultivation and exporting of bulbous, tuberous and rhizomous plants are controlled by the regulation on the uprooting, production and trade of natural flower bulbs. *Lilium candidum* L. (Madonna Lily) bulbs propagated are allowed to be exported by the regulation. The bulbs of Madonna lily with over 16 cm circumference are exported. Naturally Madonna lily is spread in Aydın, İzmir, Mersin, Muğla, Antalya, Balıkesir, Çanakkale, İstanbul and Mardin in Because of its beautiful flowers and pleasant smell, it is used as ornamental plant or perfume plant. The watery bulbs and leaves are eaten by some animals such as pigs, sheep and goats. Madonna lily bulbs are randomly collected by humans in some regions. This study aims to give some information about morphological properties, ecological requirements, common names, distribution areas, cultivation, propagation, ingredients, usage areas, economic value and exports of *Lilium candidum* L. plant which is a medicinal and aromatic value.

HARVEST AMOUNTS AND ETHNOBOTANICAL USES OF THE MISTLETOE (*VISCUM ALBUM L.*) IN TURKEY

*SİMGE ÇİZGEN*¹, *SERHAT URSAVAŞ*², *GAMZE TUTTU*²

ABSTRACT

Viscum L. is represented in our country with one species (*Viscum album L.*) and three subspecies. The mistletoe grass is a green half-parasitic shrub that grows on forest trees and shrubs. Its fruit is covered with bright white color and an inner sticky substance in pea size. Today, *Viscum album*'s dried fruits and leafy branches are used in the content of many medicines. In addition, with the chemical studies carried out, it has been determined that *Viscum album* includes lectins, viscotoxins, polysaccharides, polycholates, flavonoids, phenylpropons, lignans, biogenic amines, other nitrogen compounds and caffeic acid derivatives. The plant used in the treatment of many diseases has constipation, diuretic, digestive, emetic, emetic, cholesterol-lowering, nervous soothing, antifungal and hypotensive effects. It is also used such as a safener against both the cancer and tumor, and in the treatment of different types of cancer and cardiovascular diseases. According to the data received from General Directorate of Forestry, Department of Non-Wood Products and Services. First record belongs to year 1992 in the period of 1989-2015. In 1992, for the first time, 4.700 kg mistletoe collected and gained 0,2 TL incomes in the territory of The Forest Regional Directorate Eskişehir. Mistletoe were harvested from The Forest Regional Directorate Bolu, Adana, Kütahya, Bursa, Konya and Eskişehir till now. When analyzed 26 years of data; in total, 52,287 kg of mistletoe harvested and was earned as revenue 1.080 TL. Maximum amount of mistletoe harvested while performing from The Forest Regional Directorate Adana with 28.000 kg, and minimum amount of harvest was carried out from The Forest Regional Directorate Konya as 1.000 kg of mistletoe harvested and was earned as revenue 10 TL.

HARVEST AMOUNTS AND ETHNOBOTANICAL USES OF THE STINGING NETTLE (URTICA SP.) IN TURKEY

GAMZE TUTTU¹, SERHAT URSAVAŞ¹

ABSTRACT

Utilizing plants is as old as human history. Humankind has used some plants for nutrition, and some plants have been curing their troubles, and some of them in the treatment of diseases. Stinging nettle (*Urtica sp.*) is one of the most frequently used medicinal herbs in Turkey. It contains potassium salts, organic acids (formic acid), histamine, acetylcholine and vitamin C. It is used as an assistant product in many diseases which have nettle root, leafy branches and seeds blood purifier, cell renewal, blood maker, anti-bleeding, urine enhancer, appetizer, blood sugar lowering, laxative, muscle relaxant and stimulating effects. That plant might cure cancer, blood diseases, rheumatism, diabetes, asthma, kidney diseases, urinary tract diseases, hemorrhoids, hair loss, constipation biliary diseases etc. Nettle, which is common in the village markets as vegetables, is used for making food, soup, roasting, scalding, salads, pies, spices and tea. According to the data received from General Directorate of Forestry, Department of Non-Wood Products and Services. First record belongs to year 1989 in the period of 1989-2015. In 1989, for the first time, 300 kg stinging nettle collected and gained 0.01 TL incomes in the territory of The Forest Regional Directorate İzmir. Stinging nettle were harvested from The Forest Regional Directorate Balıkesir, Bursa, Çanakkale, Isparta, İzmir, Mersin, Muğla, Kastamonu, Kütahya and Konya until now. When analyzed 26 years of data; in total, 27.545 kg of stinging nettle harvested and was earned as revenue 1.821 TL. Maximum amount of stinging nettle harvested while performing from The Forest Regional Directorate Kütahya with 15.215 kg, and minimum amount of harvest was carried out from The Forest Regional Directorate Bursa as 100 kg of stinging nettle harvested and was earned as revenue 2 TL.

THE ROLE OF MIDKINE AND MYRICETIN IN CD133+/44+ PROSTATE CANCER STEM CELLS SURVIVAL

SUAT ERDOGAN¹, OGUZHAN DOGANLAR¹, ZEYNEP BANU DOGANLAR¹, KADER TURKEKUL¹, ILKER DIBIRDIK¹,
AYHAN BILIR²

ABSTRACT

Prostate cancer (PCa) is a leading cause of morbidity and mortality within the male population. Midkine (MK) is a heparin-binding growth factor and is overexpressed in various types of whose expression is weak or undetectable in normal adult tissues. Plant derived natural flavonoids have received considerable attention in recent years due to their diverse therapeutic benefits. In the present study we investigated the effect and mechanism(s) of MK and myricetin, a natural flavonoid, treatment in prostate cancer stem cells (PCSC). Stem cells (CD133+/44+) were isolated from the human PCa PC3 cell lines using a magnetic-activated cell sorting system. Endogenous MK mRNA expression was knocked-down by synthetic siRNA. Cell survival was measured by MTT assay. RT-qPCR and image-based cytometry were used to investigate apoptosis and cell cycle progression. PCSCs were treated with various concentrations of myricetin for up 24 - 72 h. The PCSC survival was dose- and time-dependently inhibited by myricetin. Downregulation of MK led to significant growth inhibition. Treatment of MK knock-downed cells with the IC50 value of myricetin (35 μ M) enhanced cell death to a significantly greater extent than treatment with either agent alone. The combined therapy strengthens the apoptosis and cell cycle arrest at the S phase of myricetin treatment. Myricetin therapy significantly reduces the cell migration and spheroid diameter of three-dimensional cell culture. Taken together, MK plays an important role in PCSC survival and co-treatment with myricetin might provide a promising treatment for patients with prostate cancer.

THE EFFECTS OF ECOLOGICAL FACTORS ON SOME POMOLOGICAL PROPERTIES OF FRUITS IN VACCINIUM ARCTOSTAPHYLOS (L.) POPULATIONS IN THE FIRTINA VALLEY

FILIZ YUKSEK¹, TURAN YUKSEK²

ABSTRACT

In this study, it was tried to determine the effect of environmental factors such as altitude, geological formation and canopy cover on certain pomological properties of fruit in the whortleberry populations in the Firtina Valley. For this purpose, Total 30 experimental sites with three replicates were taken in three different levels of altitude (1000-1200 m, 1300-1500 m, 1800-1900 m. a.s.l.), two different geological formations (Kaçkar Granitoyidi and Çatak) and two different canopy covers (0% and 40-60%). Pomological characteristics such as width, height, weight, dry matter amount of fruit were measured in fruit samples collected from experimental plots. As a result of the research, it was found that fruit width varied between 4.04 and 12.91 mm, fruit length ranged from 4.94 to 13.92 mm, the 100 berry weight varied between 24.61 and 87.05 g, and the total dry matter amount varied between 10.21% and 17.35%. It was determined that ecological factors, especially elevation, changed fruit characteristics statistically significant. As the altitude increased, fruit width, fruit height and 100 berry weight showed irregular change. Pomologically, the best fruit characteristics the populations were found on the Çatak geological formation at the second elevation (1300-1500 m a.s.l.). The wild caucasian whortleberry populations in the second elevation can be selected as one of the genetic resource conservation areas in the valley.

THE IMPORTANCE OF PHENOLIC COMPOUNDS AND EXERCISE IN CHRONIC INFLAMMATION

NECATİ MUHAMMED TAT¹, AYŞE MERVE TAT¹, NESLİHAN ALTUNTAŞ YILMAZ¹

ABSTRACT

Inflammation is the biological complex defense response that the body has shown to wipe out or restrict harmful stimuli after necrotic structures have been removed from damaged tissues and cells. Inflammation is part of a non-specific immune response. Inflammation can be acute (short-term) or chronic (long-term). Acute inflammation is the first response of blood and plasma to leukocytes in injured tissues, mainly by the movement of neutrophils, but then by the movement of monocytic cells. There is limited beneficial effect of acute inflammation especially when fighting infection. Chronic inflammation is also associated with the presence of cells such as macrophages and lymphocytes histologically identified with the breakdown and recovery of synaptic tissue, leading to progressive transformation in cell types at the same time. A number of chemical events shape the inflammation and allow it to spread around. Free oxygen radicals (FOR) can cause oxidative damage to lipids, proteins and nucleic acids; leading to many different diseases and chronic inflammation, leading to degradation of cellular structures and biochemical compounds in DNA structure. FOR are important mediators that trigger or sustain inflammatory processes. It releases inflammation by stimulating the release of cytokines (IL-1, TNF- α). Clinically, steroidal or non-steroidal anti-inflammatory drugs are given in inflammatory diseases. Plants show a large part of the natural antioxidants that could lead to the development of new drugs. In studies conducted with phytochemicals, compounds obtained from medicinal plants perform anti-inflammatory activities by suppressing the release of several important pro-inflammatory mediators. There is a negative correlation between consumption of some fruits and vegetables and chronic inflammation. The physiological characteristics of these fruits and vegetables are partly due to the multiplicity of phenolics. Phenolic compounds have strong antioxidant activity. The antioxidant capacities of phenolic compounds vary according to their chemical structure. They inhibit the peroxide radicals by retaining the aromatic rings and hydroxyl groups (OH⁻) in their structure and do not allow FOR to accumulate. At the same time, they have been shown to inhibit pro-inflammatory cell proliferation which they have organized enzymatic activities. For example, 35-45% of dietary antioxidants consist of tea flavanoids; It has been reported that the amount of antioxidant which is passed through the temperature during brewing also increases. It is suggested that 1 g / day tea consumption can provide 200-300 mg / day flavanoid intake, which is higher than the daily recommended C and E vitamins and β -carotene total (70 mg / day), emphasizing the importance of tea as an antioxidant source. Another antioxidant-rich fruit is apricot that include Lycopene, β -carotene, vitamins A and E are important for feeding. Chestnut is a mixture of triterpenic saponins with strong anti-inflammatory properties. Pectin and vitamins ingredient in apple may protect against colon and lung cancer formation due to antioxidants and may protect against liver and breast cancer. More specifically, foods rich in ω -3 fatty acids, vitamins and various polyphenolic plant secondary metabolite groups have been shown to be effective against oxidative stress and inflammation in

Corresponding Author: NECATİ MUHAMMED TAT, necatimuhammedtat@gmail.com

¹NECETTİN ERBAKAN ÜNİVERSİTESİ SAĞLIK BİLİMLERİ FAKÜLTESİ

various chronic pathologies such as Alzheimer's disease. Exercise in the acute phase of inflammation is not recommended too often. Protective reactions exhibit such as pain, muscle spasm and temperature increase in tissues. Exercises to be performed during this period may lead to complications such as subluxation, dislocation, tendinitis . However, in chronic inflammation conditions, the appropriate and individualized exercise program tailored by physiotherapists will remove FOR and reduce the inflammatory effect that damages the body. The aim is to reveal the interaction between inflammation and FOR, to emphasize the importance of antioxidant phenolic compounds and individualized exercise for the person in chronic inflammation.

ROLES OF THE ANTIOXIDANTS AND THE AEROBIC EXERCISE AGAINST OXIDATIVE STRESS

AYŞE MERVE TAT¹, NECATİ MUHAMMED TAT¹, NESLIHAN ALTUNTAŞ YILMAZ¹

ABSTRACT

Oxidative stress occurs when the antioxidant defense system of the body does not stabilize free radical formation. Free radicals are produced as normal cellular metabolism products as well as non-associated electron containing atoms or molecules which can also occur under the influence of many external sources. Free radicals are very short-lived but they are very dangerous because they react with non-radicals and make them radical, start a series of chain reactions and form many radicals. While normal levels of free radical formation are necessary for the body, over production plays an important role in the emergence of many diseases. The effects of free radicals have been demonstrated in many types of cancer. In addition neurodegenerative diseases, rheumatic diseases, immune system diseases, circulatory system diseases, metabolic diseases have been found to be linked to free radicals. In short, it has been shown that the formation of most diseases is linked to excessive free radical production. Many defensive mechanisms have been developed in the body to prevent excessive free radical formation and damage to them. These are known as "antioxidant defense systems" or simply "antioxidants". The antioxidant defense in the body is enzymatic and non-enzymatic. The first and basic antioxidant defense is enzymatically done. Superoxide dismutase, catalase, glutathione peroxidase, glutathione s-transferase and glutathione reductase are known enzymatic antioxidants. Glutathione, cysteine, melatonin, ceruloplasmin, transferrin, myoglobin, hemoglobin, ferritin, bilirubin, methionine, urate, lactoferrin, albumin which are endogenous non-enzymatic antioxidants. Alfa-tokoferol (vitamin E), beta-carotene retinol (vitamin A), ascorbic acid (vitamin C), folic acid (folate) and minerals such as selenium, copper, zinc, polyphenols and flavonoids are exogenous non-enzymatic antioxidants. Vitamins (A, C and E) are the most commonly found antioxidants. Example of foods rich in vitamin A are potato, carrot, pumpkin, black cherry, grapefruit, green bean, parsley, mint, spinach green leafy vegetables, egg, fish, poultry, yoghurt, cheese; vitamin C citrus fruits such as lemon and orange, onion, spinach, tomato, fresh bean, asparagus, pea, raspberry, cherry; vitamin E olive, oily seeds such as almond, nut, spinach, broccoli, apple, cucumber, tomato, flaxseed oil, wheat. One of the most important factors that improve the antioxidant defense system of body is exercise. It has been shown that regular aerobic exercise improves the antioxidant defense system of body while long time aerobic or anaerobic acute exercise by untrained people causes oxidative stress. Elderly, chronic illnesses and smokers are reported to be more susceptible to oxidative stress after exercise than healthy individuals. In order to make stronger antioxidant defense systems, suggested that antioxidant supplements and exercise programs tailored by physiotherapist accordance with physical performance of individuals.

**BIOCONTROL POTENTIALS OF ANTAGONIST BACTERIAL
ISOLATES OBTAINED FROM DIFFERENT PLANT SPECIES
AGAINST CHARCOAL ROT DISEASE AGENT ON
MEDITERRANEAN SAGE (SALVIA FRUCTICOSA)**

İMAM ADEM BOZKURT¹, ESRA SÖNMEZ¹, MERVE KARA¹, ŞENER KURT¹, EMINE MINE SOYLU¹, SONER SOYLU¹

ABSTRACT

Mediterranean sage (*Salvia fruticosa* Miller) is one of the most commercially exploited medicinal plant naturally growing in eastern Mediterranean Turkey. *Macrophomina phaseolina* (Tassi) Goid remains the prevailing causal agent of charcoal rot disease that significantly suppresses the yield of a variety of crops including medicinal plants. On sage, pathogen causes stunting, blackening of stems, and rotting of the crown and roots. Pathogen's wide host range and ability to survive under arid conditions, coupled with the ineffective use of fungicides against it, have spurred scientific endeavours for alternative avenues to control this phytopathogen. Biological control is non-hazardous strategy to control plant pathogens and improve crop productivity. Rhizosphere inhabiting beneficial bacterial species have shown unique plant growth promoting as well as antagonistic activity against fungal phytopathogens. In the present study, antagonist bacterial species were isolated from rhizosphere of various host plants of the pathogen such as cotton, lettuce and strawberry. Bacterial isolates were identified by using morphological and MALDI-TOF analyses system. A total of 65 epiphytic bacteria belonging to *Acetobacter*, *Arthrobacter*, *Bacillus*, *Burkholderia*, *Enterobacter*, *Methylobacterium*, *Micrococcus*, *Pantoea*, *Pseudomonas*, *Rhizobium*, *Serratia*, *Stenotrophomonas* spp were selected as potential biocontrol agent and screened in vitro for their ability to suppress the mycelial growth of *M. phaseolina*. Among the tested bacterial isolates, eleven bacterial isolates were found to suppress mycelial growth of the disease agent in varying ratio (5.56-74.44%). Antagonist *Arthrobacter oxydans* was the most effective isolates by inhibiting mycelial growth (74.44% inhibition of mycelial growth over control). Antagonistic effect of the most efficient bacteria on hyphal morphology was studied by using Nomarski DCI-assisted light microscopy technique revealed that effective bacterial antagonist isolates was able to damage fungal mycelia may be due to cell wall degrading enzyme(s), establishing its role as a potential antagonist against *M. phaseolina*.

AN ALTERNATIVE FOOD AND MEDICINAL CROP: QUINOA (CHENOPODIUM QUINOA L.)

LALE EFE¹

ABSTRACT

Özet Quinoa crop that belongs to Family of Chenopodiaceae and originates from South America-Andes Mountains has been consumed since thousands years for basic nutrition like cereals. Its leaves are also consumed besides of seeds. There are proteins, carbohydrates, various vitamins and minerals in its seeds considerably. Therefore it has been used as animal feed. Furthermore people in South America countries such as Chile, Bolivia, Peru, Argentina, and Ecuador have also used quinoa crop for medicinal treatment because of some components in its seeds and leaves. At the present day in countries of North America, Europe, Asia and Africa has also been cultured. In various geographies in alternative medicine quinoa seeds and leaves has been used in order to cure a number of diseases such as antihelmintic, laxative, diuretic, carminative, eye diseases, thorax complaining, cough, labored breathing, asthma. In a number of researches it was also noted that quinoa has antioxidant and anticarcinogenic effects. Researches related to food and medicinal properties of quinoa are increasing every day.

DETERMINATION OF GENETIC DIFFERENCES IN THE GENUS SALVIA USING MOLECULAR TECHNIQUES AND ITS IMPORTANCE

MÜGE ETİK¹, YONCA SURGUN ACAR², BEKİR ÇÖL¹, BETÜL BÜRÜN¹

ABSTRACT

Turkey is one of the wealthiest countries in the world in terms of medicinal and aromatic plants. It is known that *Salvia* species have been widely used throughout the world as a traditional medicine since the ancient times. In Turkey, sage species are sold in internal market and also exported. Due to high medical values of *Salvia* species, it is of great economic importance for Turkey. *Salvia* species exhibit high level of intra- and interspecific genetic diversity. By studying the genetic differences of the species belonging to this genus, the information acquired can be used in order to obtain superior genotypes and utilize them in production. Furthermore, molecular results can be used in to establish genetic stocks, characterize germplasm and determine the relationships among the species via phylogenetic studies. In this review, the RAPD-PCR studies regarding genetic difference determinations for the genus *Salvia* in the literature is evaluated and discussed.

TRUFFLE AND USE OF DOGS IN TRUFFLE HUNTING

ONUR ERZURUM¹

ABSTRACT

Truffles are hypogeous fungi of the genus *Tuber* which grow in symbiosis with certain trees (especially chesnut and oak trees). It is known that these fungi are grown mostly in the mediterranean region, but it is grown in various regions of the world. More than 20 species of truffle are grown in mediterranean forests in Europe. The annual production of truffles collected has fallen from 1000 tonnes to 200 tonnes in the last century. Edible wild fungi are traditionally used worldwide in food or pharmaceutical industries. Some truffle species such as *Tuber magnatum*, *Tuber melanosporum* and *Tuber aestivum* are the most expensive edible mushrooms due to their particular flavor and unique flavor. It is estimated that *T. melanosporum* production in France is about 20 million euros per year, 7.5 million euros in Spain and 4 million euros in Australia. The influence of the truffle economy not only includes fresh truffles but also includes agricultural activities, local gastronomy, production of truffle products, truffle fairs and retail markets, dog training and technical evaluation services. Around 180 truffle species have been reported around the world, but only 13 have received commercial interest. Truffles produced in Italy, France and Spain are considered gourmet products and fresh truffle has the highest gastronomic value. *T. melanosporum* and *T. aestivum* are the most admired and known truffle species in Spain. Truffles may be about 5-20 cm deep from the soil. For hunting truffles that are difficult to collect, it may be beneficial to follow *Suillia* flies, use pigs and use trained dogs. Pigs have been used in truffle hunting thanks to their good olfactory ability. There are risks such as the possibility of nose injuries or truffles while pigs are trying to get rid of truffles. In addition to this, the pigs quickly tired and difficult to transport. In some areas pigs continue to be used, but in some areas this activity has been abandoned with the start of use of the dogs. With the spread of truffle hunting made with dogs, the search for Hypogeous mushrooms has gained momentum in recent years. With this effect, not only was there a few new species to be found, but basically the tuff frequency changed. Several species of hypogeous fungi preferred by dogs include rare species such as *Octaviania asterosperma* and *Stephensia bombycina*. It is important to use trained dogs in truffle hunting. For example, a Périgord Truffle can be found on the bare ground, but a trained dog is a must for the commercially important White Piedmont Truffle. The aroma of white truffle is extremely powerful and attractive. It is stated that white truffle smell can only be described as unique and exotic. The use of dogs in truffle hunting has led to the production of large amounts of data, while dogs have found that only species that are predominantly odorous are found. When commercial collecting became widespread, the collectors concentrated on certain areas. Dog owners often give up non-commercial species. As a result, the data obtained by using dogs in truffle hunting are evaluated for species of commercial value.

EVALUATION OF CHICKPEAS AS SOURCE OF ANTIOXIDANT COMPOUNDS GROWN IN DIFFERENT LOCATIONS AND CROP YEARS

FATMA GIZEM AKÇAKAYA¹, LEVENT YURDAER AYDEMİR¹

ABSTRACT

In this study, the potential of water soluble chickpea extracts was evaluated to be used as functional food ingredients. 12 different registered chickpea cultivars were used in this study which were grown in Adana (in 2014 and 2015) and Erzurum (in 2015). The cultivars were grouped as Adana 2014 (A2014), Adana 2015 (A2015) and Erzurum 2015 (E2015). The water-soluble chickpea extracts mostly comprised of phenolic compounds, proteins and minorly carbohydrates. Total phenolic contents (TPC), free radical scavenging activities (FRSA) based on inhibition of ABTS and DPPH radicals, iron chelating capacities (ICC) and water soluble protein contents (WSPC) of extracts were determined. TPC of chickpea cultivars was determined by Folin-Ciocalteu method and varied from 1486 ± 37 to 2243 ± 66 μg gallic acid/g chickpea. The cultivars had good antioxidant potential based of FRSA changing from 13.92 ± 0.89 to 24.15 ± 1.01 μmol Trolox/gr chickpea by the inhibition of ABTS radical however they did not show any antioxidant activities based on inhibition of DPPH radical. The metal chelating capacity of cultivars were quite low from 2.51 ± 1.05 to 18.54 ± 0.20 μmol EDTA/g chickpea. The WSPC of cultivars were between 45.84 ± 2.63 and 78.05 ± 2.12 mg/g chickpea. Analysis of variances (ANOVA) and principal component analysis (PCA) were applied to obtained data to see the differences between the cultivars and the effects of crop year and different locations on these properties. However, the cultivars had different antioxidant activities and phenolic contents, PCA did not discriminate the cultivars based on crop year and location indicating that the mild or cold climate conditions did not have significant effect on these properties. On the other hand, the cultivars in the same group had significantly differences varying in wide range in TPC, FRSC, ICC and WSPC values. According to PCA, in A2015 Aksu cultivar (first component was 33.9% and second component was 28.8%) and in E2015 Hasanbey and İzmir cultivars (first component was 49.8% and second component was 26.7%) were discriminated from other cultivars whereas in A2014 any discrimination was determined on group basis. On cultivar basis, only Aksu and İzmir cultivars were effected significantly from varying location and year (first components were 81.4 and 77.8%; second components were 14.1 and 14.5%, respectively). This study revealed that the chickpea cultivars had potential to be used as antioxidant ingredient source in functional foods and their activities mostly were not significantly affected from different growth locations and crop years. Further chromatographic studies are needed to better evaluate the differences in phenolic compounds of different chickpea cultivars. By this way, the breeding plans could be organized not only productivity basis but also bioactivity basis to produce value added products from chickpeas. This study was supported by Adana Science and Technology University Scientific Research Coordination Unit. Project Number MÜHDBF.GIDA.2015-14.

SOME MEDICAL PLANTS SPREAD AROUND TOKAT AND ITS SURROUNDINGS AND THEIR ETHNOBOTANICAL PROPERTIES

SİBEL ULÇAY¹, GÜLCAN ŞENEL¹

ABSTRACT

Tokat has a rich vegetation cover due to its climate and geographical features. It is also among the 12 well-known ethnobotanical places in the Turkish Ethnobotanical Data Base. It also draws attention in terms of medical plant density. Experiences and treatment methods of the community are a good source of science. Information on how the various features of plants are used as medicinal and food have been passed down from generation to generation. However, with the advancement of technology, the use of new techniques in drug production, increased knowledge of pharmacy, the ready use of drugs from pharmacies, and the lack of information flow between the young and the elderly generations have led to the problem of the loss of ethnobotanical knowledge. For this reason, some medicinal plant species belonging to different family, forming the research position, were collected during flowering periods from Tokat and its surroundings and stored as a herbarium specimen. It is also aimed to identify and record some ethnobotanical features of the species and to investigate how these medical species are used among the population. The species we identify belong to families such as Caryophyllaceae, Papaveraceae, Apiaceae, Polygonaceae, Geraniaceae, Asteraceae Plantaginaceae.

ANTIOXIDANT IMPACTS OF AROMATIC PLANTS ON THE SEAFOOD AND SEAFOOD PRODUCTS

FATİH ÖZOGUL¹, FETHİYE TAKADAS¹, YESİM ÖZOGUL¹

ABSTRACT

In recent years, the consumers have been demanding fresh, natural and minimally processed food along with safety and quality concern. To prevent and delay the quality changes in seafood, numerous different synthetic antioxidants have been used for minimising the oxidation. Currently synthetic antioxidants used have been suspected to cause or promote negative health effects. The antioxidant properties of aromatic plants are related to their phenolic content since their antioxidant action is similar to that of syntetic phenolic antioxidation. Thus, medicinal and aromatic plants have been used as natural antioxidants for long years. It is considered that the antioxidant activity of phenolic compounds is due to their high redox potentials, which allow them to act as reducing agents, hydrogen donors and singlet oxygen quenchers. Crude extracts of plant materials is rich in phenolics componunts that are increasingly of interest in the food industry since they retard oxidative degradation of lipids and thereby improve the quality and nutritional value of seafood. Some of the plants as thyme, rosemary, laurel, sage tea, and lavender which contain bioactive constituents in essential oils and plant pomace. High antioxidant activity of several essential oils compared with commercial antioxidants, which are found in *Rosmarinus officinalis*, *Salvia fruticosa* and *Foeniculum dulce* that are showed the highest inhibitory activity of lipid oxidation. Also, thyme and oregano have two major constituents that are carvacrol and thymol have highest total phenol content and comprise the main antioxidant capacity. In addition to these, Cinnamon has a good antioxidant potential, which is rich in cinnamaldehyde as well as β -caryophyllene, linalool, and other phenolic compounds. Consequently, the effects of some natural compounds as antioxidants obtained from aromatic plant on the seafood and seafood products have been reviewed.

PHYSICOCHEMICAL PROPERTIES OF LICORICE (GLYCYRRHIZA GLABRA L) ROOT EXTRACT (MEYAN ŞERBETİ)

DEMET EKTİREN¹, SELİN ALİHANOĞLU¹, HASAN VARDİN¹, MEHMET KARAASLAN¹

ABSTRACT

The liquorice (*Glycyrrhiza glabra* L) is a perennial plant of Leguminosae family is native to the Mediterranean and certain areas of Asia. This plant has a cylindrical, thick and multi-branched root structure that reaches 1-2 meter in length under the soil. Its roots possess some nutritive value and medicinal properties. In recent years, phytochemical investigations on licorice have demonstrated that *Glycyrrhiza glabra* root contains that saponin triterpenes (glycyrrhizin, glycyrrhetic acid and liquiritic acid), flavonoids (liquiritin, isoflavonoids and formononetin) and other constituents such as coumarins, sugars, amino acids, tannins, starch, choline, phytosterols and bitter principles. Biological studies have revealed that licorice chemical constituents have a variety of biological effects, such as anti-inflammatory, antihepatotoxic, anti-ulcer, anti-oxidant, anti-microbial, cytoprotective, and cytotoxic activities. Extracted licorice, containing glycyrrhizin (a mixture of metallic salts of the oleanane-type triterpenoid diglucuronide, glycyrrhizic acid), has been used as an additive for flavoring and sweetening tobacco, beverages, candies, chewing gum and toothpaste. Licorice extract also used in pharmaceutical industry, coating materials and edible films. In addition to these consumption areas, Licorice root extract is consumed as a traditional, non alcoholic beverage called as Şerbet in Turkey. This beverage is very common and popular in South-Eastern of Turkey. In this study; Licorice roots (obtained from Şanlıurfa Region) were extracted with water in room temperature and its physicochemical properties were determined. According to our analysis results total phenolic contents (with Folin-Ciocalteu method) and antioxidant capacities (with DPPH radical scavenging activity method) of were determined as 683.397 mg GAE/kg and 26.52% respectively. pH of liquorice extract was examined 9.2. Brix of licorice root extract was determined 9.1 and L*, a*, b* color values were evaluated 19.33, 2.78, 2,75 respectively. In addition no anthocyanin was determined in the Licorice extract samples.

FRESH AND DRIED PHYSICO-CHEMICAL PROPERTIES OF KEME (TERFEZIA BOUDIERI) WHICH HAS THERAPEUTIC COMPOUNDS

DEMET EKTİREN¹, SELİN ALİHANOĞLU¹, MEHMET KARAASLAN¹, HASAN VARDİN¹

ABSTRACT

Mushrooms are valuable healthy foods, low in calories, fats and rich in vegetable proteins, vitamins and minerals. Wild mushrooms are more preferable than cultivated mushrooms due to their nutritional, pharmacological and organoleptic characteristics. Truffles as wild mushroom are edible hypogeous fruit bodies produced by various genera of fungi belonging to the class Ascomycetes. The truffles usually appear in the deserts following the rainy season between February and April. They are grown naturally in large quantities in virgin lands in the Middle East and North Africa (Egypt, Algeria, Tunisia and Morocco), Southern Europe (France, Spain, Greece and Italy) and other Mediterranean bordering countries (Libya, Syria, Tunisia) as well as in Iran, Iraq, Kuwait and Turkey during the autumn rain and thunderstorms. Truffles are rich sources of protein, amino acids, fatty acids, minerals and carbohydrates. In addition to their nutritional importance, aroma and flavor; truffles represented as therapeutic compounds with anti-inflammatory, antioxidant, antimicrobial, immune-suppressor, anti-mutagenic and anti-carcinogenic characteristics. Keme is a kind of truffle grow wild in the southeast part of Turkey with specific taste. It is a valuable and preferable food product in this region. Keme can be preserved as pickled, canned, frozen and dried as well as freshly consumed during the season but most preferable consumption is dried form. In this study Keme (obtained from Şanlıurfa region) was dried with two different drying methods (cabinet and frieze drying) after pre-treated 2% ascorbic acid solution. Moisture contents, protein %, ash contents, water and rehydration activities, color values of dried samples were determined thus effect drying methods on product quality were examined. According to our results L*, a*, b* values of fresh samples 60.81±1.8; 11.72±0.3; 22.56±0.6 cabinet dried samples 58.15±1.87; 6.01±0.1; 28.69±0.5 and frieze dried samples 53.44±1.6; 7.03±0.2; 26.53±0.7 were determined respectively. Maximum rehydration capacity was observed in frieze dried samples (4.06±0.04). There was a significant decrease (p<0.05) in protein% values after drying and significant different (p<0.05) between protein values of frieze dried (11.16±0.3) and cabinet dried samples (8.2±0.2). This study is reveal that drying methods effect the physico- chemical properties and quality of KEME and frieze dried samples were exhibit better sample quality than cabinet dried samples.

IN VITRO ANTILEISHMANIAL EFFECTS OF SESQUITERPENE LACTONES FROM CHRYSOPHTHALMUM MONTANUM (DC.) BOISS.

FATMA AYAZ¹, NURGÜN KÜÇÜKBOYACI¹, NEZHUN GÖREN², İHSAN ÇALIŞ³, HAYRİ DUMAN⁴, MUHAMMAD IQBAL CHOUDHARY⁵

ABSTRACT

Introduction The genus *Chrysophthalmum* Schultz Bip. (Asteraceae- Inulaeae) has three species growing in Turkey. Among them, *C. montanum* (DC.) Boiss., a perennial herb, is mainly distributed in eastern parts of Turkey and is locally named as " tutça" or "nezle otu". In Turkish folk medicine, the aerial parts of *C. montanum* have been used for the treatment of common cold and sinusitis as well as healing wounds on the body of human and animal. In our previous research, we found that the chloroform extract obtained from the aerial parts of *C. montanum* was the most active in the tested extracts of the plant on antileishmanial activity with an IC₅₀ value of 15.61±0.2 µg/ml. As the current stage of our extensive study on isolation of antileishmanial constituents from chloroform extract of *C. montanum*, we have now aimed to evaluate four guaiane type sesquiterpene lactones against promastigotes of *Leishmania donovani* by in vitro assay. **Material and Methods** Leishmanicidal activities of four guaianolides, isolated from aerial parts of *C. montanum*, 6α-acetoxy-isoinuviscolid (1), 6α-acetoxy-4α-hydroxy-9β.10β-epoxy-1βH-guaia-11(13)-en-12.8α-olide (2), 6α-hydroxy-isoinuviscolid (3), and 4α,10β-dihydroxy-5α(H)-1,11(13)-gaidien-8β,12-olide (4) were tested against promastigotes of *Leishmania donovani* in vitro. **Results** According to our results, all compounds were found to be active, except for compound 4. Compounds 1 and 2 exhibited potent antileishmanial activity with IC₅₀ values of 3.12±0.37 and 4.5±0.60 µg/ml, respectively, in comparison with standard drugs pentamidine (IC₅₀=0.37±0.60 µg/ml) and amphotericine B (IC₅₀=0.49±0.90 µg/ml). Moreover, compound 3 exhibited significant leishmanicidal activity with an IC₅₀ value of 21.6±0.53 µg/ml. **Conclusion** As a conclusion, this report represented the first study on the investigation of antileishmanial activities of guaianolides from *C. montanum*. Our data showed that *C. montanum* can be attributed for discovery of novel antileishmanial drug candidates. **Acknowledgement** This study was supported by TUBİTAK-2214/A, TUBİTAK-2211/A and ICCBS-HEJ.

PHYTOTOXIC, CYTOTOXIC AND INSECTICIDAL ACTIVITIES OF CHRYSOPHTHALMUM MONTANUM (DC.) BOISS.

FATMA AYAZ¹, NURGÜN KÜÇÜKBOYACI¹, HAYRİ DUMAN², BİLGE ŞENER¹, MUHAMMAD IQBAL CHOUDHARY³

ABSTRACT

Introduction *Chrysophthalmum* Schultz Bip., a member of the family Asteraceae, is represented by three species in Flora of Turkey and the East Aegean Islands. *Chrysophthalmum montanum* (DC.) Boiss. is a herbaceous perennial plant mainly distributed in eastern parts of Turkey. Asteraceae family is well-known as a good source of sesquiterpene lactones, which are associated with antitumor, cytotoxic, antimicrobial, antiinflammatory and phytotoxic activities. In our ongoing research on *C. montanum*, we revealed that *C. montanum* had cytotoxicity against some cancer cell lines by MTT assay. In this presentation, it was proposed to investigate in vitro phytotoxic, cytotoxic and insecticidal potential of the extracts of *C. montanum*. **Material and Methods** The crude extract (80% methanol) of the aerial parts of *C. montanum* were subsequently fractionated to obtain n-hexane, chloroform, n-butanol and remaining water fractions. The extract and fractions were evaluated for their biological activities using in vitro screening bioassays such as cytotoxicity on brine shrimp lethality, phytotoxicity against *Lemna minor* and insecticidal activity against *Rhizopertha dominica* and *Tribolium castaneum*. **Results** The extract and fractions, except for remaining water fraction, showed phytotoxic activity which was expressed as % growth regulation in a concentration dependent manner. Particularly, the n-hexane and chloroform fractions had 100 % of growth inhibition (GI) at 1000 µg/ml against *Lemna minor*, followed by the butanol fraction (62.6 % GI) and the crude extract (40 % GI) of the plant at the same concentration. The cytotoxicity assay revealed that crude extract, n-hexane and chloroform fractions of the plant have positive lethality with LD50 values of 71.51, 126.62 and 75.95 µg/ml against the brine shrimp, respectively. Otherwise, all samples had no insecticidal activity against *Rhizopertha dominica* and *Tribolium castaneum*. **Conclusion** In summary, our findings demonstrate that n-hexane and chloroform fractions of *C. montanum* possess significant phytotoxicity against *Lemna minor* and cytotoxicity on brine shrimps for the first time, which deserve further investigation in order to reveal the compound(s) responsible having these biological activities. **Acknowledgement** This study was supported by TUBİTAK-2214/A, TUBİTAK-2211/A and ICCBS-HEJ.

INVESTIGATION OF EFFECT ON WOUND HEALING OF VARIOUS PLANT EXTRACTS IN THE CELL CULTURE

EMINE TORAMAN¹, ATENA GHOSI GHAREHAGHAJI¹, EKREM SULUKAN¹, ORHAN ERDOĞAN¹

ABSTRACT

Objective: The wound is deterioration of tissue integrity the result of cuts, burns or illnesses. It can be surgical or traumatic. Wound healing is one of the most important subjects in surgery. The process of wound healing is affected by nutritional factors, circulation, oxygen supply, infection and hormones. Wounds are classified as to their appearance and type of healing and treatment is directed according to these properties. There are conditions for wound healing. First of all, there should be no problem in the blood circulation of that region. Otherwise, the oxygen, wound healing cells and building materials needed to heal the wound do not go to the wounded area and there is no healing. There are various medical treatment methods for wound healing. But alternative treatment methods are being investigated. In our study, the effect of improving the endothelial damage of vegetable oil and extracts was investigated. Materials and Methods: HUVEC (umbilical vein / vascular endothelium) cells were seeded in a 96 well plate. Cells were allowed to grow. In order to see the recovery process scratches were removed with a pipettor to damage the cells. The plant tissue to be used in this study was extracted and vegetable oil was obtained. Plant extracts (0.005 mg / ml, 0.01 mg / ml, 0.015 mg / ml and 0.02 mg / ml) were dissolved in the medium and at different doses as 2.5 µl, 5 µl and 6.5 µl of oil on cell cultures were applied. The MTT test was performed at 24, 48 and 72 hour intervals to observe how the affected the cytotoxic effect and cell viability of substances. Results: In this study, plant extracts and plant oil were applied to the damaged cells at appropriate doses according to the MTT result. As a control, some damage was not generated. Cells treated at different doses were incubated for a certain period of time. At the end of the incubation, the cells were examined under an inverted microscope. The diameter of the damage was measured in the damaged cells and the role of the substance applied in the treatment was evaluated. Conclusion: At the end of the study, studies under the microscope showed that increasing doses of plant extract and a certain dose of oil improved the damage generated in HUVEC cells relative to the control and significantly reduced the diameter of the damage caused. Keywords: Plant extract, cell culture, cytotoxicity, wound healing.

INVESTIGATION OF EFFECT ON BCL2 GENES EXPRESSION AND CYTOTOXIC EFFECT OF BERBERIS VULGARIS PLANT ON CELL CULTURE

ATENA GHOSI GHAREHAGHAJI¹, EMINE TORAMAN¹, EKREM SULUKAN¹, ORHAN ERDOĞAN¹

ABSTRACT

Objective: Cancer is a term used to describe the uncontrolled growth and abnormal spread of cells. It is made for the treatment of cancer with chemotherapy and radiotherapy made by using cancer drugs that destroy cancer cells, to inhibit the growth and proliferation. But this treatment is particularly damaging to cells. Hence alternative treatment methods are currently under development today. In our study, it is aimed to investigate the cytotoxic effect of different doses of *Berberis vulgaris* plant and its effect on Bcl2 gene expression in cell culture. Materials and Methods: Extraction was performed from plant tissue to be used in this study. Plant extract (0.005 mg/ ml, 0.01 mg / ml, 0.015 mg / ml and 0.02 mg / ml) at different doses was dissolved in a medium and applied to the cell cultures. Article of the MTT assay was performed to observe the cytotoxic effect and how to impact of cell viability at intervals of 24,48,72 hours. Cells were plated on a 6 well plate in place a certain amount. RNA isolation was performed after administration of plant extract. Real Time PCR was performed to observe the changes in BCL2 gene expression by performing cDNA synthesis. Results: Plant extract under study were administered in different doses and times on cancer cells. Showed increased of toxic effects on the cells both hours and increasing doses of plant extract at the of the study. The highest dose used in the experiment, 72 h, that was found killed of plant extracts that nearly 50% of cancer cells. Observed of increasing doses of the plant extract to decrease the BCL-2 gene expression , according to Real- Time PCR results. Conclusion: It was determined that the plant extract used in the study resulted in significant apoptosis of the cancer cells. PHENOLIC AMOUNTS AND ANTIOXIDANT ACTIVITY OF AVOCADO AND AVOCADO OIL

MERVE NUR UYAR¹, CEMAL KASNAK¹, RECEP PALAMUTOĞLU¹

ABSTRACT

Avocado (*Persea americana*) is a tree belonging to the bay family of Central Mexico and the name of the fruit of this tree. It is grown in the Mediterranean region of Turkey in the belt from Antalya to Iskenderun, as well as in the Eastern Black Sea Region where the frost like Rize is low. Avocado fruit is a very good source of antioxidant vitamins such as C and E vitamins. In addition it is a very good potassium source. Avocado also contains carotenoids and phytosterols such as lutein and zeaxanthin. Avocado is an oily fruit like olives. Most of the oil forms oleic acid, similar to olive oil. Antioxidative properties are present due to the dissolution of vitamin E and various carotenoids in the oil. Consumption of avocado in Turkey has not increased enough yet. New research on this nutritive fruit needs to be done to increase awareness. In this study, it was aimed to reveal the amount of phytochemicals and antioxidative capacity of avocado fruit and avocado oil. The results of the analyzes made on the avocado pulp are as follows: the amount of phenolic compound is 619,76 mg catechin equivalent / kg, the flavonoid amount is 240,45 mg catechin equivalent / kg, the dry matter content is 31.91 %, pH 6.85, color L is 51.20, a is -11.99, b is 31.63, acidity 0.2 g / 100 ml (in citric acid), DPPH 59,7 µg trolox equivalent / g and FRAP 5.375 mg / g. The results of analyzes made on avocado oil are as follows: the amount of phenolic compound is 202,65 mg catechin equivalent / kg, the flavonoid amount is 197,11 mg catechin equivalent / kg and DPPH 49,62 µg trolox equivalent / g.

POTENTIAL EFFECTS OF MYCELLIUM EXTRACT FROM PLEUROTUS OSTREATUS ON HUMAN PERIPHERAL BLOOD LYMPHOCYTES

KUBRA KOC¹, SALIM CERIG¹, FATIME GEYIKOGLU¹, MURAT OZDAL¹, OMER FARUK ALGUR¹

ABSTRACT

Mushrooms produce a considerable amount of antioxidants such as vitamin C, Vitamin E, and pigments as well as phenolic compounds. Oyster mushroom *Pleurotus ostreatus*, common edible mushroom, can growth rapidly on a wide variety of organic wastes. The mushroom biomass as a source of medicinal compounds and fungal protein can be produced from mycelium in submerged liquid culture. The aim of this study was to investigate cytotoxic and genotoxic effects of wide range of concentrations (0 - 1000 µg/mL) hot-water extract from mycelia of the *P. ostreatus* on human peripheral blood lymphocytes (hPBLs). With this aim, cytotoxicity was determined by neutral red (NR) and lactate dehydrogenase (LDH) leakage assay. Genotoxicity was also characterized by micronuclei (MN) and chromosome aberrations assay (CAs) for specify DNA damage. Low doses of *P. ostreatus* (0 - 100 µg/mL) didn't cause significant alterations to cytotoxicity on hPBLs. At the same time, 0-250 µg/mL doses of *P. ostreatus* didn't cause increase as genotoxic at CAs and MN rates. However, 500 and 1000 µg/mL doses of mushroom statistically increased NR and LDH release, CA/cell frequency and MN formation on hPBLs. In conclusion, the present study provides evidence on the lack of cyto-genotoxicity of hot water extract from mycelia *P. ostreatus* under our in vitro conditions. *P. ostreatus*, if used at higher concentrations (500 and 1000 µg/mL) have cytotoxic effects, genotoxic effects and cell damage as due to increased oxidative stress. Hence, the overconsumption of this traditional edible mushroom should be considered. Otherwise, it may cause serious toxic side effects in terms of human health.

NATURAL GROWING SOME MEDICINAL AND AROMATIC PLANTS BENEFITS AMONG PEOPLE: MERSİN ÇAMLIYAYLA EXAMPLE

OKAN YELER¹

ABSTRACT

The use of medicinal plants as medicine is as old as human history. The first person to see a plant suicide, and see that this practice has a positive effect, has also started medical practice among the people. The first people knew that plants had healing power; For example, plants were trying to understand whether they were healing or poisonous from taste and smell by chewing different organs and parts such as flowers, fruits, seeds, stalks, leaves, roots and bark. The most important source of natural medicines used in traditional treatment methods is plants. In the 18th century, approximately 8,000 plant species were systematically classified by Carolus Linnaeus (1707-1778), which made the task of not only natural scientists, but also pharmaceutical chemists, much easier. The medical value has been recognized as a strong possibility that bioactive substances carried by a well-known plant strain are also found in other related plant species with this species, and the plant variety that can be used as a herbal medicine has increased rapidly. In this study, the usefulness of some medicinal aromatic plants in natural species in Mersin's Çamlıyayla district, which is one of the most popular places with its natural beauty and unique landscape, has been briefly explained. As a result of the interviews with the people of the region, it has been emphasized especially the benefits of a few outstanding orange health. It has been emphasized that awareness of these species should be created more effectively in marketing, production fields should be defined and contributed to the regional economy as well as to contribute to human health.

**ACTIVATOR EFFECT OF 2B-HIDROKSI-ENT-13-EPI-MANOIL
OKSİT, ISOLATED FROM SIDERITIS PERFOLIATA, ON CARBONIC
ANHYDRASE ISOENZYMES, CA-I AND CA-II**

HÜSEYİN AKŞİT¹, İBRAHİM DEMİRTAŞ², ŞEVKİ ADEM², ÇAĞLAR GÜLER²

ABSTRACT

2-β-hydroxy-ent-13-epi-manoyl oxide is a labdan-type diterpen and precursor of forskolin which is well documented variable biological activities including antiproliferative, antihypertensive, antihypercholesteromia, antidiabetic. The title compound was isolated from *Sideritis perfoliata* as colorless needless crystals using sephadex LH-20 and silica gel column chromatography from ethyl acetate extract of floral parts of the plant material. The structure of compound identified using X-Ray, NMR and MS spectra. The quantitative amount of compound were found 45-122 mg/kg in different part of plant material according GC-MS analysis. CAI and CAII enzyme activities of the compound were assayed by spectrophotometric method. Carbonic anhydrase holds an important place in the realization of biological and physiological activities such as ion transport, acid base balance, bone absorption, respiratory, gluconeogenesis and urogenesis. It has been reported that activators of carbonic anhydrases may be used a novel approach to treating disorders such as Alzheimer's disease and aging[1]. We investigated effects of 2-β-hydroxy-ent-13-epi-manoyl oxide on CA I and CA II enzymes activities. Human erythrocytes CA I and CA II were activated by this compound with AC50 values 9 and 19 μM. USING MEDICINAL AND AROMATIC PLANTSİ IN ANIMAL HEALTH

MEHMET KÜRŞAT IŞIK¹, SABIHA ÜNAL ÜNAL², NİHAYET FADİME YALÇIN³

ABSTRACT

Animal health, which is an important part of public health, is influenced by consumed food, water, applied drugs and environmental factors. In animal health conventional (traditional) treatment is widely used. Residual risk is increasing in animal products in long-term and incorrect treatments. This causes residue and contamination in our food. It is also known that consumption of residual foods is a threat to human health. For this reason, the use of homeopathic and phytotherapeutic products in cultivation is more suitable for human and animal health. These products are licensed by the Ministry of Food, Agriculture and Livestock. As of February 2017, 17 homeopathic products have been licensed by the ministry and can be used with prescription. Phytotherapeutic products are not subject to prescription, and as of February 2017, 11 were licensed by the ministry. The aim of this study is to introduce licensed homeopathic and phytotherapeutic drugs and contribute to the widespread use of them in animal health. In this way it will be possible to protect animal health with less risky products and to reduce possible risk factors in our food.

PLANTS AS FEED SUPPLEMENTS TO BE USED FOR IMPROVED REPRODUCTIVE PERFORMANCE OF CULTURED FISH SPECIES

BURAK EVREN İNANAN¹, ÜMIT ACAR²

ABSTRACT

Different medical and agricultural plant species have been used as feed supplement in animal husbandry and aquaculture as well. When considering adding them to feed, two main reasons have come to the forefront; preventing disease outbreaks in population and improving reproduction ability including gamete quantity and quality of broodstock. This study aimed to review the plant species which have been used for enhancement of reproduction in fish. Feeding of diet containing Aloe vera, Phaseolus vulgaris, Arachis hypogaea, Helianthus annuus, Sesamum indicum, Croton zambesicus, Telfairia occidentalis, Withania somnifera, Moringa oleifera, Kigelia Africana, Lepidium meyenii, Vernonia amygdalina and Glycine max has been shown to positively affect reproduction systems of both male and female fish. Fish species commonly used in the experiments are especially cultured fish species such as Clarias gariepinus, Etroplus suratensis, Oreochromis niloticus, Oncorhynchus mykiss. Reproductive parameters in fish which positively affected by these plants are listed as embryo survival, weight of testes and ovaries, gonadosomatic index, histological examination of gonad development, fertilization, hatchability, fecundity, egg diameter, egg survival, sperm motility percentage, motility duration, sperm motility characteristics sperm density, milt volume, spermatocrit, seminal fluid pH. Moreover, some plants species like Butea superb and Mucuna pruriens have being used to obtain mono-sex culture of male fish, because of containing phytoandrogens producing substances with similar effects as testosterone. On the other hand, some plants species such as Hibiscus rosa-sinensis, Mormodica charantia, Teliostachya alopecuroidea, Azadirachta indica and Mangifera indica have potential inhibit on reproduction when given more than defined doses. These plants could be useful for prolific breeding species, like O. niloticus, resulting in large numbers of progeny to control limitation of space and food in culture conditions. Consequently, this review reveals and lists the plants and the reproductive parameters affected by them to encourage using other plants and to extend their applications in aquaculture practices.

UTILIZATION OF CARROT PRODUCTS TO IMPROVE FUNCTIONAL PROPERTIES OF FOOD PRODUCTS

HILAL ARSLAN BAYRAKCI¹

ABSTRACT

Carrot (*Daucus carota* L.) is one of the most common root vegetables in the world agriculture. *Daucus*, which includes sixty species of very few cultures, varies from white to yellow, orange, light purple, deep red or violet [1]. According to 2016 data, total carrot production in Turkey is 554 thousand 736 tons. Konya is in the first place in carrot production (336.463 tons of the total production of carrots) in Turkey [2]. Carrots are considered as a basic food ingredient because they are a rich β -carotene source, calcium, phosphorus, iron and magnesium as a source of mineral. Moisture content ranges from 86-89% [3,4]. The total carotenoid content in the edible parts of carrot varies between 6000 and 54800 $\mu\text{g}/100\text{g}$ [5]. Yellow and orange carrots contain more carotenoids [6,7]. Dominant carotenoids in orange carrots are β -carotene (45-80%), α -carotene (15-40%) and gamma carotene (2-10%) [8]. While the content of anthocyanin reaches up to 1750 mg / kg in black carrots [9]. The main anthocyanins have been identified as cyanidin 3-(2-xylosyl-galactoside), cyanidin 3-xylosylglucosylgalactoside and cyanidin 3-ferulylxyloglucosyl galactoside [10]. Thiamine, riboflavin, niacin, folic acid and vitamin C are also present in appreciable amounts in carrot roots [11]. Carrots are high in dietary fibers [12]. The composition of carrot dietary fiber compounds on dry weight basis have been reported as pectin (7.41%), hemi-cellulose (9.14%), cellulose (80.94%) and lignin (2.48%) by Nawirska and Kwasniewska [13]. Because of the rich chemical and functional components and acceptable flavors of carrots and their products (such as carrot powder/flour, carrot pomace powder, carrot leaf) there are many researches on their usage as food components in various products (pasta, cookie, noodle, spaghetti, cake, biscuit, fried dough, snack food etc.). In studies using carrot products, significant increases in the amount of functional compounds such as fiber, β -carotene, anthocyanin, and phenolic components were observed. At the same time, the sensory and physical properties of the products were also improved positively. This situation gives hope in terms of expanding the scope of carrot evaluation. CHEMICAL COMPOSITION AND ANTIOXIDANT ACTIVITY OF ÇAKŞIR (FERULA ELAEOCHYTRIS): AN IMPORTANT MEDICINAL PLANT

EBRU DEVECİ¹, GÜLSEN TEL ÇAYAN², MEHMET EMİN DURU¹

ABSTRACT

The genus *Ferula*, belonging to the family of Apiaceae, consists of 170 species which spreads from Central Asia to Mediterranean region. In Turkey, the *Ferula* genus is one of the most important genera and represented by 25 taxa. *Ferula* species are known as ‘Çakşır’, ‘Çakşır otu’ or ‘Çaşır’ in Turkey [1]. While the aerial parts of *Ferula* species are used as animal feed in winter months, the root parts are used as aphrodisiac in Eastern Turkey. *Ferula* genus was reported as a rich source of gum-resin. Therefore this genus is used in the treatment of many diseases such as digestive disorders, rheumatism, headache, arthritis, toothache and diabetes in folk medicine [2]. The aim of this study was to determine chemical composition and antioxidant activity of the essential oil and the hexane, acetone, methanol and water extracts of *Ferula elaeochytris*. The chemical composition of the essential oil of *F. elaeochytris* was analysed by GC and GC-MS. Antioxidant activities were tested by five different in vitro assay systems: β -carotene-linoleic acid, DPPH free radical scavenging, ABTS cation radical scavenging, cupric-reducing antioxidant capacity (CUPRAC) and metal chelating activity. Thirty-three compounds were identified in the essential oil of *F. elaeochytris*. The major compound was β -cubebene (21.29 %) followed by caryophyllene oxide (17.50 %) and β -caryophyllene (14.96%). The methanol extract indicated the highest antioxidant activity in all tests, except in CUPRAC assay. Moreover, the methanol extract showed higher activity than α -tocopherol and BHA used as standards in β -carotene-linoleic acid assay. References [1] A. Sahebkar, M. Iranshahi. 2010. SCREENING OF VOLATILE CONSTITUENTS AND ANTIOXIDANT ACTIVITY OF *SIDERITIS PISIDICA*

GÜLSEN TEL ÇAYAN¹, EBRU DEVECİ², MEHMET EMİN DURU²

ABSTRACT

Sideritis pisidica Boiss. & Heldr., a member of the Lamiaceae family, is an endemic species and grows in tropical and mild regions of the Northern Hemisphere. This genus represented by 46 species and 53 taxa in Turkey out of which 39 taxa being endemic [1]. *Sideritis* species are consumed as tea, flavouring agents and for medicinal purposes in various regions. Also, they have been used as antioxidant, antimicrobial, anti-inflammatory, anti-ulcer, anticonvulsant, antispasmodic, vulnerary, cytostatic, astringent, flu vaccine, stimulant circulatory, carminative and analgesic agents in folk medicine [2]. The objective of this study was to determine essential oil composition, anticholinesterase and anti-ulcer activities of the essential oil and the hexane, acetone, and methanol extracts of *S. pisidica* collected from Muđla. Essential oil was obtained using a Clevenger apparatus and analysed by GC and GC-MS. In addition to, antioxidant activity of extracts and essential oil were tested by five different assay systems namely; β -carotene-linoleic acid, DPPH free radical scavenging, ABTS radical scavenging, cupric-reducing antioxidant capacity (CUPRAC) and metal chelating activity. Thirty-four compounds, representing about 99.9 % of the essential oil of *S. pisidica* were identified. The major compound was δ -cadinene (19.5 %), followed by tau-cadinol (16.7 %) and β -cubebene (10.4 %). Among all extract and essential oil, the methanol extract indicated the highest antioxidant activity in all tests, except in metal chelating assay. The hexane extract (IC₅₀: 22.97 \pm 1.36 μ g/mL) was found to be significantly active in metal chelating assay and followed by the acetone extract (IC₅₀: 57.98 \pm 0.70 μ g/mL). DETERMINATION OF PROBIOTIC FOOD CONSUMPTION HABITS OF UNIVERSITY STUDENTS – THE EXAMPLE OF SELÇUK UNIVERSITY

DİDEM ÖNAY DERİN¹, NURAN ERDEM²

ABSTRACT

This research, a case detection, planned to determination of probiotic food consumption habits of university students. Research universe was composed of 400 students who attend department of Food Engineering Faculty of Agriculture Selçuk University. Random sampling was applied in determining the students and 208 volunteer students participated in the study (Participation rate 52.0%). Research date collected by the help of a questionnaire form written by researcher between May and October 2016. Questionnaire form is composed of various questions to determine general knowledge and probiotic food consumption habits of the students. While evaluating the date, SPSS package programme was used and necessary statistical analysis was made. According to the research results, 165 of students were women (79.3%), 43 of the students were men (20.7%), the mean age was 21.38 ± 1.91 years. 50.5% of students weren't being knowledgeable about the probiotic foods. It was determined that more than half of the students (56.3%) consumed probiotic products. The students's which consuming probiotic food consumption frequency was once a day with a rate of 35.9%. 65.0% of the students have stated that they consume probiotic foods with no meals. The students wasn't know the use of microorganisms in probiotic food products with a rate of 79.8%, they wasn't reading the packaging information when purchasing these products with a rate of 7.7%, and they were proposing probiotic food consumption to other people with a rate of 80.3%. It was determined that 75.2% of those consuming probiotic products consumed these products willingly, 65.0% found to be normal the prices of these products, 58.2% benefited from these products and 83.8% kept refrigerated to these products. Besides its therapeutic effects, and because of its productive effects, the significance of probiotic products should be emphasized and made efforts to increase of these product consumptions.

TOTAL PHENOLIC AND TOTAL FLAVONOID CONTENTS OF VARIOUS EXTRACTS OF FOUR SIDERITIS SPECIES FROM ANATOLIA

MEHMET EMİN DURU¹, EBRU DEVECİ¹, GÜLSEN TEL ÇAYAN², FATİH ÇAYAN²

ABSTRACT

Sideritis (Lamiaceae) species are represented by 46 species and 53 taxa in Turkey. 39 taxa is endemic and this genus is one of the most endemic species with 78.2 % endemism rate [1]. These species are known as "mountain tea" in the Mediterranean areas [2]. Sideritis species are described as "dađ çayı", "yayla çayı" and "ada çayı" in Anatolia and widely used in folk medicines in Mediterranean countries such as Turkey, Greece and Spain for the treatment of some diseases such as common cold, cough, gastrointestinal disorders due to their anti-rheumatic, antimicrobial, digestive and anti-inflammatory activities [3]. Phenolic compounds have antioxidant activity due to they act as reducing agent, hydrogen donors, singlet oxygen quenchers and metal chelators [4]. Flavonoids are natural phenolic compounds and well known antioxidants. In this study, total phenolic and flavonoid content of hexane, acetone and methanol extracts of Sideritis albiflora, S. leptoclada, S. pisidica and S. stricta were determined. Results were expressed as pyrocatechol and quercetin equivalents, respectively. The total phenolic contents of the extracts ranged from 1.77±0.18 to 141.05±0.11 µg PEs/mg. Acetone extracts of all studied Sideritis have the highest level of the phenolic compounds among the other extracts. The total flavonoid contents of the extracts ranged from 0.62±32 to 93.85±0.04 µg QEs/mg. The acetone extracts of Sideritis extracts except for S. pisidica exhibited highest flavonoid contents as compared to other extracts. Generally, acetone extracts were found to be richest in phenolic and flavonoid compounds for all studied Sideritis species References [1] A. Güner, N. Ozhatay, T. Ekim, K.H.C. 2001. GC AND GC/MS ANALYSIS OF FATTY ACIDS OF SOME ENDEMIC SIDERITIS AND FERULA SPECIES

MEHMET EMİN DURU¹, EBRU DEVECİ¹, FATİH ÇAYAN², GÜLSEN TEL ÇAYAN²

ABSTRACT

Palmitic, stearic, oleic, linolenic and linoleic acids are the most abundant fatty acids in plants. Linoleic acid and linolenic acid belong to $\omega 6$ and $\omega 3$ family, respectively; are essential for normal growth, health promotion, and disease resistance in human metabolism. These fatty acids have an important role in the prevention of cardiovascular diseases, being antithrombotic, anti-inflammatory, antiarrhythmic and favoring plaque stabilization [1,2]. Oleic acid reduces LDL-cholesterol levels and shows the protective effect against chronic diseases such as cardiovascular disease, cancer or age-related cognitive decline. Therefore, investigation of the fatty acid composition in natural origin has become a topic of great interest among researchers due to the fact that fatty acids have great important in nutrition. The fatty acid composition of *Sideritis albiflora*, *Sideritis leptoclada*, *Sideritis pisidica*, *Sideritis stricta* and *Ferula elaeochytris* were analyzed by using GC and GC-MS analytical techniques. The lipid fractions of the plants were obtained by extracting plants with hexane: chloroform (8:2, v/v) solvent system and derivate to their methyl ester forms by using BF₃-methanol reagent. For the identification of the fatty acids, library search was carried out by using NIST and Wiley 2005. Supelco™ 37 components of fatty acid methyl ester were used for the comparison of the GC chromatograms. Major fatty acids were identified as palmitic acid (19.83-33.3 %), linoleic acid (13.41-23.80 %), linolenic acid (16.41-42.70 %) and oleic acid (13.44-24.18 %) in all studied species. INVESTIGATION OF RELATIONSHIP BETWEEN CHEMICAL STRESS FACTORS AND CERTAIN METABOLITES INCLUDING CARDENOLIDES IN CALLUS CULTURES OF ENDEMIC TURKISH DIGITALIS L. SPECIES

GÜNCE ŞAHİN¹, SANDEEP KUMAR VERMA², EKREM GÜREL³

ABSTRACT

The aim of the present research is to obtain relationship between different stress treatments [Cu (copper) and Hg (mercury)] and content of cardiac glycosides (digoxigenin, gitoxigenin, lanatoside C, digoxin and digitoxin) as secondary metabolites of commercial value for the pharmaceutical industry and to determine the antioxidant metabolites against stress conditions in callus cultures of endemic Turkish Digitalis species. The effects of different stress treatments on cardiotoxic glycoside accumulation in *D. lamarckii* Ivanina, *D. trojana* Ivanina, *D. davisiana* Heywood and *D. cariensis* Boiss. ex Jaub. et Spach were investigated using HPLC. HPLC analysis revealed that all stress conditions were significantly effective at 5% significance level according to their control groups. The predominant cardiac glycoside was lanatoside C (Lan C) followed by digitoxin, digoxigenin, gitoxigenin and digoxin. No digoxin was detected in all treatments as well as in control groups. For the calibration curves, concentrations of 5, 10, 20, 30 and 40 mg/l digoxigenin, gitoxigenin, lanatoside C, digoxin and digitoxin were used ($R^2= 0.99$). Cardenolides were eluted with acetonitrile (A) and water (B) gradients as follows: 0 to 20 min 20% (A), 80% (B); 20 to 23.40 min 30% (A), 70% (B); 23.40 to 30 min 25% (A), 75% (B) and 30 to 40 min 40% (A), 60%(B). Average peak area of the glycoside in samples was automatically calculated and monitored by ChemStation LC/MS software against that of standards. Enhanced production of cardenolides was achieved from callus cultures elicited with 50µm CuSO₄ and HgCl₂. Higher amounts of cardenolides were obtained when callus of four Digitalis species were elicited with CuSO₄. Results demonstrated that catalase (CAT, EC 1.11.1.6), superoxide dismutase (SOD, EC 1.15.1.1) activities, the total contents of phenolics and proline were markedly stimulated under stress conditions. All these results indicated that treatments have induced changes in the redox state of callus cells and suggest that this alteration change cardenolides accumulation and antioxidative status in Digitalis L. callus cultures.

ANTIMICROBIAL PROPERTIES OF SOME MEDICAL AND AROMATIC PLANTS

HALİL İLKİMEN¹, AYSEL GÜLBANDILAR², CENGİZ YENİKAYA¹

ABSTRACT

The use of components derived from plant extracts today is rapidly increasing, especially in the pharmaceutical industry. The aim of the this study is to investigate antimicrobial and antifungal effects of extracts obtained from ethyl alcohol from medicinal and aromatic plants such as lavender (*Lavandula stoechas*), island tea (*Salvia officinalis*), thyme (*Thymus vulgaris*), chamomile (*Matricaria chamomilla*). These plants were grown in the settlement for the education of students of Dumlupınar University Altıntaş Vocational School Medical and Aromatic Plants Department. Extracts from these plants will be screened for their antibacterial and antifungal activities against *Staphylococcus aureus* (ATCC 29213) (Gram positive), *Escherichia coli* (ATCC 25922), (Gram negative) and *Candida krusei* (ATCC 6258), *Candida parapsilosis*(ATCC 22019) (yeast). The results were compared with the control compounds, Vancomycin, Cefepime, Levofloxacin as antibacterial, and Flucanazole as antifungal agents.

CYTOTOXIC AND GENOTOXIC EFFECTS OF MYCOTOXIN ENNIATIN-A USING MTT CELL VIABILITY ASSAY AND SISTER CHROMATID EXCHANGE ASSAY

SEVCAN MAMUR¹, ESRA ERİKEL¹, SERKAN YILMAZ², FATMA ÜNAL¹, DENİZ YÜZBAŞIOĞLU¹

ABSTRACT

Cytotoxic and Genotoxic Effects of Mycotoxin Enniatin-A Using MTT Cell Viability Assay and Sister Chromatid Exchange Assay Sevcan Mamur*1, Esra Erikel2, Serkan Yılmaz3, Fatma Ünal2, Deniz Yüzbaşıoğlu2 (1) Life Sciences Application and Research Center, Gazi University, 06830, Ankara, Turkey (2) Department of Biology, Science Faculty, Gazi University, 06500, Ankara, Turkey (3) Faculty of Health Sciences, Ankara University, 06340, Ankara, Turkey Abstract Enniatin-A (EN-A) is a mycotoxin produced by the *Fusarium* species. It may be accumulated in stored cereals products and pose a threat to human health. This study investigated the cytotoxic effects of EN-A in HeLA (human cervix carcinoma) cell line using 3-(4,5-dimethylthiazolyl-2)-2,5 diphenyl tetrazolium bromide (MTT) assay. The potential genotoxic effect of EN-A was also evaluated in human lymphocytes by using sister chromatid exchange (SCE) assay. Cells were treated with 0.048, 0.098, 0.195, 0.39, 0.78, 1.56, 3.125, 6.25 µg/mL concentrations of EN-A. A solvent [DMSO, 0.5% (v/v) of the culture medium] and a negative control was maintained. Mitomycin-C (MMC, 0.20 µg/mL) was used as the positive control in human lymphocytes. EN-A significantly decreased cell viability (%) at 0.78, 1.56, 3.125, and 6.25 µg/mL concentrations compared to control and solvent control (except at 0.78 µg/mL) at 24 h exposure. EN-A, at 48 h treatment, also significantly reduced cell viability (%) at all concentrations (except at 0.48, 0.78, 1.56 µg/mL). The half of inhibitory concentration (IC₅₀) in exposed HeLA cells was found to be 0.78 µg/mL for 24 h and, 0.39 µg/mL for 48 h. In addition, EN-A significantly decreased mitotic index in all treatments in human lymphocytes indicating its cytotoxic effect at 1.56 µg/mL concentration and over. However, there was no significant difference between treatment and control groups in the replication index (RI) at all treatments. None of the concentrations of the EN-A did not elevated the frequency of SCEs at 24 h, however the frequency of SCEs significantly increased at only 0.39 µg/mL concentration for 48 h treatment. As a result, EN-A showed cytotoxic effect especially at higher concentrations in HeLA cell line. However, it did not affect the frequency of SCEs in human lymphocytes in vitro except for certain concentrations and long-term treatment. To be able to evaluate the potential genotoxic effect of EN-A, other genotoxicity tests as chromosomal aberration, micronuclei and comet assay should be conducted. Acknowledgment: This study was financially supported by TUBITAK under the project number 114Z713.

PLANT TISSUE CULTURE STUDIES IN GENUS SALVIA AND ITS IMPORTANCE

YONCA SURGUN ACAR¹, BETÜL BÜRÜN²

ABSTRACT

The genus *Salvia* (Lamiaceae) includes more than 900 species and many of them have medicinal and aromatical features. *Salvia* species are used in folk medicine, in the production of various secondary metabolites, as ornamental plants and also as culinary herbs. There are some certain limitations (climate, season, diseases and pests etc.) in plants that are cultivated by conventional methods. In addition, there is also a danger of scarcity and/or extinction of naturally growing medicinal plants. In vitro culture techniques eliminate these limitations. There are some studies in which in vitro techniques are used for different purposes (rapid propagation, secondary metabolites production, conservation of rare, threatened or endangered plants, somaclonal variations creation and utilization in breeding from these variations etc.) in the genus *Salvia*. After evaluation of these literatures that have been reported in the genus *Salvia* so far, the use of in vitro culture techniques and advantages of them have been offered in this study.

POTENTIAL USE OF SAFFRON (*CROCUS SATIVUS L.*) IN MODERN MEDICINE

YONCA SURGUN ACAR¹, BETÜL BÜRÜN²

ABSTRACT

In last twenty years, studies about herbal medicines which have anti-carcinogenic activity have been gradually increasing. Correlation of long time consumption of some herbal medicines with decrease of cancer incidence generates an epidemiologic base for further studies. It is known that, from time immemorial saffron has been used in traditional medicine in different cultures of world because of its medicinal features, which is obtained from dry stigmas of saffron plant (*Crocus sativus L.*) flowers and an invaluable spice. In modern medicine, it is revealed that saffron extracts and major active compounds have anti-cancer activities on animal models and cultured human malignant cell lines. Saffron contains many bioactive compounds like crocin, crocetin, picrocrocin, safranal, anthocyanin, carotene and lycopene and besides exhibiting anti-carcinogenic and anti-tumor properties in vivo and in vitro environments, it is indicated that these compounds have various pharmacologic effects in different diseases. The various hypotheses have been suggested about the effects of saffron and its compounds on different cancer types. Some of these mechanisms have been proposed as (a) inhibition of DNA and RNA synthesis, (b) induction of apoptosis, (c) induction of cytotoxicity and inhibition of cell proliferation, and (d) inhibition lipid peroxidation and increase of the activity of antioxidant enzyme. Consequently, it is stated that studies aimed at explore of new plant candidates having potential anti-cancer effects like saffron are quite important and allows for the development of safe and effective anti-cancer therapies.

SESAME OIL: COMPOSITION, CHARACTERISTICS AND EFFECT ON HEALTH

EBRU TANRIVERDİ¹, ZEYNEP AKŞİT², ŐEYDA KARAGÖZ³

ABSTRACT

Sesame (*Sesamum indicum* L.) is an oilseed that grows in hot regions, which has been used for thousands of years due to its preventive effect on several diseases and its many functional properties (pharmacy, medicine, food industry etc.). In addition to its usage as a spice in food industry, sesame also compose raw materials in the production of sesame oil and sesame oil. However, despite high oil yield (~ 50%) sesame seeds are not used as an important oil source material in Turkey. Sesame oil have healthy compounds, and also it is more stable than many vegetable oils, and it is known that this property is enhanced by antioxidant compounds (sesamol, sesaminol, sesamolin). The most potent antioxidant compound of these compounds is sesamoid. Also important minor compounds in sesame oil such as lignans (sesamin, sesamolin), polyphenols (sesamol), tocopherols (α , γ , δ) and phytosterols (sitosterol, campesterol) enrich the oil content. Recent studies also discuss the emulsifying properties of sesame oil. Considering all these features and the literature, it is thought that the importance applied to sesame oil is inadequate. Therefore, sesame oil production, sesame oil content, usage areas and functional properties of sesame oil and the effect of sesame oil on health have been emphasized in this study.

FUNCTIONAL PROPERTIES OF POLYPHENOL COMPOUNDS IN SOME HERBAL TEAS AND IMPORTANCE IN TERMS OF TYPE-2 DIABETES

ÖZLEM ÇAĞINDI¹, CEREN İNCE¹

ABSTRACT

Diabetes, which is of great importance in our country and in the world, is a serious disease that cannot prevent deaths, despite the studies done and the new treatment methods developed. Type 2 diabetes is the most common form of diabetes patients accounting for 90%. In order to prevent diabetes or to balance the level of blood sugar, the amount of sugar in the blood should be controlled. An important risk for diabetes is the reduced plasma antioxidant level. Since antidiabetic medication leads to toxicity in liver and kidney, alternative studies for the use of herbal products in treatment gradually has been increased. Because of positive effecting on health, medical and aromatic plants are extensively used. At the present time, herbal teas are consumed one of the most herbal origin natural products. The basic indicators of the compounds that make up the health effects of these herbal teas are total phenolic content and antioxidant activity levels. Polyphenols are secondary metabolites found in many plants and shell of fruits. It has been reported that glycosidase enzymes are inhibited by polyphenol-rich compounds and positive effects are provided on blood glucose control. Herbal tea leaves contain high amounts of polyphenols and major rate of flavonoids in polyphenols. The primary phytochemical responsible for herbal tea's antidiabetic effects is epigallocatechin gallate. Also quercetin, kaempferol are significant level other polyphenolic compounds. Primary of herbal teas rich polyphenol compounds are contained green tea catechin polyphenol. In addition, peppermint, thyme, black tea, sage, roselle (hibiscus) polyphenols are rich in herbal teas. Antidiabetic properties have been found in green, black and oolong tea. It supplies that edible plants such as grape leaf, quince leaf, nettle, bean leaf and cherry leaf have the ability of alpha-glucosidase enzyme inhibition activity. It is about to positive effect on diabetes when these edible plants are consumed as herbal teas. Results showed that antioxidant activity is increased by adding lemon, bergamot, clove or cinnamon is greater than their individual actions. There has been existed studies that medicinal and aromatic plants, especially phenolic compounds and antioxidant activities, will prevent the development of Type 2 diabetes. In this study, the definition and structure of polyphenols, which are bioactive components, functional properties, in terms of polyphenol compound rich some herbal teas and effect mechanisms of diabetes have been compiled.

EFFECT OF ACTIVATED CHARCOAL ON ROOT FORMATION OF VACCINIUM MYRTILLUS

MUSTAFA CÜCE¹, TUBA BEKİRCAN², ATALAY SÖKMEN³

ABSTRACT

Vaccinium myrtillus L. (Bilberry), a member of the family Ericaceae, is economically the most important wild berry growing in the Turkish flora. This study was determined to the effect of activated charcoal on rooting *V. myrtillus* microshoots growing in the culture conditions. WPM containing 2% sucrose and 0.8% agar was used as a basal medium for rooting and was each individually supplemented with different concentrations of IBA, IAA and NAA (0.25–1.0 mg/L) with or without activated charcoal (AC). Cultures were incubated in a growth chamber maintained at 24 ± 2 °C, under a 16/8 h photoperiod with a photosynthetic photon flux density of 50 µmol m⁻² s⁻¹. The rooting percentage was also evaluated via a number of rooted microshoots, root length, and the number of root tips per explant. In terms of root formation, 0.5 mg/L IBA was found to be superior to the other tested growth regulators when combined with 1.0 g/L AC with 30% rooting success. Although the highest root length was also obtained again the same IBA/AC combined with 20.94 mm, the highest root number was obtained only 0.25 mg/L IBA applications with 3.11 per microshoot. For NAA application, only 0.5 mg/L NAA combined with 1.0 g/L AC were given a statistically significant result. At the end of the study, it was determined that auxin types and AC applications affected the rooting percentage of *V. myrtillus* microshoots. SOME NON-WOOD PRODUCTS AND THEIR GENERAL FEATURES IN EGE REGION

NIHAL ÖZEL¹, HAFİZE HANDAN ÖNER¹, NURAN ALTUN¹

ABSTRACT

Türkiye has a rich diversity due to almost 12000 plant taxon. This richness has led to dense use since long years. Therefore, there are many plant species that is used for different purposes. Having Mediterranean climate type, Ege Region has general Mediterranean vegetation properties. As it is known Mediterranean ecosystems are very rich in terms of fragrant and oily plants and especially annual species and of course medicinal and aromatic plants. Since Ege Region is also rich with medicinal and aromatic species. In this study, it will be tried to explain some medicinal-aromatic plants those will be identified at the end of our observations, records and previous studies for a long time, their biological properties and usage in Ege Region.

THE POTENTIAL EFFECTS OF A HOT-WATER EXTRACT FROM MYCELIUM OF THE EDIBLE MUSHROOM ON HUMAN BLOOD MONONUCLEAR CELLS

SALIM CERİG¹, FATİME GEYİKOĞLU¹, MURAT OZDAL¹, KUBRA KUBRA KOC¹, ÖMER FARUK ALGUR¹

ABSTRACT

Mushrooms are consumed for their nutritional and medicinal values, and have an expanding global industry. The submerged and solid state fermentation of mushrooms have great potential for the production or extraction of bioactive phenolics. *Pleurotus sajor-caju*, known as oyster, is edible mushroom. For the first time, the present study was designed to investigate genotoxic effects, cell viability and oxidative damage of increasing concentrations (5, 10, 15, 25, 40, 75, 100, 250 and 500 µg/mL) hot-water extract from mycelium of the *P. sajor-caju* on human blood mononuclear cells (hBMCs). Cytotoxic effect was detected by lactate dehydrogenase (LDH) assay, besides total antioxidant capacity (TAC) and total oxidant status (TOS) levels were determined to evaluate the oxidative injury. The DNA damage was also analyzed by cytokinesis-block micronuclei (CBMN) assay as indicators of genotoxicity. *P. sajor-caju* at the applied concentrations didn't cause significant decreases to cytotoxicity as compared to untreated culture. However, the results 24 and 48 h treatment periods of LDH showed that the high concentration of *P. sajor-caju* (500µg/mL) increased cytotoxicity. On the other hand, the increasing doses of (10, 15, 25 and 40µg/mL) significantly increased TAC levels and decreased TOS levels as compared to untreated culture. Whereas, 250 and 500 µg/mL doses of *P. sajor-caju* slightly increased of TOS levels and decreased TAC levels in cultured hBMCs. As compared to untreated culture, *P. sajor-caju* didn't cause increases at CBMN rates. In conclusion, the obtained in vitro results showed that *P. sajor-caju* can be consumed safely, but it has also in a time and dose-dependent effects on inducing oxidative damage and cyto-genotoxicity in hBMCs.

**ANTIMICROBIAL AND ANTIOXIDANT PROPERTIES OF THYME
(THYMUS VULGARIS L.), ROSEMARY (ROSMARINUS OFFICINALIS
L.) AND LAUREL (LAURIS NOBILIS L.) ESSENTIAL OILS AND
THEIR MIXTURES**

SERPİL TURAL¹, SADETTİN TURHAN²

ABSTRACT

In this study, the antimicrobial and antioxidant properties of thyme (TEO), rosemary (REO) and laurel essential oils (LEO) and their mixtures (TEO/REO, TEO/LEO, REO/LEO, 1/1, v/v and TEO/REO/LEO, v/v/v, 1/1/1) were investigated. The antimicrobial activity was measured by agar well diffusion method, while antioxidant capacity was measured FRAP and DPPH scavenging activity methods. All essential oils and their mixtures showed antimicrobial activity and antioxidant capacity. The highest antimicrobial activity against *S. aureus*, *E. coli* O157:H7 and *L. monocytogenes* was determined in TEO with zone diameters of 39.33, 28.00 and 30.67 mm, respectively. In general, essential oil mixtures negatively affected the antimicrobial activity compared to essential oils alone, and *E. coli* O157:H7 was less sensitive to the inhibitory activity of essential oils and their mixtures than *S. aureus* and *L. monocytogenes*. The FRAP values of all essential oils and mixtures ranged from 3.67 (REO) to 40.30 mg/mL (LEO), while the DPPH scavenging activity values ranged from 21.31 (REO) to 89.48% (TEO/LEO). These results suggested that essential oils obtained from thyme, rosemary, laurel and their mixtures have potential to be used as natural antimicrobial and antioxidant agents in food industry.

COMPARISON OF ANTIOXIDANT CAPACITIES AND PHENOLIC CONTENTS OF TWO TRAGOPOGON SPECIES

KAAN KALTALIOGLU¹, HUSEYİN SAHİN¹, ERSAN BEKTAS¹, SULE COSKUN CEVHER²

ABSTRACT

Traditionally, *Tragopogon* genus are used for the treatment of stomach complaints, ulcers and wounds in various countries, and are known locally as “yemlik”. In the present study we compared the antioxidant capacity and phenolic content of *T. graminifolius* and *T. pterocarpus* which are the potential medicinal plants. 5 g samples (aerial parts) were taken from each of plants and were extracted with methanol by using soxhlet apparatus. After extraction, the methanol solvent was evaporated by using rotary evaporator. The crude extracts were divided into two parts. RP-HPLC-DAD (reverse phase high performance liquid chromatography with a diode array detector) was applied on the first parts of extracts to determinate phenolic compounds. The DPPH radical scavenging activity of the rest of the extracts were analyzed by spectrophotometrically. Protocatechuic acid, p-hydroxybenzoic acid, chlorogenic acid, caffeic acid, syringic acid, p-coumaric acid, rutin, rosmarinic acid, benzoic acid and quercetin were detected in both plants with different amounts. Vanilic acid was detected only in the *T. pterocarpus* whereas gallic acid was detected only in the *T. graminifolius*. The dominant phenolic compounds identified from *T. pterocarpus* extract were the quercetin (26.01 mg phenolic/g extract) and benzoic acid (5.88 mg phenolic/g extract). The dominant phenolic compounds identified from *T. graminifolius* extract were the quercetin (9.91 mg phenolic/g extract) and chlorogenic acid (6.75 mg phenolic/g extract). Antioxidant activity of *T. pterocarpus* was found to be higher than *T. graminifolius* (SC50 values 115.80 µg/mL and 142.78 µg/mL, respectively).

PHENOLIC COMPOUNDS AND DPPH ANALYSIS OF ROOTS AND AERIAL PARTS OF ISATIS SIVASICA

KAAN KALTALIOGLU¹, ERSAN BEKTAS², HUSEYIN SAHIN¹, SULE COSKUN CEVHER²

ABSTRACT

Isatis genus are used in the traditional treatment of constipation, cuts and wounds, hemorrhage in various countries. In the present study we compared the phenolic compounds and antioxidant activities of methanolic extracts of *Isatis sivasica* (MEIS) parts which is the potential source of antioxidant. *I. sivasica* samples were separated to the parts of root and aerial. 5 g samples were taken from each of parts and were extracted with methanol by using soxhlet apparatus. After extraction, the methanol solvent was evaporated by using rotary evaporator. The crude extracts were divided into two parts. RP-HPLC-DAD (reverse phase high performance liquid chromatography with a diode array detector) was applied on the first parts of extracts to determinate phenolic compounds. The antioxidant activity of the rests of the extracts were investigated in terms of DPPH radical scavenging assays by spectrophotometrically. Protocatechuic acid, p-hydroxybenzoic acid, vanilic acid, caffeic acid, p-coumaric acid, and rosmarinic acid were found by RP-HPLC-DAD analysis of the root of MEIS. In addition to these phenolics, rutin and benzoic acid were detected in aerial parts of MEIS. For antioxidant activity, aerial parts of MEIS possessed the higher DPPH radical scavenging activities as compared to root of MEIS (SC50 values 134.05 $\mu\text{g/mL}$ and 474.45 $\mu\text{g/mL}$, respectively).

MICROPROPAGATION OF ERUCA SATIVA MILL. (SALAD ROCKET)

MUSTAFA CÜCE¹, TUBA BEKİRCAN², ÇAĞRI BEKİRCAN², ATALAY SÖKMEN³, AYKUT SAĞLAM²

ABSTRACT

The purpose of this study was determined micropropagation of *Eruca sativa* Mill. is an edible annual plant, commonly known as "salad rocket". In order to specify the most effective basal medium, two basal media, Murashige and Skoog (MS) and Gamborg B5 medium (B5) each supplemented with 1.0 mg/L 6-benzylaminopurine (6-BA) and without plant growth regulators (PGRs), were tested to determine the best basal medium for seed germination. MS, supplemented with 6-BA, was found to be the most favored basal medium tested with 90% seed germination and 29.80 ± 2.30 shoot length success. Since shoot proliferation ability highly depends on the medium and cytokinin concentration, lateral buds were selected as explants, which were then individually cultured in MS, each supplemented with 1.0 mg/L kinetin, thidiazuron (TDZ), 6-BA, and 6-(y,y-dimethylallylamino)-purine (2iP) in combination with 0.1 mg/L indole-3-butyric acid (IBA). MS containing 1.0/0.1 mg/L 6-BA/IBA was chosen to be the most effective basal media among tested. Therefore, MS medium each individually supplemented with 0, 0.25, 0.5, 1.0 and 2.0 mg/L 6-BA in combination with 0.1 mg/L IBA was again tested for most suitable 6-BA concentration. The highest shoot multiplication successes were obtained in the lowest 6-BA treatments with 37.88 mm shoot length. Acknowledgements: The authors deeply appreciate the financial support of KTU-BAP (The Scientific Research Committee of Karadeniz Technical University) for the project KTÜ-BAP.1064

INFLUENCES ON ALPHA-AMYLASE AND ALPHA- GLYCOSIDASE OF PHENOLIC COMPOUNDS IN MEDICINAL AND AROMATIC PLANTS

HÜLYA ŞEN ARSLAN¹, MUSTAFA ÇAM²

ABSTRACT

Medicinal and aromatic plants are widely used for protection and improvement of human health as well as preservation and sweetening of foods. Many illnesses that emerging from ancient times to has been tried to be treated via plants. Carotenoids, antioxidants, vitamins, phenolic compounds, terpenoids, steroids, indoles and fiber in plants have been found to have significant effects on the reduction of chronic diseases. Alpha amylase and alpha glucosidase enzymes have the key roles in the breakdown of starch and the absorption of the resulting glucose by the intestines. The increase in blood glucose level after a it is expected to limit the postprandial elevation of glucose in the blood with the help of inhibition of these enzymes after a diet containing mixed carbohydrates. This situation may be an important strategy in managing hyperglycemia resulting from Type 2 diabetes. Acarbose, miglitol and voglibose are the most commonly used antidiabetic drugs to inhibit alpha-amylase and alpha-glucosidase activity. Although these drugs are effective in preventing the increase of glucose blood levels in many patients, as a result of the continuous use of these medicines, they cause undesirable side effects such as liver toxicity and gastrointestinal symptoms. For this reason, the use of compounds of natural origin instead of synthetically produced medicines for the prevention of Type 2 diabetes has been become widespread today. Phenolic compounds known as herbal pigments over a century are widespread almost in all plants. Interest in phenolic compounds has increased due to their antioxidant and free radical scavenging properties resulting from in vitro studies. Phenolic compounds attract attention of researchers because they have free radical scavenging properties, regulate enzyme activities, inhibit cell proliferation, antibiotics, antiallergic, antidiarrheal, antiulcer and antiinflammatory properties. Phenolic compounds have been indicated sometimes inhibit and sometimes stimulate enzyme systems in mammals in vitro studies. In this study has included information about effects on alpha-amylase and alpha-glucosidase enzymes of phenolic compounds naturally found in medical and aromatic plants.

ANTIFUNGAL ACTIVITY OF CORNUS MAS L. AND NERIUM OLEANDER L. PLANT EXTRACTS AGAINST SOME PLANT PATHOGENIC FUNGI

BURAK CAN DUMAN¹, ABDURRAHMAN ONARAN¹

ABSTRACT

Studies are underway to find new compounds due to the negative effects of pesticides used against plant pathogens in agricultural areas. In these studies, the use of plants as bio-pesticide is the foreground. In this study, antifungal effects of the methanol extracts of *Cornus mas* L. (leaf and fruit) *Nerium oleander* L. (flower and leaf) were determined against *Fusarium oxysporum* f.sp. *radicis-lycopercisi* (FORL), *Verticillium dahliae* and *Rhizoctonia solani* pathogens. Agar plate method was used for activity studies. Doses of 500, 1000 and 2000 mg/ml of each plant extract were used. Negative (50% acetone) and positive control (80% thiram) were applied. A noticeable antifungal activity was observed in all extracts used against test fungi. Mycelium growth inhibition (MGI) and lethal dose (LD₁₀₋₅₀₋₉₀) values were calculated for the test fungi of the extracts. The highest effect against test fungi was determined to be *C. mas* fruit. This is followed by *N. oleander* flower, *C. mas* leaf and *N. oleander* leaf extract, respectively. These MGI effects were found to be 30% to 78% for FORL, 36% to 84% for *V. dahliae* and 0% to 69% for *R. solani*. For the test fungi, doses of LD₅₀ were found to be in the range of 314.64 to 934.38 mg/ml for *C. mas* fruit, 999.49 to 4690.50 for *C. mas* leaf, 801.58 to 1245.95 mg/ml for *N. oleander* flower and 1352.19 to 2706.67 mg/ml for *N. oleander* leaf. According to these results, it was determined that all plant extracts used had bio-fungicidal activity against test fungi.

ENDOCRINE DISRUPTOR CHEMICALS: PHYTOESTROGENS

ARIFE EZGİ TELLİ¹, YUSUF DOĞRUER¹

ABSTRACT

Endocrine disrupting chemicals (EDCs) are synthetically or naturally occurring components with the ability to modulate endocrine system pathways. EDCs can activate or inhibit estrogen, androgen, and thyroid hormone receptors. These compounds can be taken on a daily basis with trace amounts of food and can be taken at higher rates with the continuous consumption of some vegetables and fruits. Human and animal populations are continuously exposed to endocrine disruptors. Pesticides, fungicides, drugs, dioxins, plasticizers and paint additives are some of the sources of exposure to these components. Phytoestrogens, known to have EDC-features, are herbal origin components that can be found in many foods. Phytoestrogens have a very important role in biological activity by acting as steroid hormones (eg, 17 β -oestradiol) in humans and other mammals. There are many phytoestrogenic foods that are discovered and proven to be clinically effective up to day. Structure and Classification of Phytoestrogens Phytoestrogens are classified as polyphenolic, steroidal and mycoestrogens according to their cyclic structure. Polyphenolic phytoestrogens are divided into subgroups as chromenes, stilbenes, lignans, isoflavonoids, flavonoids, chalcones and deoxybenzoins. In steroidal phytoestrogens, terpene glycosides constitute the significant subgroup. Isoflavones and human steroid estrogen from polyphenolic phytoestrogens are quite similar in terms of chemical structure and molecular weight. The distance between the hydroxyl groups and the similarity of the molecular structure is important in terms of the activities at the binding points. The Existence of Phytoestrogens in Plant-derived Foods and Its Effect on Health Although the presence of phytoestrogens in a large number of plant sources is known, soy is the most common source. Isoflavonoids are the phenolic metabolites mostly found in leguminous plants. In today's food industry it is accepted as a fact that many of dietary supplements containing phytoestrogens and soy protein added to a large part of processed foods. Given this situation, phytoestrogens, which are weak estrogen agonists / antagonists with similar molecular and cellular properties to synthetic endocrine disruptors such as Bisphenol A (BPA), provide a useful model for more clearly revealing the biological effects of endocrine disruptors. There are many different opinions that phytoestrogens may be useful or harmful for health. Studies of the beneficial effects of phytoestrogens have been associated with diseases such as osteoporosis, carcinogenesis and atherosclerosis. Harmful effects are caused by endocrine disruptive side effects of these components. There are a number of studies on the linkage of synthetic endocrine disruptors to diseases such as fertility, negative effects on the reproductive system and endocrine system, cancer and obesity. Because of these different approaches, it is unclear whether phytoestrogens may have a positive or negative effect on human health. This can vary depending on a large number of determinants, such as the dose being exposed, the age of the person, the health status and the intestinal microflora.

THE VOLATILE COMPONENTS OF PHLOMIS LYCIA D. DON AND PHLOMIS LEUCOPHRACTA SPECIES NATURAL DISTRIBUTED IN GÖYNÜK DISTRICT OF ANTALYA PROVINCE

AYŞE GÜL SARIKAYA¹, HÜSEYİN FAKİR¹

ABSTRACT

Natural distributed in our country Phlomis genus, has an important place among medicinal plants. One of the species with the highest number of species of Lamiaceae family, is known as "Ballık Otu", "Calba", "Çalba" and "Şalba" in Turkey and is used as medicinal and aromatic plant among the people. The leaves and flowers of Phlomis lycia D. Don and Phlomis leucophracta P. H. Davis & Hub.-Mor. were collected from Göynük area of Antalya province in the study carried out during the 2016 vegetation period and volatile components of the flowering period of the species were determined by SPME (solid-based microextraction method) analysis. For Phlomis leucophracta, 50 different volatile components were identified and the main constituents were (E) -2-hexenal (15,81%), limonene (17,55%), β -cayophyllene (18,09%). Also 57 different volatile components were identified for Phlomis lycia, and the main constituents were (E) -2-hexenal (8,35%), (E) - β - Farnesene (10,05%) and germacrene-D (45,73%).

INHIBITORY EFFECT OF 5-HYDROXY-6,7-DIMETHOXY-2-PHENYL-4H-1-BENZOPYRAN-4-ONE ON HUMAN CERVIX CARCINOMA IN VITRO

RAMAZAN ERENLER¹, İBRAHİM DEMİRTAŞ², TÜNAY KARAN³, MUHAMMED ALTUN²

ABSTRACT

Kickxia spuria was collected from Bingöl, Turkey. Aerial parts of the plant were boiled in water for 2 h then extracted with ethyl acetate. After evaporation of the solvent by rotary evaporator, the extract was subjected to column chromatography to yield the compound identified as 5-Hydroxy-6,7-dimethoxy-2-phenyl-4H-1-benzopyran-4-one by spectroscopic method including 1D-, 2D-NMR, LC-TOF/MS. Antiproliferative activity of isolated compound was tested against HeLa (human cervix carcinoma) cell lines by xCELLigence assay, and found out that the compound exhibited excellent activity.

**CHEMICAL COMPOUNDS AND IN-VITRO ANTIMICROBIAL
PROPERTIES OF ESSENTIAL OIL OF BERGAMOT (CITRUS
BERGAMIA RISSO ET POITEAU) PEEL**

DİLEK KESKİN¹, NUR CEYHAN GÜVENSEN², TUĞÇE ERDOĐDU²

ABSTRACT

The antimicrobial properties of essential oil extracted from bergamot peel (BEO) was studied by disc diffusion method. The determination of the minimum inhibitory concentration (MIC) values via the microdilution method revealed a different antimicrobial pattern for the one microorganism investigated. The bergamot essential oil was tested against six bacteria and one fungus, which revealed various levels of antimicrobial activity. Among the bacteria, *B.subtilis* showed best antimicrobial activity with 37mm. Erythromycin and ampicillin were tested positive control. BEO showed antimicrobial activity with 10mm zones to *C.albicans*. Only, *E.coli* was showed antimicrobial activity 8 µg/mL. The GC/MS analyses allowed 18 compounds to be determined; the main constituents of the essential oil of bergamot (*Citrus bergamia*) were linalool 46.58%, limonene 22.32%, linalyl acetate 15.46%. In conclusion, on the basis of our results, BEO activities registered are mostly related to individual susceptibility of bacteria. It is recommended to estimate their efficacy on a significant number of pathogenic strains in order to prospect a concrete employ in food industries as a valid natural alternative for the bio-control of the pathogen. Bergamot peel is a potential source of natural antimicrobials that are active against Gram-negative bacteria, Gram-positive bacteria and *C. albicans*. Antimicrobial activity based on high content of linalool, limonene and linalyl acetate.

MEDICINAL AND AROMATIC PLANTS OF ESENLİ (GİRESUN) FOREST PLANNING UNIT

MUSTAFA KARAKÖSE¹, GÖZDE ÇOLAK KARAKÖSE²

ABSTRACT

Turkey is an extraordinary country in terms of plant species diversity. Besides this diversity, Anatolian lands were hosted by many civilizations. The combination of these two factors has also contributed to a wealth of human-plant use. The plants have been used for different purposes in different civilizations such as food, medical, instrument construction, fuel, paint, feed, incense. The use of plants today, especially medical and aromatic plants, continues to increase. According to the Flora of Turkey, which plant is known to grow in which region. However, there is insufficient information on the status of plant populations. Plant sociology studies can give us satisfactory information about plant populations. In this study, Medicinal and aromatic plants of Esenli [Giresun] Forest Planning Unit, located between Alucra and Yađlıdere districts, were investigated based on plant sociology. During the this study; 20 sample plots were taken. The vegetation study was carried out according to Braun-Blanquet's method. Totally, 226 naturally growing plant taxa were identified. Of these plants, 10 taxa [%4,4] belong to Pteridophyta division and 216 taxa belong to Spermatophyta division. 3 taxa [%1,3] belong to Gymnospermae subdivision, while the others 213 [%94,3] are Angiospermae subdivision. As a result of this study, 110 plant taxa which have medicinal and aromatic traits were determined in the area. These plants are 3 taxa Pteridophyta, 3 taxa from Gymnospermae and the rest from Angiospermae [104 taxa]. Families, scientific names, Turkish names, usable parts and traditional uses were given in the presentation.

DANDELİON

MERVE NUR UYAR¹

ABSTRACT

A study on dandelion, which is defined as "blowing flower" among the people, has been conducted due to the feather structure that was transformed in the autumn. In this compilation, it is reported that the feathering is actually a stage of the insemination process. In addition to this information, carbohydrates, protein, fat percentages, total calories and nutrient content of dandelions are discussed in detail. In addition, the traditional and medicinal use of dandelion, in particular its effect on the liver diseases involved in its medicinal use, its function on lipid metabolism, its antidepressant, anti-cancer, antimicrobial properties, its effect on reproductive activities, its contribution to oral mucosa hygiene and its accompanying mirosinase and inulin have been reached. The information obtained from these records has been compiled. Dandelion's separately flowers, stems, root parts, liquid extracts and plant flowers; Its use, its preparation, its application, its role in treatment, its effects on subjects have been subject to many researches, and relevant literature has been searched.

USE OF MEDICAL AND AROMATIC PLANTS IN PHYTOREMEDIATION STUDIES

BURAK SÜRME¹, DUDU DUYGU KILIÇ², HAMDI GÜRAY KUTBAY¹

ABSTRACT

Medical and aromatic plants produce various chemicals such as primary and secondary metabolites. Some of these chemicals composed of heavy metal components. In today's, many indigenous people use these plants for therapeutic and food, but toxic compounds which compose of heavy metals enter the food chain. Recently, ecological based phytoremediation techniques have gained importance because of the high cost of conventional techniques used to clean areas with heavy metal pollution. Some studies have shown that some medical and aromatic plants contain some heavy metals. This case has increased the number of preferred medicinal and aromatic plants in phytoremediation studies. However, it is known that these plants consumed for therapeutic or food purposes are dangerous to be consumed by human and animals due to the heavy metals contents. In many studies, heavy metals contents of medical and aromatic plants are controlled by the World Health Organization. For example, a study performed in Pakistan, it was found that heavy metal contents were higher than the values suggested by the World Health Organization for 43 medical and aromatic plants. Especially from Asteraceae family, in *Silybum marianum* (L.) Gaertn. and *Artemisia herba-alba* Asso were detected 54 ppm Pb 5.25 ppm Cd, respectively. Also, it has been found that *Brassica jucea* L. and *Helianthus annus* L. used in edible oil production accumulate high levels of heavy metals in their phytoremediation studies. As a result, medical and aromatic plants have been widely used in phytoremediation studies and have found that they accumulate significant amounts of heavy metals in their bodies. But This can cause heavy metals in their bodies enter into food chain either consumption by human or animals. And cause potential human health risk and ecological disturbances. For this reason, some researchers propose here a safe, economically feasible and eco-friendly approach for phytoremediation using nonedible aromatic plants. Thus, the phytoremediation works will be safe, environment friendly and low cost.

CENTAUREA BABYLONICA (L.) L. EXTRACTS: ANTIMICROBIAL ACTIVITY AND CYTOTOXIC EFFECTS ON HUMAN LUNG CARCINOMA CELLS

**NUR CEYHAN GÜVENSEN¹, DİLEK KESKİN², HATİCE GÜNEŞ³, MÜJGAN KESİK OKTAY³, TUĞÇE ERDOĞDU³,
HASAN YILDIRIM⁴**

ABSTRACT

The antimicrobial activities of above ground-parts (branches and leaves) of *Centaurea babylonica* (L.) L. extracts of acetone, chloroform, hegzan, ethylacetat, metanol and etanol were studied by disc diffusion method. These extracts were tested against six bacteria and one fungus, which revealed various levels of antimicrobial activity. In this work, inhibition zone diameters and MIC values detected for each extract and microorganism. The acetone extracts of *C. babylonica* showed the best antibacterial activity against *Bacillus cereus* (15mm). While the hegzan and acetone extracts displayed the best antimicrobial activity against *B. subtilis* (14mm). The ethylacetate extracts of *C. babylonica* showed the best antibacterial activity against *Pseudomonas aeruginosa* (1,6 µg/mL). The chloroform extracts of *C. babylonica* displayed the best antibacterial activity against *Salmonella typhimurium* (0,4 µg/mL). The ethanol extracts of *C. babylonica* laeves and branches showed the best antibacterial activity against *B. subtilis* (1,6 µg/mL). The acetone extracts of *C. babylonica* showed the best antibacterial activity against *Pseudomonas aeruginosa* and *B. cereus* (1,6 µg/mL). Thus, acetone extracts were tested for GC/MS analysis for chemical composition. The GC/MS analyses allowed 6 compounds to be determined; the main constituents of the *Centaurea babylonica* leaves and brunches acetone extract were diacetonealcohol (53.47%), 1-dexadecene (10.19%) and 1-tetradecene (8.67%). In addition, cytotoxic activities of extracts from seven different solvents were investigated on A-549 (Human lung carcinoma) cell line. Extracts (500 µg/mL) from six different solvents caused cytotoxicity between 84% and 88% compared to the control. However, water extracts was the less effective among the other extracts and resulted in cytotoxicity less than 45%. Dose dependent effects of the extracts indicated that aseton extract was the most effective one and it caused 78% cytotoxicity even at 30 µg/mL. In conclusion, the results obtained in the present study clearly demonstrate that *C. babylonica* (L.) L. exhibited a strong antimicrobial activity and cytotoxicity in vitro. In addition, the results showed a significant correlation between the phenolic components and antimicrobial or cytotoxic properties. These findings suggest that *C. babylonica* have a good potential to be used as an ingredient for the source of natural antimicrobial and poly unsaturated fatty acids in the formulation of functional foods. However, further studies are needed to isolate and characterise the active compounds that are responsible for the antimicrobial and cytotoxic activities. Finally, mechanism of cytotoxicity is under investigation.

MODE OF ACTIONS OF ESSENTIAL OILS OBTAINED FROM MEDICINAL AND AROMATIC PLANTS IN PLANT PROTECTION

ERAY ŐİMŐEK¹, MEHMET ERTUđRUL GÜLDÜR¹, MEHMET MAMAY¹

ABSTRACT

Today, the problems due to overuse of pesticides are both damaging the environment and human health. Reducing the use of synthetic chemicals or developing alternative methods for sustainable agriculture has become a global mission. Essential oils offer alternatives due to bioactive compounds they contain to synthetic chemicals in agricultural pest management. The use of essential oils as natural pesticides is of great importance in terms of the environmental and toxicological effects caused by the random use of synthetic chemicals and it offers the progression or reduction of the disease or pest resistance problem. Essential oils obtained from medicinal and aromatic plants have a wide range of effects on various plant pathogens and insects. The antifungal properties of essential oils include suppression of spore germination, germ tube elongation and reduction of hyphal growth. In insects, they have some properties include repellent, growth regulation, antifeedant, lethal and inhibition of egg laying. Essential oils with their contact and fumigant biocidal actions are also used in the preservation of stored products. It is also known that they have antibacterial and antiviral effects. In this study, effects of essential oils obtained from medicinal and aromatic plants against plant protection problems and their applicability in practice have been compiled and discussed.

USE OF MEDICINAL AND AROMATIC PLANTS AGAINST PLANT PATHOGENS

ERAY ŞİMŞEK¹, MEHMET ERTUĞRUL GÜLDÜR¹, MURAT DİKİLİTAŞ¹

ABSTRACT

Meeting the agricultural needs of the growing world population is becoming increasingly inadequate due to the decrease of the arable lands, therefore it is necessary to increased the yield per unit area. One way to increase the yield per unit area is through the management of biotic and abiotic stress factors. Today, the use of synthetic chemicals to reduce the damage caused by plant pathogens, harmful insects and weeds irreversibly damages to the nature. In recent years, the use of plant extracts to manage plant diseases has become increasingly widespread as an alternative way to synthetic chemicals. Various secondary metabolites produced by medicinal and aromatic plants show biocidal and inhibitory properties against plant pathogens. Extracts from medicinal and aromatic plants are becoming encouraging. Because, non-target organisms are heavily affected due to the use of synthetic pesticides, however, the extracts from medicinal and aromatic plants have lower toxicity. As a result, agricultural pest management employing biocidal and inhibitory properties of natural compounds is both environmentally friendly and economical. By this way, the use of medicinal and aromatic plants in the agricultural management minimize the risk of residue in the nature. This review discussed the rational use of medicinal and aromatic plants in the management of plant pathogens and their availability agricultural production.

PLANT GROWTH RESPONSE OF SALVIA OFFICINALIS L. AND SALVIA TOMENTOSAMILL. TO SALINITY STRESS

HARUN GÖÇER¹

ABSTRACT

Plant growth response of *Salvia officinalis* L. and *Salvia tomentosa* Mill. to salinity stress Harun Göcer¹, Halit Yetisir¹, Mehmet Yamacı¹, Firdes Ulas¹, and Abdullah Ulas² ¹ Department of Horticulture, Faculty of Agriculture, Erciyes University, Kayseri- TURKEY ² Department of Soil Science and Plant Nutrition, Faculty of Agriculture, Erciyes University, Kayseri-TURKEY E-mail: cevher-1313@hotmail.com Abstract The study was conducted in order to determine some agronomical, physiological and root morphological tolerance characteristics of two different salvia species under different salinity levels. The experiment was carried by using hydroponic system in fully automated climate chambers. Two different salvia species (*Salvia tomentosa* Mill. and *Salvia officinalis* L.) were grown in 8 L pots filled continuously aerated nutrient solution under different EC levels (1, 2, 3, 4 and 5 dS m⁻¹). EC levels were arranged by adding NaCl into nutrient solution. The experiment was designed in completely randomized block design with three replications. To determine the plant growth, physiological and root morphological response of salvia species shoot and root fresh and dry weight (g/plant), stem length (cm/plant), leaf area (cm²/ plant), leaf chlorophyll content (SPAD), photosynthesis, root length (m/plant), root diameter (mm), and volume (cm³/plant) was investigated under five salinity levels. The results indicated that shoot (stem and leaf fresh and dry matter, leaf area, stem length) and root (root fresh and dry matter, root length, root volume) growth significantly ($P < 0.001$) affected by different levels of EC and salvia species. Increasing EC level decreased the shoot and root parameters of both salvia species. However, in terms of most measured shoot and root parameters highly significant differences ($P < 0.001$) were found between two salvia species. The interactions between species and EC were also significant in most measured parameters. Generally, *Salvia tomentosa* Mill. showed a better performance in plant growth and salt tolerance compared to *Salvia officinalis* L. This could be the results of leaf physiological (higher leaf area) and root morphological (higher root length and volume) contributory traits which might play an important role in salt tolerance of *Salvia tomentosa* Mill. Key words: *Salvia* species, salt tolerance, hydroponic culture, root morphology. Acknowledgement: The authors would like to thank to Scientific Research Unit (BAP) of University of Erciyes for the financial support to the project of FYL-2016-6738.

DETERMINATION OF PARAMETERS REQUIRED FOR RUPTURE OF FLOWERS OF SOME SAFFLOWER CULTIVARS

DENİZ YILMAZ¹, MEHMET EMİN GÖKDUMAN¹, SABRİ ERBAŞ¹

ABSTRACT

Aspir plant (*Carthamus tinctorius* L.) is used in many fields such as red dye production, oil production and herbal medicine production. The florets of safflower are traditionally used in dyeing. In Turkey, harvesting and handling of the safflower are performed manually. The threshing is usually carried out with a homemade threshing machine. In order to optimize the threshing performance, pneumatic conveying, storage and other aspects of safflower processing, their rupture parameters properties must be known. In this study some rupture parameters of three Turkish safflower florets (Yenice, Dinçer, Remzibey-05 which are major commercial safflower varieties) were determined and compared in terms of rupture force, deformation in rupture force, energy in rupture force, maximum force, deformation in maximum force, energy in maximum force, bioyield force of in different flower regions (primer, seconder, and tertiary head). Average values for maximum force were determined to be between 8.61 and 24.40 N. The highest rupture force was found to be 14.64 N in primer head for Dincer safflower varieties. Average values for bioyield force were determined to be between 6.23 and 21.55 N in primer head. Average values for work to maximum load were determined to be between 0.0121 and 0.0437 J. The highest deformation at maximum load was found to be 4.47 mm in primer head section

ANTIMICROBIAL AKTIVITY OF ALGAEA SPECIES

ÜLKÜYE DUDU GÜL¹, MERVE ERYILMAZ¹, ÖZLEM COŞDAN¹

ABSTRACT

Today, the use of natural products, with antimicrobial activity have become important. Especially in 1988 with the observation of new pathogenic microorganisms affecting the immune system , the world of science has started to pursue new quests and treatments. Sea algae , contains high amonth of proteins , amino acids, vitamins and various minerals. It is also known that contain algae polysaccharides, lipids, and sterins. Because of this reason , marine algae has a wide usage. Countries such as Sri-Lanka , India , China , Argentina , USA have conducted extensive research on these topics. Accordry to these studies, many algae have been found to have antimicrobial activity in the direction of these studies, and the protein fractions have proven their anticoagulant, antilipolytic, antitumoral and antiulcerative activities. In a study , antimicrobial activity of Dictyopteris membraneceae, Cytoseria barbato , Jania ruban and Enteromorpha linza algae were investigated and it was found that Dictyopteris membraneceae has antimicrobial properties on Gram(+) bacteria and not , has a severe effect on Gram(-) . However , none of these algae species showed antimicrobial properties on fungus (C.albicans). In another study, the antibacterial and antifungal activity of seven families of seafoods belonging to Clorophyceae, Phaeophyceae and Rhodophyceae families were examined. Clodophora glomerat showed the highest antibacterial effect. Enteromopho linza and E. pavonica have the highest antifungal effect. In this study, the information about antimicrobial substances obtained from sea algae is presented. In our country, pharmaceutical active substances are still imported from outside because there is not enough study about this subject. According to the results of this study, many kinds of algae can produce antimicrobial substances.

DETERMINATION OF ANTIMICROBIAL ACTIVITY OF FENUGREEK SEED GUM BASED ACTIVE NANOCOMPOSITE FILMS REINFORCED WITH NANOCCLAYS

SALIHA MEMİŞ¹, FATİH TÖRNÜK¹, FATİH BOZKURT¹, MUHAMMED ZEKI DURAK¹

ABSTRACT

The aim of this work was to determine the antimicrobial activities of nanoclay reinforced nanocomposite films obtained from fenugreek seed gum. For this purpose, fenugreek seed gum based films doped with 3 different nanoclays (Na⁺ montmorillonite [MMT], halloysite [HNT] and Nanomer® I.44 P [NM]) at different ratios (0%, 2.5%, 5% and 7.5%) were prepared using solution casting method. Antimicrobial activities of the nanocomposite films against 4 different foodborne bacterial strains (Escherichia coli O157:H7, Staphylococcus aureus, Listeria monocytogenes and Bacillus cereus) were tested by agar diffusion method. In the results of the analyses, the film samples showed high antimicrobial activity against the bacteria tested and inhibition zones varying from 26.25 mm to 57.25 mm were observed. Antimicrobial activity of the nanocomposite films were not influenced from nanoclay type and concentration significantly (P>0.05). Antimicrobial activity occurred in the following order: L. monocytogenes > B. cereus > E. coli O157:H7 > S. aureus. In conclusion, fenugreek seed gum based nanocomposite films possessed an important potential for production of active packaging materials since they exhibited high antibacterial activity against the foodborne pathogenic bacteria.

IMPROVEMENT OF NUTRITIONAL AND FUNCTIONAL PROPERTIES OF TARHANA

ÖZNUR EYMİR¹, NERMIN BILGIÇLİ¹

ABSTRACT

Tarhana, traditional fermented product, is often produced by lactic acid and yeast fermentation of wheat products, yoghurt, tomato paste, onion and spices mixtures, followed by drying and grinding [1]. There are similar products to tarhana such as kishk and kushuk in the Middle East, trahana in Greece and atole in Scotland [2]. Tarhana is a good source of protein, B vitamins, minerals, organic acids and free amino acids [3]. There are several researches in the literature for improvement of nutritional and functional properties of tarhana. Tarhana were enriched/supplemented by legumes (soybean, lentil, chickpea and lupin) [4-6], cereals and cereal products (whole wheat meal, germ, bran, resistant starch, corn and barley) [7-11], buckwheat, albedos of lemon, orange and grapefruit, carob, pumpkin, carrot, bilberry [12-14], dairy products, vegetables and spices. These studies are generally focused on increasing the protein, dietary fiber, mineral matter and phytochemical content of the tarhana. Effect of different raw materials or additives used to enhance the functional and nutritional properties of the tarhana were compiled in this study. EFFECT OF LUPIN (*LUPINUS ALBUS L.*) BRAN ON UNLEAVENED FLAT BREAD PROPERTIES

NERMIN BILGIÇLİ¹, TEKMİLE CANKURTARAN¹

ABSTRACT

Lupin is valuable ancient legume which contains high amount of protein, oil, dietary fiber, minerals and different functional components. The hull of lupin is constitutes approximately 20% part of the lupin seed. Lupin bran is obtained with grinding of lupin hull, and it is a good source of dietary fiber. In this study, high fiber unleavened flat bread production was studied by using lupin bran. For this purpose, lupin bran incorporated into unleavened flat bread formulation at different ratios (0, 3, 6, 9 and 12%). Some physical, chemical and sensory properties of unleavened bread were determined. As the lupin bran ratio increased in bread formulation, spread ratio of the unleavened flat bread increased, significantly ($p<0.05$). Yellowness of the unleavened bread surface increased with lupin bran usage compared to control unleavened bread. Moisture, ash and protein content of the unleavened flat breads ranged between 8.9 % and 9.5 % ; 1.38 % and 1.58 %; 11.25 % and 11.5%, respectively. As a result of sensory evaluation, overall acceptability of the unleavened flat breads containing lupin bran above 6% level was evaluated low score.

SOME PHENOLOGIC PROPERTIES OF NATURAL ORCHID SPECIES USING FOR OBTAINING SAHLEP IN BUCAK (BURDUR) PROVINCE

EBRU HATİCE TIĐLI¹, HÜSEYİN FAKİR¹

ABSTRACT

In this study, phenologic properties of some natural orchid species that are used for obtaining sahlep in Bucak province, were determined. Data were collected from 26 stands where orchid species commonly distributed in Bucak. As result of field studies that were conducted between March and July in 2015, total 11 taxa were determined. Also, phenologic properties as first flowering period, petal leaf color, tuber maturation time and flowering periods were observed these 11 taxa. The first flowering species is *Ophrys mammosa* (beginning of March) and also the last flowering species are *Orchis purpurea* (mid of April) and *Orchis simia* (mid of April). *Ophrys mammosa* is the first full flowering species (mid of April) and the last one is *Ophrys rein subsp. leucotaenia* (mid of June). The first maturing bump belongs to *Ophrys mammosa* (end of April) and the last one to *Himantoglossum comperianum* (end of July). The stands where orchid species were densityare lower closure, in opening forests, on steep rocky slopes and near agri culturalareas. Productivity of flower and tuber are the highest on South and South-western aspects. Slopes of these stands varied between 5-40%. Orchid pecies were distributed between 300 and 1451 m.

MEMORY-ENHANCING, ANXIOLYTIC AND ANTIDEPRESSANT EFFECTS OF INHALED *ACHILLEA BIEBERSTEINII* ESSENTIAL OIL ON SCOPOLAMINE-INDUCED AMNESIC RATS

EMEL AKBABA¹, EYUP BAGCI¹, SALAM A.HASSAN¹

ABSTRACT

In this study, we investigated the possible neuroprotective effects of *Achillea biebersteinii* (Asteraceae) volatile oil. The plant is a shrub, distributed in South-west Asia, South-eastern Europe, and Northern Africa. It is an aromatic and medicinal plant and has been used traditionally to treat several conditions in Turkey and in the World. The present research investigates the memory enhancing, anxiolytic and antidepressant effects of *Achillea biebersteinii* essential oil on scopolamine-induced amnesic rats. Y-maze and radial arm maze tasks were used for evaluating memory formation. Likewise, anxiety and depressive-like behavior were conducted by elevated plus-maze and forced swimming tasks, respectively. Scopolamine-treated rats reduced memory formation as evidenced by decreased spontaneous alternation percentage in Y-maze test, and increased working memory errors and reference memory errors in radial-arm maze test. *Achillea biebersteinii* volatile oil significantly increased spontaneous alternation percentage, and decreased the working memory errors and reference memory errors. Furthermore, scopolamine-alone treated rats exhibited anxiety and depressive-like behavior as evidenced by reduced percentage of open arm time, number of open arm entries and number of crossings in the elevated plus maze and the swimming time and immobility time in the forced-swimming test. *Achillea biebersteinii* volatile oil increased the percentage of open arm time, number of open arm entries and number of crossings in the elevated plus maze, and increased the swimming time and decreased the immobility time in the forced-swimming test in scopolamine administered rats as compared to scopolamine-alone treated rats. Hence, this study suggests that the multiple exposures of *Achillea biebersteinii* volatile oil ameliorate scopolamine-induced spatial memory formation, anxiety and depressive-like behavior. In conclusion, *Achillea biebersteinii* essential oil may be useful alternative or complementary choice in either the protection or the treatment of neurodegenerative diseases such as Alzheimer's disease.

HEAVY METALS UPTAKE IN SOME WILD-GROWN EDIBLE MUSHROOMS FROM TOKAT REGION OF TURKEY

ÖMER İŞILDAK¹, İBRAHİM TÜRKEKUL¹

ABSTRACT

In this study examined to metal ion uptake in mushroom species and metal content of soil substrate for the mushroom. In addition, in this study was investigated different metal uptake and relation of heavy metal concentration in mushroom to available heavy metals in soil. Four different species of mushroom (*Verpa bohemica*, *Agaricus bitorquis*, *Amanita vaginata*, *Lactarius piperatus*) collected from Tokat region of Turkey and underlying soil (0–10 cm layer) substrate were analyzed spectrophotometrically for their heavy metals (Zn, Cd, Pb, Cu, Mn and Ni) contents. The analysis was performed using Agilent 240 FS Atomic Absorption Spectrometer. The results indicate that heavy metal content in all mushroom species are obtained lower than underlying soil substrates while uptake of some heavy metals are high in some species. Levels of heavy metals are considerably lower in the, *Lactarius piperatus* than other mushrooms. The highest metal levels have been observed in the *Verpa bohemica* and *Amanita vaginata*.

INVESTIGATION OF INORGANIC ION EXCHANGE IN DRY AND FRESH MUSHROOMS

ÖMER İŞILDAK¹, İBRAHİM TÜRKEKUL¹

ABSTRACT

In this study, content of common inorganic anions (flor, klor, brom, nitrit, nitrat, sülfat, klorat, fosfat, kromat ve oksalat) in fresh and dried samples of wild grown edible *Lactarius deliciosus* and *Lepista nuda* mushrooms species in Central Black Sea region were analyzed and the change in nutritional value was examined. Analyzes were performed by ion chromatographic method using conductivity detector. The highest anion concentration was obtained fresh sample of *Lactarius deliciosus* with 34,50 mg/g value for SO₄²⁻. Other ions 0,27 mg/g for F⁻; 8,41 mg/g for Cl⁻; 2,24 mg/g for NO₂⁻ and 0,31 mg/g for PO₄³⁻ for *Lactarius deliciosus* and 8,24 for CrO₄²⁻ and 23,46 for SO₄²⁻ for *Lepista nuda* were found. The contents of Br⁻, ClO₃⁻, C₂O₄²⁻ and NO₃⁻ have not been determined in any mushrooms species. Ion Chromatographic separation of inorganic anions ⁻were performed by AS 9-HC analytical column. Injection volume 25 µL and flow rate was determined as 1 mL / min. 20 mM sodium carbonate was used as the mobile phase. All measurements were performed at room temperature (°C 25). The separations were made in about 20 minutes. Under these conditions, inorganic ions were separated using standard mixture solutions. In all cases the retention order F⁻ < CrO₄²⁻ < Cl⁻ < NO₂⁻ < Br⁻ < ClO₃⁻ < NO₃⁻ < PO₄³⁻ < SO₄²⁻ < C₂O₄²⁻ typical was observed. Calibration curves were obtained in the 1x10⁻¹ – 1x10⁻⁵ mg/mL concentration range for. Calibration curves were obtained in the 1x10⁻¹ – 1x10⁻⁵ mg/mL concentration range for.

ANTIOXIDANT ACTIVITY AND PHENOLIC PROFILE OF ZIZIPHORA CLINOPODIOIDES LAM.

ERTUĐRUL CEYRAN¹, AHMET ALTAY¹, EKREM KÖKSAL¹

ABSTRACT

Phenolic compounds are secondary metabolites found in plants in excess. Because of their structural differences, there are thousands of different phenolic compounds in plants and in the products obtained therefrom. They can contribute to the taste and aroma of many foods as well as protection plants against insects and animal pests. In addition, phenolic compounds also exhibit natural antioxidant properties. Antioxidants are molecules that neutralize the effects of free radicals and thereby prevent chain reactions that can lead to cancer, heart diseases and premature aging. The genus *Ziziphora* L. belongs to the family Labiatae consists of four species (*Z. clinopodioides* L., *Z. capitata* L., *Z. persica* Bunge and *Z. tenuior* L.). *Z. clinopodioides* L. is a traditional medicinal plant commonly found in China, Iran and Turkey. It is mainly used for the treatment of asthma, edema, cough, bronchitis, lung abscess and wound healing and other diseases. Leaves, flowers and stalks are often used as wild vegetables or as a food additive to provide aroma and flavor. Many scientific studies show that these species have high antibacterial, antifungal and antioxidant capacities. In this study, phenolic profiles of different extracts from the leaves of *Z. clinopodioides* L. (Ergan Mountain, Erzincan, Turkey) were determined by high performance liquid chromatography (HPLC) technique. Total phenolic and flavonoid contents of the extracts were determined by Folin-ciocalteu and Aluminum colorimetric methods, respectively. Antioxidant activities were evaluated according to DPPH and ABTS free radical scavenging and metal ion chelating capacities. HPLC analysis displayed that *Z. clinopodioides* L. is especially rich in rosmarinic acid (9,566 µg/mg ext), chlorogenic acid (3,744 µg/mg ext), catechin (3,58 µg/mg ext) and t-ferrulic acid (2,861 µg/mg ext), respectively, while 9 different phenolics were detected in trace quantity. Total phenolic, total flavonoid and antioxidant activity tests showed that methanol extract had higher phenolic and flavonoid content and also higher antioxidant activity than water and ethylacetate extracts. As a result, phenolic contents of the plant was higher in the methanol extract and, accordingly, the methanol extract had higher antioxidant activity. *Z. clinopodioides* L. extracts can be considered as pharmaceutical and natural therapy in the fight against oxidative stress.

IMPROVEMENT OF NUTRITIONAL PROPERTIES OF PUFFED RICE-CORN CAKE USING WHEAT GERM

NERMIN BILGIÇLİ¹, TEKMİLE CANKURTARAN¹

ABSTRACT

Wheat germ constitutes approximately 3% of whole grain and obtained as by-product of flour milling industry. It is a good source of protein, minerals, vitamins, phytochemicals and dietary fiber. Wheat germ is an excellent product to enhance the nutritional and functional properties of foodstuffs. In this study, wheat germ was used in puffed rice-corn cake (PRCC) production at 0, 10, 20 and 30 % levels. Some physical, chemical and sensory properties of the PRCC were determined. Thickness and diameter values of the PRCC samples changed between 2.65-3.63 mm and 72.3-89.8 mm, respectively. Increasing amount of wheat germ in PRCC preparation decreased the diameter and thickness of the PRCC samples. L*, a* and b* values of PRCC varied between 61.60-80.05, -2.09-1.79 and 15.42-19.16, respectively. As the wheat germ level increased, L* values of PRCC decreased, a* and b* values increased significantly. The highest total phenolic contents and antioxidant activity values obtained 30% wheat germ usage in PRCC. Appearance, crispiness, color and overall acceptability scores of PRCC samples decreased over 10% wheat germ addition level.

EFFICACY OF AROMATHERAPY IN REDUCING ARTHRITIS PAIN: A SYSTEMATIC REVIEW

DİLEK EFE ARSLAN¹, SEVİNÇ KUTLUTÜRKAN²

ABSTRACT

Objective: This study aims to investigate aromatherapy interventions in reducing arthritis pain and to evaluate the efficacy of such interventions. **Method:** In this review, a total of 12 randomized-controlled and experimental and semi-experimental studies which met the inclusion criteria were included. All studies were systematically reviewed. **Results:** Aromatherapy interventions were applied for a period ranging from two days to 3 months in all studies. Both pre- and post-intervention measurements were performed. In only one study, weekly measurements were conducted. In 11 of 12 studies, aromatherapy interventions yielded significant results in favor of the intervention group. **Conclusion:** Our study results suggest that aromatherapy is effective in pain reduction.

UTILIZATION OF DIFFERENT ANTIOXIDANT-RICH SOURCES IN PUFFED RICE-CORN CAKE PRODUCTION

TEKMİLE CANKURTARAN¹, NERMIN BILGIÇLI¹

ABSTRACT

Corn and rice are the most widely used cereals in the production of expanded/puffed snack foods. Recently, cake form of puffed cereal have become very popular snack foods. In this study, it was aimed to improve the functional properties of puffed rice-corn cake (PRCC) by addition of different antioxidant rich-sources. Control PRCC samples was prepared from rice:corn blend (70:30 w/w) using a cereal cake machine. Antioxidant rich-sources (grape seed, black cumin seed, pomegranate seed and flaxseed) as powder form were used at 5% ratio replacing with rice:corn blend. Thickness, diameter, color values, total phenolic content, antioxidant activity and sensory properties of PRCC samples were determined. L*, a* and b* values of the PRCC samples varied between 66.67-79.70, -2.13-0.89 and 13.75-18.15, respectively. As expected, all of the antioxidant rich sources decreased the L* values of the PRCC samples significantly (p<0.05). While black cumin usage gave the darkest surface color, grape and pomegranate seeds most increased a* values of the PRCC samples. All antioxidant sources increased total phenolic content and antioxidant activity of the samples significantly (p<0.05), and the highest increments were observed in PRCC samples containing grape seed (0.68 mgGAE/g and 45.65%) and pomegranate seed (0.67 mgGAE/g and 47.27%). As a result of sensory analysis, PRCC containing black cumin seed was the most appreciated samples by the panellist.

EFFECTS OF WHEAT BRAN AND GERM ON PHYTIC ACID AND MINERAL CONTENT OF FRESH PASTA

TEKMİLE CANKURTARAN¹, NERMIN BILGIÇLI¹

ABSTRACT

Wheat bran and wheat germ are by-products of wheat milling process. The functional and nutritional properties of those by-products are quite remarkable for human nutrition. In this study, wheat bran and wheat germ were used in filled (with cheese) and unfilled fresh pasta production at different ratios (0, 5, 10, 15 and 20%). Fresh pasta samples were produced according to (2x2x5) x2 factorial design. Phytic acid and mineral matter contents of fresh pasta samples were determined. Phytic acid content of filled and unfilled fresh pasta without wheat bran was found as 121.12 mg/100 g and 131.04 mg/100 g and, respectively. Usage of 20% wheat bran in filled and unfilled fresh pasta increased phytic acid content up to 655.32 mg/100g and 665.78 mg/100 g, respectively. Fresh pasta samples produced with addition of wheat germ were found to have higher Mg, P, Zn and lower Ca, Fe, K and phytic acid contents than those supplemented with wheat bran. The use of filling in fresh pasta production caused increase in Ca, K, Mg and P while it reduced the phytic acid content. Increasing ratios of wheat bran and wheat germ usages caused increases in phytic acid and all of the measured mineral matter.

ASSAYS OF ANTIOXIDANT ACTIVITY BASED ON METAL NANOPARTICLES

SALİHA DİNÇ¹, MERYEM KARA¹, SEVGİ KOLAYLI²

ABSTRACT

Determination of antioxidants and/or antioxidant activity of food and herbal products have importance especially for medicinal plant and functional foods. Oxygen radical absorbance capacity (ORAC), trolox equivalent antioxidant capacity (TEAC) and ferric reducing ability of plasma (FRAP) are some of in vitro assays generally used to evaluate antioxidant activity. . However, these different tests give different results. Moreover, in vitro antioxidant methods use synthetic free radicals which are not found in biological systems. By virtue of mentioned reasons, development of new methods is required. Recently, antioxidant activity assay based on metal nanoparticles have been developed. Noble metal nanoparticles have different and attractive optical, electrical and chemical properties depending upon their size. One of these interesting properties is that metal nanoparticles have localized surface plasmon resonance (LSPR). In traditional methods, metal nanoparticles are synthesized by reduction of metal salts with reducing agent. Antioxidants can be used as reducing agent in synthesis of such metal nanoparticles. Recently, antioxidant activity methods based on this strategy were developed. Generation/enlargement of metal nanoparticles were determined from plasmon-absorbance band using UV –VIS spectrophotometer. Up to now, mostly gold and silver nanoparticles have been studied for the antioxidant activity assessments. Antioxidant power of green tea, black tea, orange juice, virgin argan oil, endemic medicinal plant was determined via these newly developed assays. Also utility of rhodium, vanadium, ceria, palladium nanoparticles were investigated for the antioxidant activity assays

JUJUBE FRUIT AND EFFECT ON HEALTH

MUSTAFA KÜRŞAT DEMİR¹

ABSTRACT

Jujube (*Zizyphus jujuba* Mill.) is the fruit which belonging to the Rhamnaceae family and is indigenous around China. Also, jujube is a native fruit of widely distributed in Asia and Europe. Jujube is called as Hünnap, Ünnap, günnap and Çiğde in Turkey. It is a tasty and highly nutritious fruit. Fruits are eaten fresh, dried or processed. The fruit is very nutritious on account potassium, phosphorus, calcium and manganese and also is a rich source of vitamin A, C and vitamin B complex of fresh fruits is higher than most of fruits. It is rich in nutrition including protein, fat, carbohydrate and other biological active substances. Besides, jujube has significant levels of antioxidant activity and it contains many medicinal properties. The fruit contains rich medicinal properties, especially used for diabetes in Turkey. It helps gain weight, improves muscular strength and increases the resistance immune system. Additionally, these fruits have been commonly used in medicine for liver troubles, asthma, fever, nausea, vomiting, abdominal pains, wounds, gout and rheumatism. Also, the fruits and their products have protective effects against cancer, stroke and coronary heart diseases. In this review, jujube fruit, which is substantial for diabetics, has been dealt with its nutritional, functional and medical properties.

VIBURNUM OPULUS L. (CRANBERRY BUSH)

ADNAN DİLTEMİZ¹

ABSTRACT

KAYSERİ REGIONAL DIRECTORATE OF FORESTRY REGIONAL MEDICAL-AROMATIC PLANT: VIBURNUM OPULUS L. (CRANBERRY BUSH) ABSTRACT Viburnum opulus L. (Cranberry bush) is a perennial plant that grows up to 2-4 meters, bushy, with white-flower, deciduous in winter. This plant grows mainly in the temperate climate of the northern hemisphere in the world. During the Seljuks and Ottomans, this plant was influenced by the beauty of the flowering period and was given the local name "Gül Ebru" and this name was changed to the "gileburu, gileburu, gilaboru, giraoglu" in Kayseri and its surroundings; in Sivas and Yozgat provinces, its name turned into "gilaboru, girabolu, geleboru". According to some botanists, the origin of the plant is Turkey, and according to the others it is Central China. V. opulus, which likes rich soil in terms of organic materials, needs plenty of water to grow well, sun to give good color and good quality fruit. It is naturally grown in Central Anatolia and Black Sea regions in Turkey, especially in Kayseri, Bursa, Sakarya, Ankara, Tokat, Sivas, Trabzon, Çorum, Yozgat, Kahramanmaraş, Kırşehir, Istanbul, Kocaeli, Erzurum and Samsun. V. opulus fruit juice is consumed as a traditional drink especially in Kayseri at the center of Central Anatolia. Fruits, bark and leaves of V. opulus has a variety of uses among the general public for the purposes of rheumatism, diabetes, mumps, hemorrhoids, hypertension, menstrual irregularities, laxatives and sedatives in the reduction of kidney stones and sand, urinary incontinence, liver, stomach and prostate disorders. When flowers and fruits are boiled in water, they are effective against sore throat, mouth and dental inflammation. It is known that the powder obtained from the stem cortex of the plant is mixed with the butter and applied dermatological injuries. In the chemical analysis of gilaboru fruit grown in Kayseri; Sucrose and maltose were not detected while total sugar 5.34 g / 100 g, invert sugar 5.34 g / 100 g, fructose 2.38 g / 100 g were detected. Calcium was found to be 230.3 mg / kg, potassium (K) 1867 mg / kg, phosphorus (P) 57.72 mg / kg and iron 2.48 mg / kg. It has also been proven that the fruits contain phenolic acids and such as caffeic acid, p-coumaric acid, gallic acid, protocatechic acid, citric acid, chlorogenic acid, salicin, elagic acid polysaccharides. Cortex of V. opulus contained viopudial (Nicholson ve ark., 1972), skopoletin, also α - ve β - amyryne and catechin tannins. According to the literature, fruits, leaves and cortex of the plant have various pharmacological properties. Fruits have effect antibacterial (Sađdıç et al., 2006), protective effect after lung transplantation (Eken et al., 2017), immunostimulant (Ovodova et al., 2000), gastroduodenoprotective effect (Zayachkivska et al., 2006); the cortex of plant has inhibitory effect to enzyme converting angiotensin (Barbosa-Filho et al., 2006) and hypotensive effect (Nicholson et al., 1972); leaf extract has antinociceptive effects (Altun et al., 2008c). As a result; V. opulus is being cultivated firstly to Kayseri, Yozgat and Sivas provinces that area was under the responsible of Kayseri Regional Directorate of forestry. In order to find out the potential of Gilaboru, which is a medicinal and aromatic plant, will increase the production and consumption, as a result of the interdisciplinary studies of the units such as medicine, pharmacology engineering and joint works

THE EFFECT OF URTICA DIOICA L. EXTRACT ADDED ON GREEN TEA (CAMELLIA SINENSIS) ON TOTAL ANTIOXIDANT CAPACITY

FATMA HEPSAĐ¹

ABSTRACT

Scientific research conducted in recent years shows that green tea (*Camellia sinensis*) and antioxidant active ingredients borne by *Urtica dioica* L. can help reduce the risk of developing many acute and chronic diseases. However, the addition of the stinging *Urtica dioica* L. extract to the green teas has not brought about the change in antioxidant capacity. The aim of this study is to determine the total antioxidant capacity of five different green tea samples, as well as the changes in total antioxidant capacity values after addition of *Urtica dioica* L. extract at different concentrations (0, 5%, 7.5% and 10%). The highest antioxidant effect was observed in teas with 10% > 7.5% > 5% > 0% of supplementary extracts, respectively, while the addition of *Urtica dioica* L. extract in study increased the antioxidant activity compared to the plain green tea. In conclusion, our study showed that the addition of *Urtica dioica* L. extract to green tea significantly increased antioxidant activity, and at least once a day, the immunomodulatory properties (substance that alters the immune system response by increasing or decreasing the power of the immune system) and antiinflammatory polysaccharides It is thought to be effective.

MEDICAL AND AROMATIC PLANTS FOUND IN ADANA FLORA AND THEIR USAGES

FATMA HEPSAĐ¹

ABSTRACT

The Mediterranean region has a large genetic plant diversity with its climate, geographical and topographical characteristics. As in our country, medicinal and aromatic plants, which play an important role for the local people in Adana flora, have been used in different fields such as medicine, food, natural tea, perfume, paint, spices, ornamental plants and cosmetics for the purpose of obtaining nutrition and health problems. It is important to pay attention to some important points in the cultivation, collection, sale and consumption of these plants which affect human health and which have been used for many years as folk medicines. Because these plants are usually collected in a sloppy manner, sold to people who do not have sufficient sales and usage knowledge, and consumed unconsciously. In this case, even medical plants that are beneficial to health can be harmful to humans. This traditional knowledge, which directly concerns public health, needs to be compared with existing literature. In this study, it is determined how medical and aromatic plants found in Adana natural flora and which have high economic values are provided, where they are provided, how they are named among the people, used parts, usage areas, literature searches and transcripts. As a result, it is aimed to evaluate these rich natural floras, which are obtained by transferring all acquired data to a database for scientific research, transferring this information to new generations, increasing local people's interest in medical and aromatic plants, and helping the cultivation of these plants.

BIOACTIVE POTENTIAL AND HEALTH EFFECTS OF ILEX PARAGUARIENSIS AND PERSEA AMERICANA LEAVES

SARA BULUT¹, BÜLENT BAŞYIĞIT², GÜLBAHAR AKYAR, İBRAHİM HAYOĞLU², A. FERİT ATASOY³

ABSTRACT

Ilex paraguariensis and *Persea americana* are two of the most important plants. They have played an important role on human diet around the world. They have been used commonly for medical. Additionally, *Ilex paraguariensis* and *Persea americana* leaves are important ingredient of food and different industries. The aim of this study was to determine antioxidant activity and total phenolic content of *Ilex paraguariensis* and *Persea Americana* leaves. Additionally, pH, color, brixs and extraction yield of aqueous extract of samples were evaluated. pH, color, brixs (g 100g-1) and extraction yield (g 100g-1) of *Ilex paraguariensis* leaves were 5.77, 22.09, 2.74, 5.76, 0.35, 2.40, these results were 6.05, 27.15, 0.46, 6.64, 0.1, 0.45 for *Persea Americana* respectively. Antioxidant activity (2.20±0.32 g g-1 DPPH) of *Ilex paraguariensis* leaves were higher than *Persea americana* (20.14±0.018 g g-1 DPPH). Total phenolic content of *Ilex paraguariensis* ve *Persea americana* leaves were 48.55±2.72, 5.03±0.06 mg GAE g-1 respectively. Correlations between these results and total phenolic content were observed.

DETERMINATION OF ANTIOXIDANT ACTIVITY AND TOTAL PHENOLIC CONTENT OF ARBUSCULA FOLIIS, FOLLICULI SENNAEAND, URTICA LEAVE

GÜLBAHAR AKYAR¹, BÜLENT BAŞYİĞİT², SARA BULUT, İBRAHİM HAYOĞLU², A. FERİT ATASOY³

ABSTRACT

Plants have played an important role on human diet. They are a valuable source of different bioactive compounds. Plants have been used for different purpose in the different industry as cosmetic, food and medicinal. However, they are consumed commonly as herbal teas, food additives and spices. In this study, it was aimed to obtain antioxidant activity and total phenolic content of plants (*Arbuscula foliis*, *Folliculi Sennaeand*, *Urtica*) leaves. Physical, chemical and spectrophotometric analyses were used in the analyses of leaves. Antioxidant capacity was expressed as EC50. The highest antioxidant capacity was shown by *Urtica* (6.046 ± 1.8 g g⁻¹ DPPH). *Arbusculafoliis*, *Folliculi Sennaeve* leaves of antioxidant activity as EC50 were 17.95 ± 1.2 , 80.81 ± 0.05 g g⁻¹ DPPH respectively. Total phenolic content of samples was 1.29 ± 0.35 , (*Arbusculafoliis*), 15.84 ± 0.525 (*Folliculi Sennae*), 10.06 ± 1.87 (*Urtica*) mg GAE g⁻¹. Additionally, pH (g 100g⁻¹), brixs, L*, a*, b* and extraction yield (g 100g⁻¹) of aqueous extract of samples were 6.45, 0.5, 25.67, 2.67, 6.57, 0.117 (*Arbuscula foliis*); 5.63, 0.3, 20.19, 2.67, 1.36, 1.44 (*Folliculi Sennaeand*); 7.52, 0.15, 19.48, 0.55, 0.59, 1.84 (*Urtica*).

INVESTIGATION OF THE EFFECT OF DIFFERENT SOLVENTS EXTRACTIONS ON ANTIOXIDANT AND PHENOLIC LEVELS OF CRUDE AND RIPE FIG (FICUS CARICA)

ZEYNEP DENLİ¹, MEHMET AKBULUT², HÜSAMETTİN VATANSEV³, SERDAR KARAKURT⁴

ABSTRACT

Figs have been consumed as a part of Mediterranean diet for centuries either as fresh or dried fruit. It has been defined that figs have more than 50 compounds. Antioxidant compounds such as phenols, organic acids, vitamin E and carotenoids prevent oxidative damages in the cell causing many diseases occurring in human body. The aim of this study is comparison of effects of different solvents including water, methanol, ethanol, acetone and ethyl acetate on total phenolic and antioxidant levels of crude and ripe figs collected from Akseki/Antalya. Crude and ripe figs have been lyophilized and the extraction process with water, methanol, ethanol, acetone and ethyl acetate solvents has been performed. The total phenolic content of the extracts has been determined with Folin-Ciocalteu method by using gallic acid as standard. The total antioxidant capacity has been determined with Phosphomolybdate Assay by using ascorbic acid as standard. The antioxidant capacity has been analyzed with DPPH assay and calculated with trolox standard curve. Yields obtained from crude fig extractions made in water, methanol, ethanol, acetone and ethyl acetate are 49.3%, 35.8%, 26.5%, 20.8%, 16.8%, respectively while yields for ripe fig are 85.5%, 79.7%, 80.3%, 17.3%, 7.1%, respectively. It has been determined that total phenolic contents containing in the water, methanol, ethanol, acetone and ethyl acetate extractions of crude fig are 388.3, 3336.5, 1333.2, 3680.3, 595.7 mg Gallic acid Equivalent (GAE)/kg dry weight, antioxidant capacities are 16.2, 33.0, 22.9, 27.3, 15.2 mg Ascorbic Acid Equivalent (AE)/g dry weight and antioxidant activities are 11.6, 23.2, 20.0, 54.0, 45.6 mmol Trolox Equivalent (TE)/kg dry weight respectively. It has been found that total phenolic contents containing in the water, methanol, ethanol, acetone and ethyl acetate extractions of ripe fig are 482.2, 25.3, 108.7, 3976.2, 1220.4 mg Gallic acid Equivalent (GAE)/kg dry weight, antioxidant capacities are 4.5, 9.8, 8.6, 41.9, 48.8 mg Ascorbic Acid Equivalent (AE)/g dry weight and antioxidant activities are 7.2, 5.6, 6.0, 54.5, 57.6 mmol Trolox Equivalent (TE)/kg dry weight respectively. Finally, in this study, the phenolic and antioxidant level differences in crude and ripe fig extractions making with different solvents have been evaluated. While total phenolic content is maximum in acetone extraction, it is minimum in water extraction in crude fig. The highest total phenolic content is found in acetone extraction while it is found minimum in methanol extraction in ripe fig. Besides, total antioxidant capacity is maximum in methanol extraction, it is minimum in ethyl acetate extraction in crude fig. Total antioxidant capacity is maximum in ethyl acetate extraction while it is minimum in water extraction in ripe fig. While antioxidant activity is maximum in acetone extraction, it is

DETERMINING THE FACTORS AFFECTING THE MEDICINAL- AROMATIC PLANT CONSUMPTION OF INDIVIDUALS (THE CASE OF ERZURUM CENTRAL COUNTIES)

SEMIHA KIZILOĞLU¹, RÜVEYDA KIZILOĞLU²

ABSTRACT

Medicinal and aromatic plants are used as medicines to prevent diseases, maintain health, or improve diseases. Demand for these plants in world markets is increasing every other day. Especially, the emergence of side effects of synthetic and chemical medicines has increased the use of medicinal plants. This study aimed to determine the medicinal and aromatic plant level of consciousness at purchase of individuals living in the urban areas in the central counties of Erzurum city (Aziziye, Palandöken, and Yakutiye). In the study, proportional sampling method, 90 % confidence interval, and 5 % error margin were employed. According to 2016 TURKSTAT data, the total population of Erzurum central counties was 417.385 people. The sampling of the study consisted of 272 individuals, which was found by calculating the proportion of the central counties within the total and homogeneously distributing it to the districts. The data of the study were collected through a questionnaire. The mean age of the interviewed individuals was found to be 35.04, 54.04 % were male, 76.10% were married, and 2,572.72 TL/month had income. The first ten medicinal aromatic plants bought by the individuals are; mint, garlic, cumin, thyme, red pepper, sumac, linden, rosehip, sage and relish. As the most important reasons why individuals do not buy medical aromatic products; They were not believed to be quality products (73.53%), not delicious (64.34%) and not believing that they were fresh (39.71%). 5-point Likert scale was used to determine the characteristics that individuals have been careful about when purchasing medical aromatics. In order to determine the criteria to be considered for purchasing, factor analysis was carried out to determine whether grouping within 10 properties can be done. As a result of analysis 10 properties; It is understood that the product may be collected under two factors: the status prior to the purchase of the product and the status of the purchase. These 2 factor loads were subjected to Binary logit analysis as explanatory variable. In the study, the factors affecting the purchasing of medicinal aromatic plants were determined using binary logit analysis. Conscious individuals (Constantly and often purchasing) and individuals with low consciousness level (Very rare and not), which is the dependent variable of the model, were identified. That is, 61.20 % of the individuals were determined to be conscious. The age, gender, marital status, and educational level of the individuals, educational, gender, and employment of the spouse level of the individuals' wife, monthly income, Purchase from herbalist, purchase from pharmacy, purchase from wholesaler, self-sum, season effect, preference status, pre-purchase status and purchasing status were all used as explanatory variable. As a result of the analysis, at the 1% significance level, it has been determined that individuals transfer medicinal aromatic products from their purchase location, pharmacies and positively affect them. In other words, it has been determined that individuals

ALTERNATIVE TREATMENTS IN MENOPAUSAL PERIOD

SİNEM EREM¹, AYŞE ÖZFER ÖZÇELİK¹

ABSTRACT

Abstract Alternative Treatments in Menopausal Period Objective: The purpose of this review is to investigate the effects of plant species used in alternative treatments on symptoms of menopause. **Methods:** Articles between 1990-2017 were investigated by using Pubmed, Google Scholar, Science Direct databases, using the keywords "Climacteric Complaints and Herbal Treatment", "Herbal remedies for Menopause", "Menopause and Phytoestrogens", have been compiled. **Results:** Woman in general suffer from various symptoms caused by hormonal changes in the menopausal phase. Long-term hormone replacement therapy (HRT), which is used to reduce climacteric symptoms, was shown to increase cognitive capacity, prevent cardiovascular disease and osteoporosis, but pose a risk for breast and uterine cancer. Therefore, plants which are sources of phytoestrogen and have estrogenic properties started to be used as alternative therapy instead of HRT. Particularly hops (*Humulus lupulus*), chaste-tree/berry (*Vitex agnus-castus*), yams root (*Dioscorea villosa*), flaxseed (*Linum usitatissimum*), maritime pine (*Pinus pinaster*), black cohosh (*Cimicifuga racemosa*), dong quai (*Angelica sinensis*), St. John's wort (*Hypericum perforatum*), red clover (*Trifolium pratense*), primrose (*Oenothera biennis*) were the plants studied. In the literature, depending on the amount of topical or oral use of these plants and plant extracts which have active different compounds; positive/negative effects on quality of life and vasomotor symptoms especially hot flushes, were mentioned. **Conclusion:** Although studies conducted in Turkey have been limited, in International studies is shown that the plants which are used in alternative medicine is not commonly used outside of the countries where they are grown, safety usage dosages of some extracts and deverse effects on menopausal symptoms are not specified. More studies on these plant species, that are frequently used in alternative treatment methods, are needed.

MEDICINAL AND AROMATIC PLANTS USED BY MOTHERS TO INCREASE BREAST MILK

HAMİDE AYGÖR¹, KAMİLE ALTUNTUĞ¹, EMEL EGE¹

ABSTRACT

Breastfeeding is so important for keeping and maintaining mothers and infants' health status. The World Health Organization (WHO) is aiming at increasing the rate of breastfeeding to 50% by 2025 (WHO 2014). In Turkey, starting to feed neonates with additional food or formulae is a common practice. While the age of feeding infants only with breast milk was 42% in 2008, the rate is seen to have decreased to 30% in 2013, according to the data from Turkey Demographic and Health Surveys (TDHS 2008 and TDHS 2013). As the most important reason why mothers feed their infants with no breast milk during the first six months and start additional food at an early period, mothers declare insufficient breast milk or not having enough breast milk to feed their infants. So, those considering having insufficient breast milk or not having enough breast milk to feed their infants consume various medicinal and aromatic plants to increase their breast milk. In studies performed, mothers are seen to use medicinal and aromatic plants, such as garlic, fennel, urtica urens, parsley, cummin, linden, sage and aniseed, etc. in order to increase their breast milk (Gokduman and Balkaya 2013, Dinc et al. 2015). Although the effect mechanisms of medicinal and aromatic plants used to increase breast milk still remain unclear, traditional experiences and conventional beliefs demonstrate that these plants are safe and reliable. However, mothers lack the essential information, such as the use, dose, composition and effectiveness of these plants (Tanrıverdi et al. 2014, Erkaya et al. 2015). It should be kept in mind that especially the effects of such medicinal and aromatic plants will be transmitted via maternal nourishment to the infants, and mothers considering having insufficient breast milk should be questioned as to whether mothers are using any medicinal and aromatic plant. For this reason, it is a must that primarily healthcare professional in the field should find out on what medicinal and aromatic plants proved in literature can enhance breast milk, what the appropriate amount is, and how to use. Knowing the effects of medicinal and aromatic plants used to enhance breast milk in postpartum period by healthcare professionals, and planning the training and counseling programs to be given to mothers and families are important for the evaluation of the negative effects of medicinal and aromatic plants on mothers and infants' health status.

DECONTAMINATION OF FRESH-CUT SALADS INOCULATED WITH ESCHERICHIA COLI O157:H7 AND SALMONELLA SPP. UTILIZING DIFFERENT PLANT HYDROSOLS AS A NATURAL FOOD SANITIZER

CAGIL CAKIRKOCAK¹, GULSUM UCAK², MUHAMMED ZEKI DURAK²

ABSTRACT

Minimally processed fresh fruits and vegetables are important components of the human diet and also they are highly susceptible to attack by different microorganisms because of their high nutritional content. When fresh-cut fruit and vegetables are exposed to microbial contamination with pathogenic microorganisms, they may threaten public health. In this study, it was aimed to determine the efficiency of different plant hydrosols on decontamination of two foodborne pathogens, *E. coli* O157:H7 and *Salmonella* spp., from fresh-cut salads including iceberg lettuce, parsley, cucumber, carrot pepper, carrot and red cabbage. Two experiments were carried out using two inoculation levels (approximately 10⁴ or 10⁶ CFU/mL for *E. coli* O157:H7, approximately 10³ or 10⁵ CFU/mL for *Salmonella* spp.) Hydrosols of oregano (*Origanum vulgare* L.), thyme (*Thymus vulgaris* L.) and rosemary (*Rosmarinus officinalis* L.) produced via hydro distillation method were applied to on contaminated fresh-cut salads for 0, 20, 40 and 60 min. In the low inoculum level, oregano and thyme hydrosols resulted in ~ 4 log CFU/g reduction in *E. coli* O157:H7 population at the 40 min and 60 min time period, respectively ($P < 0.05$). In the high inoculation, Oregano hydrosols reduced the population of *E. coli* O157:H7 by ~ 6 log CFU/g at the end of 60 min, while thyme hydrosol resulted in ~ 4 log CFU/g reduction in *E. coli* O157:H7 at the same time. Oregano and thyme hydrosols significantly reduced the bacterial population compared to the control samples at the 20, 40, 60 min time period ($P < 0.05$). In the low and high inoculum level, hydrosol of rosemary was inefficient for ($P > 0.05$) *E. coli* O157:H7 inactivation. In the low inoculation level, rosemary hydrosol treatment for 20 min resulted in ~1 log CFU/g *Salmonella* spp. population reduction in salads ($P < 0.05$). However, extension of hydrosol treatment period did not provide an additional reduction ($P > 0.05$). Oregano hydrosols reduced *Salmonella* spp. population significantly, resulted in ~ 4 log CFU/g reduction at the end of 60 min, while thyme hydrosol resulted in ~ 2 log CFU/g reduction in *Salmonella* spp. at the end of 20 min ($P < 0.05$) treatment. Additional reduction in microbial population was not observed with increasing treatment time for thyme hydrosol ($P > 0.05$). In the high inoculum level, rosemary hydrosol did not cause any reduction in *Salmonella* spp., population during the periods applied ($P > 0.05$). Inhibitory effect of thyme hydrosol showed the highest antimicrobial effect on *Salmonella* spp. count in the high inoculation followed by oregano. Thyme hydrosol achieved ~1 log reduction at the end of every 20 min implementation. Results demonstrate that plant hydrosols especially oregano and thyme could be successfully used as natural food sanitizers for fresh-cut salads to enhance microbiological safety depending on the sensory characteristics of the product.

ANTIMICROBIAL EFFECTS OF SOME ESSENTIAL OILS

İLYAS GÜLDAL¹, ŞENİZ KARABIYIKLI¹

ABSTRACT

Phototherapy means that herbal therapy. Therapeutic extracts obtained from certain parts of plants are used in the treatment. The plants have many functional features but the most effective parts of them are the essential oils. The most important parts of essential oils are terpenic compounds and their homologues. The basic forms of large and complex structured hormones are similar to those of simple molecules, so they are bridge molecules between essential oils and hormones. Monoterpenes and sesquiterpenes are found in volatile oils as the main active substance classes. They can be applied on skin and also be consumed for a treatment. Essential oils that contain too much phenol cause itching and irritation even on healthy skin when applied directly. For this reason they should be used as the main treatment substance and mixed with fixed oils at low concentrations. Some of the essential oils have antimicrobial activity. The majority of these compounds are phenolic structures containing a hydroxyl group. These components may disorder enzymatic reactions by causing degradation of the enzyme systems of microorganisms; may inhibit enzyme synthesis at the nucleus and ribosomal level or may change the structure of the membrane to cause sensitization and permeability of the phospholipid layer on the cell membrane. The structural and functional properties of the microorganism membrane get damaged by effecting on two components of the proton mobile power: pH gradient and electrical potential. It cause ions, ATP, nucleic acid and amino acids to leak out of the cell. The outflow of K⁺ ions is often the early sign of damage to the cell, often followed by the outflow of the cytoplasmic structures. The disappearance of the proton mobility balance and the release of the ATP pool is the main cause of cell death. In this review ginger, bergamot, argan and black cumin essential oils were researched. These oils have been used for many years for pharmacological purposes and consumption. The terpenes they contain have functional properties. There are several studies that emphasize the antimicrobial and antifungal activities on especially food borne pathogens and additionally, their contributive effects on health and their functional properties. More in-situ studies that research the opportunities to use in foods and, presentation the effect mechanism of complex ingredients in food matrix are needed.

EFFECT ON NORHARMANE PRODUCTION OF ANABAENA ORYZAE UNDER PH STRESS CONDITION

RAMAZAN ERENLER¹, TÜNAY KARAN², ZEKERİYA ALTUNER²

ABSTRACT

Cyanobacteria (blue-green algae) represent a group Gram negative procaryotes, which include highly bioactive secondary metabolites. The purpose of this study is to determinate the quantity of a pharmaceutically important norharmane under various pH stress. Cyanobacterium obtained from the water sample taken out of the Tokat Yeşilirmak River was mechanically isolated under an inverted microscope. It was grown in 250 ml of BG110 media containing different pH concentrations; 5.0, 7.0, 9.0 under controlled laboratory conditions at 25 ± 2 °C under 12:12 h (light/dark cycle) with white fluorescent lamp of 155 photons m⁻²s⁻¹ light intensity. Quantitative analysis of norharmane metabolite conducted by HPLC. Amounts of norharmane ($\mu\text{g/g}$) were calculated according to the Gauss method by drawing a calibration curve over the absorbance value in the 247 nm wavelength of the standard. Based on the results, the amount of norharmane at pH 5.0, 7.0 and 9.0 were found to be 0.269, 0.692, 1.192 $\mu\text{g/g}$, respectively. Most norharmane production was detected in alkaline medium.

QUALITY CHARACTERISTICS OF NOODLE INCLUDING GROUND YELLOW POPPY SEED

SEDA YALÇIN¹, BESİM MADEN¹

ABSTRACT

The objective of this study is the production of noodle including ground yellow poppy seed which has phenolic compounds. Phenolic compounds have antioxidant activity. According to the researches, these compounds reduce risk of many diseases like cancer. In this study, ground yellow poppy seed (purchased from Afyon) was added to the noodle formulation at the ratios of 5% and 10%. Flour used in the production was obtained by milling of two wheat variety (Kundurur and Altıntas). The control sample was noodle sample including no ground yellow poppy seed. After production, quality characteristics, total phenolic content and color values of noodle samples were analyzed. Quality characteristics of noodle samples made from Kundurur wheat flour were higher than that of noodle samples made from Altıntas wheat flour. Ground yellow poppy seed addition caused dark color at the noodle samples. Control samples had higher quality characteristics compared to noodle samples including ground yellow poppy seed. Higher phenolic content was observed for noodle samples including ground yellow poppy seed.

DETERMINATION OF QUALITY CHARACTERISTIC OF BISCUITS INCLUDING GROUND YELLOW POPPY SEED AS FAT REPLACER

SEDA YALÇIN¹

ABSTRACT

In this study, fat was replaced by ground yellow poppy seed in biscuit formulation for producing low fat biscuit and the changes in physical characteristics, color values and total phenolic content of biscuits with fat replacement were investigated. Fat replacement caused an increase in weight and spread ratio of biscuits, indicating improved quality. Lower L* values, higher a* and b* values were obtained for biscuits including ground yellow poppy seed. Total phenolic content of biscuits increased gradually as ground yellow poppy seed level in biscuits increased.

DETERMINATION OF THE SOCIO-ECONOMIC STRUCTURES OF THE HERBALISTS THAT SELL MEDICAL AND AROMATIC PLANTS: THE CASE STUDY IN CENTRAL BLACK SEA REGION

MURAT YEŞİLKAYA¹, ERGÜN KAHVECİ¹, SALİH MALKOÇOĞLU²

ABSTRACT

From accessible sources of history, it is known that people use plants to treat nutritional needs and diseases in particular. Until the early part of the twentieth century, about half of medicinal medicines were derived from plants, while in the century late the proportion fell to less than five percent, depending on scientific developments. The organic plant consumption that starts with the return to nature in the last years is the alternative of modern medicine. Turkey has a great economic potential in terms of medicinal and aromatic plants collected from the nature due to its position in the intersection of Iran-Turan (Central Asia), Mediterranean and Avrosibiria (Euro-Siberia) phytocrofiotic regions and its flora containing a large number of plant species diversity and folk medicine applications also very common. Due to its economic value and its use in folk medicine applications, care should be taken to cultivate, collect and sell these plants. Preparing, selling and unconscious consumption of medicinal plants for people who do not have technical knowledge can affect human health negatively. Herbalists (aktarlar) are at the forefront of establishments that provide medical and aromatic plants. It is a requirement that herbalists, who have a role in the presentation of medicinal and aromatic plants to the public, should have technical knowledge in obtaining and selling products. For this purpose, it is important to analyze the socio - economic and professional knowledge of herbalists. In this study, demographic and occupational information of some herbalists in Ordu, Samsun, Amasya, Tokat and Çorum in the Middle Black Sea Region were examined. We also tried to determine where they procured the products and for what purpose they sold them. Within the scope of the study, face-to-face surveys will be conducted with the herbalists in the Middle Black Sea Region who voluntarily participate in the study and the necessary data set will be created with the help of the questions on the questionnaire. The obtained data will be evaluated with the help of SPSS package program.

HUMIC SUBSTANCES POTENTIAL OF RHODODENDRON (RHODODENDRON PONTICUM L.) AREAS IN SAKARYA REGIONAL FOREST ADMINISTRATION

OKAN KURŞUN¹, HALİL KARADEMİR¹, SELDA KARAKAYA¹, MUSTAFA İŞÇİOĞLU²

ABSTRACT

Humic substances (humic acid, fulvic acid and humin) are a valuable organic substance used in many fields of industry especially agriculture and animal husbandry, health, cosmetics and so on. Therefore; There are serious studies on humic substances in different disciplines such as chemistry, biology, food, environment and health. In forestry at the production of seedlings humic substances can be used to grow larger and higher quality seedlings for afforestation and artificial rejuvenation. Rhododendrons (Rhododendron L.) are one of the rich sources of Humic substances. In this study, it was attempted to estimate the potential humic substances of Rhododendrons which are the predominant species in the lower layer of beech forests within the study boundaries of the Sakarya Regional Forest Administration. For this purpose, Rhododendron spread area was calculated by District Management size which includes Adapazarı, Akyazı, Geyve, Gölcük Forest Administrations. In Rhododendron spread areas humic depth measured millimetrically at O₂ horizon and average values calculated for every forest management. This depth values associated by Rhododendron spread areas for guessing the Humic substances potential.

RESIN PRODUCTION AT MARITIME PINE IN SAKARYA REGIONAL FOREST ADMINISTRATION (PINUS PINASTER AITON)

OKAN KURŞUN¹, İHSAN KÖSE¹, ABDULLAH DUMAN², HAKAN MERCAN²

ABSTRACT

Resin is secreted by resin channels which made by differentiate of parenchyma cells. Pine resin is an important non-wood forest product and forms the raw material of rosin and turpentine. Resin is widely used in the chemical industry. Mainly used in industries are paper, cosmetics, rubber, chewing gum, ink, paint, varnish, medicine and so on. There are forests suitable for resin production in Turkey but fewer resins are produced for commercial use. Our country is importing resin and resin products and it crates serious Money loss. With the growth of the sectors that use resins, demand for resins and derivative products is increasing day by day and our country needs to be relieved from foreign dependence and money loss. It is important to appreciate the potential resin resources and make resin production efficient, sustainable and economically widespread throughout the country. Our country has 68.000 hectares maritime pine forest and Sakarya Regional Forest Administration has 7.500 hectares maritime pine industrial plantation. One of the first examples of resin production in Turkey started at Sakarya Regional Forest Administration Taşköprü and Kefken District Forest Managament's maritime pine industrial plantations using acid paste method in year 2015. With this study, Sakarya Regional Forest Administration examined the potential of resin production in maritime pine forest industrial plantations.

THE EFFECTS OF OMEGA-3 POLYUNSATURATED FATTY ACIDS ON COGNITIVE FUNCTIONS

ALİ EMRAH BIYIKLI¹, EZGİ TOPTAŞ BIYIKLI¹, ELMAS ERSÖZ¹

ABSTRACT

Cognitive functions to maintain in a healthy way are based on adequate and balanced nutrition at every stage of life. Adequate and balanced diet also requires intake an adequate level of omega-3 polyunsaturated fatty acids which play an important role in cognitive functions. Alpha-linolenic acid (ALA) is a source of omega-3 fatty acids and be an essential throughout life, is converted to metabolites such as eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA) that have different functions in the metabolism, by desaturase and elongase in the body. **PURPOSES:** In this study, current studies about the relationship between omega-3 fatty acids and cognitive development in infancy, childhood and old age are compiled. **METHODS:** The effects of omega-3 fatty acids on cognitive function have been investigated in this compilation study that was prepared by the literatures. The effects on cognitive functions of consumption of omega-3 fatty acids with foods or as dietary supplements in infancy, childhood and old age were evaluated. **RESULTS:** Omega-3 fatty acids are provide brain development and the realization of central nervous membran functions in the period of last trimester of gestation and until two years old brain development is very fast. In addition, they are accumulate in the brain continuously during the period of growth. In adults, they are effected on regeneration of dendrits and axons in neuronal wounds and branching of neuronal dendrites in memory formation. While there is no adequate data to determine the requirements of omega-3 fatty acids which are essential for brain function, adequate intake level envisaged as daily intake of 1.1-1.6 grams. **CONCLUSIONS:** The maintainig to cognitive development and cognitive functions in a healthy way is required to intake in adequate levels of omega-3 fatty acids. But there is inadequate data that increase of cognitive development in the high level of intakes. In order to determine the net effects of omega-3 polyunsaturated fatty acids intake levels on cognitive functions are thought to be needed more than studies.

DEMENTIA AND ANTIOXIDANTS

ALI EMRAH BIYIKLI¹, EZGI TOPTAŞ BIYIKLI¹, ELMAS ERSÖZ¹

ABSTRACT

Dementia is a clinical syndrome characterized by acquired losses of cognitive and emotional abilities, being severe enough to interfere with daily functioning and independence. Incidence of dementia is rapidly increase depend on the population growth and prolongation of life in the World. Oxidative stress has an important role in neuronal and central vascular disorders which are occurs according as aging to the formation of disease. Under normal circumstances, the cells are protected by antioxidant defense systems for oxidative damage that is may caused free radical products such as peroxides. The oxidative stress, resulting from the imbalance between free radicals and antioxidants which is the strongest advocates against, is lead to impaired neuronal metabolism and apoptosis and this condition associated with dementia. **PURPOSE:** In this research aimed to evaluate of the studies investigated to the relationship between antioxidant intake and dementia. **METHODS:** In this study was prepared with surveying the literatures, researched on efficiency of antioxidants in prevention and treatment of dementia and separately evaluated of effects of antioxidants which using as food or dietary supplements on dementia. **RESULTS:** Major antioxidants such as vitamin C, vitamin E, carotenoids and flavonoids-rich diet has been shown to have positive effects to the prevention of dementia in the studies conducted on intakes antioxidants with foods. While we were meet the prophylactic effects of ginko biloba, curcumin and idebenone other than vitamin C and vitamin E in the studies were concerned antioxidants intakes with foods, it was concluded that dietary intakes of major antioxidants provides better results in the prevention of dementia. **CONCLUSIONS:** Today, increasing the dementia incidence is inevitable to parallel in raised population growth, life expectancy and elderly population. Correct dietary preferences are important to the treatment and prevention of dementia. A diet rich in antioxidants that help protect from dementia is very important, as well as the reduction of symptoms in individuals with dementia and / or are important for slowing the progression.

SUŞEHİRİ AND THE EVALUATION OF THE MEDICAL PLANTS VARIETY

FERDA KURNAZ KARAGÖZ¹, AHMET SERTESER²

ABSTRACT

In this research, survey has been made in order to characterize the medical plants which take part in public life and people take advantage of. For these reasons, surveys have been organized going to the center of Suşehri and it's villages. 68 plant samples which have medical feature, have been picked and these samples defoliated using herbarium technique. The different kinds of these plants information related to them have been gathered. According to the survey results, 12 plants have been qualified as digestive system disease, 9 plants have been used urinary tract diseases and urologic diseases, 6 plants for cardiovascular diseases, 6 plants for diabetics, 8 plants for the treatment of physical injury, are defined.

EFFECTS OF DIFFERENT DRYING AND INFUSION PROCESSES ON ANTIOXIDANT PROPERTIES OF TRIFOLIUM PRATENSE (RED CLOVER)

İHSAN GÜNGÖR ŞAT¹, MUHAMMET DEMİRBAŞ², DURMUŞ ALI SÖYLER³

ABSTRACT

Trifolium pratense, an important forage plant in many parts of the world. Otherwise, studies on phytoestrogenic and antioxidant properties are being carried out in terms of human health. Trifolium flowers are used as herbal tea. Only the flowers of the trifolium pratense plant were used in this study. Flowers were subjected to two different drying processes, microwave oven and conventional oven. Dried flowers were infused in two different ways with hot and cold water. Total phenolic content (TPC), ferric reducing antioxidant potential (FRAP), DPPH* (2,2-diphenyl-1-picrylhydrazyl) radical scavenging activity and ABTS* (2,2'-azino-bis(3-ethylbenzthiazoline-6-sulfonic acid)) radical scavenging activity were determined in water extracts of fresh and dry samples. The findings were compared with ascorbic acid, gallic acid, BHA, BHT and trolox standards. Total phenolic content and FRAP capacity of fresh sample were determined as 26,023 µgGAE/mg and 10,194 µgGAE/mg dry weight of extract respectively. DPPH (IC50) and ABTS (IC50) radical scavenging activity of fresh sample were determined as 2,850mg/ml, 1,897 mg/ml dry weight of extract respectively. Total phenolic content and FRAP capacity of microwave dried sample were determined as 21,128 µgGAE/mg and 7,992 µgGAE/mg respectively. DPPH (IC50) and ABTS (IC50) radical scavenging activity of microwave dried sample were determined as 1,214 mg/ml and 2,113 mg/ml respectively. Total phenolic content and FRAP capacity of conventional dried sample were determined as 16,307 µgGAE/mg and 5,591 µgGAE/mg respectively. DPPH (IC50) and ABTS (IC50) radical scavenging activity of conventional dried sample were determined as 2,090 mg/ml and 3,759 mg/ml respectively. Total phenolic content and FRAP capacity of infused samples were varied from 4,194-19,178 µgGAE/mg. FRAP capacity of infused samples were varied from 1,906-7,246 µgGAE/mg. DPPH (IC50) radical scavenging activity of infused samples were varied from 1,613-12,420 mg/ml. ABTS (IC50) radical scavenging activity of infused samples were varied from 2,618-15,874 mg/ml. Microwave dried and hot water infused herbal teas showed higher antioxidant activity than other processes.

THE EFFECTS OF OZONATION ON THE CHEMICAL COMPOSITION OF PECAN NUT OIL

KADIR TURHAN¹, FATMA TÜLAY TUĞCU¹, YUSUF CAN GERÇEK², GÜL CEVAHİR ÖZ²

ABSTRACT

In recent years, ozonated vegetable and fruit oils are used effectively in industries such as food, cosmetics, cleaning, pharmaceuticals and medical. It is suggested that ozone increases the shelf life of the oils and makes their chemical content more effective in treatments. Pecans [*Carya illinoensis* (Wangenh.) K. Koch], native from North America, belong to the Juglandaceae family which also includes walnuts (*Juglans* sp.). Pecan nut [*Carya illinoensis* (Wangenh.) K. Koch] contain not only phenolic acids and flavonoids, such as the flavan-3-ol monomer (+)-catechin, they also contain oligomeric and polymeric proanthocyanidin (PAC) compounds. The main compounds responsible for the antioxidant capacity of the pecan are phenolic compounds and tocopherols. Phenolic contents found in the plants attract attention because of their antimicrobial activities and antioxidant properties. The Pecan nut presents bioactive molecules, such as sterols, tocopherols and phenolic compounds in its composition. These compounds present antioxidant activity through the stabilization of free radicals. For this purpose, chemical analyses were carried out through GC-MS by obtaining oils from *Carya illinoensis*'s nuts using claevenger method. From the spectrums obtained consequently to the analysis, sterols, tocopherols and phenolic compounds contents and percentages of *Carya illinoensis* were determined. After ozonation process of these oils obtained from *Carya illinoensis*, GC-MS analyses were performed and the percentages of their chemical contents were compared with the data before ozonation. It was observed that ozonation increased the percentages of phenolic compounds. In line with these results, it is thought that *Carya illinoensis* which demonstrate strong antimicrobial activity augment their activities by being ozonated.

STUDIES ON ROSEMARY (ROSMARINUS OFFICINALIS L.) PRODUCTION AND GENE RESOURCES PROTECTION

SEVDA POLAT¹, OSMAN POLAT¹, MUHAMMET KÖSE²

ABSTRACT

Rosemary (*Rosmarinus officinalis* L.) is one of the most important medicinal and aromatic plant in the Eastern Mediterranean Region of Turkey. It is used as a spice and herbal tea in the food industry, which is an important source of antioxidants. Rosemary also consumed in aromatherapy, cosmetics, perfumery and pharmaceutical industries. Already it grows naturally the west and south coasts of Turkey the most intense spread is located between Yumurtalık-Adana and Çiftlikköy-Mersin provinces. Rosemary is not cultivated in Turkey yet so production is carried out in the areas of the forest. According to General Directorate of Forestry official records, in the last three years the average annual production was 208 tons/year. The 76% of this production is carried in Tarsus. Local people usually collect rosemary products, as General Directorate of Forestry the forest district tariff cost is so low they prefer to pay the fee, and products are sold to buyers by auction. Due to its limited area of distribution, and in order to ensure the sustainability of the natural areas the controlled production is done biannually. Selection study done on native rosemary provenances of Eastern Mediterranean Region by Eastern Mediterranean Forestry Research Institute. The aim of this study was to present improved clonal saplings to farmers who want to cultivate and to determine rosemary origins that have high dry leaf and essential oil yields making individual selection from the populations of *Rosmarinus officinalis* L. that are native to in the Eastern Mediterranean Region of Turkey which will contribute conservation of rosemary genetic resources. As a result of this project Rosemary clone garden was established with suitable clones in Mersin-Tarsus and Adana Köprüköy Nursery. Thus, the protections of gene resources of Rosemary were provided in natural distribution area (in-situ) and except for the natural distribution area in nursery (ex-situ).

BAY LAUREL (LAURUS NOBILIS L.) PRODUCTION IN THE EASTERN MEDITERRANEAN REGION AND REHABILITATION STUDIES

SEVDA POLAT¹

ABSTRACT

Bay laurel (*Laurus nobilis* L.) is one of the most important exporting medicinal and aromatic plants of Turkey. It spreads naturally along the all coastlines of Turkey. The leaves and fruits are used for production. Dried leaves are generally used as a spice. While the essential oil from the leaves are used in the food industry, the oil from fruits are used to in soap making. Bay laurel production is carried out by the local people in forest areas. The fee paid to General Directorate of Forestry (OGM) is very low (0,08 TL/kg). Local people collect leaves from forest areas and sell them as fresh or dry. According to OGM records the annual production increased three fold, which was, 7025 tons in 2008 was reached to 21788 tons in 2016. The laurel production in Adana, Mersin and Kahramanmaraş Regional Forest Directorates (RFD), which are located in Eastern Mediterranean Region, is almost met 30% of country production. Annually 2400 ton is produced in Adana RFD, the production in Kahramanmaraş and Mersin was 308t/year and 208 t/year respectively. The productions were increased eight fold in last four years. Turkey holds 90% bazaar capacity on the world bay laurel leaves trade. Thus, it has got the important state in quality, price and quantity on the bay laurel leaves. Also the export amount of the bay laurel has increased in recent years from 6932 tons in 2008 to 12741 tons 2015. The increase in production for bay Laurel was affected by the international demand along with inventory and planning in the laurel forest by OGM. The rehabilitation studies are important for the increase of leaf yield. In this study; information on production of Bay laurel in the eastern Mediterranean region, increase of production and rehabilitation studies are provided.

**RESEARCHES ON MEDICINAL AND AROMATIC PLANTS IN
EASTERN MEDITERRANEAN FORESTRY RESEARCH INSTITUTE
DIRECTORATE**

OSMAN POLAT¹

ABSTRACT

Eucalyptus (*Eucalyptus* spp.), Bay Laurel (*Laurus nobilis* L.), oregano (*Origanum* sp.) and rosemary (*Rosmarinus officinalis* L.) are important medicinal and aromatic species of eastern Mediterranean region in Turkey. Various researches were done on these species by Eastern Mediterranean Forestry Research Institute Directorate. In this paper, reaching interest groups with by sharing the results of the research is aimed. First study was carried out jointly by Medicinal and Aromatic Plant and Drug Research Center and Eastern Mediterranean Forestry Research Institute. The aim was to determine the essential oil yields and chemical compositions of some Eucalyptus species grown in Tarsus-Karabucak in Turkey. *E. globulus* ssp. *globulus* gave the highest oil yield (2.7-4.1 %) in leaf oils (Başer et al, 1998). The name the research is Cultivation and Genetic Improvement of Wild Oregano Species Growing in the Eastern Mediterranean Region of Turkey. The aim of this study was to select more productive *Origanum* species and provenances, and making individual selection for establishing clonal seed orchards to present improved seeds to farmers (Gülbaba and Özkurt, 2006). Bay laurel has very economic important specie in this region. Bay Laurel research was to determine the most suitable leaf harvesting method and cutting period, which would yield good quality, and quantity leaves of Bay Laurel and its economy. According to these results; the combined leaf harvesting method (clear cutting and pollarding) and two years interval shoot cutting were suggested for laurel production (Polat et al, 2010). The aim of first study was to identify rosemary populations and their distribution areas around Mersin and Adana province, at the same time, the determination of percentage of dry leaf yields, dry matter, essential oil yields and their seasonal variation and compositions, the most suitable harvesting time. The distribution of natural rosemary populations begins from Çiftlikköy/Mersin, stretching as half-moon, Adana at the center, to Çamtepe/Yumurtalık. Within this boundary rosemary covers about 8850 hectares and 1,8-cineole was found as major component of rosemary essential oil (Gülbaba et al, 2002). Aim of second research was to determine more productive rosemary clones making individual selection, and to present improved clonal rosemary saplings to farmers who want to cultivate establishing clonal cutting orchards and thus to contribute conservation of rosemary genetic resources of Eastern Mediterranean Region of Turkey. (Türker et al, 2011). Then the other research was undertaken on rosemary and oregano. The aim of this research was to determine the regeneration protocol for micropropagation of the ecotypes with the high yield of species of *Rosmarinus officinalis* L. and *Origanum syriacum* L. var. *bevanii* using tissue culture (in vitro) method, and also to compare the essential oil compounds of maternal and regeneration plants and callus.

PROPAGATION OF MASTIC(PISTACIA LENTISCUS VAR. CHIA) UNDER CONTROLLED GREENHOUSE ENVIRONMENT BY GRAFTING

SALIH PARLAK¹, NADIRE ALBAYRAK BAKMAZ²

ABSTRACT

Mastic is a species contained in the rich biological diversity of Turkey and has an economic potential. Mastic tree is a dioecious tree while the quantity and quality of the resin secreted by female trees are very low; therefore, male trees that are clonally propagated are used to establish commercial plantations and obtain mastic. Traditionally, Long branch cuttings are conventionally used for clonal seedling production. However, this production method requires too many materials and has a very low rooting rate. Rooting with tissue culture and green cuttings has also failed under external environmental conditions. Due to the challenges faced in the mass production of seedlings by clonal method, it is used for afforestation and plantation to a limited extend. The purpose of this study was to propagate the mastic tree clonally by grafting, which has some advantages such as adaptation to different ecological conditions and the possibility to obtain the desired crown and tree form. *P. atlantica* and *P. lentiscus* rootstocks were grafted under greenhouse conditions from 15 February to 15 October every 15 days using three different grafting methods. As for the graft union formation, it was aimed to determine the most appropriate rootstock, grafting time and grafting method. This study was planned according to combined over years two-factor randomized blocks trial design, and SPSS software package was used for statistical analysis. This study that was conducted under greenhouse conditions demonstrated that the mastic could be propagated clonally by grafting. In grafting methods used in the study, the bud-take ratios and bud sprout rates were better in *P. atlantica* compared to *P. lentiscus*. The highest graft success was obtained in *P. atlantica* with 56,6%, and *P. lentiscus* with 50%. As regards the grafting times and bud-take ratio, chip budding can be performed on 15 February, scion can be performed from 1 March and 1 April, T budding can be performed from 15 March to 1 April. The best result among the grafting methods used n the study was obtained from scions with a similar bud-take ratio in both rootstocks. The survival rates of the Atlantic mastic grafted by chip budding and T budding were higher.

THE USE OF CLOVES IN AKÇAKATIK CHEESE

İLHAN GÜN¹, ASLI ALBAYRAK¹, AYTEN SEÇİL ARSLAN¹, MEHMET AYDIN¹

ABSTRACT

The diversity of cheese production is influenced by many factors, such as the cultural level of the society, the social life conditions, the geographical situation of the region, the difference in the cheese processing technologies, the milk type used in production and the substances used for seasoning (spice or herb mixtures). It is reported that there are approximately 50 cheese varieties in Turkey where people with different cultural characteristics have been living for centuries. However, it is speculated that in many regions of Turkey, there are still cheese varieties that have no commercial value or their domestic production is on the verge of extinction. Among the traditional products, Van herby cheese (as a cheese type in the herbed cheese group) and Hatay Sürk cheese (as a cheese type in the seasoned cheese group) are the most widely known and consumed cheese types. Adding nigella to Tulum cheese, a cheese type produced in many regions, is also a common practice. Another property of the seasoning substances used in cheese production is their effect on health. The clove, produced by the *Syzygium aromaticum* tree, has antimicrobial properties along with its positive effects on health including its analgesic properties, its ability to help treat the common cold and sinusitis, its positive effects in treating coughing and bad breath, its expectorant properties, its ability to boost the immune system and prevent diarrhea. Clove powder is used in Akçakatik cheese, which is one of the traditional cheese types in Turkey. This cheese variety, which is produced in Burdur province and its vicinity by adding clove and nigella to strained yogurt, remains in the closed family economy and is yet to be produced on an industrial scale. The most important effect of using cloves in cheese production is to give the product a unique aroma. The main substance in cloves that give the products their smell and taste is the volatile oil called eugenol. This substance, extracted from clove, has the most significant antioxidant properties when compared to other substances in the plant. Moreover, terpenic compounds, such as benzyl alcohol, 2-heptanone, ethyl hexanoate, calcaren, calamenene, etc., are also part of the oil composition, albeit in minor amounts. However, overuse of cloves in the product spoils the taste, making it bitter. The spice and seasoning substances used in cheeses also affect their color. As the addition of cloves to cheese curd increases, the color of the cheese gets browner, which results in an undesirable appearance. Another property of the seasoning substances is that they have antioxidant properties. Studies have shown that cloves have an antioxidative effect as strong as butylated hydroxytoluene and butylated hydroxyanisole. Current studies have focused on the standardization of Akçakatik cheese production and the effect of the ratio of cloves in the product.

ABSTRACT

In this study, effects of microwave treatment on olive leaves were investigated in terms of total polyphenols (TP) and major phenolic compound of olive leaf, oleuropein. Microwave drying (MD) conditions regarding microwave irradiation power, sample mass and drying time were optimized by Face Centered Composite Design (FCCD) through Response Surface Methodology (RSM). Root mean square deviation (RMSD) was employed to assess the relationship between the observed and estimated results in addition to coefficient of determination (R²). Findings achieved under the optimal conditions of MD were compared with those of freeze drying (FD), vacuum drying (VD), oven drying (OD) and ambient air drying (AAD) methods. The antioxidant activity (AA) of the leaves was also evaluated by 2,2'-azino-bis-(3-ethylbenzothiazoline-6-sulfonic acid) diammonium salt (ABTS) method. The correlation between TP/oleuropein and AA values were quantified by Pearson correlation coefficient (r).

USING AROMATIC PLANTS IN TRADITIONAL DAIRY PRODUCTS

İLHAN GÜN¹, AYTEN SEÇİL ARSLAN¹, MEHMET AYDIN¹, ASLI ALBAYRAK¹

ABSTRACT

One of the most important methods used to prevent the development of foodborne microbial diseases, especially pathogens, is to add aromatic volatile oils. These are derived directly, or by steam distillation, from plant parts that are aromatic volatile oil sources including leaves, root parts, seeds, twig parts and fruits. Essential oils – along with their antibacterial, antiviral, antimycotic, antioxidant, antiparasitic and insecticidal properties – add flavor, aroma and color to products. Terpenoids, including carvacrol, carvone, thymol and phenylpropanoid groups including cinnamaldehyde, eugenol and anethole, appear in various parts of plants acting as active components and have antibacterial effects towards most bacteria. Thanks to these properties, they are added to many food products and affect various properties of these products, particularly their chemical and sensory properties. In milk and dairy products, these aromatic components are either added directly to the milk, depending on the animal feeding pattern, or are added externally to the dairy products during production. For example, the amount of carvacrol that passes to the milk when hair goats feed on natural vegetation in the high plateaus greatly affects the aroma of the products obtained from the goat's milk. In addition, nigella is commonly used in Tulum cheese, which is among the most widely consumed traditional cheese types in Turkey, and helps take thymoquinone into the body as an active component. Thymoquinone has antioxidant and anti-inflammatory effects, and inhibits tumor growth. Hatay Sürk cheese, another traditional cheese type in Turkey, contains a mixture of various spices including nigella, black pepper, clove, thyme, red pepper, cumin, coriander, nutmeg, mahaleb, peppermint, garlic, cinnamon, pimento and ginger. This is why it is one of the richest dairy products in volatile aromatic compounds produced in Turkey. In addition, the use of rosemary, a good antioxidant, is common due to its inhibition of oxidation in butter. It was determined that spices and volatile oil components added to dairy products through local herbs show antibacterial activity at varying rates against pathogens that are important for food safety including *Listeria monocytogenes*, *Salmonella typhimurium*, *Escherichia coli* O157:H7, *Shigella dysenteriae*, *Bacillus cereus* and *Staphylococcus aureus*. For example, it was determined that the "sirmo" (*Allium* sp.) in Van herby cheese had a high antimicrobial effect, the "mendo" (*Anthriscus* sp.) in the herb mixture had inhibitory effects on *K. pneumoniae*, *P. aeruginosa* and *S. aureus* and "heliz" (*Prangos* sp.) in the herb mixture had inhibitory effects on *P. aeruginosa*, *E. faecalis* and *S. aureus*.

PHYSICO-CHEMICAL PROPERTIES OF GOJI BERRY AND ITS HEALTH BENEFITS

GÖKSEL TIRPANCI SİVRİ¹, SERAP DURAKLI VELİOĞLU¹, KADIR GÜRBÜZ GÜNER¹

ABSTRACT

Berries and red fruits are rich sources of polyphenols which are known with their health benefits. Goji berry (*Lycium barbarum* or *Lycium chinense*), belongs to Solanaceae family which is deciduous shrubbery growing in China, Tibet, and other parts of Asia. Goji berry is known with its health-promoting properties, which comes from high content of phytochemical substances. Berry fruits are often the richest source of antioxidant among fruits and vegetables. There are many studies present on phenolic profiles of Goji berry extracts which indicate a strong capacity to scavenge oxygen radical species and to inhibit oxidation as well as growth of pathogenic bacteria. Based on the available data from several studies, total phenolic content of goji berries around 281.91 mg GAE/100 g FW, total bioactive compound content 6048.24 mg/100 g FW and antioxidant capacity 2300 mg/mL IC 50 of DPPH radical scavenging. The major antioxidant compound identified in commercially available goji berries was N-feruloyl tyramine. In recent years, popularity of Goji berry was increased because people's awareness on its various health-promoting properties among several illnesses (reduced risk of cancer, cardiovascular disease, heart disease and stroke). Important health-promoting properties are related to phenolics, including antioxidant activity, regulation of some metabolizing enzymes, and modulation of gene expression and subcellular signaling. The aim of this review is to discuss phytochemical profile of goji berry and its potential health effects.

HONEY PLANTS USED IN KEPSUT (BALIKESİR) FOR YARDOP FIELD

FATİH YILMAZ¹, SELAMI SELVİ², FATİH SATIL²

ABSTRACT

In this study, it was aimed to improve beekeeping activities in nearby villages by planting rich species included pollen or nectar among fire resistant plants in Kepsut-YARDOP (Balıkesir) trial areas and nectar. With this study, the peoples who living with beekeeping in settlement units around YARDOP areas have been established honey production areas which contributed economically to the people. In the research area; preferring for nectar and pollen of honey bees and species distributed naturally in Balıkesir were *Salvia virgata*, *Origanum onites*, *Lavandula angustifolia*, *Rosmarinus officinalis*, *Rhus coriaria*, *Erica arborea*, *Elaeagnus angustifolia*, *Arbutus unedo*, *Pyrus elaeagnifolia*, *Morus alba*, *Amygdalus communis* ve *Robinia pseudoacacia*. These species were periodically maintained for 2 years, their development observed and their retention rates determined.

EFFECT OF DIFFERENT PASTEURIZATION AND STORAGE TIMES ON MICROBIAL QUALITY OF FRESH PASTA

AYŞE BÜŞRA MADENCİ¹, SELMAN TÜRKER¹, NERMIN BİLGİÇLİ¹

ABSTRACT

Fresh pasta has short shelf life because of high water contents (>24%). Pasteurization and modified atmosphere packaging (MAP) applications are used to extend shelf life of fresh pasta. In this study, the effects of different pasteurization and storage times on microbial quality of fresh pasta prepared with different antioxidant and dietary fiber sources were researched. For this purpose, three different combinations of dietary fiber and antioxidant sources (comb1: oat fiber 15% + flaxseed 5%, comb2: barley fiber 15% + flaxseed 5%, comb3: oat fiber 15% + pomegranate seed 5%) were used in fresh pasta formulation. Control fresh pasta prepared with wheat semolina. Pasteurization was applied to fresh pasta samples at 90 °C for 60, 120 and 180 second. After cooling of fresh pasta, MAP was applied to fresh pasta using 50-50% nitrogen-carbon dioxide gas mixture. Packaged fresh pasta samples were stored at 8 weeks at 4 °C. The effects of different times of pasteurization and storage on microbial quality of fresh pasta were researched. While combined samples without pasteurization preserve microbiological quality until 14th day of storage with only MAP application, storage time was prolonged until 56th day by 180 second pasteurization applications. In fresh pasta production process, pasteurization at 90 °C and 180 second coupled with MAP application prolonged the shelf life of fresh pasta. Bu çalışma, TÜBİTAK tarafından 114O389 nolu proje ile desteklenmiştir.

USAGE OF DAIRY BY-PRODUCTS IN THE PRODUCTIONS OF FUNCTIONAL CEREAL PRODUCTS

SELMAN TÜRKER¹, AYŞE BÜŞRA MADENCİ¹

ABSTRACT

Cereal products have an important place in daily nutrition in our country [1]. Wheat that raw material of cereal products, is rich in vitamins such as thiamine, riboflavin, pentotenic acid, nicotonic acid and tocopherol [2]. Despite its economic and nutritional advantages, wheat is not sufficient in terms of protein quality due to inadequacy in terms of essential amino acids [3]. During the processing of milk to various products, by-products having different properties are obtained. Skim milk, buttermilk, whey, ayran and blanching water are some of the dairy by-product (DBP) [4]. DBP are frequently used food components in the nutritional and functional enrichment of cereal products. Skim milk has almost the same components as milk, except fat [4], which is widely used to increase the nutritional value and quality of cereal products [5]. The buttermilk increases the flavor of the product used and also has an effect on the product structure with emulsifying properties. Buttermilk that has high-protein and lecithin, is used in production of products such as biscuits, crackers and cakes [3]. Whey is one of the important DBP when produced during the production of cheese and is a good source of protein. The Maillard reaction that occurs between lactose and free amino acids of whey is contributes to the desired crust color of bread. [6,7]. It is stated that whey protein concentrate can be used instead of egg in the production of products such as biscuits, cakes and bread, and can be effective in obtaining the desired color and brightness of these products. It has also been reported that hydrolyzed whey can be used to remain of bread and various cereal products as fresh for a long time and to limit mold growth [8]. In a study on Kadayif production, it was determined that the use of whey increased the nutritional value of samples and the best sensory properties were formed at the rate of 50% usage [9]. In a study using different DBP in bread production, it was indicated that these DBP could be used to improve the nutritional properties of the bread and increase bread quality [5]. In another study where whey and buttermilk used in the production of flat bread, it was determined that the use of DBP improved the properties of the dough. It has also been reported that the use of whey increased the protein content of flat bread to 14.6% [10]. [1] Elgün A, Ertugay Z. 1995. Tahıl İşleme Teknolojisi. Atatürk Üniversitesi. ANTIOXIDATIVE AND ANTIHYPERGLYCEMIC EFFECTS OF ALLIUM TUNCELIANUM ON STREPTOZOTOCIN-INDUCED TYPE I DIABETES

GÖZDE ATILA¹, HAMIT USLU², DINÇER ERDAĞ³, OKTAY ÖZKAN⁴

ABSTRACT

Nowadays, diabetes does not have a certain treatment method and the existing methods are because of both expensive and causing the various complications, researchers are tend to investigating new antidiabetic agents. It is be stated that oxidative stress is effective on the formation of Diabetes mellitus and its complications. For this reason, interest in natural antioxidant agents and phytochemicals has been increasing in recent years. *Allium tuncelianum* is an endemic garlic species localized in Tunceli / Turkey. It is stated that garlic has anticarcinogenic, antimutagenic, antibacterial, antiprotozoal, antifungal, antiviral effects as well as antioxidant properties thanks to its bioactive components. There are insufficient studies on the pharmacological activities of this garlic species. In this study aims to investigated that effects of *Allium tuncelianum* extract on hyperglycaemia and oxidative stress in diabetes rats with streptozotocin-induced. In this study, 40 female Sprague-Dawley rats, each 1-2 months old, were used and randomly divided into 4 groups as 10 animals in each group. Group I: Control (C), Group II: Diabetic control (DC), Group III: Diabetic+insulin (D+I), Group IV: Diabetic+*Allium tuncelianum* extract (D+AT). Diabetes was induced in rats by a single dose intraperitoneal injection of freshly prepared streptozotocin (50 mg/kg). 72 hours after STZ administration, blood glucose level of each rat was determined. Rats with a blood glucose range of 200mg/dL were considered diabetic and included in the study. 1000 gr of minced garlic sample was waited in 5000 ml of ethanol for 20 hours at room temperature and then the mixture was filtered. The liquid fraction was removed and evaporated at 30 °C. on a rotary evaporator. The plant extract was administered by oral gavage to rats at a dose of 250 mg / kg and insulin 2 IU subcutaneously daily for 28 days. Also physiological saline was administered to the control groups to equalize stress induced by oral application in all groups. Our data show that fasting blood glucose levels were significantly increased in DC group compared to C group ($p<0.001$). However, statistical significance was not determined between DC group and D+AT group. HbA1c level was significantly increased in the DC group while insulin level was significantly decreased ($p<0.001$). There was no significant change in insulin levels despite a significant reduction in HbA1c levels in the AT group ($p<0.05$). Although the TBARS levels in the liver and kidney tissues were significantly increased in the DC group compared to the C group, the SOD and CAT levels were significantly reduced ($p<0.001$). On the other hand, in

the AT group when compared to the DC group was observed increase in SOD and CAT levels ($p<0.001$) as well as a decrease in TBARS levels ($p<0.05$). In conclusion, the current data revealed that *Allium tuncelianum* extract administration possessed conspicuous modulating effects and was capable to overcome oxidative stress in liver and kidney tissues through its antioxidant properties.

USAGE OF FLAXSEED AND POMEGRANATE IN THE PRODUCTIONS OF FUNCTIONAL CEREAL PRODUCTS

SELMAN TÜRKER¹, AYŞE BÜŞRA MADENCİ¹

ABSTRACT

Functional food are products that have been shown to have health effects in protection or treatment of various diseases [1]. Cereals and cereal products are the most important food groups in terms of human nutrition. Vegetable food sources account for about 90% of daily calorie intake, while 53% of this value is due only to the consumption of cereal products [2]. Antioxidant activities of cereal products, which are very important for human nutrition, can be increased by using various natural sources and new functional products can be produced. With antioxidant-rich nutrition, body can be protected from adverse effects of free radicals leading to various chronic disorders such as cancer, parkinson and alzheimer [3,4]. Natural antioxidant sources have become very interesting products in enrichment of various food in terms of functional properties. Flax is a plant that has been cultivated since ancient times and has attracted attention in recent years as a functional food component with positive effects on health. Flaxseed is an important source of fiber, α -linolenic acid, lignan and protein and also a rich source of phytochemicals which have antioxidant properties [5]. Flaxseed is a frequently used product in the functional enrichment of various food. Studies have been carried out on the using of different properties and proportions of flaxseed for functional enrichment of bread [6], unleavened flat bread [7], muffin [8], cakes and biscuits [9], noodles [10] and pasta [11]. Several studies have been carried out on the health effects of pomegranate [12], which has high antioxidant activity such as flaxseed [13,14]. Edible parts and seed of pomegranate contain significant amounts of minerals and phytochemicals which have antioxidant activity [15,16]. The use of pomegranate and its by-products in the functional enrichment of cereal products has recently become a current issue and studies in this area are still limited. In a study on the enrichment of bread with antioxidants, pomegranate husk was added to bread formulation at different ratios and it was determined that the addition of pomegranate husk increased the antioxidant activities and the total phenolic content of bread [17]. In a study of the effects of pomegranate powder additions on biscuit samples, an increase in the total polyphenol content of the samples was reported due to increased addition ratios [18]. In another study, pomegranate seeds were added at different ratios to the noodle (erişte) formulation and it was stated that a sensory-acceptable product was obtained with using of 5% pomegranate seed [19]. BENEFITS OF THE SHEA TREE

IZIDEEN MAANIKUU¹, KENAN PEKER²

ABSTRACT

Shea butter is a solid fatty oil extracted from the nuts of shea (Karite) tree also known as *Vitellaria paradoxa* or *V. nilotica*. The tree grows naturally in the wild across sub-saharan savannah belt stretching across West and Eastern Africa covering about 20 countries. The tree has enormous socio-cultural and economic importance to peoples living in its geographic catchment area. Its leaves, stems, roots bark are used in various traditional medicine to treat a variety of diseases and injuries including stomach ache, headaches, fever, jaundice among others. The butter extracted from the fruit is used locally as food and as a cosmetic product for the skin and hair. In recent times there has been an increasing commercial and industrial demand of shea products. This is attributed to the discovery of its importance in the cosmetic and confectionary industries. Shea butter is used in cosmetic products and in the food industry where it is used as a cocoa butter substitute in the chocolate industry. In Africa where shea butter is produced it is also used as cooking oil. Shea butter is solid at room temperature but quickly melts at around body temperature. The chemical composition of shea butter includes a saponifiable fraction composed primarily of stearic and oleic acids with lesser amounts of palmitic, linoleic and arachidic acids. It also contains a substantial unsaponifiable fraction composed of bioactive substances that are responsible for Shea butter's medicinal properties. It has sun screening properties and acts as an emollient and skin moisturizer. Shea butter has is also reported to demonstra anti-aging and anti-inflammatory properties. Consumption of Shea butter has hypocholesterolemic effect and reduces serum and organ protein concentrations.

BIOLOGICAL ACTIVITY OF CAPPARIS SPINOSE L. LEAF, FLOWER AND FRUIT EXTRACTS AGAINST SOME PLANT PATHOGENS

NEŐE ÖZBEY¹, RUKIYE AKTAŐ², ABDURRAHMAN ONARAN²

ABSTRACT

In this study, the bioactivity of ethanol extracts from different parts (leaf, flower and fruit) of Capparis spinosa L. plant was investigated against four different plant pathogens (*Alternaria solani*, *Fusarium oxysporium* f. sp. *radicis-lycopersici* (FORL), *Monilia fructigena* and *Verticillium dahliae*) causing problems in agricultural areas. Extracts at doses of 10, 50, 100, 200 and 500 mg/ml were used in the activity studies. Activity studies of the extracts were carried out using the agar plate method against the test fungi. The highest efficacy from *C. spinosa* extracts was flower, fruit and leaf extracts, respectively. Activity was observed in all doses used. Strong antifungal effects were respected between 92% and 100% against test fungi at 500 mg/ml doses of extracts. Thiam 80% was used in the positive control and 50% acetone was used in the negative control. Also, lethal doses (LD10-50-90) of the extracts were determined against the pathogens. In addition, LD90 values for each pathogen were calculated to be 270 to 446 mg/ml in *C. spinosa* leaf extract, 210 to 924 mg/ml in *C. spinosa* flower extracts and 205 to 765 mg/ml in *C. spinosa* fruit extracts. According to all these results, it was determined that the extracts of *Capparis spinosa* had strong biological activity in control of plant pathogens.

EFFICACY OF ENDOPHYTIC AND EPIPHYTIC BACTERIAL ANTAGONISTS FOR BOTRYTIS BLIGHT CAUSED BY BOTRYTIS CINEREA ON SWEET BASIL

MERVE KARA¹, EMINE MINE SOYLU¹, ESRA SÖNMEZ¹, İMAM ADEM BOZKURT¹, ŞENER KURT¹, SONER SOYLU¹

ABSTRACT

Being an economically important herb used in the food industry and for medicinal purposes, sweet basil (*Ocimum basilicum* L.) is harvested several times a season. *Botrytis cinerea* Pers. is one of the main foliar pathogens in the cultivated area of sweet basil. Gray mold infects the fresh wounds created during harvesting and also develops on harvested shoots. This fungal pathogen causes outstanding blossom and leaf blight symptoms. Control of this pathogen can be achieved with application of fungicide, however, a few chemical fungicides are registered against gray mold in sweet basil in Turkey. Additionally, fungicide resistance of causal agent is well known. Aiming at discovering efficient biocontrol agents against grey mold on sweet basil, we have selected 31 endophytic and epiphytic antagonist bacterial isolates from our biocontrol bacterial culture collection. Among 31 putative bacterial isolates, 10 bacterial isolates were found effective to inhibit of development *B. cinerea* in dual-culture assay. These antagonist bacterial isolates were identified as *Arthrobacter oxydans*, *Arthrobacter queen*, *Bacillus simplex* (2), *Bacillus endophyticus*, *Bacillus megaterium* (2), *Bacillus pumilis*, *Enterobacter cloacae* and *Micrococcus luteus* using morphological, biochemical tests and MALDI-TOF MS identification system. Among bacterial isolates against *B. cinerea*, *A. oxydans* was found to suppress mycelial growth (66.6%) significantly. Isolates of *Bacillus* spp. were also effective in mycelial growth inhibition in dual-culture assay. These bacterial isolates were observed to produce at least one of the antagonism mechanisms (such as phosphate solubilisation, cell wall degrading enzyme and siderophore production etc.), which might be involved in their mechanisms of suppressing the mycelial growth. Based on the origin of these bacterial isolates appear to be a good source of potential biocontrol agents against grey mold.

EFFECT OF AUXIN AND CITOKININ COMBINATIONS ON REGENERATION OF HULLED EINKORN (TRITICUM MONOCOCCUM SSP. MONOCOCCUM) WHEAT

MEHMET ÖRGEÇ¹, GÜNCE ŞAHİN¹, FATMA PEHLİVAN KARAKAŞ¹, NUSRET ZENCİRCİ¹

ABSTRACT

As known, the life and the nutrition cycle depend on the vegetative production. Moreover, rapidly increasing population worldwide makes a sufficient and balanced nutrition uptake difficult because of rapidly declined agricultural lands for the production. Therefore, plant improvement, which aims to increase yield and to produce high quality, biotic and abiotic stress resistant cultivars, receives even more attention either by application of classical and / or modern techniques. Wheat, an important cereals consumed in the World and in Turkey, is consumed a lot for its nutritive and health properties. Unfortunately, biotic and abiotic stresses due to climatic fluctuations cause serious yield losses in wheat. Nowadays, these problems are, in addition to classical methods, solved by applying biotechnological methods and utilizing new sources of wheat genetic resources. These two are considered to prevent 25% of crop loss by increasing wheat tolerance/resistance against biotic and abiotic stresses. Among these, one important genetic source is diploid einkorn (*Triticum monococcum* ssp. *monococcum*; 2n=14) wheat, which dates back 12-13 thousand years and is the ancestor of today's wheat. It is now rarely grown in distant mountainous terrains of Turkey, Italy, Yugoslavia, etc. Einkorn wheats should be used as genitors in wheat improvement programs. An *in vitro* einkorn (*Triticum monococcum* ssp. *monococcum*) wheat production protocol is highly expected to contribute to these improvements. This is the first, to say, *in vitro* production protocol for einkorn wheat. In this study, we tested IAA-TDZ combinations for an efficient regeneration protocol for einkorn wheat. MATERIALS AND METHODS Sterilization procedure: Removed hulled grain structure of healthy einkorn seeds was put into 100 ml distilled water with 5 drop of Tween20 for 1 min. Seeds were then washed 3 times with sterile water. After this, all seeds were put into % 20 Domestos for 10 min and, again, washed 3 times with sterile water. Germination media: For germination induction, einkorn seeds were cultured on 4.4 g/l Murashige and Skoog nutrient medium (MS) supplemented with 30 g/l sucrose and 8 g/l agar. The pH of all media was adjusted between 5.7-5.8 using 1 N HCl and 1 N NaOH before autoclaving. After autoclave, seeds were planted into medium and all cultures were incubated in growth room under the conditions of 16 h light 8 hours dark at 23±2 °C for 10 days. Regeneration media: For regeneration, einkorn seeds were cultured on 4.4 g/l MS, 30 g/l sucrose and 8 g/l agar with combination of IAA (0, 0.5, 1, 2, and 3mg/l)–TDZ (0.5, 1, 2, and 3mg/l). Root, coleoptile, and leaf were used as explants. After explants were planted, petri dishes were put into growth room for 15 days under the same conditions as germination process. RESULT AND DISCUSSION We studied the effect of 20 different IAA–TDZ combinations on regeneration. The lowest shooting combination was 3.0 mg/l TDZ–2.0 mg/l IAA (0.1333), and the best shooting combination was 0.5 mg/l TDZ–0.0 IAA (2.5333). There were two combinations with a shooting

Corresponding Author: MEHMET ÖRGEÇ, mehmetorgec@gmail.com

¹ABANT İZZET BAYSAL ÜNİVERSİTESİ

bigger than 1.0: 1.0 TDZ – 0.0 IAA (1.0667) and 2.0 TDZ – 0.0 IAA (1.5333). The shootings in other combinations were less than 1.0. Considering this study is the first one on in vitro einkorn (*Triticum monococcum* ssp. *monococcum*) wheat production protocol, the results of ours might seem a good start. According to our findings, the 3 best shooting combinations do not consist IAA a derivative of auxin hormone. Therefore, we suggest that the best combination is 0.5 TDZ–0.0 IAA, and IAA does not have an effect on the shooting of einkorn wheat.

EFFECTS OF DIFFERENT SOWING AND HARVEST TIMES ON YIELD AND ESSENTIAL OIL CONTENT

AYŞE BETÜL AVCI¹, ÖZLEM ALAN¹, R. REFIKA AKÇLALI GIACHINO²

ABSTRACT

Parsley is a biennial plant belonging to the family Apiaceae. In the first year, the plant grows leaves and vegetative structures, and in the second year it produces flowers and then fruits (Ceylan, 1997). Parsley is one of the Mediterranean plants and is found wildly in Spain, Greece, Morocco, Turkey, Algeria and Tunisia. Cultivation of the plant are made commercially in the Mediterranean, Aegean and Marmara Regions and grown in the gardens throughout the country. Leaves and seeds contain essential oil, often the main component of the oil is apiol. Leaves are rich in C and K vitamins, and it used as a diuretic, stomachic, blood pressure promoter. Parsley can be usually harvested 4-8 times in temperate climates, if some special precautions are taken it may be 10-15 times. In arid, hot and cold climate regions, 2-4 harvests can be obtained. In this study, different numbers of harvest were obtained in autumn and spring sowing, and plant height, fresh herb and drug herb yields and essential oil contents were determined. The field research was carried out in 2014 and 2015 years according to the randomized blocks design with three replication in Odemis Vocational School. As a result of the study, 4 harvests were carried out in spring of 2014 sowing and the difference between the harvests was statistically found significant in terms of plant height, fresh herb yield, drug herb yield and essential oil content. While the essential oil content reached its highest value in the second harvest in July, all the other parameters provided the highest yield in the fourth and last harvest in September. The highest values for 2014 were 10.076 kg / da in fresh herb yield, 2171 kg / da in drug herb yield and 0.7% in essential oil content. In autumn sowing of 2015, two harvested could be done and no statistical differences identified in terms of the characteristics examined. In the second year, the highest green herb yield was determined as 1850 kg in decare, while the drug herb yield was 490 kg and the essential oil content was recorded as 0.6%. According to the results of the study, it is considered that spring cultivation for the production of parsley for Odemis conditions can be recommended in terms of yield and essential oil content.

ASSESSMENT OF UNIVERSITY STUDENTS' THOUGHTS ABOUT FUNCTIONAL FOODS

ÇAĞDAŞ SALİH MERİÇ¹, HACI ÖMER YILMAZ¹, NURCAN YABANCI AYHAN¹

ABSTRACT

Functional foods are nutrient and nutritional compounds that contribute to prevention of diseases and the maintenance of healthier life and which have positive effects on the physiological and metabolic functions of body, as well as meeting basic nutrient needs such as carbohydrates, proteins, fats and vitamins and minerals in the body. This study was planned and conducted to determine the knowledge and thoughts of university students about functional foods. A questionnaire developed by researchers on functional foods and characteristics, was applied to the students. The questionnaire consists of four parts. In the first part of questionnaire, demographic information of students and the source of information obtained, in the second part opinions of students about functional foods, in the third part whether some foods are functional or not and in the last part Functional Food Information Form, developed by researchers consisting of 28 questions, was applied in order to measure the knowledge of students about functional foods. Students got 1 point for each question correctly answered and 0 point for each question answered incorrectly. The lowest and highest score that can be taken from these questions is 0 and 28, respectively. Students who scored 14 and over are classified as having sufficient knowledge level, those who score lower than 14 are classified as having insufficient knowledge level. The study was carried out on total 150 university students, 104 female and 46 male. Mean age of students was 21.1 ± 1.2 years and mean Body Mass Index (BMI) was 21.7 ± 3.2 kg / m². According to BMI classification of university students, 74.0% are normal, 14.0% are weak and 12.0% are overweight/obese. 54.3% and 51.9% of male and female students have information previously about functional foods, respectively. Students declared that information about functional foods was obtained from internet (44.3%), television (20.3%) and doctor-dietitian (17.7%). More than half of students have no information about price, content, effects, production and purpose of functional foods and majority of students think that functional foods are accessible, delicious and harmless for health and should be consumed by healthy persons. Majority of students think nutrients containing low-calorie, dietary fiber content, diabetic (no sugar) foods, enriched foods, probiotic and prebiotics and foods containing omega-3, omega-6, omega-9 as functional foods and they are undecided about low-sodium, gluten-free, antiaging and echinacea, ginkgo ginseng-added foods, and think that energy drinks are not functional foods. Mean score of male students regarding the Functional Food Information Form was 18.1 ± 7.3 while mean score of female students was 19.5 ± 6.8 and difference was not statistically significant. Mean scores of students classified as weak, normal and obese according to BMI were respectively 18.7 ± 6.9 ; 19.1 ± 6.6 and 18.5 ± 6.5 and difference was not statistically significant. Functional food knowledge score of students with normal body weight is higher than weak and obese students. It was determined that 78.0% of the students had sufficient knowledge and 22.0% had insufficient knowledge level. In the direction of the data obtained in the study, majority of university students have sufficient knowledge about functional foods but they do not exactly know

EFFECT OF THERMOTOLERANCE ACQUISITION AND DIETARY ORANGE PEEL ESSENTIAL OIL ON HISTOMORPHOMETRY AND SEROTONIN-IMMUNOREACTIVE ENDOCRINE CELL NUMBERS IN THE SMALL INTESTINES OF HEAT STRESSED JAPANESE QUAILS

ALI BAYRAKDAR¹, BESTAMI DALKILIÇ², MINE YAMAN¹, ÜLKÜ GÜLCİHAN ŞİMŞEK¹, MEHMET ÇİFTÇİ¹

ABSTRACT

Heat stress in animals is the main problem of productivity and causes significant economic losses. Many methods such as feed removal, changing the feed content, various feed supplements, early age thermal conditioning are being tested to protect the animals from adverse effects of heat stress. Today the new technologies in orange juice industry have served us the orange peel essential oil which has antimicrobial, antioxidant and antifungal properties. This study was conducted in order to measure the effects of early period thermal conditioning, feed restriction, supplementation of orange peel essential oil (OEO) into ration or combinations of them on small intestinal morphology and density of serotonin-immunoreactive (IR) endocrine cells (ECs) found in small intestines. 168 7-day-old Japanese quails were divided into six groups of 24-h fasting or thermal conditioning and their subgroups with and without supplementation of OEO (300 ppm) into ration. We determined that fasting and thermal conditioning increased villus height for duodenum in control groups and for jejunum in OEO groups. In addition, we detected that while fasting and thermal conditioning increased villus height/crypt depth (VH/CD) ratio in duodenum and jejunum, these applications did not affect this ratio in ileum. We found that supplementation of OEO into ration increased the number of serotonin-IR ECs in crypts of small intestine. We revealed that early period thermal conditioning increased the number of serotonin-IR ECs in duodenum, jejunum, and ileum especially in groups in which OEO was supplemented into ration. These results indicated that applications of early period thermal conditioning and feed restriction in quails may generally prevent adverse effects caused by heat stress on intestinal morphology and orange peel essential oil supplementation has strengthened these positive effects.

MEDICINAL PLANTS USED IN KEPSUT (BALIKESİR) YARDOP AREAS

FATİH YILMAZ¹, SELAMI SELVİ², FATİH SATIL²

ABSTRACT

The fire, which is always important among the factors damaging the forest, is one of the most important factors that endangering continuity of the forests in our country. For this purpose, YARDOP areas have been established in Turkey. In this study; Planting of medical plants provided the economic contribution of the indigeneous people of the region and the resistance to fire were carried out while it was being built fire-resistant forests in Kepsut (Balıkesir). In the research process, 13 species founded medicinal value were carried out plantings. These species are *Salvia virgata*, *Origanum onites*, *Lavandula angustifolia*, *Rosmarinus officinalis*, *Nerium oleander*, *Rhus coriaria*, *Erica arborea*, *Elaeagnus angustifolia*, *Arbutus unedo*, *Pyrus elaeagnifolia*, *Ficus carica*, *Morus alba*, *Amygdalus communis*. During the 2 years after the planting, by making periodical maintenance of the planted species was observed its development conditions and were provide to adapt of species. As a result, along with served as a barrier to prevent possible forest fires of the planted medicinal species, the local people living in settlements around the trial area were provided benefited for economic and medicinal purposes from these plants.

THE INVESTIGATION OF GENOTOXIC EFFECTS PLANTAGO OVATA FROSSK. AND LINUM USITATISSIMUM L. VIA ALLIUM CEPA L. TEST

ALEVCAN KAPLAN¹

ABSTRACT

With people heading towards nature, interest in medical and aromatic plants is increasing day by day. Medical aromatic plants are plants that have been used as medicine since the beginning of human history to prevent and cure diseases and maintain good health. However, unconscious widespread use, can adversely affect human health. Although plants are considered to be reliable since they are natural, but does not mean that the natural is always reliable. *Plantago ovata* Frossk. and *Linum usitassimum* L., which have laxative effect, have been used widely in recent times. *Plantago ovata* Frossk. plant has plenty of soluble fibre in the seed coat. In the seeds of the *Linum usitassimum* L. plant, there is also high amount of mucilage from the soluble fibres. In this study, genotoxic effects of these species have been examined using *Allium cepa* L. root tip meristem cells. As treatment group, three concentrations (For *Plantago ovata* Frossk.; 1/2 C:7.2 mg/mL, 1C:14.4 mg/mL and 2C:28.8 mg/mL; For *Linum usitassimum* L.; 1/2 C:20 mg/mL, 1C:40 mg/mL ve 2C:80 mg/mL) and as negative control distilled water, as positive control methyl methane sulfonate (MMS) was used. To evaluated the mitotic index and abnormalities of onion root tip meristem cells, 1000 cells per group including controls were counted. *Plantago ovata* Frossk. and *Linum usitassimum* L. plants were found to cause changes in the rates of mitotic index and chromosome anomalies relative to the negative control in *A. cepa* L. due to the increased concentration.

UTILIZATION OF GRAPE SEEDS AS AN ANTIOXIDANT SOURCE IN BISCUIT PRODUCTION

NILGÜN ERTAŞ¹, ELIF ÖNCEL¹

ABSTRACT

Nowadays, researches are being done to produce functional foods (those containing various factors to ensure or enhance health). One of the most important of these studies is the food products enriched with antioxidants. In this study, grape seeds were added in the biscuit formulation at different rates (0, 2.5, 5, 7.5 and 10%). The chemical (ash, moisture, crude fat, total phenolic content), physical (diameter, thickness, color) and sensory properties of biscuits enriched with grape seeds were investigated. As a result of the analysis, it was observed that as the proportion of grape seeds increases, thickness and spread ratios of the biscuits increased. L*, a* and b* values of the biscuits ranged from 57.36 to 73.49, from 1.94 to 6.29 and from 17.45 to 26.36 respectively. With the addition of grape seeds, the value of L* decreased and the biscuit color darkened. When grape seeds supplement level increased in biscuit formulation, a* values increased significantly. Ash values of biscuits ranged from 1.41 to 2.68%. The highest ash value was obtained with the biscuits enriched with 10 % grape seed. Grape seed is a strong antioxidant, it is supported with total phenolic content of biscuits enriched with grape seed. At the end of the sensory analysis, it was decided that the most desirable biscuit was the biscuit containing 2.5% grape seed.

EFFECTS OF OZONE ON THE FATTY ACID COMPOSITION OF COMMERCIAL HAZELNUT

KADIR TURHAN¹, FATMA TÜLAY TUĞCU¹, YUSUF CAN GERÇEK², GÜL CEVAHİR ÖZ²

ABSTRACT

Corylus avellana L. (hazelnut) is one of the most popular tree nuts worldwide and ranks second in tree nut production after almond. *Corylus avellana* kernels are consumed all over the world, not only as a fruit but also in a diversity of manufactured food products. Hazelnuts (*Corylus avellana* L.) are mainly produced in Turkey, Italy, Spain and the USA. Hazelnut has beneficial effects for human diet, i.e. consuming hazelnuts prevents cholesterol based atherosclerosis and ischemic cardiovascular diseases. In this study, we analyzed the fatty acid composition of four commercial hazelnut products. Total fat was extracted with n-hexane (60°C) for 6 h using a Soxhlet extractor and FAMES were prepared using boron trifluoride in methanol (20% of BF₃ in methanol) and extracted with n-hexane and then analyzed by GC. We found monounsaturated and polyunsaturated fatty acids were the most predominant fatty acids in hazelnut oil extracted from samples. A one way analysis of variance revealed significant differences for fatty acid content between hazelnut products. The most abundant fatty acid in hazelnut was oleic acid (C18:1). Furthermore, after ozonation process of these oils obtained from *Corylus avellana*, GC-MS analyses were performed and the percentages of their chemical contents were compared with the data before ozonation.

INVESTIGATION OF OPERATION PARAMETERS INFLUENCE ON BIOACTIVE INGREDIENTS OF ENDEMIC *SIDERITIS MONTANA* L. OF TURKEY

MEHMET BILGIN¹, ELAF ABDELILLAH ALI ELHUSSEIN¹, SELİN ŞAHİN¹

ABSTRACT

Sideritis montana L., an endemic species of Turkey is a genus of *Sideritis* L. belonging to the family of Lamiaceae. It is generally consumed as herbal tea and folk medicine as locally named “yayla çayı (mountain tea)” in Turkey. It has so many beneficial effects such as antiinflammatory, antistress, analgesic, antibacterial and antioxidant activity due to its biophenols having a strong free radical scavenging capacity as well as diterpenes and essential oils. In this study, Response Surface Method (RSM) has been applied in order to generate a mathematical model and optimize the response value as well as design of experiments. The aim of this study is to present the effects of operation parameters on total polyphenols (TP), total flavonoids (TF) and antioxidant activity (AA) of endemic *Sideritis montana* L. extract obtained by homogenizer-assisted extraction (HAE).

ANTIOXIDANT PROPERTIES AND PHENOLIC COMPONENTS OF DELPHINIUM FORMOSUM

HİLAL EBRU ÇAKIR¹, ZEHRA CAN², HÜSEYİN ŞAHİN³, SEVGİ KOLAYLI¹

ABSTRACT

Delphinium formosum Boiss. & Huet is an endemic plant with 26 species in Turkey and it is a perennial, herbaceous, flowering plant (Meriçli et al., 1996). In this study, the antioxidant properties and phenolic components were determined of methanolic extracts of flower, leaf and stem parts of plant collected from 1500 m altitude from Sürmene country of Trabzon. It was determined that the total amount of phenolic substance for flower 677 mg GAE/100 g, for leaf 601 mg GAE/100 g and for body 99 mg GAE/100 g body. The ferric (III) reducing antioxidant power (FRAP) were found for flower, leaf and stem as 21.17; 54.05; 9.89 µM Trolox®/g dry plant respectively. Thirteen phenolic compounds were analyzed by reversed-phase high performance liquid chromatography (RP-HPLC-UV). As a result of this study, it was determined that the plant, especially the flower part, is much richer than phenolic acid and flavanoids. References Meriçli. F., Meriçli. A. H., Becker. H., Ulubelen. A., Özden. S., Dürüst. N., & Tanker. M. (1996). Norditerpenoid alkaloids from Delphinium formosum. Phytochemistry. 42 (4) 1249-1251.

ASSESSMENT OF HERBAL MIXED TEA IN TERMS OF HUMAN HEALTH AND WEIGHT LOSS DIET

MERYEM AYRANCI¹, ŞENAY BURÇIN ALKAN¹, HAVVANUR TAŞKIN¹, HASAN HÜSEYİN KARA¹, FATMA KÜBRA SAYIN¹, ABDULLAH ÖKSÜZ¹

ABSTRACT

Obesity is one of the chief problem increasing dramatically and causes many health problems all over the world. People living in countries where obesity is a problem have been significantly aware of the importance of weight control for a healthy life and an aesthetic appearance. Like other health problems, the use of medicinal plants is preferred by many people who want to lose weight. Herbal teas are the first choice of the people because of their ease of use and easy availability. The content of 24 kinds of herbal mixed tea belonging to 14 brands, which are commonly used in Turkey and emphasize weight loss feature with the expression of "Form", have been investigated. A total of 65 different herbal preparations (flowers, seeds, leaves, etc.) were used in herbal mixed tea, varying from their mix 5 to 15 different herb, and it was seen, their proportion are not indicated on most of the labels. Rosemary, fennel, cassia, mate, erica and cherry stalk are the most common, milk thistle, diffuse knapweed, daffodil flower, shepherd obliterated, elderberry fruit, garlic, coriander, chia seed, guarana, golden flower, sweet blackberry leaf, chicory, buckthorn, juniper seed, beech tree leaf, calendula, mulberry leaf, lemon grass are the most rarely used plants. Unconscious use of certain infusions of plants can have significant adverse effects on health and It is a fact their mixed lead to more serious health problems. For example; scientific studies have been carried out to indicate that cassia may cause hepatitis, cherry stalk to kidney stones, bacillary gastroenteritis and nephritis, especially in prolonged and intensive use. It should be considered that use of herbal mixed tea can be harmful for people of all age who don't know about proper dosage, adverse effect etc. In the direction of research, control and advice of scientists studying in this area, more comprehensive and enlightening label information should be prepared due to prevent from adverse effect of these teas on health.

PHENOLIC COMPONENTS AND ANTIOXIDANT ACTIVITY OF PRIMULA VULGARIS (PRIMROSE)

HİLAL EBRU ÇAKIR¹, YAKUP ŞİRİN¹, ZEHRA CAN², SEVGİ KOLAYLI¹

ABSTRACT

Primula vulgaris subsp. Is a wild species that opens in the first spring months and the flowers are dried and consumed as tea. It is a herbaceous species found in the Eastern Black Sea Region, which is yellow, white, pink and purple in color, according to the acidity of the cultivated soil. In the study, the antioxidant activities and phenolic compositions of the methanolic extracts of *Primula vulgaris* collected from Uğurlu Village of Trabzon in March 2017 were determined. As antioxidant parameters, total amount of phenolic, flavonoid, condensed tannin contents, ferric (III) reduction/antioxidant power (FRAP) tests were studied. Total amount of phenolic content were determined for flower 2498 mg GAE / 100 g dry sample, for leaf 838 mg GAE / 100 g dry sample. 14 phenolic compounds were analyzed by reverse phase-high performance liquid chromatography (RP-HPLC-UV) using liquid-liquid extraction method. Vanilic acid, epicatechin, p-coumaric acid, ferulic acid, daidzein and luteolin were found in varying amounts in both parts of the *primula vulgaris* plant, while gallic acid, protocatechuic acid, catechin, caffeic acid and rutin could not be detected in both parts. As a result, the presence of antioxidant activity at different levels in both flower and leaf parts of the methanol extracts of *Primula vulgaris* was determined.

EVALUATION OF HEALTH SCHOOL STUDENTS' CONSUMER PERCEPTION ON FUNCTIONAL FOODS

ESMA AKSOY KENDİLCİ¹, KENAN KENDİLCİ², GÜLSEN GÜNEŞ³

ABSTRACT

Introduction: Functional food is the food made by adding bioactive substances obtained completely from natural foods into the foods we consume in daily life. Changing lifestyles have led changes in the health effects expected by the consumers from the foods and in the nutrition field. This study was designed to evaluate consumer perception of students, who were studying in Bitlis Eren University School of Health, regarding functional foods. **Material and Method:** This cross-sectional study was conducted between November and December 2016. The population of the study consisted of 480 students who were actively enrolled in Bitlis Eren University School of Health. 74.6% (n = 358) of the population were reached. The questionnaire used in the study involved questions for determining socio-demographic characteristics such as Do you have knowledge about functional foods?, Which ones are functional foods?. A Likert-type scale, which was developed by Kopuz (2011) regarding the consumer perception on functional foods, consists of 18 items and is scored between 1-5, was used. This scale consists of 4 subscales. The Cronbach's alpha reliability coefficient of the scale is $\alpha = .909$. While judgment mean score between 1-1.49 signifies the lowest level of participation, those ranging between 1.50-2.49 signify a low level of participation, those ranging between 2.50-3.49 signify the indecisiveness level, those ranging between 3.50-4.49 signify the positive opinion level for the judgment and those ranging between 4.50-5.00 signify the highest participation level. Frequency tables, Anova analysis, Independent samples t test, and Tukey test were used in the statistical evaluation of the data. Permission was obtained from the Ethics Committee of Bitlis Eren University in order to conduct the study. **Results:** 358 students including 199 males and 159 females participated in the study and their average age was 20.88 ± 2.18 . 36% of the students were studying in Nutrition and Dietetics and 38.3% of them were studying in Nursing department, and 25.7% were studying in Social Work Department. 72.1% of the students had no knowledge about functional foods and 69.3% wanted to be informed about functional foods. 27.9% of the students consumed functional food. When the distribution of the students based on their knowledge about functional foods was examined; it was found that while the low-calorie foods are known as functional foods with the highest rate of 50.0%, those increasing immune system and delaying aging (physical and mental) were known correctly with the rate of 19.6% and the foods whose fatty acids of omega 3, omega 6, and omega 9 as essential fatty acids were increased were correctly known with the rate of 18.7%. foods they had least knowledge about were modified margarine products containing phytosterols and plant stanol esters with the rate of 9.5%, gluten-free foods with the rate of 13.7% and the foods containing herbal additives such as Echinacea, ginseng, and common st john's wort with the rate of 13.7% rate, respectively. When the mean score and standard deviations of the 4 subscales for functional foods were examined, the

perception regarding the effect on health was 3.204 ± 0.651 , consumption perception was 3.365 ± 0.643 , necessity of use and product prestige perception was 2.600 ± 0.634 , physical quality perception was 3.616 ± 0.644 . As is seen, while the participants' physical quality perception on functional products was observed as "I agree", their perceptions on the effect on health, consumption and necessity of use and product prestige perception were observed as "Undecided" or in other words neither positive nor negative. In terms of necessity of use and product prestige perception level of functional foods, perception of the students in Nutrition and Dietetics Department was found to be significantly higher than those studying in Nursing Department ($p = 0.011$). The mean scores for the perception on the effect of the functional foods on health, necessity of use and the product prestige perception, were found to be significantly higher in the first class than the other classes ($p = 0.001$, $p = 0.001$, respectively). When the result of the independent samples t test was examined, it was determined that there was no significant difference among students according to their gender and place of residence in terms of the 4 subscales of the functional foods ($p > 0.05$). Conclusion and Recommendations: According to the results of this study, it was observed that on the effect on health and the necessity of use and product prestige perception status of the students studying in the school of health about the functional foods was at undecided level. Since the students in the Department of Nutrition and Dietetics took the course of functional foods in their curriculum and it is a subject related to their field, their perceptions were found to be higher than the students in the other departments. In general, elective courses about functional foods can be added to all students or functional foods can be introduced via seminars given by experts in order to increase awareness.

ANATOMICAL PROPERTIES OF CRENOSCIADIUM SIIFOLIUM BOISS. & HELDR. (APIACEAE) ENDEMIC TO TURKEY

NAGEHAN SALTAN¹, AYLAY KAYA¹

ABSTRACT

ANATOMICAL PROPERTIES OF CRENOSCIADIUM SIIFOLIUM BOISS. & HELDR. (APIACEAE) ENDEMIC TO TURKEY Nagehan SALTAN and Ayla KAYA Anadolu University, Faculty of Pharmacy, Department of Pharmaceutical Botany, 26470, Eskişehir, Turkey (ndagdeviren@anadolu.edu.tr) The Apiaceae is one of the best known families of flowering plants which contains a number of aromatic plants. The member of this family Crenosciadium Boiss. is represented by only one species (Crenosciadium siifolium Boiss. et. Heldr.) in the Flora of Turkey [1]. It is an endemic, eastern Mediterranean element and hazard category (EN) which is collected from Kütahya, Turkey. C. siifolium is locally known as "kırkısrak" in the regions where they grow [2]. It grows damp meadows and stream sides in Pinus nigra forest [1]. In this anatomical study, the internal structure of this plant is illuminated with the section taken from stem, leaves and fruits for the first time. According to our anatomical results; stem is round and ribbed. 13-17 vascular bundle are observed in the stem. The pith is empty. The leaves are bifacial. The different types of stomata (anomocytic, anisocytic and paracytic) are observed on both of leaf surfaces. Fruit is schizocarp which has two mericarps. Each mericarp has 3-5 vittae on the vallecule and, 6-8 on the commissural. Vascular bundles are located on rib. References [1] Hedge, C. and Lamond J. M. Crenosciadium, In: Davis, P.H. et al. (eds.), Flora of Turkey and the East Aegean Islands, University Press, Edinburgh, 1972, Vol. 4, p. 473. [2] Güner, A, Aslan, S, Ekim, T, Vural, M, Babaç, MT. DISTRIBUTION OF HULLED WHEATS IN THE WESTERN BLACK SEA REGION WITH THEIR MACRO - MICRO ELEMENT CONTENTS AND SOIL CHARACTERISTICS

HURİ MELEK YAMAN¹, FATMA PEHLİVAN KARAKAŞ¹, BÜLENT ORDU², NUSRET ZENCİRCİ¹

ABSTRACT

Distribution of Hulled Wheats in the Western Black Sea Region with Their Macro - Micro Element Contents and Soil Characteristics Batı Karadeniz bölgesi Siyez ve Gernik Buğdaylarının Coğrafi Dağılımı ile Yetiştirildiği Toprakların ve Danelerinin Makro ve Mikro Element İçerikleri Huri Melek YAMAN¹, Fatma PEHLİVAN KARAKAŞ^{1,2}, Bülent ORDU³, Nusret Zencirci¹ 1Abant İzzet Baysal University, Department of Biology, Faculty of Science and Art, Bolu 2Abant İzzet Baysal University, Department of Field Crops, Faculty of Agriculture and Natural Sciences, Bolu 3Abant İzzet Baysal Univ., Economical and Commercial Faculty, Business Dept., Bolu Email: hurimelek14@hotmail.com Keywords: Einkorn, Emmer, Ethnobotany, Macro and Micro Elements. SUMMARY Wheat is a basic product of human nutrition. This importance has led to an intensive breeding for yield, quality, and disease resistance. Unfortunately, Turkey, one of the wheat origin countries, does not yield enough. The excavations named the first wheat states in Anatolia. i.e. Soli-Pompeiopolis, Mezitli, Mersin had the forked cypress wheat from the Neolithic period. Hulled einkorn (*Triticum monococum* ssp *monococum*) and emmer (*Triticum dicocum* Schrank.) are the ancestors. The hulled character comes from two differences in the spike structure: the semi-brittle joints between the rachis internodes and the toughened glumes. Hulled state means other important characteristics. The thick and tough glumes protect to the grains everywhere: resistance to disease, tolerance under arid and poor soil conditions. Moreover, they are more nutritious, possess lower glycemic indices and less gluten. Einkorn and emmer are consumed mostly as bulgur, bread, macaroni, and cookies. These products have some advantages: no cholesterol and no unsaturated fat, folic acid content, and accelerated nutrient absorption. MATERIALS AND METHODS Questionnaires to obtain data on demography, agriculture, and trade in the western Black Sea regions were applied, after participants were informed about the study, to all possible participants (n=50) in the area. Grain and soil samples were collected from five cities (Karabük, Kastamonu, Samsun, Sinop, and Bolu) and analyzed for macro (N, P, K) and micro (Fe, Cu, Mn, Zn) elements. Moreover, energy, carbohydrate, crude protein, crude oil, raw fiber, total sugar, starch, raw ash, hectoliter, and thousand-grain weight were also determined. The survey as well as grain and soil sample collections were carried out in parallel. Descriptive and advanced statistical analysis were run, of which some were given here. RESULTS Previous studies have shown that there is a strong relationship between diet and chronic vascular diseases, especially obesity, diabetes, and cancer, which could be avoided by some changes in the diet. Therefore, the intake of healthy food such as einkorn and emmer, with better nutrient content and lower glycemic indexes might decrease the risks related to these chronic diseases. We can summarize the study under three headings: 1. Ethnobotanical background Data on demography, agriculture, and

¹AİBÜ FEN BİLİMLERİ ENSTİTÜSÜ BİYOLOJİ BÖLÜMÜ

²AİBÜ İKTİSAT VE İŞLETME BÖLÜMÜ

trade of hulled wheats indicated that 1) hulled wheats were grown in distant mountainous areas, 2) the yields were low, and 3) the trade was limited. 2. Grain and soil macro-micro element contents, The grains and the soils of hulled wheats diversified for macro and micro elements in the region. N, P, Fe, Cu, Mn, and Zn were the highest in einkorn while K is in emmer. Carbohydrate, energy, starch, crude oil, and thousand-grain weight were higher in emmer whereas crude protein, hectoliter, and total sugar in einkorn. The higher Ca, K, Mg, Na, Mn, Zn, Cu, and Fe in the soil, the higher they were in the grain. 3. Grains' some physical and chemical quality characteristics. Grains of hulled wheats in the western Black sea differentiated most physical and chemical quality characteristics. In conclusion, we can say that hulled wheats in the western Black sea diversify for macro-micro elements and quality characteristics. Therefore, they are good for healthier foods and potential genitors in wheat quality breeding programs.

PHENOLIC PROFILE AND ANTIOXIDANT AND ANTIMICROBIAL ACTIVITIES OF EXTRACTS OF LEAVES AND FLOWERS OF OENOTHERA GLAZIOVIANA

KADRIYE İNAN BEKTAŞ¹, MUSTAFA KARAKÖSE², KAAN KATALIOĞLU², HÜSEYİN ŞAHİN², ERSAN BEKTAŞ²

ABSTRACT

The present study aimed to determine the potential of extracts of *Oenothera glazioviana* flowers and leaves as a source of antioxidant and antimicrobial compounds. After the drying and grinding of the samples, soxhlet extraction (with methanol) were used to prepare the extracts. Total phenolic compounds (using the Folin–Ciocalteu method), antimicrobial activity (microwell-dilution assay) and antioxidant activity (by DPPH and FRAP assays) were used to evaluate for these extracts. The individual phenolic compounds found in the extracts were characterized and quantified by RP-HPLC analysis. *Oenothera glazioviana* leaves showed the highest total phenolic value at 299.23 mg GAE/g extract. Gallic acid was the most abundant phenolic compounds in the leaf and flower extracts (17.42 and 14.57 mg phenolic/g dry sample, respectively). Leaves exhibited the highest antioxidant activity in the DPPH assay at IC₅₀: 5.47 µg/mL. Extract of the leaves exhibited more ferric reducing power than the flower extract (1496 µM FeSO₄.7H₂O equivalent/g extract). Flower extract showed no antimicrobial activity against test microorganisms. But leaf extract showed moderate antimicrobial activity against microorganisms especially *Yersinia pseudotuberculosis* and *Staphylococcus aureus* (MIC: 125 µg/mL). In conclusion, these results indicate that the *Oenothera glazioviana* leaves can be considered as a promising source of phenolic compounds, with appreciable antioxidant properties and moderate antimicrobial activity.

IN VITRO EFFICACY OF PLANT EXTRACTS AND USAGE OF SOME PLANT EXTRACTS AS SEED TREATMENTS TO CONTROL BACTERIAL SPEAK DISEASE OF TOMATO

FERAY KARABÜYÜK¹, YEŞİM AYSAN²

ABSTRACT

Tomato (*Solanum lycopersicum*) is the most grown and consumed vegetable crop in the world. Seed-borne bacterial pathogen *Pseudomonas syringae* pv. *tomato* (Pst) is one of the most important bacterial diseases of tomatoes. Pathogen-free seeds should be used to manage the disease. In this study, twenty five individual medical and aromatic plants including *Allium sativum*, *Allium cepa*, *Aloe vera* L., *Anethum graveolens* L., *Calendula officinalis*, *Coriandrum sativum*, *Cuminum cyminum*, *Echinacea purpurea*, *Eucalyptus* sp., *Foeniculum vulgare* Mill., *Lavandula angustifolia*, *Myrtus communi* L., *Matricaria chamomilla*, *Mentha piperita*, *Nerium oleander*, *Ocimum basilicum* L., *Origanum onites*, *Pimpinella anisum*, *Raphanus sativus*, *Rosmarinus officinalis*, *Salvia officinalis*, *Sinapsis nigra*, *Thymus vulgaris*, *Thymbra spicata* L. subsp. *spicata*, *Zingiber officinale* were included to test their antibacterial activity against bacterial speck in vitro conditions using efficacy paper disc method and seed treatments. Coriander (*Coriandrum sativum*), eucalyptus (*Eucalyptus* sp.) and garlic (*Allium sativum* cv *Kastamonu*) has inhibited Pst development giving mean inhibition zones of 6.5 mm, 2.0 mm and 1.5 mm, respectively. For seed experiments, extracts from coriander, eucalyptus, *Kastamonu* garlic, zinger (*Zingiber officinale*), Istanbul thyme (*Origanum vulgare* subsp. *hirtum*) and Izmir thyme (*Origanum onites*) were used. Artificially inoculated tomato seeds were soaked into aqueous plants extracts for extra thirty minutes on a rotary shaker at 150 rpm/min. Treated seeds were sown in plastic trays containing sterilized soil as five replicates consisting of 30 seeds per tray. Immersed tomato seeds were subsequently air-dried at room temperature (20±2°C) for a day. After seed germinations, seedlings were controlled daily for disease development. The experiments were evaluated when the necrotic symptoms appeared on the cotyledons of the control plants. Disease incidence was recorded according to symptom presence/absence on cotyledons. Disease severity was evaluated by 0-3 scale: 0: no disease symptom; 1: 1 spot on cotyledons; 2: 2-3 spots on cotyledons; 3: 4 and more spots on cotyledons. Our results showed that all six tested plant extracts and all of mix plant extract reduced disease incidence and disease severity. Garlic, Izmir thyme, Istanbul thyme and mix extracts reduced the disease incidence and severity among 53.5-99.3% and 58.8-99.4%, respectively. Aqueous garlic extract was the most effective seed treatments. It's concluded that endemic plant extracts are promising for bacterial disease management and can be adopted to organic seed producers. This study was financed by Cukurova University with the project number FDK-2015-4071.

COMPARATIVE STUDY OF ANTIOXIDANT, ANTIMICROBIAL PROPERTIES OF FOUR PLANT COLLECTED FROM ERZINCAN, TURKEY.

ERSAN BEKTAŞ¹, HÜSEYİN ŞAHİN¹, KAAN KALTALIOĞLU¹

ABSTRACT

In recent years, plant secondary metabolites (natural products) are attracting attention due to their use as natural preservatives in different fields. Because of their various biological activities, phenolic compounds can be used in the treatment of a wide variety of diseases such as cancers, cardiovascular diseases and neurodegenerative diseases. Because of this, many plant species have been used for years as medicinal plants worldwide. The aim of this research is to investigate the antioxidant and antimicrobial activities of methanolic extracts of 4 endemic plants, namely *Onobrychis nitida* Boiss., *Hedysarum cappadocicum* Boiss., *Ebenus laguroides* Boiss. var. *laguroides* and *Ebenus macrophylla* Jaub. & Spach, collected from Erzincan, Turkey. Antioxidant activities of samples were examined by DPPH and FRAP assay and their phenolic content was determined by using the Folin – Ciocalteu method. Moreover, the antimicrobial activity of methanolic extracts against bacterial strains and yeast isolates were determined based on a microwell dilution method and minimal inhibition concentration (MIC) values ($\mu\text{g/mL}$) were calculated. None of the plant extracts showed significant antibacterial activity against tested microorganisms. Tested plant extracts showed similar antimicrobial effects against microorganisms except *P. aeruginosa*, *A. baumannii*, *E. cloacea* and *C. albicans*. MIC values varied from 1250 to 5000 $\mu\text{g/mL}$. The highest antimicrobial activity was detected in *Hedysarum cappadocicum* against *B. subtilis* and *S. aureus* with a MIC value of 1250 $\mu\text{g/mL}$. All plant extracts had inhibitory activity on DPPH radicals. IC₅₀ values of *O. nitida*, *H. cappadocicum*, *E. laguroides* var. *laguroides* and *E. macrophylla* were determined as 77.29 $\mu\text{g/mL}$, 108.32 $\mu\text{g/mL}$, 88 $\mu\text{g/mL}$ and 69.45 $\mu\text{g/mL}$, respectively. The ability of the extracts to reduce iron(III) to iron(II) ions were determined as 519, 429, 719, 572 $\mu\text{M FeSO}_4 \cdot 7\text{H}_2\text{O}$ equivalent, respectively. The total phenolic contents of plants were defined to be in the range of 50.96 ± 1.01 – 101.73 ± 0.52 mg GAE/g extract. Phenolic content was found to be higher in *O. nitida* extracts (101.73 GAE/g extract) compared to all other plants.

USE OF OLIVE LEAF AS MEDICAL AND AROMATIC PLANT

KÜBRA DOĞAN¹, FATİH TÖRNÜK¹

ABSTRACT

Use of Olive Leaf as a Medical and Aromatic Plant Kübra Dođan, Fatih Törnük Yıldız Technical University, Faculty Of Chemical/Metallurgical Engineering, Department Of Food Engineering, 34210 Istanbul,Turkey E-Posta: dogannkubraaa@gmail.com Olive leaf has been used in folk medicine for centuries. It is known that it was used as a remedy against outbreaks of malaria (malaria) in the 1800s. The American Cancer Research Center states that olive leaf is one of the important plantspossessing antimicrobial and antiviral effects. Till now, 69 books, >1.800 articles, magazines and various papers related to phytochemical properties of olive leaf have been published. The largest consumer of olive leaf in the world is USA while China is the biggestolive leaf producer country. It is known that olive leaf is naturally resistant against microorganisms and insect attacks. The medicinal effect of olive leaf was first reported as a fever reducer in 1854, after which antihypertensive and antibacterial effects were reported. According to the researches made, olive leaf contains active constituents more than 100. The most abundant active ingredient is oleuropein that is one of the polyphenolic antioxidants and converted to " calcium elenolate " after digestion in the body. In vitro antibacterial, antifungal and antiviral properties of elonic (oleonic-oleanolic) acid have been proven. Extracts of olive leaves have been demonstrated to have potential to be used as a functional food additive and pharmaceutical agent due to their antimicrobial, antifungal and antioxidant properties. Vasodilator, hypotensive, antirheumatic, diuretic, hypoglycemic and anti-cholesterol properties of the extracts obtained from olive leaves have also been well established. In this study, bioactive constituents of olive leaves and their pharmaceutical and food related beneficial properties were discussed. Keywords: olive leaf, medicinal, aromatic, bioactive compounds

OPTIMIZATION OF SUPERCRITICAL CO₂ EXTRACTION CONDITIONS OF MICROMERIA FRUTICOSA L. DRUCE FOR PULEGONE

MURAT TÜRK¹, E. SULTAN GIRAY², SALIHA KIRICI³, SERKAN KARACA², DENİZ YILDIRIM¹

ABSTRACT

ABSTRACT Response surface methodology (RSM) is a collection of statistical and mathematical techniques based on the multivariate non-linear model and useful for developing, improving, and optimizing processes. RSM provides better advantages than classical methods for optimization of parameters and includes three steps: (1) designing an experiment and executing of designed experiment, (2) calculating the coefficients of proposed mathematical model, and (3) testing the model adequacy and predicting the response. *Micromeria fruticosa* is a widely distributed perennial herb, growing up to 20-60 cm high and smelling of peppermint when crushed and found in the rocky areas of the southern and eastern Anatolia region of Turkey. Members of the genus *Micromeria* are typical Mediterranean plants. Pulegone is found to be the major component and an allelochemical widely occurring in plants of the Labiatae family. Pulegone has a pleasant mint like odor and therefore is used, directly or as a constituent of a variety of essential oils, in beverages and processed foods for human consumption. The toxic potential of pulegone to humans has been recognized following several reports of ingestion of large quantities of pennyroyal oil intended to cause abortion. In this study, *Micromeria fruticosa* L. Druce, was extracted by supercritical CO₂ and the extraction conditions were optimized by using response surface methodology for pulegone, one of the major content of *Micromeria fruticosa* L. Druce. The independent parameters were selected as temperature, pressure and extraction time. The mathematical relationship between the response and independent parameters were explained by quadratic equation. For supercritical CO₂ extraction, the statistically significant relationship was obtained between the experimental results and predicted results. According to the results of Anova for the proposed quadratic model the determination coefficient (R²) was 0.91 and the optimal extraction conditions were as follows: extraction temperature, 46.77 oC, and extraction pressure, 238.92 atm and extraction time 18.00 min.

OPTIMIZATION OF SUB-CRITICAL WATER EXTRACTION CONDITIONS OF MICROMERIA FRUTICOSA L. DRUCE USING RESPONSE SURFACE METHODOLOGY FOR PULEGONE AMOUNT

MURAT TÜRK¹, E. SULTAN GIRAY², SALIHA KIRICI³, SERKAN KARACA², DENİZ YILDIRIM¹

ABSTRACT

ABSTRACT Members of the genus *Micromeria* are typical Mediterranean plants. This genus is represented in Turkey by 14 species and 22 taxa, 12 of them being endemic. *Micromeria fruticosa* is a widely distributed perennial herb, growing up to 20-60 cm high and smelling of peppermint when crushed, found in the rocky areas of the southern and eastern Anatolia region of Turkey, and is used as a spice, a flavoring agent, and as herbal tea in the region, with names such as "taşnanesi,". They have also been reported to have sedative, anesthetic, antiseptic, abortifacient, antirheumatic, and CNS-stimulant properties and have been used in the treatment of heart disorders and colds. Response surface methodology (RSM) is an effective and powerful statistical method for optimizing the extraction process while reducing the number of experimental trials required. In this study, the optimal extraction conditions for pulegone were determined using response surface methodology. Pulegone was fundamental component of sub-critical water extracts of *Micromeria fruticosa* L. Druce. The independent parameters which are effective on the yield of pulegone were selected such as temperature, pressure and time. The mathematical relationship between the responses and independent parameters were explained by quadratic equation. However, the statistically significant relationship was not obtained between the experimental results and predicted results for subcritical water extraction. According to the results of Anova for the proposed quadratic model the determination coefficient (R²) was 0.54 and optimal extraction conditions were as follows: extraction temperature 150 oC, extraction pressure 150 atm and extraction time 21.11 min.

EFFECT OF DIFFERENT EXTRACTION METHODS (SUBCRITICAL, SUPERCRITICAL AND CONVENTIONAL) ON CHEMICAL COMPOSITION OF MICROMERIA FRUTICOSA L. DRUCE: A COMPARISON STUDY

E. SULTAN GIRAY¹, MURAT TÜRK², SALIHA KIRICI³, SERKAN KARACA¹

ABSTRACT

ABSTRACT *Micromeria fruticosa* is belong to Lamiaceae family. Members of the genus *Micromeria* are typical Mediterranean plants. This genus is represented in Turkey by 14 species and 22 taxa, 12 of them being endemic. *Micromeria fruticosa* consists of four subspecies, spp. *Giresunica* P. H. Davis, spp. *brachycalyx* P. H. Davis, ssp. *Serpyllifolia* P. H. Davis, and spp. *giresunica* P. H. Davis, and spp. *barbarta* Bois&Kotschy in Turkey. Subsp. *Serpyllifolia* is grown naturally in Northeast Anatolia and is used as a spice, a flavoring agent, and as herbal tea in the region, with names such as "taşnanesi," while subsp. *brachycalyx* grows naturally in South Anatolia. They have also been reported to have sedative, anesthetic, antiseptic, abortifacient, antirheumatic, and CNS-stimulant properties and have been used in the treatment of heart disorders and colds. The conventional methods used to prepare essential oils are steam distillation and solvent extraction. Steam distillation is also the most commonly used method to prepare essential oils on a commercial basis. However, there are a few adjustable parameters to control the selectivity of these methods. Therefore, developing alternative extraction methods with better selectivity and efficiency are highly desirable. Recently, more efficient extraction methods, such as supercritical fluid extraction (SCFE) have been used for the isolation of organic compounds from various natural products. This technique has recently been used for the isolation of essential oils from plants. However, CO₂ is unable to dissolve some moderately polar compounds such as alcohols, esters, and ketones. In recent years, a continuous and static subcritical water extraction technique has been used for the extraction of essential oils. Subcritical water extraction uses water as an extractant at temperatures between 100 and 374 °C and at a pressure high enough to maintain the liquid state. It has been reported that subcritical water is a powerful alternative for the extraction of essential oils because it enables a rapid extraction and the use of low working temperatures. The volatile extract composition of *Micromeria fruticosa* L. obtained by subcritical water extraction (sbcWE), supercritical carbon dioxide extraction (scCO₂E), subcritical ethanol extraction (sbcEtOHE), organic solvent extraction under ultrasonic irradiation (USE), hydrodistillation (HD), and organic solvent extraction (OSE) were estimated by gas chromatography-mass spectrometry (GC-MS). A total of 122 components by sbcWE, 230 components by scCO₂E, 68 components by sbcEtOHE, 62 components by USE, 112 components by HD and 50 components by OSE were detected. The major component characterized in the essential oils was pulegone and other main components were determined as isomenthone p-menthone, and piperitenone. The essential oils of sbcEtOHE were poor for monoterpenes. However, the oxygenated compounds were found in higher amounts. The quality of the oil can be linked to the amount of oxygenated compounds present in it.

EFFECT OF DIFFERENT EXTRACTION METHODS (SUBCRITICAL, SUPERCRITICAL, AND CONVENTIONAL) ON ANTIOXIDANT ACTIVITY OF MICROMERIA FRUTICOSA L. DRUCE: A COMPARISON STUDY

E. SULTAN GIRAY¹, MURAT TÜRK², SALIHA KIRICI³, SERKAN KARACA¹

ABSTRACT

ABSTRACT *Micromeria fruticosa* is a widely distributed perennial herb, growing up to 20-60 cm high and smelling of peppermint when crushed, found in the rocky areas of the southern and eastern Anatolia region of Turkey. Members of the genus *Micromeria* are typical mediterranean plants. This genus is represented in Turkey by 14 species and 22 taxa, 12 of them being endemic. *Micromeria fruticosa* consists of four subspecies, spp. *Giresunica* P. H. Davis, spp. *brachycalyx* P. H. Davis, ssp. *Serpyllifolia* P. H. Davis, and spp. *giresunica* P. H. Davis, and spp. *barbarta* Bois & Kotschy in Turkey. Subsp. *Serpyllifolia* is grown naturally in Northeast Anatolia and is used as a spice, a flavoring agent, and as herbal tea in the region, with names such as "taş nanesi," while subsp *brachycalyx* grows naturally in South Anatolia. They have also been reported to have sedative, anesthetic, antiseptic, abortifacient, antirheumatic, and CNS-stimulant properties and have been used in the treatment of heart disorders and colds. Antioxidant supplements or antioxidant-containing foods may be used to help reduction of singlet oxidative damage in the human body. There are two basic categories of antioxidants, namely synthetic and natural ones. However, the use of these synthetic antioxidants has been restricted in some countries, mainly because they are suspected to be carcinogenic. Many researchers have focused on natural antioxidants and in the plant kingdom numerous crude extract and pure natural compounds were previously reported to have antioxidant properties. Therefore, the development and utilization of more effective antioxidants of natural origin are desired. *Micromeria fruticosa* L. extracts were obtained by subcritical water extraction (sbcWE), supercritical carbon dioxide extraction (scCO₂E), subcritical ethanol extraction (sbcEtOHE), organic solvent extraction under ultrasonic irradiation (USE), hydro distillation (HD), and organic solvent extraction (OSE). Essential oils and extracts of all extraction methods were also investigated for antioxidant activity using three different methods (DPPH, Cuprac, Folin). Extracts of sbcEtOHE displayed the most antioxidant activity in the three different methods.

KONYA MEDICAL AND AROMATIC PLANT PARK

AYSUN ÖZTÜRK¹, CEYLANI KILIÇ¹

ABSTRACT

Plants that are important in human life have been a source of life throughout history and will continue to exist. In addition to being used as a medicine, the basic requirement of human beings in the formation of oxygen when you are showing the building block it improves the quality by cleaning the air in terms of cities. While the cities that are trying to be green are planning, the use of medical and aromatic plants has begun to be formed in the landscaping areas. A park project in which only medical and aromatic plants are located has been prepared in the together association of the Ministry of Water and Forestry, Konya Metropolitan Municipality and Necmettin Erbakan University. These plants, which provide therapeutic and visual feasts, do not only effect people and animals. They also play an important role in the interaction of the plant with another plant and in the destruction of microorganisms. In the past şifahane have been established in the treatment of diseases and plants have been tortured at certain rates in order to be transformed into medication and then tried to be obtained by beating and boiling. According to the kind of the disease, the plants are collected. Occasionally dry, sometimes fresh, occasionally stored in special rooms dedicated to this job as an aromatic-volatile oil. However, the recognition of plants today, until it is collected and converted into medication the attarlars who undertake this work and the medical and aromatic plant selling are serious problems at the point of information flow in the places. So, to revitalize the history and to introduce the plants, growing and by in the name of transfer of usage forms as well as a park project will be realized will be realized. This project details to be 1500 m² air-conditioned greenhouse (hmax. 10m, single floor); production, exhibition and sale, laboratory to be composed of three parts. In addition to sera, plant drying chambers, product packaging chambers, seed storage chambers, cold storage, aromatic oil production plant planning will also take place. Another building is the flower (botanical), restaurant 1200m² (400m² x 3 floor); will be presented as a three- floor flower shaped (outer covering, covering) motified structure and bistro cafe on the first floor, regional-herbal product sales departments, second floor conference room, the third floor is the restaurant (eat and salad made with the products produced in the field) will serve as. Apart from these, children's play area (2048 m²), fitness area (195 m²), basketball court (495 m²), volleyball court (595 m²), football field (705 m²), parking lot (17000 m²), total production area (2575 m²), total rubber area (2243 m²), total cast rubber area (2290 m²), total printed concrete (20500 m²), total locked parquet area (17000 m²), total building area (81500 m²) available. Administrative building (dining hall, WC, shower room, mosque, meeting room, administrative staff room) will be made for both the visitors and the staff for meet and coordinate their needs. In the name of reviving the vineyards of Meram which is the historical texture of the city, 400 m² (200 m² x 2 floor) Meram vineyard house is planned as a two storey house to be according to the original architecture. In addition, has been hosting the silk bug in the past in accordance with the historical texture of the our kadim city the symbolically mulberry trees will be planted in the park to

ANTIOXIDANT ACTIVITIES OF OCIMUM BASILICUM AND THYMBRA SPICATA FROM AMASYA

OMER ERTURK¹, GULER INCI TANRIKULU², CEREN YAVUZ², ZEHRA CAN³, HILAL EBRU CAKIR⁴

ABSTRACT

Abstract It has been known that essential oil and extracts from aromatic plants contain phenolic compounds. These compounds have redox properties and those properties make them good antioxidants acting as reducing agent, hydrogen donors and singlet oxygen quenchers. The use of antioxidant from natural sources has become popular as slowing down ageing process and treatment of human disease such as cancer. Two aromatic plants, *Thymbra spicata* (thyme) and *Ocimum basilicum* (basil), are commonly consumed in Amasya. In this study, it has been investigated antioxidant capacity and chemical composition of essential oil and extracts of thyme and basil. The polyphenolic contents of samples were used in four different ways; Total Phenolic Contents (TPC)¹, Total Flavonoid Contents (TFC)² and Condensed Tannin (CT)³ and ferric reducing antioxidant power (FRAP)⁴. Moreover chemical composition were analysed by RP-HPLC. It was observed that antioxidant capacity of the thyme was higher than that of basil. In addition, fourteen phenolic compounds were identified in thyme and basil. Results showed that thyme and basil are rich in phenolic compounds and antioxidant properties. Our results are expected to contribute knowledge about new drug development. References : [1] Singleton, V. L., Rossi, J. L. (1965). CHEMICAL COMPOSITION OF ROSACEAE

GULER INCI TANRIKULU¹

ABSTRACT

Abstract The genus Rosa (Rosaceae) includes about 200 species worldwide, approximately 20 species in Yeşilirmak Basin, distributing across from cold temperate to the subtropical regions. Many of this species are well known as fruits and some species are used for spice and folk medicine. The aim of this paper is to review the most recent literature regarding biological activities of Rosaceae chemicals. Chemical investigations on Rosaceae have revealed the presence of flavonoids, triterpenoids, steroids, tannins, ligans and polysaccharides. Especially gallic acid, philoridzin, catechin have been reported from Rosaceae¹. These compounds are powerful antioxidants and have attracted increased interest in the last years. For example, anti-microbial activity and anti-biofilm activity of gallic acid on Staphilococcus aureus were investigated². The other flavonoid, phloridzin, have been commonly investigated by mammalian physiologists since its ability to block sodium-linked glucose transport and block renal re-absorption of glucose in the kidney³. Moreover health-benefits of catechin have been reported in terms of anti-inflammatory, anti-hypertensive, anti-obesity and anti-carcinogenic^{4,5}. The phenolic constituents of Rosaceae family have been commonly researched. However, our knowledge is still primitive state. Therefore many different studies should be performed to identify the effects of chemical composition. References : [1] Yan, G., Li, S., Hu, J., Zhai, X., Ma, W., Li, N. (2014). ESTIMATION OF YIELD AT DIFFERENT HARVESTING TIMES IN FENUGREEC PLANTS (*TRIGONELLA FOENUM GRAECUM L.*)

AHMET ŞAHİN¹, UFUK KARADAVUT¹, GALİP ŞİMŞEK¹, ŞEFİKA NUR ÖZÇELİK¹, KÜBRA SOĞANCI¹

ABSTRACT

Fenugreec is grown in warm regions in our country as winter or early spring, and cold regions as summer. It is a plant with many advantages with its root caused being a legume plant. Fenugreec is used in many different forms. In Kırşehir province, planting has begun to increase in recent years. This study was conducted under the ecological conditions of Kırşehir province in 2016. Local population was used as material in the study. In the study conducted with three replications for random blocks, it was determined that four different time periods were used before flowering, flowering time, after flowering and before harvesting. Plant height, fresh and dry yields were determined before and after the plants were formed. Subsequently, protein analysis was performed in the laboratory to determine the effect of protein time on shape time. Variance analysis was performed to determine the difference in form times for the obtained data. We also tried to estimate the yields of plants using the Richards model. As a result, except for the protein ratio, all of them were obtained after the flowering after flowering, and the amount of protein was obtained in the period of seed formation. The statistical significance of the difference in form times is significant. Estimates of yields are made very close to real values.

PROJECTION STUDY ON THE FUTURE OF THYME FARMING IN TURKEY

UFUK KARADAVUT¹, KÜBRA SOĞANCI¹, GALİP ŞİMŞEK¹, ÖMER SÖZEN¹, MEHMET EMİN YAZICI¹

ABSTRACT

Thyme is an important drug and spice plants. There are many different uses. Due to these characteristics, the cultivation area and production in our country continues to increase every year. Turkey provides about 70% of the world's thyme trade. Planned production always guarantees the success of production. Therefore, it is possible to make programming in thyme farming for the future. In this study, it is aimed to predict how the cultivation of thyme will change in terms of planting, production and yield in the coming years. For this, data were used on the organs of sowing, production and yield of 2004-2016 obtained from Turkish Statistical Institute. While it has been determined how they can develop in the last 15 years with the time series analyzes, it has been tried to determine how the future regeneration prediction might change. In the time series analysis $Y = 45059 + 5141,26t$ for the sowing area, $Y = 5809,15 + 664,703t$ for the production value and $Y = 127,885 + 0,17033t$ for the yield. According to this, while there is an increase in sowing area and production amount, it is seen that there is not a significant change in productivity. It is estimated that the yield and area of production will increase some more in the coming years in the estimation of the regression set up for the future, but it is estimated that productivity will not increase again.

ETNOBOTANIC STUDIES FOR ANKARA INSTITUTION OF THE FOREST DIRECTORATE

AYDIN YUMUŞ¹, MUSTAFA ÖZKAYA¹

ABSTRACT

In this study, the use of wild plants that naturally grown at boundaries of Ankara Regional Directorate of Forestry that have been consumed as folk medicine, food and spices and used for other purposes (to prepare ornaments and household goods, as incense and protect against nazar, to prepare soap and using as a stain) have been investigated. Institution employees of Ankara, Çankırı, Kırşehir provinces and Eskipazar district of Karabük, ethnobotanical research done in the regions where lining places of local people who uses most of plants for therapeutic purposes and as food. Eventually, it has been found that uses as 37 spices at folk medicine, as 16 spices at food and one spice for other purposes. Which part of the plant is used for what purposes (medicine, food e.g.) and it is used for treatment how it is prepared and which effect is used to obtain has been questioned. This plants have been scientifically identification and local names, used parts and usage patterns and the places where the plants are identified has been given in tabular form. Obtained findings were compared with literature knowledge.

GC-MS ANALYSIS OF THE GRAPEFRUIT (CITRUS PARADISI L.) PEEL ESSENTIAL OILS OBTAINED BY HYDRODISTILLATION

FATMA TULAY TUGCU¹, KADIR TURHAN¹, YUSUF CAN GERÇEK², GÜL CEVAHİR ÖZ²

ABSTRACT

Grapefruit (*Citrus paradisi* L.) belongs to the Citrus genus, a taxa of flowering plants in the family Rutaceae. Grapefruit has attracted much attention in recent years owing to its nutritional and antioxidant properties. Furthermore, it has been known that citrus compounds have antiviral, anticancer, anti-inflammatory, antiallergenic and analgesic activities. Citrus essential oils have been applied in many products, such as foods, beverages, cosmetics and medicines, as flavouring agents as well as for aromatherapy. In this study, the chemical composition of the essential oil (EO) obtained by hydrodistillation from the peel of grapefruit (*Citrus Paradisi* L.) was analyzed by gas chromatography/mass spectrometry (GC/MS). Twenty-five components were identified in the essential oils. Limonene was observed as dominant respectively. β -Pinene, linalool, α -terpinene and the other minor components were also detected.

THE EFFECTS OF OZONATION ON THE CHEMICAL COMPOSITION OF ESSENTIAL OILS FROM CITRUS BERGAMIA RISSO

FATMA TULAY TUGCU¹, KADIR TURHAN¹, YUSUF CAN GERÇEK², GÜL CEVAHİR ÖZ²

ABSTRACT

Bergamot is the common name for *Citrus bergamia* Risso, a plant belonging to the Rutaceae family (subfamily Esperidea). The peel is smooth and thin, whereas the pulp is slightly green–yellow, with an acidic and bitter taste. Among them, bergamot (*Citrus bergamia* Risso) peel oil is the most valuable essential oil due to its unique fragrance and freshness. The essence composed of a volatile part and non-volatile fraction find application in the cosmetic, pharmaceutical and food industries. In recent years, ozonated vegetable oils are used effectively in industries such as food, cosmetics, cleaning, pharmaceuticals and medical. It is suggested that ozone increases the shelf life of the oils and makes their chemical content more effective in treatments. Oxygenated terpene contents found in the plants attract attention because of their antimicrobial activities and antioxidant properties. *Citrus bergamia* Risso, is from citrus family that is rich in d-limonene and oxygenated terpene content. For this purpose, chemical analyses were carried out through GC-MS by obtaining volatile oils from *Citrus bergamia*'s shells using claevenger method. From the spectrums obtained consequently to the analysis, terpene, flavonoid, alkaloid contents and percentages of *Citrus bergamia* were determined. After ozonation process of these volatile oils obtained from *Citrus bergamia*, GC-MS analyses were performed and the percentages of their chemical contents were compared with the data before ozonation. It was observed that ozonation increased the percentages of phenolic compounds. In line with these results, it is thought that *Citrus bergamia* which demonstrate strong antimicrobial activity augment their activities by being ozonated.

HERBAL GALACTAGOGUES THAT INCREASE THE BREAST MILK

MERYEM AYRANCI¹, HAKAN VATANSEV², HATICE FEYZA AKBULUT³

ABSTRACT

Nowadays, breast milk is accepted as the gold standard of infant feeding. Despite many efforts to facilitate breastfeeding, it has been shown that numerous social and cultural factors, such as cultural norms and the social environment, affect successful breastfeeding rates. The most common cause reported by mothers of the early cessation of breastfeeding around the world is the perception that their mother is inadequate in breast milk production. Poor breastfeeding techniques, inadequate mammary gland tissue and maternal hormonal imbalances cause insufficient milk supply. To overcome this inadequacy, the use of galactagogues is usually considered in mothers whose milk production is still inadequate following training and other strategies provided by breastfeeding consultants. Galactagogues are substances that are thought to help in the initiation, continuation or reproduction of breast milk production. Galactagogues contain natural pharmaceutical ingredients and herbal supplements. Some herbal galactagogues are proposed by the public and health professionals as alternatives to medical pharmaceutical agents in terms of increasing the breast milk. It is estimated that 15% of women lactating in the United States and internationally 43% use herbal galactagogues. It has been reported that cause of the using herbal galactagogues is seen as a reinforcement as part of the perception and tradition of inadequate milk supply. Although the mechanisms of action of herbs and foods used to enhance the breastmilk are unknown, traditional experiences and beliefs suggest that they are effective and reliable. Among the herbal galactagogues they used to enhance the breastfeeding performance of participants were fenugreek (*Trigonella foenum-graecum*), blessed thistle (*Cnicus benedictus*), fennel (*Foeniculum vulgare*), goat's rue (*Galega officinalis*), nettle (*Urtica dioica*), blackthorn berry (*Prunus spinosa*), torbangun (*Coleus amboinicus*) and shatavari (*Asparagus racemosus*). However, there is no standard information on the use of these herbs, their dosages and their composition. There is a need for well-designed and well-conducted clinical trials that address limitations to determine the efficacy of these herbs in lactating women.

INVESTIGATION OF ANTIMICROBIAL ACTIVITIES OF LAURUS NOBILIS ESSENTIAL OILS

VELİ ÇELİKTAŞ¹, HANDE OTU¹, YILMAZ UÇAR¹, SEMA DÜZENLİ¹

ABSTRACT

This study aimed to research antimicrobial activity of essential oils and evaluate two different oil solution preparation method. For this purpose, essential oil that get from leaves of *Laurus nobilis* L. spread in Mediterranean plant area has been used. Oil solutions which prepared by using different emulsion concentration (0-5-10-25-50 uL/mL) and different volumes of pure oil (5-10-20-30 uL) applied to bacteria (*Escherichia coli*, *Salmonella*, *Staphylococcus aureus*) using Kirby-Bauer disc diffusion method. After contamination of bacteria to Nutrient agar in petri dishes, these discs were put on agar and incubated 24 hours at 37 °C. Each application had three petri dishes and each petri had three discs. Antimicrobial activity of oils determined according to zone diameter that formed around antimicrobial disc. Although emulsion concentrations have not been effective on any bacteria, all pure oil concentrations have found effective. 20 and 30 ul pure essential oil doses have found most effective. However this doses have not statistically differences on disc zone diameter. So it can be considered that sufficient dose was 20 ul pure essential oil.

PESTIL (GRAPE LEATHER) ENRICHED WITH WHEAT AND SOY FLOUR: SOME PHYSIOCHEMICAL AND SENSORY PROPERTIES

FERHAT YÜKSEL¹, TOLGA GUDELEK¹, CEMALETTİN BALTACI¹

ABSTRACT

The aim of the current study was to investigate the some physiochemical and sensory properties of Pestil (grape leather) enriched with wheat (1th sample) and soy (2th sample) flour and wheat:soy flour (3th sample) mixture. Protein, ash and moisture content of samples were determined and sensory analysis was carrying out with non-education thirty panelist group members from the University of Gumushane. The moisture content of samples was determined 9.78, 11.06 and 9.96, respectively. Addition of soy flour increased the protein and ash values of the samples. The protein values was 6.27, 16.97 and 9.78 and ash values of sample was 0.76, 1.98, 1.33, respectively. As can be seen from these values, the protein and moisture values of sample increased and they speculated that higher moisture values could be due to protein level in mixture. The increase of soy flours in the mixture a significantly affected to sensory score ($p<0.05$). The sensory properties of sample decreased with the increase of soy flour while the sensory properties of sample increased with addition of wheat flour in the formulation. Nevertheless, some sensory scores such as hardness and adhesiveness had taken positive sensory scores with using soy flour in the formulation. The hardness values were 5.26, 3.43 and 4.26, respectively. The highest score of overall acceptability of sample was 5.37 in 1th sample and the lowest score was 3.30 in 2th sample. The current results could be important for the Pestil production and the wheat and soy flour could be used in Pestil formulation. However, the soy flour amount needs to study in the Pestil formulation at next future.

USE OF CINNAMON IN TYPE 2 DIABETIC PATIENTS

DUYGU İLKE YILDIRIM¹, KAMILE MARAKOĐLU²

ABSTRACT

Diabetes mellitus (DM) is one of the most common endocrine disorders in the world. The global diabetes prevalence has increased rapidly along with the growing number of sedentary lifestyles and this has been described by the World Health Organization (WHO) as an epidemic. According to the International Diabetes Federation (IDF), the number of diabetic patients in the world in 2013 is estimated to be 382 million, and in 2035 this figure is expected to reach 592 million. Although this is not so different in Turkey, Turkey has become one of the countries with the highest incidence of diabetes, and the prevalence of diabetes has risen to 13.7% with a very rapid increase in 12 years. Herbal treatments are one of the most commonly used complementary and alternative medicine (CAM) methods in the treatment of many diseases. Treatment with plants is the oldest treatment. The most important difference between phytotherapy applications that have been applied in the past and phytotherapy applied in today's medicine is that they are used not for all but useful parts of plants. 80% of people use herbal medicines in a fraction of their lives. Among these herbal therapies, cinnamon has been found to be very important in many studies carried out in recent years. Cinnamon has antioxidant, vasodilator, anti allergic, antiulcerative, antithrombotic, antibacterial properties. Most of the studies concerned Type 2 Diabetes Mellitus, metabolic syndrome and insulin resistance. In this report we aimed to evaluate the importance of CAM in addition to medical treatments in diabetic patients and the effects of using cinnamon among them.

**CHANGES IN BACTERIAL COMMUNITY STRUCTURE IN THE
INTESTINAL MICROBIOTA OF RAINBOW TROUT
(ONCORHYNCHUS MYKISS), FED WITH GARLIC SUPPLEMENTED
DIET BY NEXT-GENERATION SEQUENCING**

MIRAY ETYEMEZ BÜYÜKDEVECİ¹, İBRAHİM DEMIRKALE¹, SUAT DİKEL¹

ABSTRACT

The present study was conducted to test the hypothesis that the bacterial community structure of the intestinal microbiota is altered when rainbow trout are fed with different level of garlic supplemented diet. For this purpose, two hundred and forty fish, weighing between 7 and 9 g, were distributed into 12 cages standing in a concrete pond where four experimental groups were established. Fish were fed with the commercial basal diets supplemented with different levels of garlic (0, 10, 15 and 20 g kg⁻¹ diet) to represent a feeding group of 0 g (=Control), 10 g (=Garlic 1), 15 g (=Garlic 2) and 20 g (=Garlic 3) 100 g⁻¹ of feed for a period of 120 days.. At the end of the feeding trial, all intestine samples of six fish from each tank were removed and then genomic DNA was extracted using the DNeasy Blood & Tissue Kit (Qiagen, Germany). The taxonomic characterization and composition of bacterial communities of rainbow trout intestine among the experimental groups have been explored and compared by using a 16S rRNA approach on an Illumina MiSeq platform. Overall taxonomic characterization of the bacterial community was conducted. For instance, Betaproteobacteria and Gammaproteobacteria were the most abundant classes in the control, whereas Gammaproteobacteria and Bacilli were dominant in fish that received the highest level of garlic in the diet (Garlic 3). A phylogenetic analysis was then carried out to establish the taxonomic affiliation of each OTU (Operational taxonomic unit) and the results demonstrated that the most abundant OTUs were affiliated to the genera Deefgea (15.1 %) and Aeromonas (17.4 %) in the control, whereas members belonging to the genus Aeromonas (44.6 %), and to a lesser extent, the genera Deefgea (13.9 %) and Exiguobacterium (14.8 %) were dominant in the group that received the highest level of garlic (Garlic 3). The results confirm that administration of garlic can induce changes in the bacterial community composition, resulting in distinct communities within the fish intestinal ecosystem.

SCREENING OF BIOLOGICAL ACTIVE INGREDIENTS OF THE MOST CONSUMED BEVERAGES: A COMPARATIVE STUDY

EBRU KURTULBAŞ¹, ELAF ELHUSSEIN¹, SELİN ŞAHİN¹, MEHMET BILGİN¹

ABSTRACT

In this study, biological active ingredients of drip coffee, instant coffee, Turkish coffee, green tea, camomile tea, fennel tea, rose hip tea, apple tea, sage tea, linden tea and black tea were investigated in terms of total phenolic content (TPC), total flavonoid content (TFC) and total antioxidant activity (AA). These beverages are most consumed liquid products in Turkey. Beverages were prepared according to their traditional methods. Total phenolic content (TPC) was expressed as gallic acid equivalent per gram of dried material (mg-GAE/g-DM), total flavonoid content (TFC) was given in Catechin equivalent per gram of dried base (mg-CE/g-DM). Two different radical scavenging activity assays were used to determine the antioxidant capacity of the beverages (mg-TEAC/g-DM). The findings were also evaluated with one-way analysis of variance (ANOVA) test.

EVALUATION OF THE THERAPEUTIC POTENTIAL OF ORIGANUM MINUTIFLORUM O. SCHWARZ ET. P.H. DAVIS

CEREN ANLAS¹, FULYA USTUN ALKAN¹, ATAMAN BILGE SARI¹, TULAY BAKIREL¹, OYA USTUNER¹

ABSTRACT

Objective: It is known that failure of chemotherapy with conventional agents as a result of development of resistance and dose-limiting toxicity is a major problem in the clinical management of the cancer. Therefore, medicinal plants are increasingly used as complementary and alternative therapy for improve the outcome of patients suffering from the tumors and to reduce the long-term toxicities associated with the current standard of treatment. The aim of the present study was to investigate the cytotoxic effects of aqueous extract and essential oil of *Origanum minutiflorum* O. Schwarz et. P.H. Davis on normal and cancer cells, also determine the antioxidant activities and contents of total phenolics. **Material and Methods:** Cytotoxic effects of aqueous extract and essential oil of *O. minutiflorum* O. Schwarz et. P.H. Davis on canine mammary tumor cell lines (CMT-U27 and CMT-U309) and Swiss 3T3 albino mouse fibroblast cell line were determined by MTT assay. Also, for the determination of antioxidant activities and total phenolic contents of extract and essential oil DPPH free radical scavenging assay and Folin-Ciocalteu reagent were used, respectively. **Results:** Cytotoxic effects of essential oil obtained from *O. minutiflorum* O. Schwarz et. P.H. Davis were observed on canine mammary tumor cell lines in concentration dependent manner (86.67-7.51% and 74.45-2.42%). Cytotoxic effect of the essential oil was observed only at the highest concentration on Swiss 3T3 albino mouse fibroblast cells. Cytotoxic effect was not determined in aqueous extract. It has been determined that DPPH free radical scavenging activity of essential oil (IC₅₀ 173.09 µg/ml) and extract (IC₅₀ 173.76 µg/ml) were close to each other, while total phenolic content of essential oil (318 mg GAE/g) was higher than the extract (36.59 mg GAE/g). **Conclusion:** The results have indicated that essential oil extracted from *O. minutiflorum* O. Schwarz et. P. H. Davis has shown selective toxic effect on canine mammary tumor cells. Therefore, this essential oil can be investigated as an alternative therapy on cancer treatment.

BIOACTIVE CONTENTS OF COMMONLY USED SPICES IN TURKEY: A COMPARATIVE STUDY

ELAF ELHUSSEIN¹, EBRU KURTULBAŞ¹, SELİN ŞAHİN¹, MEHMET BILGIN¹

ABSTRACT

Globally for thousands of years spices are used not only as food additive, but also for medical and food preservation application. In this study, bioactive contents of 9 various types of commonly used spices in Turkey were compared in order of total phenolic content, total flavonoid content and antioxidant capacity of their extracts. All their methanolic extracts were obtained under suitable conditions of Homogenizer- Assisted Extraction (HAE) method. According to the Folin-Ciocalteu method and Aluminium chloride colorimetric method the amount of total phenolic content (TPC) and total flavonoid content (TFC) were determined. The cupric ion reducing antioxidant capacity (CUPRAC) assay and α , α -diphenyl- β -picrylhydrazyl (DPPH) free radical scavenging method were applied to measure the antioxidant capacity and antioxidant activity (AA %) of extracts. TPC, TFC and AA were expressed in mg of gallic/catechin/trolox equivalent per g of dried weight (mg-GAE/g-DL), (mg-CE/g-DL) and (mg-TEAC/g-DL). Distribution of results was statistically examined by Tukey's range test.

DISTRIBUTION AND IMPORTANCE OF SÜTÇÜLER PLATEAU THYME (ORIGANUM MINUTIFLORUM) GROWING AS ENDEMICALLY IN ISPARTA PROVINCE

İSMAIL TÜFEKÇİ¹, NURCAN KAYA², EBRU HATİCE TIĞLI³

ABSTRACT

Despite the presence of many aromatic plant species belonging to Lamiaceae family, which is defined as "kekik" in Turkey, the species containing especially volatile oil carvacrol and thymol are accepted as "thyme". Plateau thyme "Origanum minutiflorum" which grows endemically in the mountainous regions of the province of Isparta in the province of Isparta, is among the 10 most important species to be protected. Sütçüler Plateau thyme (Origanum minutiflorum), also known as 'Sütçüler kekiđi' and 'Tota kekiđi' in the thyme market, is an endemic species which is distributed in the Sütçüler region of Isparta province and which is concentrated in wildly dense and exported 80-90% (Özhatay ve ark., 1997). By this study, it is aimed to put forward the applications on distribution, potential, production, contribution to the local people and precautions for continuity of breeding of this thyme species.

ANTIOXIDANT AND ANTIMICROBIAL PROPERTIES OF CISTUS SPECIES

MERVE DENİZ KÖSE¹, BUSE NUR TEKİN¹, OGUZ BAYRAKTAR², EMRE TAYLAN DUMAN², YÜCEL BAŞPINAR¹

ABSTRACT

Different parts of *Cistus* species are traditionally used in folk medicine as remedy for several microbial disorders and infections. Therefore, biological activities including antimicrobial and antioxidant capacity of this plant are very important for the use of this plant in different industrial applications such as dietary supplements, functional foods and food packaging etc. In the first part of the study, the crude extract of the *Cistus* leaves was obtained to determine its antioxidant and antimicrobial activities. Then volatile compounds were extracted using hydrodistillation and hexane. The *Cistus* oil was obtained by hydrodistillation of fresh material, using leaves, in an altered Clevenger-type device. Aqueous extract of *Cistus* leaves were neutralized to precipitate the gums. The yield of gum was determined as 1%. Resinoid was obtained after ethanol extraction of the gum. Antibacterial activities of the extract were determined using disc diffusion and micro-dilution assays methods against gram-positive and gram-negative bacteria. The extract of *Cistus* leaves tested and exhibited antibacterial activities by inhibiting one or more microorganisms. The tested plant extract was more active against gram-positive bacteria compared with gram-negative bacteria, depending on the different structural and inherited features of these two groups. Total phenol content of the extract was determined with Folin-ciocalteu method. Total phenolic content of *Cistus* extract was 520 ± 15 mg GAE/ g extract. The water soluble (ACW) and lipid soluble (ACL) antioxidant capacities of the extract were also determined. ACW and ACL of *Cistus* extract was found as 650 ± 80 μ g Ascorbic acid/ mg extract as 540 ± 30 μ g Trolox Equivalent/ mg extract, respectively. In this study there is a clear relationship between the analysis results and important biological activities. In that manner, bioactive natural compounds present in *Cistus* species can be used as natural raw material in some related industrial applications.

ROOT OF ERYNGIUM CAUCASICUM TRAUTV A VALUABLE SOURCE FOR STEROLS

ARDALAN PASDARAN¹, ZELİHA SELAMOGLU², ARSALAN PASDARAN³

ABSTRACT

This study investigates root sterol contents of *E. caucasicum* Trautv which used in Iran as an edible aromatic plant and a traditional remedy for men infertility treatment. Current study presents an overview about root *E. caucasicum* as a valuable source for sterols extraction. Sitosterol, α -spinasterol, stigmastanol, campestanol, sitostanol, and stigmasterol constituted the major compounds of *E. caucasicum* sterol content. The sterol content of the root of *E. caucasicum* ranged from 8.35% to 10.39% of plant total extract. The sitostanol, stigmastanol and stigmasterol constituted the most important sterols. *E. caucasicum* could be considered as a new valuable source for phytosterols extraction.

HEPATOPROTECTIVE POTENTIAL OF THE ACANTHOLIMON GENUS

ARDALAN PASDARAN¹, ZELİHA SELAMOGLU², ARSALAN PASDARAN³

ABSTRACT

This study investigates the aerial parts hepatoprotective potential of hydro alcoholic (ethanol: water, 70: 30) extract of *Acantholimon cymosum* Bge. The hydro alcoholic extract showed an excellent protective effect on hepatocyte against formaldehyde intoxication with doses 5 and 10 mg. Also in this research isolated the major compounds of hydro alcoholic extract compounds. They were identified as 6-hydroxy-kaempferol and 4-O- α -L-glucopyranoside protocatechuic acid based on spectroscopic methods. Results showed that the hydro alcoholic extract of the *A. cymosum* has a good protective effect on liver in functional and enzymatic levels. Congested sinusoids, congested vessel, and infiltration of inflamed cells (lymphocytes), necrotic sections observed in the control group showed liver injuries. Test group, especially 5, 10 mg ameliorated intoxication of formaldehyde particularly. These effects previously reported from *Acantholimon* genus in animal models. Two major compounds 6-hydroxy-kaempferol and 4-O- α -L-glucopyranoside protocatechuic acid reported for first time from this genus. The results of this investigation and previous studies suggested that *Acantholimon* genus could be considered as a valuable plant for hepatoprotective agent development. Based on phytochemical investigation this activity probably yielded by high phenolic content of this genus plants.

CITRIC ACID PRODUCTION AS FUNCTIONAL INGREDIENTS FROM BEET MOLASSES BY A MUTANT ASPERGILLUS NIGER STRAIN

SEDA GÜÇ¹, OSMAN ERKMEN¹

ABSTRACT

Citric acid, a crystalline powder obtained from fermentations, is a widely used preservative and antioxidant in food, cosmetic, personal care and cleaning products. The citric acid slows the oxidation process that changes the flavor, color and texture of foods exposed to air. Citric acid also slows the oxidation process that causes fats to turn rancid and proteins to deteriorate, which inhibits spoilage of foods and other products that contain fats, proteins and amino acids. The interest in the functional elements (such as citric acid) in foods has increased in recent years. Citric acid have a potential to use as ingredients in the production of functional foods. The microbial production of a unique organic acid and its rapid improvement is a promising method for developing functional foods and nutraceuticals. The citric acid concentration produced by wild strains is too low for economical processes, strain improvement was carried out to develop mutants of parent strain for increased production of the products. However, strain development from wild strains to mutants depends mainly on the process of mutagenesis (physical and chemical agents). Developments of mutant strains which can synthesize higher concentration of citric acid within a short fermentation time and capable of growing at lower pH are preferred. The yield of citric acid was further enhanced by optimizing the fermentation parameters like temperature, pH, incubation time, substrate concentration, nitrogen source and several other ingredients to accumulate citric acid including strains of *A. niger*. The present work, therefore, is concerned to improve a novel *A. niger* mutant strain for production of citric acid by submerged fermentation process using non-treated beet molasses. Commercial production of citric acid utilizes *Aspergillus niger* in an industrial-scale submerged fermentation process. The effects of initial pH, sugar and different ingredients on the citric acid production from non-treated beet molasses were studied in submerged fermentation using *Aspergillus niger* OE55. Maximum amount of citric acid (19.13 and 34.62 g/L) was achieved when the initial pH of fermentation medium was 6.0 from 200 g/L and 150 sugar respectively. Citric acid production and biomass formation continuously increased during fermentation period in the media initially containing 200 g/L sugar. Remaining sugar (from 3.20 to 6.03 g/L) was higher at the end of fermentation in the media initially containing 160 g/L sugar than 200 g/L sugar. Yield of citric acid after 4 days of fermentation were ranged from 0.16 to 0.28 g/g from 160 g/L sugar. The high phosphorus and nitrogen levels stimulated biomass formation and reduced citric acid production. The optimum time of incubation for maximal citric acid production varies both with the sugar concentration in non-treated molasses and fermentation conditions for the novel *A. niger* strain.

STATISTICAL EVALUATION OF ANTIMICROBIAL EFFECTS OF AROMATIC PLANT ESSENTIAL OILS ON BACTERIA, YEASTS AND MOLDS

ANASS ALMOHAMMAD¹, RECEP BINDAK¹, OSMAN ERKMEN¹

ABSTRACT

The aim of this study was to investigate antimicrobial characteristics of aromatic plants (thyme, anisium, mint, chamomile and basil) essential oils on bacteria and fungi. Aromatic plants were obtained from Gaziantep and Halep regions. Essential oils of aromatic plants were extracted by hydrodistillation using a Clevenger apparatus. Antimicrobial activities of essential oils were tested on seven bacterial pathogens, two yeasts and 6 molds. Minimum inhibitory concentration (MIC) and minimum bactericidal concentration (MBC) of essential oils on microorganisms were detected by broth dilution and spread plate methods respectively. The experiments were repeated three times. The significance was set to $p < 0.05$ for the ANOVA value among treatments (MIC/MBC) using t-test, one-way and multiple-range analysis of variance to compare means on the assays. When MIC/MBC differences among tested factors were close to one, this was considered as significant ($p < 0.05$). Antimicrobial effect (MIC/MBC) of five plant essential oils on *E. coli*, *P. aeruginosa*, *L. monocytogenes*, *S. dysenteriae*, *B. cereus*, *K. pneumoniae*, *E. faecalis* and *S. thermophilus* were not significantly different ($p > 0.05$). On the other hand, antimicrobial effects on *S. Typhimurium*, *Y. enterocolitica*, *S. aureus* and *B. subtilis* were significantly different ($p < 0.05$). Antimicrobial values of MIC and MBC of basil on *S. Typhimurium* was lowest while it was higher for thyme. Similarly, MIC and MBC values of anisium indicated on *Y. enterocolitica* was lower and it was higher for thyme. On the other MIC and MBC differences on *S. aureus* and *B. Subtilis* were lower for anisium and higher for mint. Antimicrobial effects of thyme, mint and chamomile essential oils were not significantly different ($p > 0.05$). On the other hand, antimicrobial effects of anisium and basil on tested microorganisms were significantly different ($p < 0.05$). MIC/MBC values of anisium on *E. coli* were lower while they were higher on *Y. enterocolitica*. Basil MIC/MBC values were lower on *E. coli* and higher for *P. aeruginosa*. Antimicrobial effects of essential oils on *S. dysenteriae* obtained from two regions were significantly different ($p < 0.05$), MIC/MBC ratios were higher for essential oils obtained from Gaziantep than Halep. MIC/MBC values of essential oils obtained from Gaziantep and Halep for other bacteria were not significantly different ($p > 0.05$). The lowest MIC/MBC values for plants collected from Syria and Turkey were obtained with thyme. The highest MIC/MBC values for plants collected from Syria and Turkey were obtained with basil. Order of antimicrobial effects (MIC/MBC) of aromatic plant essential oils collected from Syria were thym < chamomile < anisium < mint < basil while it was thyme < chamomile < mint < anisium < basil from Turkey. The antimicrobial effects of five aromatic plants obtained from Syria and Turkey were not statistically significant ($p > 0.05$).

INVESTIGATION OF ANTIPROLIFERATIVE EFFECTS OF RHODODENDRON FLOWER EXTRACTS ON NORMAL AND CANCER CELLS

SALİHA EKŞİ¹, NEBAHAT EJDER¹, OSMAN BİROL ÖZGÜMÜŞ¹, BARIŞ UZUNOK²

ABSTRACT

More than 100 cancer types are formed by uncontrolled proliferation of cells in various regions of our body. According to the World Health Organization (WHO), there will be about 19.3 million new cases of cancer in 2025 due to increase in both population and age. Cancer is the second leading cause of death in Turkey. Although many synthetic or herbal medicines have been used in recent years for cancer therapy, a desirable outcome has not been achieved. Among the herbal and plant medicines, Rhododendrons have gained prominence in recent years for their anti-carcinogenic potential, which are in plentiful supply in the Black Sea Region of Turkey. In this study, the cytotoxic effects of various extracts (water, ethyl acetate, and methanol) of Rhododendron on normal (ARPE) and cancer cell lines (HeLa, A549, CRL-2923, HT-29) were investigated. Cytotoxic activity measurement was determined by MTT (3-[4,5-Dimethylthiazol-2-yl]-2,5-diphenyltetrazolium bromide) method. The results indicated that water/DMSO extract showed a dose dependent cytotoxic effect on both normal and transformed cell lines. 600 µg /ml of water soluble extract resulted in 45.72%, 66.97%, 69.94, 32.88% cell death in HeLa, A549, HT-29 and CRL-2923 cell lines, respectively, Whereas non-cancerous ARPE cells were less sensitive to the same concentration since only 20% of these cells were affected. >266 µg /ml or= concentrations of ethyl acetate extract showed dose dependent cytotoxicity for all cell lines. The most sensitive cell line was HT-29, since 118µg /ml of ethyl acetate led to 41. 2% cell death. However, the same concentration of ethyl acetate extract killed only 8.77% of normal cells (ARPE).The concentration of 400 µg /ml of the methanol extract was found to be cytotoxic to all cells. When the concentration of the methanol extract was decreased to 166µg /ml, the cytotoxic effect on all cell lines tested was abolished, except for the HT-29 cells that showed 33.96% cytotoxicity. In the present study, the results demonstrated that total Rhododendron flower extracts induced selective cytotoxic effect on different types of cancer cell lines. Further work is needed to identify the activity of the compound/compounds that may induce selective effect on different type of cancer cells.

ASYMMETRIC REDUCTION OF KETONES BY BIOCATALYSIS USING MEDICINAL AND AROMATIC PLANTS

ALİME EBRU AYDIN¹

ABSTRACT

Chiral compounds are important building blocks in the synthesis of useful chemicals for pharmaceuticals, agrochemicals, and food ingredients. The production of single enantiomers of chiral intermediates has become increasingly important in the pharmaceutical industry¹. Asymmetric syntheses of chiral alcohols have found wide application in the production of drugs, agrochemicals, flavours and pigments. These alcohols may be obtained by enantioselective reduction of prochiral ketones². The catalysts for the asymmetric reduction of ketones can be classified into two categories: chemical and biological methodologies.³ This study aimed to develop novel green procedures for the synthesis of optically active alcohols. Enantiomerically pure 1-phenylethanol was produced via asymmetric bioreduction of acetophenone. The bioreduction of the keto group was performed using ginger (*Zingiber officinale*), fennel (*Foeniculum vulgare*), coriander (*Coriandrum sativum*) as biocatalyst, obtained from local market. The bioreduction method presented allows chiral phenyl alcohols to be obtained with a very good enantioselectivity by using a methodology which is more environmentally friendly than classical reductions of prochiral ketones. In conclusion, optically active chiral alcohols with excellent good enantiomeric excesses (99.9-78%) were synthesized using ginger (*Zingiber officinale*) to be a promising biocatalyst for the production of key intermediates.

EVALUATION OF MEDICAL AND AROMATIC PLANTS FOR FOOD SAFETY

NERMIN ÖZGE BİLGE¹, ÖZLEM ÇAĞINDI²

ABSTRACT

Medical and aromatic plants are a large group of plants that have differences in terms of their use and growing conditions. The food products obtained from the plants in this community have attracted consumers and become popular. The increasing use of medicinal and aromatic plants in the food sector is due to their antimicrobial, antioxidant and functional properties. Plants that we call medical and aromatic in our country contain a large number of species and are used as food additives, herbal tea, spices and food supplies in the food sector. Some of these plants, which are consumed in various product forms in our country, are obtained from natural sources. According to World Health Organization (WHO) data; 80% of the medical and aromatic plants used in different parts of the world are collected from nature. It has become evident that the increasing number of these plant communities have to pass through certain stages and legal arrangements should be made before reaching the consumer. In order to ensure the food safety of the medical and aromatic plants used in the food sector studies are carried out by the Ministry of Food, Agriculture, and Livestock in Turkey, the European Food Safety Authority (EFSA) in the European Union countries, the United States Food and Drug Administration (FDA) in the USA and such legal authorities. The correct identification of the names of medicinal and aromatic plants and doing sales under this standard are among the first points to be considered in terms of food safety. Another issue that needs to be considered in this respect is that these crops collected do not harm human health, they are produced and consumed in healthy conditions, they are not physically, chemically or microbiologically contaminated, and do not have pest problems. In addition, inadequate drying, inadequate personal hygiene, and unsuitable storage conditions are among the issues to be considered. For example, the use of plan sifters and aerial cleaners, metal detectors before the packaging process is considered as an effective step in removing physical contamination such as stones and soil. In this study, it was aimed to determine the chemical, physical and biological contamination within the scope of food safety, to evaluate the precautions to be taken and to evaluate human health before the medical and aromatic plants reach the consumption stage.

SOME PROPERTIES OF COLOCASIA ESCULENTA (TARO) STARCH AS A FUNCTIONAL COMPONENT

BURCU YAŞAR¹, MUHAMMET ARICI², ÖMER SAİD TOKER²

ABSTRACT

Abstract: Taro (*Colocasia esculenta*) a member of the Araceae family is a tropical and sub-tropical climate plant and its tuber frequently consumed in many countries due to its high nutritional value. In our country, it is widely grown and consumed in districts of Mersin province. The taro tuber has a rich starch content and therefore has a great potential as a source of starch and carbohydrates. In this study, the various properties of taro starch and the influence of different hydrocolloids (guar gum, xanthan gum and mixture of these gums) at different concentrations (0.5 and 1%) on the pasting properties of the starch was investigated because hydrocolloids are used to improve functional properties of starches. The starch was isolated from taro tubers which were obtained from Anamur district of Mersin. When the morphological structures of the starch granules were examined, it was found that they had an irregularly shape, polygonal structure and the average size of the starch granules varied from 0.5 to 3 μm . The crystallographic structure of starch displayed A-type XRD pattern. The total starch content of the taro starch was 84.29%, the resistant starch was 3.14% and the amylose content was 9.92%. The amylose content of the taro starches was found to be lower than potato and rice starch. The low level of amylose makes taro starches more hydrolysable when compared to starches with high level of amylose. The moisture, protein, ash and fat contents of starch were 11.42, 1.29, 1.39 and 0.11% respectively. The L*, a* and b* values of the starch were found as 90.87, 2.19, 4.71 respectively. The swelling power of starches increased according as starch suspension heated from 60 to 90°C, and swelling power was 14.22 g/g at 90°C. When the pasting characteristic of the taro starch were analyzed, addition of hydrocolloids significantly affected the pasting parameters of the taro starch. As the increase of xanthan and guar gum concentrations significantly increased the peak viscosity, final viscosity, holding strength, breakdown viscosity and trough viscosity parameters. Guar gum had more dominant effect when compared with the xanthan gum, and mixture of guar-xanthan gums. Addition of 1% guar gum increased peak, final, breakdown and setback viscosity values from 1786.5 cP to 8787 cP, from 2804.5 Cp to 6439 cP, from 453.6 cP to 5760 cP, from 1471.5 cP to 3412 cP, respectively. As a result taro starch has been proposed as an alternative source for food product development due to its physicochemical and functional properties. *This work is supported by TUBITAK (Project number: 1140391).

TWO ECONOMICALLY IMPORTANT PLANT THOSE CAN BE GROWTH IN TÜRKİYE; LIPPİA CITRİODORA, CYMBOPOGAN CİTRATUS

NIHAL ÖZEL¹

ABSTRACT

Having rich plant diversity, Türkiye has rich medicinal and aromatic plant diversity. But in this subject, the most important problem is their decreasing quantitatively because of collecting uncontrolled from nature, being not growth and lacking knowledge on processing. Therefore this subject is standing in front of Turkish researcher and practitioner. With the project, investment and publication studies to be carried out in this direction, collectors and producers can provide more efficient, more effective and conscious production / collection activities about medical and aromatic plants. In Türkiye, studies on growth of medicinal and aromatic plants were started and continue. But these studies are not expected level yet. While these studies going on, it will also be useful for the country to carry out adaptation studies with new economic species while these studies continue. *Lippia citrodora* (synonym: *Aloysia citrodora*), also known as lemon beebrush, is a species that is consumed both as a food and used in many fields in terms of medicine. *Cymbopogon citratus*, also known as lemon grass, is a vegetable that is both consumed as a food and of a medicinal property. In this study, these two species, biological, ecological features and usage will be introduced and it will be discussed whether it is suitable for Turkey.

**SPREADING AREAS, GROWTH ENVIRONMENT
CHARACTERISTICS AND PROTECTION OF BOŞŞALBA IN
KUTAHYA REGION. (BIG BLOOMING SAGE- SALVIA
TOMENTOSA)**

CİHAN KÖSE¹, CEZMİ ÖZEL², SÜLEYMAN TOPAL³

ABSTRACT

Approximately 90 species of Salvia species belonging to the family of Greater henbit (Lamiaceae) are naturally distributed in our country. Salvias is a precious plant with a wide range of uses such as health, food and cosmetics. Salvia has a rich potential in our country in terms of natural sprawl and number of species. It is the largest flowering sage known as Boşşalba (S.tomentosa), which is the most used and economical value of about 11 species grown in Kütahya region. This plant is known as "boşşalba", "şalba" or "çalba" and citizens of this region only consumes the tea of sage. Commonly boşşalba's is used a source of healing. Morphologically, in the form of a cluster of "boşşalba" type is 0.3 - 0.8 m long perennial, half-bloomed plant. Leaves are simple and egg-shaped. Especially in the young development cycle, the leaves are white-gray to silver with varying colors and they are hairy. Usually flowers are violet (purple) color. The flowering time is -depending on the height- end of June to July. Even though the plant is seen separately in the province individually; Harvest plans were made in order to cover the years 2014-2034 and to provide production supply each year by making determinations at the Tükmandağı and Gümüş region, which are of importance in terms of area size, integrity and density. A total of 1529.6 hectares of field and three harvest plans were made in Kütahya Operations Directorate. Kütahya is located between the part of Western Anatolian Phyogeography Region and Iran-Turan Phytogeography Region to the Central Anatolian Region. When the climate characteristics of the plant's growing environment were evaluated according to Erinç's Rainfall Efficiency Index criteria, it was found that it has the qualities of "Very humid climate type" and "Very humid forest flora". Physiographically, the plant is mostly dry, shallow and stony in mountainous terrain and is slightly inclined and sloped (9% -32%) in the lands of 800-1850 m. Mostly in southern exposures, partly in eastern and western exposures, and never in northern exposures. Analyzes of soil specimens taken from the Turkmen Mountain and Silver Mountain growing environments were made. Refrence to this, texture of the soil, structure, porosity, permeability etc. such as the physical properties and chemical properties of the soil have been determined. The entire plant growth environment is the area under the forest regime. Nowadays these areas are now relatively far from settlement and industry pollution hazards, they are at risk from illegal and inappropriate production methods of animal grazing and plant suppliers.

FUNGAL RISKS THAT MAY CAUSE PROBLEM IN THYME CULTIVATION IN TURKEY

GÜLSÜM PALACIOĞLU¹, GÖKSEL ÖZER², HARUN BAYRAKTAR¹

ABSTRACT

Thyme (*Origanum* spp.) is an important spice plant that widely used in Turkey. Thyme is used as raw material in pharmaceutical and perfumery industry due to it contains the essential oils such as thymol and carvacrol, and also in the control of plant diseases due to its antimicrobial effect. Turkey is one of the most important thyme producer and accounts for approximately 70% of world thyme production. The production of thyme, an important export product, is restricted by different plant pathogens. However, little information is available on plant pathogens, affecting thyme production in Turkey. In previous studies, performed in our country and in the world, *Macrophomina phaseolina*, *Fusarium* spp., *Colletotrichum* spp. *Alternaria* spp., *Botrytis cinerea*, *Stemphylium botryosum*, *Cladosporium cladosporioides*, *Phoma multirostrata* var. *macrospora* and *Rhizoctonia solani* have been reported as the most important plant pathogens, causing infections in the root, stem and foliage of the thyme plant. This study included a general evaluation on morphological characteristics, symptoms and control methods of fungal pathogens to be potential risk in thyme production areas in Turkey.

OXIDATIVE STRESS AND HEAVY METAL CONTENTS OF GANODERMA APPLANATUM

HASAN AKGÜL¹, ZELİHA SELAMOĞLU², MUHİTTİN DOĞAN³

ABSTRACT

This study aimed to determine the heavy metal levels and the oxidative stress state of *Ganoderma applanatum* (Pers.) Pat. The mushrooms were extracted in the soxhlet extractor. Total antioxidant levels (TAS) and total oxidant levels (TOS) were determined using Rel Assay Diagnostics kits. OSI value was calculated by TOS / TAS ratio. Heavy metal contents (Fe, Cu, Zn, Pb and Ni) were determined using atomic absorption spectrophotometer. As a result of the studies made, the TAS value of the mushroom was measured as 2.681 mmol Trolox Eq/L. The TOS value was determined as 36.644 μ mol H₂O₂ Eq/L. Based on TAS and TOS results, OSI level was determined as 1.367. Fe, Cu, Zn, Pb and Ni contents were measured as 459.71, 117.11, 168.78, 16.62 and 11.08 mg / kg, respectively. It has been determined that *G. applanatum* may be used as a potential antioxidant source due to its high antioxidant levels. But the high oxidant value indicates that the mushroom must be carefully and limitedly used in this region. In addition, the heavy metal content, especially the Pb and Ni content is high, suggesting that there may be heavy metal pollution in this region.

CHANGES ON SOME BIOCHEMICAL PARAMETERS IN RAT LIVER AFTER GRAPESEED AND LOW LEVEL LASER APPLICATIONS

HASAN AKGUL¹, MEHMET ERMAN ERDEMLİ², ZELİHA SELAMOĞLU²

ABSTRACT

The study was aimed to investigate changes that occurred in rat liver tissue as a result of use of grapeseed extract (GSE) and Low Level Laser Therapy (LLLT) in healing of experimentally fractured mandible analyzed with biochemical parameters. The animals were initially divided into 5 main groups each containing 12 animals in random order (Control, fractured mandible [FM], FM + GSE, FM + LLLT, FM + LLLT + GSE), and then these groups were divided into two groups each as 7 days and 21 days to create total 10 groups (n = 6). The subjects were administered 300 mg/kg/day GSE until the day they were sacrificed. On the other hand, LLLT was applied on 2 different points on the fracture line in 23 J/cm² doses for 7 days in the 7 days groups and for 21 days in 21 days groups in 48 hour intervals. The changes caused by GSE and LLLT treatments in mandible fractures on rat liver tissues were determined with malondialdehyde (MDA) and reduced glutathione (GSH) levels and superoxide dismutase (SOD) and catalase (CAT) activity analyses. Significant changes in biochemical parameters such as MDA, GSH levels and SOD, CAT activities in liver tissues caused by applications of GSE and LLLT during 7 and 21 days to experimentally mandible fractured rats are obtained. It was determined that the oxidative damages induced by mandibular defects both in 7th and 21st days in rat liver tissue were mostly removed by especially GSE administration.

BLACK CUMINS' POSITIVE EFFECTS ON HEALTH

ÇAĞDAŞ SALİH MERİÇ¹, NURCAN YABANCI AYHAN¹, HACI ÖMER YILMAZ¹

ABSTRACT

Black cumin, one-year herbaceous plant belonging to the family Ranunculaceae and strain of *Nigella sativa*, originated in Southern Europe And Western Asia. Black cumin is known in different parts of the world with different names, in French it is called nigelle cultivée and cumin noir, in German as echte schwarzkummel, in Italian as nigella, in Spanish as neguilla and pasionara, in Turkish as kalonji, in Hindi as kala jeera, in Arabic as Habbatul Sauda and Habbatul Barakah. In public it is also known as black sesame, novel coriander or small coconut flower. Seeds of black cumin contain essential oil (0.38-0.49%), fixed fat (30-40%), protein (20-30%), saponin, melanthigenin, nigellin and tannin. The biologically active compounds of black cumin are thymoquinone, dithymoquinone, thymohydroquinone, p-cymene, α -pinene, carvacrol, 4-terpineol, citronellol; but thymoquinone, with significant antioxidant activity, is the most important bioactive component of black cumin. Thymoquinone (C₁₀H₁₂O₂, 2-isopropyl-5-methyl 1,4-benzoquinone), 18.4-24% in essential oil of *Nigella Sativa*, is the active ingredient of black cumin which has important spices for alternative medicine and pharmacology both in our country and in the Middle East in recent years. It has been widely used in the treatment of many diseases such as colds, headache, asthma, diuretic, hepatitis, various rheumatism and inflammation diseases for centuries. In addition, it has a wide range of effects, including antioxidant, antihistaminic, anti-diabetic, antihypertensive, inflammatory and antimicrobial activities. It has been reported that the seeds of black cumin are cytotoxic against various cancer cells, promoting cellular activation and the production of specific antibody specific antibodies and has a positive effect on fasting blood sugar, total cholesterol and LDL cholesterol. Fixed and essential oils of black cumin are a rich source of phytochemicals that have curative effect against hyperglycaemia and hypercholesterolemia. It also has milk-boosting for breastfeeding mothers, appetizing, antimicrobial effects and is used in treatment of hair loss and scurf. According to Muslims, black cumin is considered as one of the greatest source of curative medicine because it is the remedy for all diseases except death. As a result, it is thought that in humans, the daily use of 30 mg / kg of the seeds of the black cumin may activate the immune system, but further studies are needed to clarify this issue.

ENRICHMENT OF PHENOLIC CONTENT OF BREAD BY USING OF MEDICINAL AND AROMATIC PLANTS

NESİBE ARSLAN BURNAZ¹, MÜGE HENDEK ERTOP², ŞEYDA MERVE KARATAŞ¹

ABSTRACT

In recent years, there has been a large increase in consumer interest in functional food. The main reason for this is the presence of phenolic compounds and natural antioxidants in functional food and food components, that have positive effects on human health and nutrition. Many enriched product formulations are being developed for this purpose. Bread is produced by kneading the dough of bread wheat flour, water, salt and yeast mixture, left it for an appropriate period of fermentation and baked in the oven. In addition to the components mentioned in the definition of bread, breads containing cereal products and flavors are called "bread varieties". In Turkey, it is a fact that, on a daily diet, the bread located in the table in every meal is a good source of energy and an irreplaceable food for the human body. So, by diversifying the breads with aromatic or medicinal plants, enhancing nutritional value by enriching them with a protein, fiber or some other important components, can contribute to nutritional balance of the individuals. In this study, it was aimed to enrich the phenolic material content of bread by adding medicinal and aromatic plants and plant seeds to traditional bread to increase its antioxidant functionality. For this purpose, firstly during making the various breads, plants or plant seeds such as yellow / blue poppy seeds, black cumin, flax seeds, coriander, mahaleb, cinnamon and curcuma were added to bread dough. Subsequently, the breads made with these formulations were processed to suitable extraction and the total phenolic content of the samples were determined as gallic acid equivalent based on the Folin-Ciocalteu method, and the results were compared with the control white bread. In the study, the sample breads were prepared to be two parallel by using dual-pan bread making machine. In the direction of the data, when the same amount (3g) of mahaleb, cinnamon and curcuma powder added 300g of breads were compared to control white bread; especially the cinnamon (1660µgGAE) was found to be significant in increasing the total phenolic content of the control white bread (310µgGAE). When the same amount (20g) of yellow / blue poppy seeds, black cumin seeds, flax seeds, coriander added 300g of breads were compared to control white bread, it was determined that flax seeds (754µgGAE) and coriander (713µgGAE) significantly increased the total phenolic content and antioxidant activity of control white bread (310µgGAE). When all the results are considered, the contribution to the total phenolic content of cinnamon (although it is added in very small amounts) is found very high in bread making and it can be suggested to use it in the production of functional bread. Conversely, using blue poppy and curcuma in bread caused a decrease in total phenolic content. It may be thought that some of the components in these plants compose antagonist effect and cause a decrease in phenolic content in breads. [*] This work was supported by the BAP Coordinator of Gümüşhane University (Project Code: 13.A0114.02.2).

EFFECTS OF CAROB ON REPRODUCTIVE SYSTEM

İLKNUR ÜNDAĞ¹

ABSTRACT

For centuries, plants have been used in alternative medicine treatments. People who benefit from the miraculous benefits of many plants also benefited from their carob. Carob (*Ceratonia siliqua* L.), which dates back to ancient times, is belong to the Ceasalpinaceae subfamily of the Leguminoseae family. The Carob growing in the areas where the mediterranean climate is dominant are located in the 1750 km area from İzmir Urla to Hatay Samandağı and they are seen intensely in the inner part of 1-2 km from the coast. This plant, which grows naturally, can be eaten with fruits and form of a continuous green bush or tree, can grow up to 10 meters in length. The fruit of the tree is initially green, but turns brown as it matures. The fruit nutrient rich in fruit insoluble pulp and polyphenols has many benefits for human health. It has been shown that there is a preventive and healing effect of obesity, cardiovascular and gastrointestinal diseases due to the high amount of dietary fiber it contains. Since it is rich in polyphenols, it has been reported to be effective as an antidepressant. In addition, studies on carob were also shown to have effects on osteoporosis, diabetes, cancer and the reproductive system. The reproductive system is one of the most important elements for the continuity of the descendants. Reproductive systems are the entire body of organs that perform reproductive functions and produce the hormones associated with it. Reproductive system organs have a very sensitive structure to many environmental agents, stresses and drugs. Studies have shown that environmental agents such as monosodium glutamate cause the harmful effects of vaginal, uterine, and ovarian metabolism and phytochemical content of the carob helps to reduce these negative effects. It has also been reported that live cervix cancer cells have significantly decreased thanks to carob content. In a study done in rat testis, it was shown that carob increases testosterone level, decreases LH level, does not cause any change in FSH level, and increases sperm density in seminiferous tubular. The present data shows that carob may have significant effects on the urinary system. More and more detailed work will reveal how these effects are; If any, will help determine the adverse effects.

ESSENTIAL OIL COMPUNDS OF SOME MEDICINAL-AROMATIC PLANTS GROWN IN LIBYA

SOMIA M. IBRAIK BUFRAG¹, IBTESAM RAMADANA A. ABUGHADYRA², NEJDET GÜLTEPE³

ABSTRACT

More than 100 species are used by especially Bedouins in popular medicinal as hot or cold drinks, gum chewed raw fresh or dry in Libya. Also, these are used for treatment dermal disease, bacterial and viral infection, insect and animal bites, burns and sometimes for the treatment of hair problems. In Libya medicine plant exists in 4 main centers: The El-Jabal El-Akhdar which has about 50% of the total endemic species, the coastal belt, the central part of Sahara and the southern part of Libya involving Jabal Al Awaynat, Tibesti and Ghat Plateaus. The aim of the study, investigation of the fatty acid methyl esters of essential oil of ten plants (*Artemisia herba alba*, *Capparis spinosa*, *Globularia alypum*, *Matricaria chamomilla*, *Ocimum basilicum*, *Origanum majorana*, *Peganum harmala*, *Phagnalon rupestre*, *Punica granatum* (pomegranate) peel, and *Thymus vulgaris*) from Libya. As a result of this investigation, eucalyptol, methyl stearate, γ -terpinene, and *p*-cymene were found to have the highest proportion in these plants.

CHERRY LAUREL

EZGİ KARATAŞ¹, ASLI UÇAR¹

ABSTRACT

Prunus laurocerasus L. (synonym: *Cerasus laurocerasus*, *Laurocerasus officinalis*) known as “laurel cherry” is a plant of the family Rosaceae, are red and purple summer fruits. Laurel cherry trees are generally grown in the Eastern Black Sea Region. The taste of wild growers is not preferred because it is burdensome. Specially grown fruits are big and their taste is sweet. The digestion of laurel cherry is easy and consumed nonfrozen, fresh, dried or roasted. In addition, molasses, jam, salting, pickles are made. The purpose of this study is to introduce the blackberry, a fruit that grows in the Black Sea region, to give information about the nutrient content and to show the relation with the diseases. The cherry laurel and its cultivars have been studied for fatty acids compositions in their seeds, phenolic acids, fatty acids and sugar contents as well as volatile constituents in the leaves and fruits, and benzoic aldehyde in the green fruits. The ripe fruit of the plant was reported to contain high levels of fructose and glucose as sugars, mainly vanillic acid as a phenolic acid, and linoleic acid as an unsaturated fatty acid. Cherry laurel is a good source of nutrients as well as a rich source of antioxidant substances. Besides its consumption as food, both fruit and seed of cherry laurel have been utilized as traditional remedy in Turkey for the treatment of digestive system complaints, including stomach ulcer, bronchitis (seeds), eczema, hemorrhoids and as diuretic (fruits). In addition, it has been reported that high antioxidant capacity of cherry laurel may be effective in preventing cancer and cardiovascular, chronic and neurodegenerative diseases. Diabetes mellitus (DM) is caused by a disorder in glucose homeostasis. Drugs that help control serum glucose levels are very important in the prevention of these complications and in alleviating the symptoms of DM. However, anti-diabetic agents are used in DM treatment have positive side effects as well as some side effects. At this point, search for alternative nutrients or treatment methods emerges to reduce side effects to the greatest extent. Cherry laurel is one of these foods. It has been determined that even if the number of studies conducted is limited, cherry laurel has an antidiabetic effect. The tea prepared from the leaves of the plant is used against neurological disorders by the local people in Anatolia. Therefore, based on these data some researchers have investigated evaluate the neuroprotective activity of the fruits and leaves of cherry laurel. It is thought that cherry laurel can be effective in neurological diseases. Cherry laurel can be used in the prevention and treatment of cancer with the antioxidant content. In particular, it is suggest that the use of chemotherapy drugs may prevent nephrotoxicity, cardiotoxicity, ototoxicity and peripheral neuropathy caused by free radicals. In addition, it inhibits lipid peroxidation and low-density lipoprotein (LDL) oxidation by inhibiting free radical formation. Therefore, it can be effective in protecting against cardiovascular diseases. In conclusion the fruit, seed and leaves of cherry laurel may be effective in the prevention of diseases and treatment, because it contains the presence of nutrients and components which are positive effects on health. Recent years, studies about this subject are increasing but there is not enough proof, yet.

A REVIEW ON BIOACTIVE POTENTIALS OF CROCUS SATIVUS L.

ZELIHA SELAMOGLU¹, SENAY OZGEN¹

ABSTRACT

Saffron (*Crocus sativus* L.) is one of the remarkable plant in the world. Saffron cultivating in too many countries in worldwide. Many of studies have been investigated about saffron. Saffron is cultivated at least 3,500 years in too many contries such as Iran, India, Pakistan, Greece, Spain, Italy, Turkey, France, Switzerland, Israel, Pakistan, Azerbaijan, China, Egypt, United Arab Emirates, Japan, Afghanistan, Iraq and recently Australia. Today Iran is one of the most important producer. Since ancient times, saffron has been used as a medicinal plant and a spice. It has been used as a antispasmodic, sedative agent, stimulant, stomachic, reperfusion, ischemia, aphrodisiac, anticonvulsant, antidepressant, anti-inflammatory, antitumor, anticancer, anti hypertensive, antioxidant and learning and memory improving effects. Antioxidant-rich saffron compounds may modulate disorders. It has great effects on central nervous system. The findings report that using traditional medicine saffron is very beneficial to protecting disorders. *Crocus sativus*, one of the most beneficial plant in the world, is the member of Iridaceae family. Various studies reported that saffron and its components, includes a significant amount of polyphenols, possess strong antioxidant effects against the free radicals. Finally, studies concentrated in biological activities of saffron.

DEVELOPMENT AND VALIDATION OF AN HPLC METHOD FOR QUANTIFICATION OF GALANTAMINE IN NARCISSUS SP. BULBS.

İBRAHİM BULDUK¹, S. ELİF KORCAN¹, YASEMİN S. KARAFAKİOĐLU¹, TUĐBA KAHRAMAN¹

ABSTRACT

Galantamine, an alkaloid present in the Amaryllidaceae is currently undergoing clinical trials for the treatment of Alzheimer's. Common daffodils, *Narcissus* spp., contain galanthamine and other alkaloids. Galantamine is cholinesterase inhibitor and is used in treatment of Alzheimer, polio, narrow-angle glaucoma and as an antidote after poisonings and is still being investigated for use in treatment of alcohol and nicotine dependence, schizophrenia and cognitive memory disorders. In this study, in the first step, a simple, accurate and sensitive HPLC method was developed for determination of galantamine. The chromatographic separation was carried out on C18 ACE column (250 × 4.6 mm, 5 μm) using mobile phase 0.5 M potassium dihydrogen phosphate: methanol in the ratio of 65:35 v/v at flow rate 1 ml/min with UV detection at 290 nm. Retention time was 13.47 minutes. The calibration curve was linear ($r = 0.997$) in the concentration range 100-500 μg/ml. The method was statistically validated for precision, accuracy, LOD, LOQ, robustness and recovery. In the second step, ultrasound-assisted extraction (UAE) was applied to the extraction of galantamine from *Narcissus* sp bulbs. The galantamine were quantified and analyzed by high performance liquid chromatography coupled with UV detection (HPLC-UV). The content of galantamine in *Narcissus* sp. bulbs was determined as 0.1905%.

LYCOPENE AND CANCER

EZGİ TOPTAŞ BIYIKLI¹, ALI EMRAH BIYIKLI¹, ELMAS ERSÖZ¹

ABSTRACT

Adequate and balanced nutrition in sustaining a healthy life has a great importance. In the recent years, in the increase of cancer prevalence, it is seen that the unhealthy nutrition, sedentary life style, and stress are effective. In order to protect health, there is a need for a balance between oxidants and antioxidants. With taking the oxidative effective harmful substances in the body via environment and nutrition and advancing in age, as a result of decreasing in enzyme activity, anti-oxidative defending mechanism of the body remains inadequate. Since anti-oxidative nutrients, reducing oxidative stress, can provide protective effect against cancer, it is suggested to be increased the amounts in diet. Lycopene, which is naturally present in the vegetables and fruits, and gives the red color to them, shows antioxidative effect whose carotenoid is strong. Lycopene is present the most in tomatoes and fruits and vegetables such as watermelon and pink grapefruit. Processed products of tomato such as soup of tomato juice, tomato paste, ketchup, and sauce are good resources of lycopene. It was demonstrated that bio-benefits of lycopene in the products of processed tomato are higher compared to uncooked tomato and it reduced oxidative stress. **PURPOSE:** In this study, it was aimed to evaluate the studies examining the relationship between lycopene intake and sorts of cancer **METHOD:** In the study, the possible effect mechanisms of lycopene in being protected from cancer were scrutinized. In addition, examining the current literature data studying lycopene consumption and cancer relationship, the effects of lycopene on the formation of cancer and range of cancer formed were evaluated in detail. **RESULTS:** There are oxidative and non-oxidative mechanisms introduced in related to the role of lycopene consumption in the protection from cancer. Oxidative mechanism of lycopene actualizes by protecting lipids, lipoproteins, and DNA against oxidation. Its feature regulating the intercellular transition connection shows its effects via suppressing phosphorylation, induced by carcinogens, and decrease of cell proliferation, induced by insulin-like growth factor via non-oxidative mechanisms. In a number of studies carried out, it was seen that lycopene provides a protective effect against breast, uterine, and liver cancers, particularly prostate cancers. The risk of the cancer formation in the individuals, whose lycopene production is high, compared to that it is low, was frequently found low at the significant level. However, just as there are some studies showing that adding lycopene to the treatment process of cancer patients has a positive directional effect, there are also some studies, in which any effect is not observed. It is emphasized that that healthy individuals take lycopene in the dosage of 5-7 mg per day will be adequate in protecting from oxidative stress, and chronic diseases, which may be developed to this and/or preventing these diseases. **CONCLUSION:** It was seen that lycopene, an important antioxidant, has a protective effect against cancer by means of different mechanisms. Its positive effects in protecting against prostate cancer is remarkable.. However, the effect of lycopene in using for cancer treatment is not clear and there is a need for

TOTAL PHENOLIC CONTENTS OF THIRTY TAXA OF THE GENUS SALVIA (LAMIACEAE)

İBRAHİM BULDUK¹, YASEMİN S. KARAFAKİOĐLU¹, AHMET KAHRAMAN¹, KÜBRA ÇİTEKÇİ¹

ABSTRACT

Salvia, the largest genus of the family Lamiaceae and distributed world-wide, has an important role in medicinal and aromatic plants due to its antioxidant activity and phenolic content. The genus, known as “adaçayı” among local people, is represented by 100 species in Turkey. In this study, total phenolic contents in methanol extracts of thirty Salvia taxa from Turkey were investigated. The level of total phenols in methanol extracts was determined by using Folin–Ciocalteu reagent and external calibration with gallic acid. Briefly, 0.2 ml of extract solution and 0.2 ml of Folin–Ciocalteu reagent were added and then the contents were mixed thoroughly. After 4 minutes, 1 ml of 15% Na₂CO₃ was added. The volume was completed to 5 ml of demineralised water and then the mixture was allowed to stand for 2 hours at darkroom temperature. The absorbance was measured at 760 nm using a spectrophotometer. The concentration of the total phenolics was calculated as mg of gallic acid equivalent by using an equation obtained from gallic acid calibration curve. The highest total phenolic content in Salvia taxa was found in Salvia verticillata subsp. amasiaca with 77.50 mg.GAE/g.sample DW.

SYNERGISTIC AND ANTAGONISTIC EFFECTS OF ESSENTIAL OILS IN HERBS AND SPICES AGAINST SOME BACTERIA

MUTLU BUKET AKIN¹, MUSA SERDAR AKIN¹, BÜŞRA GÖNCÜ¹

ABSTRACT

Plant-origin antimicrobials are obtained by various methods from aromatic and volatile oily liquids from flowers, buds, seeds, leaves, twigs, herbs, wood, fruits and roots of plants. Essential Oils (EO) in plants generally are mixtures of several components and have demonstrated antimicrobial effects against some pathogens. EOs are a group of terpenoids, sesquiterpenes and possibly diterpenes with different groups of aliphatic hydrocarbons, acids, alcohols, aldehydes, acyclic esters or lactones. The antimicrobial effects of the EOs acts by causing structural and functional damages to the bacterial cell membrane. Some EOs in oregano, clove, cinnamon, citral, garlic, coriander, rosemary, parsley, lemongrass, sage and vanillin have been used as antimicrobial agents. But EOs in the other spices, such as ginger, black pepper, red pepper, chili powder, cumin and curry powder, showed lower antimicrobial properties. When the combined effect of substances is higher than the sum of the individual effects, this is synergy; when a combination shows less effect compared to the individual applications, this is antagonism. EOs have been used as flavoring materials and natural antimicrobial agents in many countries. It is necessary to know and investigation of synergism and antagonism and safety data (toxicity, allergenicity) of these materials before their broad application in food. In this review, synergistic and antagonistic effects of herb and spices against some bacteria, especially pathogens, have been investigated.

THERAPEUTIC PROPERTIES AND USE OF OLEASTER (ELAEAGNUS ANGUSTIFOLIA L.) IN FOLK MEDICINE

BÜLENT ÇOMAK¹, AHMET HILMI ÇON¹

ABSTRACT

Oleaster (*Elaeagnus Angustifolia L.*) is a member of elaeagnaceae family and occurring widely in Asia and Europe, particularly in Turkey, Iran, China, Mongolia, India, Caucasia and Central Asia. The fruit is reddish-brown and elliptical in shape, has a dryish mealy texture, edible and sweet, and generally collected in late September. Oleaster has been traditionally consumed fresh or dried as a rich source of proteins, sugars, minerals and vitamins such as tocopherol, carotene, vitamin C thiamine B1, and vitamins A, E, and K. Oleaster shows high phenolic content, antioxidant and antiradical activities. Researches revealed the presence of phytochemicals such as flavonoids, polysaccharides, sitosteroles, cardiac glycosides, terpenoids, coumarines, phenol carboxylic acids, amino acids, saponins, carotenoids, vitamins, and tannins in oleaster. Being a source of flavonoids, alkaloids, minerals and vitamins, it has been used as analgesic, antipyretic, cholegogic (for bronchitis), antihelmintic and diuretic, and anti-ulcer remedy for wound healing. In folk medicine, oleaster fruit and its preparations are used for the treatment of nausea, vomiting, jaundice, asthma, flatulence, tetanus and rheumatoid arthritis, sore throat, cough, flu, cold, fever, vomiting, diarrhea, kidney disorders (inflammation and kidney stone) and some other symptoms and diseases. In Turkey, it was also common to eat the fruits an hour before the meal as an appetizer. In Armenia a drug called "pshatin", a concentrate of polyphenolic compounds, is prepared from oleaster and used for the treatment of cholitis and other diseases of the gastrointestinal tract. The reports of many studies about oleaster and its extracts have provided a scientific verification for the traditional usage of this fruit as a remedy for the relief and cure of many common symptoms and problems as well as some other more serious diseases. All in all, oleaster can be used easily as an accessible and a rich source of natural antioxidants and as a functional food supplement or in the pharmaceutical industry with the phytochemicals beneficial for the human health.

POMEGRANATE PEEL EXTRACT: POTENTIAL USES AND APPLICATIONS IN FOOD SAFETY AND QUALITY

ELIF BÜŞRA ERSÖZ¹, HASAN TEMİZ¹

ABSTRACT

Functional products are becoming increasingly important in the human diet. The free radicals, what are results of improving technology, UV rays, stressful life of our days, taking alcohol and smoking are the most important reason of a lot of illnesses and aging period. Additionally, synthetic products and additives are associated with many important diseases of our time like cancer, obesity, etc. Plant-based diet is a way in human life to protect against diseases. The use of bioactive components rich plants and these plants extracts in the food and beverage industry is a growing trend every day. These extracts used in the industry are selected according to their functional properties like antioxidant, antimicrobial, etc. and positive health effects, cheapness and properties that affect the final product (sensory, textural, etc.). The functional properties of plant extracts generally attributed to the phenolic compounds they contain. The pomegranate (*Punica granatum L.*) belongs the family of Punicaceae and originated in the Middle East and India. Pomegranate has reputation for its beneficial healthy properties. Pomegranate peel comprises about 33-40% of total fruit weight occurs as a by-product after pomegranate juice production. Pomegranate peel characterized by phenolic compounds such as flavonoids, condensed tannins and hydrolysable tannins. Pomegranate and its by-products (shell, flower, leaves, and seed) extracts are in the functional food category due to their positive effects on human health. It is suggested to use this by-product as a natural-cheap food additive which contains more phenolic material and strong antioxidant properties compared to whole fruit and individual parts of the fruit (pulp, seed etc.). Pomegranate peel has been used for health benefits of phenolics in ethnopharmacology in many countries such as Egypt and India through the centuries. Pomegranate peel extract (PPE) is suggested to be used as food preservative, stabilizer and functional ingredient in various food systems. Major phenolic compounds, such as anthocyanins, gallotannins, ellagitannins, gallagyl esters, hydroxybenzoic acids, hydroxycinnamic acids and dihydroflavanols, which provide antioxidant, antimicrobial, antimutagenic and antiviral properties of PPE increase its epidemiological significance. Researches have indicated that PPE has cardioprotective, anti-inflammatory, anti-allergic, anti-diabetic and anti-carcinogenic activity against many disease. PPE prevents the lipid oxidation in food systems with antioxidant properties and thus preventing the loss of essential fatty acids and vitamins, the formation of toxic substances, color loss and rancidity. PPE also shows antimicrobial activity against various food-borne pathogens like *Staphylococcus aureus*, *Escherichia coli*, *Listeria monocytogenes*. Antioxidant and antimicrobial properties of PPE help to preserve and increase the functional properties of foods. PPE also has quality improving properties such as the development of textural properties in raw sausage and the development of probiotic microbiota with its dietary fiber content. This review focused on functional, anti-infective properties of PPE and their application as food additive.

THE ANTIMICROBIAL ACTIVITY OF ALLIUM AKAKA AND ALLIUM SCABRISCAPUM

NESRİN HAŞİMİ¹, HAMDİ TEMEL², EBUBEKİR İZOL², KEREM ŞENTÜRK², HİLAL SARUHAN FIDAN², ELİF VARHAN ORAL², HÜSEYİN ALKAN², ABDULSELAM ERTAŞ²

ABSTRACT

The genus *Allium* belongs to the Alliaceae and is one of the widest genera of the family. It is represented by 800 species in the world and by 197 taxa in Turkey. Members of this genus are wonderful plants that are known for their medicinal effects and are used for this purpose since ancient times. Onion, garlic and leek varieties are member of this genus. From this point of view, we aimed to determine the antimicrobial activity of *Allium akaka* and *Allium scabriscapum*. Root and aerial parts of the plants macerated with ethanol. The antimicrobial activity of the extracts was evaluated by minimum inhibitory concentration (MIC) against Gram positive (*Streptococcus pyogenes* ATCC19615, *Staphylococcus aureus* ATCC 25923) and Gram negative (*Pseudomonas aeruginosa* ATCC 27853, *Escherichia coli* ATCC 25922) bacteria and yeast (*Candida albicans* ATCC10231). The MIC values were determined by broth dilution method. All the extracts exhibited antimicrobial activity. The strongest antimicrobial activity was recorded by aerial parts of *A. scabriscapum* against *S. aureus* (150±0.2 µg/ml MIC value). The root extract of *A. akaka* showed the weakest activity with 800±0.5 µg/ml MIC value against *P. aeruginosa*.

KEYWORDS

Allium Akaka, *Allium scabriscapum*, antimicrobial activity, MIC

UTILIZATION POTENTIAL OF ALLICIN IN GARLIC (*ALLIUM SATIVUM* L.) TO INCREASE VIRUS ELIMINATION IN MERISTEM CULTURE

MELİS MUTLU¹, SERVET KEFİ¹

ABSTRACT

The efforts to obtain virus-free plants from meristem culture, which is one of the plant tissue culture techniques, have been continued extensively. Chemotherapy, one of the methods used to increase the elimination of viruses in vitro culture, has been implemented in a shorter time, as more effortless and more practical than other methods. However, inadequate numbers of antiviral compounds used in the chemotherapy method have limited the work done in this area. Currently the most widely used ribavirin for this purpose is not sufficient for studies and therefore new antiviral compounds have been required. Allicin is one of the most important bioactive components of garlic. As a result of crushing, cutting or chewing of the garlic, allicin has formed via break down of the aliin by the alinaz enzyme. So far, studies have shown that allicin in garlic (*Allium sativum* L.) is the most important chemical compound causing pharmacological effects presented by garlic such as antiparasitic, antibacterial, antimycotic, antiviral, anticarcinogenic and immunological properties. In this paper prepared with a comprehensive literature search, the use of allicin, the most important compound of garlic, has been investigated to increase virus elimination as an antiviral compound during in vitro culture. Because allicin inhibits virus formation, it has been demonstrated that allicin has utilization potential as a novel compound alternative to ribavirin for chemotherapy application in meristem culture.

ETHNOBOTONICAL ASPECTS OF SOME SPECIES IN DÜZCE AND ITS VICINITY

FATMA ÇİĞDEM SAKİNOĞLU ORUÇ¹, SADIK HASAN ORUÇ²

ABSTRACT

This study was carried out in Düzce and its vicinity. During the floristic studies in the area in 2016, the vernacular names and the usage of some plants were compiled. In the region, 56 plants used for medicinal purpose and as food materials were determined. In addition to their uses as foods or spices, Notes about the names and usage areas of the plants in the region were prepared with the information obtained from Provincial Directorate of Agriculture, herbalists, Düzce' people and agricultures engineers. The plants collected from this region were diagnosed with the Turkish Flora. However 19 plants were also reported for medicinal purposes. A pharmaceutical business was also established for one of those species, this plants are *Arbutus unedo*, *Brassica oleraceae* L. *Capitata*, *Capsella bursa-pastoris* (L.) Medik., *Carpobrotus edulis*, *Cirsium arvense* (L.) Scop. subsp. *vestitum*, *Corylus* L., *Cynara cardunculus*, *Juglans regia* L., *Malva sylvestris* L., *Mentha aquatica* L., *Ononis spinosa* L., *Petroselinum crispum* (Mill.) A.W.Hill., *Platanus occidentalis*, *Rosa Canina*, *rosmarinus officinalis*, *Sorghum bicolor* var. *Saccharatum*, *Taraxacum officinale* Weber, *Tilia argentea*, *Urtica pilulifera* L., ve *Vitis labrusca* L. *İsabella*. *Vitis labrusca* L. *İsabella* (locally known as black grape or migrant grape) to make its mass production for medicinal purposes. In Turkey, especially in Düzce Province and its neighborhoods, pharmaceutically valuable plants should be further investigated and efforts be also done for their market applications. This work is therefore thought to provide significant insights for future ethnobotanical studies on the subject

MEDICINAL PLANT APPROACH IN INFERTILITY

NURIYE DEĞİRMEN¹, CANSU ÖZBAYER¹, MÜGE GIDIŞ¹

ABSTRACT

Infertility is a challenging process that affects the quality of life by affecting the physical, emotional and social relations of people negatively. According to the definition of the American Society for Reproductive Medicine Practice Committee (ASRM), infertility is the inability to achieve pregnancy in at least one year, despite unprotected sexual intercourse. Nowadays, infertility affects 10-15% of the couples. Infertility incidence is 8.5%, this corresponds to 1.5 million couples and affects 3 million people in Turkey. The reproductive effort of the human being is based on the continuity of life. In all cultures, special attention has been given to being a fatherhood and motherhood, reproductive related folk medicine applications have been used intensely until today. The first articles about infertility are based on the years BC 2200-1950. The prescriptions for the early diagnosis of pregnancy and the prevention of infertility were first used in ancient Egypt. Hippocrates (BC 460-337) emphasized the prevalence of uterus, tubal and semen in pregnancy. Soranus (AD 98-138) was the first who described the fertile period. In human being's philosophy of existence, the continuity of life is essential. At the heart of this, there is woman with her spirit and body. Woman is considered to be the breath of God, during the Neolithic and Chalcolithic times, Hittites and Phrygians, owing to the fertility, and woman was crowned as "Mother Goddess", the greatest of the gods, also Mother of Goddess, known by "Kybele" is also the mother of gods and goddess. The privilege of fertility also extends the usage of folk medicine for this purpose. The usage of medical plants colloquially for many years have changed at the beginning of 20th century and various characteristics of plants that are used for medical purposes have been started to be investigated in laboratories. It is the socio-cultural situation of the people that determines the health level of the societies. By evaluating the socio-cultural situation of societies and regulating the wrong health practices by researching and education, health culture can be influenced positively. In this study, drug characteristic, forms of utilization, research results and pharmacological mechanisms of vitex (*Vitex agnus castus*), goat's head (*Tribulus terrestris*), nettle (*Urtica dioica*), yarrow (*Achillea millefolium*), locust (*Ceratonia siliqua*) and long pepper (*Piperis longum*) that are used in folk medicine frequently for infertility will be explained.

A REVIEW OF PERILLA SEED OIL; A GOOD SOURCE OF PLANT BASED OMEGA-3 AND OMEGA-6

TUGBA AKTAR¹, EDA ADAL²

ABSTRACT

Perilla frutescens is an edible plant which is commonly used in Asian Cuisine as a source of oil and colorants. The seeds of the plant is mostly used as an oil source, where the leaves are mainly used as a garnish for raw fish, flavor and also as a medicine for food poisoning due to its antidote property. Another main function of the seeds and leaves is the use as a medicine for colds and coughs as well as digestion promoter. As oil the *Perilla* seed is used and it is one of the potential sources with its good fat and protein with good quality. More importantly the seeds are good source of α -linolenic acid (C18:3 n-3; ALA). Despite its popular ancient use in Asian kitchen and herbal medicine, since early 2000s *Perilla* has been introduced to Europe and USA as an oilseed crop and as a source of Omega-3 and Omega-6. Researchers has shown that *Perilla* oil includes; terpenoids, phenolics, flavonoids, cyanogenic glycosides and anthocyanins. This review aims to emphasize the high potential of *perilla* oil with all its functional properties in terms of health. It is necessary to highlight that *perilla* seed oil has the highest ALA content amongst the other sources (56%). Additionally the consumption of *Perilla* seed oil was proven to be improving the learning ability, retinal function, suppressing of carcinogenesis, metastasis, thrombosis and allergies; meanwhile decreasing the circulating levels of serum cholesterol and triglycerides without showing toxicity.

BUCKWHEAT AND HEALTH EFFECTS

HACI ÖMER YILMAZ¹, NURCAN YABANCI AYHAN¹, ÇAĞDAŞ SALİH MERİÇ¹

ABSTRACT

Buckwheat is a one-year-old plant and belonging to family Polygoneaceae. There is no kinship connection with grains. Buckwheat, which is a plant different from grains grown from agriculture such as wheat, rice and barley, is also included in pseudo-cereal group (cereal-like), which shows similarities and differences with cereals. The basic structural difference separating buckwheat from cereals and ability adapt to development at high altitudes in a short time. Buckwheat species use to as a food source. Buckwheat is not cultured in Turkey; but it is a vegetable produced in many countries of the world, has high economic value, at the same time increasing consumption and versatile usage. Because it is a strong ecological harmony of buckwheat, it can be grown almost everywhere in different habitats. Buckwheat has versatile usage and use to many local products of different cultures such as "stove", "kasha", "porridge", "crumpet", "naengmyeon" and "pizzoccheri" and in production of basic foodstuffs such as cakes, breads, pasta, noodles, muffins, crackers, cookies, crepes and tortillas, in puddings, desserts, poultry stuffed with cooked meat and vegetable products. Buckwheat has been described as an alternative food because of important effects on health and nutritional value. Studies on animals have shown that buckwheat inhibits high cholesterol, hypertension and diabetes. The routine glycoside contained in buckwheat is used to treatment of hypertension and cardiovascular disease resulting in retinal hemorrhage leading to tearing of blood vessels in brain or prevent this condition. This glycoside is also used in treatment of kidney hemorrhage, hereditary hemorrhagic lesions, haemophilia and some hemorrhagic diseases. Foods have characteristics such as protect, develop and reduce risk of disease besides nutritional effect, are defined as functional foods and this condition led to increase in the functional foods of consumers and supply of such products in the market. Buckwheat is used in many functional foods produced in the world, so buckwheat products are dual-use products as food and medicine and have interesting effects on human body in chronic diseases. Buckwheat is include of resistant starch. Foods containing resistant starch have generally low glycemic indexes. Considering that low glycemic indexed diets regulate blood sugar, help prevent obesity and reduce heart disease risk, buckwheat can also be used in treatment of some chronic diseases. Because of gluten-free it can find use in development of new, high-nutritional products for celiac disease. Buckwheat protein is one of the best sources of high-biological value proteins, as well as amino acid composition and nutritional superiority to other cereal proteins. Buckwheat has major components such as zinc, copper, manganese, selenium and macroelements such as potassium, sodium, calcium and magnesium, basic functional components such as flavonoids, polyphenols, inositol, organic acids and is highly nutritious with high levels of protein, dietary fiber, vitamins, mineral substances, basic polyunsaturated fatty acids. Iron content is highest among all cereals and legumes. It is an ideal product for people who have frequent anemia problems, pregnant women and infants. In addition, positive effects on health of buckwheat, it is include polyphenol, trypsin and alpha amylase inhibitors. Due to some anti-nutritional factors in buckwheat,

human body can be more difficult to digest than wheat and legumes. As a result, buckwheat is an important food ingredient wherefore functional properties. It does not lose these components with processing steps, enriching product to which added nutritionally and functionally. In addition, more invivo and invitro studies should be done to improve nutritive properties of buckwheat.

**TAXONOMICAL EVALUATION OF MEDICALLY AND
AROMATICALLY VALUABLE YEDIKEKİK (SATUREJA
WIEDEMANNIANA) AND ÇİBRİSKA (SATUREJA HORTENSIS)
SPECIES IN CENTRAL ANATOLIA**

MEHTAP ÖZTEKİN¹

ABSTRACT

16 taxa of *Satureja* L. (Lamiaceae), known as *Kayakekiđi* (Savory), grow naturally in Turkey. Two species of this genus, *Satureja wiedemanniana* (Ave-Lall.) Velen. (*Yedikelik*) and *Satureja hortensis* L. (*Çipriska*), grows in Central Anatolia. *Yedikelik* (*Satureja wiedemanniana*) species which is a member one of the 5 endemic taxa in Turkey, is also grows more than one local region in Central Anatolia. *S. hortensis* grows extensively in Eastern Europe, especially in the Balkans and in every part of our country, and has intensive medical and aromatic use. In this study, the habitats at both species in Central Anatolia, their characteristics, usage area, medical and aromatic properties are given. The data of this study was compiled from "Taxonomic Studies on the Species of *Satureja* L. (Lamiaceae) in Turkey" the ongoing Ph.D. thesis study of the author.

THE ANTIOXIDANT AND APOPTOTIC EFFECTS OF THYMOL ON PANCREAS OF RATS

SALIM CERİG¹, FATİME GEYİKOĞLU¹, KUBRA KOÇ¹, MURAT BAKIR¹, GÜLSAH YILDIZ DENİZ¹, FERHUNDE AYSIN¹

ABSTRACT

Medicinal plants and their essential oils have been widely used to treat several diseases since ancient times and plant essential oils have been related to effectively improve several pancreas disease. Thymol (5-methyl-2-isopropylphenol) is a common constituent of essential oils derived from different plant species. It is phenolic compounds belonging to a class of natural antioxidants due to the presence of one hydroxyl group linked to aromatic ring and the possibility of stabilizing free radicals formation. Thymol is also believed to exhibit different biological properties such as antimicrobial, antifungal, antioxidant, anti-inflammatory, antibacterial, anti-hepatotoxic, antiapoptotic, neuroprotective, and radioprotective activities. Moreover, it has been reported to stimulate digestive secretions in pancreatic enzymes in rats. Therefore, this study was conducted to determine the effects of Thymol on performance antioxidant enzyme activities in rat pancreas. Fifteen Sprague-Dawley rats were randomly allocated into three groups including, control, groups which received orally 100, 200 and 400 mg/kg Thymol. After six hours from treatments, animals were sacrificed and their pancreases were removed. Caspase-3 activity, Total oxidative stress (TOS) and total antioxidant status (TAS) levels were evaluated in homogenized pancreas samples by ELISA. Besides, the histology of pancreas was examined by using three different staining methods: Hematoxylin-eosin, Periodic acid Schiff, Alcian blue. The results showed that compared to the control group, Thymol at the dosage of 400 mg/kg significantly increased the level of TOS and caspase-3 activation, while decreased level of TAS in tissue samples. On the other hand, Thymol at the dosage of 100 and 200 mg/kg significantly caused to no alteration the level of TOS and caspase-3 activation; but increased levels of TAS in tissue samples. As compared to two tested doses of 100 mg/kg and 200 mg/kg, Thymol at dose 200 mg/kg was showed significant anti-oxidative effect on the parameters studied. In addition, histopathological findings that observed in Thymol 400 mg/kg group in the pancreatic tissue is not seen in 100 and 200 mg/kg groups. The above outcome concludes that Thymol may exhibit promising anti-oxidant activity at low dosages; however, its high dosage has harmful effects for pancreas tissue. Thus, the dosage of Thymol should be taken into account for future investigations of novel treatment strategies for Thymol in pancreas. We hope that the results of this study will provide an impetus for future investigations of novel treatment strategies for Thymol in pancreas.

ABSTRACT

Nowadays, nanoparticle synthesis has been a very important research area because of the wide use of nanoparticles in many fields. Green synthesis is one step ahead of other synthesis methods due to both cost reduction in production and environmentally friendly approach. For these reasons, we chose green synthesis method which is nature friendly in our research. In this study; It was aimed synthesis of copper nanoparticles by the green synthesis method using with the water extract of Erzincan Cimin grape (*Vitis vinifera* cv. Black plum) and 0.1 M CuCl₂ in the reaction medium¹. Then, optimum conditions for the green synthesis reaction have been determined and nanoparticle production optimized. The characterization of the copper nanoparticles obtained was then characterized using spectroscopic techniques such as UV-Vis, FTIR, XRD and SEM. It is understood that the CuO nanoparticles obtained by the green synthesis method have a spherical shape with a size of 25-50 nm. Due to the new physical and chemical properties of copper nanoparticles obtained using a cost-effective and environmentally friendly method; it is thought that many areas can be used².

ABSTRACT

Today, more than 10.000 denier synthetic paints are used in the industry food, paper, textile, etc. The annual amounts of these dyes used are rather high and 10-15% of these dyes are mixed with water as waste. For this reason, the systems that will eliminate the harmful effects of these waste dyes on the environment have been considered. At the beginning of these methods are chemical and physical methods, and biological systems have recently gained considerable importance¹. In the study, CuO nanoparticles were synthesized using Cimin grape, an endemic species belonging to the Erzincan City and of 0.1 M CuCl₂ solution by green synthesis in the first step. Then, these obtained metal nanoparticles were used to remove the methylene blue dye. For this purpose, Fenton reaction has been used. As a result of the studies, 95% of the methylene blue dye could be removed under moderate conditions at the end of two hours with the Fenton reaction used with CuO nanoparticles. When the results are evaluated, it is clear that this method can also be used to remove paint from waste water of textile or other industries². References: 1. ABSTRACT

Reactive oxygen species (ROS) have the potential to interact with many cellular components, causing significant damage to membranes and other cellular structures [1]. There is a rising interest in many vegetables and fruits due to the production of natural antioxidants (especially phenolic compounds) aimed at scavenging ROS. This relationship between diet and health has led to intensive research in bioactive compounds in foods [2]. Plants have been used as an important drug source for thousands of years. Even today, the World Health Organization estimates that up to 80 per cent of people still rely mainly on traditional remedies such as herbs for their medicines [3]. Medicinal plants are widely used in everyday life as part of folk medicinal remedies in Turkey. Turkey's flora is remarkable for its diversity and it is a rich source of medicinal plants [4]. Linden, which is frequently seen in our forests in the Marmara, Black Sea, Aegean and North Anatolian regions, is the common name of the tree species forming the *Tilia* genus from the family of the Tiliaceae. *Tilia flos* is used since antiquity in traditional medicine in case of migraine, hysteria, feverish colds, hypertension associated with arteriosclerosis [5]. Herbal teas containing *Tilia flos* are on the European and Turkey market mainly for the relief of common cold. Several studies have shown that the plant contains many phenolic compounds such as flavonoids and phenolic acid derivatives [4]. In this work, extracts of fruits of *Tilia cordata* obtained with infusion (IE) and ultrasound-assisted extraction (UAE) techniques were initially screened for their total phenolic contents (TPCs) and total antioxidant capacities (TACs) via Folin-Ciocalteu and CUPRAC methods, respectively. IE and UAE were carried out with ultrapure water and methanol/water solution (70/30, v/v), respectively. TPCs of the extracts obtained with IE and UAE were found as 58.86 ± 21.51 and 111.84 ± 13.99 mg gallic acid equivalent (GAE) / g sample, respectively. Furthermore, TACs of the extracts obtained with IE and UAE were calculated as 82.99 ± 13.13 and 197.52 ± 12.69 mg trolox equivalent (TE) / g sample, respectively. Subsequently, 31 phenolic compounds in the same extracts were scanned by liquid chromatography-electrospray tandem mass spectrometry (LC-ESI-MS/MS) method. Among phenolics, 24 compounds were quantitatively determined with protocatechuic acid as the dominant one ($1723.1-2183.5 \mu\text{g g}^{-1}$). Contents of phenolic compounds in the extracts varied from 0.17 to $2183.5 \mu\text{g g}^{-1}$. Also the other dominant species in the extracts, (+)-catechin, (-)-epicatechin and gallic acid were determined as $720.3-1737.9 \mu\text{g g}^{-1}$, $352.3-1091.7 \mu\text{g g}^{-1}$ and $356.9-584.0 \mu\text{g g}^{-1}$, respectively. In all cases, the extracts obtained with UAE were found to be richer in terms of the phenolic compounds and showed higher antioxidant capacity. Results showed that fruits of *Tilia cordata* grown in Turkey were rich in phenolic

Corresponding Author: **MUSTAFA CİTTAN**, mustafa.cittan@cbu.edu.tr
¹MANİSA CELAL BAYAR ÜNİVERSİTESİ

constituents. Therefore, the industrial products of the plant can significantly contribute to the country's economy. Additionally, the traditional hot water infusion is considered to be a comparatively effective (approximately 50% yield as compared to the UAE technique) method for the extraction of phenolic compounds. ABSTRACT

In this study, essential oil (EO) compositions of the dried and fresh aerial parts of *Nepeta pilinux* and *Nepeta isaurica* collected from Mersin and Konya was investigated. EO was distilled by using Clevenger type apparatus for 3 h and the chemical compositions were detected in GC-MS. While, the oil yields of the the collected *Nepeta pilinux* and *Nepeta isaurica* was determined to be 0,1 ml-0,4 ml and 0,1 ml-0,3 ml in fresh and dried aerial parts, respectively. Drying of the material also increased the oil yield in the collected *Nepeta pilinux* and *Nepeta isaurica*. While there were 42 and 60 and 36 and 27 of EO components were observed in the fresh and dried parts of the collected *Nepeta pilinux* and *Nepeta isaurica*. Besides EO yields, in this research the differences with respect to composition and components were determined between the fresh and dried plants. On the other hand, in this study, it was determined that the EO compositions varied with respect to be fresh or dry of the plant parts. It was observed that germacrene D, caryophyllene oxide, alpha terpineol, 1,8-cineole and linalool were the major EO contents. The aim of the study to compare of differences between the EO compounds and compositions varied according to be the plant fresh and dry of collected plants in nature.

ABSTRACT

In this study, antifungal effects of thyme (*Thymus vulgaris* L.) and black cumin (*Nigella sativa*) against *Aspergillus niger* and *Pencillium* spp. have been investigated. For this purpose, thyme and black cumin plants has been used by extracted. Antimicrobial activities of spice extracts were evaluated according to "Agar Disk Diffusion Method". In this method, disc is placed on medium. Instead of the disc, calix or well can also be used. Antimicrobial agent is added into calix or wells. Activity of antimicrobial agent is measured by the resultant zone diameter of the target microorganism. The size of the resulting zone diameter depends on the effectiveness of the antimicrobial agent and its ability to be easily diffused. In study PDA has been used as a medium. *Aspergillus niger*, *Pencillium* spp., thyme and cumin extracts were added into wells, which were opened in medium. Samples were incubated at 25°C for 5-7 days and antifungal effect was determined by measuring the zones occurred around the wells According to results, it was determined that thyme and black cumin had antifungal effect against *Aspergillus niger* and *Pencillium* spp..

INVESTIGATION OF CONSUMER BEHAVIOURS IN MEDICINAL AND AROMATIC PLANTS: CASE OF KAHRAMANMARAS PROVINCE

HÜMEYRA ZELİHA EREN¹, MÜCAHİT PAKSOY¹

ABSTRACT

Medicinal and aromatic plants were used with the purpose prevent illness and heal, survive healthy life. Demand of medicinal and aromatic plants increase in world markets day by day. Medicinal plants usage was increased especially with emerging side effects of synthetic and chemical medicines. In this research it was aimed that, investigation of consumer behaviors in medicinal and aromatic plants in Kahramanmaraş Province. A survey was conducted with 385 households to determined by proportional sampling method during January-February 2017. According to results 63,1% of respondents were woman and average age was 37,48. It was found that, more than half of the consumers (53%) have information about medicinal and aromatic plants. When we looked at the frequently used medicinal and aromatic plants, red pepper (89,1%), mint (80,3%), thyme (51,2%) basil (47%), sumac (31,7%) were take part in consumption. Consumers buy 28,5 kg medicinal and aromatic plants annually and 47% of them prefer herbalists. It was determined that, 28,3% of consumers looked color as quality characteristics when buying medicinal and aromatic plants. Relatives, kith and kin have influence on using of medicinal and aromatic plants.

COMPARISON OF ESSENTIAL OIL COMPOSITIONS OF FRESH AND DRIED PLANT OF ENDEMIC SCUTELLARIA ORIENTALIS L. SUBSP. PECTINATA EDMONDSON IN TURKEY

YAVUZ BAĞCI¹, YÜKSEL KAN¹, SÜLEYMAN DOĞU², AYŞE SADIYE ÇELİK¹

ABSTRACT

In this study, essential oil (EO) compositions of the dried and fresh aerial parts of *Scutellaria orientalis* subsp. *pectinata* collected from Konya was investigated. EO was distilled by using Clevenger type apparatus for 3 h and the chemical compositions were detected in GC-MS. While, the oil yields of the the collected *Scutellaria orientalis* subsp. *pectinata* was determined to be tr and 0,2 ml in fresh and dried aerial parts, respectively. Drying of the material also increased the oil yield in the collected *Scutellaria orientalis* subsp. *pectinata* While there were 14 and 28 of EO components were observed in the fresh and dried parts of the collected *Scutellaria orientalis* subsp. *pectinata*. Besides EO yields, in this research the differences with respect to composition and components were determined between the fresh and dried plants. On the other hand, in this study, it was determined that the EO compositions varied with respect to be fresh or dry of the plant parts. It was observed that germacrene D, nerolidol, alpha cadinol and spathulenol were the major EO contents. The aim of the study to compare of differences between the EO compounds and compositions varied according to be the plant fresh and dry of collected plants in nature.

FUNCTIONAL PROPERTIES AND HEALTH EFFECTS OF CAROB BEAN

CEMALETTİN BAĐCI¹, S. SONGÜL YALÇIN², SAKİNE YALÇIN³

ABSTRACT

Carob bean (*Cerotonia siliqua* L.) is a fruit that has high nutritional value and health benefit. It has an important economic potential. Most of the pods contain sugar but it didn't cause tor ise blood sugar. Pods are used for the production of syrup and crystallized sucrose. Carob bean syrup contains D-pinitol as a bioactive compound. Carob bean is rich in fiber. Gallic acid in carob bean has a strong antioxidant property and ensures that health is also influenced significantly. Carob seeds are 10% of the total fruit weight. Gum in the seeds is used in various food industries such as ice cream, yoghurt, pudding, cheese, candies, drinks, ketchup, mayonnaise, tomato paste and baked goods. In addition, carob bean is also important in pharmaceutical and cosmetic products. Carob has antiallergic, antimicrobial, antiviral, antihelminthic, anticancerogenic, antioxidant and immunostimulant effects. It has also been reported that it improves digestion, lowers cholesterol, and is useful against tooth problems.

FUNCTIONAL PROPERTIES OF GREEN TEA

CEMALETTİN BAĞCI¹, S. SONGÜL YALÇIN², SAKİNE YALÇIN³

ABSTRACT

Tea is produced from the bud and leaves of the plant of *Camellia sinensis*. It is classified as green, oolong or black tea depending on the manufacturing process. About 20-22% of tea produced and consumed is in the form of green tea. It can be used as drink and medicine. Green tea contains enzymes, polyphenols, alkaloids, nitrogen compounds, carbohydrates, pigments, vitamins, organic acids and minerals. Polyphenols make up about 20-40% of green tea. Approximately 60-80% of polyphenols are catechins. Main catechins in green tea are epigallocatechin gallate, epigallocatechin, epicatechin and epicatechin gallate. The main flavonols are quercetin, kemferol and myristate, which are in the form of glycosides. It contains gallic acid, chlorogenic acid, neochlorogenic acid and p-coumaric acid as phenolic acids. 50% of the aminoacids in tea are found as in the form of theanine. Green tea has functional properties due to these components. It has been shown that green tea with a significant antioxidant effect has different effects such as antimicrobial, antiinflammatory, antimutagenic, anticarcinogenic, antiallergic, hypocholesterolemic, antiviral, antidiabetic and antiaging. Green tea has an antioxidant effect especially in improvement of the shelf life of foodstuffs such as vegetable oils and animal fats.

DETERMINING SOCIO-ECONOMIC FACTORS IN SUMAC AND WILD PISTACHIO PRODUCTS PICKING: CASE OF KAHRAMANMARAS PROVINCE (TURKEY)

MÜCAHİT PAKSOY¹, FATMATÜL ZEHRA YILDIZ¹, MERVE AKSU¹

ABSTRACT

Great part of medicinal and aromatic plants present market after collecting in Turkey. Sumac and wild pistachio take part in these plants and mostly consumed. Aim of this research is to determine socio-economic factors effective in sumac and wild pistachio products picking and put on market. For this purpose survey was conducted separately with 88 sumac and wild pistachio products pickers determined by proportional sampling in Kahramanmaraş province during October-December 2016 period. According to results, 61.4 % of sumac pickers were woman and average age was 40.73. Duration of sumac picker experience obtained as 16.18 years. Sumac pickers per household found 2.34 people as average. Beside 53.4 % of wild pistachio pickers were man and average age was 42.62. Duration of wild pistachio picker experience obtained as 13.52 years. Sumac picked in July and August averagely 2.56 days. Average picked sumac was obtained as 134 kg and average annual income determined 470 TL. Collectors obtain averagely 448.79 TL annual income from wild pistachio products. Besides, it was determined that, collectors picked up 15.48 kg terebinth and 33.48 kg pistachio shoot annually. Contribution of income was determined important reason for preference of sumac and wild pistachio products picking. Results showed that pickers were make sumac and wild pistachio products picking business as side income.

POLYPHENOLS AND FLAVONOIDS CONTENTS AND THE ANTIOXIDANT CAPACITY OF BILBERRIES.

TUBA ALBAYRAK¹, CEMAL KASNAK¹, RECEP PALAMUTOĐLU¹

ABSTRACT

Bilberry (*Vaccinium myrtillus*) or bear grape is a kind of grape fruit adorned with temperate climates from the family Ericaceae. Especially in Turkey, the Black Sea region grows in shrub form in high forested regions. The consumption of bilberries, which are rich in phenolic compounds and flavonoids, is important for the elimination of free radicals that damage tissues in the body. But it is not possible to find the fruit of this fruit every season. For this reason, it is necessary to go to dried bilberries. Especially in snacks, consumption of dried blueberries is recommended to calm hunger. The aim of this study is to reveal the phytochemical potential of this fruit in order to increase the consumption of blueberries. From this point of view, a series of analyzes were carried out in dry packed blueberries. The results obtained are as follows: Color L: 25.93, a: 16.25, b: 5.40, acidity as citric acid 0.41%, dry matter 89.85%, phenolic substance 1,413 mg / g catechin equivalent, flavonoid 2,527 mg / g catechin equivalent, antioxidant power 61.34%, DPPH 49,23 mg / 100 g trolox equivalent, ABTS 327,95 mg / 100 g trolox equivalent.

NEW TREND IN CELIAC PATIENT'S NUTRITION: UTILIZATION OF ENDOPEPTIDASE

SALIHA DINC¹, MERYEM KARA¹, HATICE BERNA POÇAN¹

ABSTRACT

Celiac disease occurs in people who cannot digest gluten protein, found especially in wheat, rye, oat and barley. In gliadin, one of the components of gluten, glutamine and proline rich peptide sequences cause gluten toxicity. Genetic and environmental factors increase in the number of celiac patients. The only treatment for those suffering from celiac disease is to follow a gluten-free diet for life. However, plants such as ginger rhizome, ginseng and black cumin are utilized in celiac patient's therapy as immune system improver. Plant and microorganism proteases have curative effect by cleaving peptides derived gliadin. Black cumin proteases degrade gliadin of T. aestivum and T.durum. Aspergillus niger has an industrial utilization in the production of citric acid and gluconic acid. Recently, it has been determined that, endopeptidase produced by Aspergillus niger, specific to proline, cleavage these peptides. Aspergillus niger endopeptidase is active under stomach conditions of low pH and resistant to pepsin. New trend in celiac patient's therapy is cleavage of the peptides derived from gluten by oral uptake of proline specific endopeptidase in gastrointestinal track. It is commercially available and when taken before meal it can digest hidden gluten. Moreover, in literature, there is a patent about the inclusion of this endopeptidase to food formulations. This topic, novel in our country, may expand new horizon for celiac patients and producers to prepare functional food/ nutraceuticals.

KEYWORDS

THE USE OF ROSEMARY (*ROSMARIUNUS SP.*) AND THYME (*THYMUS SP.*) ESSENTIAL OILS IN EDIBLE COATING OF MEATBALL

SÜLEYMAN BAYTUR¹, NEŞE ÖZDİNÇ¹, HASAN MURAT VELİOĞLU¹

ABSTRACT

Meatball is a traditional meat product produced from minced meat and different spices such as cumin, black pepper, garlic and onion. There are number of studies on extending the shelf life of meatball in the literature. However, the use of chemical antimicrobial agents is not allowed by legislations in Turkey. In this context, the studies are focused on the use of natural additives for preservation of raw meatball. Edible coatings have been used in food sector to enhance the overall quality of the products, especially for improving the resistance against deterioration. In the present study, edible coatings including 0.25, 0.50, 0.75 and 1.00 % rosemary and thyme essential oils were used to coat meatball samples and microbiological and color changes were compared with control group that was coated with edible coating without essential oil addition. Analysis were done after 5 days storage at +4°C. The results showed that total mesophilic aerobic bacteria (TMAB) count of sample containing 1.00% rosemary essential oil was 4.11 log cfu/g where that of control sample was 4.25 log cfu/g. Thyme essential oil was also effective on microbial count where TMAB count of the sample containing 1.00% thyme essential oil was 4.22 log cfu/g and that of control sample was 4.25 log cfu/g. Additionally, the results clarify that the more essential oil addition resulted a significant decrease in TMAB count ($P < 0.05$). The color value of meatball samples was also measured at the end of the 5 days storage period at +4°C. The results confirmed that the L (lightness) value was lower in the sample containing 1.00% essential oil and the a (redness) value of that was the highest ($P < 0.05$) for both sample sets containing thyme and rosemary essential oil. In conclusion, the findings showed that the use of rosemary and thyme essential oils in edible coatings can positively affect some quality properties of raw meatballs.

4-HYDROXYCOUMARINE FUNCTIONALIZED CYCLOTRIPHOSPHAZENES: SYNTHESIS AND CHARACTERIZATION

GÖNÜL YENİLMEZ ÇİFTÇİ¹, YAKUP EKER¹, ELİF ŞENKUYTU¹

ABSTRACT

Cyclotriphosphazenes are a member of class of cyclophosphazenes and they are generally prepared by nucleophilic displacement of reactive Cl atoms of hexachlorocyclotriphosphazene, N₃P₃Cl₆ (1), with different mono, di, tri and tetrafunctional, and organometallic reagents [1]. During the past two decades nucleophilic substitution reactions at phosphorus atoms of phosphazene have been extensively explored leading to the enormous variety of materials with interesting properties, such as biomedical materials, anticancer and antimicrobial agents [2]. Coumarins are area group of compounds that play important role an food constituents, antioxidants, and fluorescent sensors. A number of coumarol derivatives and their metal complexes have been synthesized and tested for their antifungal, insecticidal, antibacterial, antiallergic, anticoagulant, and pharmacological properties [3]. 4-Hydroxycoumarin is an important component in coumarins family and natural products with biological activities including anticoagulant and anti- HIV activities [4]. In the current study, all these compounds were synthesized and fully characterized by MALDI-TOF mass spectrometry, ¹H, ¹³C, ³¹P NMR spectroscopies and elemental analysis. The investigation of the reaction of these compounds with different groups for biological activity works will continue in our laboratories. STRUCTURAL PROPERTIES OF CYCLOTETRAPHOSPHAZENES INCLUDING THIAZOLE OR THIADIAZOLE RINGS

GÖNÜL YENİLMEZ ÇİFTÇİ¹, ESRA TANRIVERDİ EÇİK¹, ELİF ŞENKUYTU¹

ABSTRACT

Phosphorous-nitrogen double bond containing compounds are called as phosphazene which are an important inorganic group. Generally, linear, cyclic and polyphosphazenes are the three well known types [1]. Cyclophosphazenes and their derivatives have been of considerable interest for a number of years, partly because of their versatile chemistry and partly because it is possible to use them to design materials such as antimicrobial agents, organic light emitting diodes (OLEDs), anticancer agents, flame retardant agent, liquid crystals, fluorescent chemosensor [2]. Small-ring heterocycles including nitrogen and sulfur have been of considerable interest for a number of years on account of their synthetic diversity and therapeutic relevance. Among the wide range of heterocycles such as thiazole core is present in many biologically relevant molecules [3]. All these compounds are fully characterized by elemental analysis, FT-IR, mass (MS), ¹H and ³¹P NMR spectroscopies. The investigation of the reaction of these compounds with different groups for biological activity works will continue in our laboratories. AWARENESS OF MEDICIAN AND AROMATIC PLANTS BY PHYSICAL THERAPY AND REHABILITATION STUDENTS: THE MODEL OF ABANT İZZET BAYSAL UNIVERSITY

ECE ACAR¹, AYŞE NERİMAN NARİN², ÖZLEM ÖZER², MAHMUT BEŞLİ², TUBA ZOROĞLU¹

ABSTRACT

Introduction: Medical and aromatic plants have an important place in physiotherapy and rehabilitation especially during therapeutic massage applications. Aromatic oils are preferred as an inclusion body for manuel therapies, such as friction massage on the purpose of slackened a scar tissue or conventionel massage for muscle relaxation. Medicinal and aromatic plants, in addition, are used when relaxation treatments are required. Today, with the being become populer alternative and supportive therapies, the demand for medicinal and aromatic plants is increased. Objective: The aim of the study is to determine how much knowledge physiotherapy students have about medical and aromatic plants, that have been getting training for a long time and intensively about manual therapy techniques. Methods: The study was carried out by Abant İzzet Baysal University Kemal Demir Physical Therapy and Rehabilitation Department with the first, second, third and fourth grade students. A questionnaire was used to determine the situation of recognizing medicinal and aromatic plants and the usage of these plants. The 10 medicinal and aromatic plants which was the subject of the questionnaire are selected randomly from 84 medicinal and aromatic plants that commonly used in Turkey. Ten multiple-choice questions were related to the usage of the medicinal and aromatic plants were presented at the questionnaire The questionnaire was distributed to the students who were attending classes at different grades at the same time and after filling the form, they were collected. Since the possibility of discussing the questions among themselves was considered, the data collection process was not repeated another day Results: 193 students (women 59,06% -men 40,94%) age 21,25 ±3,01 was attended the study. 27,5% of the the students are at the first grade, 35,8% in the second grade, 26,9% at the third grade and 9,8% at the 4th grade. Five of the ten medicinal and aromatic plants which their effects are well known by the students are aniseed (78.2%), fennel (75.1%), lavender (72.5%), rosemary (70.5%) and turmeric (69,9%) plants. Two herbs that least known by the students are quassie Amara (3.6%) and olibanum (4.1%) plants. The correct response rates for the medicinal effect of the mentioned five herbs, which are indicated to be known by the students for their effects are anise (66,9%), senna (56,3%), fennel (44,8%), rosemary (70,5%) and turmeric (34,1%) plants. 53.1% of the students stated that they use medicinal and aromatic plants rarely and 74.1% of them use the plants to protect themselves from diseases. Only 18.7% of the students stated that they use medicinal and aromatic plants for massage. 79.2% of the students indicated that they have learned from internet what know about aromatic plants. Students with at least one book on medicinal and aromatic plants are 28% of the all participants. Discussion: Physiotherapy students do not have enough knowledge about medical and aromatic plants. Students, however, indicated that they know the effects

of the herbs but they did not answer the questions correctly. So that, this result indicated us that, the students do not have scientific knowledge about medician plants and oils. Indeed, this is confirmed by the fact that a large majority of the participants stated that they learned information from the internet and the low proportion of those who possess at least one book about medical and aromatic plants. Especially when the proportion of those who use medicinal and aromatic plants for massage applications is low, it will cause to be low usage after graduation. They will not be able to provide enough information to the individuals who consult them. Lectures on the potential benefits and risks and the usage of medicinal plants and oils should be incorporated to the medical curricula.

POISONOUS PLANTS FOR ANIMALS KEPT IN HOUSE

ALI BİLGİLİ¹

ABSTRACT

In this proceeding, it was dealt with plants that have toxic effect for animals kept mostly in house. In this context, the poisonous effects of more than 30 plants including Allium, Galerina, Common Laburnum, Jasmine spp., Cuckoopint and Narcissus from poisonous plants present in natural environments, and parks and gardens, as well as grown mostly in homes in our country were discussed. The plant species leading to poisoning for both dogs and cats, as well as leading to poisoning only dogs and only cats were presented in Tables by aligning separately. Their adverse effects in different organ and tissues and their clinical signs occurring in the result that they are eaten by dogs and cats were explained. Concise knowledge was given on the required measures for preventing poisoning of animals kept in home with these plants in also our country, as in world countries.

AWARENESS OF AROMATIC OILS BY FAMILIES OF INDIVIDUALS WITH SPECIAL NEEDS: THE MODEL OF KARABUK CITY

TUBA ZOROĐLU¹, TAMER ANKAYA², ECE ACAR¹

ABSTRACT

Introduction: The majority of individuals with special needs constitute individuals who are diagnosed with a diseases that have limited or no treatment options such as, cerebral palsy, autism, down syndrome, muscle disorders. In these diseases, for instance, spasticity, respiratory problems, joint limitations and pain complications, usually caused by the disease, should be handled. Considering that the treatment processes of individuals with special needs last for a long time or even for a lifetime, families are expected to be in search of new and alternative treatments. For this purpose, the use of aromatic oils by families is often seen among alternative treatment methods. Its be needed that presenting this situation based scientifically that we frequently observe it. **Objective:** The primary aim of the study is to demonstrate the usage of aromatic oils in the families of individuals with special needs. This preliminary study, in addition, will be the first research that can reveal the awareness of aromatic oils by the families in our country. Furthermore it is aimed to raise awareness among the health personnel who provide individuals with special needs with health service. **Methods:** The study was conducted with families of individuals with special needs who received treatment rapidly by special education and rehabilitation center at Karabuk in Turkey. A questionnaire was applied to identify participants' demographic information and usage of aromatic oils. It was also questioned through this form , that consists of 15 questions, which aromatic oils was preferred by families for spasticity, respiratory problem, pain and sleep problems which are common problems in individuals with special needs. **Results:** 38 parents (34 females (89.5%), 4 males (10.5%)) with a mean age of 39, 11 ± 10, 03 were attended in the study. 26.3% of individuals with special needs have cerebral palsy, 10.5% muscle disease, 15.8% autism, 15.8% down syndrome and 31.6% have other diagnoses (not diagnosed, premature birth, epilepsy) . 73.7% of participants have used aromatic oils (5.3% always use aromatic oils, 36.8% occasional, 31.6% rarely). 68.4% of participants stated that preferred massage method and 5.3% of participants stated that preferred steam / inhalation method. Bath, room perfume, hot / cold compress applications are not used by participants. 41.2% of the participants stated that they use aromatic oil without consult a health care provider. They stated that they most preferred olive oil (68,4%) for spasticity, lavender oil (10,5%) for respiration, anise (31,6%) for sleep problem and rosemary (26,3%) for pain. 47.4% of the participants stated that they do not know which aromatic oil should be preferred for respiratory, sleep and pain problems. Participants have had information about aromatic oils on television (31.6%), internet (26.3%) and from their friends (26.3%). **Discussion:** Despite the high rate of usage of aromatic oils in the families, they know only two methods of application that suggests a lack of information about aromatic oils. The vast majority of families use aromatic oils without consulting any healthcare staff, which may be due to the fact that families

suppose that healthcare providers don't have adequate knowledge about this issue. Unconscious use of aromatic oils in individuals with special needs who are dealing with chronic conditions can lead to greater problems. It should be questioned all special needs individuals and their parents whether have applied additional treatments. Training can be organized about not using the aromatic oils without consulting the health personnel. In this way it can be provide an environment for families could have questions. This research, which carries a preliminary study, is planned to be carried out again by increasing the number of participants.

THE USE OF ESSENTIAL OILS FROM THYME (THYMUS SP.) AND ROSEMARY (ROSMARINUS SP.) FOR THE PREVENTION OF MOLD GROWTH IN TOMATO PASTE

NEŐE ÖZDİNÇ¹, SÜLEYMAN BAYTUR²¹, HASAN MURAT VELİOĐLU¹

ABSTRACT

Tomato is a seasonal fruit and it is generally processed to tomato paste or sauce to extend the shelf life. Dry matter content of tomato paste is about 28-32 % and it is naturally acidic food product, and these properties protect it from bacterial deterioration. However, tomato paste is suitable medium for growth of molds, especially in aerobic conditions. It is not allowed to use chemical antimicrobial agents in tomato paste production that is why natural antimicrobials are of interest to scientific studies in recent years. The aim of the present study was to investigate the effects of essential oils from rosemary and thyme on the mold growth in tomato paste during the storage at different temperatures. The essential oils of rosemary and thyme were added to the tomato paste samples (28 °Bx) at the levels of 0.25, 0.50, 0.75 and 1.00 % and mixed with laboratory homogenizer. Spore solution of *Aspergillus foetidus* containing 8×10⁵ cfu/ml was inoculated at a level of 1% on the samples. One set of samples was stored at +4°C and the other set was stored at room temperature (25°C). The analyses were done at the day on which the mold colonies could be seen by naked eye (day 5 for 25°C storage and day 15 for +4°C storage). The results showed that essential oils have preventive effect on the growth of mold, especially at a level of 1.00%. Mold counts for the control group without essential oil addition was 4.21 log cfu/g at the end of the storage period while that of the sample containing 1.00% thyme oil was 3.91 log cfu/g. Similar results were found for rosemary essential oil such as the mold count decreased to 3.94 log cfu/g at the end of the storage period. The findings showed that the addition of essential oils to tomato paste is significantly effective (P < 0.05) on the prevention of mold growth during storage.

DISCRIMINATION OF COLD-PRESSED OILS USING RAMAN SPECTROSCOPY

HASAN MURAT VELIOĐLU¹

ABSTRACT

Numbers of cold pressed oil are commercially produced and sold in Turkish food and medical market. Among those the oils of black cumin and almond are the well-known examples of publicized dietary supplements. However, availability of cold pressed oil is limited due to its high price and so it is an attractive target for fraudulent activities. In this study, we investigate the authenticity of the cold pressed oils sold in Turkish food and medical market using Raman spectroscopy combined with principal component analysis (PCA). For this purpose, cold-pressed oils of black cumin and sweet almond were produced in laboratory conditions and compared with the samples collected from Turkish market. The equipment used for Raman analysis was DeltaNu Examiner Raman Microscopy system with 785 nm laser source and a CCD detector. The spectrum obtained was in the range of 200-2000 cm⁻¹ at a resolution of 2 cm⁻¹. Validation of the study was done using fatty acid methyl esters by GC. PCA was applied to evaluate the Raman data where the GC results were subjected to ANOVA. Eleven commercial samples of almond oil and 8 commercial samples of black cumin oil were compared with the oils produced in laboratory. While both almond and cumin oils were found to be rich in linoleic acid (C18:2n6) and oleic acid (C18:1) according to GC results, they could be classified using chemometric applied to Raman spectrum. The signal obtained at 1300 cm⁻¹ showed higher intensity for almond oil where the signal at 1021 cm⁻¹ was stronger for cumin oil. The first one was associated with twisting of -CH₂ and the second one, probably, related with bending of -CH. Briefly, it can be concluded that the use of Raman spectroscopy in authentication of cold-pressed oils is possible.

OYSTER MUSHROOM (PLEUROTUS OSTREATUS) CULTIVATION AROUND ANAMUR (MERSIN)

AYŞE NUR ŞEN¹, PROF.DR.MUHİTTİN DİNÇ²

ABSTRACT

Oyster mushroom cultivation around Anamur (Mersin) city Oyster mushroom cultivation around Anamur (Mersin) city Pleurotus ostreatus (oyster-poplar mushroom) is the second popular cultivated mushroom all over the World, but in our country it's not so known. To negative effects on mushroom consumption is, mushroom species especially in nature poisonous effects on human body and health. In Turkey, cultivated mushrooms' past is so recent. For the first time in 1960, it was cultivated at Ankara Faculty of Agriculture. Then in 1970 it was increased and 'mushrooming department' has been established at 'Yalova Atatürk Garden Cultivation Research Institute' connected with Ministry of Agriculture. After Agaricus genus, Pleurotus genus is becoming more common in the world and our country. In Turkey The Mediterranean Region is the first region about this cultivation. In this study, The Mediterranean Region was searched about oyster mushroom cultivation. 110 meters two area was prepared; one 13 tons of straw (640 straw sack) and another; 200 poplar billets, mycelia growth were examined with Sylvan and K17 kind mycelias with White- yellow colours. Product yields were compared with different ecological requests. Anamur's mushroom cultivation – marketing was searched about climate conditions, heat temperature, light. In this study oyster mushroom's mycelia's duration of the growth, harvest time, yield time were searched around the area. For this soilless agriculture even a house's damp ground floor is suitable. For benefits of country economy, this cultivation –marketing is so important and people's protein requirement. In the conclusion; K17 mycelia kind has grown quicker than another poplar mushroom sylvan mycelia (in the room2). Cultivation has been at 40 days, straw substrate has been at 20-25 days. In the first days temperature should be 20-25 C, dampness should be %80-90. After mycelia pins have existed temperature must be reduced otherwise mold will be in the straw. Fogging machine should be worked after pin existings. In this study some negative results were detected like; less cultivation incentive, between the agriculturists there is not enough unity, marketing casing time, good quality at mushroom mycelia, high costs of mushroom setting companies, molding, reeling, drying, oxygen insufficiency, carbon dioxide increasing, handle growing. In the Mediterranean Region in Korkuteli (Antalya), mushroom cultivating is common but in Anamur although Anamur Forest Management's incentive meetings, it hasn't become common enough. In total 1 big, 2 small total 3 mushroom cultivation place were detected. Oyster mushroom's benefits for the human health, it's cultivation must be common.

HERBAL TEAS OF LAMIACEAE CONSUMED IN ANATOLIA: A SYSTEMATICAL LIST FROM THE EDIBLE PLANTS DATABASE OF TURKEY (TUGBIV 2.0)

EZGİ BELLİKÇİ KOYU¹, HALİL KOYU², SERDAR DEMİR³, MEHMET ALİ EGE⁴, ŞURA BAYKAN⁵, BİNTUĞ ÖZTÜRK⁵

ABSTRACT

Tea is the most widely consumed beverage in the world after water. Although tea is usually prepared from *Camellia sinensis* (L.) Kuntze., a great variety of plants are used for making “tea” in Anatolia. As being in the intersection for three different phytogeographical zones which provides a wide diversity of plants, Turkey has been a unique area. Besides 11.707 taxa with high endemism ratio (about one third) which brings speciality, rich history of Anatolian culture dating back to 11.000 BC leads a huge potential for ethnobotanical uses. This biodiversity can also be observed in Lamiaceae family. Their rich flavor content make them suitable and attractive for making tea. Recording the ethnobotanical usage and creating an inventory of plants are necessary due to fast-disappearance of traditional knowledge with increasing urbanization. The importance of databases as modern and remotely accessible devices for the conservation of traditional heritage will keep on due to continuously updateable and improvable structure with new functions. Since 1999 our study group has been working on the project for the formation of “Ethnobotanical Database of Turkey”. It was prepared by an extensive scanning through all scientific sources, in particular the ethnobotanical studies, which have been revealed up to today. “The Edible Plants Database of Turkey (TUGBIV 2.0)” has been accomplished as a part this project. From this database, herbal teas of Lamiaceae which are consumed in Anatolia is presented. A systematic list showing the plants scientific names according to APG III system, vernacular names, localities, methods of use was given for herbal teas of Lamiaceae. It is determined that more than 100 taxa of Lamiaceae have been used as herbal tea in Turkey. This study is presented with the aim of sharing the scientific data related to floral richness and ethnobotanical heritage.

BENEFITS OF WOLF BERRY TO HUMAN HEALTH

AYŞEN MELDA ÇOLAK¹, VOLKAN OKATAN², FATMA ALAN²

ABSTRACT

When medicinal plants are mentioned, they cover a wide field in terms of their active ingredients. Natural compounds obtained from plants have been used in the treatment of various diseases for centuries. From the ancient times to the modern ones, plants have been utilized in medicine, chemistry and biology fields in order to treat human diseases. When we look at historical texts about plants, flowers, leaves, barks, seeds, oils or roots, it is seen that these texts can be backtracked centuries from Sumerians to ancient Egyptians and Medieval Europe. Natural products obtained from medicinal plants are usually important for human health and their trade volume has been increasing day by day. It is expressed that the annual medicinal and aromatic plant trade on the world is about 100 billion dollars. One of the plants in medicinal and aromatic plants is wolf berry . Wolf berry taxonomically belongs to Solanales order Solanaceae family Lycium species and Lycium barbarum, L. chinense and L. ruthenicum genus. The plant known as wolf berry in whole world spreads from Himalayas to Western China, Mongolia and Tibet and it has three species that are commonly grown and consumed in China. Lycium genus including approximately 80 species spreads to the tropical and sub-tropical regions of the world. In the oldest book called as Shen Nong Ben Cao Jing, which gives information about China's traditional 365 medicinal and agricultural plants it is mentioned that wolf berry was used medically in about 200 B.C. and its fruits and leaves are highly beneficial and it has no side effects. Chinese people have been consuming wolf berry widespread for centuries, believing that it is a life-sustaining effect. For many thousands of years as well as being a good nutritional source wolf berry fruits have also been used as herbal medicine with their lots of features such as anti-pyretic, anti-inflammatory, liver protection, anti-osteoporosis, anti-fatigue and anti-aging, and blood glucose balancing. Importance of wolf berries for human health will increase day by day with the conducted studies.

THE POTENCY OF USES AS FOOD ADDITIVE FROM HAWTHORN SPECIES (CRATAEGUS SPP.) IN TURKEY

ASUMAN KAN¹

ABSTRACT

Turkey's flora has a total of 31 hawthorn species belonging to Rosaceae family, including almost all medicinal and functional plants. Hawthorn species are used in many different purposes by Turkish populations, such as fruit, tea, jam, as well as pharmaceuticals and landscaping plants. Phytochemical investigations of these hawthorn plants which grow naturally in Turkey have revealed many interesting bioactive compounds. The parts of hawthorn plant contain rich compounds as phenolic (procyanidins, flavon glycosides) sugar, sugar alcohols, vitamin C, protein, organic acids and minerals (Ca, P, K, Mg and Fe) for use as a food additive. Part of the hawthorn plant species such as leaf, flowers and fruit, has been used in conventional and traditionaly medicine. In recent years, It has been recorded a lot of papers on howthorn products in the world. But until today, hawthorn species have been not enough investigated for the uses of food additives in Turkey. In this presentation, Characteristics of functional food additives potency with the hawthorn species from natural flora of Turkey will be evaluated.

THE EFFECT OF ACUTE AND CHRONIC ADMINISTRATION OF ELLAGIC ACID ON ANTIOXIDANT PARAMETERS IN RATS

ERSİN BEYAZÇİÇEK¹, SEYİT ANKARALI², ÖZGE BEYAZÇİÇEK¹, HANDAN ANKARALI³

ABSTRACT

Ellagic acid (EA), which is a natural polyphenolic compound (2,3,7,8-tetrahydroxy-chromene, C₁₄H₆O₈) is commonly found in grape-type fruits, pomegranate, hazelnut and some other medical plants. Ellagic acid is a molecule with a molecular weight of 302.197 g/mol, a density of 1.67 g/cm³ and a melting point of 350 °C. Aim of this study was to investigate the effects of acute and chronic administration of EA, which has been shown analgesic, antidepressant, antioxidant and anticancer effects, on superoxide dismutase (SOD), catalase (CAT) and glutathione peroxidase (GPx) levels in rats. In this study 49 adult male Wistar rats were used. Rats were divided 7 different groups which were control group, acute groups as 10, 50 and 100 mg/kg doses of EA, and chronic groups as 10, 50 and 100 mg/kg doses of EA. All of the substances were administered intraperitoneally. When applying substances throughout 21 days to the chronic study group, to the acute study group was administered 2 hours before the blood samples were taken. Rats were anesthetized with 1.25 g/kg dose urethane intraperitoneally after the administration of EA. In order to indicate the effects of EA on the antioxidant mechanism, levels of superoxide dismutase, catalase and glutathione peroxidase were determined in serum by ELISA method. Kruskal-Wallis test were used for statistical comparisons of groups in terms of SOD, CAT and GPx values, and homogeneous subgroups multiple comparison method were used for determining different groups. The levels of SOD obtained from both chronic and acute groups were determined to be significantly lower than the control group (p<0.05). In addition, SOD values obtained from 10 and 50 mg/kg of chronic groups were seen to be lower than the acute groups (p<0,05). When groups were examined in terms of CAT, the levels of CAT obtained from both chronic and acute groups were found statistically lower than the control group (p<0,05). The CAT values obtained from the chronic groups were detected to be significantly higher than the acute groups (P<0.05). The GPx values obtained in chronic groups were found to be significantly lower than the control and acute groups (P<0,01). Consequently, this study showed that ellagic acid reduces SOD, CAT and GPx levels in both acute and chronic groups.

POLYPHENOLIC COMPOSITION AND ANTIOXIDANT POTENTIAL OF ORIGANUM (L.)

ABDÜLMELİK ARAS¹, ERCAN BURSAL¹, MUZAFFER SİLİNSİN¹, MUHAMMED NURİ BİNGÖL¹

ABSTRACT

In recent decades various plants has received considerable attention due to they are important sources of many antioxidant and cancer chemopreventive agents. Origanum is used as a stimulant, sudorific, emmenagogue and galactagogue and also useful in asthma, hysteria, paralysis and antibacterial activity. Origanum genus are extensively used among the people as diuretic, sedative, antiseptic, sweater and also in the treatment of gastrointestinal diseases, constipation and a spicy additive for food instead of thyme and rich in essential oils and bitter substances. This research was aimed to investigate the active compounds with antioxidant properties from Origanum L. by using different in vitro methods (DPPH radical scavenging , FRAP and CUPRAC reducing methods).

DETERMINATION OF ANTIOXIDANT ACTIVITIES OF INULA GRAVEOLENS (L.) DESF.

MUZAFFER SILİNSİN¹, ERCAN BURSAL¹

ABSTRACT

In this research, antioxidant potential of ethanol and water extracts of the *Inula graveolens* (L.) Desf. leaves were measured by in vitro DPPH, FRAP and CUPRAC techniques. Several *Inula* spp. are used as traditional herbal medicines to treat many diseases, including bronchitis, diabetes and intestinal ulcers. Therefore the genus *Inula* comprises several species of reputed medicinal value. Phenolic compounds are the alternative therapeutic agents for the prevention of many diseases as well as being used for their treatment. In this study our main goal was to determine the antioxidant activities of ethanol and water extracts of leaves of *Inula graveolens*.

**DETERMINATION OF ANTIOXIDANT ACTIVITIES OF ACORNS
AND LEAVES OF OAK (QUERCUS ROBUR SUBSP.
PEDUNCULIFLORA) AND "GEZO" MOLASSES.**

REMZİ BOĐA¹, ERCAN BURSAL²

ABSTRACT

A traditional farmer product of homemade oak molasses, acorns and leaves of oak (*Quercus robur* subsp. *pedunculiflora*) are the main materials of this study. The leaves of oak tree have been extracted in water and this extracts have been evaporated by farmers. Colloidal precipitants have been widely used as dietary molasses that also have very effective antiseptic functions at alternative medicine for ages in some region of East and Southeastern Anotolia. Present study aimed to evaluate the antioxidant activities of ethanol and water extracts of acorn, leaves and oak molasses named "gezo molasses" that obtained from the leaves of oak trees (*Quercus robur* subsp. *pedunculiflora*).

THE INFLUENCE OF HARVESTING PERIOD AND CUTTING HOUR ON YIELD AND QUALITY IN THYME (*THYMUS VULGARIS* L.) IN ÇUKUROVA CONDITIONS

CEREN DENİZ YILDIRIM¹, MUHAMMET ENES AKDOĞAN¹, TUNCAY ÇALIŞKAN¹, HASAN MARAL², EBRU
KAFKAS³, SALIHA KIRICI¹

ABSTRACT

This research was conducted in 2016 at the Research Area of Department of Field Crops, Faculty of Agriculture, Çukurova University, Adana for the influence of harvesting period and cutting hour on yield and quality in *Thymus vulgaris* L. Field trial was arranged in randomized complete block design, with three replications. Thyme seeds were sown on December 17, 2015 in the green house. Seedlings were transferred to field at March 31, 2016. The plants were harvested three times at one month interval (first: August 22, second: September, 23 and third: October 21, 2016). Cutting hours were 9:00 am, 12:30 am and 16:00 pm. In the study, plant height (22.7 – 32,8 cm), drug herbage yield (39 - 156 kg da⁻¹) and essential oil content (1.54- 1.88%) were determined. The highest essential oil content was obtained as a mean 1.88 % from the first harvest at 16:00 pm cutting. The lowest value was obtained from second harvest at 9:00 am cutting time.

THE BIOLOGICAL ACTIVITIES OF EUPHORBIA ALEPPICA AND E. ERIOPHORA SPECIES

İSMAIL YENER¹, ABDULSELAM ERTAŞ², SERKAN YIĞİTKAN³, MEHMET BOĞA⁴, MEHMET ÖZTÜRK⁵, HASAN ŞAHİN², İŞİL AYDIN¹, FIRAT AYDIN⁶, UFAK KOLAK¹, KEREM ŞENTÜRK⁷

ABSTRACT

Euphorbia species are commonly used in Turkish folk medicine for the treatment of rheumatism, swelling as well as a wart remover. However, inflammation and diarrhoea are the two potential side effects that might occur during the treatment . The genus Euphorbia is the largest in the spurge family, comprising about 1100 species in the World . Most of the representative Euphorbia species are characterized by the occurrence of highly irritant latex . Euphorbia species are named as "Sütleğen" and "Xaşıl" . The genus Euphorbia is the source of a large number of biologically active compounds. An increasing attention has been paid to Euphorbia diterpenes because of their diverse structures and therapeutical importance . Root and aerial parts (stem, leave, flower and seed) of E. aleppica and E. Eriophora were collected from Diyarbakır in flowering period. β -Carotene method, ABTS cation radical decolorisation method, cupric reducing antioxidant capacity assay and DPPH free radical scavenging activity were carried out to indicate their antioxidant activity. Additionally, the methanol extract these Euphorbia species were tested for anticholinesterase (Acetyl- and butyrylcholinesterase enzymes) activities. The methanol extracts of E. aleppica and E. eriophora showed good antioxidant and weak butyrylcholinesterase activities.

THE NUTRITIONAL AND FUNCTIONAL PROPERTIES OF PHYSIOLOGICALLY MATURE AND IMMATURE WHEAT

HACER LEVENT¹

ABSTRACT

Wheat, which is in the first place in agricultural production in the world has important place in human nutrition. Its grain can be ground into flour and semolina which are the basic ingredients of bread, pasta, noodle, biscuit, cake and other bakery products. Wheat based products are the major energy supplier of individuals throughout the world. Also whole wheat products are an excellent source of dietary fibres, minerals, vitamins and bioactive phytochemicals that include carotenoids, tocopherols, lignans and phenolic acids. These antioxidative components may prevent life important molecules such as DNA and enzymes from oxidative damages. The unique phytochemicals content of cereal based foods produced from whole wheat flour complement those in fruits and vegetables when consumed together. Therefore whole wheat products have additional health benefits beyond basic nutrition. Whole wheat products are associated with various types of diseases such as obesity, cardiovascular disease, cancer, diabetes, and other chronic diseases. These health benefits are attributed to the bioactive factors in wheat grain such as dietary fibers and phytochemicals. While the wheat is in immature form, it has some additional nutritional and functional advantages compared to physiologically mature wheat. For that reason, the interest to immature wheat has been increasing in recent years. Maturation of wheats affects micro and macromolecular components related to nutrition and health. Immature wheat has a high content of dietary fiber, essential amino acid-lysine, minerals (P, K, Ca and Cu), fructooligosaccharides (FOS) and simple sugars. FOS, non-digestible fructose polymers, occur naturally in many plants, including wheat and stimulate the growth of bifidobacteria in human colon, rebalance of metabolic activities and strengthen the immune system of humans. Therefore, FOS are evaluated as "prebiotic". Immature wheat contains more polyphenols and flavonoids and has higher antioxidant capacity than mature wheat. Also, immature wheat contains considerable amount of vitamin C especially at early stage of kernel development. Considering nutritional and functional characteristics, immature wheat is a innovative food ingredient and can be added various cereal products as a natural source of FOS and other bioactive components. In recent years, the health concerns of consumers have increased with the increased of diseases. For that reason, there is a rising interest to functional foods which are foods that contain not only traditional nutrients but also provide other compounds beneficial to health. Immature wheat flour at early stage of maturity is an important functional ingredient and can be added to various cereal products to increase the nutritional and functional status of foods.

CHEMICAL PROFILE OF SALVIA BLEPHAROCHLAENA ETHANOL EXTRACT BY LC-MS/MS

ELIF VARHAN ORAL¹, HAVA BATIBAY¹, ABDÜSELAM ERTAŞ¹, YETER YEŞİL², MUSTAFA ABDULLAH YILMAZ¹,
HÜSEYİN ALKAN¹, HAMDİ TEMEL¹, BERRİN ZİYADANOĞULLARI¹, UFAK KOLAK²

ABSTRACT

Salvia L. is one of the largest and the most important aromatic and medicinal genus of the Lamiaceae family which exists approximately 900 species widespread throughout the world. Salvia L. genus is represented with about 98 species in Turkey and half of them is endemic (1). Salvia species are commonly used in traditional medicine for treatment of more than sixty diseases such as headache, cough, colds, stomachache, antipyretic, anti-inflammatory (2). Salvia species possess high amount of rosmarinic acid which has antioxidative, anti-inflammatory, antimutagenic, antimicrobial, antibacterial, antiviral effects (3). Root and aerial parts (stem, leaf, flower and seed) of *S. blepharochlaena* were collected from Kayseri in flowering period. A gram of powdered plant material was macerated three times with methanol (each part with 10 mL) at 25 °C for 24 hours. After filtration, the solvent was evaporated to get the crude extract. Phenolic components of the methanol extract were quantified by LC-MS/MS. LC-MS/MS analysis of the phenolic compounds was performed by using a Nexera model Shimadzu UHPLC coupled to a tandem MS instrument. In the current study, twenty-four phenolic compounds (flavonoids, flavonoid glycosides, phenolic acids, phenolic aldehyde, coumarin) and three non-phenolic organic acids which are widespread in plant materials were qualified and quantified in *S. blepharochlaena*. Among 27 compounds, LC-MS/MS study showed that rosmarinic acid, gallic acid, caffeic acid, protocatechuic acid, fumaric acid and malic acid were found to be the more abundant compounds in *S. blepharochlaena*. In addition, the amount of gallic acid, caffeic acid, protocatechuic acid, fumaric acid and malic acid were found to be high in stem, and rosmarinic acid in flower extracts.

TOTAL PHENOLIC-FLAVONOID CONTENTS, ANTIOXIDANT AND ANTICHOLINESTERASE ACTIVITIES OF SALVIA BLEPHAROCHLAENA

HAVA BATIBAY¹, ELIF VARHAN ORAL¹, YETER YEŞİL², MEHMET BOĞA¹, HÜSEYİN ALKAN¹, MUSTAFA
ABDULLAH YILMAZ¹, HAMDI TEMEL¹, UFUK KOLAK², BERRİN ZİYADANOĞULLARI¹, ABDÜLSELAM ERTAŞ¹

ABSTRACT

Different *Salvia L.* species are reported to show many biological activities and medicinal properties, such as antimicrobial, antioxidant, antibacterial, anti-inflammatory, antitumoral, anxiolytic, antidiabetic, anti-inflammatory, antifungal, antiplasmodial, hypoglycaemic and anticarcinogenic effects (1,2). *Salvia* species are used as herbal tea due to their antiseptic, stimulant, diuretic and wound healing properties in Turkey (3). The aim of this study was to determine total phenolic and flavonoid content, antioxidant (DPPH free radical scavenging activity, β -carotene bleaching assay, CUPPRAC, ABTS cation radical scavenging activity) and anticholinesterase (acetyl- and butyrylcholinesterase enzymes inhibition) activities of the extracts obtained from various parts of (roots, leaves, stems, flowers and mixed) *S. blepharochlaena*. Total phenolic and flavonoid contents in crude extracts were determined by expressing as pyrocatechol and quercetin equivalents, respectively. Among the studied extracts, the root extract was found to be the richest in terms of both total phenolic and flavonoid contents. The anticholinesterase potential of the extracts was indicated by Ellman method (Ellman 1961). It was determined that none of the extracts showed acetylcholinesterase activity but they exhibited moderate butyrylcholinesterase activity. All of the antioxidant tests which were used in this study, especially ABTS cation radical scavenging test system, the ethanol extracts of *S. blepharochlaena* showed high antioxidant activity in all parts of plant.

**SEED CHARACTERISTICS AND CUTTING PROPAGATION OF
ALDER BUCKTHORN (FRANGULA DODONEI ARD. SUBSP.
DODONEI) WITH MEDICINAL AND AROMATIC IMPORTANCE**

NEBAHAT YILDIRIM¹, ALI BAYRAKTAR¹, FAHRETTİN ATAR¹

ABSTRACT

Alder buckthorn (*Frangula dodonei* Ard. subsp. *dodonei*) is widespread in the whole of Europe and Western Siberia, except for the northernmost regions where temperature conditions have reached the extremes. The most common place in Turkey is the Black Sea region, and especially the northeastern part of this region. In locations outside this area, it has a more local distribution. Alder buckthorn is a deciduous slow growing woody plant species, belonging to Rhamnaceae family. And it can also grow up to 4-5 m. Fruits (in the pharmaceutical industry) and barks of this species is mainly used as a medicinal and aromatic plant. This species is located in the leafy forest zone as individual, cluster and locally in groups in its natural distribution areas. These areas are subject to agricultural activities in particular and it faces with the threat of annihilation. A basis related to in-situ and ex-situ protection will be formed with studies to be made on seed characteristics and propagation methods of the species. In the scope of this study, seed and fruit characteristics of alder buckthorn taken from the natural distribution areas were investigated. In addition, effect on rooting of different hormone applications in cutting propagation tried to determine. As a result of the study, average seed length, average seed width, seed fullness and 1000 seed weight was found as 5.27 mm, 4.29 mm, 79% and 21.76 gr, respectively. Numbers of seeds in the fruit were determined, and it was found that 30% of these fruits were with 2 seeds, the rest of these fruits (70%) were with 3 seeds. A low rooting success was obtained from cutting propagation.

PRODUCTION TECHNIQUES OF SOME WOODY MEDICINAL AND AROMATIC PLANTS NATURALLY FOUND IN EASTERN BLACK SEA REGION

FAHRETTİN ATAR¹, HÜLYA TURNA², İBRAHİM TURNA¹

ABSTRACT

Plants, that are the most important element of forest ecosystems providing vital benefits for living things, are as old as human history. And they fulfill countless benefits and various functions. Forests, one of the habitats of plants, are our most important natural resources with their wood and non-wood economic values, ecological and social benefits. The Eastern Black Sea Region has an asset that can be considered rich in terms of non-wood forest products, and it is home to numerous herbaceous and woody plant species. These species are used for a variety of purposes, primarily medical and aromatic. Lately, consciousness of large masses of people related to usage areas of medicinal and aromatic plants increases the importance of plants. Plants are used as medicines in the prevention and treatment of diseases, and in nutrition as nutritional supplements, herbal tea, taste, flavor. In addition to their use in perfumery and cosmetics, they also have a wide range of uses in different branches of the industry. However, due to unconscious harvests of some plants, these plants are faced with separation and extinction from the ecosystem. Medical and aromatic plants need to be met from natural sources, determination of the inventory of these species in order to ensure participation to its national economy, being made in accordance with the techniques of harvesting and using methods and also knowing production methods and making production to ensure its continuity. In this study, production techniques of some woody species (35 plant species) used as medicinal and aromatic plants from the natural species in The Eastern Black Sea Region were revealed. Accordingly, it was determined that it should be made production with seed+cutting of 51.43%, with seed+grafting+cutting of 22.86%, with seed+tissue culture of 8.57%, with seed+cutting+grafting of 5.71%, with seed of 5.71%, with cutting of 2.86% and with grafting+seed of 2.86% of the species.

**THE EFFECT OF DIFFERENT PLANTING DENSITIES ON
ESSENTIAL OIL COMPONENTS OF DADAŞKÖY TARRAGON
ECOTYPE (ARTEMISIA DRACUNCULUS L.)**

KEMALETTİN KARA¹, İHSAN GÜNGÖR ŞAT², YEŞİM MUALLA ÇİL³, DURMUŞ ALI SÖYLER⁴

ABSTRACT

In this study, the effect of different planting densities on essential oil contents of Dadaşköy tarragon ecotype (*Artemisia dracunculus* L.) was determined. In the study there were three row and three intra-row spacing (40, 50, 60 cm and 30, 40, 50 cm). The study was established as "Split Plot" arrangement in "Randomized Blocks" experimental design with three replications and repeated two years. Methyl chavicol was found to be predominant essential oil in 11 essential oils detected in the Dadaşköy tarragon ecotype. All components except for methyl chavicol were larger quantity in the first experiment year than the second year. Similarly, the first cuttings gave larger quantity of all components except for methyl chavicol than the later cuttings in both years. Essential oil components ratio was significantly different ($p > 0.01$) in regard to planting density. Major constituents of the essential oil investigated were bicyclogermacrene (1.9%) and β -sesquiphellondrene (0.8%) in 40x50 cm planting density, methyl chavicol (76.4%), methyl eugenol (7.2%) and α -zingiberene (1.5%) in 50x40 cm planting density, bornyl acetate (0.4%) in 50x50 cm planting density, bicyclogermacrene (1.0%) β -sesquiphellondrene (0.6%), spathulenol (6.8%) and α -acorenil (2.1%) in 60x40 cm planting density, germacrene (2.5%), β -Cubebene (1.1%) and Jasmolin (0.1%) in 60x50 cm planting density, respectively. It can be concluded from the study that planting densities had significant effect on essential oil components.

EFFECTS OF DIFFERENT OSMOTIC PRESSURES AND SALT CONCENTRATIONS ON ANTIOXIDANT ACTIVITY IN HULLED EINKORN AND BREAD WHEATS

FATMA PEHLIVAN KARAKAŞ¹, NUSRET ZENCİRCİ¹, BIHTER GÖKÇE BOZAT¹

ABSTRACT

Effects of Different Osmotic Pressures and Salt Concentrations on Antioxidant Activity in Hulled Einkorn and Bread Wheats Farklı Osmotik Basınç ve Tuz Konsantrasyonlarının Siyez ve Ekmeklik Buğdayların Antioksidan Aktivitesi Üzerine Etkileri Fatma PEHLİVAN KARAKAŞ^{1,2}, Nusret Zencirci², Bihter Gökçe Bozat² 1Abant İzzet Baysal University, Department of Field Crops, Faculty of Agriculture and Natural Sciences, Bolu, Turkey 2Abant İzzet Baysal University, Department of Biology, Faculty of Science and Art, Bolu, Turkey Email: fatmapehlivankarakas@gmail.com Abstract Climatic changes worsen the production of wheat, an important stable crop and improve its some healthy quality characteristics. This study was conducted to determine the effects of drought (different osmotic pressure) and salinity stress on antioxidant activity [total phenolic content, total flavonoid content and 2,2-diphenyl-1-picrylhydrazyl (DPPH) free radical scavenger activity] of 2 hulled einkorn (*Triticum monococcum* spp. *monococcum*; AA; 2n=14) populations (Pop-1 and Pop-2) and 4 bread wheat (*Triticum aestivum* L.; AABBDD; 2n=42) cultivars (cv. Gerek-79, İkizce, Demir-2000 ve Gün-91) grown in Turkey. Three different salt concentrations [0.0 (distilled water), 50, and 100 mM sodium chloride (NaCl)] and 3 different osmotic pressures (0.0 MPa., -0.5 MPa. and -1.0MPa), which were created by polyethylene glycol (PEG-600) were used on the seed germination process. The seed material of "Gerek-79" was provided by Anatolia Agricultural Research Institute, Eskişehir. "İkizce", "Demir-2000" and "Gün-91" were kindly provided by Central Research Institute for Agricultural Research, Ankara. "Population-1" (Haccağız Village, Seben/Bolu) and "Population-2" (Kavaklı Yazı Village, Seben/Bolu) were kindly provided by Bolu Quality and Feed Industry Corporation. Totally 6 different wheat genotypes were counted (100 pieces of seeds) and put into beaker (250 ml) separately. Seeds were surface-sterilized in 150 ml of 5% sodium hypochlorite (NaClO) for 15 min and thoroughly rinsed 4-5 times in distilled water. Ten sterilized seeds are placed between the sterile filter papers placed in the petri plates of 10 ml distilled water for control, 10 ml -0.0 MPa., -0.5 MPa. or -1.0 MPa. PEG 600 for drought stress, and 10 ml of 50 mM ve 100 mM NaCl for salt stress were put on petri plates. The pH of each concentration was adjusted to pH 5.8 and germinated at 22 ± 2 °C in a dark growth room and, then, transferred into a enlightened room. Five replicate petri dishes were prepared for each group (5 petri × 10 seeds). Paraffin wrapped around the petri dishes to prevent the solution from evaporating. All petri dishes were kept at 22 ± 2 °C in the dark room for 4 days in darkness and in a growth room with a 16 h photoperiod following 6 days. After 10 days from sowing, antioxidant activities of seedlings were measured under control (distilled water), drought (-0.5 MPa. PEG 600), and salt stress (50 mM NaCl). Seedlings were liquid nitrogen dried and powdered in a porcelain mortar. One g of powdered plant material was transferred to a glass

test tube containing 10 ml of 80% methanol (MeOH) for 18 h at 35 °C in an agitated hot water bath for extraction. Then, the test tubes were centrifuged at 5000 rpm for 10 min. The supernatant was filtrated by 0.45 µm pore size Whatman syringe filter. Antioxidant activities of these extracts were assessed using selected bioassays; radical scavenging activity (DPPH), total phenolic content (Folin-Ciocalteu method) and total flavonoid content (aluminum chloride colorimetric method). Statistically significant differences for antioxidant activities of wheats were recorded ($p < 0.05$). The highest total phenolic content (31.23 ± 1.81 mg GAE/g) and total flavonoid (84.00 ± 6.01 mg QE/g) contents were in Gerek-79 and Demir-2000 under salt stress, respectively. When free radical scavenging antioxidant activities were compared, Demir-2000 had the lowest IC₅₀ values (13.98 ± 0.25 mg/L) under salt stress among all entries. The highest antioxidant activity of Demir-2000 under salt stress demonstrated that antioxidant defense system of that was more effective than other available wheat cultivars. Keywords: Antioxidant activity, total fenolic content, drought stress, salt stress, Demir-2000

EFFECT OF SALT AND PH STRESS ON BIOACTIVE METABOLITE PRODUCTION IN GEITLERINEMA CAROTINOSUM

TÜNAY KARAN¹, RAMAZAN ERENLER¹

ABSTRACT

Cyanobacterial metabolites are natural products that have an important features in pharmaceutical and medicinal industries. In this study, the presence of the secondary metabolite norharmane in the indole structure was determined in *Geitlerinema carotinosum* isolated from Tokat Yeşilirmak River and its production in salt stress and pH stress was investigated. In salt stress, cyanobacterium was cultured for two weeks by adding NaCl to BG11 medium in erlenmeyers of 0.5, 1.0, 3.0, 5.0 M. pH conditions were executed at 5 and 9. Norharmane amount was determined by HPLC using C18 reverse phase column at a temperature of 40 °C and a flow rate of 1 ml/min. The amount of norharman metabolite ($\mu\text{g/g}$) was calculated according to the Gauss method by drawing a calibration curve over the absorbance value of the standard 247 nm wavelength. According to the analysis results, metabolite production was 0.612, 1.299, 0.011 at 0.5 M, 1.0 M, 3.0 M respectively. At 5 M, there was no norharmane production. The norharmane production is higher at pH 5 (1.293 $\mu\text{g/g}$) than that of the pH 9 (0.448 $\mu\text{g/g}$).

EFFECTS OF PHYTOESTROGEN SUPPLEMENTATION ON OBESITY AND TYPE II DIABETES

MÜBERA ÇİL¹, GÜLİZER ÇELİK¹, BÜŞRA GÖZ¹, EZGİ TOPTAŞ BIYIKLI¹, ALI EMRAH BIYIKLI¹, ELMAS ERSÖZ¹

ABSTRACT

Obesity and type II diabetes is one of the increasing health issue all over the world. In addition to eating habits, living style, age, sex and social economic conditions are also effective for these diseases to occur. Diet is one of the important factor for preventing these diseases. Phytoestrogen is effective against obesity and diabetes, according to the studies made. Phytoestrogens act like estrogen hormone with binding estrogen receptors. They decrease the activity of the lipase of lipoprotein which regulates the lipid intake from the adipocytes and inhibit the lipogenesis. Due to their estrogenic activities, they regulate the lipid and carbohydrates homeostasis. OBJECTIVE: The aim of this study is to investigate, phytoestrogen supplementation's effects on serum lipid levels and body composition which are obesity parameters and glycemic control and insulin levels which are diabetes parameter. METHOD: By literature research, a review on the phytoestrogen supplementation's effects on obesity and diabetes is made. RESULTS: At the studies made, phytoestrogen supplementation for over weighted and obese persons have positive effects on, body weight, waist circumference, body fat weight, body weight without fat, blood lipids, leptin levels, adiponectin levels, C-reactive protein (CRP), fasting glucose, fasting insulin levels, insulin resistance, insulin sensitiveness and blood pressure. Phytoestrogen supplementation on people with type II diabetes shows that, phytoestrogen has positive effects on fasting glucose, fasting insulin, insulin resistance, insulin sensitiveness, blood lipid levels, HbA1c, homocysteine, leptin, adiponectin, CRP levels and blood pressure. Suitable supplementation amount shows variety for each study, therefore it is not clear. CONCLUSION: With the changing life conditions, obesity and diabetes incidence has shown an increase at the populations. In order to prevent these diseases, diet has an important role. Phytoestrogen supplementation decreases body weight, body fat weight (FM), blood lipids, leptin levels, fasting glucose, insulin levels, CRP and HbA1c, and increases body weight without fat (FFM), insulin sensitivity and adiponectin. Therefore it is thought that, it can help to prevent obesity and diabetes.

DETERMINATION OF FATTY ACID COMPOSITION BY GC-MS IN THE SEEDS OF PALIURUS SPINA CHRISTI MILLER

ELİFE KAYA¹, GÖKHAN CEYHAN¹, PERİHAN AKBAŞ²

ABSTRACT

In this study, *Paliurus spina christi* Miller plant was collected from the 10th km of the roads of Kahramanmaraş Kazma vineyard. *Paliurus spina christi* Miller is a member of Rhamnaceae family, the plant can be grown in most parts of Turkey, deciduous in winter, the flowers are yellow, the fruits are circle; flat, winged, is a seed plant. It is seen as a thorny hedge of two to three meters in height, which grows in almost all parts of Anatolia. *Paliurus spina christi* Miller with various medicinal uses among the people, it is important in terms of contained substances. Studies have shown that the fruit of plant has been used for antiinflammatory, treatment of rheumatoid arthritis, as a diuretic and tonic in traditional medicine for many years. In this study, *Paliurus spina-christi* Miller plant seeds were extracted, later it's oil rate and fatty acid composition were determined using GC-MS instrument. In order to perform fatty acid analysis, first fatty acid methyl esters were formed. Then, gas chromatography method was employed using a FID detector. Seed oil rate was found to be (%17.15). *Paliurus spina christi* Miller plant in the seed were detected fatty acid total of 27 components. The most important of these components were Oleic acid (%44.965), Linoleic acid (%39.868), Palmitic acid (%7.538) and Elaidic acid (%3).

INVESTIGATION OF PHENOLIC CONSTITUENTS IN SOME SALVIA L. (LAMIACEAE) SPECIES BY RP-HPLC-DAD

HÜSEYİN ŞAHİN¹, ERSAN BEKTAŞ¹, KAAN KALTALIOĞLU¹

ABSTRACT

The genus *Salvia* with about 900 species, is one of the most widespread members of the Lamiaceae family (Karatoprak et al. 2016). *Salvia* L. (Lamiaceae) species are used for culinary and therapeutic purposes. They possess hypoglycemic, spasmolytic, stomachic, estrogenic choleric, antioxidant, antiproliferative, anti-inflammatory and gastroprotective properties (Gird et al. 2014). The aim was to investigate the phenolic contents of *Salvia divaricata*, *Salvia euphratica*, *Salvia hypargeia* collected from Erzincan, Turkey. Phenolic constituents were analyzed by using RP-HPLC-DAD (reverse phase-high performance liquid chromatography with a diode array detector). These analyses were achieved on Thermo Scientific Dionex Ultimate™ 3000 system (Thermo Scientific, Bremen, Germany). Chromatographic separation was carried out on a Thermo Scientific™ Hypersil™ ODS C18 HPLC (250 mm × 4.6 mm × 5 µm) column (Thermo Scientific, USA) at temperature 30°C using a mobile phase, consisting of 2 % (v/v) acetic acid in water (A), 70% (v/v) acetonitrile in water (B) at a flow rate 1.2 mL/min, under gradient elution conditions. The gradient used was as follows: zero-time condition was 5% B and it was increased to 60% B in 26 minutes. The eluted 10 standard phenolic acids: gallic, protocatechuic, p-hydroxybenzoic, chlorogenic, vanillic, caffeic, syringic, p-coumaric, rosmarinic, benzoic, and two flavonoids: rutin, quercetin were monitored by comparison at 280 and 315 nm. In the three samples, analyzed phenolics were found to be total ranging from 40.358-65.988 mg phenolic/g extract. Gallic acid was not detected in all samples, but other phenolics were found with different quantitative amounts. Especially rosmarinic acid was the major with 32.005-51.534 mg phenolic/g extract. According to the amount of analyzed standards, *S. hypargeia* was the strongest. Also, it was evaluated by nearly same potential for other species. These results were the evidence that in vivo metabolic system could be regenerated by consuming of these plants.

DETERMINATION OF PHENOLIC COMPOUNDS IN FOUR ENDEMIC TANACETUM L. (ASTERACEAE) SPECIES BY RP-HPLC-DAD

HÜSEYİN ŞAHİN¹, KAAN KALTALIOĞLU¹, ERSAN BEKTAŞ¹

ABSTRACT

Tanacetum is genus of about 160 species of flowering plants in the Asterea family, generally consumed as tea (Stojkovic et al., 2014). The benefits of its consumption may extend throughout the body and also known to show some bioactive properties as antitumor, anti-inflammatory, antioxidant, antimicrobial. Phenolic compounds are majorly responsible for these activities (Lahlou et al., 2008). This study was designed to determine the phenolic constituents within four endemic plants of Tanacetum genus (Tanacetum heterotomum, Tanacetum eginense, Tanacetum alyssifolium, Tanacetum argenteum) collected by using RP-HPLC-DAD (reverse phase-high performance liquid chromatography with a diode array detector) from Erzincan, Turkey. LC analyses were performed on Thermo Scientific Dionex Ultimate™ 3000 system (Thermo Scientific, Bremen, Germany). Chromatographic separation was carried out on a Thermo Scientific™ Hypersil™ ODS C18 HPLC (250 mm × 4.6 mm x 5 µm) column (Thermo Scientific, USA) at temperature 30°C using a mobile phase, consisting of 2 % (v/v) acetic acid in water (A), 70% (v/v) acetonitrile in water (B) at a flow rate 1.2 mL/min, under gradient elution conditions. The gradient used was as follows: zero-time condition was 5% B and it was increased to 60% B in 26 minutes. The eluted 10 standard phenolic acids: gallic, protocatechuic, p-hydroxybenzoic, chlorogenic, vanillic, caffeic, syringic, p-coumaric, rosmarinic, benzoic, and two flavonoids: rutin, quercetin were monitored by comparison at 280 and 315 nm. In the four samples, analyzed phenolic concentrations were found to be total ranging from 13.411-20.323 mg phenolic/g extract. When comparing initial situation of dry samples, the range results could be seen as 0.190-0.872 mg phenolic/g dry sample. Protocatechuic acid, p-hydroxybenzoic acid, chlorogenic acid, caffeic acid, syringic acid, p-coumaric acid, rosmarinic acid and quercetin were detected in all samples with different quantitative amounts. According to the analyzed standards, quercetin was the major phenolic especially in T. argenteum with 10.239 mg phenolic/g extract.

PROSTATE CANCER AND PHYTOESTROGEN

MÜBERA ÇİL¹, BÜŞRA GÖZ¹, GÜLİZER ÇELİK¹, EZGİ TOPTAŞ BIYIKLI¹, ELMAS ERSÖZ¹, ALI EMRAH BIYIKLI¹

ABSTRACT

Prostate cancer has the second place for the male person's death reasons related with the cancer category. Genetic structure, diet and environmental factors influences the prostate cancer risks. Diets rich with isoflavone, decreases the risk of prostate cancer. Phytoestrogens which are chemicals made from herbs, can repression, enzymes like aromatase which is at steroid metabolism and 17-hydroxy steroid dehydrogenase and other anti-carcinogenic effects could help prevent prostate cancer. In addition to phytoestrogens estrogenic properties, it has antioxidant properties related with its isoflavone polyphenolic structure. Isoflavones have effect on free radicals directly or effects with antioxidant enzymes and prevent oxidative DNA damage. **OBJECTIVE:** In this study, the effects of phytoestrogens on prostate cancer is investigated through literature research. **METHOD:** Recent studies have been investigated, and effects of phytoestrogen intake on prostate cancer risks and phytoestrogen intake's effects on cancer patients. **RESULTS:** On healthy persons, phytoestrogen intake as supplementation has a positive effect on preventing prostate cancer risks. On the people who once prostate cancer, uses phytoestrogen after the treatment and prevent the prostate cancer to occur again. On some studies it is shown that, patients with prostate cancer, phytoestrogen supplementation has a chemical prevention on the cancer to grow. On the other hand, some studies show that, phytoestrogen has no effect on prostate cancer. **CONCLUSION:** Prostate cancer is of the important health issue on the male persons. In a nut shell, in order to prevent prostate cancer, to slow down the prostate cancer and prevent the cancer to occur again after the treatment, phytoestrogens have an important role. Effects of phytoestrogen intake on prostate cancer should be investigated more for more clear results.

THE USAGE OF FLAXSEED FLOUR IN THE PRODUCTION OF BISCUIT AND THE IDENTIFICATION OF SOME CHARACTERISTICS

AYŞENUR DOĞMUŞ¹, İLYAS ÇELİK¹

ABSTRACT

In recent years, consumers begin to consider the food not only as a way of essential nourishment but also as important substances that has use full effects on health. The flaxseed, that is rich in terms of a-linolenic acid and protein of good quality, is the natural resource of phyto chemicals such as flavonoid, lignan and phenolic acids. Moreover, the flaxseed contains some fatty acids like omega -3 and omega- 6 and by means of these acids, it is effectively used in preventing some illnesses such as cancer and cardiovascular disease. In general, the flaxseed is classified as functional food, bioactive food and endocrine active food. In this study, it was aimed that the biscuits which commonly consumed in daily life, would gain the functional properties of flax flour by substitution of it at certain rates (control, 10%, 20%, 40%). As the amount of supplement increases, some changes are observed: decrease in specific volume rates, decrease in 'L' colour rates (lightness-darkness), rise of 'a' (red) rate, decrease of 'b' (yellow) rate. In texture analysis, the biscuit with flaxseed flour of 40% is the most stiff one. Even though we have obtained insignificant results in sensory analysis, panelist evaluation and all parameters in terms of statistical; when other results are taken into consideration it is concluded that the flaxseed flour can be used with the percentage of 20 in the formulation of biscuit.

THE EFFECTS OF SOME ESSENTIAL OILS ON RICE WEEVIL (SITOPHILUS ORYZAE L. COLEOPTERA: CURCULIONIDAE)

İSLAM SARUHAN¹, İSMAIL ERPER¹, ŐEYMA TOKSÖZ¹, CELAL TUNCER¹, İZZET AKÇA¹

ABSTRACT

Rice weevil (*Sitophilus oryzae* L. Coleoptera: Curculionidae), considered to be one of the most dangerous insects in stored product pests, is a pest commonly seen worldwide. The amount of insect damage in stored grains is around 10-40% in countries where modern storage techniques are applied. Different control methods against stored product pests have been implemented, including the use of certain essential oils and successful results were achieved. In this study, fumigant and repellent effects of commercially available essential oils of mint (*Mentha piperita*), thyme (*Thymus vulgaris*), laurel (*Laurel nobilis*), rosemary (*Rosmarinus officinalis*), myrtle (*Myrtus communis*) and lavender (*Lavandula angustifolia*) on adult *S. oryzae* were investigated. Accordingly, 100, 150 and 200 µl/l doses of six different essential oils were used. To determine the fumigant effects in the study, 10 g rice were placed in plastic tubes (100 ml) with filter paper impregnated with essential oil on their caps and 10 rice weevils were placed in each tube. For the determination of repellent effects, 1 kg plastic containers (25x15x10 cm) were used. Accordingly, 10 g rice coated with 200 µl/l essential oil was placed on one side of each container while the same amount of uncoated rice was placed on the other side. Then 10 rice weevils were placed in the middle of the container. In both effect trials, containers were placed in incubators at 22 ± 2 °C and 60-70% humidity. The trials were carried out in a completely randomized design with four replicates. The results revealed that there were significant differences in terms of the effects and doses of the essential oils used on rice weevils (P<0.05). All essential oils used against rice weevils had the highest fumigant effect at 200 µl/l dose and at the 72th hour. It was also found that the most effective essential oils were mint (97.5%) and laurel (95.0%). They were followed by rosemary (87.5%), myrtle (85.0%), thyme (85.0%) and lavender (72.5%) essential oils. In the repellent effect studies, 100% repellent effect was observed in lavender, laurel and rosemary at the dose of 200 µl/l at 48 hours while 90% repellent effect was observed in myrtle and thyme. Mint showed 25% repellent effect and, on the contrary to other essential oils, its attractant effect was more evident. In conclusion, all of the essential oils used in the study showed a fumigant effect over 70% and they can be used in the control against *S. oryzae*. It was determined that other essential oils have repellent effects except for mint essential oil.

GLUTEN-FREE DIETS AND USE OF QUINOA

BERAT DEMİR¹, MEHMET ŞAHİN¹, AYSUN GÖÇMEN AKÇACIK¹, SEYDİ AYDOĞAN¹, SÜMEYRA HAMZAOĞLU¹

ABSTRACT

Grain based nutrition has an important place in human life. Many types of cereals are presented for consumption by subjecting them to different technological processes in different formulations. However, there are some diseases that affect the quality of life in individuals by impairing the equilibrium of absorption in the digestive system with the slightest contamination. One of them is celiac. The sensitivity of the intestinal mucosa to the gluten protein found in cereals is the basis of the disease. Therefore, it is necessary to remove grains from the diet of such individuals that causes allergies such as wheat, barley and rye which have the lower fraction of gluten protein prolamin and gliadin fraction. For this reason gluten-free rice, soy, amarant and buckwheat is widely used in the production of these kind of foods. Quinoa is also rich in essential amino acids that do not contain gluten and have high protein and fiber content. The quinoa made into flour is used in gluten-free bread and macaroni, used in rice as seeds and salad by germination and also used in baby foods composition.

RESVERATROL, A POLYPHENOLIC COMPOUND FOUND IN GRAPES, INHIBITS THE VIABILITY OF PANCREATIC INS-1B INSULINOMA CELLS

SEFA ÇELİK¹, BARIŞ BAYSAL¹

ABSTRACT

Pancreas is an endocrine organ behind the stomach. The most important of its functions is to synthesize the hormone insulin which controls the level of sugar in the bloodstream. When blood sugar is too low, the pancreas stops producing insulin. When an insulinoma occurs in the pancreas, it continues to produce insulin even if blood sugar is very low. This can cause severe hypoglycemia. Hypoglycemia is a dangerous condition that causes blurred vision, dizziness and loss of consciousness. It can also be life-threatening. Pancreatic cancer (PCa), the fourth most common cause of cancer-related deaths, is 6 months shorter in survival and has a 5-year survival rate of <6%. The most important feature of pancreatic cancer is short duration of survival and treatment resistance. The poor prognosis of PCA is related to lymph node and liver metastases and peritoneal spread. Resveratrol, found in many different plants and fruits especially grapes, is a natural phytoalexin. Resveratrol is especially found in red grapes, peanuts and pineapple in high concentrations. Over the past few years, many reports have shown resveratrol as a cancer-inhibiting agent. For this reason, resveratrol has attracted much attention. In different studies, resveratrol has been shown to inhibit cancer, and it has been shown that this compound has the ability to inhibit all phases of carcinogenesis: initiation, promotion and progression. Moreover, resveratrol has been shown to induce growth inhibition, cell cycle arrest, apoptosis and changes in biomarker expression in various human cancer cell lines. In this study, the effect of a polyphenolic compound, resveratrol, on the survival of pancreatic cancer cells was aimed. Rat insulinoma INS1-beta cell line was used for his purpose. After reaching the appropriate number of cells culture operations by cell culture, resveratrol (80 µM, 48h) application have been made. After incubations analyses were done for detecting the viability of the cells. We observed that resveratrol significantly decreased ($p<0.05$) cell viability through the 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT). Furthermore, with the comet test, it was found that DNA strand breaks in insulinoma cells are increased by resveratrol, although not statistically significant. Based on these data, it can be said that resveratrol may be used as a potential anti-cancer agent in the treatment of pancreatic cancer.

KEYWORDS

Resveratrol, pancreas cancer, INS1-β cell, viability

**DETERMINATION OF ANTIMICROBIAL ACTIVITY, TOTAL
PHENOLIC CONTENT AND ANTIOXIDANT ACTIVITY OF
METHANOL EXTRACTS OF NARCISSUS SPECIES COLLECTED
FROM İZMİR KARABURUN**

YASEMIN SUNUCU KARAFAKIOGLU¹, ELIF KORCAN², İBRAHİM BULDUK³, RUKİYE KAYHAN²

ABSTRACT

In today's developed and developing countries, diseases and deaths due to infection are increasing day by day. According to the research conducted in the United States, in 1981, while deaths due to infection were in the 5th rank, while in 1992 it reached the 3rd rank with an increase of 58%. This situation necessitated the development of new strategies in the prevention and treatment of infectious diseases. The search for new antimicrobial and antioxidant substances from natural sources is at the forefront of these strategies. There are 1100 species of Amaryllidaceae. Their most common species is Narcissus genus. It is grown in Karaburun and Mordođan in Aegean Region in Turkey. Narcissus sp. collected from İzmir Karaburun was used in this study. Its bulbs was extracted with methanol in ultrasonic water bath. Antimicrobial effect was investigated by disc diffusion method. In the result of the study, it was determined that E.coli fecalis ATCC 51289, Bacillus subtilus and E. coli 33219 from the strains tested in the bulbs shell methanol extract, and its internal bulbs methanol extract showed antimicrobial activity against E. faecalis ATCC 51289 and Bacillus subtilus. Total amount of phenolic substances were determined in the bulbs and shell of Narcissus sp. as 0,5208 and 0,0828 mgGAE/g sample, respectively. "Scavenging" radical capacity of samples was determined using DPPH radical according to the method of Hatano et al. The results are in the shells; 0,1666 mg/g; in the bulbs; 0,1557 mg/g. Furthermore, it has been determined that the bulbs methanol extract has more antimicrobial activity than the root methanol extracts. When the total amount of phenolic substances is taken into account, it is observed that the plants taken from the bulb are higher than those taken from the crust. DPPH method, one of antioxidant activity determination methods, also found that our shell samples had higher antioxidant activity compared to onion samples.

DETERMINATION OF UTILIZATION POSSIBILITIES FROM CISTUS (CISTUS L.) SPECIES SHOWN NATURAL DISTRIBUTION IN ANTALYA REGION

MUSTAFA TÜRK¹, ABDULLAH YÜKSEL¹

ABSTRACT

Cistaceae (Ladengiller) family, which is evaluated in non-wood forest products, is represented by 8 species and 175 types distributed in the temperate regions of the Northern Hemisphere and especially in the Mediterranean climate. As an important medicinal and aromatic plant, Cistus (Cistus L.) is spreading as 21 types around the World and 5 types in Turkey (C. creticus L., C. parviflorus Lam., C. laurifolius L., C. salviifolius L., C. monspeliensis L.). Cistus creticus and Cistus salviifolius species are spread in the province of Antalya. In pharmacological studies to investigate the effects of the cistus strain on human health; Antifungal, anti-inflammatory, antiulcer, antiviral, antioxidant, cytotoxic, wound healing, vasodilator, antispasmodic, hypotensive activity, blood circulation regulating and analgesic effects depending on the group of substances contained in the various extracts of the plant. Therefore, cistus can be determined as a medical aromatic plant. In recent years, it has been observed that the production of drugs, especially against infectious diseases, has begun by the active ingredients obtained from Cistus species. In Antalya, located in the Western Mediterranean Region, which is quite rich in terms of non-wood forest products, cistus plant species have a wide spread. It has been observed that it is the pioneering species that grows after the fire of forest, preferring dry and rocky soils as the growing environment. Within the scope of this study, Cistus L. species, which is also known as Laden and Karagan, which are spreading in parts of Antalya province, are specified and it is aimed to introduce the potential utilization amount and usage areas in Antalya region.

THE EFFECTS OF LYCIUM BARBARUM (GOJI BERRY) POLYSACCHARIDES ON ANTIOXIDANT ENZYMES IN OVARIECTOMIZED RATS

FATMA PEHLİVAN KARAKAŞ¹, HAMİT ÇOŞKUN¹, HAYRIYE ORALLAR¹, BIHTER GÖKÇE BOZAT¹

ABSTRACT

The Effects of Lycium barbarum (Goji berry) Polysaccharides on Antioxidant Enzymes in Ovariectomized Rats Lycium barbarum (Kurt üzümü) Polisakkaritlerinin Ovarektomili Sıçanlarda Antioksidan Enzimler Üzerine Olan Etkileri Fatma PEHLİVAN KARAKAŞ^{1,2}, Hamit COŞKUN³, Hayriye ORALLAR⁴, Bihter Gökçe BOZAT¹ 1Abant İzzet Baysal University, Department of Biology, Faculty of Science and Art, Bolu, Turkey 2Abant İzzet Baysal University, Department of Field Crops, Faculty of Agriculture and Natural Sciences, Bolu, Turkey 3Abant İzzet Baysal University, Department of Psychology, Faculty of Science and Art, Bolu, Turkey 4Abant İzzet Baysal University, Department of Poultry Breeding, Faculty of Agriculture and Natural Sciences, Bolu, Turkey Email: fatmapehlivanarakas@gmail.com Abstract Ovariectomy has been used to clarify insufficiency of estrogen hormone and its metabolic results to rodents during menopause transition. A decrease in ovarian hormones results in increasing production of reactive oxygen radicals and thus increased oxidative stress induces tissue or cell damages. During the menopause, reduction in estrogen hormone level is associated with elevated oxidative stress, which occurs due to an instability between production and elimination of reactive oxygen species (ROS) via the antioxidant defense system. In previous studies, goji berry was one of the powerful antioxidants. The goji berry (Lycium barbarum Linnaeus) is also known as, wolfberry, super fruit, and has many beneficial effects for human because of these dietary constituents such as flavonoids, phenolics, vitamins and caretonoids. L. barbarum have also their major components, which are polysaccharides. The L. barbarum polysaccharides (LBPs) are a complex mixture of highly branched polysaccharides and proteoglycans. Several animal studies indicate that LBP has in ocular neuroprotective, antioxidant, immunomodulatory, hepatic protective and antitumor effects in animals. The antioxidant activities of LBPs are mainly connected to the amelioration of the activities of antioxidant enzymes, such as superoxide dismutase (SOD), catalase (CAT), glutathione peroxidase (GPX) but it also could diminish their malondialdehyde (MDA) content. Because the antioxidant effects of goji berry, we investigate the effects of the Lycium barbarum L. polysaccharides (LBP) on antioxidant enzymes activities of ovariectomized female rats. Two weeks after ovariectomy operations, rats were divided into treatment groups: distile water (3 mL/kg, oral gavage, per day), low dose of LBP (20 mg/kg, 3 mL/kg, oral gavage, per day), high dose of LBP (200 mg/kg, 3 mL/kg, oral gavage, per day), 17 beta estradiol (1 mg/kg, 3 mL/kg, oral gavage, per day), each treatment groups were divided two operation groups: sham (pseudo ovariectomized rat) and overiectomized (ovx) rat groups. The treatments were applied for 30 consecutive days and then serum of all rats were collected. Biochemical (SOD, CAT, GPX and MDA) analysis of the samples were performed by Elisa. The findings of biochemical study showed that serum of the high dose of

¹ABANT İZZET BAYSAL ÜNİVERSİTESİ

LBP administrated rats showed highest level of SOD, lowest level of MDA. 17- β estradiol administrated groups showed lowest GPX and CAT serum levels. In conclusion, high dose of LBP treatments increases antioxidant enzymes activities in ovariectomized female rats. Keywords: Goji berry, Antioxidant enzymes, SOD, CAT, GPX, MDA Acknowledgement: This work was supported by grants from the Abant Izzet Baysal University Research Foundation (Project No: 2016.10.07.956).

THE EFFECT OF CAFFEIC ACID PHENETHYL ESTER (CAPE), AN ACTIVE COMPONENT ISOLATED FROM HONEYBEE PROPOLIS, ON INDUCING APOPTOSIS IN PANCREATIC INSULINOMA INS1-B CELLS

SEFA ÇELİK¹, AHMET KAHRAMAN¹, ÖMER HAZMAN², SERKAN ŞEN³

ABSTRACT

Caffeic acid phenethyl ester (CAPE), an active component of propolis, has many biological and pharmacological properties such as antitumoral, antiinflammatory, antineoplastic and antioxidant activities. CAPE has a higher hydrophobicity and potent inhibitory potency against xanthine oxidase (XO) and inhibits enzymatic activity by binding to the molybdoprotein region of the active site. Since XO has the action of both purine and pyrimidine bases to metabolize, by this inhibition mechanism. CAPE can stop the nucleotide turnover recovery pathway, which shows anticancer activity in all cell types. It is recommended to use it in the treatment of gout and hyperuricemia due to XO inhibitory effect. The aim of this study was to investigate the mechanism of CAPE-induced apoptosis in rat pancreatic insulinoma cells INS1- β . For this aim, the levels of p53 and CAS-12 mRNA expressions in pancreatic insulinoma cells analysed by real time quantitative polymerase chain reaction (QRT-PCR), and the level of insülin both in cell lysate and medium were analysed by ELISA technique, and also DNA fragmentation analyse was done via comet assay. It was found that CAPE induced characteristic DNA fragmentation and mRNA expression levels of caspase-12 and p53. Addition to these results, CAPE reduced the levels of insülin both in cell lysate and medium. These results suggest that CAPE is a potent apoptosis-inducing agent; its action is accompanied by up-regulation of Cas-12 and p53 in pancreatic insulinoma INS1- β cells. In view of the above-mentioned mechanisms and findings in our laboratory and those of others in literature, we suggest that CAPE possess anti cancer and apoptosis inducing activities. If it is going to be used as an anti-cancer agent, further investigations of the potential toxicities of CAPE are needed.

DETERMINATION OF TOTAL PHENOLIC AND ANTIMICROBIAL ACTIVITY IN ERODIUM LACINIATUM (COV.) WILLD COLLECTED FROM THE ADANA

YASEMİN SUNUCU KARAFAKIOĞLU¹, İBRAHİM BULDUK², ELİF KORCAN³, MERAL ÖZTÜRK³, HAVVA KÖLEMEK³, AHMET KAHRAMAN⁴

ABSTRACT

Considering the number of Erodium species registered in Turkey, there are a total of 30 taxa with 25 species and subspecies, and 16 units of these taxa are endemic. Literature surveys revealed that there is no report regarding The Phenolic Compound analyses and antimicrobial activity information of this species. In this study, total phenolic content and antimicrobial activity of Erodium laciniatum (Cov.) Willd were studied. The total amount of phenolic substance in the extracts was determined according to Folin Ciocalteu method. The agar disc diffusion method was used to determination of antimicrobial activities of the plant extract. The plant extracts exhibited antibacterial activity against the bacteria tested as concentration dependent. The extracts, however, did not show any antifungal activity. It was found that the methanol extract of Erodium laciniatum possess antimicrobial activity against Escherichia coli ATCC35218, Klebsiella pneumoniae ATCC700603, Bacillus subtilis, Staphylococcus aureus ATCC25923 and Enterococcus faecalis . ATCC 51299. Total phenolic content of the methanol extract of Erodium laciniatum was determined as 63,64mg / 1 gr.

EVALUATION OF YIELD AND SOME FOOD INGREDIENTS OF OAT(AVENA SATIVA SPP.) VARIETIES GROWN IN KONYA REGION

MEHMET ŞAHİN¹, SAİT ÇERİ¹, AYSUN GÖÇMEN AKÇACIK¹, SEYDİ AYDOĞAN¹, SÜMEYRA HAMZAOĞLU¹, BERAT DEMİR¹

ABSTRACT

Oats are a good source of dietary fiber, essential amino acids, fatty acids, minerals and antioxidants, especially beta glucan in human nutrition. In order for the oats to take more place in human nutrition, it is important that more efficient and quality oat varieties are brought to the industry. In this study, 11 winter oat genotypes(Çekota, Faikbey, Seydişehir, Fetih, Haskara, Kahraman, Kırklar, Sarı, Sebat, Yeniçeri ve Şems) were used. Genotypes were examined in terms of yield and 8 different quality traits. Average values of examined traits were as;Yield 336.8 kg/da, Thousand kernel weight 30.6 g, hectoliter weight 43.3 kg, protein content 14.4%, oil content 5.1% , cellulose 13.0%, ADF 16.5 % , NDF 31.4 % . The changes in nutritional habits in the world and the increase in obesity have started to be effective in our country in recent years. The importance of adequate and balanced nutrition is increasing day by day. Because of the content of beta glucan and other digestible dietary fiber in the oat, diet and breakfast products are increasingly used. Demand is increasing with the increasing use of oats. The breeding work should be continued and new varieties should be presented to the market for the development of oat varieties with this traits and the traits desired by the industrialists. Breeding studies for the development of oat varieties should be continued and new varieties should be presented to the market with the characteristics desired by the industrialists.

EVALUATION OF LANDRACE WHEAT GENOTYPES IN TERMS OF BISCUIT QUALITY QUALITIES

MEHMET ŞAHİN¹, SEYDI AYDOĞAN¹, AYSUN GÖÇMEN AKÇACIK¹, MELTEM YAŞAR¹

ABSTRACT

This study was carried out to determine chemical properties and mixograph quality parameters of suitable genotypes in terms of biscuit quality of the landrace population within the scope of 214O051 Tubitak project with 200 genotypes and 5 standard varieties according to augmented trial design in the center location of Konya in Bahri Dağdaş International Agricultural Research Institute.; Obtained parameters in the study changed between; Protein content 10.79-13.57%, Zeleny sedimentation value 11.82-65.82 ml, hardness value (SKC) 11.59-86.70, solvent water retention capacity 43.99-82.69%, mixograph parameters (development time 0.92-4.13 min, peak height 49.68-95.90, softening degree 6.18-32.80, peak width 2.05-13.33%, peak area 31.25-148.6 Nm and total area 240.40-512.60 Nm. As a result of the statistical analyzes significant differences were found between the varieties.
