The effects of lyophilized rosehip powder addition on the physicochemical and microbiological properties of fermented sucuk were investigated. Experimental sucuks were manufactured with added 5, 10, 15, 20 and 25% lyophilized rosehip powder and the control group did not contain rosehip powder. Changes in pH, moisture, protein, fat, ash, color parameters (L^* , a^* , b^*), oxidation level and microbiological properties of the sucuks were determined during fermentation and storage period. The results indicated that TBARS values gradually increased during fermentation and storage period in all treatment groups ($p < 0.05$). However, addition of more than 15% rosehip powder decreased TBARS values compared to control group ($p < 0.05$) during fermentation and storage period. pH values of sucuks were decreased with addition of rosehip and control group had highest pH values at the end of fermentation ($p < 0.05$). The addition of rosehip showed non-significant effects on moisture, protein, fat and ash levels in batters. Similar to TBARS values, addition of more than 15% rosehip powder increased L^* and a^* values compared to control group sucuk ($P < 0.05$). Total viable aerobic counts and lactic acid bacteria count for control groups had higher than other groups after fermentation period ($P < 0.05$). The use of β -glucan affected lactic acid bacteria counts and fermentation process in positive manner ($p < 0.05$). And, the addition of rosehip did not affect yeast, mold and coliform counts during fermentation. The results indicated that the use of rosehip powder in sucuk manufacture had no negative effects on quality parameters of sucuk.

THE KNOWLEDGE AND ATTITUDES OF NURSING STUDENTS TOWARDS MEDICAL AND AROMATIC PLANTS

DİLEK ÇİLİNGİR¹, ENES BULUT¹, CEYDA UZUN ŞAHİN², GÜL ÇAKIR¹, PERİHAN ŞİMŞEK¹

ABSTRACT

Medical and aromatic plants are often used with the aim of maintaining health. The use of these plants is influenced by the knowledge level and attitudes of the nurses to the plants. So, the knowledge level and attitudes of nursing students who will practice nursing profession in later years are important. The study was conducted to determine the knowledge and attitudes of nursing students towards medical and aromatic plants. The research was carried out with the participation of 212 students who have been educated in the department of Nursing in Health Sciences Faculty in Karadeniz Technical University. The data were gathered using data collection form designed by researchers. The data collection form consists of two parts. In the first part, there are questions that examine the sociodemographic characteristics of participants such as age, gender, marital status and the place of living with their family. In the second part, there are questions that examine the information of participants to medical and aromatic plants. For the assessment of the data, means, percentages and chi-square test were used. Average age of students participating in the survey was 20.43 ± 1.51 . 63% of attendees were studying in the second grade, 84% were female, 99.1% were single and 50% lived in the city center with their family. Of participants, 22.6% had information about medical and aromatic plants and it was found that 68.8% of these students obtained information by internet and television. It was found that there was no difference between the obtain information status of male students and female students ($p > 0.05$). 70.8% of participants stated that the lessons related to medical and aromatic plants should be in nursing curriculum. Also, 69.3% of students stated that it is necessary that these plants should be used in nursing practices. It was determined that the knowledge level of big part of students (63.7%) was insufficient. Medical and aromatic plants most commonly heard by the participants were linden (100%), mint (100%), cummin (99.1%), rosehip (99.1%) and dill (99.1%). Medical and aromatic plants were described as beneficial by 89.6% of participants. Of the students, 86.3% stated that medical and aromatic plants moved the natural healing power of the body and 84.4% stated that these plants effected psychology of human positively. It was determined that 84.4% of the students who participated in study had benefited from medical and aromatic plants and that they most frequently referred to these plants when they were sick. The most used plants were linden (97.2%), mint (88.8%) and rosehip (71.5%). Nursing students stated that their knowledge level about medical and aromatic plants were insufficient. Also big part of students said that lessons related to plants should be integrated in nursing curriculum. This shows that the attitudes of students towards medical and aromatic plants were positive and they wanted to improve themselves in this field. By placing the lessons related to medical and aromatic plants in nursing curriculum, it is possible to increase the knowledge level related to topic of the students.

**STUDIES ON THE SCOLIIDAE (INSECTA: HYMENOPTERA)
SPECIES FED ON MEDICAL AND AROMATIC PLANTS IN TURKEY**

TAMER KUŞAKSIZ¹, SINAN ANLAŞ¹

ABSTRACT

The wasp species belonging to the family Scoliidae (Insecta: Hymenoptera) are known as many parasitoids of agriculture and forest pests ,at the same timeas pollinators of numerous flowering plants. In this study, medical and aromatic plants, which are visited by 18 scoliid species, have been given. These are *Vitex agnus-castus* L., *Rubus canescens* DC., *Echinops orientalis* Trautv., *Lythrum salicaria* L., *Mentha* sp., *Echium plantagineum* L., *Carduus nutans* L., *Teucrium polium* L., *Eryngium billardieri* Delar., *Notobasis syriaca* L., *Capparis ovata* Desf., *Origanum* sp., *Onopordum turcicum* Danin., *Centaurea solstitialis* L., *Coridothymus capitatus* L., *Opopanax hispidus* (Friv.), *Anchusa* sp., *Cardopatum corymbosum* L. Among them, *Vitex agnus-castus* L. is the most preferred plant with 18 species by the scoliid wasps. 12 wasp species were collected from *Rubus canescens* and eight species were collected from both *Lythrum salicaria* and *Mentha* sp.

AN INVESTIGATION ON THE USAGE OF TURMERIC AND GINGER POWDERS IN BISCUIT PRODUCTION

KÜBRA AKTAŞ¹, HACER LEVENT²

ABSTRACT

Biscuit is a popular bakery product consumed all over the world. The popularity of biscuit mainly resulting from its low cost, ready-to eat feature, abundant variety and long shelf life. In recent years, there is an increase in chronic diseases. Due to the health concerns of consumers, there has been a rising trend to foods which have specific features that improve health. Because of its important place in diets biscuit can be supplemented with various components of high nutritional and functional properties. Turmeric (*Curcuma longa*) is a member Zingiberaceae family and it is extensively grown in Asian countries. The parts of plant are traditionally used to enhance the food quality, flavor and antioxidant properties. Turmeric is one of the most investigated medicinal plants. Curcuminoids and essential oils which are major bioactive ingredients of turmeric show different bioactivities in in vitro and in vivo bioassays. Ginger (*Zingiber officinale* Roscoe) belong to the family Zingiberaceae and it has been cultivated in many tropical and subtropical countries. Some polyphenol compounds obtained from ginger roots have a high antioxidant capacity and antiinflammatory effect. For centuries, it has been used an important ingredient as a spice in various industries of food, beverage, and fragrance. In this study, turmeric and ginger powder were used at 0%, 4% and 8% in biscuit formulation. The effect of turmeric and ginger powders on the physical and sensory properties of biscuit were investigated. The usage of turmeric and ginger powder in biscuit formulation decreased ($p<0.05$) the lightness (L^*) values of samples. The highest redness (a^*) and yellowness (b^*) values were obtained in biscuits containing 4% ginger and 8% turmeric, respectively. The diameter, thicknees and spread ratio of biscuit samples were ranged between 57-60 mm, 9.4-9.8 mm and 5.94-6.38, respectively. Usage of ginger effected the sensory properties of biscuit samples especially taste-odor. Characteristic taste of ginger decreased the score of biscuit samples even at 4% replacement ratio. The biscuits prepared with turmeric gained taste-odor, texture, crispness scores closed to control samples even at high usage ratios. According to the overall acceptability rating, it was concluded that biscuit could be produced with satisfactory results by the addition of turmeric powder up to 8% and ginger powder should be used in biscuit formulation at lower ratios.

EFFECTS OF DIFFERENT GREENHOUSE MEDIA, ROOTING MEDIA AND HORMONES ON PROPAGATION BY CUTTING OF EUROPEAN YEW (TAXUS BACCATA L.)

ALI BAYRAKTAR¹, FAHRETTİN ATAR¹, NEBAHAT YILDIRIM¹, İBRAHİM TURNA¹

ABSTRACT

According to the surveys of World Health Organization (WHO), the number of medicinal plants used for medical purposes is around 20.000. These plants are also used for adding taste, odor and color to food since the ancient times. European yew (*Taxus baccata* L.), belonging to Taxaceae family, grows in North and Central Europe, Mediterranean countries, Azores, Turkey and Caucasus. The species has a wide range of uses as medical and aromatic. One of the most important features of European yew is Taxol, which is used in cancer treatments. In addition, its bark and foliage are also utilized in medical fields. It is necessary to have sufficient material for usage in medicine of this species having a great importance in terms of medical and aromatic uses. In this study, the effects of different greenhouse media (Sera-1 media with air temperature of 20°C, rooting table temperature of 20°C and Sera-2 media without temperature adjustment), rooting media (perlite and peat) and hormones (IBA 1000 ppm, IBA 5000 ppm, NAA 1000 ppm and NAA 5000 ppm) were investigated on propagation by cutting of European yew. At the end of the study, the highest rooting percentage occurred as 76,67% in NAA 1000 ppm treatment in perlite rooting media of Sera-1 media. The highest callus percentage was observed as 96.67% in NAA 5000 ppm treatment in peat rooting media of Sera-2 media. The longest root length was determined as 4,60 cm in IBA 1000 ppm in perlite rooting media of Sera-2 media. The highest number of roots was found as 3.30 roots in NAA 1000 ppm treatment in perlite rooting media of Sera-1 media.

HERBAL MEDICINES FOR OSTEOARTHRITIS THERAPY

MUSA ACAR¹

ABSTRACT

Osteoarthritis (OA) is a complex multifactorial disease of whole joint. Pathological loss of cartilage reflects the imbalance between catabolic and anabolic mechanism of cartilage remodeling, which is influenced by oxidative and inflammatory changes in the surrounding tissues especially synovium and subchondral bone. Osteoarthritis is a major cause of disability throughout the world, it causes pain due to inflamed knee joints, which involves progressive degeneration of articular cartilage, synovitis, formation of osteophyte, increased fibrillation due to increased denaturation and loss of collagen fibers. Despite the increased incidence of OA in recent years, therapies are still symptomatic, pain control, functional improvement and quality of life. The most common symptom of OA is pain in the affected joint. Therapeutic interventions conventionally employed for OA include the use of physiotherapy and antidepressant therapies, patient education and weight control. In addition, drug therapy includes non-opioid analgesics such as paracetamol, non-steroidal anti-inflammatory drugs (NSAIDs), topical analgesics, opioid analgesics and intra-articular steroid injection. Such treatments may prove ineffective in some patients and NSAIDs often have serious adverse effects. Gastrointestinal complications are frequently reported. Patients suffering from musculoskeletal problems are likely to be users of herbal treatments. It is therefore important to determine the effectiveness and safety of herbal medicines in the treatment of OA. There is promising evidence of the effect of some herbal preparations on the treatment of osteoarthritis. In addition, herbal preparations have been found to reduce the use of non-steroidal anti-inflammatory drugs. Understanding the therapeutic properties of metabolic plant herbs and the usage of these plants in modern medicine, have positive thoughts of many people, to treatment with medicinal and aromatic plants. Nowadays, in some countries doctors can prescribe herbal medicines instead of synthetic medicines. Herbal medicines have a long tradition in the treatment of osteoarthritis. Herbal medicinal products are used in a variety of forms for the treatment of osteoarthritis (OA) worldwide. Although their mechanisms of action have not yet been elucidated in full detail, interactions with mediators of inflammation and cartilage destruction provide a rationale for using them to treat OA complaints. One of these plants *Hijikia fusiforme* (brown seaweed) which is widely distributed in Japan, Korea, and China. As well as many similar plants in the literature.

SEED CHARACTERISTICS, GERMINATION AND USAGE AREAS OF EPHEDRA FOEMINEA FORSSK.

İBRAHİM TURNA¹, ALİ BAYRAKTAR²

ABSTRACT

There has been a global trend for the revival of interest in the traditional system of medicine during the past several decades. Turkey with a huge variety of flora (type of plants grown in a region or a country) reserves lots of medical and aromatic plants within its structure. Ephedra foeminea Forssk., belonging to Ephedraceae family, is a woody plant that can be used on the medical field. It is possible to benefit from fruits, shoots and roots of this species. In addition, usage areas and demand of the species are increasing. While it is necessary to make use of contribution to the country economy of this plant, under threat in the IUCN Red List (LC), in terms of medicinal and aromatic, it is necessary to have knowledge about seed technology and nursery technique to ensure sustainability. In this study, seed characteristics and germination ability of the species were investigated. As a result of the study, average seed length, average seed width, seed fullness and 1000 seed weight of Ephedra foeminea Forssk. was found as 7,07 mm, 3,41 mm, 100% and 41,1 gr, respectively. In the scope of this study, different pre-treatments (cold water, 1000 ppm and 5000 ppm gibberilic acid (GA3) pre-treatment for 18 hours and control) were applied in the germination of seeds of this species. Thus, germination percentage and germination speed were determined. The fastest germination was determined as 85% in GA3 1000 ppm pre-treatment in the measurements made at the end of day 7.

NATURAL DYE PLANTS USED IN İBRALA REGION (KARAMAN)

TURAN AKDAĖ¹, SÜLEYMAN DOĖU², MUHİTTİN DİNÇ³

ABSTRACT

For a country, the most important wealth among natural wealth is flora. The plants has indispensable roles in the preservation of the ecological stability of the geography, as much as in human life. It is known that plants are used in different forms in Anatolia, which is one of the few places in the world in terms of plant abundance. The dyes obtained from different parts of plants have been used for centuries in Turkey. Karaman is a region where traditional handicrafts are made in Central Anatolia and natural dye plants are used for carpet weaving. As a result of the research, İbrala region where carpet weaving is still continuing within the provincial districts of Karaman, it has been found that 14 taxa growing naturally in İbrala region were used as dye plants. It has been determined that red color was obtained from *Rubia tinctorum* L., yellow color was obtained from *Salvia absconditiflora* Greuter & Burdet, *Rhamnus tinctoria* L., *Antehemis tinctoria* L, *Hypericum perforatum* L., *Hypericum scabrum* L. and *Berberis crataegina* DC. and brown color was obtained from *Juglans regia* L. as tetir. According to the study, it has been determined how the intermediate colors can be obtained from primary colors and how these plants were preparing for usage.

MEDICINAL PLANTS SOLD IN SEYDİŞEHİR (KONYA) HERBALISTS

SÜLEYMAN DOĞU¹, TURAN AKDAĞ², MUHİTTİN DİNÇ¹

ABSTRACT

The treatment methods progressed by people based on their experiences and the characteristics of the plants which used in these methods have been transferred to next generations. The use of medical plants in our country is widely used in the treatment of many diseases. Several important subjects should be considered about these plants under name of their cultivation, harvest, sale and consumption which people used as folk medicine. In our country, medicinal plants are generally collected carelessly, sold by people who do not have enough knowledge about its usage and consumed unconsciously. As a result of this study carried out within the year of 2016, 37 plants which sold for healing purposes for the diseases and used parts of these plants were determined in Seydisehir herbalists.

THE DETERMINATION OF TRACE METAL CONTENT OF DIFFERENT PARTS OF SAME EUPHORBIA

ISMAIL YENER¹, ABDULSELAM ERTAŞ², HILAL SARUHAN FIDAN³, MEHMET AKDENİZ⁴, MEHMET FIRAT⁵, ELIF VARHAN ORAL¹, FIRAT AYDIN⁶, HAMDİ TEMEL⁷

ABSTRACT

Euphorbia is one of the largest genus which belongs to the Euphorbiaceae family, and represented by 105 species in Turkey. Euphorbia species are named as ‘Sütleđen’ and ‘Xaşıl’. Euphorbia species are commonly used in Turkish folk medicine for the treatment of rheumatism, swelling as well as a wart remover. However, inflammation and diarrhoea are the two potential side effects that might occur during the treatment. It’s known that plant’s root parts are accumulate trace metal elements more than plant’s other parts. Additionally some Euphorbia species show accumulating few metals effect was known in literature. In this study, different parts of E. seguieriana subs seguieriana, E. fistulosa and E. eriophora species (seed, root, stem, leaves, flower and also mixed parts separately) were dried and then homogenized. Homogenized plant samples were digested by microwave oven. Heavy metal contents of prepared samples were observed by ICP-MS instrument. Generally some toxic metal element (lead, cadmium and arsenic) levels was found high in Euphorbia species which has been studied by us. Specially some species has more highly concentrations for a kind of metal element. In species of E. eriophora, E. fistulosa and E. seguieriana higher levels of metals were found specially as chromium, lead, cadmium and arsenic respectively. As result when we made a literature review, we observed that the researched Euphorbia species were having a potencial of being biomonitor. Depending on our results, different parts of the studied species were observed to contain different amounts of trace metals.

CHEMICAL PROFILE BY LC-MS/MS THE METHANOL EXTRACT OF TWO EUPHORBIA SPECIES

*İSMAIL YENER¹, MEHMET FIRAT², MUSTAFA ABDULLAH YILMAZ³, MURAT YOLCU⁴, SERKAN YİĞİTKAN⁵,
HAMDI TEMEL⁶, ABDULSELAM ERTAŞ⁷*

ABSTRACT

The family Euphorbiaceae is widely distributed in temperate regions of the world. Within the family Euphorbiaceae, the sixth largest flowering genus Euphorbia L., with well over 1000 species, is subdivided into many subgenera and sections, a number of which have been treated as distinct genera. Plants belonging to Euphorbia spp. have been the subject of many investigations for their biologically active components. Their biological activities, including skin irritant, tumor promotion, and pro-inflammatory properties are attributed to the presence of specific classes of macro- and polycyclic diterpenes. Some species of Euphorbia have been used for the treatment of skin diseases, gonorrhea, migraine, intestinal parasites, and warts, and as anti-inflammatory agents in folk medicine. A literature survey of the genus showed that many of its constituents are highly bioactive in phytochemical analysis. Many different parts of the Euphorbia species like roots, seeds, latex, stem, stembarks, leaves and whole plants have been studied. Moreover, it is found that the plants in the Euphorbiaceae family are well known for the chemical diversity of the isoprenoid constituents. The major constituents of the genus are diterpenoids. Many biological activities of the constituents of the Euphorbia species have been reported for a decade. Root and aerial parts (stem, root, branch, leaf, flower and mixed) of *E. eriophora* and *E. aleppica* were collected from Diyarbakır in flowering period. Powdered form of the parts plant material was weighed (1 g) and macerated three times with methanol (10 mL each) at 25 °C for 24 hours. After filtration, the solvent was evaporated to get the crude extracts. Phenolic components in the methanol extract was quantified by LC-MS/MS. LC-MS/MS analysis of the phenolic compounds was performed by using a Nexera model Shimadzu UHPLC coupled to a tandem MS instrument. In the current study, twenty-four phenolic compounds (flavonoids, flavonoid glycosides, phenolic acids, phenolic aldehyde, coumarin) and three non-phenolic organic acids which are widespread in plant materials were qualified and quantified in *E. eriophora* and *E. aleppica*. Among 27 compounds, malic acid, p-cumaric acid, quinic acid and tannic acid were found to be the more abundant compound in *E. eriophora* and *E. aleppica*.

THE USING OF THE RURAL MELON SEED POWDER (KULTİK) İN PRODUCTION OF BİSCUIT

SELDA İDİKURT¹, İLYAS ÇELİK¹

ABSTRACT

The melon known as Kultik, is famous due to its sharper smell, besides the fruits, the seed is widely produced and consumed locally with in the Tunceli and Elazığ regions. Rural melon seed protein powder is a good source of dietary fiber and mineral resources. In this research obtaining higher functionality biscuits by importing the mentioned feature of the rural melon seed powder was aimed. For this purpose; Samples of kernal seeds were obtained by grinding in the stone mill. In different applications (roasted and unroasted) and in proportions (0, 10, 20 and 40%), biscuit production was carried out by replacing the cultural core powders with biscuit flours. The properties of the biscuits produced Which are characterized by hardness, volume, weight, specific volume, color (L, a and b), physical (blistering and spreading), chemical (ash, protein) and sensory (taste, color, smell, appearance and general taste) have been researched. While 20% and 40% roasted melon seed powder showed the lowest L value, a values were increased at a value. a negative effect on the swelling, spreading rate and hardness of melon seed powder hasn't been observed. In sensory analysis, biscuit panalists made with roasted melon dust with 40% added aroma, brittleness, color, flavor and overall liking received the lowest value; Control and biscuits made with 10% added unroasted melon dust received the highest value. In sensory analysis, biscuits made with 20% added unroasted melon powder showed the best mouth disintegration feature. It has been determined that the melon seed powder has adifferent effect on the biscuit flavor used roasted and unroasted. Finally, the application rate of 10% melon seed powder application is concluded to be a usable ratio.

THERAPEUTIC POTENTIALS AND USAGE OF TRITERPENE SAPONINS FROM QUINOA

OZGUR KIVILCIM KILINC¹, SENAY OZGEN¹, ZELIHA SELAMOGLU¹

ABSTRACT

The aim of this review is to report pharmacological, phytochemical and nutritional aspects of quinoa seeds that have been wide range of usage, such as in foods, cosmetics, medicines and botanical supplements. Saponin in quinoa has been used as a many plant drug content and folk medicines for many centuries for treatment of diseases. In addition to role in plant defense system, saponins possess various biological and pharmacological properties, including hemolytic, cytotoxic, immune modulatory, anti-inflammatory, and antitumor impact. Furthermore, cosmetic and beverage industry benefits from surfactant properties of saponins. It also used as a bubbling factor for different aims along with in fire-extinction. The most noticeable feature of saponins is membrane permeabilization. These compounds have more effects on the enzyme activity, transport, redox related functions, organelle integrity and other signal transduction and cellular processes, for example, interfere with the cells by activating programmed cell death. Saponins are found in food crops and taken as a human diet which shows different effects on human health i.e., reducing blood cholesterol levels. Quinoa seeds are also naturally gluten free and has high nutrient profile which are increases the attention has been given to these plants. Therefore, quinoa (*Chenopodium quinoa* Willd.), an Amaranthaceae plant of Andean region, recently became important for the researchers.

ALLELOPATHIC EFFECTS OF FLOWER EXTRACT OF OLEANDER (NERIUM OLEANDER) ON THE GERMINATION OF SEED AND SEEDLING GROWTH OF LOLIUM MULTIFLORUM

ÖMER SÜHA USLU¹, OSMAN GEDİK¹, ALI RAHMI KAYA¹, ADEM EROL¹, MUHAMMAD AZIM KHAN², MUSTAFA NUR TAŞSEVER¹, ETEM TÜRKKAYA¹

ABSTRACT

Allelopathy is described as the effects of plant chemical secretions on the near-by plants or microorganisms. Allelopathic substances are normally leaching into the soil as phytotoxic substances which are soluble in the water from cultivated and wild plants parts such as root, stem, leaf, rhizome, flower, fruit, seed, cloth and feather. In this study, the allelopathic effect of flower extract of oleander plant was investigated. The experiment was laid out in completely randomized design (CRD) with three replications and treatments in climate cabin in the Kahramanmaraş Sutcu Imam University, Faculty of Agriculture, Department of Field Crops Laboratory during January 2017. Fresh plants flower of Nerium oleander were collected, dried and ground. Then the powder was soaked in tap water. Twenty five seeds of nigella were placed in petri dishes separately and different concentrations of extracts were applied according to the requirements. A control treatment (0 g/liter) was also included for comparison. In the study, ryegrass seeds were germinated in the extracts of nerium flower that two different colour (red and white) and different concentrations (0, 10, 20 and 40 mg/liter). The allelopathic effect of nerium flower extracts on the germination and seedling growth of ryegrass were determined. In the study, while the highest germination rate (93%) were obtained from the application of red flower extract of nerium, the highest vigor index (846.24) and seedling length (18.43) were obtained from the application of white flower extract of nerium. The results showed that with increasing the red flower extract concentration of Nerium oleander, a significant decrease was noted in the germination percentage (47%), while seedling growth was decreased. According to the results of the research, with increasing red and white flower extract concentrations significant decrease was noted in the germination and seedling growth of ryegrass.

ALLELOPATHIC EFFECTS OF FLOWER EXTRACT OF OLEANDER (NERIUM OLEANDER) ON THE GERMINATION OF SEED AND SEEDLING GROWTH OF NIGELLA SATIVA

OSMAN GEDİK¹, ÖMER SÜHA USLU¹, ADEM EROL¹, ALI RAHMI KAYA¹, WALID SOUFAN², EROL KESER¹, ABBAS SEKİN¹

ABSTRACT

Allelopathy is described as the effects of plant chemical secretions on the near-by plants or microorganisms. Allelopathic substances are normally leaching into the soil as phytotoxic substances which are soluble in the water from cultivated and wild plants parts such as root, stem, leaf, rhizome, flower, fruit, seed, cloth and feather. In this study, the allelopathic effect of flower extract of oleander plant was investigated. The experiment was laid out in completely randomized design (CRD) with three replications and treatments in climate cabin in the Kahramanmaraş Sutcu Imam University, Faculty of Agriculture, Department of Field Crops Laboratory during January 2017. Fresh plants flower of Nerium oleander were collected, dried and ground. Then the powder was soaked in tap water. Twenty five seeds of nigella were placed in petri dishes separately and different concentrations of extracts were applied according to the requirements. A control treatment (0 g/liter) was also included for comparison. In the study, nigella seeds were germinated in the extracts of Nerium flower that two different colour (red and white) and different concentrations (0, 10, 20 and 40 mg/liter). The allelopathic effect of Nerium flower extracts on the germination and seedling growth of nigella were determined. In the study the highest germination rate (88%), vigor index (436.44) and seedling length (9.38) were obtained from the application of red flower extract of Nerium. The results showed that with increasing the red flower extract concentration of Nerium oleander, while a significant decrease was noted in the germination percentage (28%), seedling growth was limited. According to the results of the research, with increasing flower extract concentration significant decrease was noted in the germination and seedling growth of nigella in all application.

THE EFFECT OF PRIMING AND VERMICOMPOST COMBINATION ON SEEDLING EMERGENCE IN DILL (*ANETHUM GRAVEOLENS* L.) SEEDS

EREN ÖZDEN¹, KEVSER ÖZEL², DILAN KAPÇAK¹, NURCAN MEMİŞ¹, İBRAHİM DEMİR¹

ABSTRACT

This work was conducted to test the effect of priming and vermicompost combination on seedling emergence and seedling size in dill seeds. Seeds were primed by keeping them on top paper for 17 hours at 20°C, and dried at room temperature over 24 hours. Vermicompost was provided by Polatlı/Ankara Aybasol Company. After priming, seeds were sown in peat moss and either 100 % vermiculite or combined with vermiculite and vermicompost mixture of 95+5%, 90+10% and 80+20% was spread over sowing medium. Control seeds were not treated and 100 % vermiculite was spread. Seedling emergence percentages were calculated over 21 days at 22°C in a climatically controlled room. Seedling fresh and dry weight, as well as root fresh and dry weight were calculated after 21 days. The seedling emergence percentage in control seeds increased from 52% to 75% after priming. The treatment subjected to addition of 5 % vermicompost to the the peat moss had the highest emergence percentage of 90%. Even though significantly higher ($p<0.05$) than control 10% and 20% of vermicompost addition to vermiculite resulted to a decline in emergence as compared to 5%. The highest seedling fresh and dry weight were recorded as 82.9 mg/plant and 6.1 mg/plant, when 5% vermicompost was added to the vermiculite. Similarly root fresh and dry weight were found to be superior; 38.3 and 1.69 mg/plant at 5% addition of vermicompost. Preliminary result indicated that priming and subsequent vermicompost addition to vermiculite spread can increase the efficiency of the priming treatment in dill seeds.

**THE EFFECT OF TEMPERATURE DIFFERENCES ON SEED
GERMINATION AND GERMINATION RATE IN DILL (ANETHUM
GRAVEOLENS L.)**

EREN ÖZDEN¹, SINEM ÇAMURCU¹, CİHAT ÖZDAMAR¹, MERVE ÖZDEMİR¹, ELİF DURMUŞ¹, İBRAHİM DEMİR¹

ABSTRACT

Temperature is main criterion that affect germination percentage and rate. This work was conducted to test how germination is affected by temperature variations in dill seeds. Four seed lots (Gönen 010) produced by different companies were tested (four replicate of 50 seeds per lot) at 15, 20, 25, 30 and 35°C over 21 days. The highest seed germination percentages were obtained from seeds kept at 20°C; as 97, 91, 72 and 61% from four lots. At 30°C only lot 1 and lot 2 germinated, with 41 and 7%, respectively. None of the seeds lots germinated at 35°C. Normal seedling percentages gradually declined as germination temperature increased. The fastest germination was observed at 20°C with 4.5 and 8.7 days between lots. Results indicated that the optimum seed germination temperature for dill seeds are 15 and 20°C.

BIOACTIVE TERPENIC ACIDS: THEIR PROPERTIES, NATURAL SOURCES AND EFFECTS ON HEALTH

ILKAY KOCA¹, BELKIS TEKGÜLER¹, BURÇIN TÜRKYILMAZ¹

ABSTRACT

Triterpenic acids, which may as free acids or aglycones of triterpenoid saponins, are found in many plants. For centuries, these components have been used as medicines in the folk medicine due to their hepatoprotective, anti-diabetic and anti-inflammatory properties. The triterpenic acids are phytochemicals which are formed against bacteria, fungi and plant pathogens by plants. Among the triterpenic acids, the most common in plant kingdoms are oleanolic, betulinic, ursolic and maslinic acid. They are especially found in the waxy layers of the fruits. In this review, the triterpenic acids, which are common in nature, and their bioactive properties are discussed.

URSOLIC AND OLEANOLIC ACID CONTENTS IN WILD VARIETIES OF SOME FRUITS

BURÇİN TÜRKYILMAZ¹, İLKAY KOCA¹

ABSTRACT

The fruits grown as wild are important in terms of public economy and nutrition. These fruits contain significant amounts of bioactive compounds. Ursolic acid and oleanolic acid, which are bioactive components, are pentacyclic triterpenoid compounds. This study was conducted to determine the content of ursolic and oleanolic acid in the wild fruits naturally grown in Turkey. In this study, the white and black myrtle (*Myrtus communis* L.), blackthorn (*Prunus spinosa* L.), barberry (*Berberis vulgaris* L.), plum (*Prunus domestica* L.), cherry laurel (*Laurocerasus officinalis* L.), burnet rose (*Rosa pimpinellifolia* L.), cornelian cherry (*Cornus mas* L.) and Caucasian whortleberry (*Vaccinium arctostaphylos* L.) fruits were analyzed. The ursolic acid and the oleanolic acid analyzes were performed by HPLC-DAD. The highest oleanolic acid (183.51 ± 60.46 mg kg⁻¹) and ursolic acid (158.78 ± 25.04 mg kg⁻¹) were found in burnet rose, while the lowest oleanolic acid (6.83 ± 2.96 mg kg⁻¹) and ursolic acid (7.73 ± 2.62 mg kg⁻¹) contents were determined in Caucasian whortleberry fruit. There were no any presence of ursolic acid in cornelian cherry and Karaca plum fruits.

ALBEDO OF CITRUS FRUIT AND ITS EFFECT ON HEALTH

MUSTAFA KÜRŞAT DEMİR¹

ABSTRACT

Depending on our nutrition style, new methods are required which will make food healthier. One of these methods is using fibers which are functional properties of nutrition as a food ingredient while reducing fat content. In this aspect, citrus albedo plays an important role. Albedo forms the white parts of citrus and has a soft form since the large amounts of pectin and hesperidin content existent in the cell gaps. Albedo contains large amounts of dietary fiber and fibres plays a great role on providing stable form for structural and textural properties of food by means of binding fat and water features of fibers. Moreover, it forms the basic components of low-calorie-products. Texture, density and sensory properties of final product can be modified by using fibers. Dietary fibers built in citrus albedos show some positive effects on colon cancer, obesity, diabetes and cardiovascular diseases.

MELITOPALYNOLOGIC ANALYSIS OF THE HONEY SAMPLES COLLECTED FROM AZERBAIJAN GANJA GAZAKH REGION

DUYGU NUR ÇOBANOĞLU¹, KADRIYE SORKUN¹

ABSTRACT

In this study, it was aimed to evaluate the botanical sources of the honeys that were collected from Azerbaijan Ganja Gazakh Region with melitopalynological analysis. For this purpose, 23 honey samples were collected from 8 different administrative regions (rayon) of Azerbaijan Ganja Gazakh Economic Region during the honey harvest period in 2014. The pollen contents, total number of pollen (TPN-10) and starch content of 10 g honey were examined by melitopalynological analyses. As a result of these analysis, 34 different plant families, 42 plant genera and 4 species were determined and it was determined that 7 honey samples were monofloral and 16 honey samples were multifloral.

DETERMINATION OF BIOACTIVE PROPERTIES AND BIOAVAILABILITY OF LAUROCERASUS OFFICINALIS ROEMER LEAVES

OSMAN SAĐDIÇ¹, KÜBRA ÖZKAN¹

ABSTRACT

Since the days of mankind's existence, plants have been used for therapeutic purposes. It is reported that many doctors have been interested in medical plants and have been used for treatment in many diseases since the Mesopotamian civilization B.C. in 3000. Due to different climatic conditions, various medical and aromatic plants are growing in every region of today's Turkey and it is among the richest countries in the world. However, medical and aromatic plants in Turkey are not evaluated sufficiently and economic income can not be obtained. Therefore, it is important to carry out various researches in order to determine plant diversity, usage areas and how they are called as regional. The vast majority of phenolic compounds such as phenolic acids, flavonoids and tannins present in medical plants exhibit free radical scavenging properties. Thus they carry antioxidant properties. *Laurocerasus officinalis* Roemer one of these medical and aromatic plants. The area of spread of the plant is the eastern regions of the Black Sea, Caucasus, Taurus, North and East Marmara. It is generally the fruit of temperate climate regions. In this regard, this plant is grown in the coastal zone of the Black Sea region. It is also known as *Prunus laurocerasus*, laz cherry. To better understand the benefits of these medicinal plants on human health, the consequences of human metabolism and the bioavailability values must be known. In this study, extracts were obtained from *Laurocerasus officinalis* Roemer leaves the effects of in vitro digestion and bioavailability values were determined on the bioactive components of the leaves of the *Laurocerasus officinalis* Roemer. Total phenolic substance, total flavonoid and antioxidant capacities of post gastric (PG), IN (with small intestinal absorbers) and OUT (without small intestine absorbers) samples obtained as gastric and intestinal digestion in vitro were measured. As a result of the study, the total amount of phenolic substance in raw sample is 17,62 mg GAE/g while in boiled sample it is 0,83 mg GAE /g. The total amount of flavonoids in the raw sample is 11.61 mg CAE /g while in the case of boiled sample is 0.47 mg CAE /g. Antioxidant capacity is measured by DPPH and CUPRAC methods. Accordingly, total antioxidant capacity measured by DPPH method is 41.11 mg TEAC / g and 0.77 mg TEAC /g in raw and boiled samples, respectively. Total antioxidant capacity measured by the CUPRAC method is 67,05 mg TEAC /g and 1,63 mg TEAC /g in raw and boiled samples, respectively. As a result of digestion, the amounts of bioactive components decreased in the stomach and intestinal environment. The bioavailability values for the phenolic compounds in the raw and boiled starter samples were 3.86-11.66% for the total flavonoid substance, respectively, while the bioavailability values for the antioxidant capacity were 10.58-19.48% (by the DPPH method), 6.50-50.3% (by the CUPRAC method). Although the boiling process causes loss of bioactive component amounts, it also causes an increase in bioavailability values.

THE EFFECTS OF SECONDARY METABOLITES ON THE ANIMAL HEALTH IN RANGELAND AND PASTURE PLANTS IN MEDITERRANEAN ECOLOGICAL CONDITIONS

EMRE KARA¹, MUSTAFA SÜRME¹

ABSTRACT

Grazed areas including rangelands and pastures cover approximately 51% of the Earth's continental surface. The plant species which are in these areas which form a wide biodiversity with living and non-living organisms, stand out with both as a forage source and medical use. In this natural habitat, plants are surrounded by a large number of potential enemies. Since plants are not able to escape from these enemies (herbivores and pathogenes), plants produce substances which are not functional for growing and develop but protect plants against external factors as defence mechanisms. These substances are called secondary metabolites. These substances which are seen differently from the primer metabolites, possess characteristics specific to each plant species. Secondary metabolites of plant origin can be divided into three main groups as terpens, phenolic compounds and nitrogenous compounds. Terpenes have negative effects on many mammals and insects, because they are toxic. The lignin, a phenolic compound, is located in the plant cell wall and has a particularly digestibility – lowering effect. In addition, flavanoids, which are again phenolic compounds, are thought to be produced against harmful effects of UV rays and pathogen invasion. Tannins, another phenolic compounds, are generally toxic. When plants which have tannins are grazed by herbivorous, they significantly reduce chances of growth and survival of animals. Finally, the alkaloids which are in the nitrogenous secondary products, are seen in a very wide area. These metabolites, especially in invasive plants that are heavily exposed to heavy grazing rangelands and pastures, affect the nervous system in livestock and can cause paralysis and even sudden deaths. These three secondary metabolite groups are also commonly found in plants that are not properly managed in the meadow and pasture areas of the Mediterranean climate zone and can cause economic damage by affecting animal health and quality of animal products, especially in areas where animal production are seen. However, these economic losses are not only due to the plant species but can change with the influence of environmental factors. Moreover, not every livestock is affected by the same damage, the damage threshold varies according to the livestock species. This situation affects the livestock sector and natural vegetation, which already have problems. If the rangelands and pastures we call quality and natural forage sources, are not properly managed, the grazing and other factors may lead to the increase of the plant species which affect of reducing the animal production and may cause the deterioration of the natural vegetation cover. In this study, many rangeland and pasture plants which are located in the Mediterranean climate zone and have different secondary metabolites have been examined and the positive and toxic effects on livestock health have been discussed. In addition, the proper management systems in the rangeland and pasture areas where these species are seen have been described and accordingly, possible changes in both animal production and natural vegetation have been mentioned

Corresponding Author: **EMRE KARA**, emre.kara@adu.edu.tr

¹ADNAN MENDERES ÜNİVERSİTESİ

if there is not properly managed. With rangeland and pasture improvement studies to be carried out in accordance with the information described here, both increase in animal production can be achieved and plants in these areas can contribute to the economy in terms of both medical and chemical substance possibilities.

THE INVESTIGATION OF CYTOTOXIC ACTIVITIES OF DIFFERENT EXTRACTS FROM *ACHILLEA VERMICULARIS* AERIAL PARTS

ECE GULER¹, TURGUT ŐEKERLER², ÖZLEM B.ÖZAKPINAR², AHMET DOGAN³, FIKRIYE URAS³, TURGUT TASKIN¹

ABSTRACT

The genus *Achillea* L. (Asteraceae), with about 115 species, is widely distributed in Europe, Asia and northern Africa and is naturalised in other parts of the world. Species of the genus *Achillea* are widely used for numerous pharmacological properties, such as antimicrobial, anti-inflammatory, antiallergic, and antioxidant activities (1). Turkey is one of the main centers of diversity for the genus *Achillea*. *Achillea* species are important in Turkish folk medicine for matters such as stomachache, hemorrhoids and inflammation (2). The *A. vermicularis* Trin. naturally grows in east Anatolia at an altitude between 1200 and 3500 m. In flora records this plant is reported to occur in Southeast Asia including Caucasia. Some researchers have reported the major constituent in the oil of the plant as camphor, 1,8-cineole, borneol, camphene, germacrene D and piperitone. Also, vermicularon A, vermicularon B, achilleanone, vermiculone, vermicularone, germacranolides, guaianolides and flavonoids compounds were isolated from *A. vermicularis* (3). Cytotoxic effects on cancer cells of n-hexane, chloroform, ethyl acetate, ethanol and ethanol-water (1:1,v/v) extracts the from *Achillea vermicularis* aerial parts is not known and there is no literature about this topic. Therefore, the aim of the present study are to evaluate cytotoxic activities of different extracts from *A.vermicularis* aerial parts. Cytotoxicity of differant extracts from *A. vermicularis* was evaluated and screened against human MCF-7 (breast), HeLa (cervical), PC-3 (prostate), A549 (lung), HT-29 (colon), Hep3B (liver) cancer cell lines and normal NIH/3T3 cell lines. The reduction of viability of cells in 50-200 µg/mL concentration of different extracts was evaluated using MTT assay. According to study,the chloroform extract (100 µg/mL) showed strong activity and selectivity against HeLa and HT-29 cell lines. ABSTRACT

The genus *Achillea* of the family Compositae (Asteraceae) comprises 42 species and 47 taxa in Turkey, of which 23 taxa are endemic, the *Achillea* genus are used in wound healing, abdominal pain, stomachache, symptomatic relief of colds, ulcer, and diarrhea. The *Achillea* genus contains phenolic compounds (terpenoids and flavonoids) responsible for biological activity (1,2). *Achillea lycaonica* Boiss. et Heldr. is a member of the genus *Achillea* L. belongs to family Asteraceae and is endemic to Turkey (3). Cytotoxic effects on cancer cells of n-hexane, chloroform, ethyl acetate, ethanol and ethanol-water (1:1,v/v) extracts the from *Achillea lycaonica* (endemic) aerial parts is not known and there is no literature about this topic. Therefore, the aim of the present study are to evaluate cytotoxic activities of different extracts from *A. lycaonica* aerial parts. Cytotoxicity of n-hexane, chloroform, ethyl acetate, ethanol and ethanol-water (1:1,v/v) was evaluated and screened against human MCF-7 (breast), HeLa (cervical), PC-3 (prostate), A549 (lung), HT-29 (colon) cancer cell lines and normal NIH/3T3 cell lines. THE BIOLOGICAL ACTIVITIES AND CHEMICAL PROFILE OF ETHANOL EXTRACT OF ALLIUM AKAKA

ABDULSELAM ERTAŞ¹, MUSTAFA ABDULLAH YILMAZ², SERKAN YIĞITKAN¹, NESRİN HAŞİMİ³, HÜSEYİN
ALKAN⁴, ELİF VARHAN ORAL⁵, FIRAT AYDIN⁵, HAMDİ TEMEL²

ABSTRACT

In Turkey, traditionally consumed *Allium* genus like kormen, rock garlic, savage onion, savage garlic, dog onion and shepherd garlic are also used as food or used in treating aim. In this research, total phenolic and flavonoid content, antioxidant and anticholinesterase activities of extracts obtained from various parts of *Allium akaka* were compared. *S. suffruticosa*, which was collected from east Turkey (Hakkari) in May 2015 and characterized by Mehmet Fırat (Yüzüncü Yıl University, Faculty of Education, Department of Biology, TR-65080 Van.). Voucher specimens were deposited in the Herbarium of Van Yuzuncu Yil University, Faculty of Science (VANF 164090). β -Carotene method, ABTS cation radical decolorisation method, cupric reducing antioxidant capacity assays and DPPH free radical scavenging activity were carried out to indicate the antioxidant activity. The anticholinesterase potential of the extracts were indicated by Ellman method. The amounts of total phenolic and flavonoid components in crude extracts were determined by expressing as pyrocatechol and quercetin equivalents, respectively. The powdered plants (stems, leaves, flowers, roots and mixed parts) were extracted three times with ethanol (50 mL each) at room temperature for 24 h. Afterwards, the extracts obtained were combined, filtered and evaporated under low pressure. Dry filtrates were reconstituted in ethanol at a concentration of 250 mg L⁻¹ and filtered through the 0.2 μ m PTFE filter prior to LC-MS/MS analysis. The antioxidant and cytotoxic activities of *A. akaka* were determined medium values, generally. The LC-MS/MS studied showed that *A. akaka* was including high amount p-coumaric acid, kaemperol and apigenin.

THE FATTY ACID ANALYSIS OF SOME SALVIA SPECIES BY GC-MS AND CHEMOMETRIC APPROACH

ÖZGE TOKUL ÖLMEZ¹, ABDULSELAM ERTAŞ², MUSTAFA ABDULLAH YILMAZ³, MEHMET ÖZTÜRK¹, İSMAIL YENER⁴, MEHMET FIRAT⁵, ESRA YARIS², SEVGİ İRTEGÜN⁶, HAMDİ TEMEL³, UFUK KOLAK⁷

ABSTRACT

The genus *Salvia* L. (Lamiaceae) is represented more than 900 species on the world and about 98 species in Turkey. Fifty-three of them are endemic. These plants have trichomes and aromatic qualities, due to containing of various essential oils used in perfumery and medicine. Medicinal plants are biologically active materials traditionally used in the treatment of a variety of diseases since ancient times. The most used common chemometric analyses techniques are Principal Component Analysis (PCA) and Hierarchical Cluster (HCA) Analysis. PCA technique search for answers about the type of relationships between samples and the issues interaction between variables. Hierarchical Cluster (HCA) technique, however, provides information on the classification (characterization) of examples. These both techniques reveal the unrevealed relationships and allow to predict the results that cannot be considered so ordinary . In our study, Principle Component Analysis (PCA) and Hierarchical Clustering Analysis (HCA) were performed with 7 fatty acid components of 10 samples collected at different times. As a result of the PCA analysis with 10 samples and 7 fatty acid components, the first three principal components explained the variance as 94.2%, 1st principle component as 46.4% and 2nd. principle component as 28.3% (Fig. 1). Statistical calculations were performed using Minitab 16.2.1 statistical software (MINITAB Inc. 2010). *Salvia* species collected at different times in the study were evaluated with 7 fatty acid components. Acknowledgements: The research was funded by grant : KBAG 114Z801 from TUBITAK, The Scientific and Technological Research Council of Turkey.

THE AROMATIC-MEDICINAL PLANT TAXA OF PURE SCOTS PINE STANDS IN SÜRMENE - CAMBURNU (TRABZON)

ARZU ERGÜL BOZKURT¹, SALIH TERZIOĞLU²

ABSTRACT

Forests are not the ecosystems that they only produce wood raw materials. They are rich in medicinal and aromatic plants and produce many other goods and services. In forest ecosystems, to regulate the usage of these goods and services taking into consideration conservation and utilization equilibrium is extremely important. In order to ensure sustainable utilization of forest ecosystems, first of all, it is necessary to identify the natural components in these ecosystems. In this study, medicinal-aromatic plants of natural pure Scots pine (*Pinus sylvestris* L.) stands, which are delicate ecosystems, were investigated in the years 2014-2015. This tree species has special ecological conditions in Sürmene-Çamburnu (Trabzon) mostly because of its distribution descending down to the sea-side. In the present study, 81 (77%) of 105 vascular plant taxa were found to have medicinal-aromatic potential. From medicinal and aromatic purpose of view, available parts of these taxa are explained in detail. In addition, recommendations have been made about regulation of utilization in such kind of sensitive ecosystems.

GEOPHYTES OF PURE SCOTS PINE FOREST IN ALPU (ESKIŞEHİR- TURKEY) REGION

ARZU ERGÜL BOZKURT¹, SALIH TERZİOĞLU²

ABSTRACT

In this study, geophytes of pure stands of Scots Pine forests, which are important from non-wood forest products point of view, were investigated in Alpu (Eskişehir-Turkey) region. Research area was divided into three altitude levels such as 1200-1400 m, 1400-1600 m and 1600-1800 m. Total of 33 relevés were studied for the present study. As a result of the study, 29 geophytes were identified. Vegetative and / or generative parts of these taxa which have been used as non-wood forest products are explained in detail. Furthermore, the usage purpose of each taxon and their potentials are explained. In addition, with comprehensive phytosociological studies in the field, cover-abundance and sociability (or gregariousness) values of each geophyte plants were determined according to Braun-Blanquet approach. In particular, considering CITES regulations, the possibilities of benefiting from these plants within the conservation and utilization equilibrium were discussed in detail.

EVALUATION OF TOTAL PHENOLIC CONTENT AND FREE RADICAL SCAVENGING ACTIVITY OF SOME HERBAL TEA PREPARED BY DECOCTION AND INFUSION

GÖKSEL TIRPANCI SİVRİ¹, DENİZ DAMLA ALTAN¹, FİGEN DAĞLIOĞLU¹

ABSTRACT

Herbal tea is preferred by consumers since it contains several bioactive constituents, especially phenolic compounds and antioxidants providing beneficial health effects. These compounds are claimed to be antistress, anti-inflammatory, stimulant, blood purifier, energizer, antidepressant, antidiabetic, antiviral, diuretic, antihypertensive and memory enhancer. This study was conducted to investigate antioxidant activity and phenolic compounds of 7 different herbal tea including fennel (*Foeniculum vulgare*), sage (*Salvia officinalis*), daisy (*Flos chamomillae*), echinacea (*Echinacea purpurea* L.), lemon balm (*Melissa officinalis*), linden (*Tilia platyphyllos* L.), rosehip (*Rosa canina* L.). The ready to use tea bags were prepared by infusion (85 °C for 5 min) and decoction (100 °C for 5 min) process and their total phenolic contents (TPC) and antioxidant activity were compared with methanol extracts. Total phenolic contents of herbal tea were analyzed by Folin–Ciocalteu's procedure. The TPC of herbal tea samples was reported as mg of Gallic acid equivalents (mg GAE/L) of tea samples. Antioxidant activities of herbal tea were evaluated by the effect of extracts on DPPH (2,2-diphenyl-1-picrylhydrazyl) radical scavenging assays. Antioxidant activity was expressed as percentage of inhibition in relation to control. The herbal tea of lemon balm and Echinacea had the highest phenolic content among the investigated tea as 1182 and 1102 mg GAE/L respectively. In contrast with the general advice to prepare herbal tea by infusion, the total phenolic content of the herbal tea prepared by decoction were determined as higher. Similarly the antioxidant capacity also changed with both infusion and decoction processes. Consequently, it was understood that some herbal tea should be prepared by decoction instead of infusion method.

ANTIOXIDANT PROPERTIES, AND PHENOLIC COMPOUNDS OF SAPONARIA L. DETERMINED BY LC/MS-MS

EKREM KÖKSAL¹, HATICE TOHMA¹, ÖMER KILIÇ², YUSUF ALAN³, İLHAMİ GÜLÇİN⁴, ERCAN BURSAL³

ABSTRACT

Saponaria taxa contains saponin and has been used for medicinal purposes in the past and today. The aim of this study was to evaluate the antioxidant activity and phenolic composition of Saponaria L. Antioxidant activity of Saponaria L. was measured by the 2,2-diphenyl-1-picrylhydrazyl (DPPH) free radical scavenging effect, the ferric reducing antioxidant power (FRAP), and Cupric reducing antioxidant power assays using ethanol and water extract of the sample. Phenolic composition of ethanolic extract of Saponaria L. was studied with liquid chromatography coupled to tandem mass spectrometry (MS/MS). The identification of the phenols were made based on retention time, tandem MS spectras of authentic standards. The result showed that although ethanol extract has slightly better activity compared to water extract, both extracts of the sample have low antioxidant activities compared to standard antioxidant including BHA, BHT and ascorbic acid as shown with DPPH, FRAP and CUPRAC assays. LC–MS/MS analysis of ethanolic extract indicated that there are 14 detectable phenolic compounds in Saponaria L. and rutin is primary phenolic compound found. The present study is the first such detailed report on chemical composition and antioxidant activity of Saponaria L.

ANTIOXIDANT PROPERTIES OF ALLIUM SCORODOPRASUM L. SUBSP. ROTUNDUM L. STEARN FLOWERS

BAHTINUR TAŞCI¹, İLKAY KOCA¹

ABSTRACT

Allium scorodoprasum L. subsp. *rotundum* L. STEARN plant is a perennial, aromatic plant with bulbs, which is grown in different parts of the world. The plant has an important place in folk medicine due to its medical properties. In our country, its leaves and bulbs are consumed as cooked or raw. As well as being used as flavoring in Van herby cheese, it is also used in meals such as pilav and börek in many places. Besides its leaves and bulbs, its flowers are eaten as salad in some countries. The objective of this study is to find out the antioxidant properties of the flowers of *Allium scorodoprasum* L. subsp. *rotundum* L. STEARN plant, which is grown naturally in our country. For this purpose, the flowers of the plant, which is grown in 5 different locations of the city of Tokat, were picked. Dry matter, color, pH, ascorbic matter, total phenolic matter, total anthocyanin, ascorbic acid and antioxidant activity (DPPH free-radical scavenger effect and iron reducing power-FRAP) analyses were conducted in the flowers. In addition, the presence of organosulphur compounds was also researched with FT-IR (Fourier Transform Infrared spectroscopy). Ascorbic acid was found with high performance liquid chromatography (HPLC), total phenolic matter was found with Folin-Ciocalteu method, total anthocyanin was found with pH differential method and antioxidant activity analyses were found colorimetrically. The results of the study showed that the ascorbic acid content of the flowers differed between 504.83 and 783.79 mg/kg, total phenolic matter amount differed between 11.54 and 13.79 mg/g, total anthocyanin content differed between 4.50 and 34.47 mg/100g, DPPH free-radical scavenger effect differed between 47.23 and 54.86 µmol Troloks equivalent (TE)/g and FRAP differed between 430.88 and 545.66 mM TE/g. In addition, when the IR bands of the flowers were analyzed, allicin and alliin were found in all samples. It was recorded that the flowers of *Allium scorodoprasum* L. subsp. *rotundum* L. STEARN plant included high natural antioxidant compounds and it was concluded that the consumption of these flowers in different ways such as salad and tea could be useful in terms of health.

PLANTS USED AS PAINKILLER IN FOLK MEDICINE IN TURKEY IV - TOOTHACHE

MERYEM ŐEYDA ERBAY¹, SEZİN ANIL¹, GÜLAY MELİKOĐLU¹

ABSTRACT

Due to the geography in which Turkey is located, it has a rich flora and many plants used by public for the treatment of various diseases. The usage of these medicinal plants has been transferred from generation to generation. Ethnobotanical studies carried out by traditional methods of treatment are recorded and this information is aimed to contribute to the development of the drug. This study, which is fourth article of series about painkiller plants, contains the plants used against toothache. In this survey, was prepared by screening of ethnobotanical researches, 52 taxa were traditionally used in toothache treatment in Turkey. Information about scientific and local names, families, used parts and usage patterns of these plants are given. According to the research result, the most common families are Lamiaceae, Asteraceae, Solanaceae, Euphorbiaceae and Rosaceae. The species commonly used in different regions of Turkey are *Cornus mas* L., *Dianthus zonatus* Fenzl var. *zonatus* and *Hyocyanus niger* L. Reasons of the usage of plants for toothache treatment are that they contain analgesic and anti-inflammatory compounds. Plants are usually used externally. In addition, decoction and infusion are prepared and used internally.

ESSENTIAL OIL COMPOSITION OF TWO SALVIA SPECIES FROM ANATOLIA

HATICE ÇAKIRCA¹, ABDULSELAM ERTAS², ISIL AYDIN¹, MEHMET FIRAT³, ISMAIL YENER¹, HILAL SARUHAN FIDAN⁴, FIRAT AYDIN¹, GÜLAÇTI TOPÇU⁵

ABSTRACT

The genus *Salvia* comprises 700 herbs and shrubs, growing in the temperate and warmer zone of the World. Some species of genus *Salvia* are used as medicinal aromatic and ornamental plants. *Salvia multicaulis* and *S. hypergia* are an evergreen shrub growing to 0.3 m × 0.25 m, native to south-west Asia, particular eastern, central and southern Turkey. Essential oil samples were obtained by a Clevenger apparatus from the whole parts of plants which were crumbled into small pieces and soaked in distilled water for 3 h. Then, these samples were dried over anhydrous Na₂SO₄ and stored at +4°C for a sufficient period of time. In the next step, the essential oil samples were diluted using CH₂Cl₂ (1:3 volume/volume) prior to GC/FID and GC/MS analyses. Essential oil of analysis of *Salvia multicaulis* and *S. hypergia* were analyzed with GC-MS/FID. α - Pirene, Eucalyptol, (+)-2-Bomanone and Caryophyllene were determined as the main compounds of *S. multicaulis*. *S. hypergia* was found to be rich in monoterpenes, but quite different than *S. multicaulis* in the means of chemical composition. β -elemene, Caryophyllene, Germaciene D and Viridifloral were found to be the main compounds of *S. hypergia*. This species was found to be particularly rich in Germacrene D.

PHYTOBIOTICS: A NATURAL, SAFE AND MULTIPLE ACTIONS FEED ADDITIVES FOR ANIMAL FOOD PRODUCTION

YILMAZ BAHTİYARCA¹, MUHAMMET ALI KARA²

ABSTRACT

Phytobiotics which are plant origin products are natural bioactive (secondary) plant compounds such as essential oils, oleoresins and flavonoids, which are derived from various aromatic-medicinal plants and spices as well as fruits constitute. Phytobiotic term is used to identify secondary compounds obtained from these plants as well as plant parts such as fruits, flowers, seeds, roots or bark. In fact, the use of phytobiotics in animal nutrition, which has been used for thousands of years, has received great interest in the past 30 years and more than 300 studies have been published in various journals. Today, in the feeding of poultry and other monogastric animals, this class of feed additives is being used to a great extent as an alternative to antibiotics growth promoters (AGP). Studies have shown that these additives have better physiological effects on many parameters related to yield and health in poultry. These positive effects of phytobiotics are attributed to their antimicrobial, antioxidant, antiviral, antiinflammatory, antiparasitic and insecticidal potentials. The goal of this presentation is to review scientific data related to the effect of phytobiotics on performance, gut health and function, carcass quality of broiler chickens.

ANTIMICROBIAL EFFECT OF GINGER (ZINGIBER OFFICINALE) EXTRACTS AGAINST STREPTOCOCCUS PYOGENES

SERAP DURAKLI VELİOĞLU¹, GÖKSEL TIRPANCI SIVRİ¹

ABSTRACT

Ginger (*Zingiber officinale*) has been used widely as a food spice and an herbal medicine. It is very common to use it to treat sore throat, cough, fever etc., that are prevalent during winter. The purpose of this study was to investigate the antimicrobial effect of ginger extracts against *Streptococcus pyogenes* (ATCC® 19615™) which is group A streptococci causing infections. Although there is a wide range of antibiotics for the treatment of bacterial infections, the development of resistance to chemotherapeutic agents increasingly become a pressing problem which makes researchers looking for alternative therapeutic agents. For this reason, fresh and dried ginger aqueous extracts and essential oils were assessed for their antimicrobial activity. Disc-diffusion method on blood sheep agar was used to test the antimicrobial efficiency of the extracts. The essential oil obtained from hydrodistillation of dried ginger was the most effective with 17.43 mm inhibition zone. The aqueous extracts obtained by decoction process was not effective as essential oils. Tetracycline, cefixime and streptomycin were used as positive controls and antimicrobial activity of the essential oil of dried ginger is not significantly different than that of tetracycline ($p < 0.05$). It was concluded that the essential oil of ginger may contain compounds with therapeutic activity against *Streptococcus pyogenes*.

**DETERMINATION OF SOME IMPORTANT POMOLOGICAL AND
PHYSICOCHEMICAL CHARACTERISTICS OF STRAWBERRY TREE
GENOTYPES (ARBUSUS UNEDO L.) SELECTED IN BOLU
PROVINCE IN TURKEY**

TAKİ DEMİR¹, ÖMER BEYHAN¹, HAMDİ ZENGİNBAL², BAYRAM YURT³

ABSTRACT

This study was carried out in order to determine some important pomological and physicochemical characteristics of strawberry tree (*Arbutus unedo* L.) genotypes selected in Bolu province in Turkey. Twenty genotypes, which were found to be most promising according to the data obtained during the two last years, were examined. Fruit length was ranged from 15.48 to 21.44 mm, fruit width from 14.07 to 21.46 mm and fruit weight from 2.94 to 7.47 gr for the examined genotypes. Soluble Solid Content (SSC) was ranged from 13.95 to 21.75%, fruit juice pH value from 3.40 to 3.83, titratable acid content (TAC) from 0.48 to 0.83%; ash content from 0.428 to 0.848%, moisture content from 63.78 to 77.93%, nitrogen content from 0.11 to 0.3% and protein content from 0.76 to 1.85%. The results obtained suggest that the comparison of the results of the studies done in our country and the international data shows that the genetically domesticated genotypes that have grown in the region constitute a promising potential and that selection studies should be continued under controlled conditions.

**DETERMINATION OF ANTIOXIDANT ACTIVITY, PHENOLIC
COMPOUNDS AND PHYSICOCHEMICAL PROPERTIES OF CHERRY
LAUREL GENOTYPES (*LAUROCERASUS OFFICINALIS R.*) GROWN
IN SAKARYA PROVINCES IN TURKEY**

ÖMER BEYHAN¹, TAKİ DEMİR¹, BAYRAM YURT²

ABSTRACT

This study was carried out in order to determine some important physicochemical characteristics, phenolic compounds and antioxidant activity of cherry laurel genotypes (*Laurocerasus officinalis R.*) grown in Sakarya provinces in Turkey. Fifteen genotypes which were found to be most promising according to the data obtained during the two last years (2014-2015) were examined in this study. The average fruit weight ranged from 1.08 to 5.33 gr, fruit length from 14.07 to 21.46 mm and fruit weight from 2.94 to 7.47 gr. Results showed that dry matter content of fruit ranged from 16.62 to 25.49%, titratable acid content (TAC) from 0.22 to 0.49%; fruit juice pH value from 4.43 to 4.93; nitrogen content from 0.11 to 0.37%, crude protein content from 0.760 to 1.850%, soluble solid content (SSC) from 15.53 to 31.36%, refractive index from 1.356 to 1.385 and ash content from 0.237 to 0.720%. Furthermore, total phenolic content ranged from 1197 to 4741 mg GAE/100 g and antioxidant activity from 3.36 to 25.10% for the studied genotypes. The results obtained suggest that the comparison of the results of the studies were conducted in our country and the international data shows that the genetically domesticated genotypes that have grown in the region constitute a promising potential and that selection studies should be continued under controlled conditions.

IN-VITRO GLYCEMIC INDEX DETERMINATION OF SOURDOUGH BREADS PREPARED BY USING SOURDOUGHS COLLECTED FROM DIFFERENT REGIONS OF TURKEY

EZGI ŐENOL¹, MUSTAFA YAMAN², M. ZEKİ DURAK¹

ABSTRACT

Bread is of great importance for diet of Turkish people. Especially white bread is one of the most consumed foods with its high glycemic index (GI). As known, white sourdough bread or sourdough bread containing different rate of dietary fibers has lower GI than white bread. The aim of this study was to collect traditional sourdough samples from different regions of Turkey and determine the GI of sourdough breads made from these sourdoughs. For this purpose, 5 different traditional sourdoughs were obtained: 4 different homemade white sourdoughs (Ođuzlu (O), Kastamonu (K), Lüleburgaz (L), Afyon/ Bolvadin 2 (B2)) and 1 commercial whole wheat sourdough, Safranbolu Yıldız Fırını (SYF). Sourdough breads were prepared using the dough of these samples with their own flour and long timed-cold fermentation (18h). Then GI values of the prepared sourdough breads were evaluated by using an in vitro method based on Goni-assay calculating the GI by measuring rate of starch digestion. A similar glycemic response was observed for sourdough breads except whole wheat sourdough bread. O, K, L, B2, SYF had GI of 50.05 ± 0.3 , 51.8 ± 1.65 , 50 ± 0.5 , 51 ± 0.5 and 46.5 ± 0.5 , respectively. Compared to the control (White bread, GI: 70), the GI of sourdough breads was found low (<55). There was no significant difference among the GI values of white sourdough breads collected from different regions. The difference of SYF was thought to stem from dietary fiber. There was a negative correlation between the GI value and sourdough - dietary fiber. According the results, the ability of breads to lower GI was affected by sourdough, dietary fiber and long timed-cold fermentation.

CHEMICAL COMPONENTS AND ANTIMICROBIAL ACTIVITIES OF NEST MATERIALS DOLICHOVESPULA SAXONICA

ÖMER ERTÜRK¹, CEREN YAVUZ², ZEYNEP KOLÖREN¹

ABSTRACT

Social wasp nests serve as a place for rearing brood and the centre for their nesting activities [1,2]. Wasps collect plants, woody fibers, mud, which they masticate and mix with oral secretion to construct the nest with a variety of architectural design [1]. This salivary secretion is also used to physically maintain their nests. In the present study, were determined the antimicrobial effects of bee nest samples obtained from East Black Sea Region. The nest of *D. saxonica* collected in Trabzon during July-August 2015 Region of East Black Sea. Larvae, pupae and eggs were removed from the nest. Small fragments were cut from the comb for observation. The nests were stored in the Entomology Laboratory at Biology Department of Ordu University. The antimicrobial effects of bee nest sample was determined with disc diffusion method. The antimicrobial activity of bee nest samples was studied using ten microorganisms. Three gram-positive: *Staphylococcus aureus* ATCC®25923, *Micrococcus luteus* B1018, *Basillus subtilis* B209, and five gram negative: *Proteus vulgaris* B123, *Klebsiella pneumonia* ATCC®13883, *Pseudomonas aeruginosa* ATCC®27853, *Streptomyces murinus* ISP 5091, *Yersina enterocolitica* ATCC®27729, and two fungus ATCC®10231, *Aspergillus niger* ATCC 9642. The antibacterial activity of diluted with ethanol five fraction nest was assayed in vitro by agar disc diffusion method against 8 bacterial and 2 fungi species. The five dilute nest ethanol extract showed Antibacterial antifungal activity. On the other hand, ethanol extracts of almost all the nest exhibited antibacterial antifungal activity towards one or another bacterium against to all of microorganism used in this study. The maximum antibacterial antifungal activity was shown by diluted 25 µL (2.5 mg) of nest extracts 20 µL (2 mg), followed by and 15 µL (1.5mg), respectively. In conclusion, beeswax nest extracts possess a broad spectrum of activity against a panel of bacteria responsible for the most common bacterial diseases. FATTY ACID COMPOSITION OF SOME EUPHORBIA SPECIES BY USING GC/MS

İSMAIL YENER¹, ABDULSELAM ERTAŞ², SERKAN YİĞİTKAN³, MURAT YOLCU⁴, HILAL SARUHAN FIDAN⁵, ESRA YARIŞ², YETER YEŞİL⁶, MEHMET ÖZTÜRK⁷, HAMDİ TEMEL⁸, UFUK KOLAK⁹

ABSTRACT

Euphorbia genus have been investigated for a long time in view of different specialities, like more energy content as alternative source of hydrocarbons, laticifers , phytochemicals and systematics. Mediterranean Euphorbia species have been the object of various studies and they have been proposed as potential renewable sources of unsaturated and uncommon fatty acids. Euphorbia genus patterns has been found to include chemotaxonomically important myrsinane diterpenoids and cycloartane triterpenoids. The aim of this study was to determine the fatty acid composition of petroleum ether extracts of Euphorbia aleppica, E. eriophora, E. grisophylla, E. seguiriana subsp. seguiriana, E. craspedia, E. denticulata and E. fistulosa. E. aleppica, E. eriophora, E. grisophylla, E. seguiriana subsp. seguiriana, E. craspedia, E. denticulata and E. fistulosa species were collected from Turkey (Diyarbakır, Diyarbakır, Van, Diyarbakır, Mardin, Kayseri and Diyarbakır, respectively) and identified by Mehmet Fırat (Yüzüncü Yıl University, Faculty of Education, Department of Biology). Powdered form of the whole plant material was weighed (100 g) and macerated three times with petroleum ether (250 mL each) at 25 °C for 24 hours. Esterification of the petroleum ether extract and GC/MS procedures were applied as described by Ertas et al . Thermo Scientific Polaris Q GC-MS/MS instrument was used. The major fatty acid components were identified as 17-tetratriactonen (31.59%) for E. aleppica, palmitic acid (43.83%) for E. eriophora, hexatriasontan (52.32%) for E. grisophylla, 17-tetratriactonen (19.86%) for E. seguiriana subsp. seguiriana linoleic acid (40.52%) for E. craspedia, 17-tetratriactonen (64.75%) for E. denticulata and hexatriasontan (38.13%) for E. fistulosa.

DETERMINATION OF BIOACTIVE COMPONENTS OF THYMUS PRAECOX OPIZ. SSP. GROSSHEIMII PLANT BY USING ON-LINE HPLC-FRAP METHOD

NESİBE ARSLAN BURNAZ¹, MURAT KÜÇÜK², KAMIL COŞKUNÇELEBİ²

ABSTRACT

Thymus praecox OPIZ ssp. grossheimii (Ronniger) Jasas, which is an aromatic plant with its own odor, is used for therapeutic purposes. It is a thyme species and is known as the "yayla çayı" in the Sürmene, county of Trabzon, in Turkey. It is consumed as herbal tea because of its appetizing, digestion facilitating and nervous relaxing effects. It also has antimicrobial and antioxidant effects and is used in cases of colds. In this study, FRAP (Fe (III) reduction antioxidant power) assays were performed by spectrophotometric (off-line) and on-line HPLC methods in yayla çayı extracts prepared in six different solvents (water, methanol, ethanol, isopropanol, butanol and acetonitrile). By the developed post-column HPLC-FRAP method, separation and antioxidant activity determination were performed simultaneously. In the course of method development with HPLC, fifteen phenolic acid standards were used (gallic acid, protocatechuic acid, protocatechuic aldehyde, p-OH benzoic acid, chlorogenic acid, vanillic acid, caffeic acid, syringic acid, vanillin, p-coumaric acid, syringic aldehyde, benzoic acid, ferulic acid, sinapic acid and rosmarinic acid). When chromatograms of yayla çayı extracts in different solvents were examined, the most phenolic acids (protocatechuic acid, protocatechualdehyde, p-OH benzoic acid, vanillic acid, caffeic acid, syringic acid, ferulic acid) were detected in the aqueous extract of yayla çayı. In addition, when the spectrophotometric (off-line) iron (III) reduction potential values of 1:10 diluted samples of yayla çayı extracts were compared in μM FRAP and μM TEAC, especially the iron (III) reduction antioxidant power value (1501 μM FRAP, 590 μM TEAC) of aqueous extract was found significantly higher than the others. The fact that this plant is consumed as a tea brewed with water among the people and shows highest activity in aqueous extract makes consumption of yayla çayı become important (*). *This work reflects a part of the doctoral thesis prepared in Karadeniz Technical University, Institute of Science, Department of Chemistry and was supported by Scientific Research Project of KTU. Project No. 666 (2008-111.02.5).

HAMİT USLU¹, GÖZDE ATILA², MUSA KARAMAN³

ABSTRACT

Diabetes mellitus is a metabolic disorder that is diagnosed with hyperglycemia resulting from defects in insulin secretion, insulin action, or both. The chronic hyperglycemia can adversely effect various organs like as eyes, kidneys, liver, nerves, heart, and blood vessels. The existing drugs are not treating diabetes only in the prevention of complications. Nowadays researchers are directed to find new sources due to the lack of certain treatment of diabetes. For this reason herbal sources have begun to be preferred because of the less or no side effects. The extract used in this study was obtained from *Prunus laurocerasus* leaves. *Prunus laurocerasus* is a member of the Rosaceae family which is known wild cherry or chery laurel. This plant is mostly spread on during the coast of the Black Sea region of Turkey and is locally called Taflan or Karayemiş. This species is also well known as a traditional medicine in northern side of Anatolia; the leave extract is used in the therapy of coughs, hemorrhoids, eczemas, asthma, digestive system complaints as well as in the treatment of stomach ulcers. In northern Anatolia, the fruits and seeds of Cherry laurel are used against Diabetes mellitus and its complications widely on the grounds that useful in among to local people. In this study, we aimed to determine effect of administering oral Cherry laurel leaf extract and subcutaneous insulin for 28 days on fasting blood glucose and glycated hemoglobin (HbA1c) levels and oxidative stress. It was determined that *Prunus laurocerasus* plant has antioxidant properties in vitro total phenolic component, nitric oxide scavenging and iron reduction tests. A total of 60 Spraque-Dawley rats, aged 2 months, divided into 6 groups including 10 animals, were used. Groups were consist of normoglycemic control group, diabetic control group, 500 mg/kg (PL500), 1000 mg/kg (PL1000), 1500 mg/kg (PL1500) leaf extract administrating groups and insulin group (2IU). The rats were defined as type I diabetic if the fasting blood glucose levels were higher than 200 mg/dL after 72 hours of Streptozotocin administration. Blood glucose levels in insulin-treated group significantly decreased from day 7th ($p<0.05$). At the end of study blood glucose levels of PL500, PL1000 and PL1500 groups lower than diabetic control group, though this reduction was not significant ($p>0.05$). HbA1c levels significantly increased ($p<0.05$) as serum insulin levels decreased ($p<0.001$) in the diabetic control group. However no significant change in both insulin and HbA1c levels in the experimental group ($p>0.05$). Thiobarbituric acid reactive substances (TBARS) levels increased in both the liver and kidney tissues ($p<0.05$, $p<0.001$ respectively), while catalase (CAT) ($p\leq 0.001$) and superoxide dismutase (SOD) ($p<0.001$, $p<0.05$ respectively) levels decrease significantly in the diabetic control group compared to

normoglycemic control group. Despite significant reduction of TBARS levels in kidney tissue at the end of substances use ($p \leq 0.001$), this reduction was observed only in the liver of the insulin group ($p < 0.05$). SOD enzyme levels of the PL500, PL1000, PL1500, and of the insulin groups were significantly higher than the liver ($p < 0.01$) and kidney ($p \leq 0.001$) tissues of the diabetic control group. CAT enzyme levels in liver ($p < 0.05$) and kidney ($p < 0.01$) tissues were increased by insulin administration, but the changes in other groups were not significant ($p > 0.05$). In conclusion, *Prunus laurocerasus* has not been a significant effect on hyperglycemia, HbA1c and insulin levels in diabetes, but it has been determined that to be effective in reducing oxidative damage by decreasing TBARS levels and increasing SOD levels.

LAVENDER ESSENTIAL OIL IN CLINICAL PRACTICE

ENES BULUT¹, DİLEK ÇİLİNGİR¹, CEYDA UZUN ŞAHİN²

ABSTRACT

Patients take health care due to their health problems. In health care process, people get medical treatment and/or surgical treatment. Because they think that they will have high level of pain and they will die due to operation, especially in surgical treatment people are anxious. Also, because there are invasive approaches, infection risk is available. These problems increase the hospitalization time and health care costs. Also they effect negatively the quality of health of people. To eliminate these possible situations, drugs have different effects are used. But using many drugs cause liver dysfunction. To hinder this, today complementary therapies are used commonly. Aromatherapy is one of these therapies. In this therapy, essential oils extracted from aromatic plants are used. These oils can be applied by inhalation, topical or massage. Lavender essential oil is well known. This essential oil has different properties. Some of these properties are antiseptic, antifungal, sedative, anxiolytic and analgesic activity. In the literature, it is seen that lavender essential oil is used for different aims and it has positive effects. Soltani et al. (2013) found that aromatherapy with lavender essential oil was effective to decrease the number of required analgesics after tonsillectomy. Ghods et al. (2015) stated that topical application of lavender essential oil decreased intensity of pain related to dialysis needles. In an other study conducted with patients undergoing coronary artery bypass graft surgery, Bikmoradi et al. (2015) found that lavender aromatherapy decreased the systolic blood pressure. Also Vakilian et al. (2011) stated that lavender was superior to povidone-iodine for episiotomy wound care. As seen in the studies, lavender essential oil is important in managing the symptoms which can be seen in health care. By generalizing this therapy, a qualified care can be provided to patients. For this, more scientific meetings should be organized and people should be informed.

NORHARMANE PRODUCTION OF ANABAENA ORYZAE UNDER DIFFERENT TEMPERATURE AND LIGHT CONDITIONS

TÜNAY KARAN¹, RAMAZAN ERENLER¹

ABSTRACT

Cyanobacteria are photosynthetic prokaryotes found in all around the world including the extreme condition. Cyanobacteria have been accepted as one of the most promising groups of organisms having biologically active natural products. Herein, *Anabaena oryzae* was collected from freshwater and was isolated under inverted microscope. Identification was carried out by morphologically. The isolated *Anabaena oryzae* was cultivated in BG11 nutrient medium. The different temperature and light conditions were executed at 15 °C and 35 °C at the irradiation of 1896 lux and 4300 lux. The norharmane production was determined by HPLC using the C18 120 A reverse phase column. Based on the results, the amount of norharmane at 15 °C and 1896 lux, 15 °C and 4300 lux, 35 °C and 1896 lux, 35 °C and 4300 lux were 0.231, 0.268, 2.741, 1.016 µg/g respectively.

**EVALUATION OF PULPS OF THE FRAGRANT JUNIPER
(JUNIPERUS FOETIDISSIMA) CONES USED FOR PRODUCTION IN
THE ISPARTA REGION**

HASAN ASLANCAN¹, İSMET DOKUR², RAFET SARIBAŞ¹, NAZLI ÖZGÜ²

ABSTRACT

Total forest area in our country is 21,678,134 ha and it is constitutes 27.6 % of our total land size. Approximately 4.29 % (958.423 hectares) of this area constitutes the junipers that have the potential to use as a non-wood forest product. In our country, especially Eğirdir Forest Nursery, Forest Nursery Directorates collect an average of 85 tons of cones every year and about 5 million fragrant juniper (*Juniperus foetidissima*) saplings produced from these cones. During this production, about 20 tons of seeded cone emerged and this pulp completely discarded. In this study, the evaluation possibilities of the Fragrant Juniper (*Juniperus foetidissima*) pulp as a non-wood forest product investigated. In the study, it was determined that the fragrant Juniper (*Juniperus foetidissima*) cone pulp contained about 2% volatile oil. It found that about 400 liters of juniper volatile oil could obtained annually when about 20 tons of pulp produced.

ISOLATION OF AXILLARIN FROM TANACETUM ALYSSIFOLIUM AND DETERMINATION OF ANTICANSEROGEN AND ANTIOXIDANT PROPERTIES

SAMED ŐİMŐEK¹, EKREM KÖKSAL¹, MUSTAFA ŐATIR¹, ALI RIZA TÜFEŐÇ², İBRAHİM DEMİRTAŐ²

ABSTRACT

The aim of this study was to isolate the available secondary metabolites in *Tanacetum alyssifolium* plants by column chromatography and determine their structures with spectroscopic methods. It was also aimed to examine the antioxidant and anticancerogen properties of *Tanacetum alyssifolium*. For this purpose, *Tanacetum alyssifolium* plants was collected from the foothills of Munzur Mountains in Erzincan province and dried at room temperature. The upper part of ground plant was extracted with ethyl acetate/ butanol solvent system. The ethyl acetate extract was subjected to the procedure of column chromatography. The structure of the isolated compound with column chromatography method was elucidated by spectroscopic techniques (1D-NMR, 2D-NMR, HPLC-TOF). The isolated compound was determined as 2-(3,4-dihydroxyphenyl)-5,7-dihydroxy-3,6-dimethoxy-4H-chromene-4-on (axillarin). The antioxidant capacity of the isolated compound was evaluated with CUPRAC method and DPPH radical scavenging activity tests, respectively. Trolox was used as standard antioxidant. In terms of the iron (Fe+3) reduce ability, axillarin compound was found to have more reduction potential than standard trolox and when compared the copper (Cu+2) reduce ability, axillarin compound displayed less reduction potential. However, axillarin and trolox showed close results in terms of DPPH radical scavenging capacities. For anticancerogen tests, 3 different concentrations of axillarin compound were prepared and applied to HeLa cells in order to determine the concentration at which the maximal activity was shown. The highest anticancerogen activity was observed at 50 µg/mL and reached at 43 hours.

THE EFFECTS OF TARAXACUM OFFICINALE EXTRACT ON HYPERLIPIDEMIA, OXIDATIVE STRESS AND VASCULAR CONTRACTION–RELAXATION RESPONSES IN EXPERIMENTAL TYPE II DIABETES

HAMİT USLU¹, GÖZDE ATILA², EMİN ŞENGÜL³, VOLKAN GELEN², DİNÇER ERDAĞ⁴, MUSTAFA MAKAV²

ABSTRACT

Diabetes mellitus is a very important health problem increasing day by day in the world. This disease negatively affects of the entire body, especially the cardiovascular system. Nowadays, there is no drug that treats diabetes precisely; for this reason scientists to search for new sources of may be effective on diabetes and its complications. *Taraxacum officinale*, a member of the Asteraceae family, its expressed that to be effective in the treatment of disorders such as upper respiratory tract infections, jaundice, anemia, fever, eye problems, gastrointestinal problems, eczema in traditional medicine. There are also expressions that *Taraxacum officinale* may have an impact on the complications of diabetes. In this study, we aimed to determine the effects of administering oral *Taraxacum officinale* extract and metformin for 30 days on the hyperlipidemia, oxidative stress and vascular contraction–relaxation responses in type II diabetic rats. *Taraxacum officinale* plant was collected from Trabzon province and then extracted with ethanol using soxhlet method. It was determined that *Taraxacum officinale* plant has antioxidant properties in vitro total phenolic component, nitric oxide scavenging and iron reduction tests. In this study a total of 50 Sprague Dawley male rats, aged 3 months, divided into 5 groups including 10 animals, were used. Groups were consist of normoglycemic control (NC), extract (E) (50 mg/kg), diabetic control (DC), diabetic + extract (D + E) (50 mg/kg) and diabetic + metformin (D + M) (1000 mg/kg). Rats with fasting blood glucose levels of ≥ 200 mg/dL 7 days after nicotinamide + streptozotocin injection were defined as type II diabetics. Serum HDL, LDL and triglyceride levels were determined by commercial ELISA kits. MDA, GSH and GPx analyzes were performed spectrophotometrically in homogenizates obtained from heart and aortic tissues. Furthermore, thoracic aorta tissues were used for take values of phenylephrine (PE 10-9–10-5 M) induced contraction acetylcholine (ACh 10-8–10-5 M) induced relaxation in the isolated organ bath. The triglyceride level decreased significantly in the D+E ($p < 0.05$) and D+M ($p < 0.001$) groups compared to the DC group. LDL cholesterol level increased, while HDL cholesterol level decreased significantly in the DC group ($p < 0.01$). Although there were some positive changes in HDL and LDL cholesterol levels of D+E and D+M groups, this changes was not significant ($p > 0.05$). The MDA level of aortic tissue was significantly elevated in the DC group ($p < 0.01$), but this result did not change with substance applications ($p > 0.05$). There was no change in the MDA levels of heart tissue among groups

A DIFFERENT USE AREA OF AROMATIC PLANTS: LIQUID SMOKE FOR MEAT PRODUCTS

CEM OKAN ÖZER¹

ABSTRACT

Researchers and industry in many different areas have been an increased interest in medicinal and aromatic plants in recent years. However, aromatic plants have been used in preservation of meat products by smoking process for centuries. The smoking process of meat products is one of the most ancient and important methods. Smoking process contribute flavor and color of meat products with aromatic compounds and additionally show bacteriostatic and antioxidant effect. However, from a human healthy point of view, smoking with gases is not very favorable as it generates several polyaromatic hydrocarbons that are carcinogenic compounds. Therefore, liquid smoke has been used as an alternative method to gas smoking in recent years. The organoleptic smoke properties depend on the smoke composition and therefore depend on the source from which it is produced. Some aromatic plants such as daphne, juniper, thyme and linden have used in liquid smoke. These aromatic plants provide suitable gas composition that contains some phenols, carbonyls, alcohols and organic acids for meat products. In this review study, properties and usage areas of liquid smoke produced from aromatic plant for meat industry are explained.

IMPORTANT FUNGAL DISEASES IN CUMIN PRODUCTION AND SUGGESTIONS FOR THE DISEASE MANAGEMENT

GÖKSEL ÖZER¹, HÜSEYİN KABAKCI¹, GÜLSÜM PALACIOĞLU², HARUN BAYRAKTAR²

ABSTRACT

Cumin is an important spice plant that is widely grown in the Central Anatolia Region of Turkey and commonly used in cooking and also in traditional medicine because of its essential oils. Cumin production is seriously affected by some seed-borne and soil-borne plant pathogens causing significant crop losses. Different fungi species that cause diseases were determined previously in cumin production. *Fusarium* wilting caused by *Fusarium oxysporum* f.sp. *cumini* and *Alternaria* blight caused by *Alternaria burnsii* have been identified as the most important diseases limiting the production of cumin in Turkey. In the field observations, *Alternaria* blight was determined as the most widespread in the periods after flowering and the losses could be up to 100% in some areas. It has been observed that *F. oxysporum* f.sp. *cumini* restricts seed germination, destroys the root systems and causes typical signs of wilting. In this study, the prevalence of the pathogens, favorable environmental conditions required for the disease epidemic and genetic structures of the pathogens were assessed. The necessary elements to be considered in the breeding studies and integrated diseases management methods to prevent possible losses have been discussed.

ANTIOXIDANT, ANTIMICROBIAL ACTIVITIES, AND PHENOLIC COMPOUNDS OF LYCOPUS EUROPAEUS DETERMINED BY LC/MS- MS

ABDÜLMELİK ARAS¹, EKREM KÖKSAL², HATICE TOHMA², ÖMER KILIÇ³, YUSUF ALAN¹, İLHAMİ GÜLÇİN⁴, ERCAN BURSAL¹

ABSTRACT

Evaluation of biological activities of medicinal plants is important, because they are the largest natural source of pharmaceuticals. In the present study, we assessed antioxidant, antimicrobial activities, and phenolic composition of *Lycopus europaeus*, (*L. europaeus*) which is widely known and used in medicinal treatments in different part of the globe. For Antioxidant activity of the sample, CUPRAC, FRAP and DPPH assays were utilized. For Antimicrobial activity properties, disc diffusion method was used against three Gram positive, four Gram-negative microbial species and three fungi species. Phenolic composition of *L. europaeus* was evaluated by LC/MS/MS technique. The result showed that water and ethanol extract of *L. europaeus* exhibited moderate metal reducing and DPPH radical scavenging activities compared to standard antioxidants (BHA, BHT and ascorbic acid). The sample showed the strongest antibacterial activity against the *B. megaterium*, *K. pneumoniae* and *E. aerogenes*, weak antibacterial activity against *P. aeruginosa*, *S. aureus* and *E. coli* however no antifungal activity. The HPLC-MS/MS analysis has revealed that Rosmarinic and Kaempferol are the most abundant phenolics among the studied 27 compounds. The findings of this study have could be useful for the preparation of high-value medicines and functional ingredients for foods.

TOTAL PHENOLIC CONTENT AND ANTIMICROBIAL ACTIVITY OF METHANOL EXTRACT OF GERANIUM MACRORRHIZUM L. (GERANIACEAE) NATURALLY FOUND IN TURKEY

S. ELIF KORCAN¹, İBRAHİM BULDUK¹, YASEMİN S. KARAFAKİOĐLU¹, MERAL ÖZTÜRK¹, HAVA KÖLEM EK¹,
AHMET KAHRAMAN¹

ABSTRACT

The genus *Geranium* L. is taxonomically classified within the family Geraniaceae and comprises about 400 species distributed in temperate regions and tropical mountains all over the world. Turkish *Geranium* includes 40 species, 9 of which are endemic. *G. macrorrhizum* L. is mainly distributed in temperate zones of Europe, but in Turkey it is only found on the Kapıdađ Peninsula (Erdek, Balıkesir Province). This species is a perennial herbaceous plant with a stout, long, cylindrical and horizontal rhizome, orbicular leaves and erect stems with entire and magenta petals. *Geranium* has been used in folk medicine for the treatment of various ailments due to its therapeutic characteristics, such as anticarcinogenic, antipyretic and antiseptic in wounds. However, total phenolic content and antimicrobial activity of many species of this genus have been virtually unexplored. In this study, total phenolic content and antimicrobial activity of methanol extracts of *G. macrorrhizum* in Turkey were comprehensively investigated for the first time. The level of total phenols in methanol extracts was determined by using Folin–Ciocalteu reagent and external calibration with gallic acid. The absorbance was measured at 760 nm using a spectrophotometer. The concentration of the total phenolics was calculated as mg of gallic acid equivalent by using an equation obtained from gallic acid calibration curve. The total amount of phenolic substance in the extracts was 76.32 mg. GAE/g.sample DW. Additionally, susceptibility tests were performed by the disc diffusion method of Bauer et al. (1966) with Mueller-Hinton agar (Difco). Zones of inhibition were measured after 24 hours of incubation at 37°C. A bacteria culture was used to Mueller-Hinton agar plates evenly using a sterile swab. The test organisms used in this study were as follows: *Escherichia coli* ATCC35218, *Klebsiella pneumoniae* ATCC700603, *Bacillus subtilis*, *Pseudomonas aeruginosa* ATCC27853, *Staphylococcus aureus* ATCC25923, *Enterococcus faecalis* ATCC 51299 and *Listeria monocytogenes* ATCC1911. Methanol was used as a negative control while Ceftizoxime (ZOX 30 µg), Penicillin (P 10U), Tetracycline (TE 30 µg), Clindamycin (DA 2 µg), Erythromycin (E 15 µg), Chloramphenicol (C 30 µg), Ofloxacin (OFX 5 µg) and Vancomycin (VA. 30 µg) were used as positive controls. The antibacterial activities were assessed by the presence or absence of inhibition zones and MIC values. The negative control showed no inhibiting effect. The antimicrobial activity of GE extract was compared with standard antibiotic disc and showed inhibition diameters ranging from 8 to 46 mm. The microbial strains displayed a variable degree of susceptibility against the GE methanole extract. Antimicrobial activity was observed against *K. pneumoniae* ATCC700603, *B. subtilis*, *S. aureus* ATCC25923 and *E. faecalis*. The most susceptible bacteria to the *G. macrorrhizum* extract preparations was *K. pneumoniae* ATCC700603 (13 mm).

ANTIBIOFILM EFFECTS OF THREE MACROFUNGİ (MORCHELLA ANGUSTICEPS, TRAMETES VERSICOLOR, LACTARIUS DELICIOUS) ON ENTEROCOCCUS FAECALIS

ARZU COLERİ CİHAN¹, BASAR KARACA¹, AYSE BUSRA KARAKAYA¹, ILGAZ AKATA¹, ERGİN MURAT ALTUNER²

ABSTRACT

It is commonly well known that 80% of all the bacterial infections are in relation with biofilms. Due to common problems caused by biofilms, alternative antibiofilm strategies must be developed. Enterococcus strains are able to form complex surface-associated communities, called biofilms, contributes to its resistance and persistence in both host and non-host environments. Mushrooms are functional foods and a source of physiologically beneficial medicines. Possible antibiofilm effects of medicinal mushrooms have also a notable potency against biofilms. Additionally, increasing prevalence of infectious diseases is becoming a world wide problem, and the resistance problem demands that novel antimicrobial agents originated from natural products such as medicinal mushrooms to combat with the infections should be observed. The present study reports the capacity of three medicinal methanolic macrofungi extracts (Lactarius deliciosus, Trametes versicolor, Morchella angusticeps) to inhibit in vitro biofilm formation by Enterococcus faecalis ATCC 21599 strain. The strain's antimicrobial susceptibility testing was performed by microdilution method. 6.25, 12.5, 25, 50, 100, and 200 mg/mL concentrations of three macrofungi extracts were selected to perform MIC (Minimum Inhibition Concentration) test. For antibiofilm assays, the optimum biofilm forming capacity of the strain was primarily confirmed under different incubation conditions such as incubation period (24-48 h) and culture media (TSB medium was adjusted with the different concentrations of glucose; 0, 0.25, 0.5, 1.0, and 1.25%) by microtiter biofilm assay. Quantification of the antibiofilm effects of macrofungi was carried out by modifying the microtiter biofilm formation protocol described by Stepanovic et al (2000). Briefly, in a U bottom 96 microplate, wells were filled with 200 μ L different concentrations of methanolic macrofungi extracts (6.25, 12.5, 25, 50, 100, and 200 mg/mL) and at 5% (v/v) inoculum. Following this step, the microplate was incubated at 37 $^{\circ}$ C for 48 h. To quantify biofilms, the each well was discarded and washed 3 times with sterile 0.85% NaCl in order to remove non-adherent cells. The attached biofilm samples were fixed with 200 μ L of methanol (95%) for 10 min. Methanol was then discarded and the wells were air dried. After that, 200 μ L of crystal violet solution (0.1%, prepared with distilled water) were added to the wells for 30 min. Excess stain was removed by rinsing the plate under tap water and then air dried. The bounded dye was dissolved with 70:30 ethanol-acetone solvent mixture for 15 min. The amount of dye was quantified by measuring the Optical Density (OD) at 595 nm using a microtiter plate reader. Results for this test were given as percentage of biofilm formation inhibition applying the following formula: Biofilm formation inhibition percentage = $[100 - (OD_{\text{assay}}/OD_{\text{control}})] \times 100$. The MIC values were determined as 50, 25, and 50 mg/mL for M. angusticeps, T. versicolor, and L. delicious respectively. The optimum biofilm forming conditions for the strain were assigned as 48 h-incubation period and

Corresponding Author: ARZU COLERİ CİHAN, arzucoleri@gmail.com

¹ANKARA UNİVERSİTY

²KASTAMONU UNİVERSİTY

0.50% glucose concentration. The biofilms were sampled considering these conditions for antibiofilm assays. While all macrofungi extracts had inhibitory effects on the biofilm formation of the strain, *T. versicolor* extract was found to be the most effective with the highest reduction rates of 99.54, 100, and 100% (50, 100, and 200 mg/mL, respectively). The results obtained showed that all the tested mushroom extracts, but mostly the *T. versicolor* extract, had inhibitory effects on *E. faecalis* biofilm production. As this report was the first on the inhibition of *E. faecalis* biofilms by these macrofungi extracts, it can be concluded that medicinal macrofungi could be considered as candidates for novel antibiofilm strategies.

ANTIMICROBIAL EFFECT OF ESSENTIAL OIL EXTRACTS OF ONION AND GARLIC

DIDEM SÖZERİ¹, NİHAT AKIN², MEHMET DEMİRCİ²

ABSTRACT

Physical and chemical preservative methods were used for many years to protect foods from spoilages and pathogens. Essential oil extracts which extracted from various part of plants have been considered as natural preservatives or food additives. They are mixture of numerous components and aromatic oily liquids. They also contain alkaloids, flavonoids, isoflavonoids, tannins, coumarins, glycosides, terpenes and organic acids which may have antimicrobial and antioxidant properties. Distillation, extraction and pressing methods are used in extraction of essential oils from matrix. Allium family have more than 500 species although have similar biochemical, nutraceutical and phytochemical properties. Many are known to have antibacterial and antifungal effects because of containing antioxidants, sulphur and phenolic components. Onion and garlic are members of Allium family and also contain medically important organosulfur including components. The aim of this study was to discuss area of utilization and antimicrobial effect of essential oil extract of onion and garlic.

USE OF AROMATIC PLANTS AND SPICES AS AN ALTERNATIVE FEED ADDITIVE

AYSUN KOP¹, ALI YILDIRIM KORKUT¹, HATICE TEKOĞUL¹, HÜLYA SAYĞI¹, HARUN DIRAMAN²

ABSTRACT

The rapid increase in the world population makes it necessary to use limited food sources more efficiently. Today, it has been understood that a balanced diet is very important for people. The production of aquatic products in the world and in Turkey is increasing every year and natural fish stocks are decreasing due to various environmental factors. This suggests that the products obtained through hunting can no longer be increased and that existing stocks must be protected. As a result, it is inevitable that there will be an increase in the products obtained by aquaculture. Along with the increasing amount of aquaculture, the feed sector has also gained great importance. In aquaculture, feed constitutes 40-60% of the cost required for successful and healthy production. Fish feeds are obtained by mixing animal (fish meal, fish oil, squid flour, crab flour, shrimp flour, fish silage etc.) and vegetable (soybean flour and pulp, wheat, corn flour and gluten etc.) raw materials as well as feed additives (Antioxidants, pigment substances, vitamin-mineral mixture, etc.) in varying proportions. Fish meal is the most widely used protein source in fish feeds because of its good protein quality, its rich energy and mineral properties, its high digestibility and its consumption by fish. Due to the fact that the factories producing fish meal in Turkey are few and the nutritional content of fish flour is inadequate, the importation of fish meal from abroad has begun to be started and the feed cost has increased accordingly. Therefore, research on the use of alternative vegetable protein sources to reduce the use of fish meal in fish feeds has begun to gain importance. As raw materials of alternative vegetable origin which can be used in fish feed, algae, hazelnut meal, potato flour, duckweed, alfalfa flour can be given. Alternative raw materials of animal origin are more limited, such as worm flour and black fly flour. New alternative additives used in practice are enzymes, organic acids, probiotics, oligosaccharides (prebiotics) and plant extracts. The aim of this study was to investigate the use of natural and partially cheaper aromatic plants and spices such as fennel, marjoram, caraway, chamomile and garlic as alternative feedstuffs and / or additives in previous national and international publications and to evaluate the nutritional content of the morphological properties and its benefits and to investigate its use in fish feeding.

SYNERGISM BETWEEN LACTARIOUS DELICIOUS AND VANCOMYCIN AGAINST VANCOMYCIN-RESISTANT ENTEROCOCCUS FAECIUM

ARZU COLERİ CİHAN¹, BASAR KARACA¹, ERGİN MURAT ALTUNER², ILGAZ AKATA¹, OZLEM YILDIRIM¹

ABSTRACT

Novel drug development strategies are needed to struggle antimicrobial resistance. The object of our study is to highlight a strategy such as: treating *Enterococcus faecium* antibiotic resistance with Lactarius delicious extract rather than individual antibiotics. In this respect, screening of antimicrobial activity of medicinal and edible macrofungus *L. deliciosus* was performed against vancomycin resistant *Enterococcus faecium* NJ-1 and this natural macrofungus extract and antibiotic combinations were evaluated to treat *E. faecium*. Disk diffusion and micro dilution tests were performed according to the National Committee for Clinical Laboratory Standards guidelines for enterococci (NCCLS). Agar well diffusion and micro dilution tests were also performed with methanolic (60%) extracts of *L. deliciosus* against *E. faecium* NJ-1 strain. Minimum bactericidal concentrations (MBC) of vancomycin and *L. deliciosus* extract were also determined to maintain combinative antibiotic/macrofungus antimicrobial studies. 99.9% logarithmic reduction of the bacterial population was considered as MBC value for both antibiotic and *L. deliciosus* extract. While performing the MBC assay, EC50 values were synchronously determined by performing plate count assay and the logarithmic reductions of microbial populations under different concentrations of antibiotic and macrofungus extracts were evaluated by "XLSTAT" 2017 software, in terms of evaluating the effects of antibiotic/macrofungus extract combinations further. For developing an approach in an effort to evaluate possible antimicrobial interactions (synergistic, antagonistic, additive etc.), vancomycin/*L. deliciosus* extract was selected in different combinations. The possible antimicrobial effects of combinative vancomycin/macrofungus extracts were quantified and determined by the "Compusyn" software. The strain was found to be resistant to vancomycin with 6 mm (milimeter) zone diameter (disk diffusion) and with $\leq 128 \mu\text{g/mL}$ MIC value. 10 mg/mL and 50 mg/mL concentrations of methanolic medicinal *L. deliciosus* extracts were used to evaluate antimicrobial susceptibility with agar well diffusion method. Both 10 mg/mL and 50 mg/mL extracts of *L. deliciosus* were found to be effective against the strain with the inhibition zone diameters of 17 mm and 30 mm, respectively. 6.25 mg/mL concentration of *L. deliciosus* was found as MIC value against the strain. 1024 $\mu\text{g/mL}$ of vancomycin concentration and 25 mg/mL of *L. deliciosus* extract values were found to be as MBC values. EC50 values of vancomycin and *L. delicious* extract were calculated as 145.4 $\mu\text{g/mL}$ and 12.41 mg/mL, respectively by XLSTAT software. 140, 145.4, and 150 $\mu\text{g/mL}$ concentrations of vancomycin, 10, 12.41, and 15 mg/mL concentrations of *L. delicious*, and all possible dual combinations of these factors were applied to calculate "dose effects" and "dose response curves". Dose effects values were specified according to the log-reduction of microbial population by using XLSTAT software. Obtained dose effect data were used to model the

Corresponding Author: ARZU COLERİ CİHAN, arzucoleri@gmail.com

¹ANKARA UNIVERSITY

²KASTAMONU UNIVERSITY

drug/macrofungus interaction by using Compusyn software. According to the “dose response index” (DRI) and dose response curve data, there was an absolute synergism between the vancomycin and *L. delicious* extract. As the aim in this study was to achieve synergistic therapeutic effect and dose reduction, it was absolutely concluded that natural products, such as *L. delicious*, could be taken into consideration to struggle with the antibiotic resistance in the context of combining medicinal macrofungi extracts and commonly used antibiotics. This approach has a notable potency to develop alternative clinical applications to struggle infectious diseases.

TRUFFLES AND STUDIES OF FOREST GENERAL DIRECTORATE

ÖZGE DENLİ¹, ÖZGÜR BALCI², MURAT MASUN³

ABSTRACT

Truffles have a special position in gourmet kitchens, due to their intensive aroma. Valuable truffle species grow naturally in forests that are especially in Mediterranean ecosystem. The amount of truffles, which are harvested from natural areas, is not enough to supply the demands. Therefore, many European countries like France, Spain, Italy, Norway and Sweden, United State of America, Australia and many other countries like New Zealand carry out truffle cultivation. There are many families in Europe engaged in cultivation of truffles and transferring it from generation to the next. Cultivation of truffles is more complex than typical mushroom cultivation. The cultivation of this mushroom which is the fruit of the mycorrhizal collaboration between forest trees and fungus needs specific seedling propagation techniques. The most valuable truffle species are Tuber magnatum, T. melanosporum and Tuber aestivum which can all be cultivated except T. magnatum. T. aestivum can be collected from natural Red pine-oak and Black pine-oak mixed forests in Turkey. Truffle hunting has its own unique methods, because the fungus matures under the soil and never appears on the soil surface. Till 2014, local people who live in naturally truffle distributed regions did not have the tradition of collection, consume and trade in Turkey. The General Directorate of Forestry prepared the Truffle Action Plan in 2014 with the recognition of that truffles naturally grow in many parts of Turkey but were not know by the people. The aim of the action plan is to stimulate the collection truffles from nature, and increase the knowledge and awareness of local people and entrepreneur to establish the specific plantations for truffle cultivation. In this work, the studies which were carried out by the General Directorate of Forestry related to truffles and the plans which are under consideration for future activities are explained. Additionally, the fields where truffle mushrooms are grown in Turkey, the actual situation of truffle market in the world, and ecological needs of truffle mushrooms are given.

USE OF AROMATIC PLANT EXTRACTS IN CHEESE PRODUCTION

NEŞE BADAĞ¹, YUSUF TUNÇTÜRK¹

ABSTRACT

Nowadays, the use of natural additives as food preservatives has become popular due to concern for synthetic chemical additives and consumer conscious. There is great interest in developing new techniques to make foods safer and more natural. High quality flavored cheeses containing some aromatic vegetable such as sage, thyme or rosemary have been described as suitable in studies. Aromatic plants and their essential oils can be used as antimicrobial and antioxidants agents and also some of them can prevent cheese blowing. Cheeses are traditionally affected by common paste defects known as early and late blowing. Early blowing is caused by coliform bacteria such as Escherichia coli, Enterobacter aerogenes and late blowing is caused by butyric acid fermentation of the clostridial spores present in raw milk. The use of certain aromatic plants as antimicrobial agent can prevent blowing defect and innovative cheese covers may help to prevent the external growth of fungal spoilers and thus avoid consumer exposure to mycotoxins. In addition, recent research on spices and aromatic herbs suggests that they may be more effective in improving flavour and preserving food than artificial flavourings.

EVALUATION OF PLEUROTUS OSTREATUS EXTRACTS FOR ITS POTENTIAL ANTIBIOFILM ACTIVITY

**BASAR KARACA¹, NAZNOOSH SHOMALI MOGHADDAM¹, AYSE BUSRA KARAKAYA¹, ARZU COLERİ CİHAN¹,
OZLEM YILDIRIM¹**

ABSTRACT

Biofilms are structures formed by aggregates of bacterial cells on both biotic and abiotic surfaces. These naturally existing biofilms can cause major risks to human beings, as 80% of the bacterial infections were obtained by biofilms. Biofilms are major causes of nosocomial infections and the bacterial attachment to some surfaces and the subsequent biofilm formation are important steps in the establishment of chronic infections. In the food industry, biofilms can be a source of recalcitrant contaminations, causing food spoilage, and are possible sources of public health problems. The reason why bacteria growing in biofilm structures attain antimicrobial resistance is still unknown. Therefore, the resistance of biofilm cells to antimicrobial agents make biofilms important on behalf of discovering and developing novel and natural antibiofilm and antimicrobial agents. In this context, a common edible mushroom, *Pleurotus ostreatus* was evaluated with respect to its antibiofilm activities on Gram-positive and Gram-negative pathogens. *Pseudomonas aeruginosa* ATCC 27853, *Escherichia coli* ATCC 25922, *Staphylococcus epidermidis* ATCC 35984, and methicillin-resistant *Staphylococcus aureus* (MRSA) ATCC 43300 strains were used both antimicrobial and antibiofilm assays and were routinely cultured in Tryptic Soy Broth (TSB) at 35°C. A total of 20 g *P. ostreatus* dried samples were powdered and treated with 200 mL of 95% ethanol under shaking conditions at room temperature for 24 h. Then, the ethanolic extract was filtered through Whatman No. 4 paper, and finally, the filtrate was lyophilized. The lyophilized extract was resuspended in sterile distilled water with a final concentration of 200 mg/mL. The other extraction protocol was carried out with hot water. 20 mg of the dried sample was boiled in 200 mL of distilled water for 2 h. These two suspensions were used in both antimicrobial and antibiofilm assays. Biofilm production conditions were optimized for all strains before antibiofilm assays. Cultivation under low osmolar conditions (Luria-Bertani broth without NaCl) at 28°C for *E. coli*, cultivation in TSB medium supported with 3% NaCl, and 1.0% glucose at 35°C for *S. aureus*, and *S. epidermidis*, cultivation in TSB medium supported with 0.5% glucose for *P. aeruginosa* were preferred to increase their biofilm productions. Antimicrobial assay was performed according to the microdilution method (NCCLS). Antibiofilm assays were performed according to the Stepanovic et al. (2000) with slight modifications. Briefly, the TSB broths, prepared according to the optimal biofilm forming conditions of the pathogens and different concentrations of ethanolic and hot water extracts of *P. ostreatus* (0, 6.25, 12.5, 25, 50, and 100 mg/mL) were transferred to the U bottom 96 well microtiter plates with a final concentration of 200 µL. The plates containing *E. coli* cultures were incubated at 28°C, whereas other bacterial cultures were incubated at 35°C for 24 h. The wells, containing only bacterial inocula, and the wells containing only test media were considered as positive and negative controls, respectively. At the end of the incubation period, crystal violet binding assay was performed to determine the potential antibiofilm

Corresponding Author: **BASAR KARACA**, karaca@ankara.edu.tr
¹ANKARA ÜNİVERSİTESİ

activities of these extracts. Briefly, the plates were aspirated and washed with sterile physiological serum for three times. The dried plates were filled with 200 μ L of 95% methanol and emptied again. Following this step, the plates were filled with 0.1% crystal violet solution and incubated for 30 min at room temperatures. Finally, the plates were rinsed under running tap water and each well was filled with 200 μ L of an ethanol:acetone solvent mixture (70:30) to dissolve the bounded dye. The dissolved dye was quantified by measuring the Optical Density (OD) at 595 nm using a microplate reader. Results for this test were given as the percentage of biofilm formation inhibition using the following formula: Biofilm formation inhibition percentage = $[100 - (\text{OD}_{\text{assay}} / \text{OD}_{\text{control}})] \times 100$. There was not a significant antimicrobial activity on all the tested bacteria, but a significant antibiofilm activity of *P. ostreatus* was observed. The ethanolic extract of the mushroom sample was found to be more inhibitive on biofilm formation than hot water extract. The highest antibiofilm effect was detected on MRSA for both ethanolic and hot water extracts (almost 100% reduction). The lowest antibiofilm effect was detected on *P. aeruginosa* ATCC 27853 strain for the ethanolic extract of the mushroom sample having a reduction rate of 45.78%. *P. ostreatus* is an edible mushroom that also has high medicinal value such as its antimicrobial effect. In this study, *P. ostreatus* was tested for its ability to inhibit the in vitro biofilm formation of common pathogens for the first time. It can be certainly concluded that this mushroom should be taken into consideration to develop novel antibiofilm strategies.

USE OF BLACK SEED IN FOODS AS A NATURAL ADDITIVE

YUSUF TUNÇTÜRK¹, NEŞE BADAĞ¹

ABSTRACT

Nowadays, there is a tendency for the use of additives which will not affect the structure, appearance, taste and smell of foods negatively and will protect the microbial, physical and chemical properties of foods. Synthetic antioxidants have been used to prevent oxidation, which is one of the most important problems that can occur during the storage of foods, and to extend the shelf life of foods. In recent years, due to their toxicological and carcinogenic properties synthetic antioxidants added to food has been avoided. The most important feature of antioxidants to be added to food is being natural, not synthetic. Another criterion for the use of antioxidants is the low cost of antioxidants, which is an important factor in consumer preference. One of the plants with antioxidant effect is the essential oil of black seed. Black seed is a valuable medicine and spice plant of Ranunculaceae family whose botanical name is *Nigella sativa* L. and used for more than 2000 years. Seed, oil and seed components - mainly thymoquinone - are traditionally used because of their potent therapeutic properties. It has attracted attention recently due to its antimicrobial, antioxidant, antiinflammatory, gastroprotective, antidiabetic, antitumor, hepatoprotective, immune system strengthening effects and contains important fatty acids, vitamins, minerals and volatile components. Black seed is widely consumed worldwide as food and spices due to its nutritious, flavorer and ornamental qualities.

TOTAL PHENOLIC CONTENT AND ANTIMICROBIAL ACTIVITY OF METHANOL EXTRACT OF STACHYS OBLIQUA WALDST. & KIT. AND S. THRACIA DAVIDOV (LAMIACEAE) IN TURKEY

S. ELIF KORCAN¹, YASEMIN S. KARAFAKIOĐLU¹, İBRAHİM BULDUK¹, HAVA KÖLEMEK¹, MERAL ÖZTÜRK¹,
AHMET KAHRAMAN¹

ABSTRACT

Stachys L. is one of the largest genera of the family Lamiaceae with about 300 taxa. Stachys is a taxonomically complex and widely distributed genus in the temperate regions of the world. Many species of Stachys mainly grow in rocky areas. In Turkey, it is represented by 110 taxa, 51 of which are endemic. *S. obliqua* Waldst. & Kit. is a perennial plant with erect stems, oblong-lanceolate basal leaves, mostly remote verticillasters, subcampanulate sepals and pale yellow petals. *S. thracica* Davidov is a perennial plant with erect or ascending stems, oblong or oblong-lanceolate to lanceolate basal leaves, distant verticillasters, subcampanulate sepals and purple petals. Phytochemical investigations on Stachys species have shown the occurrence of flavonoids, diterpenes, phenyl ethanoid glycosides and saponins. They have been reported to treat genital tumors, sclerosis of the spleen, inflammatory tumors and cancerous ulcers. The aim of this work is to comprehensively investigate total phenolic content and antimicrobial activity of methanol extracts of *S. obliqua* and *S. thracica* naturally growing in Turkey. The level of total phenols in methanol extracts was determined by using Folin-Ciocalteu reagent and external calibration with gallic acid. The absorbance was measured at 760 nm using a spectrophotometer. The concentration of the total phenolics was calculated as mg of gallic acid equivalent by using an equation obtained from gallic acid calibration curve. The total amount of phenolic substance in the extracts was 35.76 mg. GAE/g.sample DW. Susceptibility tests were also performed by the disc diffusion method of Bauer et al. (1966) with Mueller-Hinton agar (Difco). Zones of inhibition were measured after 24 hours of incubation at 37°C. A bacteria culture was used to Mueller-Hinton agar plates evenly using a sterile swab. The test organisms used in this study were as follows: *Escherichia coli* ATCC35218, *Klebsiella pneumoniae* ATCC700603, *Bacillus subtilis*, *Pseudomonas aeruginosa* ATCC27853, *Staphylococcus aureus* ATCC25923, *Enterococcus faecalis* ATCC 51299 and *Listeria monocytogenes* ATCC1911. Methanol was used as a negative control while Cefprozime (ZOX 30 µg), Penicillin (P 10U), Tetracycline (TE 30 µg), Clindamycin (DA 2 µg), Erythromycin (E 15 µg), Chloramphenicol (C 30 µg), Ofloxacin (OFX 5 µg) and Vancomycin (VA. 30 µg) were used as positive controls. The antibacterial activities were assessed by the presence or absence of inhibition zones and MIC values. The negative control showed no inhibiting effect. The antimicrobial activity of extract of the species studied was compared with standard antibiotic disc and showed inhibition diameters ranging from 7 to 18 mm. The microbial strains displayed a variable degree of susceptibility against the methanol extract of the species examined. Antimicrobial activity was observed against *K. pneumoniae* ATCC700603, *S. aureus*

Corresponding Author: HAVA KÖLEMEK, hava.klmc@gmail.com

¹UŞAK ÜNİVERSİTESİ

ATCC25923 and *E. faecalis*. The most susceptible bacteria to their extract preparations was *S. aureus* ATCC25923 (17 mm).

THE INVESTIGATION OF GENOTOXIC EFFECTS OF SITAGLIPTIN THE ACTIVE INGREDIENT OF AN ANTIDIABETIC DRUG USING CHROMOSOMAL ABERRATION TEST

DENİZ YÜZBAŞIOĞLU¹, CEMİLE ENGÜZEL¹, FATMA ÜNAL¹

ABSTRACT

Sitagliptin, the active ingredient of an anti-diabetic drug, is used in the treatment of Typ 2 diabetes mellitus. The aim of the present study was to investigate the ability of Sitagliptin to induce chromosomal aberrations (CAs) in human lymphocytes in vitro. The effect of Sitagliptin on mitotic index (MI) was also evaluated. 31.25, 62.50, 125.00, 250.00, 500.00, 1000.00 µg/mL concentrations of Sitagliptin were used. A negative, a solvent (25% DMSO) and a positive control (MMC) were also included. This study was approved by the ethical committee of Gazi University, Faculty of Medicine (14.11.2012-363). Sitagliptin significantly increased the frequency of CAs at 125.00, 500.00, and 1000.00 µg/mL concentrations for 24 h and at all the concentrations for 48 h treatment compared to the negative control. MI significantly decreased at the highest concentration (1000.00 µg/mL) of Sitagliptin for 24 h treatment and at all the concentrations of Sitagliptin (except for 31.25 µg/mL) for 48 h treatment compared to the negative control. Our results demonstrate that Sitagliptin have clastogenic and cytotoxic effects on human lymphocytes in vitro. Acknowledgment: This study was supported by TUBITAK under the project number 212T256.

INVESTIGATION OF RETINOL (VITAMIN A) POTENTIAL ANTIGENOTOXIC EFFECTS ON MITOMYCIN-C GENOTOXICITY BY CHROMOSOMAL ABERRATION TEST

KÜBRA SEVİMLİ-CAN¹, DENİZ YÜZBAŞIOĞLU¹, ECE AVULOĞLU-YILMAZ¹, FATMA ÜNAL¹

ABSTRACT

Vitamin-A (Vit-A) has a supporting effect on skin and immune system and protects against harmful effect of pro-oxidants. The free radical scavenging effect of Vit-A is ineffective to neutralize of singlet oxygen (1O₂), but it is considered to be a strong antioxidant since it can affect the level of other antioxidants in the tissue. In this study, potential antigenotoxic effect of Vit-A (retinol) was investigated in human peripheral lymphocytes (HPLs) by chromosomal aberration (CA) test against Mitomycin-C (MMC), an antitumor agent. Different concentrations of retinol (0.05, 0.010, 0.015, and 0.020 µg/mL) were used in combination with Mitomycin-C. Three treatment procedures were applied for 24 h and 48 h; pre-, simultaneous and post-treatment. At the 24 h pre-treatment with retinol, the percentage of abnormal cells and the frequency of abnormality significantly decreased in all the concentrations compared to positive control. This decrease was significant at the two highest concentrations at simultaneous treatment and at the only highest concentration at post- treatment. At 48 h, in all the treatments and concentrations (except 0.05+MMC µg/mL in simultaneous treatment) the frequency of abnormality and percentage of abnormal cells reduced compared to positive control. These results indicates that retinol reduced the frequency of CAs induced by MMC at all the treatment types. It can be concluded from these results that retinol has protective and ameliorating effect against MMC induced genotoxicity in vitro human lymphocytes.

QUALITY EVALUATION OF FLAXSEED AND BLACK CUMIN OIL OBTAINED BY MICROWAVE AND ULTRASONIC EXTRACTION

FETHIYE TAKADAŞ¹, ONUR DÖKER¹

ABSTRACT

The growing interest in green chemistry requires fresh perspectives on analytical extractions on the medicinal and aromatic plants. Reduced solvent consumption, alternative safer solvents, and reasonable energy demands must be balanced with traditional analytical considerations such as extraction yield and selectively [1]. Especially medicinal and aromatic plant extraction methods tend to use of green solvent and new extraction technologies instead of the traditional methods. Studies in recent years, different extraction methods of plant extraction have been become crucial. Some of those supercritical fluid extraction, microwave extraction, ultrasonic extraction and accelerated solvent extraction [2,3]. In this study, the effect of different extraction technologies on flaxseed oil and black cumin oil composition will be aimed. However, these investigations are needed for the appropriate assessment of the prospective of these novel techniques. Also, black cumin seed oil and flaxseed oil is quite valuable in terms of the linoleic acid and oleic acid. The presence of these bioactive compounds helps in the prevention of cardiovascular diseases, diabetes, memory loss, and constipation. In accordance with the aim of this work, the oils will be extracted by microwave extraction and ultrasonic extraction with ethanol and oil composition will be analyzed. Consequently, for these seeds, which are wealthy in terms of fatty acid, an alternative extraction method will be investigation. [1] Essel, Victor, and Douglas E. Raynie. EFFECT OF LAVANDULA ANGUSTIFOLIA ESSENTIAL OILS ON SOME RHEOLOGICAL PROPERTIES (ALVEOGRAPH AND FARINOGRAPH) OF DOUGH

HARUN DIRAMAN¹, YUNUS EMRE GÖKÇE², TURGAY ŞANAL³, AMIR SOLTANBEİĞİ⁴

ABSTRACT

The effects of *Lavandula angustifolia* essential oils on rheological profiles (alveograph and farinograph characteristics) and also, some chemical properties (moisture content 12.1 %, ash content 0.73 %, total protein content 12.90 %, wet gluten 31 %, Perten Gluten Index 90 %, standard and modified sedimentation tests 39 ml and 62 ml respectively, before essential oil addition) for flour quality were investigated. There is no detailed study concerning the effect of essential oils of *L. angustifolia* on rheological properties (alveograph and farinograph) of dough. Aromatic profile of essential oil obtained by a hydrodistillation method from *Lavandula angustifolia* (leave + flower) grown in Afyonkarahisar – Turkey (Medicinal and Aromatic Plant Center), was determined by GC-MS (Agilent 7890 B) and this volatil oil contained as major components 1,8 Cineole (59.446 %), camphor (7.202 %), Linalol (5.368 %), β -pinene (2.950), dl-linomenen (2.337%) and α -pinene (1.460 %), respectively. This essential oil from *Lavandula angustifolia* was added to dough as % 0.2 in the course of mixing. The purpose of the present study was to elucidate the effect of essential oils (0.2 % *Lavandula angustifolia*) on the alveograph and farinograph characteristics of wheat dough. The standard and modified Zeleny sedimentation values and all farinograph data (except for development time) were generally not affected by adding with essential oil (*Lavandula angustifolia*). These results on dough rheological were rewardigly found based on alveograph (increasing W [213 -230 Joules] and L [34 -38 mm]) and farinograph data(increasing development time 2.29 – 7.49 and Falling Quality Number 116-122).

INFLUENCE OF DIFFERENT CARBON SOURCES ON GROWTH AND ROSMARINIC ACID ACCUMULATION OF THYMUS LEUCOTRICHUS HAL. SHOOT CULTURES

TUBA BEKİRCAN¹, MUSTAFA CÜCE², SERCAN YILDIRIM¹, ATALAY SÖKMEN³

ABSTRACT

Aim of the study: The aim of this study was to examine the effect of different concentrations of sucrose on growth and rosmarinic acid accumulations in vitro grown *Thymus leucotrichus* Hal. **Material and Methods:** Four different groups were obtained by changing the sucrose concentrations of the MS medium which include 2 mg/L 2ip and 0.1 mg/L NAA. Cultures in sucrose-containing (10%, 20%, 30%, 40%) media were evaluated 4 weeks later. Number of shoot and node, shoot length, fresh and dry weight of *Thymus leucotrichus* seedling were measured. In addition, the in vitro grown seedlings were dried and subjected to HPLC analysis to determine the amount of rosmarinic acid. **Results:** The highest shoot length (34.00 ± 2.83 mm) and number of nodes (6.47 ± 0.68) were observed at 10% sucrose concentration. The highest number of shoots was observed in the medium containing 30% sucrose with 4.47 ± 0.51 . When the fresh (114.8 ± 11.2 mg) and dry weight (18.05 ± 1.6 mg) parameters were examined, the most effective group was 40% sucrose concentration. While rosmarinic acid content of natural seedling was 6.78mg/g dry weight the highest rosmarinic acid value observed in the experimental groups was 19.10 ± 1.10 mg / g dry weight at 40% sucrose concentration. As the sucrose concentration increased, the amount of rosmarinic acid was found to be statistically significantly increased

PHYTOESTROGENS EFFECTS ON CARDIOVASCULAR DISEASES

GÜLİZER ÇELİK¹, MÜBERA ÇİL¹, BÜŞRA GÖZ¹, EZGİ TOPTAŞ BIYIKLI¹, ALI EMRAH BIYIKLI¹, ELMAS ERSÖZ¹

ABSTRACT

Cardiovascular diseases have the most incidence density all over the world which are originated from oxidative stress, reactive oxygen production and peroxidation of lipids. In order to prevent this disease, decrease its complications or inhibit its development diet has an important factor. Phytoestrogens which are a kind of functional nutrition, act as a guardian against oxidative stress on the vascular cells. This property of phytoestrogens is coming from the endothelial nitric acid synthesis, thereby stimulating the vasodilatation activity. In addition to this, phytoestrogens provide anti thrombotic and anti atherogenic effects. **OBJECTIVE:** In this review study, phytoestrogens cardiovascular risk factors, serum lipid levels, inflammatory reagents and arterial hardness effects are investigated. **METHOD:** According to the up to date literature research, the influence of phytoestrogens which are naturally occurring on the food or supplementary phytoestrogens on cardiovascular diseases are investigated. **RESULTS:** Soya, which's phytoestrogen contribution is too high, is consumed too much in Asia territory. According to this, the cardiovascular disease rate in Asia is too low with respect to western populations. Phytoestrogens, especially increase the isoflavone groups anti oxidative activity and nitric oxides bioavailability and thereby provides vasodilatation and prevents vascular cell damage. In addition to this, it decreases liver and/or total serum triglyceride level and/or LDL cholesterol, and it increases HDL cholesterol and/or HDL/LDL cholesterol rate. Therefore it has positive effects on cardiovascular disease risk factors. Phytoestrogens contribute to the vascular consistency and helps to prevent hypertension which is one of the important risk factor due to atherosclerosis. In some studies it is mentioned that, there is a reverse relationship between dietary isoflavones and aorta hardness. However, there are also some studies which provide that, the isoflavones coming from soya and red trefoil has no influence on cholesterol levels. **CONCLUSION:** Phytoestrogens could be one of the important nutrition for preventing cardiovascular diseases which are the most common public health issue. However, there should be more studies made on this issue, in order to understand its effects more clear and the amount should be consumed for these type of illnesses.

DETERMINATION OF FACTORS AFFECTING INDIVIDUALS' THYME CONSUMPTION (THE CASE OF MANISA PROVINCE OF SALIHILI DISTRICT)

RÜVEYDA KIZILOĞLU¹, SARA NİLDA ATAĞLU¹

ABSTRACT

Total spice plant production in Turkey is 38341 tons for the year 2016. Of these 48.48% are caraway, 38.40% are thyme, 6.59% are black seed, 6.43% are fennel and 0.11% are coriander. A total of 14724 tons of thyme were produced in Turkey in 2016. Thyme was produced 1585 tons in TR33 (Manisa-Afyon-Kütahya-Uşak) region and 828 tons of in Manisa province. In other words, the production of Manisa is generated thyme constitutes 5.62% of Turkey and 52.24% of the region. With 752 tons of production, Salihli is firstly found in 90.82% of the thyme production. Salihli produces 47.44% of the region's thyme production and 5.11% of Turkey. In this context, it is aimed to determine of the individuals in Salihli Province, which is one of the most produced places of the region and province the level of thyme, which is one of the medicinal aromatic plants, consumption consciousness and factors affecting thyme consumption. This was discussed with 272 individuals determined by proportional sampling. The average age of the interviewed individuals was found to be 36.07 age, 52.21% female, 63.60% single and average income was 2,634.77 TL / month. The first ten medicinal aromatic plants that individuals bought; sage (%85.29), mint (%74.26), thyme (%73.53), tilia (%70.96), garlic (%68.75), nettle (%61.40), dill (%58.46), hibiscus (%49.63), cumin (%47.43) and nigella (%45.96). Thyme, which is the third choice for individuals to consume consumption is 59.10 grams per month. Binary logit analysis was used to determine the factors that affect the thyme consumption of individuals. A dummy variable is used as a dependent variable for consuming or not consuming thyme. As an explanatory variable; the age of the individual, gender, marital status, education status, monthly income, the number of individuals in the family, the state of knowing the definition of medical aromatic plants, use purpose (treatment and odor-taste), consumed amount, purchasing frequency (weekly and monthly), preferred shape (open and packed) and the factors to be considered when purchasing (harvest time, color, smell, freshness, drying environment, amount of drying and amount of moisture) were modeled. As a result of the analysis, it was determined that thyme consumption at the 5% significance level negatively affected the gender and the product positively affected the open purchase and drying environment. That means that women may consume 9% more thyme than men. One unit increase in thyme consumption is expected to increase by 14% when buying thyme, rather than buying it openly. In the same way, consumers consume about 11% of the drying environment compared to those who do not consume. It was observed that those who prefer to use for treatment, use for taste, and purchase once a week, which are meaningful at the 1% significance level, are positively related to consumption. One unit increase in those who prefer to consume is a 45% increase in therapeutic use. That is, consumers consume 45% probability of treatment according to their consumption. It has been determined that 21% of the thyme is consumed

Corresponding Author: **SARA NİLDA ATAĞLU**, arasadlin25@gmail.com

¹GAZİOSMANPAŞA ÜNİVERSİTESİ

for taste and odor. One unit increase in the likelihood of consuming another tag is expected to increase the likelihood of choice for taste and odor by 21%. The likelihood of consuming in individuals is directly proportional to the increase in the purchase frequency of thyme. That is, a unit increase in the likelihood of consumption is expected to increase the frequency of purchases per week by 21%. It gives the result that the individual prefers to consume freshly or take it as much as they need to buy thyme.

PHYTOESTROGENS AND THYROID FUNCTIONS

GÜLİZER ÇELİK¹, BÜŞRA GÖZ¹, MÜBERA ÇİL¹, EZGİ TOPTAŞ BIYIKLI¹, ELMAS ERSÖZ¹, ALI EMRAH BIYIKLI¹

ABSTRACT

Thyroid gland is an organ which regulates the metabolic functions via hormones. Heredity, microorganisms, aging, iodine deficiency or over iodine and some of the medicines could cause thyroid originated illnesses. In addition to these, some endocrine damagers may negatively influence thyroid functions. Phytoestrogens are natural endocrine damagers. A phytoestrogen called genistein effects thyroid functions negatively. Therefore studies made to understand this issue. **OBJECTIVE:** In this study, thyroid autoantibody, subclinical hypothyroid parameters are investigated with their interactions between phytoestrogens. **METHOD:** Phytoestrogen supplementation and its effects to thyroid related sicknesses are investigated through literature research. **RESULTS:** Most of the studies point that, phytoestrogens effect the connections of thyroid hormone receptors to the thyroid hormone and negatively effects the thyroid hormone signals. Guanthyrogenic effects of genistein is coming from isoflavone's thyroid hormone synthesis, its metabolism and thyroid hormone transport proteins. Some invivo and invitro studies shows that, genistein inhibits the thyroid peroxidase (TPO) which have an important role in synthesis of thyroid hormone, and decreases the thyroid hormone levels in the circulating system. Soya, which contains phytoestrogen, consumption negatively influences the thyroid functions. Although there are some studies which reveal that, phytoestrogen consumption on healthy or thyroid sickness persons has no reasonable effects. **CONCLUSION:** Phytoestrogens have lots of positive effects on healthy people. However it shows negative influences on thyroid metabolism. But at some studies it has no effect on thyroid functions. In order to enlighten this topic, there should be more studies made.

**DETERMINATION OF TOTAL PHENOLIC, TOTAL FLOVANOID,
CONDENSED TANNINS AND ANTIOXIDANT ACTIVITY OF
KARAÇALI FRUITS (PALIURUS SPINA CHRISTI)**

KASIM TAKIM¹, MESUT IŞIK², ADEM NECİP²

ABSTRACT

Paliurus spina-christi (PSC) plant is used against the antidiarrhea, diuretic and rheumatism among the population. In addition, the plant's samara-type fruits are used as anti-inflammatory agents against kidney stones, chest and eye infections, and the leaves are externally used for inflammation of the uterus [1]. There are five known species of plant, a member of the Rhamnaceae family. In Turkey, there are only *P. spina-christi* Mill from these five species [1]. The PSC (blackcurrant) plant is a very well known plant in Asia and the Mediterranean region. Southern Europe, Crimea, Caucasus, Western Syria, North-South-West Iran and Northern Iraq. Where the forests are destroyed, the invaders are in frequent bushes and woodlands. The zigzag branch, which grows in almost all Anatolia in Turkey, is seen as a thorny hedge with a height of two to three meters. Leaves are ovate, stipules are thorn-like, flowers are yellow, fruits are circle; Flat, winged, three-seeded and dry [3]. In this study on the mature fruit of the PSC known to be biologically active, Total phenolics, total floovoid and condensed tannin analysis of the fruits used as part of the plant were investigated and the antioxidant activity was investigated accordingly. The total phenolic compound content of the PSC extracts prepared by the deoxygenation method was found to be $22,10 \pm 0,09$ mg Gallic Acid Equivalent / g dry PSC. Total amount of flavonoid compound: $8,29 \pm 0,07$ mg Quercetin Equivalent / g dry PSC. The amount of compound in the condensate of PSC extracts was determined to correspond to $238,11 \pm 2$ mg Tannic Acid Equivalent / kg dry PSC. The total antioxidant capacity of PSC was determined by Cuprac method and found to be 10.47 ± 0.07 mg Trolox Equivalent / g dry PSC. This result shows that Trolox, Ascorbic acid and BHT, which are standard antioxidant compounds and used for comparison, have higher activity. In addition, the DPPH method was used to determine the specific antioxidant properties of PSC, and consequently PSC was reduced to $63.69 \pm 1.32\%$ at $30 \mu\text{g} / \text{mL}$ with gallic acid as standard antioxidant compounds ($66.33\% \pm 2.11$), BHT ($42.44 \pm 1.87\%$) showed higher radical reduction activity than trolox (23.10 ± 0.91) and ascorbic acid ($28.38 \pm 1.12\%$).

ANTIHYPERTENSIVES AND GENOTOXICITY

DENİZ YÜZBAŞIOĞLU¹, ECE AVULOĞLU-YILMAZ¹, FATMA ÜNAL¹

ABSTRACT

Hypertension known as high blood pressure is the most common cardiovascular disease in the world. Hypertension usually does not cause symptoms initially, but sustained hypertension over time is a major risk factor for hypertensive heart disease, coronary artery disease, stroke, aortic aneurysm, peripheral artery disease, and chronic kidney disease. Antihypertensive are drugs used to regulate blood pressure which is a measure of the repulsive force of the blood on the vessel wall. In this study, investigations of the genotoxic effect of antihypertensive agents using different genotoxicity tests and model organisms were reviewed and the results were presented. The genotoxic effect of antihypertensive was evaluated in many *in vivo* and *in vitro* studies. Some of these studies showed that some drug active ingredient did not have genotoxic effect. On the other hand, some other studies have suggested that long-term use of antihypertensive drugs may be genotoxic and therefore associated with increased risk of cancer. In addition, the association between hypertension disease and increased incidence of some types of cancer (especially renal cancer) is determined in some studies. For this reason, it is considered that the *in vitro* and *in vivo* genotoxic effects of antihypertensive should be investigated by independent laboratories.

GENOTOXIC AND ANTIGENOTOXIC EFFECTS OF CYNARIN AGAINST MMC- INDUCED MICRONUCLEUS FORMATION

ESRA ERIKEL¹, FATMA ÜNAL¹, DENİZ YÜZBAŞIOĞLU¹

ABSTRACT

Artichokes are traditionally used as a medicinal plant and consumed fresh or canned since ancient times. It has been known that artichoke extracts possess many pharmacological activities, including hepatoprotection, anti-oxidative, anti-inflammatory, anti-microbial, anti-mutagenic, and anti-proliferative effects. It is a good source of natural phytochemicals such as flavonoids (mainly apigenin and luteolin) and hydroxycinnamic acids (mono- and dicaffeoylquinic acids i.e.). Cynarin, a phenolic compound present especially in leaves, is a type of di-caffeoylquinic acid in artichoke. It has strong antioxidant activity. The aim of this study was to investigate in vitro genotoxic and antigenotoxic effects of cynarin against MMC induced micronuclei in human lymphocytes (HLs). HLs from two healthy donors (1 male and 1 female) were incubated with different concentrations of cynarin (6.25, 12.5, 25, 50, 100 µg/mL) alone and simultaneously with mitomycin-C (MMC, 0.20 µg/mL) at 37°C for 48 h. A negative (sterile distilled water), a solvent (50% methanol) and a positive control (MMC, 0.20 µg/mL) were also run. Cytochalasin B was added at 44 h of culture for blocking cytokinesis. Totally, 2000 well-spread binucleated cells (1000 binucleated cells per donor) were examined for each treatment. All the concentrations of Cynarin alone did not induce statistically significant micronuclei formation compared to controls. Simultaneous treatment of Cynarin+MMC diminished the frequency of micronuclei induced by MMC alone compared to positive control in all the concentrations (except 6.25 µg/mL). However, this decline was significant at only 12.5 µg/mL concentration. The results of this study showed that cynarin neither genotoxic alone nor strong antigenotoxic against MMC induced MN formation.

CYTOTOXIC ACTIVITIES OF FRUIT AND LEAF EXTRACTS OF *E. ELATERIUM* AGAINST MALIGN MELANOMA

FATMA AYDOĞMUŞ ÖZTÜRK¹, KERİMAN GÜNAYDIN², MEHMET ÖZTÜRK¹, MUHAMMAD IQBAL CHOUDHARY³

ABSTRACT

Ecballium elaterium, a member of the Cucurbitaceae family, is a poisonous plant. The fruit of the plant is used in different regions of the world to treat sinusitis traditionally. It was reported that it exhibits various biological activities such as cytotoxic, antitumor, anti-inflammatory, antihepatotoxic, purgative, cardiovascular, analgesic and antipyretic. To the best of our knowledge, the studies have been continuing for searching a cure to skin cancer. Recently, the incidence of mortality from malignant melanoma of the skin has been rising rapidly in white populations around the world for many years. It accounts for 75% of skin cancer-related deaths in the world, although the incidence is 4% in all skin cancers. As a continuous of our study, *Ecballium elaterium* was studied against Malign Melanoma cell lines (HT 144). In this study, cytotoxic activity, intracellular ROS production, apoptosis of fruit and leaf extracts of *E. elaterium* were investigated against malign melanoma cells. Our results revealed that the extracts exhibited strong cytotoxic activity against HT 144. The extracts induced cell death through apoptosis was used Annexin V/PI. *E. elaterium* fruit and leaf methanolic extracts also promoted the release of reactive oxygen species (ROS). Therefore, it can be concluded that the cytotoxic activity of *E. elaterium* extracts induced apoptosis through generation of ROS.

DOES LUTEOLIN PROTECTS DNA AGAINST GENOTOXINS?

ESRA ERIKEL¹, DENİZ YÜZBAŞIOđLU¹, FATMA ÜNAL¹

ABSTRACT

Compounds that can resist or repair genetic damage caused by a chemical mutagen are known as antigenotoxic agents. Recently, numerous studies have been conducted on the antigenotoxic effects of phytochemicals. Especially, there has been a growing interest in chemopreventive phytochemicals to protect and to develop alternative treatment strategies against many chronic diseases such as cancer. Luteolin, one of the most common flavonoid, exists in medicinal plants and in some vegetables. A major source of luteolin are celery, green pepper, carrots, olives, and artichokes. It is known that this flavonoid has many biological activities such anti-oxidant, anti-inflammatory, cardioprotective, anti-diabetic, anti-allergic, and anti-cancer. The purpose of this research is to review investigations on genotoxic and antigenotoxic effects of Luteolin. In vivo and in vitro studies using different genotoxicity tests and model organisms have been compiled to include genotoxic and antigenotoxic activity of luteolin against DNA damage induced by various genotoxins (mitomycin -C, aflatoxin B1, and hydrogen peroxide i.e.). Numerous studies have demonstrated that luteolin exhibits protective effect against genetic damage caused by different type of mutagens in in vitro and in vivo. Furthermore, epidemiological studies have shown that luteolin has an anticancer activity against lung, head and neck, prostate, breast, colon, liver, cervical, and skin cancers. Generally, this efficacy of luteolin is associated with the induction of apoptosis and inhibition of cell proliferation, metastasis and angiogenesis. Thus, it is believed that luteolin could be a potent chemopreventive agent.

ISOLATION OF THE CHEMICAL COMPONENTS OF TURMERIC AND THEIR SEMI-SYNTHETIC MODIFICATIONS

GULAY ZENGİN¹, MERVE FIRAT¹, HUSEYİN ZENGİN¹

ABSTRACT

Turmeric (*Curcuma longa*) is a perennial herb of the ginger or Zingiberaceae family. It is cultivated mainly in India, China and South East Asia. The turmeric plant has underground rhizomes, otherwise known as its root, and is a valuable part of this plant, having culinary and medicinal properties. It's scientific history is covered by two centuries of research. It was in the year 1815 when it was first isolated [1] and later in 1870 it's crystalline form was presented [2], being identified as 1, 6-heptadiene-3, 5-dione-1,7-bis(4-hydroxy-3-methoxyphenyl) (1E,6E) or diferuloylmethane. Potential medicinal benefits of turmeric is described in the literature on many occasions, and include anti-microbial and anti-cancer properties, among many others. The literature describes turmeric as an orange-yellow crystalline powder, and with respect to its solubility it is considered to be soluble in ethanol, dimethylsulfoxide, and acetone and insoluble in water and ether [3,4]. The characteristic colour of turmeric is due to the presence of curcumin, the principal curcuminoid found in turmeric. The word curcuminoid has been coined to refer to as the chemical constituents of turmeric and include mainly curcumin (~70%), demethoxycurcumin (~17%) and bis-demethoxycurcumin (~3%), also known as curcumin I, II and III, respectively. Curcumin exists as the keto-enol tautomeric forms, where the keto form predominates in acidic and neutral solutions and enol in alkaline solutions [5]. The aim of this study was to extract and isolate components to be reacted with other compounds, in order to synthesize semi-synthetic compounds of improved medicinal uses. Typical spectroscopic techniques, such as, GC-MS, NMR, FT-IR, UV-Vis and Photoluminescence will be used for characterization purposes and in vitro biological and pharmacology data of these new semi-synthetic derivatives will be obtained. IDENTIFICATION OF THE COMPONENTS OF WALNUT KERNELS AND THEIR SOAP PREPARATION

HUSEYİN ZENGİN¹, ÖZDEN DOĞAN¹, GULAY ZENGİN¹

ABSTRACT

Walnuts are the nuts of temperate regions and belong to the Juglandaceae plant family. They are considered to be the oldest cultivated fruit in the world [1]. Walnuts and grow on large trees and bear edible nuts described as kernels; the most outer part a tough leathery husk, then the hard shell enclosing these kernels. A diet intake of these flavorful nuts provides beneficial effects on the human health, such as the lowering of blood cholesterol [2] and cardiovascular protection [3]. There many varieties of walnuts but the main types are the Persian or English walnut (*Juglans regia* L.), Black walnut (*Juglans nigra* L.) and White walnut (*Juglans cinerea* L.). Walnut kernels are rich in oil content, varying from 52-70%, where cultivar, location and irrigation rate affects this amount [4]. Hence, due to the high fat content, walnuts may assist in skin treatments for the care and repair of skin functions and thus provide valuable cosmetic value. The literature provides a wide variety of other medicinal applications of walnuts and include anti-cancer [5], and anti-microbial properties [6]. The goal of the study was to extract, isolate and identify the components of walnut kernels. Extraction was to be achieved by the soxhlet extraction technique. The extracts were then to be tested for their antimicrobial effects. The collected walnut kernel oils will be utilized for soap making purposes. REFERENCES [1] Caglarirmak, N. DETERMINATION OF THE COMPONENTS OF CRANBERRY SEEDS AND THEIR ANTI-MICROBIAL EFFECTS AND SOAP PREPARATION FROM CRANBERRY SEED OIL

HUSEYİN ZENGİN¹, ADEM MERT¹, GULAY ZENGİN¹

ABSTRACT

Cranberries are evergreen dwarf shrubs found worldwide, and fall under the genus *Vaccinium*, and their subgenii include *oxycoccus*, *erythrocarpum*, *macrocarpon* and *microcarpum*, depending, on the region of cultivation. Cranberry fruit is a berry of admirable sweet sour taste. They have health promoting qualities and may contribute colour, flavour, and nutritional value, allowing them to be used as dyes, foodstuff and dietary supplements. They are well known for their rich phenolic compound content [1], and have been shown to exhibit beneficial anti-oxidant and anti-proliferative properties [2]. Research on the health benefits of cranberries has been provided in the literature on numerous occasions [3,4]. The literature gives a report on the anti-adhesion effects of cranberries, leading to bioactivity against urinary tract infections [5]. Anti-adhesion effects were also observed in another study, offering promise in the prevention and cure of ulcers due to *Helicobacter pylori* infections [6]. Cranberry seeds are described as being the waste material of cranberry fruit. However, the oils extracted from these seeds are known for their fine quality and invaluable cosmetic applications. Cranberry seed oil (CSO) is rich in tocotrienols and tocopherols (Vitamin E), and other anti-oxidants, and has significant amounts of Vitamin A [7], and thus can help nourish, soothe and moisturize skin and hair. The purpose of the study was to isolate and identify the components of CSO. Several CSO extraction procedures will be presented and compared for optimal oil yields. The CSO extracts will be evaluated for their anti-microbial properties, and the extracts collected will be utilized for CSO soap preparations. REFERENCES [1] Singh, A. P., Wilson, T., Kalk, A. SYNTHESIS, CHARACTERIZATION AND ANTI-MICROBIAL STUDIES OF DOPAMINE-DERIVED SULFONAMIDES

GULAY ZENGİN¹, MUDHAFAR SALLOOM AHMED AL TAMEEMİ², HUSEYİN ZENGİN¹

ABSTRACT

Dopamine (DA) is a catecholamine neurochemical having neurohormonal functions that include cognition, and coordination. In addition to being present in the human body, it is found in many types of food. DA is essential for the proper life-dependent functions of the human body, and plays an important role in many diseases and disorders, of which Parkinson's disease [1] and schizophrenia [2] are the most common ill conditions. Further, DA has also been shown to have anti-oxidant properties [3], effectively scavenging any superoxide and hydroxyl radicals (O₂^{•-} and HO[•]-, respectively), and thus has been widely used in the food industry, as well as for medicines. The literature provides work on DA and various derivatives of pharmaceutical applications, and as anti-oxidants and anti-microbial agents in the food and cosmetic industry. Sulfonamide-type drugs are known for their varied biological applications, and are particularly used for the treatment of urinary tract infections, bronchitis and malaria [4]. The aim of this study was to synthesize new dopamine-sulfonamide derivatives with valuable medicinal properties, for potential use in the treatment of various ill states and disorders, and for application in food and cosmetics. The characterization techniques to be used include FT-IR, UV-Vis, GC-MS, NMR and Photoluminescence. Further, in-vitro biological and pharmacology data for the synthesized novel dopamine-sulfonamide derivatives will also be obtained. REFERENCES [1] Mueller, T. EFFECTIVENESS OF GARLIC ON HIGH BLOOD PRESSURE

ÇAĞLAR AKÇALI¹, ASLI UÇAR¹

ABSTRACT

Death rates due to cardiovascular diseases is the first in the world and in our country. Recently it has been reported that garlic has lowered blood pressure and therefore has a positive effect in preventing cardiovascular diseases. This effect was associated with the “allicin” compound found in garlic. While this compound regulates the blood pressure with the help of angiotensin-II inhibition and vasodilator effect, its mechanism of action is still contradictive. It has been stated that garlic and allisin that is its active metabolite cause a nitric oxide dependent relaxation on pulmonic arteries that are isolated from rats. It has been asserted that gamma-glutamyl-S-allyl cysteine which is a peptide in garlic inhibits an enzyme that takes a role in production of certain hormones increasing blood pressure. Moreover, it has been stated that garlic regulates the blood pressure of hypotensive people. Garlic is the second most common consuming food among individuals with cardiovascular diseases due to these effects. It is used in many European countries such as Germany, England and Austria due to its nutraceutical properties. Some studies suggest that garlic and garlic derived bioactives have important medicinal features with the potential for ameliorating hypertension. In this study, it was aimed to investigate the studies which searched garlics’ effect on blood pressure, and to make recommendations interested with nutrition.

ANTIOXIDANT PROPERTIES AND PHENOLIC COMPONENTS OF PRUNUS SPINOSA L. BRANCHES, LEAF AND FRUITS FROM TEKIRDAG

GÜLŞAH YILMAZ¹, YAKUP ŞİRİN², HILAL EBRU ÇAKIR², SEVGİ KOLAYLI²

ABSTRACT

Prunus spinosa, named in traditional as çakal plum, or güvem plum, a species from the family of Rosaceae. A wide distribution area is shown in Anatolia. This plum type is widely consumed as fresh, dried or marmalade. The high antioxidant capacity of the fruit is depends on polyphenols compositions and this changed collected area geographical properties.1 In this study, polyphenolic profiles and antioxidant capacities of Güvem plum was studied in the three part of stembark, leaf and fruit collected from Tekirdağ Muratlı region. The total phenolic contents of the ethanolic extracts was found 382, 927 and 956 mg GAE / 100 g in fruit, leaf and branch, respectively. Rutin was the major component. While rutin, epicatechin and ferulic acid were detected in stembarks, vanillic acid, luteonil, \square -OH benzoic acid and p-coumaric acid were found in the fruits. Syringic acid and cinnamic acid were detected only on the leaf side. Compared with other studies, Gümüşhane species, vanillic acid and benzoic acid were major components of the fruit, but it was found that other polyphenols were changed. As a result, the stembark and leaves of Gövem plum is rich in flavanoids, and it is beneficial for public health to evaluate these parts as phytotherapy. References 1. THE EFFECTS OF DIFFERENT PREPARATION CONDITIONS ON THE ANTIOXIDANT POTENTIALS OF CINNAMON, CLOVE AND HIBISCUS TEAS

FATMA GIZEM AKÇAKAYA¹, LEVENT YURDAER AYDEMİR¹

ABSTRACT

In this study, the effects of different preparation conditions on the antioxidant activities of cinnamon, clove and hibiscus teas were investigated. The teas were prepared by infusion at 95°C and decoction of dried plant materials (2 g/40 ml deionized water) for 5 and 10 minutes. Total phenolic contents (TPC), free radical scavenging activities (FRSA), and iron chelating capacities (ICC) of teas were determined and their antioxidant potentials were evaluated by using Folin-Ciocalteu reagent, measuring the DPPH radical scavenging activity, and measuring the Fe²⁺ chelating capacity, respectively. The highest TPC and FRSA values were determined for hibiscus teas and varied from 19580 to 52779 µg gallic acid/g and from 54.86 to 73.91 µmol trolox/g, respectively. Hibiscus teas had between 2 and 45 times higher TPC and between 1.25 and 17 times higher FRSA than other tea samples. As the infusion time increased from 5 to 10 minutes, TPC (between 12 and 87%), FRSA (between 62 and 93% - except for clove teas) and ICC (more than 500%) values of teas were significantly increased (P<0,05). Particularly cinnamon tea had the highest increment in antioxidant parameters among teas. On the other hand, decoction process had reverse situation and all parameters were inversely changed as the time was increased (P<0,05). Only ICC of clove tea increased almost 4 times. In hibiscus tea, TFC was conserved while FRSA was decreased for 25% as the decoction time was increased. However, decoction process produced teas with lower TPCs compared those of produced with infusion process, FRSA values of teas were higher in 5 minute-decoction but lower in 10-minute-decoction (P<0,05). This study revealed the potential of mostly consumed teas to use as natural antioxidant additive in functional food formulations by determining the variations in their antioxidant activities depending on the preparation conditions. For better evaluation, further studies are needed to determine the storage stability of teas and formation of powder from teas by lyophilization or spray drying.

ABSTRACT

Plants generate secondary metabolites, which could be used as novel therapeutic compounds. These compounds are well known for their beneficial effects on human health. Thus, it is important to evaluate total phenolic and flavonoid contents as well as antioxidant activities of different plants. The present study was conducted to determine the total phenolic/flavonoid content and antioxidant activity of ethanol extract prepared from fruits of *Rosa canina*. This black *Rosa canina* is only grown in Gümüşhane, Bayburt, Ağrı and Erzurum in our country. The total phenolic content of the ethanol extract of the sample were determined using the Folin-Ciocalteu reagent. Antioxidant activity of *Rosa canina* was determined using different in vitro experimental models, which include DPPH, FRAP, CUPRAC and potassium thiocyanate method. Total phenolic and flavonoid contents of *Rosa canina* were found to be 153,4 mg GAE/g and 13,8 mg QE /g, respectively. Antioxidant activity of the sample was comparable to commercial antioxidant standards (BHT, α - tocopherol and trolox). The results showed that *Rosa canina* has moderate free radical scavenging and reducing capacity. Overall, this study discovers total phenolic and flavonoid content as well as antioxidant properties of *Rosa canina*.

POLLEN AND NUTLET MORPHOLOGY OF TWO MEDICINAL SALVIA L. (LAMIACEAE) TAXA IN HATAY

AHMET İLÇİM¹, BERNA DEMİR¹, FARUK KARAHAN¹

ABSTRACT

The genus *Salvia* L. (Lamiaceae), is represented by 950-100 taxa worldwide. The genus has been widely distributed in five regions of the world; central and South America (*500 spp.), western Asia (*200 spp.), eastern Asia (*100 spp.), Africa (*60spp.) and Europe (*36 spp.). Turkey is one of the centres of diversity regions in Southwest Asia with 99 *Salvia* species. Turkey is main center of diversity for the genus. Of the 97 *Salvia* taxa in Turkey, 51 are endemic to the country and endemism rate of the genus is 52,5%. In this study, pollen and seed morphology of *Salvia sericeo-tomentosa* var. *tomentosa* L. and *Salvia sericeo-tomentosa* var. *hatayica* L. endemic for Turkey were investigated. Plants specimens used in this study were collected from Çevlik coastal area (C6 Hatay) in vegetation period in 2016. The detailed pollen and seed morphological structures of *Salvia sericeo-tomentosa* var. *tomentosa* L. and *sericeo-tomentosa* var. *hatayica* L. were comparatively studied using scanning electron microscopy (SEM). In the SEM investigations pollen grains were directly placed onto stubs, sputter-coated with gold, and examined by ZEISS Evo LS10 scanning electron microscope. Palynological analysis showed that the pollen shape of *S. sericeo-tomentosa* var. *hatayica* is oblate, but *S. sericeo-tomentosa* var. *tomentosa* is suboblate. The ornamentasyon are reticulate and bireticulate. Aperture number/type is similar (6-colpus). The nutlets are subprolate and prolate-spheroidal. nutlet surface sculpturing are reticulate. However according to size of nutlets, *Salvia sericeo-tomentosa* var. *hatayica* (1,58x,66 mm) is bigger than *S. sericeo-tomentosa* var. *tomentosa* (1,28x1,62 mm). The results demonstrated that pollen and seed micromorphology useful for the identification of these species. We believe that finding of this study will significantly contribute to the biodiversity and taxonomy studies of medicinal endemic plant species at local and regional scales.

ANTIOXIDANT PROPERTIES OF ETHANOLIC EXTRACT OF BEE POLLEN FROM EREĞLİ (KONYA, TURKEY) REGION

GÖKHAN ZENGİN¹, HALUK OZPARLAK¹, RAMAZAN CEYLAN¹

ABSTRACT

Pollen of bee is one of the purest and the richest natural food supplements packed by honeybees into granules and subsequently harvested from hives by humans. Honeybee-collected pollen is composed of nutritionally essential substances such as proteins, amino acids, carbohydrates, lipids, vitamins, mineral substances and trace elements. Its beneficial effect on health is thought to be due to the presence of phenolic compounds with its antioxidant activity. The aim of this study was to determine the total phenolic and flavonoid contents and antioxidant activity of ethanolic extract of honeybee-collected pollen from Ereğli (Konya, Turkey) region for the first time. In this study, ultrasonication assisted extraction method was used in contrast to routine methods. Total phenolic and flavonoid contents present in the extract were also determined by Folin-Ciocalteu and AlCl₃ assays. Antioxidant activities were investigated by using different assays, including free radical scavenging assays (DPPH and ABTS) reducing power (FRAP and CUPRAC), phosphomolybdenum and metal chelating assays. Total phenolic and flavonoid contents were found to be 15.90 mgGAE/g extract and 4.89 mgRE/g extract, respectively. The extract was more effective than ABTS (34.77 mgTE/g extract) as compared to DPPH (19.64 mgTE/g extract). Moreover, the reducing abilities were 77.12 mgTE/g extract for CUPRAC and 18.02 mgTE/g extract for FRAP. Molybdenum reducing power was found to be 260.54 mgTE/g extract. Ferrous chelating power was 9.47 mgEDTA/g extract. Results indicate that, pollen of bee from Ereğli region could be considered as a natural source of high-valued functional ingredients for further use in healthful formulations.

IN VITRO ENZYME INHIBITORY PROPERTIES OF ETHANOLIC EXTRACT OF BEE POLLEN FROM EREĞLI (KONYA, TURKEY) REGION

GOKHAN ZENGİN¹, HALUK OZPARLAK¹, RAMAZAN CEYLAN¹

ABSTRACT

Bee pollen is a valuable apitherapeutic product greatly appreciated by the natural medicine because of its potential nutritional and medical applications. In the last three decades many papers have been published on issues concerning bee pollen. Although many studies have been conducted on bee pollen and other bee products, there are few studies of enzyme inhibition. Therefore, the enzyme inhibitory potentials of ethanolic extract of honeybee-collected pollen from Ereğli (Konya, Turkey) region were investigated against cholinesterase, amylase and glucosidase for the first time. In this study, ultrasonication assisted extraction method was used in contrast to routine methods. The in vitro enzyme inhibitory potentials were measured with a microplate reader. The activities were evaluated as standard equivalents. The extract was found to be effective on these enzymes. Acetylcholine- and butrylcholinesterase inhibitory activities were 2.51 mgGALAE/g and 1.70 mgGALAE/g, respectively. Anti-diabetic activity was evaluated with α -amylase and α -glucosidase inhibitions and the results were determined as 0.34 mmolACAE/g and 2.57 mmolACAE/g extract, respectively. The results suggested that honeybee-collected pollen from Ereğli region could be considered as a source of natural enzyme inhibitors for the treatment of major health problems such as Alzheimer Disease and Diabetes mellitus.

THE CHARACTERISTICS OF POPLAR MUSHROOM (AGROCYBE AEGERITA) AND WOOD CHICKEN MUSHROOM (LEATIPORUS SULPHUREUS) SPECIES

EYUP BAŞER¹

ABSTRACT

In this study, some characteristics of the species of poplar mushroom (*Agrocybe aegerita*) and wood chicken mushroom (*Leatiporus sulphureus*) identified in Konya ecology have been discussed. The poplar mushroom was found in the root zone of poplar tree and the wood chicken mushroom was found on trunk of the black willow tree (*Salix nigra*). Poplar mushroom is a kind of mushroom which is on the white stalk with a cap and milky coffee color, non-poisonous, edible and delicious. If poplar mushroom spores are present in the roots or logs of old poplar trees, they grow spontaneously when ambient conditions occur. Mushrooms can harvest in 20-28 days, if mushroom spores begin to develop after rainfall in spring and autumn, when the relative humidity reaches 95-100% and the temperature reaches 21-27 °C in Konya central ecology. Poplar mushroom is a natural type of Turkey nature and is not culturally cultivated but it is seen in the nature of Asia, Europe and Australia and culture is also being made. The wood chicken mushroom known as sulfur mushroom is a kind of edible mushroom species from the Polyporaceae family. The taste is known as chicken mushroom because it is similar to chicken meat taste. Chickens are easily recognized by their large clusters of overlapping brackets, and bright yellow-orange colors. The colors fade as the mushroom grows older. Its appearance is impressive, like an opened large flower that is fleshy, in large chunks, and weight can be too much. The chicken mushroom tree which is the subject of my work of this study, have been identified in the fall on the ordinary willow tree (*Salix nigra*). It has been reported in the literature in which chicken mushrooms are also found in eucalyptus, elm and walnut trees. If the chicken mushroom is not harvested on the tree, it becomes aged and becomes wood. Fresh mushrooms should be preferred for consumption. Wood chicken mushrooms can cause allergies in some people. Adults should consume a small amount by trying. It has been reported that wood chicken mushrooms cause some problems such as hallucinations and ataxia in children and that consumption is not appropriate. As a result, the types of poplar and wood chicken mushrooms found in the central ecology of Konya are not among the cultivated mushroom species that are very well known in Turkey. It has been concluded that it is appropriate to study for cultivation these mushroom species in terms of human nutrition and economic contribution.

CULTIVATION OF NATURAL PLANTS "MEDICAL MINT" EXAMPLE IN TOKAT-ERBAA

TUĐBA ŐAHİN¹, CEVDET YILMAZ²

ABSTRACT

The rural part of Tokat's Erbaa County is very rich in terms of medical and aromatic plant diversity, and some people continue their livelihood by collecting them. Some of these plants that grow in natural environment are cultured depending on demand. As a matter of fact, some plants such as rosehip, poppy, fenugreek grass are raised by taking incentives from the government. One of these plants, Medical Mint (*Mentha x piperita* L.), has grown in size over the last years in terms of the size of the cultivation area, as well as the amount of production. In the research, the subjects such as the production, drying, processing, packaging, marketing and exporting of the medical mint in the rural part of Erbaa have been determined on site by contacting the relevant institutions. The research also examines the place of other plants in natural plant diversity of Erbaa and the potential and emphasizes its contribution of Erbaa and Turkey to the economy in case of making use of this potential. Some of the farmers who participated in the medical and aromatic plant course launched in Erbaa in 2012 applied for the benefit of the relevant monetary grant and incentive for production after they have received their certificates. The mint seedlings brought to Erbaa through a company were replicated by two farmers in an area of 100-150 m² and first production was achieved. Thus, the medical mint whose production started in 2013, soon attracted attention with its efficiency in rural part of Erbaa due to the suitability its geographical conditions. Later, as a result of the fact that purchase guarantee was provided for this plant whose production continued with contracted agriculture method to the producers, they achieved a guaranteed and stable income. The harvest that starts on May, despite changing based on the natural conditions, continues up to November in harvesting 4-5 times. At each harvest, 2 tons per acre are produced. There is also no need for extra labor due to the fact that the natural environment conditions are effective and machinery is used during harvest. The harvested medical mint is dried with natural methods and exported abroad through the related company. There are around 10 farmers who produces it, as well as the farmers who are currently in the preparation stage for sowing. With the increasing demand for natural products, studies on medical and aromatic plants in the world and in Turkey have gained importance. Natural plants and new drugs derived therefrom are becoming more and more important as an alternative to widely used drugs such as antibiotics, etc. The increase in the consumption of these plants as raw materials both in the chemical and pharmaceutical industries has also changed the way these plants are obtained. The production in the form of harvest in the past is being replaced with plantation-type production over time. As demand increases in the market, this transition is accelerating. Increasing market value of natural plants has led to the necessity of readdressing the production and sale of these plants with more scientific methods. In addition, in order to slow down the immigration process from rural areas to urban areas, which is one of the biggest problems of our country, the cultivation of these products in the rural areas provides

an important contribution. The revenue generated is likely to be an important revenue channel for those residing in rural areas and wanting to engage in such agricultural activities. As one of the leading counties in Turkey, Erbaa contributes to the economy of the country through both rural development and exports.

INVESTIGATION OF PHENOLIC COMPOUNDS AND ANTIOXIDANT ACTIVITY OF TEUCRIUM POLIUM L. DECOCTION AND INFUSION

ZÜLEYHA ÖZER¹, TURGUT KILIÇ¹, SEMA ÇARIKCI¹, HASIBE YILMAZ²

ABSTRACT

Teucrium polium L. belongs to the family of Lamiaceae (Labiatae), which is one of the most common and diverse plants in the world, comprising over 150 species. T. polium named as 'mayasıl otu' and widely used as herbal tea in folk medicine. Also decoction and infusion of this species is used as treatment diabetes, kidney, liver diseases, stomach and hemorrhoids. In the previously studies anti-inflammatory, anti-nociceptive, anti-bacterial and anti-hypertensive activities of T. polium were reported. In this study, we report the phenolic compounds and antioxidant activity of the decoction and infusion of T.polium. The quantitative amounts of the phenolic compounds were determined by LC/MS-MS. The main compounds and amounts were determined as follow for decoction; fumaric acid, luteolin-7-glucoside, luteolin-5-o-glucoside, palargonin (2060.09; 1167.04; 835.18; 829.96 mg/kg dried herba, respectively). For the infusion samples main compounds and amounts were as follow; fumaric acid, luteolin-7-glucoside, palargonin, luteolin-5-O-glucoside (1456.2; 431.15; 312.5; 278.43mg/kg dried herba, respectively). The antioxidant activities were determined based on three methods: 2,2-Diphenyl-1-picrylhydrazyl (DPPH) free radical scavenging, β -carotene linoleic acid and cupric ion reducing antioxidant capacity (CUPRAC) assays. For all the activity assays, infusion and decoction of the T.polium showed good activity.

PHENOLIC COMPOUNDS AND ANTIOXIDANT ACTIVITY OF SIDERITIS SIPLEA BOISS. TEA

TURGUT KILIÇ¹, SEMA ÇARIKÇI¹, ZÜLEYHA ÖZER¹, HASIBE YILMAZ²

ABSTRACT

The genus *Sideritis* (Labiatae=Lamiaceae), collected under two sections, 46 species, 12 subspecies and two varieties in Turkey. The species are widely found in the Mediterranean area especially Spain and Turkey and Turkey is gene center of these species. Moreover *Sideritis* is one of the genera with high endemism rate, almost 80%. The species have spread especially in Western Anatolia. *Sideritis* species have been popularly used as herbal tea especially in Aegean and Mediterranean regions for centuries due to their anti-inflammatory, anti-ulcerogenic, digestive and antimicrobial properties. In this study, we aimed to determine phenolic compounds and antioxidant activity of infusion and decoction tea samples of the *Sideritis sipylea*. For this purpose, the aerial parts of *S. sipylea* collected from Sipil Mountain (Manisa)-Turkey, in June 2014. The quantitative amounts of the phenolic compounds were determined by using LC/MS-MS. Fumaric acid and chlorogenic acid were determined as the main components of the both decoction and infusion. The amounts are as follow; fumaric acid (277.7; 281.05 mg/kg dried herba) and chlorogenic acid (204.47; 174.85 mg/kg dried herba) respectively. The antioxidant activities were determined based on three methods: 2,2-Diphenyl-1-picrylhydrazyl (DPPH) free radical scavenging, β -carotene linoleic acid and cupric ion reducing antioxidant capacity (CUPRAC) assays. The tea samples of *S. sipylea* showed good antioxidant activity for all the tested activity assays.

PHENOLIC COMPOUNDS AND ANTIOXIDANT ACTIVITY OF SIDERITIS TMOLEA P. H. DAVIS TEA

SEMA ÇARIKÇI¹, TURGUT KILIÇ¹, ZÜLEYHA ÖZER¹, HASIBE YILMAZ²

ABSTRACT

Sideritis L. belongs to the family of Lamiaceae (Labiatae), which is one of the most common and diverse plants in the world, comprising over 150 species. Sideritis species are generally known under the names “adacayı or dagcayı” and widely used as herbal tea in folk medicine in Turkey as well as Europe. Phenols are very important plant constituents because of their scavenging ability on free radicals due to their hydroxyl groups. Therefore, phenolic contents of plants may contribute directly to their antioxidant activity. Sideritis tmolea P.H. Davis, named as Sivri çayı in vernacular, is an endemic species for Turkey. Aerial parts of S. tmolea collected in July 2015 from Bozdağ, Ödemiş in Turkey. In present study, we investigated the phenolic compounds and antioxidant activity of the decoction and infusion of S. tmolea. The quantitative amounts of the phenolic compounds were determined by using LC/MS-MS. The main compounds and amounts were determined as follow for decoction; fumaric acid, penduletin and chlorogenic acid (240.33; 160.85; 160.21; mg/kg dried herba, respectively). For the infusion samples main compounds and amounts were as follow; fumaric acid, chlorogenic acid and penduletin (238.71; 142.22; 70.22 mg/kg dried herba, respectively). The antioxidant activities were determined based on three methods: 2,2-Diphenyl-1-picrylhydrazyl (DPPH) free radical scavenging, β -carotene linoleic acid and cupric ion reducing antioxidant capacity (CUPRAC) assays. For all the activity assays, infusion and decoction of the S. tmolea has showed good activity.

PHENOLIC COMPOUNDS OF CHERRY LAUREL (*LAUROCERASUS OFFICINALIS* ROEM.)

HILAL AKIR¹, ZEHRA CAN², SEVGI KOLAYLI², MERYEM KARA³

ABSTRACT

Cherry laurel (*Laurocerasus officinalis* Roem.) or taflan is a characteristic summer fruit of Blacksea Region. It's a variety of cherry that grows up without using agricultural pesticide or fertilizer. It's mostly consumed as fresh fruit. Also it's consumed after dried, pickled or boiled as molasses. Total phenolic content, total flavonoid content, antioxidant activity and phenolic compositions of the edible parts of the fruits were investigated in this study. The quantity of total phenolic content was found as 280 mg GAE /100 g fresh fruit according to Folin-Ciocalteu method, total flavonoid content was found as 7.2 mg QUE/100 g and total antioxidant activity was found as 300 μ mol Trolox/100 g according to FRAP method. The phenolic compounds of the fruit was determined by using HPLC-UV system. While the major component was found as vanillic acid; syringic acid, epicatechin, gallic acid, p-OH benzoic acid, protocatechuic acid, caffeic acid, rutin, luteolin, p-coumaric acid and ferulic acid were determined in a descending sort. The cherry laurel fruit that has high phenolic content and antioxidant capacity is a valuable natural fruit for preventive medicine. It will be beneficiary to extend it's utilization by cultivation and to return it to the economy.

RELATION OF MINERAL COMPONENTS IN OUR NUTRITION AND CANCER

YAVUZ YÜKSEL¹

ABSTRACT

Cancer is one of the most important diseases of today. There are many types of cancer. Every type of cancer is affected by many factors. In some societies, the incidence and type of cancer and their lifestyle, culture and nutritional habits have been compared. Misnutrition is one of the causes of cancer. Reduction of cancer risk can be achieved through proper nutrition. We take many food items with our food in our bodies. While some nutrients help prevent cancer formation, some nutrients can also increase. Minerals, which are a major factor in the survival of our vital functions, are one of these nutrients, even though they are small in quantity. In our regular work of our body, more than 20 denier minerals are involved. Some minerals help prevent cancer, while others cause cancers. Some of them affect both ways, depending on their intake patterns. In this study, information on the types of minerals found in foods and the positive or negative effects on cancer were compiled.

THE RESEARCH OF THE USING OF OPUNTIA FICUS-INDICA, A MEDICAL AROMATIC PLANT IN THE FIELD OF LANDSCAPE ARCHITECTURE

ŞÜHEDA BASİRE AKÇA¹, LEVENT YAZICI², KÜBRA YAZICI³

ABSTRACT

The plants which are significant element of landscape arrangement are used to form both living and livible places. Being the core elements of green places, plants fulfill so many tasks in terms of functionality, esthetic and ecology. In this regard, xerophilous landscape movement has gradually become widespread nowadays and instead of common cultivated plants, the usage of natural plants has been increased in planting works. Opuntia ficus-indica from opuntia kind, is a plant of cactus (Cactaceae) family. In Turkish, some different names such as ‘‘frenk inciri, frenk yemişı, dikenli incir’’ or public saying ‘‘kaynanadili’’ are used. This plant can be seen in West and South Anatolia. As it is an edible fruit, it is a means of living for people. In this study, the using of Opuntia ficus-indica in the area of landscape architecture for ornamental purposes and application (aesthetic and functional properties) opportunities are evaluated.

A TOXICOLOGICAL INVESTIGATION OF GENETICALLY MODIFIED ORGANISMS

KEYSER YÜKSEL¹, GÜLDEN ZEHRA OMURTAG¹

ABSTRACT

Genetically modified organisms (GMO) has been a question of debate in science for years. Production of GMO's is increasing gradually. They take place in numerous fields of our lives and they benefit us, however they also have risks. Thus society approaches GMO's with suspicion. But the gene technology that takes place in various sectors from agriculture to health, is a new technology and it has been improving fast. Therefore there are not sufficient scientific data about the subject, such as; long term studies or human trials to prove those risks. Even so, it is an acknowledged necessity to approach this process with caution.

UTILIZATION OF ESSENTIAL OILS AS BIOPESTICIDES

SEMA DEMİR¹, BANU AKGÜN¹, MERTİN HAMZAOĞLU¹

ABSTRACT

Essential oils are lipophilic and highly volatile secondary metabolites of plants. They are extracted from more than 17,000 aromatic plant species commonly belonging to angiospermic families Lamiaceae, Rutaceae, Myrtaceae, Zingiberaceae and Asteraceae. They have insecticidal, nematicidal, ovicidal, fungicidal and bactericidal effects against pathogens and pests owing to the active biochemical compounds. Mode of action of these effects is based on the ability to disrupt the cell wall and cytoplasmic membrane of bacteria and fungi, leading to lysis and leakage of intracellular. There is an increasing demand for alternative strategies to control of insect pests for avoiding the negative effects of the chemical control of pests. From this aspect, biopesticides is one of the best alternative strategies for eco-friendly and relatively safe pest management. Biopesticides are much more active to the targeted pests as opposed to synthetic pesticides that have harmful effects to birds, mammalian species and human. According to the Food and Agriculture Organization (FAO), about 1000 million metric tons of food is wasted each year because of mycotoxins produced by moulds during storage. *Boswellia carterii* essential oil is recommended for fumigation against these moulds and aflatoxin metabolites. "Active packaging" that is based on adding active compounds in the packaging material is one of the most promising innovations for food preservation. In this context, the use of citronella essential oil in a coating material for carton packages has been published in a study, recently.

CLINICAL STUDIES EXAMINING THE EFFECTS OF ALOE VERA IN SKIN CONDITIONS: A SYSTEMATIC REVIEW

ZEHRA GÖK METİN¹

ABSTRACT

Background: Aloe vera is a succulent from the Aloe family includes 400 different species, a tropical plant which is easily grown in hot and dry climates and widely distributed in Asia, Africa and other tropical areas. The use of Aloe vera is being promoted for a large variety of skin conditions. The aim of this systematic review was to summarize all skin oriented clinical studies on Aloe vera products in human subjects. Methods: Extensive literature search were carried out to identify all clinical studies published between 1991-2017 years on the subject. Data were extracted from PubMed, Medline, Google Scholar data bases a predefined standardized manner using Aloe vera, clinical trial, psoriasis, burn, skin condition, wound-healing research terms. All studies published in English were read by author and data were extracted in a standardized, predefined manner. Results: A total of thirty-seven studies met inclusion criteria. They were characterized by different study designs including double-blind placebo-controlled or double blind controlled (n=27), experimental (n=7) and case-reports (n=3). Total of 3001 patients participated in all studies. The mean age of participants was 42,2 years. The big majority of studies were performed in Asian countries (45.9%), USA (18.9), and European countries (18.9%). Duration of intervention varied between two days and nine months. Aloe vera applied orally or topically once, twice, third or four times throughout the day. Studies focused on dermatitis (n=10), wound-healing process (n=6), oral-mucosa related problems including stomatitis, radiotherapy-induced mucositis, and burning mouth syndrome (n=5), lichen planus (n=3), psoriasis (n=3), burn (n=3), dry skin (n=3) and other skin-conditions involved ultraviolet erythema test, acne vulgaris, scabies and sulfur mustard exposure (n=4). Dermatitis-related studies on topical administration of Aloe vera had contradictory findings whether Aloe vera was effective (n=5) or not (n=5). As for oral mucosa-related problems, studies (n=2) indicated that use of Aloe vera had superior impact on radiation-related mucositis rather than placebo and was as effective as placebo in remaining studies (n=3). Studies (n=3) conducted in oral-vulval Lichen Planus reported that Aloe vera gel reduced erosive and ulcerative lesions and assisted a complete clinical remission. Considering psoriasis studies, two of those found that placebo was more effective than Aloe vera, while one of them showed Aloe vera was superior that of placebo. Likely, wound-healing studies founded misleading findings including beneficial (n=4), harmful (n=1) or no effects (n=1). In addition, Aloe vera showed a significant effect on second-degree burn (n=1) or no superior effects than placebo in patients with sunburn or sun exposure (n=2). All studies (n=3) implied that Aloe vera was efficacious for dry-skin problem. Other skin-related studies (n=4) involving ultraviolet erythema test, acne vulgaris, scabies and sulfur mustard exposure problems stated promoting results including significant reductions in the frequency of pruritus, burning sensation, and inflammatory lesions scores. Moreover, almost all studies (89.1%) reported no side effects associated with use of Aloe vera. Conclusion: In conclusion, studies outcomes point that Aloe vera is an important aromatherapeutic plant is generally well tolerated,

¹HACETTEPE ÜNİVERSİTESİ HEMŞİRELİK FAKÜLTESİ İÇ HASTALIKLARI HEMŞİRELİĞİ AD

as no serious side effects were reported. However, small sample size, limited number of studies, and lack of knowledge on randomization procedures in included studies need to be considered. Results on the effectiveness of Aloe vera are contradictory; study analysis reveals the presence of methodological gaps preventing to reach final conclusions. Therefore, clinical effectiveness of oral and topical Aloe vera application is need to be evaluated using recent guidelines and well-designed clinical trials.

INVESTIGATION OF THE EFFECT OF DIFFERENT DRYING METHODS ON BIOACTIVITY AND BIOAVAILABILITY OF CHESTNUT POLLEN

SELMA KAYACAN¹, HATICE BEKİROĞLU¹, OSMAN SAĞDİÇ²

ABSTRACT

Pollen is a bioactive food with high nutritional value, which is gathered from flowers by honey bees. Although our country is a very rich country in terms of bee products, there is no standardization about bee products to put on market as qualified products in some countries. Due to high water content and nutritional value, pollen can be exposed to spoilage by microorganisms. Therefore, drying of pollen and preserving the bioactive compounds of pollen when it is dried is important. In this study, chestnut pollen obtained from a beekeeper in Duzce was dried using oven, vacuum and microwave dryers and the effect of drying processes on bioactive properties and bioavailability of chestnut pollen were investigated. To determine the bioactive properties of bee pollen; total phenolic content, total flavonoid content and total antioxidant capacity were performed. Total antioxidant capacity was carried out two different methods which were DPPH and CUPRAC methods. Total phenolic content and total flavonoid content were determined as spectrophotometrically. According to results of analyses, values of total phenolic content, total flavonoid content, antioxidant activity and bioavailability of fresh chestnut pollen were decreased after drying processes. The lowest value of total phenolic content was found with oven method and the lowest values of total flavonoid and antioxidant activity was found with microwave method. The bioavailability percentage of the fresh pollen IN fraction was determined to 8.27% for the total phenolic content. After drying this value was ranged from 2.05 to 3.32%. It was determined that the total flavonoid content was 1.64%, while it was 1.08 to 1.43% after drying. Total antioxidant activity decreased from 1.05% to 0.33-0.69%.

SPARTIUM JUNCEUM'UN FARKLI EKSTRAKLARININ ANTIOKSIDAN ETKİLERİ ÜZERİNE BİR ÇALIŞMA

GOKHAN ZENGİN¹, ABDURRAHMAN AKTUMSEK¹, YAVUZ SELİM ÇAKMAK²

ABSTRACT

In this study, antioxidant abilities of different extracts (ethyl acetate, methanol and water) form *Spartium junceum* were investigated with spectrophotometric methods. Antioxidant capacity was evaluated using different assay including free radical scavenging (DPPH), reducing power (FRAP), phosphomolybdenum and β -carotene/linoleic acid test system. Total phenolic and flavonoid contents were also determined. Total phenolic and flavonoid contents in methanol extract was higher than other extracts. Also, DPPH scavenging activities were determined as 32.79% (in ethyl acetate), 77.68% (in methanol) and 73.65% (in water) at 1 mg/ml concentration. The best FRAP activity was observed in the methanol extract, followed by water and ethyl acetate extracts. In β -carotene/linoleic acid test system, the inhibition abilities of these extracts were ranked as water (90.86%), methanol (82.38%) and ethyl acetate (74.82%). From these results, *S. junceum* could be considered as potential candidate for designing new nutraceuticals or drugs.

ASPHODELINE LIBURNICA KÖKLERİNİN METANOL EKSTRAKTININ ANTIOKSIDAN ÖZELLİKLERİ

ABDURRAHMAN AKTUMSEK¹, GOKHAN ZENGİN¹

ABSTRACT

Asphodeline is one of the most important genera of family Xanthorrhoeaceae (the genus was recently classified under the family Liliaceae) and widely distributed in the Mediterranean region (mainly in the Middle-East countries). In Turkey this genus contains 20 taxa, 12 of which are endemic. The genus Asphodeline has medicinal importance and some Asphodeline members are traditionally used in different countries including Turkey. Antioxidant effects methanol extract form Asphodeline liburnica were investigated with spectrophotometric methods. Antioxidant capacity were evaluated using different assay including free radical scavenging (DPPH and ABTS), reducing power (FRAP and CUPRAC), phosphomolybdenum, and metal chelating. Total phenolic and flavonoid contents were also determined. Total phenolic and flavonoid contents of A. liburnica were determined as 9.67 mgGAE/g extract and 1.48 mgRE/g extract, respectively. Radical scavenging effects in ABTS and DPPH assays were found to be 66.99 mgTE/g extract and 13.23 mgTE/g extract. Also, the reducing power activities of the extract were moderate in CUPRAC (33.29 mgTE/g extract) and FRAP (33.81 mgTE/g extract). These findings suggest that the A. liburnica could serve as an important natural source of biologically active agents for using in food and pharmaceutical industry.

ASPHODELINE LIBURNICA KÖK EKSTRAKTININ ALZHEIMER, DIYABET VE DERİ HASTALIKLARI İLE BAĞLANTILI ENZİM ÜZERİNE İNİHİTÖR ETKİLERİ

ABDURRAHMAN AKTUMSEK¹, GOKHAN ZENGİN¹

ABSTRACT

Key enzyme inhibitory theory is the most popular for the management of global health problems including Alzheimer Disease, diabetes mellitus and skin disorders. For these purposes, enzyme inhibitory effects (cholinesterase, tyrosinase, α -amylase and α -glucosidase) of root methanolic extract form *Asphodeline liburnica* were investigated with spectrophotometric methods. The cholinesterase inhibitory activities were determined as 1.67 mgGALAE/g extract in AChE and 1.64 mgGALAE/g extract in BChE. Anti-tyrosinase effect was found to be 29.78 mgKAE/g extract. Anti-diabetic effects of the extract were determined 0.31 mmolACAE/g extract in amylase and 0.70 mmolACAE/g extract in glucosidase. The presented results suggest that the *A. liburnica* roots may be considered as valuable candidate for new nutraceutical, pharmaceutical or cosmeceuticals.

AROMATHERAPY OILS USED FOR SYMPTOM MANAGEMENT IN RHEUMATIC DISEASES: A LITERATURE REVIEW

AFRA ÇALIK¹

ABSTRACT

Background and aim: Rheumatic diseases are characterized by inflammation that affects the connecting or supporting structures of the body most commonly the joints, but also sometimes the tendons, ligaments, bones, and muscles. Some rheumatic diseases even affect the organs^{1,2}. Patients with rheumatologic diseases seek to use complementary therapies due to the etiology of rheumatic diseases is not fully understood, lack of complete cure, chronic symptoms including pain and fatigue, decreased quality of life, and side effects related conventional therapies. Particularly, aromatherapy oils have gained popularity for alleviating rheumatic symptoms in recent years. This review was written to evaluate the specific effects of aromatherapy oils used for the management of symptoms in rheumatic disease. **METHOD:** Extensive literature search was conducted using PubMed database involving 1990 and 2017 years. Predefined standardized keywords including ankylosing spondylitis, Behcet disease, fibromyalgia, osteoarthritis, systemic lupus erythematosus and rheumatoid arthritis, Studies conducted in pediatric population were excluded. A total of 178 articles were found and finally 12 studies met inclusion criteria³⁻¹⁴. **RESULTS:** Studies had randomized controlled trials (RCTs) (n=10) and semi-experimental design (n=2). The big majority of studies conducted osteoarthritis (n=10), in patients with rheumatoid arthritis (n=1) and fibromyalgia (n=1). The total of 727 patients participated in the studies and the age of patients ranged from 29 to 40 years. Aloe vera (*Aloe Barbadensis*), black seed (*Nigella sativa*), castor oil (*Ricinus communis*), chamomile (*Matricaria chamomilla*), eucalyptus (*Eucalyptus globulus*), ginger (*Zingiber officinale*), lavender (*Lavandula angustifolia*), lemon (*Citrus lemon*), orange (*Citrus sinensis*), peganum (*Peganum harmala*), peppermint (*Mentha piperita*), rosemary (*Rosmarinus Officinalis*) mostly preferred aromatherapy oils. The intervention period varied between two and 12 weeks. Aromatherapy oils were applied orally, topically or with a compress. Specific symptoms including pain, fatigue, joint motion and quality of sleep were examined in the studies. ³⁻¹⁴. Brief Pain Inventory (BPI), Fullerton Advanced Balance Scale (FAB), Korean Sleep Scale, Modified Health Evaluation Questionnaire (MHEQ), Ontario and Mc. Master Universities Osteoarthritis Index (WOMAC), SF-36 Quality of Life Scale, Ritchie Articular Index (RAI) and Visual Analog Score (VAS) often used in data collection process³⁻¹⁴. Studies testing the effects of ginger oil (n=5), found a significant reduction in pain scores in the intervention group compared with the control group³⁻⁷. Another study examining the impact of lavender, ginger and chamomile aromatherapy oil blend reported a decrease in pain and fatigue scores and improved functional capacity^{8,9}. A semi-experimental study conducted in patients with rheumatoid arthritis, applying black seed topically revealed a significant reduction in disease activity scores of patients¹⁰. **CONCLUSIONS:** Considering the results of these clinical studies, aromatherapy oils have promising outcomes in pain, fatigue, inflammation parameters and capability of joint motion. However, small sample sizes and lack of information on randomization procedures need to be

ANALYSIS OF BAY (LAURUS NOBILIS) LEAF VOLATILE OIL BY GC/MS AND ITS USAGE IN COSMETIC APPLICATIONS

ŞEYDA KIVRAK¹, TOLGA GÖKTÜRK¹, İBRAHİM KIVRAK¹

ABSTRACT

Bay-tree (*Laurus nobilis*) is an evergreen tree specie unique to the Mediterranean region and has been extensively cultivated as an ornamental plant in many countries. Turkey is the leader bay leaf exporter of the World. The reason of great attention on the bay leaf as a medicinal and aromatic plant is the content of volatile oil in its leaves. Volatile oils have been used since ancient times in order to make people healthier, change their appearance, protect the body against possible damage by environment. Volatile oils are used in fragrances, skin products, hair care products and in general terms to give a pleasant fragrance to the products. These oils, also known as essential oil, etheric oil by people, can contain terpenic hydrocarbons and their oxygenated derivatives as well as organic acids, alcohols, phenols and ketones. Volatile oils are found in any organs of the plant as well as in organs such as secretory follicles, secretory pockets, secretory ducts or secretory cells according to the family. It has been concluded that the essential oils are formed by the hydrolysis of glycosides as well as asserted that its presence in protoplasm of the plant or formed by the decomposition of the resinous layer of the cell wall. Antioxidant, antimicrobial, analgesic and antiinflammatory properties of bay (*Laurus nobilis*) leaf volatile oil have been proven in previous studies. Previous studies have also reported the use of bay leaf volatile oil in the form of soap and anti-dandruff hair care preparations. In this study, the components of the obtained volatile oil were determined using Agilent 6890 GC (Gas Chromatography) and 5975 MS (Mass Spectrometry). 1,8-Cineole (46.16%), alpha-Terpinyl acetate (10.62%), alpha-Pinene (6.27%), Terpinen-4-ol (5.07%) and Sabinene (4.99%) were found to be the major compounds in volatile oil. The obtained volatile oil was used to prepare skin lotion. For this purpose, 6 g of lilac-flavored hazelnut oil and 6 g of bay leaf oil were added to 87 g of purified water. Then it was stirred with magnetic stirrer for 10 minutes. Finally, the formulation is completed by the addition of the homogenized polymer mixture. The rheological properties of the final product were determined after all treatments were finished.

DETERMINATION OF PHENOLIC COMPOSITION OF *TILIA TOMENTOSA* FLOWERS USING UPLC-ESI-MS/MS

TOLGA GÖKTÜRK¹, ŞEYDA KIVRAK¹, İBRAHİM KIVRAK¹

ABSTRACT

As a result of bioactive components found in different parts of plant such as flowers, peel, leaf and increased interest in natural products, medicinal and aromatic plants have found application fields such as pharmaceutical, cosmetic and dye industries. Therefore, they have been subjected to numerous researches. Phenolic compounds, which are secondary metabolites of plants, are one of the main groups of compounds that provide antiallergic, antiarterogenic, antiinflammatory, antimicrobial, antioxidant, cardioprotective properties of medicinal and aromatic plants. These broad physiological effects that they possess lead researchers to examine the phenolic contents of plants. *Tilia tomentosa* Moench is one of 45 species belonging to Tiliaceae family, and the usage of flowers in traditional treatment methods is quite common. Researches on different parts of *T. tomentosa* showed that the plant possesses spasmolytic, diuretic and sedative effects due to its flavonoids, essential oil and mucilage components and has been used to treat disorders such as nervous tension, cough, flu, migraine. There are no studies on phenolic components of its parts such as leaves, flowers using UPLC-ESI-MS / MS, etc. until now. In this study, firstly, *T. tomentosa* flowers were extracted with hexane and volatile oil fractions were separated from the plant. Distilled water was added to the remaining flower part at 80 ° C and subjected to extraction for 15 minutes. The obtained extract was filtered and dried in a lyophilizer at -70 ° C. The residue was redissolved in a mixture of water:methanol (80:20). The solution was analyzed by UPLC-MS / MS (Waters Acquity Ultra Performance LC, Xevo TQ-S MS-MS) by passing through Macherey-Nagel Chromafil Xtra PTFE-20/25 0.20µm filters. According to the analysis results, 3,4-Dihydroxybenzoic acid (66.82 mg/kg), Myricetin (29.39 mg/kg), Rutin (21.42 mg/kg), Ferulic acid (12.33 mg/kg) ve 3,4-Dihydroxybenzaldehyde (10.38 mg/kg) were detected. *T. tomentosa* flowers have great potential to usage in industries such as food, medicine and cosmetic due to its rich content of phenolics.

INVESTIGATION OF MYRTUS COMMUNIS LEAF ESSENTIAL OIL AND SEED FIXED OIL COMPOSITION USING GC-MSD

TOLGA GÖKTÜRK¹, ŞEYDA KIVRAK¹, İBRAHİM KIVRAK¹

ABSTRACT

Myrtus communis belongs to Myrtaceae family and it is a evergreen plant in the form of shrub. This plant which grows by itself along the Mediterranean region has been used for its medicinal and aromatic benefits since ancient times. It is called "hambeles", "mersin" or "murt" in various regions of Turkey. The essential oil of plant's leaves has very rich content and this essential oil is widely used in food, pharmaceutical and cosmetic industries. It has been determined in various studies that about 30 components constitute %90 of the myrtle leaf essential oil. However, the essential oil yield and composition varies according to ecological and geographical conditions. Some of the known biological activities of leaf essential oil include antioxidant activity and antimutagenic activity, antimicrobial activity, antibacterial activity and antifungal activity. There is few research on the seeds of plant but in some studies, it has been reported that the content of seed's fixed oil is rich in linoleic acid and shows antioxidant activity. In this study, the components of essential oil obtained by *M. communis* leaves using hydrodistillation and fixed oil obtained by its seeds using cold press method analyzed with GC-MSD. According to the analyse result, 1,8-Cineole (21.68%), Alpha-Pinene (18.02%), Linalol (14.12%), Alpha-Terpinyl Acetate (10.40%) and Myrtenol (8.59%) were detected as majör compounds in the myrtle leaf essential oil. In the content of fixed oil obtained by its seeds presences Linoleic acid (77.59%) as the major fatty acid. According to the analyse result toher fatty acids were determined as Palmitic acid (10.36%), Oleic acid (8.26%), Stearic acid (2.81%), Elaidic acid (0.91%), Eicosanoic acid (0.05%) and Myristic acid (0.03%).

ASPHODELUS AESTIVUS KÖKLERİNİN FARKLI EKSTRAKLARININ INVITRO ANTIOKSIDAN AKTİVİTELERİ

ABDURRAHMAN AKTUMSEK¹, GOKHAN ZENGİN¹, SENGUL UYSAL¹

ABSTRACT

Asphodelus aestivus is mostly used in the treatment of hemorrhoids, nephritis, and burns in Turkey. The aim of the study was to test the antioxidant activity of *A. aestivus* extracts obtained by extraction with ethyl acetate, dichloromethane, methanol, and water. Antioxidant activity of these extracts was evaluated by different assays (including ABTS, DPPH, FRAP, CUPRAC, phosphomolybdenum and metal chelating activity). The higher level of total phenolic content was in the ethyl acetate and dichloromethane extracts. Generally, the ethyl acetate extract exhibited the best results in these assays. The highest free radical scavenging activity was observed in ethyl acetate extract in both ABTS (21.23 mgTE/g) and DPPH (9.12 mgTE/g). Our findings suggest that *A. aestivus* could be used as a biologically-active compounds for food and pharmaceutical purposes.

ABSTRACT

Asphodelus aestivus is known by different local names like çiriş otu and yabani pırasa in Turkey. In the present study, the various solvent extracts (ethyl acetate, dichloromethane, methanol and water) from *Asphodelus aestivus* were assessed for in vitro enzyme inhibitory activity against AChE, BChE, α -amylase, α -glucosidase and tyrosinase. The methanol extract exhibited the strongest AChE (1.91 mgGALAE/g extract) and BChE (2.07 mgGALAE/g extract) inhibitory activity. The anti-diabetic activity of *A. aestivus* was screened using α -amylase, and α -glucosidase inhibition assays. The ethyl acetate extract showed high α -amylase (0.75 mmolACAE/g) and α -glucosidase (2.97 mmolACAE/g) inhibitory activity. The dichloromethane extract had the highest lipase inhibitory activity (86.32 mgOE/g). *A. aestivus* could be effective as natural for treatment of various diseases like Alzheimer's disease, diabetes mellitus, and obesity.

LOTONONIS GENISTOIDES SOLVENT EKSTRATKLARININ ANTIOKSIDAN ÖZELLİKLERİ

ABDURRAHMAN AKTUMSEK¹, RAMAZAN CEYLAN¹, GOKHAN ZENGİN¹

ABSTRACT

Antioxidant effects of ethyl acetate, methanol, and aqueous extracts from *Lotononis genistoides* (Fabaceae) were investigated with spectrophotometric methods. Antioxidant capacity were evaluated by using different assay including free radical scavenging (DPPH and ABTS), reducing power (FRAP and CUPRAC), phosphomolybdenum, and metal chelating experiments. Total phenolic and flavonoid content was also determined as 30.40-53.94 mg GAEs/g and 29.53-51.15 mg REs/g, respectively. ABTS and DPPH free radical scavenging activities were ranged from 112.90 to 126.10 mgTE/g and 80.76 to 99.27 mgTE/g extract, respectively. The best reducing activity in CUPRAC and FRAP were observed in ethyl acetate and water extracts, respectively. The highest metal chelating ability were detected in ethyl acetate extract with 12.31 mgEDTAE/g extract, followed by methanol and water. This study supports the potential use of *L. genistoides* for designing new functional food formulations.

LOTONONIS GENISTOIDES FARKLI SOLVENT EKSTRATLARININ NÖROPROTEKTİF, ANTI-DIABETIC VE DERİ HASTALIKLARI ÜZERİNE INVITRO BİR ÇALIŞMA

ABDURRAHMAN AKTUMSEK¹, RAMAZAN CEYLAN¹, GOKHAN ZENGİN¹

ABSTRACT

Enzyme inhibitory properties of water, methanol and ethyl acetate extracts from *Lotononis genistoides* (Fabaceae) were investigated by using colorimetric methods. Enzyme inhibitory effects were evaluated against cholinesterases, tyrosinase, α -amylase and α -glucosidase. The ethyl acetate (1.92 mgGALAE/g) and methanol (1.89 mgGALAE/g) extracts have the highest acetyl cholinesterase inhibitory effects as compared to water extract. The ethyl extract exhibited the strongest anti-tyrosinase effect with 13.51 mgKAE/g. α -amylase and α -glucosidase inhibition were found to be 0.11-1.51 and 11.26-28.14 mmol ACAEs/g. Our findings could provide an important contribution for *Lotononis genistoides* different solvent extracts potential uses in pharmaceutical and nutraceutical fields.

DORYCNIUM PENTAPYLLUM SUBSP. HAUSSKNECHTII'NIN FARKLI METOTLAR İLE ANTIOKSIDAN ÖZELLİKLERİNİN İNCELENMESİ

ABDURRAHMAN AKTUMSEK¹, ALİME CİFTCİ¹

ABSTRACT

The extraction yield and antioxidant properties of *Dorycnium pentapyllum* subsp. *haussknechtii* have been evaluated by use different extraction methods including maceration, soxhlet, and ultrasonication-assisted extraction. Antioxidant properties were performed by free radical scavenging activity (DPPH and ABTS), reducing power activity (FRAP and CUPRAC), metal chelating activity, and phosphomolybdenum assays. Compared with different extraction methods for the yields, the soxhlet extraction was more efficient than other methods. Total phenolic content was varied from 48.33 to 105.12 mgGAE/g. In free radical scavenging assays (ABTS and DPPH), the methanol extract exhibited more potent radical scavenging activity as compared to ethyl acetate and water extracts. The water extract showed highest metal chelating activity as compared to ethyl acetate and methanol extracts. This study demonstrated that *Dorycnium pentapyllum* subsp. *haussknechtii* can be use as a promising source in the fields of food and pharmaceutical.

DIANTHUS CALOCEPHALUS 'UN ENZİM İNHİBİTÖR ÖZELLİKLERİ ÜZERİNE BİR ÇALIŞMA

ABDURRAHMAN AKTUMSEK¹, HAMIYET UNUVAR¹

ABSTRACT

Dianthus genus is represented by 67 species in Turkey. Dianthus species are widely used for treating gastro-intestinal disorder, wound, and cough. This work aimed to evaluate the effects of three various solvents (ethyl acetate, methanol, and water) and three different extraction methods (maceration, soxhlet, and ultrasonication-assisted) on extraction yield, phytochemical profile and enzyme inhibitory activity of *Dianthus calozecephalus*. The inhibitory activities of extracts were tested against cholinesterase's (AChE and BChE), α -amylase, α -glucosidase and tyrosinase. The highest extract yields were obtained from soxhlet extraction method. In all extraction methods, methanol extract had the highest total phenolic and flavonoid content. The water extract demonstrated the lowest AChE inhibitory activity than ethyl acetate and methanol. The results showed that ethyl acetate extract exhibited the greatest tyrosinase and α -amylase inhibitory activity. *D. calozecephalus* can be used as natural sources in cosmetic and pharmaceutical industries.

**BARSSIA SP. NOVA (ASCOMYCOTA, PEZIZALES); A NEW
HYPOGEOUS SPECIES TURKEY (OSMANIYE)**

HASAN HÜSEYİN DOĞAN¹, ŞABAN GÜNERİ²

ABSTRACT

Osmaniye situated in the East Mediterranean region of Turkey and in square C6 according to grid square system of Davis (Davis, 1965). Antakya in south Kahramanmaraş in north, Gaziantep in east and Adana in west of Osmaniye are located. Many studies on the fungal diversity of Turkey were investigated by different researchers (Sesli and Denchev, 2014). Recently, new fungal records for Turkey were determined with macrofungal studies (Allı et al. 2011; Güngör et al., 2013; Sesli and Helfer, 2013; Kaya, 2015). Thus, aforementioned these local studies show that it is necessary more research on fungal diversity of Turkey. The aim of this study is contribute to macrofungi of Turkey with a new fungal record.

THE EFFECTS OF LYCIUM BARBARUM (GOJI BERRY) POLYSACCHARIDES ON 17-B-ESTRADIOL SERUM LEVELS OF OVARIECTOMIZED FEMALE RATS

BIHTER GÖKÇE BOZAT¹, FATMA PEHLİVAN KARAKAŞ¹, HAYRIYE ORALLAR¹, HAMİT COŞKUN¹

ABSTRACT

The Effects of Lycium barbarum (Goji berry) Polysaccharides on 17- β -estradiol Serum Levels of Ovariectomized Female Rats Lycium barbarum (Kurt üzümü) Polisakkaritlerinin Ovarektomili Dişi Sıçanların Serum 17- β -Östradiol Seviyeleri Üzerine Olan Etkileri Bihter Gökçe BOZAT¹, Fatma PEHLİVAN KARAKAŞ^{1,2}, Hayriye ORALLAR³, Hamit COŞKUN⁴ 1Abant İzzet Baysal University, Department of Biology, Faculty of Science and Art, Bolu, Turkey 2Abant İzzet Baysal University, Department of Field Crops, Faculty of Agriculture and Natural Sciences, Bolu, Turkey 3Abant İzzet Baysal University, Department of Poultry Breeding, Faculty of Agriculture and Natural Sciences, Bolu, Turkey 4Abant İzzet Baysal University, Department of Psychology, Faculty of Science and Art, Bolu, Turkey Email: bozatgokce@gmail.com Abstract Menopause is a physiological and endocrinological process that lead to a diminish in circulating levels of the female sex steroids naturally or after surgery. During menopause, both diminish in 17-beta-estradiol (17- β ES) and the increment in follicle-stimulating hormone trigger several alterations in the body. Healthy women's reproductive life span is average 36 years, with an age range varying between 40 and 60 years. Although bilaterally surgical removal of ovaries has been applied for treatment in women with endometrial and ovarion cancer, but it has been applied for ovariectomy model in rodents. The ovariectomy has been used to clarify insufficiency of estrogen hormone and its metabolic results to rodents. Estrogens are steroid hormones found in three form (estrone, 17- β ES and estriol) in the women body, protect and regulate life of neurons and glial cell and regulation of brain functions. Goji berry belongs to genus Lycium of the family Solanaceae. The fruits used in herbal medicine and health food for thousands of years in China, Southeast Asia, Europe, and North America. Goji berry can lower blood lipid levels and promote fertility. Goji berries have carotenoids, zeaxanthin and polysaccharides. Especially, its polysaccharides importantly alleviated neuronal injury and obstructed lactate dehydrogenase release. Furthermore, it was also reported that Lycium barbarum polysaccharides (LBP) could prevent cognitive and memory deficits. Similarly, estrogen has protective roles in woman body, lock of the protective roles during the menopause causes trigger many of diseases such as behavioral, hormonal and cognitive disorders. For these similar protective roles of estrogen and LBP on brain functions, we investigated the effects of LBP on 17- β -ES serum level of ovariectomized female rats using ELISA test. Fifteen days after ovariectomy operations, rats were divided into four major groups: control (distile water, 3 mL/kg, oral gavage, per day), low dose of LBP (20 mg/kg, 3 mL/kg, oral gavage, per day), high dose of LBP (200 mg/kg, 3 mL/kg, p.o., per day), 17- β -ES (1 mg/kg, 3 mL/kg, oral gavage, per day) and two minor group within the each major group: sham (pseudo ovariectomized rat) and overiectomized (ovx) rat groups. The treatments were

Corresponding Author: **BIHTER GÖKÇE BOZAT**, bozatgokce@gmail.com

¹ABANT İZZET BAYSAL ÜNİVERSİTESİ

applied for 30 consecutive days and then serum sample of all rats were collected. 17- β ES analysis of the samples were performed by ELISA test. The findings of the experiment showed that distile water treated-sham operated group had higher serum level of 17- β -ES than distile water treated-ovx operated group ($p < 0.05$). This means that ovariectomy model caused decreasing 17- β ES serum level. Furthermore, the high dose LBP, low dose of LBP and 17- β ES applications showed a similar increase in 17- β ES serum levels of ovariectomized rats compared to control group (distile water treated) ($p < 0.05$). In conclusion, LBP treatments may be perform protective and regulator roles on the brain by increasing 17- β ES serum level. Keywords: Goji berry, Lycium barbarum polysaccharides, Ovariectomy, 17- β -estradiol, ELISA Acknowledgement: This work was supported by grants from the Abant Izzet Baysal University Research Foundation (Project No: 2016.10.07.956).

USE OF SOME MEDICINAL AROMATIC PLANTS IN DAIRY PRODUCTS

BÜŞRA GÖNCÜ², MUSA SERDAR AKIN¹, KAMILE BURCU BÜYÜKKILIÇ¹

ABSTRACT

Turkey has an important place that geographical location, climate, plant diversity and flora with regard in trade of medical and aromatic plants. Today, about 50% of this plants, which are used in many areas including medicine, cosmetics, perfume, paint etc. industry, has been used in food sector. In food industry, it is offered as consumption of spices, herbal tea and food additives in terms of functionality. In recent years, with increasing demand for minimum treatment and natural additives products, the studies on the active ingredients in essential oils, which obtained from medicinal aromatic plants and their extracts, have also gained momentum. It has been found that these components both give flavor and prolong the shelf life of the foods by the antioxidative effect and bacteriostatic / fungustatic effect, which are prevented oxidative rancidity, and microbial spoilage. Nowadays, studies has been increased which benefit from antimicrobial compounds naturally found in spices instead of chemical and synthetic antimicrobial agents. In this regard when looking at the studies done, has been seen the most use of thyme, black cumin, pepper (pulbiber, isot), cumin, cinnamon like spices, extracts and oils that high antimicrobial and antioxidant capacities. In this review has been searched use of thyme, black cumin, pepper, cumin and cinnamon in dairy products and showing antimicrobial effects.

IN VITRO MICROPROPAGATION OF HYPERICUM PRUINATUM BOISS& BAL.

ŞEYMA ÖNLÜ¹, HUSSEIN ABDULLAH AHMED AHMED², SERKAN URANBEY³

ABSTRACT

Hypericum pruinatum Boiss & Bal. is a medicinal plant spread out in Blacksea region in Turkey. *Hypericum* species have medicinal properties such as antidepressant, antibacterial and antiviral and has been used traditionally for many years in the world. Secondary metabolite contents of the species are very rich and plant tissue culture applications represent a potential source of valuable bioactive compounds. The goal of the research was also to achieve high compact, friable callus production and regeneration of *H. pruinatum* by somatic embryogenesis or organogenesis. The seeds of *H. pruinatum* were collected from Amasya-Gümüşhacıköy district and incubated in a water solution containing 1.5 g /L GA for breaking dormancy. The seeds were surface sterilized and germinated on MS medium containing 0.005 mg/L GA and 0.6 % agar. Leaves, axillary buds, root and hypocotyledon explants were excised and cultured on MS medium supplemented with B5 vitamins. The compact and suitable callus production obtained on MS callus induction medium containing 2 mg/L 2,4-D using axillary buds. Axillary buds gave the best regeneration results in all media tested. The best adventitious shoot regeneration was also achieved on MS medium supplemented with B5 vitamins and 1mg/L BAP+0.5 mg/L NAA and 1mg/L BAP. The shoots were successfully rooted on MS medium containing 1.5 mg/L IBA and rooted plantlets were transferred to torf and perlite (1:1) mixture and acclimatized in greenhouse conditions with high survival ratio.

CAULERPIN, A BISINDOLE ALKALOID, FROM CAULERPA SPP OFF THE TURKISH COASTLINE

SONGÜL TURHAN¹, LEVENT CAVAS¹

ABSTRACT

Caulerpa cylindracea and Caulerpa taxifolia are the most famous members of Genus Caulerpa because of their invasive properties. Although the number of publications on C. taxifolia is higher than that of C. cylindracea, the latter one has invaded more areas compared to C. taxifolia. Turkey is one of the countries where C. cylindracea has invaded. No eradication method has been proposed for these species, therefore the biotechnological evaluation methods are of great importance. Recent studies show medicinal importance of secondary metabolites of Caulerpa genus. One of the secondary metabolites is bisindole based caulerpin. Anticancerogen effect has been recently attributed to caulerpin. Therefore, the monitoring of caulerpin within invasive and non-invasive species is important for their biotechnological evaluation. In this study, the levels of caulerpin were analysed in the C. cylindracea and C. prolifera collected off the İzmir coastlines (Turkey). Since there is no authentic caulerpin standard available in market, caulerpin was first isolated from C. cylindracea and then characterized by means of chromatographic techniques. According to the results, the levels of caulerpin in C. cylindracea are significantly higher than that of non-invasive C. prolifera. In conclusion, the conditions related to biotechnological production of caulerpin from invasive C. cylindracea are strongly recommended.

DENİZLİ DE TRUFFLE MUSHROOMS

KADIR ÜNLÜ¹, MUSTAFA KORUCU¹

ABSTRACT

ABSTRACT Truffle mushroom known as black diamond in the world has come to the agenda of Turkey widely in Denizli city. Denizli Forest Regional Directorate has determined which tuff mushroom species are in our records. *Tuber aestivum* (summer truffle) is usually found widespread in fungus flora of Denizli. The trees with truffle mushroom were controlled its productivity taking under protection. Our staffs were informed about truffle by Truffle experts from the USA and European Union. Sapling infected with mycorrhizae of *Tuber melanosporum* (winter truffle) was planted for the purpose of the experiment. When detected that Turkey was rich in the direction of truffle, a species action plan comprising 2014-2018 years was prepared by General Directorate. Sapling infected with mycorrhizae of *Tuber melanosporum* (winter truffle) was planted for the purpose of the experiment. Oak seedlings infected with truffle mycorrhizae were produced by Seedlings Directorate in Regional Directorate. For this purpose, a special greenhouse was build and taken equipment. The necessary seedlings will be provided here for erection of artificial truffle forests that will be generated in constitution of species action plan of Forest General Directorate.

USE OF PROBIOTICS AND PREBIOTICS IN CHRONIC KIDNEY DISEASE

FERAY GENÇER¹, HILAL YILDIRAN¹

ABSTRACT

Chronic kidney disease is defined as decrease in glomerular filtration rate that would cause significant changes in kidney function. Uremic syndrome is a clinical manifestation of severe renal insufficiency and is intoxication affecting many systems. In healthy individuals, uremic toxins are cleared by the kidneys, but these toxins cause to uremic syndrome by accumulating in individuals with renal insufficiency. In uremic syndrome, toxins such as phenols and indole are formed throughout the gastrointestinal tract and impaired intestinal microbiota has an important role in their production. Potential use of intestinal microbiota-regulating treatments such as probiotics has emerged as an attractive strategy to reduce uremic toxins. Experimental and clinical data have strengthened the hypothesis that probiotics have a therapeutic role in the protection of the gastrointestinal tract, the progression of chronic kidney disease, and the reduction of uremic toxin formation. It is believed that probiotics make this effect by blocking the passage of pathogens through the mucosa and reducing intestinal permeability. Prebiotics, which are indigestible nutrients, have a positive effect because they stimulate the activity and development of bacteria in the colon. Nutritional resources of probiotics and prebiotics usually contain high levels of sodium, potassium, phosphorus and sugar. For this reason, patients with renal insufficiency have difficulty in taking probiotic and prebiotics with nutritional resources, and supplementation is an alternative. Individuals have different microbiota diversity. For this reason, increase in strain type of supplementation suggests that it increases the positive effect. Personal biota analysis together with evolving technology can be an important guide for supplementation.

USEFUL PLANTS USED AS HERBAL TEA IN TOSYA (KASTAMONU) DISTRICT

GAMZE TUTTU¹, GÖKHAN ABAY², ŞINASI YILDIRIMLI³

ABSTRACT

Introduction: The relationship between man and plants is as old as human history. Some plants have been used as food sources and some of them in the treatment of diseases. In the course of time, humans learned to identify plants in the nature, benefit from them and developed different forms of usage. One of the common usage forms is to brew the tea. To prepare a drink, the plant parts (leaves, fruits, barks, branch etc.) are brewing (pouring boiling water on the plant and waiting for 5 min-infusion) or boiling (putting the plant in cold water for half an hour by boiling-decoction). This drink is generally named tea. Also, tea has special names according to the prepared herbs (linden tea, sage tea, lemon balm tea etc.). In our country, tea is often consumed as food or in order to benefit from its medicinal properties (to increase body resistance and the treatment of diseases). The aim of this study is to determine the plants used as herbal tea in Tosya district and to present usage purposes. **Material and Methods:** The plants specimens were collected from Tosya district, Kastamonu province, in 2014-2016 within the fieldwork of the doctoral program. The specimens were identified by using 'Flora of Turkey and the East Aegean Islands'. Interviews were carried out with local people in Tosya center and villages to determine the ethnobotanical usages of plants. Also we went to Tosya Bazaar to get information about plant usages from sellers and villagers. In addition, a survey about 'edible plants' and 'medicinal plants' was applied to 217 people. This study includes, plants used as herbal tea and their usage purposes is presented. **Results:** In this study, as a result of the interviews and surveys 48 taxa were determined used as herbal tea in Tosya. One of them is food, 34 are medical and 13 are both food and medical purposes. Most of the plants (25 taxa) used to prepare herbal tea are collected from nature and some of them are cultivated (16 taxa). However some plants which are not growing in Tosya (7 taxa) are taken from the bazaar. Some of the diseases commonly treated with herbal tea are: cold, cough, flu, stomach diseases, indigestion, rheumatism, urethritis, diabetes and cancer. **Acknowledgement:** We thank to Çankırı Karatekin University scientific research projects unit (BAP-project no: of12035d02), for the support provided for this project.

EVALUATION OF ANTIOXIDANT AND ANTICHOLINESTERASE ACTIVITIES OF IRIS XANTHOSPURIA EXTRACTS GROWING IN KÖYCEĞİZ REGION

MEHMET ALI ÖZLER¹, YUSUF SICAĞ², MEHMET ÖZTÜRK¹, MEHMET EMİN DURU¹

ABSTRACT

The effect of oxidation on human health has been widely recognized. Oxidative metabolism is compulsory for the survival of cells. An antioxidant may be defined as a substance that significantly delays or inhibits the oxidation of a substrate even at low concentrations when compared with oxidizable. Antioxidants play an important role in the prevention and cure of various of chronic diseases such as cancer, cardiovascular, atherosclerosis, stroke, diabetes, and Alzheimer's diseases. The study was aimed to determine antioxidant and anticholinesterase activities of various extracts; namely, n-hexane, dichloromethane, ethyl acetate and n-butanol obtained from rhizome and stem of *Iris xanthosporia*. The in vitro antioxidant activity were performed by four complementary assays, namely, ABTS cation radical scavenging, β -carotene-linoleic acid, CUPRAC and DPPH free radical scavenging methods, while anticholinesterase activity performed according to Ellman method in which acetylcholinesterase and butyrylcholinesterase were used as enzymes. The ethyl acetate extract of rhizome and stem showed the highest antioxidant capacity and anticholinesterase activity. The results for both activities were close to those of standards. Compounds present in this plant are good candidates for isolation and commercial use as antioxidants and anticholinesterase agents.

AN ASSESSMENT OF NON-WOOD FOREST PRODUCTS IN TURKEY

ÜSTÜNER BİRBEN¹, SERHAT URSAVAŞ¹, HASAN EMRE ÜNAL¹

ABSTRACT

Forest resources produce a variety of benefits such as direct use values, indirect use values, option values and existence or non-use values. Wood has been the most recognized economic product form while Non-Wood Forest Products (NWFPs) have been labelled as minor forest products. The term NWFPs encompasses all biological materials other than wood, and may include foods, medicines, spices, essential oils, resins, gums, tannins, dyes, ornamental plants, water and wildlife. Turkey has a spectacular geography with its natural passageway between Asia and Europe, and is at the junction of Mediterranean, Irano-Turanian, and Euro-Siberian phytogeographic regions, besides being under the influence of Mediterranean, continental, oceanic climates. These unique properties put Turkey among the richest countries with regard to biodiversity that covering diverse flora and fauna values. That is why Turkey has great potential in NWFPs. This study sought to introduced NWFPs important in Turkey and to reveal the economic value of NWFPs in the national market and to determine both the difficulties in managing of NWFPs and the policies, strategies and regulations that govern, and finally, various deliberations and suggestions have been made on the axis of sustainable development of that resources.

A ETHNOBOTANICAL RESEARCH ON WILD FRUITS OF BİNGÖL

RİDVAN POLAT¹, EBRU YÜCE BABACAN², UĞUR ÇAKILCIOĞLU²

ABSTRACT

This study carried out between May 2012 and September 2014 proposed to identify wild fruits and the diverse ways they are used by the local populations of Bingöl. During this period, 56 vascular plant specimens were collected. The plants were pressed in the field and prepared for identification. A total of 22 wild fruit plants belonging to different families were identified in the region. In the research area, local people were found to use wild fruits for food and for curative purposes. These plants are used in the treatment of many diseases. By drying infusions or decoctions of these plants, local people use them during the whole seasons of the year. Most commonly used plants genus are Crataegus, Rosa, Rubus and Pyrus.

CEREALS AND ANTHOCYANINS

ÇAĞLA KAYIŞOĞLU¹, MÜNİR ANIL¹

ABSTRACT

Cereals and Anthocyanins Çağla KAYIŞOĞLU, Münir ANIL Ondokuz Mayıs University Engineering Faculty Food Engineering Department, Samsun The anthocyanins compose a group of intensely coloured pigments responsible for the orange, red, purple and blue colours of many fruits, vegetables, flowers, leaves, roots and other storage organisms of plants. They are found in nature in the form of polyhydroxylated and or methoxylated heterosides which derive from the flavylum ion or 2-phenylbenzopyrilium. The de-glycosylated or aglycone forms of anthocyanins are known as anthocyanidins. Aglycon (anthocyanidin) is found united to one or various sugars, which, in turn, can be acylated with different organic acids. The presence of these hydroxyl groups on the rings, as well as one or several sugar molecules, make these compounds quite soluble in water, ethanol, and methanol. Anthocyanin stability increases with the number of methoxyls in the B ring and decreases as hydroxyls increase. Thus, among the most common anthocyanidins, the most stable is malvidin, followed by peonidin, petunidin, cyanidin and delphinidin. The differences between anthocyanins relate to the number of hydroxyl groups, the nature and number of sugars attached to the molecule, the position of this attachment, and the nature and number of aliphatic or aromatic acids attached to sugars in the molecule. Anthocyanins occur naturally in fruits and vegetables as glycosides, having glucose, galactose, rhamnose, xylose or arabinose attached to an aglycon nucleus. Purple corn is a special cultivar of corn that is rich in anthocyanins and other functional phytochemicals. The health benefits of anthocyanins in purple corn have been attributed to their high antioxidant activities and to other mechanisms, such as the presence of components that have been shown to potentially reduce the risk of colon cancer by inhibiting the proliferation of human colon cancer cells in vitro. The anthocyanins of purple corn have been characterized and these include cyanidin-3-glucoside, cyanidin-3-(6"-malonylglucoside), cyanidin-3-(3", 6"-dimalonylglucoside), pelargonidin-3-glucoside, peonidin-3-glucoside and their malonated counterparts as the major anthocyanins. Although widely consumed as white rice, there are many special cultivars of rice that contain colour pigments, such as black rice, red rice and brown rice. Their name refer to the kernel colour (black, red or purple) which is formed by deposits of anthocyanins in different layers of the pericarp, seed coat and aleurone. The most abundant colored rice anthocyanins are cyanidin 3-glucoside and peonidin 3-glucoside with cyanidin 3-glucoside levels being significantly higher than peonidin 3-glucoside. The functional properties of the extracts from black rice have been widely studied using in vivo and in vitro models. Because of their high antioxidant activity, they can protect endothelial cells prevent heart and cardiovascular diseases and act as anticancer agents. Whole wheat grain is a good source of dietary fiber and antioxidants which can promote health benefits towards several chronic diseases usually associated with oxidative stress. Although most of the cultivated cultivars are white or red-grained, some varieties such as purple and blue wheat grains have drawn the attention of researchers and food industry due to their high content in anthocyanin pigments and to their antioxidant properties. Color in wheat grains is

localized in the bran layers. The red color is due to the presence of major catechin-tannin and minor anthocyanins in the diploid testa of seed coat. The purple color is due to anthocyanins and in the diploid pericarp layer. Blue color is due to anthocyanins in the aleurone layer. Anthocyanins in purple wheat; delphinidin 3-galaktosid, delphinidin 3-arabinosid, siyanidin 3-arabinoz, petunidin 3-galaktosid, siyanidin 3-glukozid, peonidin 3-glukosid, malvidin 3-glukosid 3-galaktosid, pelargonidin 3-arabinosid ve peonidin 3-arabinosid, malvidin 3-glukosid, siyanidin. Siyanidin 3-glikosid was also the most abundant anthocyanin in purple wheat; however, this was followed by siyanidin 3-galaktosid and malvidin 3-glikosid. Blue wheat, reported the most abundant anthocyanin to be delphinidin-3-glucoside followed by delphinidin-3-rutinoside, accounting for %37 and %32 of the total anthocyanin content, respectively. Cyanidin-3-glucoside and peonidin-3-glucoside have also been detected in purple wheat reported that cyanidin-3-glucoside was the principal anthocyanin in aleurone blue wheat with pelargonidin 3-glucoside and cyanidin-3-galactacide also being present. In barley, delphinidin 3-glucoside, delphinidin 3-rutinoside, cyanidin 3-glucoside, petunidin 3-glucoside, and cyanidin chloride were positively identified with delphinidin 3-glucoside and cyanidin 3-glucoside being high in yellow and purple barley, respectively.

A REVIEW OF DIETARY TOTAL ANTIOXIDANT CAPACITY AND CORONARY ARTERY DİEASE

NESLIHAN ARSLAN¹, GAMZE AKBULUT¹, NILÜFER ACAR TEK¹, GÜLSÜM DEVECİ¹

ABSTRACT

The relationship between diet and health have been an important issue. The roles of dietary antioxidants and health also have been of particular interest. Compounds in fruits and vegetables are bioactive and they interact with each other. These compounds are antioxidants. The Institute on Medicine has defined a dietary antioxidant as “a substance in foods that significantly decreases the adverse effects of reactive species (oxygen and nitrogen species) on normal physiological function in humans. Reactive oxygen species can form as a result of metabolic and physiological processes and as oxidative reactions in the organism. The organism can prevent these reactive oxygen species with enzymatic and non-enzymatic antioxidative mechanisms. Under some circumstances, the increase of oxidants and the decrease of antioxidants may not be prevented and the oxidative/antioxidative balance may shift towards the oxidative state. As a result, oxidative stress is responsible for more than 100% of the disease. Antioxidant molecules prevent oxidative reactions that occur in the organism. The total antioxidant capacity (TAC) aims to measure the free radical-reducing capacity of all antioxidants in the diet and takes into account synergistic effects between substances. Measuring the “total antioxidant capacity of the diet” is a challenge and different alternatives have been explored which show similar ranking of foods according to their antioxidant capacity. Concentrations of different antioxidants in serum can be measured separately in the laboratory environment. But these measurements are both time consuming, expensive and complicated. Since individual measurements of different antioxidant molecules are impractical and the effects of these antioxidants are synergistic, an antioxidant response is measured, and this is named Total Antioxidant Capacity (TAC). Dietary intake of antioxidants has been reported to reduce the risk of many metabolic diseases. However, it is not clear which antioxidant is more effective in reducing this risk, but there are also studies showing the ineffectiveness or adverse effect of using a single antioxidant. Total antioxidant capacity reflects all antioxidants in the diet and synergistic effects of these antioxidants. Dietary total antioxidant capacity and serum antioxidant capacity were found to be inversely related to coronary artery disease according to the data obtained from epidemiological studies. At the same time the antioxidant capacity of serum is related with coronary artery disease. The purpose of this review is to demonstrate the relationship between dietary and serum total antioxidant capacity and coronary artery disease. In a study of 53 coronary artery 42 healthy control groups, serum TAC levels in the patient group were significantly lower than in the healthy control group ($p < 0.001$). TAC levels were significantly lower in diabetic, smokers, hyperlipidemic and obese subjects compared to those who did not include these factors [13]. In the study with individuals with coronary angiography abnormalities who admitted to the hospital with 42 myocardial infarction under the age of 35, the TAC level was significantly higher in the control group. TOS level was significantly higher in the patient group. The disease showed a positive correlation with severity and TOS. As a result, increasing the total antioxidant capacity of the

DETERMINATION OF APPROPRIATE AREAS AND DESIGN PROPOSALS FOR HEALING GARDENS IN TOKAT

KÜBRA YAZICI¹, ŞÜHEDA BASİRE AKÇA², LEVENT YAZICI³

ABSTRACT

In recent years, research on the psychological impact of the structural environment on human health has come to the fore in the world public, resulting in the emergence of the 'healthcare design and quality of life' approach. Healing garden designers have positive effects on users by creating spaces with natural and artificial elements. Created spaces ensure that people are physically and mentally healthy. Recently, in Tokat, projects related to the importance of medicinal aromatic plants as well as their development have been carried out. However, the design of healing gardens is a fairly new topic today and there is no public healing garden in Tokat. The purpose of this research was to determine the appropriate areas for the healing gardens in Tokat in the light of the available research and to explain the design principles and benefits for visitors. In conclusion, this study was described the role of the history of the region and plant diversity in planning in the design of healing garden.

DETERMINATION OF ANTIBACTERIAL ACTIVITIES OF DIFFERENT PLANT SPECIES BELONGING TO ASTERACEAE FAMILY

DUDU DUYGU KILIÇ¹, ARIF AYAR¹, CEREN YAVUZ¹, TUBA YILDIRIM¹

ABSTRACT

The use of herbs as alternative medicine have increased dramatically in the last years. In recent years, due to the harmful effects of chemical drugs are frequently observed antimutagenic, antioxidant, antibacterial and antifungal properties of extracts which derived from plants and they have been used in medicine. In this study, aim was investigate the antibacterial activities of some plant species belonging to Asteraceae family which distributed to different ecological conditions in Amasya. The antibacterial activities of *Anthemis tinctoria*, *Matricaria chamomilla* and *Achillea biebersteinii* plant extracts which belonging to Asteraceae family from Amasya region were determined by disc diffusion and microdilution method. The methanolic extracts of these plants were prepared with Soxhlet extractor. The antibacterial activities of plant extracts were tested against standard strains of *Staphylococcus aureus* ATCC 25923, *Escherichia coli* ATCC 35218, *Klebsiella pneumoniae* ATCC 70600, *Pseudomonas aeruginosa* ATCC 27853 and *Salmonella enteritidis* ATCC 13076. As a result of this study, it was observed that plant extracts had antibacterial effects when they compared with control group antibiotics According to the results of disk diffusion method, the highest antibacterial effect was identified *Anthemis tinctoria*, *Matricaria chamomilla* and *Achillea biebersteinii* respectively. The microdilution method was studied concentration range from 6.25 - to 50 mg/ml. The minimum inhibition concentration (MIC) of the most effective *Anthemis tinctoria* plant extract were 12.5 mg/ml for *Klebsiella pneumoniae* and *Pseudomonas aeruginosa*; 25 mg/ml for *Staphylococcus aureus* and *Escherichia coli*; 25 mg/ml for *Salmonella enteritidis*. The MICs of the most effective *Matricaria chamomilla* plant extract were 25 mg/ml for *Klebsiella pneumoniae*, *Escherichia coli*, *Salmonella enteritidis* and *Pseudomonas aeruginosa*; 50 mg/ml for *Staphylococcus aureus*. The MICs of the most effective *Achillea biebersteinii* plant extract were 25 mg/ml for *Klebsiella pneumoniae*; \geq 50 mg/ml for *Escherichia coli* and *Pseudomonas aeruginosa*; 12.5 mg/ml for *Staphylococcus aureus*; 50 mg/ml for *Salmonella enteritidis*. As a result, We determined *Anthemis tinctoria*, *Matricaria chamomilla* and *Achillea biebersteinii* plant extracts which are belonging to Asteraceae family have properties of bacterial inhibition. In this context, it can be considered that these plant species are used as an alternative treatments and can lead to later studies.

TYROSINASE INHIBITORY ACTIVITIES OF IRIS XANTHOSPURIA EXTRACTS

MEHMET ALI ÖZLER¹, YUSUF SICAK², MEHMET ÖZTÜRK¹, MEHMET EMİN DURU¹

ABSTRACT

Tyrosinase inhibitors inhibit the production of melanin in the derm. Up to date, many natural compounds have been screened for their tyrosinase inhibitory potential, and they were compared to those of synthetic tyrosinase inhibitors. The tyrosinase inhibitors such as arbutin, kojic acid, and hydroquinones are used as whitening and anti-hyperpigmentation agents. In this context, there is a need for new tyrosinase inhibitors without the side effects. The study was aimed to determine tyrosinase inhibition activities of various extracts obtained using n-hexane, dichloromethane, ethyl acetate and n-butanol solvents from rhizome and stem of *Iris xanthosporia*. In this study, it can be concluded that the ethyl acetate extracts of *I. xanthosporia* rhizome can be a potential candidate for the inhibition of tyrosinase enzyme.

SPIRULINA AND ITS HEALTH EFFECTS

NESLIHAN ARSLAN¹, GAMZE AKBULUT¹, NILÜFER ACAR TEK¹, GÜLSÜM DEVECİ¹

ABSTRACT

The dried state of *Arthrospira platensis*, an oxygenic photosynthetic bacteria found in sea water, is called Spirulina. The name Spirulina comes from the spiral filaments of *Arthrospira platensis*. Spirulina naturally grows in alkaline lakes and seas and is commercially produced under controlled conditions in the greenhouse. Because it has not cellulose and cell walls, it is readily digested. In this review, spirulina's effects on health such as antioxidant, antidiabetic, antihypertensive, antiinflammatory are discussed. THE CONTENT OF SPIRULINA 60-70% of the dry weight is composed of protein. It contains all essential amino acids ; gamma-linolenic acid, alpha-linolenic acid, linoleic acid, EPA, DHA, stearidonic acid and arachidonic acid. It contains vitamin B1, B2, B3, B6, B9, C,A and E and minerals such as calcium, potassium, chromium, copper, manganese, iron, phosphorus, magnesium, and selenium. EFFECTS ON HEALTH ANTIOXIDANT EFFECT The antioxidant effect of spirulina has been demonstrated by in vitro and in vivo studies. This antioxidant effect is known to be caused by phycocyanins, B-carotene and other vitamins and minerals contained in the content. In a study conducted in hypercholesterolemic rats, 1-5 g / kg spirulina is administered for 8 weeks. Ultimately, it has been shown to increase glutathione, glutathione peroxidase and glutathione reductase activity in the liver. The DNA degradation in lymphocytes is significantly reduced. ANTIDIABETIC EFFECT In a study of diabetics, SP administration reduced plasma fasting glucose level significantly. Fluid uptake was significantly lower in the SP group than in the 2 diabetic groups. The possible mechanism of SP is suggested to stimulate pancreatic beta cells, either to increase insulin release or to help transport blood glucose to peripheral tissues. NUTRITION STATUS A study in which 87 malnourished children aged 0-5 years were given 3 grams of spirulina for 12 weeks showed significantly better height and body weight when compared to the vitamin and mineral treated group. It is also more effective than vitamin-mineral treated group at ferritin and iron levels. TOXICITY There is no information yet on the toxicity of spirulina. However, it is said that potentially toxic materials such as heavy metals can be found in the water. It has also been reported that pesticides may contain cyanobacterial toxins. That is why Spirulina should be acquired from trusted sources. Spirulina usually works at 1-10 g/day doses. Doses recommended for adults are 3-10 g/day. The Dietary Supplements Information Expert Committee (DSI-EC) has shown that spirulina does not constitute a class of health hazard. However, it is still unclear whether it interacts with other medicines. Headache, stomachache, muscle pain and concentration problems have been reported in some cases. It is also not recommended for use in patients with phenylketonuria, autoimmune diseases and ALS . Spirulina is generally recognized as safe (GRAS list). In 2012, it was found safe to use both spirulina and extract as a coloring agent. The dose with no observable side effects (NOAEL) was determined to be 10.00 mg/ kg. The safe dose was 4,12 mg/kg according to the information obtained from human studies. CONCLUSIONS AND RECOMMENDATIONS Human studies done up to daylight are rather limited. More case-control studies are needed. Given its composition, spirulina is

said to be a rich source of protein, vitamins, minerals and phytochemicals. The use of this source in poor and malnutrition-fighting countries is being debated. In order to be cheap and accessible, studies on the use of spirulina for this purpose should be undertaken.

ANTIBACTERIAL EFFECTS OF METHANOL EXTRACTS OF SOME PLANT SPECIES BELONGING TO LAMIACEAE FAMILY

DUDU DUYGU KILIÇ¹, ARIF AYAR¹, CEREN YAVUZ¹, TUBA YILDIRIM¹

ABSTRACT

The effects of medicinal and aromatic plants have been known since ancient times and these plants are widely used in the treatment of diseases. Especially the species belonging to Lamiaceae family are used as antibacterial agent among medical plants. The aim of the present study was to determinated the antibacterial effects of the methanolic extracts of some plant species belonging Lamiaceae family which distributed to different ecological conditions in Amasya. The antibacterial effects of *Stachys annua*, *Scutellaria salviifolia* and *Nepata nuda* plant extracts was determined by disc diffusion and microdilution methods. The methanolic extracts of these plants were prepared with Soxhlet extractor. The antibacterial effects of plant extracts were tested against standard strains of *Staphylococcus aureus* ATCC 25923, *Escherichia coli* ATCC 35218, *Klebsiella pneumoniae* ATCC 70600, *Pseudomonas aeruginosa* ATCC 27853 and *Salmonella enteritidis* ATCC 13076. In this study, we observed that plant extracts had antibacterial effect when they compared with control group antibiotics. According to the results of disk diffusion method, the highest antibacterial effect was identified *Scutellaria salviifolia*, *Stachys annua* and *Nepata nuda* respectively. The microdilution method was studied concentration range from 6.25 - to 50 mg/ml. The minimum inhibition concentrations (MIC) of the most effective *Scutellaria salviifolia* plant extract were 12.5 mg/ml for *Staphylococcus aureus*, *Salmonella enteritidis* and *Escherichia coli*; 25 mg/ml for *Klebsiella pneumoniae* and *Pseudomonas aeruginosa*. The MICs of *Stachys annua* plant extract were 12.5 mg/ml for *Pseudomonas aeruginosa*, *Salmonella enteritidis* and *Escherichia coli*; 25 mg/ml for *Staphylococcus aureus*; 50 mg/ml for *Klebsiella pneumoniae*. MICs of *Nepata nuda* plant extract were 12.5 mg/ml *Klebsiella pneumoniae*; 25 mg/ml for *Staphylococcus aureus*; 50 mg/ml for *Pseudomonas aeruginosa*, *Salmonella enteritidis* and *Escherichia coli*. As a result, Our study it was determined that *Scutellaria salviifolia*, *Stachys annua* and *Nepata nuda* species belonging to the Lamiaceae family have antibacterial activities in vitro conditions. After investigating toxicological and pharmacological properties, we think that it may be the subject of use in medicine, food, cosmetics and other industrial fields.

ANTIOXIDANT PROPERTIES OF SOME NON-WOOD FOREST PRODUCTS AT DIFFERENT TEMPERATURES

CEYHUN KILIÇ¹, ZEHRA CAN², AYŞENUR YILMAZ³, HÜLYA TURNA¹

ABSTRACT

Some non-wood forest products are brewed and consumed as tea. Among the reasons for the consumption of herbal tea, digestive problems are located in the first row. Antioxidants help to human body for arranging digestive and immune system. Herbal tea is brewed in various ways such as boiling at different durations or waiting in hot water at different temperatures etc. Type of brewing can affect to bioactive properties of herbal tea. In this study, it was investigated the bioactive properties (total phenolic content, total flavonoid content, condensed tannin content and antioxidant properties) of some herbals brewed (Green tea / *Camellia sinensis*, senna / *Zea mays* ssp., corn silk / *Cassia* ssp., rosemary / *Rosmarinus officinalis*) at different temperature. These herbs were brewed for 10 minutes at 60oC, 80 oC and 100 oC temperatures. After cooling, total phenolic content, total flavonoid content, condensed tannin content and antioxidant properties of these herbs were determined. Consistently; the highest results were found in the tea brewed at 100oC The highest total flavonoid (0.305 ± 0.005 mg QE/g) and ferric reducing ability (670.150 ± 2.121 μ mol FeSO₄7H₂O/g) was in *Rosmarinus officinalis*. . The highest condensed tannin (9.443 ± 0.524 mg CE/g) and the highest total phenolic content (4.872 ± 0.005 mg GAE/g) was in *Camellia sinensis* and *Cassia* ssp., respectively

UTILIZATION OF JERUSALEM ARTICHOKE FLOUR IN THE MANUFACTURING OF TURKISH DRY FERMENTED SUCUK

AYŞEGÜL GÜNDEM¹, DUDU GÖÇMEN¹, DILEK KAZAN¹, CEM OKAN ÖZER¹

ABSTRACT

Jerusalem artichoke is a medicinal plant with various effects such as antimicrobial, antifungal and anticancer activities and it is often used as folk medicine for the treatment of some problems. Additionally, it contains high amount of phenolic compound, antioxidants and dietary fiber. It can be concluded that artichoke may be used as a functional food additive in food industry because of these useful properties. The objective of this study was to investigate the effect of replacing animal fat with Jerusalem artichoke flour on the quality characteristics of sucuk (Turkish dry fermented sausage). Experimental sucuks were manufactured with replacing animal fat with 0, 5, 10, 15 and 20% artichoke flour. Chemical composition, color and texture properties and microbial properties of sucuks were determined during manufacture and storage period. The results indicated that addition of artichoke flour decreased TBARS values compared to control group ($p<0.05$). The use of Jerusalem artichoke flour affected lactic acid bacteria counts and fermentation process in positive manner ($p<0.05$). Moreover, pH, ash and hardness values were influenced by use of Jerusalem artichoke flour ($p<0.05$). Addition of artichoke flour enhanced pH decrease in sucuk during the fermentation and storage period ($p<0.05$). Increasing levels of artichoke flour in sucuk formulation caused a decrease in hardness values of sucuk ($p<0.05$). The results indicated that the use of artichoke flour in sucuk manufacture had no negative effects on quality parameters of sucuk and therefore it can be concluded that utilization of artichoke flour in sucuk manufacture may has positive nutritional effects and may contribute to improve shelf life of sucuk.

YOUTH ATTITUDES AND BEHAVIORS OF MEDICINAL PLANT OR MEDICINAL PLANT BASED DRUG USE

ÖZKAN GÖRGÜLÜ¹, ASLI AKILLI²

ABSTRACT

Herbal treatment and alternative medicine methods are widely used in old and strong eastern cultures like China and India and also Middle East countries like Syria, Iran, and Iraq. In the last 20 years, interest in herbal medicine has been dramatically increased in our country and Europe. When compulsory migrations from the Middle East are expected to affect western cultures; it is envisaged that herbal cure will become prevalent and the importance of the herbal cure will increase. This work was supported by the Ahi Evran University Scientific Research Projects Coordination Unit. Project Number: TIP.E2.17.006. In this study, it was aimed to determine the attitudes and behaviors of the young population in the age of university in Turkey regarding the use of medicinal plants or medicinal plant based drugs. For this purpose, a survey study was conducted on 400 university students. Participation in the survey was done on a voluntary with randomly selected students. The descriptive statistics as well as the chi-square test were used in the study. The average age of the students who participated in the survey was calculated as 20.43 ± 0.098 . In this study conducted with a young group, it was determined that 32.5% of the youth use medicinal plants or medicinal plant based drugs and 67.5% do not use them. Gender was statistically significant in the use of these products ($p < 0.01$) and also it was found that the place of birth in the rural or urban was not effective on the medicinal plant or medicinal plant based drug use ($p > 0.05$). Mothers and grandparents were found to be most effective in the use of these products in their families ($p < 0.01$). In the study of participation from seven geographical regions of Turkey, it was determined that there was no significant relationship between the medicinal plant or medicinal plant-based drug use and the regions where the students' families lived ($p > 0.05$). However, the distribution of the medicinal plant or medicinal plant based drugs used according to regions was statistically significant ($p < 0.01$).

DETERMINATION OF ANTIOXIDANT AND ANTIMICROBIAL ACTIVITIES OF SOME TAXA OF THE GENUS TANACETUM L.

YUSUF ALAN¹, AHMET SAVCI¹, SIRAÇ TOPDEMİR², MURAT KURŞAT²

ABSTRACT

Tanacetum L., the third largest genus in the family Asteraceae (Compositae), which has 160 taxa worldwide. Usually, the taxa of Tanacetum have spread to Europe, Asia, North Africa and North America. In our country, 46 taxa are present. In our work, plant samples were collected in the province of Bitlis. Extracts of Tanacetum taxa (Tanacetum aureum (lam.) Greuter var. oligocephalum (DC.) Kandemir (Ekşi pireotu), Tanacetum parthenium (L.) Sch. Bip. / beyaz papatya, Tanacetum balsamitoides L. (Marsuvanotu), Tanacetum zahlbruckneri (Nab) Grierson (Özge pireotu)) were obtained from the plant samples by cleverger hydrodistillation. Antimicrobial and antioxidant activities of extracts of Tanacetum taxa were investigated. The antimicrobial activities of the T. aureum var. oligocephalum, T. parthenium, T. Balsamitoides and T. zahlbruckneri taxon extracts were determined by the hollow agar method. Bacillus subtilis ATCC 6633, Staphylococcus aureus ATCC 25923, Bacillus megaterium DSM 32, Enterobacter aerogenes ATCC 13048, Escherichia coli ATCC 11229, Pseudomonas aeruginosa ATCC 9027, Klebsiella pneumonia ATCC 13883, Candida albicans ATCC 10231, Yarrowia lipolytica and Saccharomyces cerevisiae was used as test microorganisms. Eritromisin (E-15), Ampisillin (AM- 10), Amikasin (AK-30), Rifampisin (RD-5) and Fluconazole (25 µg) antibiotics were used for positive control. According to the results obtained, T. aureum var. oligocephalum extract showed the highest antimicrobial activity against Y. lipolytica (26 mm) and T. zahlbruckneri extract the lowest activity against B. subtilis (11 mm). We have found that plant extracts generally have better antimicrobial activity when compared with antibiotics that we use. Antioxidant activities of plant extracts were examined using different in vitro methodologies such as total antioxidant activity by ferric thiocyanate, total reducing power by potassium ferricyanide reduction method, reduction capacity of cupric ions (Cu²⁺) by the Kuprak method, 1,1-diphenyl-2-picrylhydrazyl (DPPH•) free radical scavenging, 2,2'-azino-bis(3-ethylbenzthiazoline-6-sulfonic acid) (ABTS) radical scavenging activity. Compared with the standard antioxidants BHA, BHT and α-tocopherol, reduction capacities for samples are as follows T. balsamitoides > BHA > T. aureum var. oligocephalum > BHT > α-tokoferol > T. parthenium > T. zahlbruckneri. According to the results of the study, % inhibition was 70.77% for BHT, 66.35% for BHT, 62.11% for α tocopherol, 61.86% for extracts. When we look at the results of ABTS•+ radical scavenging activity, we can say that all of them are close to each other and show very good activity. ABTS radical activities of plants and standards are listed as follows: BHT (%96,16) ≥ α-tocopherol (%96,15) ≥ BHA (%96,04) ≥ T. aureum var. oligocephalum (%95,99) ≥ T. balsamitoides (%95,97) ≥ T. parthenium (%95,95) ≥ T. zahlbruckneri (%95,92).

**INVESTIGATION OF ANTIMICROBIAL ACTIVITIES OF EXTRACTS
OBTAINED FROM NEPETA TRANSCAUCASICA GROSSH. VE
SCUTELLARIA ALBIDA L. SUBSP. CONDENSATA (RECH.F.)
J.R.EDM. TAXA**

YUSUF ALAN¹, AHMET SAVCI¹, SIRAÇ TOPDEMİR², MURAT KURŞAT²

ABSTRACT

Lamiaceae family in Turkey is represented by 46 genera, 577 species and 755 taxa in total. In our work, plant material was collected in Bitlis province. The collected plant samples of *Nepeta transcaucasica* (Kaf pisikotu) and *Scutellaria albida* L. subsp. *condensata* (Kırk kaside) were dried and extracted with the soxhlat method. The antimicrobial activities of the extracts obtained were investigated. The antimicrobial activities of the *Nepeta transcaucasica* ve *Scutellaria albida* L. subsp. *condensata* taxon extracts were determined by the hollow agar method. *Bacillus subtilis* ATCC 6633, *Staphylococcus aureus* ATCC 25923, *Bacillus megaterium* DSM 32, *Enterobacter aerogenes* ATCC 13048, *Escherichia coli* ATCC 11229, *Pseudomonas aeruginosa* ATCC 9027, *Klebsiella pneumonia* ATCC 13883, *Candida albicans* ATCC 10231, *Yarrowia lipolytica* and *Saccharomyces cerevisiae* was used as test microorganisms. Eritromisin (E-15), Ampisillin (AM- 10), Amikasin (AK-30), Rifampisin (RD-5) and Fluconazole (25 µg) antibiotics were used for positive control. According to the results obtained, *Nepeta transcaucasica* extract showed the highest antimicrobial activity against *C. albicans* (27 mm) and extracts the lowest activity against *E.coli* ve *P. aeruginosa*'a (12 mm). When we compare plant extracts with the antibiotics we use, it has been found that they generally exhibit similar antimicrobial activity.

ASTAXANTHIN, OXIDATIVE STRESS AND SENESCENCE

GÜLSÜM DEVECİ¹, NİLÜFER ACAR TEK¹, GAMZE AKBULUT¹, NESLİHAN ARSLAN¹

ABSTRACT

A progression process becomes reality by each turn of Earth around the sun. In this period, numerous systems such as hormones, proteins, immunity are affected by results of changes in gene expression of human. In addition to gene expression, changeable factors such as type of nutrition, environment, stressve life style end up with people' s appearanceduringthis all term.Senescence ensues from these differentiations and cumulations increasing based on it. Stochastic theories that are some of assumptions explained by approximately over 300 theories, suggesting which senescence occurs with accumulation of toxic products, include hypotheses of free radical, wear and tear, destructive DNA damage, mitochondrial and lacking of cellular adaptation mechanism. Besides of degenerative diseases, process of senescence also accelerates due to heaps and increments of free radicals in cells and tissues and alterations in oxidation pathway depending on some metals. Natural antioxidants that are present as ascorbic acid, caratenoids, phenolic compounds, phospholipids,sterols, reaction products of maillard and protein-related components in foods minimize this oxidative damage of biomolecules and hinders oxidative cycle. Although astaxanthin, being a carotenoid source, resembles its genus, having both hydroxy- and oxi-parts makes it different from other carotenoids. Including both bathces, double bonds in its structure and property of polar-nonpolar-polar enable it to be more antioxidant activity. Astaxanthin, doses of it is 2 mg/kg/day, 6 mg/day or 0.02 % of daily diet, possesses favorable effects on reactive oxygen species by affecting activity of antioxidative enzymes such as superoxide dismutase, catalase and glutathione peroxidase, levels of oxidative stress products such as nitric oxide, acrolein and 8-hydroxydeoxyguanosine (8-OHdG), pathways of heme oxygenase-1, nuclear factor like-2 (Nrf2) and phosphatidylinositol-3 kinase/protein kinase-B (PI3K/Akt), and also decreases these cases increasing with senescence. It is mentioned that effects of different amounts of astaxanthin on oxidative stress and aging process in this review. After all, it has been stated that effects of antioxidant and inflammation prevention would influence positively senescence mechanisms and impressions of aging. Astaxanthin is important with regards to awareness raising in this topic.

POTENTIAL EFFECTS OF ASTAXANTHIN IN THE PREVENTION OF DISEASES

GÜLSÜM DEVECİ¹, NİLÜFER ACAR TEK¹, GAMZE AKBULUT¹, NESLİHAN ARSLAN¹

ABSTRACT

Astaxanthin, belonging to xanthophyll's which are oxidized derivatives of carotenoids, differs from other xanthophylls due to having both hydroxy- and oxy-groups. Hydroxyl groups in both terminal ends gives astaxanthin polar property and middle section also does nonpolar property. While there have been various isomers in parallel with configurations of these hydroxy groups, esterification of astaxanthin with diverse fatty acids and their degree influence its effectiveness and half of life. Not being activity of vitamin A during metabolized in liver, ability of passing blood-brain barrier, joining in grey matter of brain are other specific features of astaxanthin. In addition these, taking part in membrane structure, activities of antioxidative, anti-inflammatory and antiapoptotic make it protective effect in diverse chronic diseases. Treatments with different quantity of astaxanthin, 25 mg/kg/day, 50 mg/kg/day, 75 mg/kg/day, 100 mg/kg/day or 720 mg/kg/day, result in a reducing in cytokine and bacterial burden in gastric inflammation, amelioration of GLUT4 and interlinkage of insulin-substrate, decreasing postprandial blood sugar, enhancing insulin secretion by β -cells. Besides these findings, inhibiting growth of cancer cells, enhancing cerebral edema and blood-brain barrier, attenuating retinal ischemic damage, increasing liveliness of sperm and ameliorating glomerular function and social interaction in autism are also suggested. As a result, astaxanthin may be a promising in usage of it as adjuvant to prevention and treatments of renal, cardiovascular, neurologic and diabetes mellitus diseases. Accordingly, it has been reported to be needed more studies.

MIYTHS RELATED TO MEDICAL PLANT OLIVE IN THE AEGEAN REGION

NEŐE ERDİNÇ¹, ÖZLEM YILMAZ²

ABSTRACT

In recent years there have been many studies on the effects of medicinal and aromatic plants on human health. Turkey has an important place in the world with its geographical features and unique culture in terms of medical plants. The richness of the Aegean region has also been noticed in ancient times. There are many legends and mythos, which are quoted daily before the history, and various plants are mentioned. Mythos have played an important role for the daily use of these plants for their medical use. The history of medical plants is as old as human history. Plants are considered to be the most precious gift of the gods to mankind. Hippocrates is known as the father of medicine and has produced about 400 medicinal plant classifications in his books. The great Turkish Islamic scientist Ibni Sina mentioned various plants used as medicines in his book "The Law" written in the 11th century. In later years, Ibni Sina's books have been used as resources for many years in medical education in Europe. In this study, the use of olives (*Olea Europaea*) for medical purposes throughout the history and related myths are mentioned. Our findings are the result of the literature search.

WATER SOLUBLE FLUORESCENT CALIX[4]ARENE AS NARINGENIN CARRIER: ENHANCED SOLUBILITY, CYTOTOXICITY AND CANCER CELL IMAGING

MEHMET OGUZ¹, ASIF ALI BHATTI², SERDAR KARAKURT³, MUSTAFA YILMAZ⁴

ABSTRACT

Flavonoids are micronutrients that are widely identified in foods of plant origin and have been recognized potent antioxidants, possessing bioactive potential to reduce cancer risk, prevent cardiovascular disease, and neurodegenerative disorders. Among flavanone, naringenin is regarded as a phytoestrogen with weak estrogenic and antiestrogenic activities that inhibits proliferation of colon cancer cells and melanoma cells. However, poor water solubility of this flavanone make it less bioactive. To tackle problem of solubility of this anticancer drug, different methods are being used in pharmaceuticals. Moreover, in recent years, supramolecular chemistry has gained large attention in drug delivery system and enhancement of solubility of the water insoluble drugs. In this connection, different macromolecules have been used as carrier. In this study we have synthesized water soluble calixarene containing fluorescent moiety at lower rim and formed the inclusion complex with naringenin. Different studies such as jobs plot, phase solubility and binding constant were determined. Cancer cell imaging were carried out to observe the movement of drug in cancer cells and IC₅₀ values were determined.

MYTHOS CONCERNING DAPHNE AND ITS MEDICINAL USAGE

NEŞE ERDİNÇ¹, ÖZLEM YILMAZ²

ABSTRACT

Healing with medicinal plants is as old as mankind itself. The connection between human and his search for drugs in nature dates from the far past, of which there is ample evidence from various sources: written documents and legends. In recent years, with the growing interest of traditional medicine, many studies have been carried out on the effects of on the effects of plants on health. The ancient legends and myths occupies an important place for understanding the properties of medicinal plants. This information is transmitted orally and in writing illuminate still holds today. Turkey has a special precaution in terms of medical plants in terms of both its geographical features and the myths. The daphne tree is one of the important medicinal plants subject to the myths in Anatolia. Laurel leaves be obtained from the daphne tree . Turkey, the most important laurel leaves exporter country in the world, meets about 90% of the world bay requirement. In this study, it is mentioned about mythos and medicinal use areas related to Daphne / Laurel leaves (*Laurus nobilis*) plant.

**THE PHENOLIC PROFILE OF NEPETA CONGESTA VAR.
CONGESTA AND NEPETA CELIOTROPIFOLIA VAR.
CELIOTROPIFOLIA**

ABDULSELAM ERTAŞ¹, MEHMET VEYSİ ÇAĞLAYAN¹, MUSTAFA ABDULLAH YILMAZ², NESRİN HAŞIMI³, FIRAT AYDIN⁴, SERKAN YİĞİTKAN¹, İSMAIL YENER⁴, UFUK KOLAK⁵

ABSTRACT

The genus *Nepeta* is a member of Lamiaceae family and has a worldwide distribution with over 250 species which widely grow in Europe, Asia, North America, North Africa and in the Mediterranean region . In Turkey, *Nepeta* species are represented by 41 taxa (18 of them are endemic) and mostly distributed in East Anatolia and Taurus Mountains . Some *Nepeta* species have been traditionally used as diuretic, diaphoretic, antitussive, antispasmodic, antiasthmatic, febrifuge, sedative, spice and herbal tea . In this study, the chemical profile of ethanol extracts of *Nepeta congesta* var. *congesta* and *Nepeta celiotropifolia* var. *celiotropifolia* were determined using LC-MS/MS. A comprehensive LC-MS/MS method validation was developed for the qualitative and quantitative analysis of 37 phytochemicals including 15 phenolic acids, 17 flavonoids, 3 nonphenolic organic acids, 1 phenolic aldehyde and 1 benzopyrane. The powdered plant materials (stems, leaves, flowers, roots and mixed parts) were extracted three times with ethanol (50 mL each) at room temperature for 24 h. Afterwards, the extracts obtained were combined, filtered and evaporated under low pressure. Dry filtrates were reconstituted in ethanol at a concentration of 250 mg L⁻¹ and filtered through the 0.2 µm PTFE filter prior to LC-MS/MS analysis. These two species were found to be rich in rosmarinic acid. Especially, their flowers extracts possessed very high amount of rosmarinic acid and cosmosiin. Acknowledgements: The research was funded by grant: BYP-2016-20585 from Istanbul University

THE ANTIBACTERIAL ACTIVITY OF LAUREL (*LAURUS NOBILIS*) ESSENTIAL OILS AGAINST *BACILLUS SUBTILIS*

DENİZ DAMLA ALTAN¹, TUNCAY GÜMÜŞ¹, ERAY TULUKÇU²

ABSTRACT

Medicinal and aromatic plants have been used since ancient times for their organoleptic characteristics, therapeutic and medicinal properties. There has been an increased interest in antimicrobial properties of essential oils and extracts from aromatic plants. *Laurus nobilis* L. is an aromatic plant, frequently used as a spice in Mediterranean cookery. Laurel commonly known as sweet bay, bay laurel, Grecian laurel, true bay, and bay. It belongs to Laureacea family and is native to warm regions of the world, particularly in the Mediterranean countries (Turkey, Greece, Spain, Portugal, Italy and France). The essential oil and extracts obtained from the leaves of laurel have been used to fungal and bacterial infections, to treat epilepsy, parkinsonism, hemorrhoid and rheumatic pains. Several studies show that essential oils of this plant can prolong the storage life of foods by their antioxidant and antimicrobial activities. Ropiness is bacterial spoilage of bread that is commonly caused by *Bacillus* spp., especially *Bacillus subtilis*. It is the most important spoilage of bread after mouldiness which occurs particularly in summer and initially occurs as an unpleasant fruity odor, followed by a discoloured, sticky and softbread crumb, caused by enzymatic degradation. The aims of this study was to determine antibacterial activity of essential oils of laurel against *Bacillus subtilis*. The essential oils were obtained from laurel leaves that collected from different locations of Turkey (Izmir, Denizli, Antakya-Hatay) and purchased commercially, were experimented for their antibacterial activity against *Bacillus subtilis*. Reference bacteria used in the study was *Bacillus subtilis* ATCC 11774. Disc diffusion method was employed for the determination of antibacterial activity of the essential oils and the inhibition zone diameters were measured in millimeters. The essential oils of laurel (Izmir, Antakya-Hatay, Denizli and commercial) showed antibacterial activity against tested reference bacteria *Bacillus subtilis* with different inhibition zones of 37.90±3.89, 17.50±0.43, 7.60±0.84 and 37.95±0.63 mm, respectively.

ANTIOXIDANT ACTIVITIES OF THE EXTRACTS FROM DIFFERENT PARTS OF ENDEMIC SALVIA CERINO-PRUINOSA VAR. CERINO-PRUINOSA AND SALVIA ROSIFOLIA

ESRA YARIŞ¹, ABDULSELAM ERTAŞ¹, HATİCE ÇAKIRCA², MEHMET FIRAT³, MEHMET BOĞA⁴, MUSTAFA ABDULLAH YILMAZ⁵, MEHMET ÖZTÜRK⁶, HAMDİ TEMEL⁵, UFAK KOLAK⁷, GÜLAÇTI TOPÇU⁸

ABSTRACT

The genus *Salvia*, with about 900 species, is one of the most widespread members of the Lamiaceae family plants. An unusually large number of useful secondary metabolites, belonging to various chemical groups, such as terpenoids, flavonoids, and other compounds, have been isolated from the genus, which features prominently in the pharmacopeias of many countries throughout the world for wound healing and alleviating stomach, liver, and rheumatism pains and for treating the common cold in the form of infusion. Some *Salvia* (Sage) species have been used as medicinal plants to treat bronchitis, tuberculosis, menstrual and digestive disorders. They are also being used as spices and tea throughout the world since ancient times. They possess antioxidant, antibacterial, antitumor, cardioactive and antidiabetic activities. Antioxidant activities of Lamiaceae (Labiatae) plants which are widely grown in Turkey were also investigated by our group. In this research, antioxidant activities of extracts obtained from various parts of (roots, leaves, stems, flowers and mixed) *Salvia cerino-pruinosa* var. *cerino-pruinosa* and *Salvia rosifolia* were compared (DPPH, Beta Caroten Cuprac, ABTS). While petroleum ether and chloroform extracts of both species have shown low antioxidant activity, ethanol extracts of both species have shown well antioxidant activity. When comparing both species various parts each other, ethanol extracts of leaves of both species have shown high activity, especially. It can be said that both endemic *Salvia* species have potential of antioxidant. Acknowledgements: The research was funded by grant : KBAG 114Z801 from TUBITAK, The Scientific and Technological Research Council of Turkey.

ENZYME INHIBITORY PROPERTIES OF DIFFERENT SOLVENT EXTRACTS FROM COLUTEA CILICICA

ABDURRAHMAN AKTUMSEK¹, GOKALP OZMEN GULER², GOKHAN ZENGİN¹, RAMAZAN CEYLAN¹

ABSTRACT

Enzyme inhibitory properties of ethyl acetate, methanol, and water extracts from *Colutea cilicica* (Fabaceae) were investigated with spectrophotometric methods. Enzyme inhibitory effect were evaluated against cholinesterase, tyrosinase, α -amylase and α -glucosidase. The methanol extract exhibited the strongest cholinesterase inhibitory activity with 1.326 mgGALAE/g extract in AChE and 0.682 mgGALAE/g extract in BChE. However, the water extract was not active on cholinesterases. The best tyrosinase inhibitory effect were observed in the ethyl acetate extract with 54.70 mgKAE/g extract. Similarly, the ethyl acetate extract exerted the strongest amylase and glucosidase inhibitory effect. These findings suggest that the *C. cilicica* could serve as an important natural source of biologically active agents for using in food and pharmaceutical industry. Acknowledgements: This work was supported by The Scientific and Technological Research Council of Turkey (TUBITAK), Turkey, Project No: 113Z892.

ENZYME INHIBITORY EFFECTS OF DIFFERENT SOLVENT EXTRACTS FROM EBENUS HIRSUTA

ABDURRAHMAN AKTUMSEK¹, GOKALP OZMEN GULER², GOKHAN ZENGİN¹, RAMAZAN CEYLAN¹

ABSTRACT

Enzyme inhibitory capacities of ethyl acetate and water extracts from *Ebenus hirsuta* (Fabaceae) were investigated with spectrophotometric methods. Enzyme inhibitory effects were evaluated against cholinesterase, tyrosinase, α -amylase and α -glucosidase. The ethyl acetate extract has the highest cholinesterase inhibitory effects as compared to water extract. However, the water extract exhibited the strongest anti-tyrosinase effect with 55.06 mgKAE/g extract. Also, the ethyl acetate extract had the best anti-diabetic effects with the highest amylase inhibition. Our findings suggest that the *Ebenus hirsuta* could serve as a valuable source of natural enzyme inhibitors. Acknowledgements: This work was supported by The Scientific and Technological Research Council of Turkey (TUBITAK), Turkey, Project No: 113Z892.

ABSTRACT

Medicinal and aromatic plants play a significant role in the life of people and are present in innumerable forms. Medicinal and aromatic plants constitute a major segment of the flora, which provides raw materials for use in the pharmaceuticals, cosmetics, and drug industries. The main aim of this study is to analyze consumer structure, consumption trends and preferences with data obtained by survey from households in urban area of Izmir. For this aim, 96 surveys by proportional sampling have been carried out with members of households in center of Karşıyaka district of Izmir. Study was carried out on households of dwellings located at six distinct streets of 16 quarters. As a results of the study, a large part of household, medical and aromatic plants does not recognize under the name. In their natural environment, the additives include, delicious foods, and they have to be protective, immune system booster due to the properties of the products are preferred. Consumer preferred the kind, quantity and product production with the right group of consumers as a result of the determination, the process from production to marketing for effectiveness and sustainability will be provided.

ABSTRACT

There are three species of *Lallemantia* (Lamiaceae) genus in Turkey. In our work, plant material was collected in Bitlis province. The collected plant samples of *Lallemantia canescens* (Topajadarbaşı) and *Lallemantia peltata* (Kalkanbaşı) were dried and extracted with the soxhalat method. The antioxidant activities of the extracts obtained were investigated. Antioxidant activities of plant extracts were examined using different in vitro methodologies such as total antioxidant activity by ferric thiocyanate, total reducing power by potassium ferricyanide reduction method, reduction capacity of cupric ions (Cu²⁺) by the Kuprak method, 1,1-diphenyl-2-picryl-hydrazyl (DPPH•) free radical scavenging, 2,2'-azino-bis(3-ethylbenzthiazoline-6-sulfonic acid) (ABTS) radical scavenging activity. Compared with the standard antioxidants BHA, BHT and α -tocopherol, reduction capacities for *L.canescens* and *L. peltata* plants are as follows; BHA > *L.peltata* > BHT > α -tokoferol > *L.canescens*. According to the results of the study, % inhibition was 70.77% for BHT, 66.35% for BHT, 62.11% for α -tocopherol and 61.86% for extraction. When we look at the results of ABTS•+ radical scavenging activity, we can say that all of them are close to each other and show very good activity. ABTS radical activities of plants and standards are listed as follows: BHT (%96,16) \geq α -tocopherol (%96,15) \geq BHA (%96,04) \geq *L.peltata* (%95,86) \geq *L.canescens* (%95,50).

ANTIOXIDANT AND ANTIINFLAMMATORY EFFECTS OF CURCUMIN

EMEL AKTAŞ¹, HILAL YILDIRAN²

ABSTRACT

Throughout the history of humanity, plants have been used for treating many diseases. This information, obtained through trial and error, has reached to day with some changes and developments in the manner of use throughout the ages. Recently, interest in antioxidant and antiinflammatory products and consumption of natural foods and nutritional bioactive components has been increasing steadily. Curcumin is found in turmeric spice which is a popular member of the ginger family. It gives the curry bright yellow color and is used as a herbal medicine in China and India for thousands of years. In humans, curcumin is known to be safe, but not toxic, and turmeric is classified as an additive in the E100 category. Curcumin has been reported to have various pharmacological properties such as antimicrobial, antiviral, antifungal, anticarcinogenic and wound healing. However, it has radical scavenger, iron chelator and antiinflammatory properties in different tissues. Antiinflammatory and antioxidant properties are two important mechanisms underlying the majority of the pharmacological effects of curcumin.

Compared with the standard antioxidants BHA, BHT and α -tocopherol, reduction capacities for *L.canescens* and *L. peltata* plants are as follows; BHA > BHT > α -tokoferol > *N. transcaucasica* > *S. albida* subsp. *condensata*. According to the results of the study, % inhibition was 70.77% for BHT, 66.35% for BHT, 62.11% for α -tocopherol and 61.86% for extraction. When we look at the results of ABTS•+ radical scavenging activity, we can say that all of them are close to each other and show very good activity. ABTS radical activities of plants and standards are listed as follows: BHT (%96,16) \geq α -tocopherol (%96,15) \geq BHA (%96,04) \geq *S.albida* subsp. *condensata* (%96,04) \geq *N. transcaucasica* (%95,98).

KEYWORDS

THE ANTIOXIDANT ACTIVITIES OF THE ESSENTIAL OILS OF SOME SALVIA SPECIES FROM TURKEY

HATİCE ÇAKIRCA¹, ABDULSELAM ERTAŞ², İŞİL AYDIN¹, MEHMET FIRAT³, MEHMET BOĞA⁴, SERKAN YİĞİTKAN⁵,
HASAN ŞAHİN⁵, NESRİN HAŞİMİ⁶, FIRAT AYDIN¹, GÜLAÇTI TOPÇU⁷

ABSTRACT

The *Salvia* L. genus belongs to the subfamily Nepetoideae in Lamiaceae family. The genus consists of about 900 species. Many *Salvia* species are used as herbal tea and for food flavoring, as well as in cosmetic, perfumery and the pharmaceutical industries throughout World. *Salvia* species are generally known for their multiple pharmacological effects including their antibacterial, antiviral, antioxidative, antimalarial, anti-inflammatory, antidiabetic, cardiovascular, antitumor and anticancer activities. Also, some studies showed that a part of these activities depended on their essential oil composition. The essential oils of four *Salvia* species were tested for antioxidant (β -Carotene-linoleic acid test system, DPPH free radical scavenging activity, ABTS cation radical decolorisation and cupric reducing antioxidant capacity) activities in this study. Essential oil samples were obtained by a Clevenger apparatus from the whole parts of plants which were crumbled into small pieces and soaked in distilled water for 3 h. Then, these samples were dried over anhydrous Na₂SO₄ and stored at +4°C for a sufficient period of time. The antioxidant activities of essential oils of four *Salvia* species were found to be medium and low, generally. The essential oils of *S. multicaulis* and *S. montbretii* showed good activity (IC₅₀: 436,632±36,32 and 374.753±34,97, respectively) with ABTS cation radical decolorisation method.

A HEALING HERB IN KARSNIYA...CINCAR

LALE SARIYE AKAN¹, YAHYA ÖZDOĞAN¹, RAHİME EVRA KARAKAYA¹

ABSTRACT

Ardanuç is a district which had hosted rooted and rich civilizations. Karsniya village of Ardanuç is located in eastern of Black Sea, left slope of Çoruh valley where is founded neolithic age human evidence BC 10-8 thousand years. Excavations exposing metallic and especially various kitchen equipment demonstrate that prehistorical ages are lived respectively. Karsniya which is a high mountain village is not convenient for agriculture and farming. Not only vegetable, fruit and cereal production but also farming is made traditional procedures in Karsniya and the obtained products are not satisfactory. Vegetable requirement in Karsniya is obtained from herbs called greens. The main herbs that provides emerging a rich nutrition style and grows itself in nature are: cincar herb, flutter herb, gumi herb, crowbar, gelin parmagi, pampara and sorrel. The aim of this study is to present various herbs and declare benefits of cincar soup and its ingredients and making processes which is made of cincar herb which is believed to be healing. Cincar herb blooms in may- october, reaches 20-60 cm, is located in bottom of walls and roadsides and causes severe blushing and itching when leaves are exposed to skin. Herbs roots are dried up in spring and autumn, leaves are dried up in may and july, seeds are dried up in july and august by collecting. Even though the belief of herbs healing property is came across in Middle Europe, the women in Karsniya observed that touching this herbs heals skin wounds, boiling the herb's water inhibits hair loss and consuming the herb cures stomach and intestinal diseases. As a conclusion it is detected that cincar herbs is used in various meals and especially cincar soup is believed to be a healing meal by village women. Recording making processes of cincar soup is considered to bring Turkish Culture richness by generalizing formation of it.

CYTOTOXIC EFFECTS OF NATURALLY OCCURRING FLAVONOIDS ON HUMAN COLON CANCER CELLS

SERDAR KARAKURT¹, ÇIĞDEM GÖKÇEK SARAÇ², SEVTAP KARAKURT³

ABSTRACT

Colon cancer is the third leading disease of death in the world. The resistance against drugs used in colon cancer treatment and elevated side effects of those drugs leads investigators to find new strategies. Up to now, about 500 different polyphenols have been isolated and reported in foods and beverages of plant origin. In this study, we focused on to investigate effects of quercetin (Q) and rutin (R) against human colon cancer cells. DLD1 cells and HT-29 cells were grown in Leibowitz's L-15 medium and McCoy's 5a medium respectively supplemented with 10% fetal bovine serum and 2 mM glutamine. Optimum cell number and growth time of cells were determined spectrophotometrically and effect of Q and R on the viability of DLD1 cells and HT-29 cells were determined with Alamar blue and IC₅₀ values were calculated from the sigmoidal graph. The IC₅₀ values of Q were calculated as 144 μ M and 44 μ M in DLD-1 and HT-29 cells, respectively. On the other hand, R was found less toxic on both cancer cells with IC₅₀ of 213 μ M and 552 μ M for DLD1 cells and HT-29 cells, respectively. The data obtained from this study will supply valuable information about the usage of these flavonoids in the treatment of colon cancer since quercetin and rutin are found plenty amounts in vegetables and fruits.

A CURE ALL ST.JOHN'S WORT

RAHİME EVRA KARAKAYA¹, LALE SARIYE AKAN¹, YAHYA ÖZDOĐAN¹

ABSTRACT

St.John's wort is a herb that grows by itself in nature and it is believed to be healing as its usage area varies progressively. The aim of this study is to specify St.John's Wort's properties, usage areas and side effects. This herb is also called as 'kanotu, yaraotu, kılıřotu, mayasılotu, binbirdelik otu' among public and its flower and roots are used for benefit. St.John's Wort includes tannin, volatile oils, flavon species (rutin, guercitin, guercitrin), hipericin (hypericin), hyperin (substance that gives colour to herb), caroten, bitter materials, rosin, pectin and colic, gum, vitamin c and resin as substances. This herb is usually consumed as tea or its oil is used externally. According to studies accomplished with this herb, quick recovery is observed with depression, lack of attention, bone diseases, irritabl bowel syndrome, wound healing, skin diseases and burn. It is reported that long term usage of this herb as treatment might cause unfavourable effects on health. This herb's content and dosage may differ due to its vegetative region. Although St.John's Wort is known with various benefits, in order to generalize its usage areas it is thought that more studies might be beneficial about its habitat, dosage level, duration and side effects.

THE USE OF ESSENTIAL OILS AS ANTIMICROBIAL SUBSTANCES IN SEAFOOD

HATICE GÜNDÜZ¹, FATMA ÖZTÜRK¹, SEVİM HAMZAÇEBİ², ASENA ÜNVER¹, M. DILCAN AKPINAR¹

ABSTRACT

Seafood is a food product that is rapidly spoiled due to microbial activity during cold storage. This is an important issue both economically and in terms of human health. There are several methods in traditional and long-term conservation to prevent or delay the growth of pathogenic and spoiled microorganisms during the storage of seafood. In addition, the storage period can be extended by adding antimicrobial or antibacterial agent to seafood. These substances added to protect of foods can be synthetic or natural additives. Today, consumers are choosing to reduce the use of synthetic chemicals in order to increase the shelf life of foods. Essential oils, which offer an alternative to chemical use, are natural antimicrobials prolonged shelf-life of seafoods and can be used alone or in combination with other preservation methods. Volatile oils, also called essential oils, are obtained from plants or parts of these plants by distillation or pressing. It has been revealed by researchers that essential oils with antimicrobial and antiseptic properties are effective on microorganisms cause deterioration and poisoning in food. Phenolic compounds in volatile oils cause sensitization of the phospholipid layer in cell membranes and increase the permeability of this membrane. Thus, they inhibit microorganisms by causing intracellular components to leak out of the cell or to degrade enzyme systems. The composition, structure and functional groups of essential oils play an important role in the effectiveness of these antimicrobial activities. The oils of plants such as carnations, thyme, rosemary and sage are the most effective oils against microorganisms. Antimicrobial effects of thyme, oregano, lemon, rosemary, laurel, clove, orange and mandarin peel essential oils have been investigated in seafood. In this study, the use of essential oils as antimicrobial substances in seafood will be compiled.

NUTRITIONAL QUALITY AND HEALTH BENEFITS OF LUPIN

BURCU DENİZ GÜNEŞ¹, HATİCE BÖLÜKBAŞI¹, GAMZE AKBULUT¹, NILÜFER ACAR TEK¹

ABSTRACT

Legumes are important especially in regions where the economic status is not good due to the fact that it can be obtained more and cheaper. Lupin, which belongs to the Leguminosae (or Fabaceae) family, includes 450 *Lupinus* species. Only four species are cultivated; *Lupinus albus* (white lupin), *Lupinus luteus* (yellow lupin), *Lupinus angustifolius* (blue lupin, narrow-leaved lupin), and *Lupinus mutabilis* (tarwi, Andean lupin). Lupin is used as soy substitute, gluten free flour, emulsifier, a bread, biscuits, cakes, pasta and snack in the world. The lupine, which has 2-3 times more protein than grains, is also rich in vitamins and minerals such as calcium and iron. *L. mutabilis* is rich in complex oligosaccharides, fiber and omega 3 fatty acids. Lupin flour increase the nutritional quality and potential health benefits of bread by increasing protein, dietary fiber and carotenoid content, levels of the protein γ -conglutin. Consuming lupin compared to wheat bread and other baked products reduce chronic disease risk markers. Protein γ -conglutin improves glucose transport and elevates pancreatic insulin content. Lupin have positive effects on hyperglycemia and insulin release. Furthermore, treatment with lupin improved insulin resistance in subjects with glucose abnormalities. Lupin shows hypolipidemic effect in individuals who have diet-induced hypercholesterolemia, by decreasing in plasma total cholesterol, triglycerid, very low density lipoprotein (VLDL-C) and low density lipoprotein (LDL-C). Increased dietary fibre may have a favourable influence on blood pressure decrease. Lupin has also positive effects on the energy balance by suppressing appetite. Higher satiety and lower energy intake of Lupin affects appetite-regulating hormone called ghrelin. However; long term effects on energy intake and body weight in obese is not clear yet. Lupin and their products may effects on human body positively. Therefore, they begin to offer in shops with other legume species. Consequently; increases in lupin products in the diet may have a beneficial role in chronic diseases, but additional data from human intervention studies are needed.

EFFICIENCY OF A HERBAL LIQUID EXTRACT MIXTURE FOR PREVENTING OF SALMONELLA GROWTH IN WHIPPED CREAM

ÖZÜM ÖZOĞLU¹, EVRİM GÜNEŞ ALTUNTAŞ¹

ABSTRACT

Pastry products with cream are commonly used in the food and confectionery industries¹. Desserts and cakes containing milk or cream which are milk-based products are suitable media with high nutrient content for microbial growth^{1,2}. Besides, pastry creams tend to contamination with several pathogenic microorganisms because of their ingredients and production methods like using raw cream^{1,2,3,4,5}. Therefore; pastry cream is the main cause of food poisoning among humans¹. Salmonella is one of the major pathogenic microorganisms in the pastry cream^{1,3,4}. The most common recorded cause of diarrheal illnesses is Salmonella contamination in industrialized countries⁵. In addition to that, the Ministry of Health in Italy was reported that Salmonella was the most important reason of the outbreaks⁶. Salmonella is found in the environment such as water, soil, sewage and gastrointestinal tract of animals and humans^{3,7}. Meat, poultry, fish, egg, milk, dairy products, fruits and vegetables are transmission vector of Salmonella^{3,5,7,8,9,10}. While Salmonella infection (Salmonellosis) is prevented with lots of different methods, including adding antimicrobial or antibiotic compounds^{8,9}, last studies have been focused on using spice liquid extract for preventing Salmonella growth^{11,12,13,14,15}. In this study, a herbal liquid extract mixture containing sorrel extract (*Rumex acetosella*), millfoil extract (*Achillea millefolium*), ribwort plantain extract (*Plantago lanceolata*) (ASATİM® ST 1412; recommended for milk-based product and whipped cream by company, Kayseri, Turkey) was used to exhibit the inhibitory effect on Salmonella Enteritidis ATCC 13076 growth in whipped cream (prepared with milk as the company proposed). For this aim, 8 different groups were designed which were only pastry cream as K1, cream with Salmonella as K2, cream added herbal liquid extract mixture at 0.1%, 1% and 10% ratio as K3, K4, K5 respectively, cream added Salmonella and herbal liquid extract mixture of 0.1%, 1%, 10% to the samples were left 1 to 3 hour at room temperature. Then, these samples were inoculated to Plate Count Agar in two parallel for each group with regard to Dropping Plate Technique at the end of the 1st, 2nd and 3rd hours. The inoculation amount of Salmonella was selected as 0.4 (O.D.600) which equal to 106cfu/ml. After inoculation, the plates were incubated at 37°C for 24 hours and then colonies were counted. As a result of this study, number of the bacteria of K1 was calculated as 4x10⁴cfu/g at the end of 1 hour and then 2 logarithmic unit increasing was observed and the colony number has reached to 1.7x10⁷cfu/g, at the end of 3rd hour. This means that, whipped cream has microbial risk when it is waited in room temperature. The other remarkable result was observed in the sample containing 10% herbal liquid extract mixture and 106cfu/g Salmonella as well. The amount of bacteria was calculated as 3.8x10⁴cfu/g, 2.68x10⁵cfu/g and 1.3x10⁵cfu/g at the end of the 1st, 2nd and 3rd hours respectively. Thus, it can be reported that 10% ratio of herbal liquid extract mixture in whipped cream has an inhibitory effect on the bacteria when the result compared with the control sample. The producing

Corresponding Author: **ÖZÜM ÖZOĞLU**, ozum.ozoglu@gmail.com

¹ANKARA ÜNİVERSİTESİ BİYOTEKNOLOJİ ENSTİTÜSÜ

company of the herbal liquid extract mixture proposes that the herbal liquid extract mixture should be added from 0.2% to 1% ratio to milk-based product and whipped cream. This approach is acceptable, so that in this study, high level of Salmonella was inoculated to the samples at the beginning which is an unusual situation. In conclusion, the study has shown that the herbal liquid extract mixture is an alternative and useful method for precluding Salmonella growth in whipped cream. REFERENCES 1. PROBIOTICS: THE EFFECTS ON GUT MICROBIOTA AND OBESITY

HATICE BÖLÜKBAŞI¹, GAMZE AKBULUT¹, NILÜFER ACAR TEK¹, YELİZ SERİN¹

ABSTRACT

Pathogenic and non-pathogenic microorganisms are in balance in healthy individuals. When this balance deteriorates, the barrier-building function of the mucosa deteriorates and inflammation begins. The changes in the microbiota increase the intestinal permeability and alter the functions of the brain, pancreas, liver, muscle and fat tissue. As the permeability increases, there is also an increase in the level of plasma lipopolysaccharides, which leads to rise in inflammatory cytokines. The risk of metabolic disease increase due to inflammation. In obese individuals with insulin resistance there is also an increase in the ratio of firmicutes / bacteroides on the basis of changes in the intestinal microbiota. Diet is one of the most important factors contributing to the composition and diversity of the intestinal microbiota. It is accepted in the society to think of protecting and improving the healthiness of the foods other than providing the metabolic requirements. The use of probiotics is increasing by the determination of the importance of the microbiota. According to the Food and Agricultural Organization of the United Nations and the World Health Organization, probiotics are defined as 'living microorganisms, which when administered in adequate amounts confer health benefits on the host'. Several different species of bacteria are used as probiotics. The most common species are Bifidobacterium (adolescentis, animalis, bifidum, breve and longum) or Lactobacillus (acidophilus, casei, fermentum, gasseri, johnsonii, paracasei, plantarum, rhamnosus and salivarius). Antimicrobial molecules produced by the probiotic inhibits growth of pathogenic microorganisms. Metabolites such as short-chain fatty acids produced by probiotics are found to inhibit the growth of bacterial pathogens as a result of lowering intestinal pH. Many Lactobacilli strains increase barrier function by increasing mucus layer and increase barrier function by preventing apoptosis of intestinal epithelial cells. Probiotic Lactobacillus strains enhance the integrity of the intestinal barrier, decreased translocation of bacteria across the intestinal mucosa. The lowest amount needed for beneficial effects probiotic in humans remains is unknown. Generally the lowest proposed dose is 10⁶-10⁷cfu/mL ; sufficient dose is 10⁷-10⁸cfu/mL. Probiotics may be beneficial in the prevention and treatment of obesity by enhance microbiota. Recently it is indicated that 8 to 12 weeks of probiotic supplementation may confer benefits such as decreased body weight, body mass index (BMI), as well as decreased body weight gain, fat accumulation, and prevention of insulin resistance. Anti-obesity effects of probiotics are the regulation of lipid and glucose metabolism, reduction of adipose cell size and inflammation in adipose tissue, and reduction of inflammation in the liver. Probiotics is also gaining wide attention because of increasing evidence of the role of gut microbiota.

FUNCTIONAL CHARACTERISTICS AND PHYSIOLOGICAL EFFECTS OF LEGUMES

ZELİHA ÖNÇİRAK¹, MÜNİR ANIL¹

ABSTRACT

For many years legumes have been regarded as high nutrients because of their high protein content and the many functional components they contain. In the world, 22% of plant proteins and 7% of carbohydrates in human nutrition are provided from the edible legumes. Legumes, which have very high nutritional values, are rich in basic amino acids such as lysine, threonine, leucine, phenylalanine, tryptophan and aspartic acid. At the same time the digestibility of legume proteins is between 70-94%, which is quite high. The fat content of legumes being generally low and often from polyunsaturated fatty acids, especially linoleic acid (omega-6) increase nutritional value. The linoleic acid contained plays a role in regulating the physiology of reproduction and lactation, the cholesterol distributor in arteriosclerosis, the regulation of cardiovascular system, vision systems and mental activities, and the prevention of the formation of nitrosamines in nitrate-nitrite poisoning. In addition, soluble raffinose, which are carbohydrates found in legumes, are prebiotics that support the development of probiotics selectively and progressively to the colonic without digestion. These substances support the development of beneficial bacteria in the field, especially Bifidobacterium species. Since these carbohydrates can not be digested in the small intestine, they are fermented by colon microflora in the large intestine. The products of fermentation products are gas and short chain fatty acids. The resulting short chain fatty acids promote beneficial colon mucosal health and have beneficial physiological effects. Phenolic compounds, which are important compounds in legumes, also have important effects on human health. Of these compounds, especially isoflavones have biological properties, including broad-spectrum protection against hormones associated with certain types of cancer. Nutritional isoflavones are known to protect against the oxidation of LDL particles. At the same time, isoflavones have protective properties against osteoporosis by regulating calcium exchange on the cell membrane. It is known that isoflavones inhibit the development of many diseases such as cancer, atherosclerosis, diabetes and chronic inflammation, which act as antioxidants besides these effects and inhibit free radical formation and accumulate in the organism. The most important nutritional factors in legumes are nutritional fibers in the organic structure that come from the colon without being digested. While nutritional fibers reduce sugar, lipid and cholesterol content in blood, it also shortens the duration of solid waste, allowing rapid release of toxic substances from the colon. Often monosaccharides and sugar acids (mannuronic, galacturonic, glucuronic and 4-o-methyl glucuronic acid) are the major compounds that form nutritional fibers. The nutritional fibers in legumes have many important physicochemical properties such as solubility, water and oil retention capacity, ion exchange capacity. It is known that the fiber in the legume plays a role in strengthening the colonic function and lowers the level of cholesterol in the high level fiber. Legumes are also protective against many diseases that can be overcome by using dietary treatments such as diverticular diseases, colon and rectal cancers, appendicitis, varicose veins and hemorrhoids, coronary heart diseases, gall stones and diabetes. The

Corresponding Author: **ZELİHA ÖNÇİRAK**, oncirakzeliha94@gmail.com

¹ONDOKUZ MAYIS ÜNİVERSİTESİ

physiological effects of nutritional fiber and the benefits of health are stated to be shortening transit time and increasing the amount of waste, binding bile acids, breaking up into short-chain fatty acids in the large intestine, increasing viscosity, slowing digestion and absorption. In addition, clinical trials have shown that postprandial blood sugar, insulin levels, lipid levels in blood serum are reduced, which is useful for the second type of diabetes. Therefore, with the dissemination of legumes consumed, society will be fed healthy and as a result, treatment expenditures and labor loss will be reduced and comfort periods in human life will be increased. For this purpose, it is necessary to increase the production of legumes and to expand the usage areas of the food industry.

THE ANTIOXIDANT AND ANTICARSINOGENESIS EFFECT OF ROSEMARY

HATICE BÖLÜKBAŞI¹, GAMZE AKBULUT¹, NILÜFER ACAR TEK¹, YELİZ SERİN¹

ABSTRACT

Antioxidants; have protective effects against the oxidation that occur during the preparation and consumption of foods and maintain product quality. The determination of the toxic effects of synthetic antioxidants on human health, the use of herbal products began to gain importance. It has been highlighted on the use of aromatic plants rosemary that has antioxidant activity due to essential fatty acids. Rosemary (*Rosmarinus officinalis* L.) from the Lamiaceae (Labiatae) family is an important medicinal and aromatic plant species. The aromatic plant rosemary has been used for medicinal purposes due to its antioxidant, antiinflammatory, chemoprotective and antiadipogenic affects. It is also known that rosemary extracts have antioxidant activity similar of synthetic antioxidants. The potent antioxidant properties more than 90% of rosemary have been mainly attributed to its major compounds; rosmanol, carnosol and carnosic acid. Rosemary extracts highest antioxidant properties are also due to the presence of phenolic diterpenes. Terpenes are recognized for various benefits especially in the prevention and treatment of a wide range of cancer types. Rosemary extract is also modulate the alteration of signaling pathways and molecules directly related to tumor initiation and development. Rosmanol acts as a strong anti-inflammatory agent and inhibite tumor development. Carnosol may induce apoptosis through the intrinsic pathway; purified carnosol and carnosic acid are powerful inhibitors of lipid peroxidation in microsomal and liposomal systems. Carnosol and carnosic acid could contribute to the chemopreventive, antitumoral and antimetastatic activities of rosemary extracts . Oral administration of carnosol is well tolerated and mean intake is estimated to be between 500 and 1500 mg/ day of carnosol and carnosic acid for adults. Rosemary extract is a potential may be included in the anti-cancer diet. It is suggested that carnosic acid alone or with the anticancer drugs preferable as a good practise for the treatment of many typies of cancers that are resistant to chemotherapy.

HEALTH EFFECTS OF NUTS

OSMAN BOZKURT¹, NILÜFER ACAR TEK¹, GAMZE AKBULUT¹, BURCU DENİZ GÜNEŞ¹, GAMZE YURTTAŞ¹

ABSTRACT

Nuts are on the diet of human beings since pre-agriculture times. The word "Nut" is rooted in the words "nutrient, nutriment, nutrition" which are also nutritional and nutritious. Today the most consumed nuts are almond, hazelnut, walnut and pistachio. Nuts are rich sources of saturated, unsaturated fatty acids (MUFA, PUFA), vegetable protein, fibre, phytosterols, polyphenols, vitamins and minerals. Nuts are also rich in vitamins and minerals such as niacin, B6, folic acid, magnesium, zinc, copper and potassium. The Adventist Health Study 1992 found that the consumption of nuts, reduced the risk of coronary heart diseases. With these study, the number of studies on the health effects of nuts has increased steadily. However, four points have to be noted regarding the consumption of nuts. They may lead to possible weight gain, increase fat tissue in the body, cause metabolic complications such as metabolic syndrome and diabetes, and allergic reactions. The idea that nuts have high energy content and that the consumption of these foods can cause obesity are the negative perception about nuts. However, studies have reported that consuming a certain amount of nuts within the diet helps body to lose weight. In one study, the participants who consumed nuts had lower BMI and waist circumference than those who did not consume or consumed less nuts. In addition, nuts play a role in the regulation of blood sugar because of its rich magnesium content. In one study, the prevalence of diabetes was found to be 25% lower in women consuming nuts more than 5 days a week than those who never consumed. In another study, a decrease in HbA1C levels was observed in those who consumed 28 g nuts 5 days a week for 12 weeks. In a different study, when a standard healthy diet was compared to a healthy diet enriched with walnuts, a healthy diet containing walnuts was found to lower serum cholesterol levels more than the other diet at the end of the study. Clinical and observational studies have demonstrated that the consumption of nuts reduces risk of cardiovascular diseases. U.S. Food and Drug Administration (FDA) has indicated that there is a significant effect of the consumption of nuts in reducing cardiovascular diseases risk. Moreover, the American Heart Association emphasized that nuts must be found in a healthy dietary within the context of 2020 health promotion and development. On the other hand, it is stated that excessive consumption of nuts may lead to atherosclerosis due to high fat content, an increase in the body weight and adipose tissue. In the last 20 years, with the increase in research on nuts, the importance of nuts has become even more pronounced. By means of this situation, the macro and micronutrients contained in the nuts are indispensable for nutrition. In addition, the relationship of nuts between mortality, cardiovascular diseases, serum lipid levels, diabetes have been studied and they were found to have positive effects on them in many studies. However, as with any nutrient, it must be consumed in the amounts specified in the diet on nuts. Therefore, it is recommended that nuts are consumed as much as the recommended daily amount 28 gr / day.

CUPRIC REDUCING ANTIOXIDANT CAPACITY (CUPRAC), DPPH FREE AND ABTS CATION RADICAL SCAVENGING ACTIVITIES OF ETHANOL EXTRACT FRACTIONS OF ENDEMIC SALVIA CERINO PRUINOSA VAR. ELAZIGENSIS

EVİN AYGÜN TUNCA¹, LEYLA BALUR¹, MEHMET FIRAT², İSMAIL YENER¹, EYÜP TUNCA¹, HİLAL SARUHAN FIDAN³, ESRA YARIŞ¹, MEHMET BOĞA⁴, ABDULSELAM ERTAŞ²

ABSTRACT

The genus *Salvia* L. includes more than 900 species and is mostly found in both subtropical and temperate parts of the world; the two largest gen centers of the *Salvia* are in America and SouthWest Asia. In Turkey, endemism ratio of *Salvia* is 48 %, so Turkey is a major gen centre for the *Salvia* genus. This genus is named “*Salvia*”, derived from latin “*Salveo*”, which means to “save, to recover”. *Salvia* taxa is used in folk medicine from ancient times and find application in many commercial and medicinal products, particularly in essential or volatile oils and flavoring agents manufacture and is widely used in the food and cosmetic industries. 73 fractions were gained from ethanol extract from the aerial parts of *S. cerino pruinosa* var. *elazigensis*. And also 37 fractions were gained from the roots ethanol extract of this plant. According to the applied thin layer chromatography results, totally 12 fractions from ethanol extract of aerial parts and 11 fractions from the root extract by combining similar fractions. And also antioxidant activities were studied. In the DPPH free radical scavenging activity it was determined that 41-44,45-48 numbered fractions from the extract of *S. cerino pruinosa* var. *elazigensis* plant’s aerial part, showed higher activity than BHT and α -TOC used as standarts. And also 17-18, 21-26 fractions gained from root of *S. cerino pruinosa* var. *elazigensis* extract, showed higher activity than BHT used as standart. In the ABTS cation radical scavenging activity, it was determinated that the 41-44, 45-48, 49-56, 61-64, 65-69 ve 70-73 fragments which were gained from the of the aerial part’s ethanol extract, showed higher activity than BHT and α -TOC compounds used as standarts. When looked at the result of CUPRAC-Copper(II) reduction capacity, aerial parts ethanol extract’s 41-45 numbered fractions showed higher copper(II) reduction capacity than the standarts was determined. According to the activitiy results generally the aerial parts activities was higher than the root fractions activities was shown. Acknowledgements: The research was funded by grant : KBAG 114Z801 from TUBITAK, The Scientific and Technological Research Council of Turkey.

DETERMINATION OF ANTIOXIDANT PROPERTIES OF INULA HELENIIUM ROOTS AND COTINUS COGGYGRIA LEAVES

NEVİM ÇALIŞKAN¹, ÖNDER AYBASTIER¹

ABSTRACT

Inula helenium L. (Family: Asteraceae) is a widely occurring perennial herb in East Asia particularly China, North American and Europe. The roots of *I. helenium* are used as versatile medicine against fever, lung disorders, bronchitis, indigestion, chronic enterogastritis, and infectious diseases. *Cotinus coggygria* Scop. (Family: Anacardiaceae) is a shrub or a tree usually growing up to 5 m. It grows mainly in South and Central Europe, South Russia, Crimea, Caucasia, Latakia and Turkey. The leaves of this species have been used in Balkan and Anatolian folk medicine as antipyretic, antiseptic, antihemorrhagic, treatment of diarrhoea and wound healing. The leaves and young branches from naturally growing trees are utilized in producing an essential oil with terpenic odour. The composition and antimicrobial activity of *C. coggygria* oils have been reported in different studies. Antioxidants are substances that have the ability to delay, remove, or prevent the oxidation processes occurring to other compounds. The measurement of the antioxidant capacity of plants has become very important for researchers because it may provides information about resistance to oxidation, quantitative contribution of natural antioxidant substances. Natural antioxidants are substances that may protect human cells against the effects of produced free radicals. Free radicals can damage cells, and may play a role in heart disease, cancer, and other diseases. Therefore, the antioxidant compounds may play an important role in the prevention of certain diseases. The extracts of the plants were obtained in methanolic, acidic methanolic and ethanolic, acidic ethanolic media using ultrasonic-assisted extraction. The total phenolic contents of extracts were determined by Folin-Ciocalteu method and also total antioxidant capacities of extracts were determined by ABTS and CHROMAC methods. Phenolic compounds such as phenolic acids and flavonoids were analyzed in the extracts using high-performance liquid chromatography-diode array detection (HPLC-DAD). The chlorogenic acid, ferrulic acid in *Inula helenium* roots and myricetin, rutin, quercetin in *Cotinus coggygria* leaves were determined. According to the results of these assays the extracts were showed to have good antioxidant properties.

BOTANIC ORIGIN AND ANTIOXIDANT ACTIVITIES OF THE PROPOLIS FROM REFAHIYE (ERZINCAN) AS NUTRITIONAL SUPPLEMENTS

İLGİNÇ KIZILPINAR TEMİZER¹

ABSTRACT

Propolis is a resinous, sticky gum and used by bee as versatile material. In addition, biological properties of propolis are potential for the improvement of new drugs and nutritional supplements. Pollen analysis, antioxidant activities, total phenol and total flavonoid contents were studied at the first time propolis sample from Refahiye (Erzincan). Mellisopalynological analysis was made according to the relevant literature and botanic origin of sample, mainly from the Fabaceae (38.4%), Asteraceae (20.2%) and Fagaceae (11.2%) families. The antioxidant capacity of propolis extract was assessed by the hydrogen peroxide scavenging activity (in terms of SC50), ferric reducing antioxidant power capacity (FRAP), DPPH radical scavenging activity (in terms of SC50), metal-chelating activity (%), total phenol content (TPC), and total flavonoid content (TFC). The values were found as 25.86 µg/mL, 72.25%, 52.15 µg/mL, 41.51%, 3163.85 mg GAE/100g and 118.59 mg CAE/100g, respectively. For comparison of these results, Butylated Hydroxy Anisole (BHA), Butylated Hydroxy Toluene (BHT) and α-Tocopherol (TOC) were used as standard antioxidant compounds. The high activity of propolis could be related with their different pollen composition. It could be beneficial for human health.

PHENOLIC COMPOUNDS AND ANTIOXIDANT ACTIVITY OF BUCKWHEAT POLLEN OF KONYA REGION

SEVGI KOLAYLI¹, OKTAY YILDIZ², ZEHRA CAN³, MERYEM KARA⁴

ABSTRACT

Pollens are male reproductive organs of flowering plants and are accepted as a food balanced with proteins, sucrose, vitamins and minerals. Pollen is an essential nutrient for raising brood after honeybee larvas and also for improving tissues, muscles, secretory glands and other organs sufficiently during youth. Buckwheat is a species of wheat produced commonly in countries such as North America, China, Europe, Poland, Holland and Russia and is not much well-known in Turkey. Buckwheat, which started to be produced recently in our country in Konya plain as a pilot area, gives a yield twice per year. Buckwheat, an important source of protein for the celiac patients, its honey and pollen are also valuable products. In this study total phenolic content, total flavonoids, antioxidant capacity (FRAP), and some phenolic compounds of the buckwheat pollens obtained from Konya region were investigated. Phenolic compounds were determined by HPLC-UV. In a study performed on three different pollens, the average total phenolic content, the average total flavonoid and total antioxidant capacity were determined as 762 mg gallic acid /100 g fresh pollen, 75 mg quercetin/100 g fresh pollen and 490 mikromol Trolox/100 g, respectively. It was found out that pollens were rich in catechin, coumaric acid, ferulic acid and cinnamic acid.

THE IMPORTANCE OF CARNATION (*SZYGIUM AROMATICUM*) AND CASTOR OIL (*RICINUS COMMUNIS L.*)

SEVİM HAMZAÇEBİ¹, FATMA ÖZTÜRK¹, HATİCE GÜNDÜZ¹

ABSTRACT

Throughout history, people have used plants as the most important food ingredient. However, healing plants have been evaluated for the treatment of diseases in all parts of the world and in all cultures. In ancient cultures, the use of herbal plants and herbal medicines continues to be preserved by being transmitted to them. Herbal treatments, which are among the alternative treatments and have very effective results, are increasing in our country as well as in the whole world. All plants present in the world are used for herbal medicines according to their contents and structures. Therapeutic features in any disease have been discovered and are known to be herbal plants are proven. Carnation and castor oil are also used by people for healing. Clove is one of the most used and useful plants with its strong aroma and strong smell. Carnation oil obtained from carnation is extremely rich in terms of phosphorus, sodium, potassium, calcium, hydrochloric acid, iron and vitamin C. It is good for complaints such as indigestion, nausea, stinging, earache, cough, sputum, bronchitis, sinusitis, asthma, colds in the treatment of infections of the throat and gums, wounds, cuts, mushrooms, rashes, insects and infections. With the blooming of Indian flower seeds, Indian oil is obtained, which is a colorless, slightly yellowish, clear and dark oil. It acts on small intestines to relieve constipation. Avoids hair and eyelash pouring, especially in the hair curler is very useful. Antiseptic properties help fight infections. It has excellent antioxidant properties that allow the body to fight harmful free radicals. Anti-inflammatory properties help relieve inflammation in various parts of the body. Carnations and castor oil, which are very important for human health, are also used as an anesthetic agent for fish in the aquaculture sector worldwide. The use of these oils as an anesthetic increases the use of vegetable sources.

POTENTIAL EFFECTS OF CAFFEINE CONSUMPTION ON ENERGY BALANCE, WEIGHT CONTROL AND TYPE 2 DIABETES

OSMAN BOZKURT¹, NILÜFER ACAR TEK¹

ABSTRACT

Obesity is an important public health problem throughout the world and its prevalence is 30.3% in Turkey. There are two important ways to prevent obesity. These are to reduce energy intake or to increase energy expenditure. The aim of this review is to examine the mechanisms of action of caffeine on energy balance and the possible effects on obesity. The thermogenic effect of the catecholamines from extracts of some plants is present. From catecholamines whose effects on energy balance are indicated, caffeine; especially in tea and coffee varieties, capsaicin; red pepper and chili pepper, ephedrine from ephedra is contained. Recently, it has been reported that approximately 80% of the world's population consumes products containing caffeine. The effects of caffeine on the energy mechanism are through the sympathetic nervous system. Even if the amount of caffeine taken in the body is small, it stimulates the sympathetic nervous system. Fat oxidation and thermogenesis in the control of the stimulated sympathetic nervous system are effective on the basal metabolic rate (BMR), increasing energy expenditure for a certain period of time. Caffeine that may stimulate thermogenesis and fat oxidation through inhibition of phosphodiesterase, an enzyme that degrades cyclic AMP and through the antagonism of the negative modulatory effect of adenosine on the increased noradrenaline release. Studies have also reported that caffeine increases thermogenesis, as well as the effect of reducing nutrient intake. It was also observed that the intake of caffeine between 200-300 mg increased the metabolic rate between 2% and 12%. It has been reported that regular consumption of coffee has been studied in epidemiological studies and animal models that prevent weight gain and increase glucose tolerance and is particularly effective in the prevention of type 2 diabetes. However, the mechanisms that create these potentially beneficial effects are not fully explained. In a study conducted in obese individuals, it was observed that the patients that were given caffeine and ephedrine combination lost more body weight and fat than the ones just given placebo and only ephedrine. On the other hand, it is known that excessive caffeine intake results in dehydration, insomnia, hypercalciuria and hypertension. The European Food Safety Association (EFSA) recommends up to 400 mg of daily caffeine intake and a single dose of 200 mg of caffeine do not raise safety concerns for adults. As a result, it can be said that a moderate caffeine intake (daily <400 mg) is beneficial in the prevention of obesity and in the maintenance of health, such as fat oxidation, thermogenic effect and increased glucose tolerance in the body.

IN VITRO CYTOTOXIC ACTIVITY OF SALVIA KURDICA FROM ANATOLIA

HILAL SARUHAN FIDAN¹, LEYLA BALUR², ESRA YARIŞ², SEVGI İRTEGÜN³, ABDULSELAM ERTAŞ², MEHMET FIRAT⁴, UFUK KOLAK⁵, GÜLAÇTI TOPÇU⁶

ABSTRACT

Salvia L. (Lamiaceae) species consists of about 900 species distributed throughout the world. In Turkey, this genus is represented by 100 species, 53 (53%) of which are endemic. The genus is named "Salvia", derived from latin "Salveo", means "save, or recover". Many of Salvia species are named "adaçayı" in Anatolia, Turkey, and used as herbal tea due to their antiseptic, stimulant, diuretic and wound healing properties. Salvia species are generally known for their several pharmacological effects including antibacterial, antituberculous, antiviral, cytotoxic and cardiovascular activities. In this study, the cytotoxic activity of chloroform and ethanol extracts of Salvia kurdica was determined by MTT method. In this study, human-derived cancer cell series and the Primary Dermal Fibroblasts series were used. For this purpose, the breast cancer cell line (MCF-7), the colon cancer series (HT-29) and the Primary Dermal Fibroblast Series (PDF) were provided. Preliminary work has been done to optimize the number of cells to be placed in the plates for each cell series. 22,000 for MCF-7, 20,000 for HT-29, 12,000 cells for PDF were placed in a 96-well plate and the cells were allowed to sit for 24 hours at 37 ° C and 5% CO₂ in a humid environment to adhere to the plate. After 24 hours, the cells were treated with prepared extracts at 10 [mu] of different concentrations for 48 and 72 hours. After 48 and 72 hours of treatment, the cells were incubated with 10 [mu] MTT solutions for 4 hours. After incubation, a dark blue colored formazan was formed. After adding 100µl solubilization buffer to the cells and incubating overnight at 37 ° C in 5% CO₂ humidified atmosphere, the absorbance of formazan at 570 and 690 nm was measured with a plate reader. Measurements at 690 nm were used as reference absorbances. Ethanol and chloroform extracts of S. Kurdica showed cytotoxic effect only at high concentrations against HT29 and MCF7 cell series was determined. But it was determined that the extracts in these high concentrations showed cytotoxic effect on healthy fibroblast cell series. Acknowledgements: The research was funded by grant : KBAG 114Z801 from TUBITAK, The Scientific and Technological Research Council of Turkey.

THE POSSIBLE FUNGAL PATHOGENS LIMITING BASIL PRODUCTION

GÜLSÜM PALACIOĞLU¹, GÖKSEL ÖZER², HARUN BAYRAKTAR¹

ABSTRACT

Basil (*Ocimum basilicum* L.), belonging to the family of Lamiaceae is an important medicinal and aromatic plant. It is used as a raw material in the food and perfumery industry and in the control of a wide range of plant disease with antimicrobial effect as well as used as a spice. There are many significant plant pathogens that cause yield and quality losses in the basil growing areas in the world. However, there is little information on the biology and control methods of these disease agents. Fusarium wilt caused by *Fusarium oxysporum* f.sp. *basilicum* is the most destructive disease in the basil growing areas worldwide. Also, gray mold (*Botrytis cinerea*), root rot (*Rhizoctonia solani*, *Pythium* spp.), white rot (*Sclerotinia sclerotiorum*), mildew (*Peronospora belbahrii*), leaf spot (*Colletotrichum* spp., *Cercospora ocimicola*) are common fungal pathogens, restricting basil production. This study provided the detailed information on symptoms, morphology and disease management of especially, Fusarium wilt and the other pathogens that may cause problems in basil production of Turkey.

ESSENTIAL OIL CONSTITUENTS OF THE LEAVES AND FRUIT OF MALABAILA DASYANTHA (K. KOCH) GROSSH. FROM TURKEY: A TRADITIONAL MEDICINAL HERB

ŞÜKRÜ HAYTA¹, GÜLDEN DOĞAN², EYÜP BAĞCI²

ABSTRACT

Members of Apiaceae usually possess a characteristic pungent or aromatic smell which is due to the occurrence of essential oil or oleoresin in their different organs. Therefore, volatile oils of Apiaceae plants have a wide application in aromatherapy. The essential oil composition of the leaves and fruit of *Malabaila dasyantha* (K. Koch) Grossh. collected from natural habitats in Tunceli (Turkey) were determined by hydrodistillation in 0.7% (weight/weight) yields. The essential oils were analysed by gas chromatography and gas chromatography/mass spectrometry. A total of 25 compounds have been identified constituting 96.7% in fruit and 97.8% in leaves of the essential oils of the taxon. The predominant compounds were spathulenol (22.5%), palmitic acid (17.6%), stearic acid (10.5%) and oleic acid (9.8%) in the oils from the fruit. The main constituents in leaves of the essential oils of the taxon were found as germacrene D (34.8%), Iso spathulenol (11.3%) and bicyclogermacrene (9.8%). Quantitative and qualitative variations were determined in the essential oil composition of different parts of the studied plant. In the present study, the chemical essential oil composition of the leaves and fruit of *Malabaila dasyantha* is determined and examined to indicate the source of particular essential oils for flavour, fragrance and other potential usefulness.

ENDOPLASMIC RETICULUM STRESS IN PLANTS AND NEW THERAPEUTIC APPROACHES TO PLANT DISEASES

SERKAN ŐEN¹, MERVE ŐEN², SEFA ŐELİK³

ABSTRACT

In eucaryotic cell, the Endoplasmic Reticulum (ER) is the major organelle in the synthesis of proteins and in the modifications after synthesis. As a result of physiological events such as cell differentiation or adaptation to certain environmental conditions, protein production capacity increases in the ER organelle. If this condition becomes chronic, the balance between the rates of production and folding of proteins in the ER organelle deteriorates and a so-called ER stress presentation emerges. Since viruses that infect plant cells induce plant cells to produce hyperactive proteins in an abnormal manner, consequences that lead to ER stress are encountered in such circumstances. For instance, it was found that the transcription factor basic-region leucine zipper 60 (bZIP60) protein, which is one of the ER stress markers in plants, was expressed when Potato Virus X (PVX) was infected with tobacco (*Nicotiana benthamiana*) plant. Similarly, it was found that Bip3 (Heat Shock Protein 70-Hsp70) and bZIP60 proteins as ER stress indicators were expressed together when the same plant was infected with Garlic virus X (GarVX). The fact that the silencing of the genes of ER stress markers resulting from the viral infections in plants using siRNA enables physiological changes that allow plants to tolerate the viral attack by restricting the virus infection is included in the literature data. Since ER stress plays a key role in virus replication and pathogenesis in plant cells in this regard, ER stress-mediated signaling pathways in the development of broad-spectrum potent antiviral therapeutic agents emerges as the target pathways for new generation antiviral treatments.

THE ANTIMICROBIAL EFFECT OF POMEGRANATE PEEL, APPLE PEEL AND ARTICHOKE LEAF EXTRACT

FATMA ÖZTÜRK¹, HATİCE GÜNDÜZ¹, SEVİM HAMZAÇEBİ¹, GÖKNUR SÜRENGİL¹, ASENA ÜNVER¹, M. DILCAN AKPINAR¹

ABSTRACT

Introduction Synthetic antimicrobial agents are widely used to prevent the development of pathogenic bacteria in foods, but concerns about the safety of these chemicals are increasing from day to day. Because of the resistance of these microorganisms to these chemicals, fruits, vegetables, spices, plants or their extracts have begun to be used in the preservation of raw or unprocessed foods, pharmaceuticals, alternative medicine and natural therapies. Therapeutic use of plants is as old as human history and there are many plant species that are used as traditional medicines. In this study, it was aimed to determine the antibacterial effect of pomegranate peel extract, apple peel extract and artichoke leaf extract against food pathogens by disk diffusion method. **Material and method** Preparation of the extract The pomegranate peel, apple peel and artichoke leaves used in the study were dried in drying oven at 50 oC. The dried samples were triturated in a blender. 20 gr sample was weighed and placed in 100 ml of solvent (80% ethanol). It was kept in a shaking water bath for 6 hours at 50 oC. Then the filtration was done with filter paper. 100 ml (80%) of solvent were added on it again and this process was repeated 4 times. After the final filtration phase, the ethanol in obtained solution was evaporated using a rotary evaporator. **Preparation of bacterial inoculums** The stock cultures of *Listeria monocytogenes*, *Escherichia coli*, *Escherichia coli* O157: H7, *Bacillus cereus*, *Salmonella enteritis* and *Staphylococcus aureus* that are in liquid form were stored at -20 ± 2 oC on glycerol containing (20%; v/v). For the experiments, 100 μ L of stock cultures were transferred to 10 mL TSB medium, and the bacteria were activated by incubation at 30 oC for 24 hours. The activated bacterial cultures were transferred to centrifuge tubes that each of them is 10 mL, and after centrifuged at 5000 rpm for 10 minutes, bacteria inoculums to be used in experiments were prepared by adding 0.85% physiological saline on obtained pellet part and by being adjusted the cell densities according to 0.5 MacFarland (108 CFU / mL) haze. **Disk diffusion method** (Kirby-Bauer method) 24 hour cultures of *L. monocytogenes*, *E. coli*, *E. coli* O157: H7, *B. cereus*, *S. enteritis* and *S. aureus* strains were made into the standard density of 0.5 McFarland by diluting with sterile physiological saline. 0.1 ml of bacteria from the bacterial inoculums prepared in this way was planted in petri dishes containing MHA according to the spreading plate method. 25 μ l (0.25%, 0.50%, 1%, 1.5%, 2.5%, 5%, 7.5%, 10% concentrations) of plant extracts were soaked into sterile empty discs placed in petri dishes in which planting was made. The Petri dishes in which planting was made were left to the incubation process at 30 oC for 24 hours. After the incubation, the zone diameters composed were measured and thier antibacterial activities were determined. **Conclusion** While, different concentrations of pomegranate peel extract have antibacterial effect against *L. monocytogenes*, *E. coli*, *E. coli* O157: H7, *B. cereus*, *S. enteritis* and *S. aureus* only 7.5% and % 10 concentrations of apple peel extract and artichoke leaf extract have antibacterial effects on the *B. cereus*, *E. coli*, *S. aureus*. Antibacterial properties of apple

MUSHROOMS OF NATURE

ÖYKÜ PEREN TÜRK¹, YAHYA ÖZDOĞAN¹, LALE SARIYE AKAN¹

ABSTRACT

Natural mushrooms have been known with its nutritional and medical properties in many cultures by people for many years. Different types of mushrooms are considered as functional foods because of their effectiveness in preventing and treating many diseases. The aim of this research is to examine the benefits of mushroom species that grow in the nature spontaneously for the community. Edible mushrooms contain variable bioactive components with high level of protein, fiber, vitamins and minerals. Mushrooms are used medically as well as consumed as food. The medical effects of mushrooms have been stated as immunomodulatory, cardiovascular protective, detoxifying, antiviral, antioxidant, antibacterial and antidiabetic. At the same time, natural mushrooms which are collected by local people in Turkey, is a cultural interest for the individuals. Our country has a rich macrofungus flora. It is expressed that “mor, kanlıca (çıntar), tellice, ebe, kavak, kuzugöbeği, bolet, kıtış (karnıkara), dobalan, doru, kayışkan” etc. mushrooms are collected in Ankara at Kızılcahamam, Elmadağ, Çubuk, Işık Mountain, Çamlıdere Plateau regions by the public. For example the mushroom named “kuzugöbeği” has a place in most important mushroom species both in our country and in the world in terms of its nutritional and economic value. Collected natural mushrooms can be used for commercial purposes and also it is a demand as food. In Turkish culinary culture, it is prepared and consumed in various ways like roasting and drying. It is thought that exports of the natural edible mushrooms may be increased further with the incentives and arrangements which can be made. For contribution to country economy and nutrition of the individuals, ways for identification and best usage of edible mushroom species should be found.

**COMPOSITION OF ESSENTIAL OIL TWO MEDICINAL PLANTS
(EUCALYPTUS CAMALDULENSIS DEHNH. AND VIBIRNUM
OPULUS L.)**

GÜLDEN DOĞAN¹, EMEL AKBABA¹, ÖMER KILIÇ²

ABSTRACT

Eucalyptus is one of the world's important and most widely planted species belongs to the family Myrtaceae. Several species of Eucalyptus are used in folk medicine as an antiseptic and against infections of the upper respiratory tract, such as cold, influenza and sinus congestion. The essential oil of Eucalyptus species showed a wide spectrum of antimicrobial, antifungal, anticandidal, antibacterial, expectorant and cough stimulant activity. In this study, the chemical composition of the essential oil from the leaves and fruits of Eucalyptus camaldulensis Dehnh. and aerial parts of Vibirnum opulus L. grown in Mersin (Turkey) were analyzed by using GC and GC/MS techniques. The yields of essential oils were 1.2% in leaf and 1.0% (v/w) in fruit of E. camaldulensis and identified representing 93.8% and 99.0% of the total oils, respectively. The major constituents of leaves were p-cymene (42.1%), eucalyptol (1,8-cineole) (14.1%), α -pinene (12.7%) and α -terpinol (10.7%), and in fruit were eucalyptol (1,8 cineole) (34.5%), p-cymene (30.0%) and α -terpinol (15.1%). Our results showed that both oils has rich in terms of monoterpene hydrocarbons and oxygenated monoterpenes. Viburnum opulus is from Adoxaceae family and it is reported that has anticancer, antiaging and antioxidant activity. This species used for renal stone reduction. The yields of essential oil of V. opulus was 0.5% (v/w) and 6 compounds identified representing 97.0% of the total oils. The α -pinene (27.3%), α -pinene (27.2%) and butanoic acid (15.8%) were the main compounds identified in the oil of Vibirnum opulus.

ESSENTIAL OIL COMPOSITION OF ANACYCLUS CLAVATUS (DESF.) PERS. (ASTERACEAE) FROM TURKEY

M. YAVUZ PAKSOY¹, EYÜP BAGCI², SÜKRÜ HAYTA³, AZİZE DEMİRPOLAT²

ABSTRACT

Anacyclus clavatus (Desf.) Pers is a medicinal plant, belonging to the Asteraceae family. This plant used as food, in various treatments and applications. *Anacyclus clavatus* can be used in many ethnopharmacological applications, equally against upset stomach and treat gastric ulser. The essential oil of the aerial parts of this plant was obtained by hydrodistillation and analyzed by GC and GC-MS. The essential oil yields of *A. clavatus* were determined as 0.3(v/w). Twenty six constituents were identified and comprised 85.3 percentage of the total essential oil from *A. clavatus*. Palmitic (27.0 %), linoleic acid (14.5%), 2-pentadecanone (6.6%) were determined as main compounds. The medicinal importance of the plant and essential oil composition were discussed in the genera patterns.

MACRO ALGAE: HEALTHY FROM SEA

SEVİM HAMZAÇEBİ¹, M. DILCAN AKPINAR¹, ASENA ÜNVER¹, FATMA ÖZTÜRK¹, HATICE GÜNDÜZ¹

ABSTRACT

Algae, called seaweed, is one of the important living resources of the sea. These aquatic creatures of plant origin are evaluated in many industrial areas such as food, phycocolloid, agriculture, pharmacy, medicine and energy because of their rich contents. According to the size of the algae are divided into two as micro algae and macro algae. Micro algae are in microscopic size and macro algae are in sizes ranging from 1 - 2 cm to 40 - 50 m. Far East and South Asian countries, as well as naturally collected, cultures are made, and seas are planted like black lands. Algae include bromine, iodine, organic acids, monosaccharides, polysaccharides, agar, alginic acid, sterols, proteins and vitamins. Algae was first used as color material in the cosmetics industry and in the Roman empire during the time of Virjil and Heros. Macro algae is one of the foods that should be consumed on a daily basis because it contains the nutrients needed by the human body. The use of macroalgae as an additive, and even in medicine, is increasing. Compounds that are responsible for antibiotic activity are commonly found in macroalgae. The most important of these are; Halogenated compounds, alcohols, aldehydes, terpenoids, hydroquinones and Ketones. Minerals such as calcium, magnesium, sodium and potassium are also preferred in thalassotherapy centers due to trace elements and vitamins such as iron, copper, zinc and manganese. Macro-algae agar gels are also used in various products such as perfumed underarm creams, sun creams and dermatological creams containing zinc oxide or penicillin. It has also been noted that alginates used in creams have a feeling of freshness and relaxation due to the rapid evaporation effect on the skin. In soaps and shaving foams, sodium alginate is used as a lubricant, to impart an oily property to foam-free shaving creams, and to provide foaming continuity in foams. In medicine and cosmetics industry, carrageenans are also frequently used because of their fluid properties. They are used as stabilizers in shampoos, hair balms to protect foam in shaving foams and soaps, and as absorption enhancers in products such as facial masks. Carrageenic subdermal deodorants prevent the development of bacteria responsible for their relative degradation and ultimately leading to unwanted sweat odors. In this study, the use of macroalgae in areas such as health and cosmetics will be compiled.

EFFECTS OF OREGANO (ORIGANUM SYRIACUM) ESSENTIAL OIL ADDITION ON THE SHELF LIFE EXTENTION OF RAINBOW TROUT (ONCORHYNCHUS MYKISS, WALBAUM, 1972) FILLETS

AYŞE ÖZYILMAZ¹, ABDULLAH ÖKSÜZ², GÜLSÜN AKDEMİR EVRENDİLEK³

ABSTRACT

Effects of oregano essential oil (*Origanum syriacum*) at the concentrations of 0 (control), 5, 20 and 35µL/g on rainbow trout (*Onchorhynchus mykiss*) fillets stored on ice at 2°C for 19-day of storage were measured by the means of chemical, microbiological and sensory analyses. At the beginning of the storage, pH values of the fillets were close to neutral (6.61±0.01) whereas it increased to 7.68±0.01 towards the end of the 19 days of storage. Furthermore, initial TVB-N value of 18.9 mg TVB-N/100 g reached to 39 mg TVB-N /100 g in control group (A), 33 mg TVBN-N /100 g in group B (treatment with 5µL/g), and 38.9 mg TVBN-N /100 g in group C (treatment with 20µL/g) and 43.1 mg TVBN-N /100 g in group D (treatment with 35µL/g) when fillets were rejected by panelists. The spoilage of fillets was fastest both in control group and group B, while the spoilage of group C was slower than group B during storage. Sensory evaluation was taken as the most important criteria for the determination of shelf-life. The results have shown that oregano essential oil extended shelf-life of rainbow trouts fillets. It was found out that the higher concentration of oregano essentialoil (35µL/g) provided the longer shelf-life of fillets up to 11 days at 20C compare to other treatments.

**ESSENTIAL OIL COMPOSITION OF LALLEMANTIA PELTATA (L.)
FISCH. ET MEY. (LAMIACEAE) FROM TURKEY**

SUKRU HAYTA¹, EYÜP BAGCI², M.YAVUZ PAKSOY³, GULDEN DOGAN²

ABSTRACT

The genus *Lallemantia* is represented by three taxons in the Flora of Turkey. *Lallemantia peltata* (L.) Fisch. et Mey. is a widely used plant and has antifungal and antibacterial activities, colloborating the traditional therapeutic uses, it can be used in the therapy of infectious diseases as well as an antimicrobial additive in foods. The essential oil composition of *Lallemantia peltata* obtained by hydrodistillation and analyzed by gas chromatography (GC) and gas chromatography - mass spectrometry (GC-MS). The essential oil yields of *L. peltata* were determined as 0.2 (v/w) in aerial part. 13 constituents were identified and comprised 94.7% of the total essential oil. Germacrene-D (26.1 %), caryophyllene oxide (14.3%), 1H-Siklopro[e]azulen-7-ol (13.0%) and 2- pentadecanone (9.1 %) were determined as main compounds of *L. peltata*. The results has shown that the parts of the plant and essential oil may be used as source of natural product.

DATE PALM AND ITS ANTIOXIDANT EFFECT

SERKAN ASLAN¹, NEVIN ŞANLIER¹

ABSTRACT

Date palm has an important place in many ways in history of humanity. Several components of date palm have positive effect on health. Date palm specifically involves components that have antioxidant effects. This review aims to show date palm's antioxidant components and conditions that effect these components. Along with various phenolic compounds such as; p-coumaric, ferulic and synaptic acids, date palm provides its antioxidant feature from carotene, flavanoid, procyanidin and anthocyanin. Besides, date palm involves lutein, betacarotene, neoxanthin and as the largest phytochemical, carotenoid. Date palm is rich in selenium which is an antioxidant mineral. However, there are several apprehensions about date palm's rich selenium amount (average 0.31 mg/100g) is close to daily toxic level (0.85 mg). Date palm's antioxidant content is influenced by many factors. Dehumidification process affects date palm's antioxidant components. During dehumidification, carotenoid loss is detected when dried and fresh date palms' carotenoid levels are compared. Again, there are considerable amount of total polyphenol loss in dried date palm. Storage conditions are affecting date palm's antioxidant ingredient as well. Increase in total phenolics and flavonoids is being occurred when date palm stored in +4°C. Eventually, storage in refrigerator for a long time (until six months) may be recommended in order to gain more antioxidant value from date palm. As a result date palm is an important antioxidant source thanks to various antioxidant compounds that it is containing. Consumption of 100 g of date palm (approximately 6-7 pieces) provides 80400 µmol/100 g antioxidant and it compensates 50-100% of fiber and 11-15% of an adult's daily energy requirement. Contained antioxidant components may vary due to storage conditions and whether date palm is dried or fresh.

NUTRITIONAL COMPOSITION AND HEALTH BENEFITS OF EDIBLE MUSHROOMS

TUĐBA TATAR¹, NILÜFER ACAR TEK¹, GAMZE AKBULUT¹, MERVE PEHLİVAN¹

ABSTRACT

Mushrooms and other fungi are special because of being neither plant nor animal. They have been position in a place of their own, called Myceteae. In the world, there are more than 2000 species of mushrooms. But less than 25 species are widely accepted as food. Mushrooms have a great nutritional value since they are quite rich in protein, with an important content of essential amino acids and fiber, and poor in fat. Edible mushrooms also provide a nutritionally significant content of vitamins (B1, B2, B12, C, D and E). The crude protein content of edible mushrooms varies ranges from 15% to 35% of dry weight. The protein quality of mushrooms is higher compared to most plant proteins. The proteins of mushrooms are relatively rich in threonine, valine, glutamic acid, aspartic acid, and arginine but are poor in methionine and cysteine. Mushrooms' carbohydrate content ranges from 35% to 70% of dry weight. Mushrooms' carbohydrates include oligosaccharides such as trehalose and cell wall polysaccharides such as chitin, β -glucans and mannans. Because of these cell wall components including non-digestible carbohydrates, mushrooms are also rich in dietary fiber. High fiber intake is recommended for constipation. Fiber supplements containing ear mushrooms which have the highest dietary fiber improves constipation related symptoms without serious side effects in patients with functional constipation. The polysaccharides in mushrooms' composition have immunomodulatory characteristics such as the improvement of lymphocyte proliferation, antitumorpromoting activities and antibody production. Mushrooms show antitumor activity due to their β -glucan content. β -glucan content also demonstrates a hypoglycemic effect. They perform it via a direct interaction with insulin receptors on target tissues. Mushrooms influence LDL and HDL cholesterol, triacylglycerol, homocysteine and blood pressure that are generally accepted biomarkers of cardiovascular diseases. When fat composition of mushrooms is examined, trans isomers of unsaturated fatty acids which increase serum total cholesterol and high density lipoprotein ratio are not detected. Dietary fibers of mushrooms also contribute this effect. In conclusion edible mushrooms have beneficial effects on health with its rich nutrient and fibre composition. Also edible mushrooms are called as functional foods because of their beneficial effects.

THE USE OF STEVIA POWDER (STEVIA REBAUDIANA) AS A SWEETING IN TURKİSH DELİGH T PRODUCTION

İLYAS ÇELİK¹, HÜSEYİN DOĞAN BOZKURT

ABSTRACT

One of the most fundamental objectives of the food industry is to guide efforts to meet conscious consumer demands. Food industry workers are aiming at lowering the amount of sugar in the diet (due to diabetes, obesity, chronic illnesses, etc.) in parallel with general tendency. In this study, the sweetener for this problem was aimed at the production of stevia (*Stevia rebaudiana*) (sugar plant, sugar candy) plant which is 250-300 times more sugar than normal sugar and which is traditionally produced and used in the production of Turkish delight, which does not increase the level of glucose. According to the results of the research, the sensory control of Turkish delight containing 0.03% stevia powder was found to differ from the Turkish delight in terms of taste and general taste. It can be said that the obtained values are higher than the average, and that the use of stevia powder in the production of Turkish delight is positive. When the color parameter was examined, samples of stevia dusted with the lightest color were obtained. In terms of tackiness values; There was a significant difference between control and Turkish delight samples in stevia Turkish delight samples ($p < 0.05$).

GREEN SYNTHESIS OF LAUROCERASUS OFFICINALIS ROEMER (CHERRY LAUREL) FRUIT EXTRACTS BASED NANOFLOWER WITH IN VITRO AMOEBICIDAL AND CATALYTIC ACTIVITY

AYŞE BALDEMİR¹, ÜLKÜ KARAMAN², SADI YUSUFBEYOĞLU¹, AYŞE EKEN¹, NILAY İLDİZ¹, CEMİL ÇOLAK², GAMZE ŞAHİN², İSMAIL ÖÇSOY¹

ABSTRACT

The pathogenic *Acanthamoeba* often causes *Acanthamoeba* keratitis, which is an opportunistic protozoan infection, related with soft contact lens wear. If not treated quickly, it is a type of infection that can result in corneal ulceration, visual loss or even blindness. While there are many chemotherapy options available in the treatment of *Acanthamoeba* infections, they are tough treatments and have limited efficacy [1-3]. Hydrogen peroxide is a commonly used contact lens disinfectant and is effective against *Acanthamoeba*. However, it is toxic to the cornea and must be rapidly neutralized before the lens wears to avoid corneal damage. The single-stage hydrogen peroxide systems applied for the rapid neutralization have very few cysticidal effects [4]. For these reasons, new, more efficacious treatments are required for *Acanthamoeba* infections. *Laurocerasus officinalis* Roem. (Cherry laurel) belongs to the Rosaceae family and is a popular fruit, commonly distributed in the coasts of the Black Sea region of Turkey and is locally called "Taflan", "Laz kirazı" or "Karayemis". Besides its use for food, in Turkey both fruit and seeds of cherry laurel are have been used for many years for the treatment of stomach ulcers, digestive system complaints, bronchitis, skin diseases (especially eczemas) and haemorrhoids [5]. In particular, there is information about the use of seeds against parasites in this region. In previous studies it was determined that the fruits were rich in phenolic components [6,7]. In present study, the effects on the proliferation *Acanthamoeba castellanii* of methanol extracts prepared from endocarp, mesocarp and seeds of the cherry laurel fruit and nanoflowers (NFs) structures which is synthesized from these extracts were investigated [8]. Thus, for the first time, novel organic-inorganic nanobio-antiparasitic agents called NFs were produced and the increase in the amoebicidal activity of the NFs was elucidated. The NFs were characterized with several techniques such as Scanning Electron Microscopy (SEM), Fourier Transform Infrared Spectrometer (FT-IR), Energy-Dispersive X-ray (EDX) and X-ray Diffraction Analysis (XRD). In addition, the catalytic activity of fruit extracts and the NFs were measured against guaiacol in the presence of the H₂O₂. The viability test of *Acanthamoeba castellanii* cysts for amoebicidal activity was performed using 4% trypan blue. Methanol extracts and NFs were prepared at concentrations of 32, 16, 8, 4, 2 and 1 mg / mL in 0.9% saline and distributed in 200 µl of tubes. 200 µl added to 98% viable *A. castellanii* cysts (20X10⁶ parasite/mL) were incubated at room temperature. In the statistical analysis, the Kruskal-Wallis, Friedman and Conover tests were used to analyze significant differences between the mean values. A p value of <0.05 was considered statistically significant. As a result, NFs synthesized from fruit extracts were demonstrated about 5 times more effective than extracts alone for Ameobicidal activity. This can be explained as an increase in the amobisidal activity of a new nano-

ANTIBACTERIAL ACTIVITIES OF CALENDULA OFFICINALIS CALLUS EXTRACT

BURCU ÇETİN¹, FATİH KALYONCU², BETÜL KURTULUŞ¹

ABSTRACT

The use of *Calendula officinalis* Linn. (Asteraceae) preparations for, topical application, is widespread both in dermatology and in cosmetics and one of the relevant pharmacological activities for this use is the anti-inflammatory one. It grows in the forests of India, China, Central Europe, and some tropical areas. Plant tissue culture techniques enable the production of plant tissue or cells in sterile environments under controlled conditions. By one of these methods, callus cultures, pharmacologically active molecules could be produced at the desired amount and constant quality at any time in laboratory conditions. This technique is an alternative method for obtaining the raw material source required for the food, pharmaceutical and cosmetic industries. In this study, the antimicrobial activity of *C. officinalis* callus derived from cotyledon explants were determined. The seeds were immersed in 70% ethyl alcohol for 3 min, followed by surface sterilization with 0.5% NaOCl solution for 5 min and rinsed with sterile double-distilled water. Later on, they were germinated in jars containing 30 mL MS (Murashige and Skoog, 1962) medium without plant growth regulators. Cotyledons excised from in vitro germinated seedlings were used as explants. They were transferred on MS medium supplemented with benzil amino purine (BAP; 2 mg/l), α -naphthalene-acetic acid (NAA; 2 mg/l) for callus studies. The cultures were maintained on the same media compositions and sub-cultured at an interval of four weeks. Callus cultures were harvested at the end of the 16th week. Callus were dried at 40° C in the dark for antimicrobial studies. *Calendula officinalis* callus extracts were tested for their antibacterial activities by using agar well diffusion method. Ethanol and chloroform extracts from these callus were assayed against nine bacteria species (*Staphylococcus aureus* ATCC 6538, *Escherichia coli* ATCC 25922, *Bacillus cereus* ATCC 7064, *Bacillus subtilis* ATCC 6633, *Salmonella typhimurium* CCM 5445, *Proteus vulgaris* ATCC 6896, *Enterococcus faecalis* ATCC 29212, *Enterobacter cloacae* ATCC 13047, and *Kocuria rhizophila* ATCC 9341). The test antibiotics penicillin G, novobiocin, ampicillin, chloramphenicol and erythromycin were used for comparison. *Calendula officinalis* seeds were germinated without any plant growth regulator on MS medium in one week. Callus formation was observed at the end of the 5th week on cotyledon explants. The extracts were prepared from 16-weeks-old callus. *C. officinalis* callus extracts showed 38 mm inhibition zone against *S. aureus*, and chloroform extracts showed 32 mm inhibition zone against *B. cereus*. These results are very close to the test antibiotics used and *C. officinalis* was found more effective on gram positive bacteria.

**SOME ECOLOGICAL AND PHYTOCHEMICAL PROPERTIES,
USAGE AREAS AND DISTRIBUTION OF JUNIPERUS COMMUNIS
VAR. SAXATILIS PALL. IN ERZURUM**

MEHMET ÖNAL¹, TURGAY DINDAROđLU², ZÜHAL GÜVENALP³, SEFA GÖZCÜ⁴, HAFIZE YUCA³

ABSTRACT

Juniperus communis var. *saxatilis* Pall. is a species belonging to the *Oxycedrus* section in the *Juniperoideae* subfamily of the *Cupressaceae* family. This species is 1-7 m high and is an evergreen shrub in winter. It is grown in Bursa, Bolu, Kastamonu, Amasya, Sivas, Gümüşhane, Rize, İzmir, Kayseri, Tunceli, Bitlis and Denizli in Turkey. This study was carried out to determine some ecological and phytochemical characteristics of this species with usage area and some data of inventory in Erzurum province. In addition, the *in vitro* α -glucosidase enzyme inhibition assay of methanol extract of fruits of *J. communis* var. *saxatilis* plant was also evaluated in our study. Enzyme inhibition activity of fruit extract was investigated using α -glucosidase enzyme obtained from *Saccharomyces cerevisiae* and *p*-nitrophenyl- α -D-glucopyranoside as substrate. The results are compared according to the Acorbose. This species has been identified in the study area between 2000-2600 m elevations and spreads to about 4635 hectares. The species is mixed with pure or other tree and shrub species on the north, north-east and north-west slopes. It is a tolerant plant. It grows in light and semi-shaded environments. It grows well in coarse textured, well-aired and quickly warming soil. It can grow up slightly acidic, neutral and slightly alkaline soil. Methanol extract showed enzyme inhibition at 90% (IC₅₀: 0.0525 mg / ml) at 1000 μ g / mL concentration; the standard substance Acorbose showed enzyme inhibition of 26.10% (IC₅₀: 4.5629 mg / ml) at the same concentration. In previous phytochemical studies, flavonoids, polyprenols and monoterpenic hydrocarbons were isolated from different parts of *J. communis* var. *saxatilis*. This species has been reported to have abortus potential as well as anti-infertility, antioxidant, antibacterial and anti-diabetic activities. It is known that the fruits of the plant are effective in rheumatic diseases and gout diseases in addition to the urine-boosting, sweating use among the people. Various organs used in medicine and cosmetic industry is as skin diseases, worm-reducing, stimulant, antiseptic, sedative, antispasmodic. They also provide a place for nutrition and welfare for wildlife. It is also a preferred plant species in landscape arrangements.

GASTROPROTECTIVE EFFECTS OF ZIZIPHUS JUJUBA FRUIT EXTRACT AGAINST ETHANOL-INDUCED GASTRIC MUCOSAL HEMORHAGIC LESIONS IN RATS

MEHMET RAMAZAN BOZHÜYÜK¹, MUSTAFA CAN GÜLER², AYHAN TANYELİ², ERDEM TOKTAY³, ERSEN ERASLAN²

ABSTRACT

Purpose: Gastric ulcer is a common worldwide disease. The most common causes of gastric ulcer are the consumption of alcohol, *Helicobacter pylori*, and the use of non-steroidal anti-inflammatory drugs (NSAIDs). Excessive alcohol consumption usually increases the risk of gastric mucosal damage. Thus, the experimental model of ethanol-induced gastric injury in rats is generally used to investigate alcohol-induced gastric ulcer in humans and the main compounds involved in the antiulcer activity. The underlying mechanisms of ethanol-induced gastric ulcer have not been fully identified. In this study, it was aimed to investigate gastroprotective effects of extract of *Ziziphus jujuba* fruit (Jujube), on ethanol-induced gastric ulcer by histopathological method. **Method:** In this study, 32 Wistar albino female rats weighing 257±4.3 gr were used and 4 groups were formed (n=8). Nothing was applied to the control group. Purified water, 4ml/kg and 8ml/kg jujuba extract were respectively administered intragastrically for 10 days in the groups treated with ethanol and jujuba extract. On 11th day, 5 ml/kg ethanol was administered intragastrically to the rats and they were sacrificed after 90 minutes. The gastric tissues were obtained. Macroscopic imaging was first performed and then they were stored in 10% formalin until histological studies to be performed. **Findings:** Histopathological evaluation was performed by comparing the mucosal images of the control group. In evaluation of hematoxylin and eosin (H&E) staining, there was no degradation in the gastric tissue in the control group. In the group with ulcer, it was observed that there were degenerative changes in the surface epithelial cells and dilated gastric pit and gland structures and neutrophil infiltration. In the group treated with 4 ml/kg jujuba extract, it was seen that there were the partial irregularities in the gastric pits and the decrease in neutrophil infiltration. In the group treated with 8 ml/kg jujuba extract, it was seen that the gastric pits were regular, the mucosa generally appeared like that of the control group and there was the significant reduction in neutrophil infiltration and the number of necrotic cells. In immunohistochemical evaluation of nuclear factor kappa B (NF-κB) and caspase-3 immunopositivity, the group with ulcer had higher immunopositivity compared to the control group. Moreover, it was seen that the groups treated with jujuba extract had lower immunopositivity due to its dosage dependent effect compared to the group with ulcer. In order to better understand the histopathological evaluation, histopathological damage was scored as - (none), + (little damage), ++ (medium damage) and +++ (severe damage) according to the regularity of the

CARDIOPROTECTIVE EFFECTS OF THE QUERCETIN AND RUTIN IN 5-FLUOROURACIL-INDUCED CARDIOTOXICITY IN THE RATS

EMİN ŐENGÜL¹, VOLKAN GELEN², SEMİN GEDİKLİ¹

ABSTRACT

Introduction and aim: 5-Fluorouracil (5-FU) is widely used in the solid tumors such as lung, breast and gastrointestinal cancers. 5-FU causes cardiotoxicity and hepatotoxicity. In this study, in the 5-FU-induced cardiotoxicity has aimed investigations of the cardioprotective effects of Quercetin (Q) and Rutin (RU) Method: In this study, 50 piece male Sprague Dawley rats (250±25 g) were used. Rats were divided randomly into eight group, which there was 10 rats in each group. The group control was given intragastric (ig) corn oil (1 ml) for 14 days. The group 5-FU rats were given ig corn oil for 14 days and eleventh day injected intraperitoneal (ip) a single dose (50 mg/kg) of 5-FU. Group Q50+5-FU and Q100+5-FU were given ig 50 mg/kg and 100 mg/kg Q for 14 days, respectively. These groups were injected 5-FU (50 mg/kg) single dose on the 11th days of Q application. The group Q100 was given Q (100 mg/kg-i.g) for 14 days. Group RU50+5-FU and RU100+5-FU were given ig 50 mg/kg and 100 mg/kg doses of the RU for 14 days, respectively. Also, these groups were injected the single dose of 5-FU (50 mg/kg) in the 11th days of RU application. The group RU100 was given RU (100 mg/kg-i.g) for 14 days. In the end experimental applications, the blood sample were collected from anesthetized rats and rats were scarified. Sera were separated by centrifugation and utilized for the evaluation of various cardiac marker enzymes (CK, CK-MB, AST, ALT, LDH, cTnI). The cardiac tissues used for biochemical and histopathological analysis. The data were analyzed by Tukey test in the one-way ANOVA. Results: When data are showed compared among groups that in the MDA level was significantly higher in the 5-FU group than control group and decreased significantly RU100+5-FU and Q100+5-FU groups. SOD and GSH levels were markedly decreased in the 5-FU group compared with control, RU100+5-FU and Q100+5-FU groups. AST, CK, CK-MB, ALT, Troponin I and LDH levels were significantly increased in the 5-FU group when compared to other groups. In the histopathological examination of cardiac tissue was determined that in the 5-FU group had markedly degenerated cells and cardiac myofibril. Intensity of β -MHC positivity was higher in the 5-FU group sections compared to the control, RU100+5-FU and Q100+5-FU groups sections. Conclusion: In the present study was determined that especially high doses of the Q and RU have protective effects on 5-FU-induced cardiotoxicity.

THE EFFECT OF STORAGE ON SOME PROPERTIES OF 3 DIFFERENT GROUND POPPY SEED FATS

BESİM MADEN¹, SEDA YALÇIN¹

ABSTRACT

The poppy seed is a traditional product in Afyon. There are three types of poppy seed. These are white poppy seed, yellow poppy seed and gray poppy seed. The objective of this study is to investigate the effect of storage at 15-20⁰ C for several times (0, 7, 15, 30, 45 and 60 days) on some properties of 3 different poppy seed fats. In this study, fats were obtained from white poppy seed (TMO1), yellow poppy seed (TMO2) and gray poppy seed (Afyon-95). Then free fatty acid amount (%), peroxide value (meq O₂/g) and iodide number of these fats were analyzed. Free fatty acid amount, peroxide value and iodide number at these fats were increased with increasing of storage time, but this increase was little. The results of 3 different poppy seed fat were found as similar. It was concluded that three different poppy seed fats were stable for long times at 15-20⁰ C. It was investigated the effects of storage on L*, a*, b* color values of three types of poppy seed fats and total phenolic contents of these fats were determined. The fat contents of three types of poppy seeds were found as 53.85 % (white poppy seed), 49.85% (yellow poppy seed) and 49.17 % (gray poppy seed). L* and b* color values of white poppy fat and gray poppy seed fat were decreased when storage time was increased, while a* color values of those were increased. L* and a* color values of yellow poppy seed fats were increased when storage time was increased, whereas b* color value of that was decreased.

**EFFECT OF ACCELERATED SOLVENT EXTRACTION (ASE)
SYSTEM TEMPERATURE ON THE AMOUNT OF PHENOLIC ACIDS
IN THE METHANOLIC EXTRACT OF CHAMOMILE (MATICARIA
CHAMOMILLA L.)**

TIMUR TONGUR¹, SERPİL KILIÇ¹, TANER ERKAYMAZ¹, MURAT KILIÇ¹

ABSTRACT

Chamomile (*Matricaria chamomilla* L.) is one of the preferred hot beverage as herbal tea. The aim of this study was to determine effective methanolic extraction temperature of chamomile (*Matricaria chamomilla* L.) for phenolic acids by using accelerated solvent extraction (ASE). In the study a commercial chamomile tea was used as a testing material. Detection of phenolic acids were done with LC-ESI-MS/MS. The study was performed at 5 different temperatures; 40°C, 50°C, 60°C, 80°C and 100°C. 1.0 g chamomile tea sample and 1.5 g diatomaceous earth weighed to the 10 ml ASE extraction cell. Extraction time was 25 minutes for one sample. Nitrogen flow was used for drying extract. Hydrolysis step were implemented to dried samples. Phenolic content of hydrolysed chamomile samples were determined with LC-ESI-MS/MS. Caffeic acid, p-coumaric acid, rosmarinic acid, ferulic acid, quercetin, chlorogenic acid, isorhamnetin, luteolin, syringic acid, and apigenin were analysed in the study. For chromatographic separation Hypersil Gold 50 mm x 2.1 mm x 1.9µm C18 column was used with gradient flow. Analysis time was for 8 minutes for one sample. LC-MS/MS method was found to be selective, linear ($r^2 > 0.99$) and precise for all of interested phenolic compounds. The results showed that phenolic compounds were sensitive to temperature. The methanolic extract which obtained at 40°C had a highest phenolic acid values comparing to other temperatures. The extraction yield was better at 40°C for methanolic ASE extract.

GASTROPROTECTIVE EFFECTS OF PERSIMMON (*DIOSPYROS KAKI L.*) AGAINST ETHANOL-INDUCED GASTRIC ULCER IN RATS

MUSTAFA CAN GÜLER¹, MEHMET RAMAZAN BOZHÜYÜK², AYHAN TANYELİ¹, ERSEN ERASLAN¹, ERDEM TOKTAY³

ABSTRACT

Aim: Gastric ulcers are a major problem worldwide with no effective treatment. Ulcer is caused by an imbalance between two factors: aggressive factors in the lumen (physical, chemical or psychological) and protective mechanisms. Aggressive factors include acid, pepsin, *Helicobacter pylori*, stress, alcohol, and use of non-steroidal anti-inflammatory drugs (NSAIDs). Protective mechanisms include mucus, bicarbonate, prostaglandin, blood flow, antioxidant system, nitric oxide, and cell proliferation. Current treatments are not always effective. They also have side effects and are expensive. Therefore, the protective effect of herbal medicines is important. Persimmon (*Diospyros kaki L.*) is widely used in the treatment of various diseases. Previous studies have shown that *Diospyros kaki L.* has anti-oxidant activity. Our study aimed to investigate gastroprotective effects of persimmon (*Diospyros kaki L.*) on ethanol-induced gastric ulcer by histopathological method. **Method:** In our study, 32 Wistar albino male rats weighing between 250-300 gr were used. We formed 4 groups each containing 8 rats. Group 1 was the control group and was placed on a normal diet. Group 2 was the ethanol group and purified water was administered by oral gavage for 10 days. Low dose (4 ml/kg) and high dose (8 ml/kg) persimmon extract were administered by oral gavage for 10 days in Group 3 and 4, respectively. In our study, we used Japanese persimmon (*Diospyros kaki L.*) harvested in the ninth month in Mersin Province, Turkey. At the end of the 10th day, ethanol (absolute ethanol 99%, 5mL/kg) was administered by oral gavage in order to produce gastric ulcer in Group 2, 3 and 4. The animals were sacrificed at the end of the experimental period (90 min). The gastric tissues obtained from animals were investigated by histopathological methods. **Results:** Hematoxylin-eosin staining results; Histopathological evaluation was performed based on the gastric mucosa. Accordingly; In the control group, it was seen that the gastric pits were regular and the mucosal cells were in normal size and shape. In the group with ulcer, it was seen that the gastric pits lost their normal appearance. However, it was remarkable that the mucosal cells were necrotized in both the superficial and deep layers of the mucosa and there was an increase in the number of lymphocytes. In the group treated with low dose (4 ml/kg) persimmon extract, it was seen that the gastric pits were regular and the surface mucosal cells had hypertrophic changes. In the group treated with high dose (8 ml/kg) persimmon extract, it was seen that the gastric pits were regular and the mucosa was generally similar to that of the control group. In order to better understand the histopathological evaluation, histopathological damage was scored as - (none), + (little damage), ++ (medium damage) and +++ (severe damage) according to the regularity of the gastric mucosa, the depth of the mucosal injury, and

the presence of hemorrhage and necrotic cells. The results of immunohistochemical evaluation In order to better understand the results of immunohistochemical evaluation, NF- κ B and caspase-3 immunopositivity was scored as - (none), + (little damage), ++ (medium damage) and +++ (severe damage). In immunohistochemical staining performed with NF- κ B and Caspase-3 antibody, while the group with ulcer showed severe immunopositivity, the control group, the group treated with low dose persimmon extract and the group treated with high dose persimmon extract showed mild immunopositivity. Conclusions: It has been shown that persimmon (*Diospyros kaki L.*) may have protective roles against ethanol-induced gastric ulcer. Persimmon (*Diospyros kaki L.*) can be considered as a new potential natural method in gastric ulcer treatment. This study was supported by Atatürk University SRP (Project no: 2016/051).

ABSTRACT

Aim: Gastric ulcer is one of the most common diseases in the world and is a global problem. Excessive alcohol consumption usually increases the risk of gastric mucosal damage. Herbal medicines are used in the prevention of many diseases. In this study, an extract of pear fruit which belongs to the Rosaceae family was used. Pear extract contains a large number of flavonoids, acids and antioxidants. In this study, gastroprotective effects of pear extract on ethanol-induced gastric ulcer in rats were investigated by histopathological methods. **Method:** In the study, 4 groups were created by using 32 male wistar albino rats (n=8). Nothing was applied to the control group. Purified water, 4ml/kg and 8ml/kg pear extract were respectively administered intragastrically for 10 days in the groups with ulcer and treated with pear extract. On 11th day, 5 ml/kg ethanol was administered intragastrically to the rats and they were sacrificed after 90 minutes. The gastric tissues were obtained. Macroscopic imaging was first performed and then they were stored in 10% formalin until histological studies to be performed. **Results:** Histopathological evaluation was performed based on the gastric mucosa. In evaluation of hematoxylin and eosin (H&E) staining, there was no degradation in the gastric tissue in the control group. It was clearly seen that gastric pits lost their normal appearance in the group with ulcer. However, it was remarkable that mucosal cells were necrotized in both the superficial and deep layers of the mucosa and there was an increase in the number of lymphocytes. In the group treated with 4 ml/kg pear extract, it was seen that there were the partial irregularities in the gastric pits and the necrotic cells on the mucosal surface. In the group treated with 8 ml/kg pear extract, it was seen that the gastric pits were regular, the mucosa generally appeared like that of the control group and the necrotic cells were rarely found on the mucosal surface. In immunohistochemical evaluation of nuclear factor kappa B (NF- κ B) and caspase-3 immunopositivity, the group with ulcer had higher immunopositivity compared to the control group. Moreover, it was seen that the groups treated with pear extract had lower immunopositivity due to its dosage dependent effect compared to the group with ulcer. In order to better understand the histopathological evaluation, histopathological damage was scored as - (none), + (little damage), ++ (medium damage) and +++ (severe damage) according to the regularity of the gastric mucosa, the depth of the mucosal injury, and the presence of hemorrhage and necrotic cells. **Conclusion:** Pear extract showed gastroprotective effects on ethanol-induced gastric damage in a dose-dependent manner. MEDICAL BENEFITS OF BLACK CUMIN (NIGELLA SATIVA) PLANT

GÜLTEN ŞENOCAK SORAN¹

ABSTRACT

Nigella sativa Ranunculaceae family of flowers, 20-30 cm high, with a bluish-green plant. For this plant in our country names such as blackcurrant, black cumin and black cumin seeds are used. It grows in western and central parts of the country (Afyon, Burdur, Isparta) while our country is grown in countries like Southern Europe, Russia, Sudan, Ethiopia, Syria, Iran, Afghanistan and India. The homeland is the Eastern Mediterranean countries, Eastern and Southern Europe. The seeds of the plant are black and cornered, carrying essential oils. The seeds of this plant are used in the food industry due to its aromatic nature, in some decorations (biscuits, muffins, etc.) and as a flavor in foods such as overalls and sediment. They are also used as medicines for the treatment of various diseases. *N. sativa* seeds are used in many countries for bronchial asthma, rheumatism, allergic diseases, various digestive disorders and parasitic infections, and it is reported that there is no side effect when used correctly and in the right dose. *N. sativa* seeds increase interleukin-3 (IL-3) secretion from T lymphocytes. It has also been reported that *Pseudomonas aeruginosa*, *Escherichia coli*, *Bacillus subtilis*, *Streptococcus faecalis* and antibacterial activity against various bacteria causing dental caries. It can also be used as a preservative in the storage of certain foods by taking advantage of this antibacterial property of *N. sativa*. *N. sativa* has been reported to contain over 100 substances in its chemical content, 38% of these substances are reported to be carbohydrates (glucose, xylose, arabinose), 0.38-0.49% essential oil, 30-40% fixed fat, 20-30% protein, saponin, melanin, nigellin and tannin. Çörekotu is used in the treatment of many diseases in Far East and Middle East countries over 2000 years. It has been reported that *N. sativa* proteins have antioxidant effect and regulate immunological response.

PHYTOCHEMICAL STUDIES OF NIGELLA SATIVA IN SYRIAN AND BURDUR SPECIMENS

SENA AKDOĐAN¹, İBRAHİM DEMİRTAŞ¹, FATİH GÜL¹, İSA TELCİ²

ABSTRACT

Çörek otu are the Latin name *Nigella sativa* which is known to be 12 species in the family of wedding flowers (Ranunculaceae) and especially in Turkey. It is also grown in most parts of the world. The leaves that grow in Turkey such as Isparta, Konya, Burdur are fine and have a small seed of black seeds about 35-40 cm in length. Syrian and Burdur plants' seeds were initially stored at 1:1 in MeOH and CH₃Cl solvent mixtures and extractions were carried out. The same plants' seeds specimens were then crushed in the air and kept in the same solvent mixture in the same manner and the extraction procedure was repeated for four times. *Nigella sativa* seeds extracts obtained from Burdur and Syrian were primarily esterified and then fatty acids analysis was performed using GC-MS method. In the obtained results, the main component was identified as linoleic acid in both samples. The second and third major components were identified as oleic and palmitic acids. These three acids were found to be more than 90% of total fatty acids. Also, in this study, isolation and esterification techniques of fatty acids will be discussed. In particular, the effects of saturated and unsaturated fatty acids on activity will be presented. Analyzes and effects of essential oils and especially anti-cancer properties will be presented. In addition to this, the amount of the volatile contents will be also presented.

INVESTIGATION OF ANTIMICROBIAL EFFECT OF SUMAC AND CINNAMON EXTRACTS ON PARSLEY

OKTAY TOMAR¹, GÖKHAN AKARCA¹, TESLİME EKİZ¹

ABSTRACT

It is very important to consume healthy foods during healthy growth and development. It is possible for people to grow up and to continue their lives by consuming healthy ingredients, starting from raw materials. Foodborne microorganisms, which contaminate the food and food raw materials at various stages, can lead to food poisoning and infections. Today, various processes (low temperature or heat treatment application, packaging methods, etc.) and additives such as salt, sugar and antimicrobial additives are used in order to prolong the shelf life and preservation of food. Consumers' skepticism towards these additives has increased because some of the additives used are unhealthy and can be carcinogenic and toxic depending on the usage rate. So, the acquisition and use of natural and reliable additives has become very important. Nowadays, there is increasing interest in the using of various plant extracts as antimicrobial agents to prevent microbial degradation and prolong shelf life. In this study antimicrobial properties of *Rhus L.* (sumac) and *Cinnamomum L.* (cinnamon) were investigated. Parsleys, obtained from the district bazaar, was washed with sumac and cinnamon extracts prepared in different concentrations. In the study, 6 applications (control (unwashed), 1%, 2.5% and 5% sumac and cinnamon extracts) were performed. Total aerobic mesophilic bacteria, coliform group bacteria, coagulase positive *Staphylococcus* bacteria, *Lactobacillus* spp. bacteria, yeast and mold counts, *Listeria* bacterium and *Salmonella* spp. were investigated in the obtained samples.

EVALUATION OF SPICE USE, STYLES AND FREQUENCY OF ADULTS

DUYGU AĖAGÜNDÜZ¹, NILÜFER ACAR TEK¹, GAMZE AKBULUT¹, MERVE PEHLIVAN¹

ABSTRACT

Aim: This research was conducted to evaluate the spice use, styles and frequency of adults aging between 18 and 64. **Material and Method:** The research was conducted on total 1125 (244 males – 781 females) adults aged between 18 and 64. Participants were asked to fill out a questionnaire form by means of face to face interview in order to determine their general characteristics of the participants and their spice use, consumption styles (adding to dishes, making tea or consuming in powder form) and frequency of consumption (every day, once a week, twice a week, three times a week). **Results:** 91.1% of the participants indicated that they use red pepper and add the spice to their dishes (98.9%) mostly. 54,7 of the participants use red pepper (1.37 ± 0.74 tea spoon) every day and 20.5% of them three times a week. 43.8% of the participants use black pepper (1.16 ± 0.61 tea spoon) every day, 24.0% of them three times a week and 14.8% of them twice a week. 99,1% of the participants using black pepper (85,8%) stated that they add the spice to their dishes. 97.0% of the participants using isot (Urfa pepper, 29.7%) add the spice to their dishes and 2.7% of them consume isot in powder form. Frequency of isot consumption is as follows: every day (23.1%), once a week (21.6%) and once a month (18.9%). On the other hand, thyme consumption frequency is 69.6% and participant generally add thyme (89.4%) to their dishes. Thyme is often consumed once a week (28.9%) and its average consumption amount is 1.22 ± 0.68 tea spoon. 54.8% of the individuals use cinnamon and 57,8 of cinnamon users prefer it in powder form. Additionally, cinnamon consumption (1.23 ± 0.60 tea spoon) frequency is once a month (33.0%), once a week (26.8%) and twice a week (12.7%). Locust consumption frequency of the participants is 3.6% and they consume the tea of locust mostly (55.0%). 10.4% of the participants mostly add rosemary to their dishes (50.4%) and make tea of it (4.5%). Rosemary is usually used once a month (29.4% - 1.35 ± 0.75 tea spoon). Fennel use frequency of the participants is 7.9%. In addition, fennel consumption frequency is once a month (38.2%), once a week (18.0%) and twice a week (13.5%). 12.2% of the participants use basil and mostly add it to their dishes (85.2%) and consume in powder form. Basil is monthly consumed once a month (40.1% - 1.68 ± 0.99 tea spoon). 58.5% of the participants using coconut (33.4%) consume it in powder form. The participants consume mostly once a week (33.0%) and average consumption amount is 1.60 ± 1.18 tea spoon. 71.4% of the participants consume mint (1.58 ± 1.16 tea spoon) by adding the spice to their dishes (90.2%), using it in powder form (7.2%) and making tea of the ground mint (2.6%). **Conclusion:** This research showed that most of the spices are consumed in dishes and consumption style, frequency and amount of each spice differs from each other.

DRUG INTERACTIONS WITH ST JOHN'S WORT

GAMZE YURTDAS¹, EFSUN KARABUDAK¹

ABSTRACT

St. John Wort (*Hypericum perforatum* L.) is a perennial plant belonging to the family Hypericaceae, which grows in Europe, Asia, North Africa and the United States and has golden blossoms of 30-90 cm height. In Turkey, it is known with the names such as union herb, sword herb, lamb shredder, yellow centaur, wing herb (1). St. John's wort is indicated to have sedative and astringent properties, and has been used traditionally for the treatment of excitability, neuralgia, brositis, sciatica, menopausal neurosis, anxiety, depression and as a nerve tonic, and in topical preparations for the treatment of wounds (2). It contains different groups of compounds such as hypericin, hyperforin and flavonoides. Hypericin and hyperforin are suggested to be responsible for its pharmacological activity (1, 2). Hyperforin induces cytochrome P450 3A4 (CYP3A4) and hypericin induces the intestinal drug transporter P-glycoprotein (P-gp). These mechanisms might dramatically affect the bioavailability of most of currently marketed drugs (3). St. John Wort has been shown to lower the plasma concentration (and/or the pharmacological effect) of a number of drugs including alprazolam, amitriptyline, cyclosporine, digoxin, fexofenadine, indinavir, irinotecan, methadone, nevirapine, simvastatin, tacrolimus, theophylline, warfarin, phenprocoumon and oral contraceptives (4). Induction of P-glycoprotein and/or cytochrome P450 (CYP) enzymes (particularly CYP 3A4) by St. John Wort could explain such pharmacokinetic interactions. Combining St. John's wort with serotonin selective re-uptake inhibitors and other antidepressants can cause serotonin syndrome and therefore should be avoided (4). As a result, St. John Wort represents a herbal medicine with a high potential for drug interactions. Some of such interactions may have serious clinical consequences. Therefore, clinicians and patients should be conscious of possible reductions in systemic bioavailability of conventional drugs when taken together with St John's wort. More research is required to ensure reliable information to guide clinical practice. 1. Hışıl Y, Şahin F, Omay S. VOLATILE OIL COMPOSITION OIL OF SCANDIX AUCHERI BOISS. (APIACEAE) FROM TURKEY

AZİZE DEMİRPOLAT¹, GULDEN DOĞAN¹, EYUP BAĞCI¹

ABSTRACT

Genus *Scandix* L. genus belonging to Apiaceae family is represented by nine taxons while eight of them are species. The analysis has led to the identification of 39 components comprising 98.0% of the oils. The essential oil yield was determined as 0.4 (v/w) and the main constituents of the essential oil were germacrene-D (22.3%), spathulenol (11.5%), 1,5-epoxy-salvial-4(14)ene (6.4%) and heptadecane (6.2%) and palmitic acid (5.7%). The essential oil *S. aucheri* has 40.2% sesquiterpenes, 33.8 % sesquiterpene hydrocarbons and 16.1% alkene and fatty acids. The results were compared with the results of the genus patterns and discussed in the Flora of Turkey. This study, reports the essential oils composition of the aerial parts of *Scandix aucheri* Boiss. From Elazığ/Turkey. The oil was extracted by using Clevenger apparatus and analysed by GC and GC/MS system.

KEYWORDS

Scandix aucheri, Apiaceae, 9,12-Octadecanoic acid, n-Hexadecanoic acid, Natural Product.

CHEMICAL COMPOSITION SCANDIX PECTEN VENERIS L. AND SCANDIX MACRORHYNCHA C.A. MEY (APIACEAE) ESSENTIAL OIL

AZİZE DEMİRPOLAT¹, EYUP BAĞCI¹

ABSTRACT

The *Scandix pecten veneris* L. commonly known as Shepherd's needle and *S. macrorhyncha*, which belongs to Apiaceae. The *S. pecten veneris* leaves showed highest to moderate activity against the studied microbial strains and anti-inflammatory. The present study revealed that the *S. pecten-veneris* leaves could be the potential sources of balance diet with significant biological potentials. The chemical composition of different parts of *S. pecten veneris* L. and *S. macrorhyncha* C.A. Mey. essential oils naturally grown in Turkey were analyzed by GC and GC-MS system. The qualitative and quantitative essential oil variation were also determined. The essential oil yields of *S. pecten veneris* were found as 0.3(v/w) in aerial part and 0.2 (v/w) in fruits. 19 constituents were identified and comprised 89.6 percentage of the total essential oil from *S. pecten-veneris* aerial parts, and identified 17 constituents comprised 87.7 % in fruit essential oil, respectively. The predominant compounds of the aerial part oil of *S. pecten-veneris*, palmitic acid (28.2%), spathulenol (19.6%), 1,5-epoxy-salvial-4(14)ene (7.2%) and caryophyllene oxide (5.4%) were the the main compounds and 9,12, Octadecanoic acid (6.7%), α -curcumen (6.2%), caryophyllene oxide (5.4%) were the major compounds in fruit. On the other hand, 10 constituents were identified and comprised 87.8 % of the total essential oil of *S. macrorhyncha* aerial parts. The main compounds in oil were palmitic acid (31.5%), 1-heptadecanol (25.2%), pentadecanoic acid (13.4%) ve 9-octadecanoic acid (12.6%). Fatty acid, sesquiterpene and saturated hydrocarbons were determined as significant compounds for the characterization of *S. pecten-veneris* and *S. macrorhyncha* essential oil. The results were discussed in view of the chemotaxonomy and natural products.

KEYWORDS

Scandix pecten-veneris, *S. macrorhyncha*, Essential oil, palmitic acid, spathulenol, oleic acid.

EFFECT OF NIGELLA SATIVE ON DYSLIPIDEMIA

GAMZE YURTDAS¹, NILÜFER ACAR TEK¹, GAMZE AKBULUT¹, TUĞBA TATAR¹

ABSTRACT

Dyslipidemia is a wide term covering diverse lipid and/or lipoprotein abnormalities [1]. The main findings of this disorder include elevated plasma concentrations of total cholesterol (TC), low-density lipoprotein cholesterol (LDL-C) and triglycerides (TG), and low concentrations of high-density lipoprotein cholesterol (HDL-C) [1]. Dyslipidemia is an important risk factor for cardiovascular disease, the leading cause for morbidity and mortality among patients [2]. There is growing interest in finding safe natural alternatives to common drugs used to treat dyslipidemia, specially in patients resistant to or intolerant of statins [3]. *Nigella sativa* (*N. sativa*), popularly known as black seed, is one of these safe plants used as an herb for more than 2000 years and has been shown to produce multi-systemic beneficial actions, including hypoglycemic, hypocholestermic, and antioxidant effects. It contains numerous biologically active constituents such as thymoquinone (TQ), flavonoids, sterols, and polyunsaturated fatty acids and the lipid-lowering effect is likely mediated by a synergistic action of its different components [3]. Several studies on *N. Sativa* demonstrated improvement in serum lipid levels including decrease in total lipids, TG, low-density lipoprotein (LDL) and increase in high-density lipoprotein (HDL) levels [4, 5]. For instance, dietary supplementation of *N. Sativa* seeds (400–600 mg/ kg) for 1, 2 or 4 weeks is useful in the prevention and treatment of the hyperlipidemia and hypercholesterolemia [5]. Bhatti et al. indicated that oral administration of powdered black seeds (1g/day) to hypercholesterolemic patients for 2 months significantly decreased the total cholesterol, TG, and LDL-C levels and increased the HDL-C level [6]. Bamosa et al. observed an important effect of six different doses of thymoquinone on blood lipids in rats [7]. The effects dyslipidemic of *N. sativa* and TQ may be related to the significant decrease in hepatic HMG-CoA reductase activity, increase in arylesterase activity, regulatory effects on genes that influence cholesterol metabolism, as well as antioxidant mechanisms [4]. As a result, *Nigella sativa* and thymoquinone appear as effective and safe natural treatments for patients with dyslipidemia.

THE BIOLOGICAL ACTIVITIES AND ESSENTIAL OIL COMPOSITION OF SALVIA KURDICA

HILAL SARUHAN FIDAN¹, IŞIL AYDIN², ESRA YARIŞ³, EVİN AYGÜN TUNCA³, GÖKHAN ZENGİN⁴, MEHMET FIRAT⁵, MEHMET BOĞA⁶, ABDULSELAM ERTAŞ³

ABSTRACT

The genus *Salvia* L. (Lamiaceae) comprises about 900 species world-wide, while it is presented with 89 species and 94 taxa in Turkey, approximately half of which are endemic. Anatolia is the major gene center in Asia. *Salvia* species, known as “adacayi” in Anatolia, are used in folk medicine for the treatment of a variety of diseases, including infectious diseases. They are used as antiseptics, stimulants, diuretics and for wound healing in Turkish folk medicine and for herbal teas. *Salvia fruticosa* and *Salvia tomentosa*, which have similar chemical composition and effects with the medicinal species (*Salvia officinalis* L.), are preferred in Turkey beside of *S. officinalis*. The essential oil of *S. fruticosa* is used traditionally as carminative, stomachic, antiperspirant and diuretic. Due to several studies indicating antimicrobial, antifungal and antioxidant activities of *Salvia* species, especially *S. officinalis*, similar studies on these species increased gradually all over the world. The aim of this study was to determine the essential oil profile of *Salvia kurdica* by GC/MS. Additionally, the essential oil of this *Salvia* was tested for antioxidant (DPPH, Beta Caroten Cuprac, ABTS) and anticholinesterase activities. The main constituents of *S. kurdica* were identified as Linalool (26.4%), Geranyl acetate (22.4%) and trans-Linalool oxide (furanoid) (9.1%). The essential oil of *S. kurdica* exhibited moderate antioksidant and good anticholinesterase activities. Acknowledgements: The research was funded by grant : KBAG 114Z801 from TUBITAK, The Scientific and Technological Research Council of Turkey.

THE ESSENTIAL OIL ANALYSIS OF SOME SALVIA SPECIES FROM ANATOLIA WITH CHEMOMETRIC APPROACH

ÖZGE TOKUL ÖLMEZ¹, ABDULSELAM ERTAŞ², HILAL SARUHAN FIDAN², MEHMET FIRAT³, MUSTAFA ABDULLAH YILMAZ⁴, GÖKHAN ZENGİN⁵, MEHMET ÖZTÜRK¹, HAMDİ TEMEL⁴, UFUK KOLAK⁶

ABSTRACT

The genus *Salvia* L. a member of the Lamiaceae family grows naturally all over the world with more than 900 species. Lamiaceae family have been interested since many of the Lamiaceae species include essential oils which are used in perfumery and pharmaceutical industries. Medicinal plants having biological activity have been used in the treatment of a variety of diseases since ancient times. PCA is one of the best multivariate statistical techniques for extracting linear relationships among a set of variables. PCA is a set of widely used analytical techniques whereby a complex dataset containing variables is transformed to a smaller set of new variables, which maximize the variance of the original dataset. PCA provides information on the significant parameters with minimum loss of original information. This is achieved by transforming to a new set of variables which are uncorrelated, and which are ordered so that the first few retain most of the variation present in all of the original variables. The principal components are generated in a sequentially ordered manner with decreasing contributions to the variance, i.e. the first principal component (PC1) explains most of the variations present in the original data, and successive principal components account for decreasing proportions of the variance. In this study, Principle Component Analysis (PCA) and Hierarchical Clustering Analysis (HCA) were performed with 13 variables in 8 samples. As a result of the PCA analysis with 8 samples and 13 volatile oil components, the first three principal components explained the variance as 85.3%, 1st principle component as 44.6% and 2nd. principle component as 28.1%. Statistical calculations were performed using Minitab 16.2.1 statistical software (MINITAB Inc. 2010). *Salvia* species collected at different times in the study were evaluated with 13 volatile oil components.

DETERMINATION OF CONSTANT OIL COMPONENTS OF NIGELLA ARVENSIS VAR. GLAUCA SPECIES NATURALLY GROWING IN FLORA OF KAHRAMANMARAS

OSMAN GEDİK¹, YUSUF ZIYA KOCABAŞ², ÖMER SÜHA USLU¹, ALI RAHMI KAYA¹, ADEM EROL¹, MUHAMMAD
AZIM KHAN³, WALID SOUFAN⁴

ABSTRACT

Black sesame (*Nigella* sp.) is a one-year herbaceous plant belonging to the family Ranunculaceae (wedding flowers). Its origins are based on the Eastern Mediterranean, Southern Europe and West Asia. The genus *Nigella* is represented by about 20 species from the Mediterranean region to Western Asia and comprises about 13 species in Turkey. There is %32-40 fixed fat, %16-19.90 protein, %33.90 carbohydrate, %5.50 saponins, alkaloids and fibers, %1.79-3.44 tannins and minerals in the seeds of Turkey, as well as differences according to the regions. In fixed oil, unsaturated fatty acids include linoleic acid, oleic acid and linolenic acid while saturated fatty acids include palmitic acid, stearic acid and myristic acid. *N. arvensis* var. *glauca* is spreading naturally in Kahramanmaraş Sutcu Imam University Avşar Settlement. In this study totally twenty different fatty acid components was determined. Primarily fixed fatty acids components and ratios of the species *N. arvensis* var. *glauca*; linoleic acid (%68.11), oleic acid (%12.00), palmitic acid (%10.88), cis-11,14-eicosadienoic acid (%2.90), stearic acid (%2.36), gamma- linolenic acid (%1.59), myristic acid (%0.23) were detected.

SOME VEGETABLE OILS USED IN WOUND CARE AND THEIR EFFECTS ON WOUND HEALING

FIGEN EROL URSAVAŞ¹, SEHER GÖNEN ŞENTÜRK¹

ABSTRACT

Aromatherapy, a complementary treatment alternative, refers to use of essential oils derived from different parts of plants (leaf, flower, bark, seed, fruit etc.) for health and wellbeing purposes. These oils are applied through respiratory tract, skin and oral route. It is known that essential oils are utilized in mother and child health, pain management, care for cancer patients, treatment of skin, neurological, respiratory and gastrointestinal diseases, wound healing/care and mental health. It has been shown in the literature that essential oils used in wound care accelerates healing. Health professionals play an important role in development and use of wound care products containing essential oils which quicken wound healing. Purpose of this study is directed towards examination of essential oils which quicken wound healing and their uses, at the same time, to create awareness in this matter. It has been shown in the literature that essential oils (tea oil, lavender oil, canola oil, St. John's Wort oil, olive leaf extract, beeswax-olive oil) have effects on wound healing. Tea oil has antimicrobial features. Wound dressing with tea tree oil every day three times a week has been found to have effects on healing of MRSA positive wounds. Episiotomy is a surgical incision made during vaginal delivery. A study comparing bathing with 5-6 drips of lavender oil in 4-liter water and bathing with povidone iodine for 10 days did not reveal any differences in terms of wound healing complications, but showed less redness in episiotomy wounds exposed to lavender oil. In a study examining effectiveness of canola oil and lavender honey in wounds created in rats, canola oil applied through a syringe two times for the first four days was found to be more effective than lavender honey applied in the same way. In a study on effects of a wound care product containing beeswax, olive oil and alkanna tinctoria on the second-degree burns, wound dressing was made with the product every day and it was found to be effective. St. John's Wort is a plant used in treatment of several diseases. Applying St. John's Wort on wounds created on rats once daily was found to be effective in soft tissue defects. Olive leaves have tannin, essential oils, organic acids and resin. Using topical olive oil extract on diabetic wounds in rats for 21 days was shown to accelerate wound healing. Aromatherapy/essential oil use, a complimentary therapy, plays a part in improving health and wellbeing and influences nursing care having a key role in wound care. In studies conducted that essential oils have been found to have a beneficial effect on wound care. Studies have revealed that they have impact on wound healing. In light of the literature, it can be recommended that randomized controlled studies should be performed to evaluate effects of wound care products made from essential oils on types of wound in Turkey.

ANTICARCINOGENIC EFFECTS OF FERMENTED WHEAT GERM EXTRACTS

HAKAN VATANSEV¹, MUSTAFA KÜRŞAT DEMİR²

ABSTRACT

Fermented wheat germ extract (FWGE) is a natural product obtained by fermentation of wheat germ and registered as a special nutrient in Hungary for cancer patients in 2002. According to some researches in recent years, quinones found as glycosides in wheat germ are thought to be responsible for some biological properties of FWGE. FWGEs production process includes fermentation of this extract by *Saccharomyces cerevisiae*, separation, drying and granulation of the fermentation liquid. FWGE is available without prescription from pharmacies and the effects are versatile. They are reported to show no toxicity, mutagenicity or genotoxicity. In particular, the role of cancer prevention and treatment has come to the forefront with its various aspects. Compared to normal tissues, cancer cells exhibit a hypermetabolic state with high amounts of glucose use while FWGEs inhibit cancer growth by inhibiting glucose uptake in cancer cells. In cell culture studies in which the antitumoral effect of FWGE is examined; It has been demonstrated that they have potential antitumoral activity in the colon, testis, thyroid, ovary, non-small cell lung, breast, gastric, head and neck, hepatoma, glioblastoma, neuroblastoma, melanoma, cervical cancer cell lines.

KEYWORDS

FWGE, cancer, antitumoral effect.

THE ANTICHOLINESTERASE ACTIVITY AND TOTAL PHENOLIC CONTENT OF ESSENTIAL OILS OF SOME SALVIA SPECIES FROM ANATOLIA

HATICE ÇAKIRCA¹, ABDULSELAM ERTAŞ¹, MEHMET FIRAT², İŞİL AYDIN³, ESRA YARIŞ⁴, MEHMET VEYSİ ÇAĞLAYAN⁴, MEHMET AKDENİZ³, İSMAIL YENER³, HÜSEYİN ALKAN⁵, GÜLAÇTI TOPÇU⁶

ABSTRACT

Salvia L. (Lamiaceae) species consists of about 900 species distributed throughout the world. In Turkey, this genus is represented by 100 species, 53 (53%) of which are endemic. The genus is named “*Salvia*”, derived from latin “*Salveo*”, means “save, or recover”. Many of *Salvia* species are named “*adaçayı*” in Anatolia, Turkey, and used as herbal tea due to their antiseptic, stimulant, diuretic and wound healing properties. *Salvia* species are generally known for their multiple pharmacological effects including their antibacterial, antiviral, antioxidative, antimalarial, anti-inflammatory, antidiabetic, cardiovascular, antitumor and anticancer. Also, some studies showed that a part of these activities depended on essential oil composition. The essential oils of some *Salvia* species were tested for anticholinesterase (Acetyl- and butyrylcholinesterase enzymes) activities and total phenolic content in our study. Essential oil samples were obtained by a Clevenger apparatus from the whole parts of plants which were crumbled into small pieces and soaked in distilled water for 3 h. Then, these samples were dried over anhydrous Na₂SO₄ and stored at +4°C for a sufficient period of time. The essential oils of studied four *Salvia* species were determined the similar results as total phenolic content. The acetyl- and butyrylcholinesterase enzyme activities of *S. macrochlamys* (88,68±3,60 and 104,34±4,25 respectively) were determined as high. The essential oils of *S. sclarea* and *S. palaestina* were showed a good activity in butyrylcholinesterase enzyme.

ANTIFUNGAL EFFECTS OF SOME PLANT EXTRACTS ON KASHAR CHEESE

GÖKHAN AKARCA¹, MUHAMMED YUSUF ÇAĞLAR², AYŞİN KAHRAMAN¹

ABSTRACT

Cheese, which is a milk product rich in protein, fat and minerals, has had a significant place in the diet of all societies for centuries. A large number of varieties of cheese are produced and consumed in our country. One of them is the kashar cheese which is in the cake-filata class. In its production, there are production steps such as fermentation, coagulation, ripening of the clot, processing and salting. After these stages, it has a long ripening phase so that it can possess its sensory, physical and chemical properties until the consumption phase. During this ripening phase, the surface of the cheese is completely covered with mold. Mold growth on the surface causes quality loss, discoloration, bad odor and aroma disorders. Besides, due to the toxic metabolites, mycotoxins, which they develop on the surface, molds can lead to poisoning which can result in death when the cheese is consumed. Although these toxins are more dense in the 1-2 cm surface layer of the cheese, they can also migrate to the interior. For this reason, the problem of mold must be avoided. Various methods are used to solve this problem. One of these methods is to try to mechanically clean the crust layer by chewing with a brush and water and sometimes even with a knife while the cheese is being consumed. However, this process can not solve the health and quality problems caused by molds. Other methods of preventing molds are known to be the use of preservatives (antifungal) and special packaging methods. The use of antifungal agents is intended to prevent quality losses and deterioration reactions, prolong shelf life and maintain sensory properties. For this purpose various plant extracts are used as antifungal agents. Within the scope of the study, the fresh kashar cheese produced is covered with prepared sage, locust, thyme, cinnamon and ginger alcohol extracts. The study was carried out with 6 designation (control, sage, carob, thyme, cinnamon and ginger extracts x 3 time (day 0, day 7, day 15) trial design. At the end of storage, the number of yeast-molds on the surfaces of the samples was determined. According to the obtained data, it is thought that the plant extracts used prevent the growth of mold on the surface of kashar cheese and it is advisable to use vacuum packaging as an alternative packaging material for covering the natural plants with kashar cheeses.

SAGE (SALVIA OFFICINALIS L.)

TESLİME EKİZ¹, OKTAY TOMAR¹, MEHMET KILINÇ¹

ABSTRACT

The *Salvia* species belonging to the Lamiaceae family consist of approximately 900 species that are common worldwide and exhibit significant morphological and genetic diversity relative to their geographical origins. In many studies, it has been reported that sage species have pharmacological properties such as antioxidant, antiinflammatory, analgesic, antipyretic, hemostatic, hypoglycemic and antitumor effects. *Salvia officinalis* L., which is called as medical sage, is a plant with fringing roots and a length of 60-100 cm. Leaves are whitish gray and silver colored and furry. This aromatic plant contains essential oil. Among people in our country; it is widely consumed in the form of herbal tea because it is thought to have some important medical effects such as cutting nausea, reducing abdominal pain, digestion regulation, relieving rheumatic pain, improving tongue and gingivitis, protecting liver, cleansing blood and lowering blood pressure. Apart from that, cosmetics, perfumery, pharmaceutical industry are in use. In food industry, besides giving flavor to products, it is a spice with widespread use as an alternative to synthetic and chemical antimicrobial and antioxidant substances.

USE OF OCIMUM BASILICUM L. IN FUNCTIONAL FOOD PRODUCTION

MEHMET KILINÇ¹, TESLİME EKİZ¹

ABSTRACT

The *Ocimum* genus contains over 150 species and is considered the largest genus of the Lamiaceae family. *Ocimum* spp. contains essential oils rich in phenolic compounds and other natural products in a wide range including polyphenols such as flavonoids. This genus *Ocimum basilicum* L. species is an important spice and essential oil plant that grows in various parts of the world. This medicinal and aromatic plant is originated from North East Africa, North West India and Central Asia. Among the people in our country is known as 'fesleğen' and 'reyhan'. The length of grown up basil is usually between 20-60 cm. It has soft leaves in the length of 1-5 cm, width of 1-3 cm. There are many basil varieties which vary according to leaf color (green or purple), flower color (white, red, purple) and aroma. There are oil glands forming characteristic aromatic smell in plant leaves and flowers. Basil contains 0.2-1% essential oil and the content of essential oils in different basil cultures is also different. Along with essential oil, it is reported that this plant contains 14% protein, 6.1% carbohydrates and high vitamin C and vitamin A content. Fresh flowering branches and seeds of this plant, which is cultivated and traded in our country, are used. Basil, which has high aromatic character, is widely used both as fresh and dried food spice in Turkish cuisine. Apart from this, the plant also finds use in food products, oral care products and cosmetic industry. Among people in our country; it is consumed for various purposes such as gas remover, appetizer, and digestion facilitator. In addition, in some studies, it has been reported that basil leaves have tonic, antiseptic and insecticidal properties and this plant has antiviral, antimicrobial and antioxidant activities. In addition to these mentioned properties, by examining the benefits of the proprietary aroma especially for human health; It is thought to be an alternative plant for the production of new functional food products. There are various studies on the use of basil in functional food products and it is considered that different studies should be done in the development of new functional food products.

USE OF SOME PLANTS WITH ANTIBACTERIAL AND ANTIFUNGAL PROPERTIES IN THE CONSERVATION OF SUCUK

TESLİME EKİZ¹, OKTAY TOMAR¹

ABSTRACT

Meat is a valuable food material with its nutrients such as minerals, vitamins, essential fatty acids and its odor, taste and aroma properties. Thanks to these nutritious ingredients, it has an extremely important place among the elements of balanced nutrition in human life. Due to its high moisture content, nitrogenous nutrients, minerals and other growth factors, the meat becomes suitable for many microorganisms to grow rapidly and for deterioration in a short time. Since ancient times, various methods have been used, such as drying and fermentation processes, in order to impart different flavor and aroma to the meat and increase the period of preservation of the meat which is degradable in a short time. Thus, many meat products appeared in different flavor, structure, color and appearance. One of these products is 'sucuk'. Sucuk is an important meat product that has been produced and consumed in our country since ancient times. Various microbial spoilage can be seen in sucuks, because of the reasons like; having high pH and moisture content after production, not being transported under cold chain and not being kept in cold. Mold growth on sucuk surface, which is one of these microbial spoilages, is a serious problem in the industry. Chemical preservatives are frequently used in the food industry to prevent this problem. But, the consumer's skeptical attitude towards chemical additives and their interest in natural functional food products are increasing day by day. As a result, efforts are being made to search for natural antimicrobial agents that can be used to prevent microbial spoilage and extend shelf life. For this purpose, various plants such as *Thymus vulgaris* L., *Ocimum basilicum* L., *Cuminum cyminum* L., *Origanum majorana* L., *Foeniculum vulgare* Miller., *Terminalia chebula* Retz. extracts, extract mixtures, and essential oils have been investigated for their antibacterial and antifungal effects. The increasing demand for natural and healthy food reveals the necessity of carrying out more detailed scientific studies in the following period.

NATURAL PHARMACY: CLOVE (SYZYGIUM AROMATICUM)

OKTAY TOMAR¹, MEHMET KILIÇ¹, ABDULLAH ÇAĞLAR¹

ABSTRACT

Clove (*Syzygium aromaticum*) is one of the oldest and most valuable spices in the world and is among the most traded medical and aromatic plants. The clove which the Southern Philippines and the Molluk Islands are its mainland, are cultivated in all tropical countries today and are produced mostly in Indonesia, Tanzania's Zengibar and Pemba Islands. Clove has a strong aroma, sharp smell, burning, bitter pungent flavor; it contains 15-20 % volatile oil. The main component of this volatile oil is eugenol, which is present in about 75-90% of the main component in the phenolic structure, which gives the typical aroma of clove to its therapeutic properties. Eugenol in the clove is a phenolic substance giving antiseptic, bacteriostatic, bactericidal, analgesic, antifungal properties. Clove is mainly used in food, pharmaceutical and also widely used in the fields of perfumery and cosmetics fields. Many scientific studies have been conducted on cloves; they show that it is a medicinal and aromatic plant which is effective in various fields such as antiseptic, antifungal, antiviral, local anesthetic, antioxidant, antimicrobial, antithrombotic, antiinflammatory, anticarcinogenic, diarrhea, digestive system disorders. It is also used in the treatment of many diseases such as ulcers, wounds, arthritis, rheumatism, sprains, asthma, bronchitis, nausea, minor infections and antispasmodia in dental infections, mouth perfumes and toothpastes in folk medicine. In the past, clove has been used in the treatment of many diseases among the public, and also many medical features have been discovered today. It is thought that clove is a natural and effective alternative to synthetic drugs by carrying out more scientific studies on these properties of human health. It is also widely used in the food industry to enhance the flavor and aroma of food. On the other hand, there is a need for new research on cloves to ensure food safety in food production processes and to increase the functionality of food.

ROSELLE (HIBISCUS SABDARIFFA L.): EFFECTS ON HEALTH

SEDEF AYDIN¹, GÖKHAN AKARCA¹, DUYGU ERCAN ORUÇ¹

ABSTRACT

About 300 species of the genus *Hibiscus* are used in various applications. Roselle belongs to the family Malvaceae and is one of the most consumed species of hibiscus. It is an important annual crop grown in tropical and subtropical climates, called 'kerkeda' in the local area. *Hibiscus sabdariffa* L. is used in food, animal feed, cosmetics, nutraceuticals and medicines. It is widely consumed in the form of herbal tea, jelly and jam. The bright red color and unique flavor make it a valuable product. The most important part of the plant is considered to be the sepals surrounding the fruit. Calyces, stalks and leaves have sour aroma. It is thought that fruit juice obtained from sepals is a healthy drink because of high vitamin C, anthocyanin and antioxidant content. Seeds are low in cholesterol, other phytosterols and tocopherols in β -sitosterol and γ -tocopherol. Pharmacological investigations of the *H. sabdariffa* L. line revealed the biological activity of this plant. Some of the therapeutic effects of consuming Roselle, especially in tea form are antioxidant, anticarcinogen, antipyretic, antidiarrheal, antiinflammatory, antitumor, antibacterial, antifungal, antiparasitic, anticholesterol effects, digestive regulator and support for kidney function. The fact that it is rich in anthocyanins makes gives this plant a good antioxidant source as well as gives it a good color appearance. Roselle plant's numerous medical applications are developing worldwide. The biological activity of anthocyanins such as antioxidant activity, which protects against atherosclerosis and anticarcinogenic activity, has been investigated and found to have positive effects on the treatment of diseases. Besides, it has been determined that the sepal extract of *Hibiscus sabdariffa* plant has therapeutic effect against leukemia due to high polyphenol content. The result of phytochemical and pharmacological studies is that Roselle has a positive effect on the treatment of many diseases, suggesting that the work to be done on this field will be carried out on a broader scale.

AVOCADO'S COMPOSITION AND POSITIVE EFFECTS ON HEALTH

GÖKHAN AKARCA¹, SEDEF AYDIN¹, MUHAMMED YUSUF ÇAĞLAR²

ABSTRACT

Avocado (*Persea americana* Mill.) is a green and perennial plant belonging to the family Lauraceae, which is produced in about 50 countries, including the USA and Mexico. The avocado fruit is considered as 'functional food' because of its beneficial effects on health. Avocado's oil has great importance on the occurrence of its own flavor and aroma. It has a similar chemical composition with olive oil which has an important place in Mediterranean diet. Studies have shown that avocado oil contains higher levels of vitamin C, β -sitosterol and chlorophyll, and lower levels of squalene and polyphenol than olive oil. Avocado, an essential nutrient and serving as an exogenous antioxidant, contains more lipolytic extract, C and E vitamins than other fruits. In addition, it contains monounsaturated fatty acids, folate and B6 vitamins and phytosterols, which reduce the level of low-density lipoprotein cholesterol (LDL) in the blood. These and similar compounds obtained from avocado avocado oil and pulp are functioning as bioactive substances. Avocado, which is among the fruits that have the highest concentration of phytosterols, assumed as the major bioactive group, is especially rich in β -sitosterol, the main sterol. The most apparent effect of phytosterols on cardiovascular disorders has been determined to cause a decrease in cholesterol levels through the inhibition of intestinal fat. In vitro and in vivo studies have been found that increased consumption of avocado on a daily diet significantly reduce the risk of cardiovascular disease, osteoarthritis, cancer, obesity, and inflammation. In addition, it has been reported that D-Mannoheptulose (MH), which is contained in avocadonin, has an aging-retarding effect and is used as a potential treatment for hypoglycemia. Given the positive health effects of avocado-enriched diets, studies using avocado and avocado-derived products are predicted to accelerate significantly in the coming years.

THE BENEFITS OF BLACKCURRANT (*RIBES NIGRUM* L.) FOR HEALTH

ABDULLAH AĐLAR¹, HÜLYA VATANSEVER¹, ELIF EKMEKÇİ¹

ABSTRACT

Blackcurrant (*Ribes nigrum* L.) which is native to Europe and Northern Asia is a perennial plant with edible, small, dark purple (near-black) colorful fruits. Its fruits and leaves have been used for a variety of health problems in traditional plant medicine in Europe and Asia. Blackcurrant is a rich source of anthocyanins, which are vitamin C and natural food coloring. It is also known that it has a higher antioxidant capacity compared to other widely consumed berry fruits. Black currant seeds are rich in α -linolenic acid and γ -linolenic acid, which play an active role in growth, healthy bone development, development of normal brain function and regulation of metabolism. Blackcurrant fruits contain polyphenolic compounds with antioxidant, anticarcinogenic, antibacterial, antimicrobial and antiviral properties. Thanks to these properties of polyphenols, many functions of the organs and especially the nervous system, digestive system and circulatory system are protected and supported. Anthocyanins (delphinidin-3-glucoside, delphinidin-3-rutinocyte, cyanidin-3-glycoside and cyanidin-3-rutinocyte), the basic polyphenols of the fruit extract, are used in the treatment of eye defects and eye diseases. In addition, blackcurrant extracts inhibit the development of cardiovascular diseases, certain types of cancer, and chronic inflammation-related diseases. Quercetin derivatives found in black currant leaves have a range of activities including antimicrobial, anti-inflammatory, antiviral, antitoxic, antiseptic and antioxidant effects. Studies have shown that because the extracts from fruits, buds and leaves of blackcurrant destroyed the free radicals by fighting them and increased body resistance against many diseases, their use should be widespread and increased.

A HERB WITH AROMATIC TASTE AND PLEASANT ODOUR: COFFEE

ELIF EKMEKÇİ¹, MUHAMMED YUSUF ÇAĞLAR², DUYGU ERCAN ORUÇ¹

ABSTRACT

The coffee of the Rubiaceae family, first time seen in the Kaffa region of Abyssinia, it is mind stimulant and one of the most popular beverages in the world with an aromatic taste. There are over 90 different types of coffee. Coffee; until phase of consumption, it is passed from five stage such as the maturation of the seeds, the collection, the separation of the crusts, the roasting and the grinding. Coffee is a drink rich in antioxidants, phenolic and aroma components. The green coffee bean is rich in antioxidants and phenolic compounds and contains high levels of chlorogenic acid. But green coffee beans are very poor in flavor. Therefore, the green coffee beans are roasted at different times and temperatures to produce complex polytic reactions, thereby improving the taste and flavor of the desired coffee. The most important factor in the aroma and flavor of the coffee is the degree of roasting coffee beans. The roasted coffee has a very attractive and unique aroma. The most known bioactive component of coffee is caffeine. Coffee, contains many chemical components such as caffeine and chlorogenic acid. Due to these compounds, it has been stated that coffee have properties such as improving mental and physical performance, increasing alertness. It was also found that the chlorogenic acid in coffee is exhibited a high bioavailability and that 30% of the received chlorogenic acid is excreted as metabolites within 24 hours. Studies have shown that some of these metabolites at low μM concentrations have neuroprotective properties. Studies conducted on decaffeinated, roasted coffee have showed that coffee contain proadenosine, antimorphan and antioxidant compounds exhibiting activity in brain. Studies, which were conducted in recent years, have been reported to show a positive effect of coffee on diseases such as Parkinson's, Alzheimer's, etc.. Studies have shown that coffee may prevent the development of Alzheimer's disease because picolinat detected in coffee increases zinc absorption and L-rhamnose and fumarate in coffee show high antioxidant activity. Decaffeinated coffee has been shown to reduce the risk of diabetes. Chlorogenic acids affect the absorption and utilization of glucose. It has been also found that there are positive effects on liver health and liver function. Various studies are needed in this regard.

THE EFFECTS ON HUMAN HEALTH OF KIWIFRUIT

ABDULLAH AĐLAR¹, ELİF EKMEKÇİ¹, HÜLYA VATANSEVER¹

ABSTRACT

There are a wide variety of species and forms of kiwifruit which are native to China. Among these species, *Actinidia deliciosa* ('Hayward') and *Actinidia chinensis* ('Hort16A') are the most significant two species with commercial importance. During fruit maturity, the fruit color of *Actinidia deliciosa* is green while the fruit color of *Actinidia chinensis* is yellow. At the beginning of the 1900's, the kiwifruit was not cultivated much outside of China, it was started to be grown in various countries after these years. The promotion and adaptation studies of kiwifruit were made in 1988 in our country. In 1994, our country entered agricultural statistics data. The largest share of the kiwifruit production area in our country is the Black Sea Region. Kiwifruit; in addition to consumption as fruit, it is also used in canned food, fruit juice, fruit yogurt, marmalade, jam, frozen or dried food, tea, cake sauces, ice cream, pudding, wine, shampoo, soap and cosmetics. Kiwifruit is determined that it is a fruit rich in phenolic compounds (anthocyanins and flavanoids), vitamins (vitamins C, B2, A and E), antioxidant components, minerals (potassium, iron, phosphorus, calcium, chromium, copper and magnesium) and carotenoids (xanthophyll, beta carotene and lutein). Kiwifruit; because of the high nutritional content, high vitamin C content and low calorie levels, it is expressed as a health fruit. The green kiwifruit fruit in 100 g fresh weight contains on average 85 mg ascorbate (vitamin C). Kiwifruit has 3 times more vitamin C than orange. Like most fruits, although the kiwifruit contains water at high concentrations, it contains vitamin E in higher concentrations than many other fruits. Vitamins C and E, which are from antioxidants and are highly present in the contents of kiwifruit, prevent blockage of arterial vessels. As a result of epidemiological, pharmacokinetic and metabolic studies, it has been reported that the intake of vitamin C contributes to prevent certain cancers, cardiovascular diseases, diseases related to upper respiratory tracts such as influenza and colds. Studies have determined that kiwifruit improves intestinal and digestive health, alleviates constipation, strengthens immunity, regulates lipid profile, improves iron uptake, improves DNA repair activity and reduces platelet aggregation. The proteolytic enzyme actinidin, found in green kiwifruit, has been shown to help digest food proteins, and kiwifruit consumption has been found to increase the number of appropriate probiotic strains. In addition, recent studies have been determined that the sleep-inducing properties of the kiwifruit are present. The most dense carotenoids found in the kiwifruit are β -carotene and lutein, which are considered as strong antioxidants. The lutein from the carotenoids is important in the maintain of the vision. Kiwifruit has the highest lutein content among commonly consumed fruits. Even though kiwifruit contains useful bioactive compounds, it contains some compounds such as allergens and oxalate that may be harmful to health. The actinidin enzyme found in kiwifruit is allergic to some people. The amount of oxalate present in the kiwifruit is not a concern for individuals who sustain a balanced diet.

A-AMYLASE AND α -GLUCOSIDASE INHIBITORY ACTIVITIES OF THE EXTRACTS AND CONSTITUENTS OF FERULAGO BRACTEATA ROOTS

SONGÜL KARAKAYA¹, SEFA GÖZCÜ¹, ZÜHAL GÜVENALP¹, HILAL ÖZBEK¹, HAFİZE YUCA¹, BENAN DURSUNOĞLU¹, CAVIT KAZAZ², CEYDA SİBEL KILIÇ¹

ABSTRACT

Context: Ferulago species have been used since ancient times for the treatment of intestinal worms, hemorrhoids and as tonic, digestive, aphrodisiac and sedative. Apart from its medicinal uses, they have been used as salad or spice due to their special odors. Objectives: This study reports α -amylase and α -glucosidase inhibitory activities of extracts and bioactive compounds isolated from the roots F. bracteata. Material and methods: The structures of isolated compounds through in vitro bioassay-guided fractionation processes from the roots of F. bracteata were elucidated by detailed analyses of 1D and 2D NMR and ESI-MS data. Results: A new coumarin, peucedanol-2'-benzoate (1), along with nine known ones, osthole (2), imperatorin (3), bergapten (4), prantschimgin (5), grandivitol (6), suberosin (7), xanthotoxin (8), felamidin (9), umbelliferone (10), and a sterol mixture consisted of stigmasterol (11), β -sitosterol (12) was isolated from the roots of F. bracteata. Felamidin and suberosin showed significant α -glucosidase inhibitory activity with 0.42 and 0.89 mg/mL IC₅₀ values, respectively, when compared to the reference standard acarbose (IC₅₀ 4.95 mg/mL). On the other hand, none of the tested extracts were found to be active on α -amylase inhibition. Discussion and conclusion: The present study demonstrated that among the compounds isolated from CH₂Cl₂ fraction of F. bracteata roots, coumarins were determined the main chemical constituents of this fraction. This study aims to give first report on isolation and characterization of the bioactive compounds from root extracts of F. bracteata and to report α -amylase and α -glucosidase inhibitory activities of this species. Keywords: Ferulago bracteata; Apiaceae; α -glucosidase; α -amylase; coumarin; peucedanol-2'-benzoate.

ASSOCIATION OF PROBIOTIC AND PREBIOTICS WITH INSULIN RESISTANCE, INTESTINAL PERMEABILITY AND ZONULIN ASSOCIATED WITH POLYCYSTIC OVER SYNDROME

ELİF ÇELİK¹, GAMZE AKBULUT¹

ABSTRACT

Polycystic ovarian syndrome is the most common endocrine disorder of women in reproductive age in the world. According to the National Institute of Health (NIH) prevalence is reported as 6-10%, while prevalence according to Rotterdam criteria is reported as 15%. Insulin resistance, obesity, dyslipidemia are complications associated with PCOS. In particular, insulin resistance is one of the most important complications associated with PCOS. Many factors affecting insulin resistance are addressed in PCOS and also intestinal permeability is one of these factors. Disruption of the gut microbiota by various factors may lead to increased intestinal permeability, which may lead to lower levels of inflammation and the development of chronic inflammatory diseases. Increased intestinal permeability is associated with factors such as menstrual disorder, obesity, insulin resistance, and dyslipidemia. Zonulin is a parameter that shows the change in intestinal permeability. Intestinal permeability is associated with an increase in the level of zonulin. Individuals with PCOS have increased levels of zonulin and are linked to insulin resistance. Probiotics and prebiotics are shown in many studies in relation to obesity, insulin resistance and intestinal permeability. They may be effective on PCOS-related parameters. A number of studies are carried out on the effects of probiotics and prebiotics on insulin resistance, obesity and intestinal permeability, but there are few studies directly affect on polycystic over syndrome . Probiotic supplementation on women with PCOS significantly effect fasting plasma glucose, serum insulin concentration, insulin resistance, β -cell function, and serum triglyceride levels and may have beneficial effects on PCOS symptoms . Similarly, probiotics effective on intestinal permeability and zonulin. In addition to probiotics, prebiotics are affect gut microbiota, insulin resistance and intestinal permeability. In this way, both prebiotics and probiotics may be effective on PCOS-related symptoms. However, increasing the study done directly on individuals with PCOS will help to ensure that this relationship is shown.

FATTY ACID COMPOSITION OF CHLORELLA VULGARIS GROWN IN OPEN POND

YUSUF CAN GERÇEK¹, YIĞIT SABRİ ÜNLÜ¹, EHSAN SARAYLOO¹, SALİM ŞİMŞEK², HANDE MORGİL¹, MAHMUT ÇALIŞKAN¹, GÜL CEVAHİR ÖZ¹

ABSTRACT

Microalgal species, especially those grown in outdoor cultivation systems need a wide tolerance to environmental conditions. Geographical location and climatic conditions, especially temperature and solar radiation are the main environmental factors affecting lipid productivity (Radolfi, 2009; Hindersin, 2014). Generally, high added value compounds can be extracted from microalgae, such as fatty acids (linolenic, arachidonic, eicosapentaenoic, docosahexaenoic acids, etc.), pigments (carotenoids and ficobiliproteins), biochemically stable isotopes and vitamins such as biotin, vitamins C and E; also some metabolites appear to have some pharmacological activities, among others the anticholesterolemic, antitumoral, immunomodulatory, antibacterial and antimycotic ones (Converti, 2009). Chlorella has been the oldest commercial application of microalgae. Green algae have the bulk of their fatty acids as saturated and unsaturated C18, a composition similar to that of vegetable oils (Benemann and Oswald 1996). *C. vulgaris*, a fresh-water, fast-growing green alga, has different lipid production capabilities (30–40% of dry weight) under stress conditions. In this study, *Chlorella vulgaris* were cultivated in 3-ton and 10-ton capacity open ponds with Bold's Basal medium and added sodium bicarbonat for the additional CO₂ source. Cells were harvested 6 weeks after cultivation and dried in the oven at 65°C. After that dried cells were powdered by using mortar. Total lipid was extracted with n-hexane (60C) for 6 h using a Soxhlet extractor and FAMES were prepared using boron trifluoride in methanol (20% of BF₃ in methanol) and extracted with n-hexane and then analyzed by GC-MS.

THE EFFECT OF GREEN COFFEE BIOACTIVE COMPONENTS ON OBESITY

ELİF ÇELİK¹, GAMZE AKBULUT¹, NİLÜFER ACAR TEK¹, BÜŞRA ATABİLEN¹

ABSTRACT

Obesity is a growing health problem worldwide. It is stated that nowadays about 600 million adults and 41 million children are overweight and obese. Obesity Type 2 DM is associated with many diseases, such as cardiovascular diseases, cancer, and non-alcoholic liver disease. There are many factors affecting obesity such as genetics, increased energy intake, culture, and inadequate physical activity. Depending on these factors, various treatments such as diet regimens, lifestyle modification, physical activity, surgery are applied in the treatment of obesity. However, since each treatment method has certain limitations, the use of functional foods in body weight control has become a research topic. Coffee is also one of these foods and it is a complex structure composed of chemical components. The chemical composition is influenced by the coffee bean species (*Coffea arabica* and *Coffea canephora*), roasting and infusion. Chemical composition of green coffee beans before roasting: 6.5-10% chlorogenic acid (CA), 1.2-2.2% caffeine, 10-16% lipids containing special diterpene (Cafestol and kahweol), 0.7-1.0% trigonellin, 45-52% carbohydrates, 11% protein and 4.2-4.4% mineral. The roasted coffee has a special aroma, taste and color due to the chemical reaction, and a large number of positive bioactive components are formed during the roasting process. Chlorogenic acids (CAs) are polyphenol compounds found in the seeds of *Coffea arabica* and *Coffea canephora*. In general, the amount of commercial ground coffee varies depending on the roasting degree and the percentage of *Coffea arabica* and *Coffea canephora* seeds in the mixture. Green coffee is a rich source of chlorogenic acid derived from unroasted coffee beans and a source of caffeine. Chlorogenic acids exhibit a variety of biological activities, including the ability to alter antioxidant enzyme activity, as well as high antimutagenic, anticancerogenic, anti-inflammatory and antioxidant properties. In addition to these features, there are both animal and human studies showing that body weight loss, fat tissue hormone regulation, triglyceride levels, body fat percentage are also effective. Possible effects on loss of body weight of green coffee, lipolytic effect on adipocytes, reduction of pancreatic lipase, inhibition of fatty acid synthesis, increase of hydroxymethyl glutaryl CoA reductase and acetyl CoA cholesterol acyl transferase, increase of AMP-active protein kinase-1 levels according to the results obtained from studies And reducing acetyl CoA carboxylase activity. However, the bioavailability and anti-obesity effect of coffee consumption with other foods, medicines and bioactive component requires further research.

OPTIMIZATION OF HERBAL TEA FORMULATION PRODUCED FROM AROMATIC PLANTS

SERENAY AŞIK¹, TUĞÇE ATBAKAN¹, ZEHRA KASIMOĞLU¹, AYHAN TOPUZ¹

ABSTRACT

Tea (*Camellia sinensis*) is a specie from Theaceae family grown in humid regions. Leaves and buds of tea are used as beverage after extraction in hot water. Tea is one of the mostly consumed beverage around the world due to its aromatic and refreshing properties. However, some people cannot consume tea due caffeine sensitivity. Therefore, these people consume herbal beverages obtained from different plants. Additionally, consumption of herbal tea increases progressively due to their health beneficial and immune regulation effects. Different plants such as hibiscus, lemon peel, mint and clove are used for production of herbal tea. Hibiscus, caffeine-free plant, supports immune system due to its high Vitamin C content. It decreases cardiovascular diseases risk, and regulates blood pressure. Lemon peel inhibits free radicals and supports immune system. Mint has also a lot of benefits on human health, especially on respiratory and gastrointestinal disorders. Clove is used for therapeutic purposes on mouth and dental health. In addition, clove is good for tiredness and used for cold cure. In the present study, hibiscus (*Hibiscus sabdariffa*), lemon peel (*Citrus lemon*), mint (*Mentha spicata*) and clove (*Syzygium aromaticum*) were used for production of mixed herbal tea with high content of phenolics and sensorial acceptability. A mixture design with 20 different experiments were created using Design Expert software. Total phenolic content and sensory properties of the tea produced using each mixtures were evaluated as response. Optimum herbal tea formulation were calculated as 0.380% of hibiscus, 0.472 of lemon peel and 0.148% of clove. The optimum formulation was produced in three replicates and total phenolic content and sensory properties (using hedonic scale) were determined. Taste, flavor and appearance point of optimum formulation were 6.07, 8.32 and 8.75, respectively. In addition, total phenolic content of herbal tea was determined as 558 mg GAE/g dm. Sensorial acceptability of optimum herbal tea produced in present research was found to be high.

FUNCTIONAL COMPONENTS OF RICE BRAN

HÜSEYİN BOZ¹, KAMIL EMRE GERÇEKASLAN²

ABSTRACT

Rice (*Oryza sativa*) is one of the main grain crops and consumed by over half of the world's population, especially in Asia. It is emphasized that there is a relationship between white rice consumption and many diseases such as cardiovascular and diabetes, especially in low-middle income countries. On the other hand, it is stated that the brown rice had many components, which has the beneficial effect on human health, such as γ -aminobutyric acid, vitamins, phenolic substances, dietary fiber, and γ -oryzanol. Although brown rice has the high nutritional composition and beneficial physiological properties, brown rice consumption is very limited because of its undesired sensorial properties and poor cooking properties. The rice bran contains approximately 11-22% fat, 11-17% protein, 6-14% fiber, 10-15% moisture and 8-17% ash. It is also particularly rich vitamins (especially vitamin E, thiamine, niacin) and minerals (aluminum, calcium, chlorine, iron, magnesium, manganese, phosphorus, sodium, potassium, zinc). Additionally, the rice bran also contains important nutraceutical components such as tocopherols, tocotrienols, γ -oryzanol, ferulic acid, caffeic acid, tricin, coumaric acid. Because of this, the rice bran is one of the valuable by-products of the food industry. The aim of this review, to give an information about the biologically active compounds of rice bran and their beneficial effects on human health.

AS A PROTECTIVE AND THERAPEUTIC AGENT AGAINST ALZHEIMER'S: CURCUMIN

BÜŞRA ATABİLEN¹, GAMZE AKBULUT¹, NILÜFER ACAR TEK¹, HILAL BETÜL ALTINTAŞ¹

ABSTRACT

Alzheimer's is a progressive and irreversible neurodegenerative disease that affects 27 million people worldwide. Alzheimer's may be developed according to many pathophysiological conditions. Studies that have been done over the last two decades are to understand underlying causes of Alzheimer's and to develop new protective and therapeutic methods. For this reason, recent studies have focused on spices that have flavor, coloring or protective properties as well as effects of reducing the risk of chronic diseases. In particular curcumin, a component of turmeric, is being investigated for its use in the treatment of Alzheimer's. In 2000, Ganguli et al. have reported a lower prevalence of Alzheimer's in India where people consume curcumin as part of the curry spice compared to the United States or Ng et al. have indicated that cognitive performance was better in elderly individuals who often consume curry. These studies pioneered in vivo and in vitro studies in order to investigate the protective effects of curcumin on Alzheimer's. For example, in a small study in Japan, 3 patients with Alzheimer's were treated with 100 mg/day of curcumin for 12 weeks. At the end of the study, the mini-mental status assessment scale score was significantly increased in only one of the patients. However, the patients began to remember their families within a year. Also in studies performed in different mouse models, curcumin supplementation at different doses decreased β -amyloid plaque formation, reactive oxygen species and proinflammatory factors. At the same time, an increase in cognitive performance after treatment was observed. Several mechanisms related to the protective and therapeutic properties of curcumin on Alzheimer's have been proposed. These: • Curcumin is a powerful antioxidant. With this feature, it protects against protein oxidation. • It is reported that it suppresses early growth response-1 (Egr-1) activation due to its anti-inflammatory effect. This may represent a potential therapeutic approach for Alzheimer's. • It has the ability to bind iron, copper and zinc effectively. This inhibits nuclear factor kappa (NF- κ) induction and plays a protective role against metal-induced neurotoxicity. • Because it has the ability to cross the blood-brain barrier, it binds directly to small β -amyloid oligomers, prevents β -amyloid accumulation and toxicity. • Curcumin reduces hypercholesterolemia, which can play an active role in Alzheimer's development, through upregulation of apolipoprotein A1, lecithin-cholesterol acyltransferase and low-density lipoprotein (LDL) -receptor genes. • It stimulates embryonic neuronal cell proliferation and hippocampal neurogenesis. • Curcumin, promotes neuronal protective effect in the brain by increasing expression of heat shock protein (Hsp). As a result, curcumin has the potential to be a protective and therapeutic agent for Alzheimer's. Although not in sufficient numbers, in most of the studies have been reported that curcumin have beneficial effects on Alzheimer's. It has also been recently tested for its utility as a diagnostic tool for Alzheimer's because of its natural fluorescence and affinity for binding to β -amyloid protein. In addition to the positive properties, low bioavailability of oral curcumin restricts its protective or therapeutic role. To increase curcumin's bioavailability, addition of components such as

piperine to the formulations may interact with the drugs. Alternatively, the use of curcumin at high doses to achieve the desired effect may stimulate an increase in reactive oxygen species. For this reason, the acceptable intake quantity determined by The Joint FAO (Food and Agriculture Organization) and WHO (World Health Organization) Expert Committee on Food Additives (JECFA) should not exceed 0-3 mg/kg/day.

TOTAL PHENOLIC CONTENT AND SENSORY PROPERTIES OF MIXED HERBAL TEA PRODUCED FROM DIFFERENT AROMATIC PLANTS

TUĐE ATBAKAN¹, SERENAY AŐIK¹, ZEHRA KASIMOĐLU¹, AYHAN TOPUZ¹

ABSTRACT

Tea is a beverage produced by boiling or infusing of tea (*Camellia sinensis*) leaves. Tea is the mostly consumed beverage in the world after water. Herbal teas are also consumed frequently due to its aromatic properties and beneficial health effects. Herbal Tea can be described as "beverages obtained from processed fruit or plants". Those are also prepared in hot water via decoction or infusion. Demand of aromatic plants such as ginger, licorice, cinnamon and cardamom for production of herbal tea increases day by day due to their beneficial effects on human health. Ginger is an aromatic plant which is rich in carbohydrates, essential oils, Vitamin A and C. It is frequently used for treatment of stomach disorders. Additionally, it is good for throat ache and helpful for detoxication. Similarly, licorice is used in treatment of throat ache and cough for many years. Cinnamon is used for treatment diabetes mellitus due to its reducing effect on blood glucose level. It is also effective on the sniffles, cold and flu. Although cardamom is not known adequately in Turkey, it has a lot of beneficial effects on human health. Especially, it is used against digestion problems deodorization of bad breath. In addition, it is an appetizing plant and can be used for failure to thrive problems. In the present study, to produce a mixed herbal tea with high phenolic content and sensorial acceptability, ginger (*Zingiber officinale*), licorice (*Glycyrrhiza glabra*), cinnamon (*Cinnamomum verum*) and cardamom (*Elettaria serrula*) were used. A mixture design including 20 different herbal tea mix was created using Design Expert program. Total phenolic content and sensory analysis results were used as response of the mixture design. According to optimization results, 0.072%, 0.765% and 0.163% of licorice, cinnamon and cardamom were determined as optimum formulation, respectively. Total phenolic content and sensory analysis (with 9 points hedonic scale) were carried out for mixed herbal tea produced at optimum conditions. Sensory properties of taste, flavor and appearance were determined as 6.75, 7.69 and 7.44, respectively. Total phenolic content of the optimized formulation was determined as 369.95 mg GAE/g dm. The experimental values of the sensorial properties and total phenolic content of optimum formulation were in agreement with theoretical values. Herbal tea formulation determined in the present study was highly acceptable by consumers.

LAUREL REHABILITATION

OZAN ACUN¹

ABSTRACT

Any kind of vegetable (fruit, seed, flower, leaf, bark, root, shoot, onion, tuber, rhizome, mushroom etc.) that grow in the forests and openings and that people and other living beings use to supply their own needs or to provide income. (FOCUS). Can be defined as Non-Wood Forest Products (ODOÜ). Can be defined as Non-Wood Forest Products (ODOÜ). The main Asian homeland is in Asia Minor and in the Balkans, all green is a vegetation type. It is one of the characteristic plants of the Mediterranean and the Mediterranean is called the Lauretum zone of the Mediterranean region. Bay, one of the 40 genera of the Laureaceae family, grows naturally in the coastal waters of the Aegean, Mediterranean and Black Sea regions of our country. The leaves are in an elliptical structure and are tough or rough like the skin. They are 5-10 cm in length and 2-4 cm in width. The edges of leaves are slightly wavy. The number of shoots in the January is the leaf yield and the blockages of the shoots are made and animation sections are made and it is tried to determine how many shoots should be left in the shoot dilution process. The defoliation can be seen in almost all different environments of growth (wet creek, rocky rocky areas) within the area. Detections were made according to the Braun-Blanquet scale. After the necessary examinations, determinations and sample procurement were completed, firstly the cover against the area was cut off and lastly the animation section was applied on the treasure hobs. 2013 and 2015 were cleaned twice in the area. At the end of the project, deflaze leaf was produced and weighed in full area, in quarries. In the analysis of the data; Variance Analysis, Duncan Test and Kruskal-Wallis Test were used. As a result of the statistics, it is evaluated that the dropout process in the first group and the first one, which is located in the first rank, can be implemented.

SUPERCritical CARBON DIOXIDE EXTRACTION OF SEA BUCKTHORN (*HIPPOPHAE RHAMNOIDES L.*) SEED AND FATTY ACID COMPOSITION

ALIYE ARAS PERK¹, YUSUF CAN GERÇEK¹, FATMA DUYGU CEYLAN², ŐÜHEYDA GÜLŐEN¹, ONUR YANAR¹,
MEVZULE YAZGAN¹, ESRA ÇAPANOĐLU²

ABSTRACT

Sea buckthorn (*Hippophae rhamnoides L.*) is a bush that grows wildly in the mountain regions of the middle and southeastern Asia and Europe. Its fruit are berries of orange to red colour and have an acid, lightly bitter taste. They contain many vitamins (B, C, E, K, provitamin A) and other biologically active substances. The main products obtained from the fruit are juice rich in vitamin C and oil rich in unsaturated fatty acids. Seabuckthorn berry oil having high nutraceutical, cosmeceutical, and therapeutic activity has been extracted from dried seabuckthorn (SBT) whole berry powder using supercritical carbon dioxide (SC-CO₂), a green process for extraction of bioactives. Wild Turkey berries of *Hippophae rhamnoides L.* were collected from twenty-one different locations. Seeds were isolated from berries. For each experiment, dried SBT berry seed was subjected to SC-CO₂ extraction. Fatty acid methyl esters in the sea buckthorn extract were determined by GC-MS. The dominating fatty acids in seed oils were oleic (18-33 %), linoleic (11-32%), alfa linoleic (9-21%). The seed of sea buckthorn berries are rich in lipid which is rare in the plant kingdom. The studied samples of sea buckthorn from Turkey have proven to be potential sources of valuable oils.

THE IMPORTANCE OF CHIA (SALVIA HISPANICA L.) PLANT AND POSSIBILITIES OF CULTIVATION

UđUR TAN¹, OLCAY ARABACI¹, HATICE KÜBRA GÖREN¹

ABSTRACT

Salvia hispanica L. is a flowering plant that has edible seeds of the Labiatae family and known as chia. *Salvia hispanica* L. seeds are a traditional food of Central and South America. The 16th Century Codex Mendoza records indicate that the plant was cultured in pre-Columbian times and those seeds were used at that time. In addition that It has been reported that seed was used as a body moisturizer (medicine), varnishing of pottery etc. (oil) and edible in the form of mushes roasting or without roasting Chia seeds contain 15-25% protein, 30-33% fat (alpha-linolenic acid) (ALA), 26-41% carbohydrates, 18-30% fiber, 4-5% ash, 90-93% dry matter. Additionally, it contains high antioxidant. In recent years, heart and vascular diseases, diabetes and obesity have increased in the worldwide and in Turkey year after year. Malnutrition plays a major role in the occurrence of these conditions. People who have come to realize that have searched for healthier foods (Novel Food) than those traditionally ones for health. The interest on this plant has been increased due to conducted studies about Chia (*Salvia hispanica* L.) that proof that valuable resource for human health and nutrition. For that reason, it is necessary to include *Salvia hispanica* in the cultivation and breeding programs and produce it like other traditional field crops. Thus, new, nutritious, healthy and healing alternative food source that people can edible will be offered. In this article, importance and possibility of cultivation of chia plant were investigated.

EFFECTS OF PROBIOTICS ON MENTAL HEALTH

BÜŞRA ATABİLEN¹, GAMZE AKBULUT¹, NILÜFER ACAR TEK¹, ELİF ÇELİK¹, YELİZ SERİN¹

ABSTRACT

Between the gastrointestinal system and the central nervous system, there is a two-sided and functional relationship involving anatomic connections such as the vagus nerve, the immune system, the hypothalamus-pituitary-adrenal axis (HPA axis). The other key component involved in this relationship is the intestinal microbiota. It has recently been thought that the microbiota-intestine-brain axis plays an important role in the neurodevelopmental phase. Therefore, microbial changes are associated with the development of diseases such as inflammatory bowel disease, obesity as well as neurodegenerative diseases such as anxiety, depression, alzheimer's, parkinsonism and autism. The increasing prevalence of these diseases, which affect mental health negatively, has accelerated the studies that study microbiota and the healing effect of probiotics on microbiota. Although studies on humans are still inadequate, the data obtained from these studies show that probiotics have therapeutic effects on depression and anxiety. It was also observed that probiotic supplementation in individuals with Alzheimer's disease significantly improved their mini-mental status assessment score. In addition to studies on humans, studies are also carried out in different animal models. According to the results of these studies, it has been found that supplements containing different probiotic species reduced anxiety and depression findings in animal models. Because each of the probiotic bacteria has different feature, many mechanisms have been proposed for the positive effects of probiotics on mental health: • Mental health-related diseases are associated with factors such as inflammation, oxidative stress, and increased release of inflammatory cytokines. Probiotics control glutathione levels by increasing glutamate-cysteine ligase activity. Thus, affecting the local and systemic antioxidant status; probiotics positively influence mental health. • Lactobacillus and bifidobacteria species on the gastrointestinal tract are important in the synthesis of gamma-amino butyric acid (GABA). Gamma-aminobutyric acid is an inhibitor-specific neurotransmitter that increases release in neuropsychiatric conditions such as anxiety and depression. At the same time, acetylcholine neurotransmitter, which is important in cognitive events such as memory, concentration is synthesized by subspecies of lactobacillus. Probiotics can affect mental health positively by providing the proliferation of beneficial bacteria that play a role in the synthesis of GABA and acetylcholine. • Approximately 90% of serotonin is expressed in enterochromaffin cells in the gastrointestinal tract. For this reason, intestinal microbiota, which controls the production of serotonin, can directly affect the functions of the central nervous system. Or the probiotics can increase the plasma level of tryptophan, the precursor of serotonin. The kynurenic acid resulting from the metabolism of the tryptophan has neuroprotective effect. • Probiotics regulate central nervous system functions by acting on intestinal barrier permeability. Because intestinal barrier permeability is essential for maintaining of the immunity and the nervous system. Increased permeability of insteinal barrier has been associated with diseases such as depression and autism. • Reducing corticosteroid response, it alleviates the HPA stress responses having an impact on emotional state and mood. • Improving carbohydrate malabsorption positively, probiotics can affect

mental health. As a result, changes in intestinal microbiota may cause changes in the central nervous system. This information may provide to development of new strategies in the use of probiotics as an adjunct for development of cognitive and sensory aspects of mental health. At the same time, probiotics may enhance the efficacy of psychopharmacology because they influence expression of genes in the brain. This makes possible the use of pharmacological active ingredients at low doses and reducing the toxic side effects of the components.

MEDICINAL PLANT POTENTIAL OF BALIKESİR

FATİH SATIL¹, SELAMI SELVİ¹, GÜLENDAM TÜMEN¹

ABSTRACT

This study carried out between 2014 and 2016 was done to identify the medicinal plants spreading at flora of Balıkesir and to reveal the medicinal and aromatic plant potential of Balıkesir. For this purpose, herbariums of plant specimens collected periodically in different regions of Balıkesir were done. In the determination of medicinal plants; both Commission E, Pharmacopoeia and various Monographs were used, as well as species used local people with field studies were identified. As a result of the research; 144 genera and 179 taxa belonging to 61 families could be seen included in the potential medicinal plant class. The families to be the highest number of taxa are; Lamiaceae (33 taxa), Asteraceae (21 taxa) and Rosaceae (15 taxa), respectively. Also, 59 taxa are registered in Commission E and various Pharmacopoeia with Monographs. According to the results obtained in the study, it was seen that the plants were mostly used with the infusion method by local people. With this study, it is seen that Balıkesir has a quite rich medicinal plant potency and of this wealth could be seen contributed to the pharmaceutical sector by making a significant contribution to the country's economy.

HAVE ECONOMIC POTENTIALS WOODEN OUTDOOR PRODUCTS INTRODUCTION GUIDE

OZAN ACUN¹

ABSTRACT

Our country has diversity of genetic, flora, fauna and ecosystem to show continental character. Approximately 3,000 of these are endemic to my country, with a plant diversity expressed in approximately 12,000 taxa. Our forests are not only rich in biodiversity but also rich in wood products. It can not be said that the forestry sector has benefited from the non-wood forest products sufficiently. The purpose of preparing this work is; Identify the value of the country's economy by identifying the presentations, production, processing and marketing of non-wood forest products and the solutions to them. By applying this work to practice; The result of employment of forestry engineers, forestry industry engineers and similar technical personnel in the process of processing and improving the forest village, reducing the pressure on the forest, production of non-wood forest products and procurement, marketing and consumption of raw materials . In addition to creating added value to the country's economy, it may also be possible to provide foreign currency entry by exporting. With this book, the promotion and promotion of non-wood forest products which are not explained to this day is done. This work also has the feature of becoming a source in our educational times. Local people in Zonguldak, Bartın and Karabük earn these economies by collecting and selling these products which are grown at the end. Preliminary evaluations made are not as many as the number of people in this person. Losses of detected products. These provide the wrong collection, drying and storage conditions. The most important condition of a sustainable use is not to damage the resources. During this time we have to evaluate the eye contact in his time. The purpose of this guide is to introduce better forest products without Zonguldak, Bartın and Karabük. Sustainable production is essential.

ASSESSMENT OF ANTIMICROBIAL ACTIVITY OF BLACKTHORN (PRUNUS SPINOSA L.) EXTRACTS ON SOME SELECTED MICROORGANISMS

MUHAMMED ZEKİ DURAK¹, GULSUM UCAK¹, EZGİ METİN

ABSTRACT

Blackthorn (*Prunus spinosa* L.) generally grows wild in the Thrace region of Turkey. It is a deciduous large shrub or a small tree growing up to 5 meters in height. The extracts of fresh blackthorn contains high amount of polyphenolic compounds which can suppress the negative effect of free radicals in the organism. For this reason, they possess health benefits such as free radical scavenging, antioxidant, anti-inflammatory, antimicrobial, and anticancer activity. The aim of this study was to evaluate the antimicrobial action of aqueous extracts from *Prunus spinosa* L. fresh fruit on nine bacterial strains (*B. subtilis* ATCC 6633, *E.coli* ATCC 25922, *P.aeruginosa* ATCC 27853, *Salmonella Typhimurium* ATCC, *L. monocytogenes* ATCC 13932, *Klebsiella pneumoniae* ATCC 43816, *Bacillus cereus* ATCC 11778, *E.coli* O157:H7 ATCC 43888 and *S. aureus* ATCC 25923) and two fungal strains (*S. cerevisiae* ATCC 9763 and *Candida albicans* ATCC 10251). Blackthorn fruit was obtained from Çanakkale, Turkey. The stone of fruit was removed and the remaining material was grounded via a blender. Twenty (20) gram of sample was weighed and extracted with 200 mL of %75 ethanol at room temperature with shaker for 2 h. After filtering and centrifuging the resulting aqueous solution, the supernatant was evaporated at 50 °C in a rotary evaporator. The concentrated solution was dried at 50 °C for overnight in an oven and the initial concentration was designated with sterile distilled water as 1g/mL. Antimicrobial tests were carried out by disc diffusion method in which antibacterial activity was evaluated by measuring the zone of inhibition against test microbial strains. Ethanol fruit extract showed antimicrobial activity against all tested bacteria. The antifungal activity was tested against two organisms *S. cerevisiae* ATCC 9763 and *Candida albicans* ATCC 10251. The investigated extract exhibits antifungal activity against *S. cerevisiae* ATCC 9763. *S. cerevisiae* ATCC was more susceptible to the extracts than all tested microorganisms. *L. monocytogenes* ATCC 13932 was showed the highest antimicrobial activity among the others pathogen bacteria. These results showed that *Candida albicans* ATCC 10251 was found the most resistant among the microorganisms tested against blackthorn extract, followed by *Klebsiella pneumoniae* ATCC 43816. A long as the concentration of the extract decreased, the level of antibacterial activity and the size of inhibition zone alleviated directly. In general, the inhibition zones of microorganisms were ranged from 8.00 mm to 31.75 mm. On the basis of obtained results, we concluded that the investigated blackthorn (*Prunus spinosa* L.) fruit extract have significant antimicrobial activity.

EFFECTS OF PHOENIX DACTYLIFERA ON MALE INFERTILITY

MUSA TATAR¹, TUĐBA TATAR²

ABSTRACT

Infertility is an important health problem which affects one in six couples. Male-originated factors cause infertility approximately 60%. Many factors such as physical activity, environmental pollution, using of certain drugs or alcohol and tobacco, and nutrition influence reproductive functions. Among these factors, the effects of nutrition on reproductive functions have been particularly noted in recent years. Consumption of some foods can cause sperm quality to increase or decrease in men. For example; decrease in the consumption of vegetables and fruits reduces the intake of antioxidants. Therefore sperm quality is affected negatively. Herbal antioxidants protect the sperm from oxidative stress and help to survive. The date palm (phoenix dactylifera) which has been grown in Southwest Asia and Northern Africa, has a high antioxidant composition. Composition of the date palm contains approximately 3942 mg/100 g of carotenoid and phenolic compounds and 80400 µg/100 g of antioxidant compounds. In studies, the administrations of date palm products with different doses cause an increase in FSH, LH, testosterone and estradiol hormone levels, a significant increase in weights of the testicle and epididymis of rats and have positive effects on spermatogenesis and sperm parameters such as an increase in sperm count and motility. It is observed an increase in Leydig cells which produce testosterone, sperm concentration in seminiferous tubules and a decrease in testicular DNA damage and adverse effect created by infertility agent on spermatogenesis. There is an association between sex hormones and sperm parameters. FSH hormone facilitates spermatogenesis in seminiferous tubules via binding sertoli cells. Decrease in testosterone levels causes lower sperm concentrations in the epididymis. Estrogen regulates reabsorption of the luminal fluid on head of epididymis that leads more concentrated sperms. Increase in sex hormones is an indicator for increase in secretory activity that causes an increase in weights of the testicles and epididymis. In conclusion, antioxidant factors within composition of the date palm have an efficient role on spermatogenic cells and may be useful to prevent and treat infertility.

AMASYA REGIONAL DIRECTORATE OF FORESTRY RESEARCH ON POTENTIAL OF RUSCUS ACULEATUS

ZEKERIYYA NANE¹, MUTLU TURAN¹

ABSTRACT

There are significant deficiencies in the production studies of non-wood forest products work in our country's forestry. Problems arise about continuous and planned operation of non-wood forest products that meet the raw material demands of many industries such as food, medicine, cosmetics. One of the most important reasons of the problems is that the inventory studies of non-wood forest products have not been done sufficiently. Within this scope, inventory studies of non-wood forest product were started in 2013, Amasya Regional Directorate of Forestry. It is aimed that planned production and marketing with inventory of *Ruscus aculeatus* used in alternative medicine and pharmaceutical industry. In this study, the distribution areas, growth environment characteristics, production and marketing issues of the *Ruscus aculeatus* L which is naturally found in the Amasya Regional Directorate of Forestry, Bafra Forest Management Directorate, Ondokuzmayıs Enterprise will be revealed and application results will be evaluated.

THE USE OF BETALAINS AS NATURAL COLOR MATERIALS AND THEIR EFFECTS ON HEALTH

HÜSEYİN GENÇCELEP¹

ABSTRACT

THE USE OF BETALAINS AS NATURAL COLOR MATERIALS AND THEIR EFFECTS ON HEALTH Hüseyin GENÇCELEP Ondokuz Mayıs University, Faculty of Engineering, Department of Food Engineering Samsun Betalaines are structurally water-soluble nitrogenous pigments and contains a derivative of nitrogen, betalamic acid. Red beet is the only source approved and approved for use in food and pharmaceutical products for betalain coloring matter. Betalamic acid forms different structures as a result of biosynthesis with various molecules. These structures are generally called betaxanthin and betacyanin. Betaxanthin is yellow color pigment and betasiyanin are red-violet pigments. In the investigations conducted, about 50-70 betalaine were detected. 50% of these are betasiyanin; and 20% is the betaxanthins. It is known that many factors influence the stability of betalaines. The degree of glycosylation and acylation in the high affects positively the low water activity, the presence of antioxidant, the pH 3-7 range, the pigment content of the plant in the low temperature and dense nitrogen environment. On the other hand, it is suggested that temperature, light, oxygen, high water activity, low degree of glycosylation, low acylation and existence of metal ions negatively affects. The optimum pH for the enzymatic degradation of both betacillins and betaxanthins has been reported to be about 3.4. Red beet is quite rich in color pigment called betalaine. This color can be used as a coloring agent in food and pharmaceutical products by making pigment into a powder. Betalins have a wide range of biological activities including antioxidants, antiinflammatory, hepato-protective and anti-cancer properties. Antioxidant properties of betalaines and phenolic acids have been reported to prevent age-related diseases, cancer and cardiovascular diseases. It is also reported that antiviral and antimicrobial effects are present. The antioxidant betalaines found in the red beet are betanein and betanidine 5-O- β -glucoside. It has also been determined that betalaine in red beet showed potent health benefits such as strengthening the immune system and preventing cardiovascular diseases, neurodegenerative disorders and cancer, as well as free antioxidant and free radical scavenging properties. The fact that it is a good electron donor thanks to a phenolic group and a cyclic amine group implies the antioxidant property. Among the betalain components in the beet, attention has been drawn to recent studies that betacyanins are usually one of the most important anti-cancer compounds. Betaine, one of the most important components of betalain, has been identified as the primary and potent compound responsible for anti-cancer effects. Betaine, isolated from red beets, has been shown to exhibit a dose-dependent growth inhibition on human chest, lung, colon, abdominal and central nervous system tumors. In conclusion, studies on the health effects of red beet pigment betalaine and studies on the anticancer effects are at an early stage and have been used in combination with strong anticancer drugs currently used to provide synergistic effects with novel studies and particularly effective dose reduction potency and reduce drug toxicity related to treatment research is needed.

EDIBLE WILD MUSHROOMS AS FUNCTIONAL FOODS

HÜSEYİN GENÇCELEP¹

ABSTRACT

EDIBLE WILD MUSHROOMS AS FUNCTIONAL FOODS Hüseyin GENÇCELEP Ondokuz Mayıs University, Faculty of Engineering, Department of Food Engineering Samsun Functional food "defines foods that provide a health benefit as well as stimulating nutrients. Another definition; food or food ingredients that provide additional benefits on human physiology and metabolic functions beyond the basic nutritional needs of the body so that they are effective in protecting from disease and achieving a healthier life. In addition to nutritional effects, one or more active ingredients have the effect of reducing the risk of disease-protective, corrective and /or disease risk, these effects being called scientific and clinically proven food functional foods. For centuries, macrofungi, a good source of food for human beings, as well as high protein and vitamin content, It is rich in fiber, carbohydrates and minerals and is a valuable food with a low fat content. Fungi are separated from other vegetables because they have easy digestible proteins. Important amino acids in the composition of edible fungi are vitamins B (thiamin, riboflavin, nicotinic acid, biotin) and vitamins C, D and K. Cooked or edible fungi processed by various methods are a good dietary component for vegetarians because of their superiority in nutrition. It is also suitable for the consumption of diabetics and heart patients. Since it is rich in folic acid, mushrooms are used to treat anemia. In addition, macrofungi are rich in minerals such as calcium, phosphorus, potassium, iron and copper. The dry matter content of fresh mushrooms is relatively low, ie around 10%, and predominantly consists of carbohydrate, protein, fiber and minerals. The composition of the mushroom contains 90.7% water, 3.5% protein, 0.3% fat, 4.5% carbohydrate and 1% mineral matter. In the production of ready-made soup and pizza raw materials, various sauces and baby foods, dried mushrooms are used as an auxiliary material. The quantities of important minerals generally found in wild growing fungi; Sodium 100-400, Potassium 20,000-40,000, Calcium 100-500, Chlorine 1000-6000, Magnesium 800-1800, Phosphorus 5000-10000 and Sulfur 1000-3000 mg/kg of arsenic are present. It also contains iron 30-150 and selenium 0.5-20 mg/kg. Mushrooms contain different secondary metabolites such as phenolic compounds, terpenes and steroids. Fungal phenolics are both an excellent antioxidant and a non-mutagenic active chemical component and it has been determined that there is a correlation between the antioxidant activities of some edible fungi and the total amount of phenolic compounds. Fungi are widely found in fat, carbohydrate, fiber, protein, essential amino acids and other amino acids, some minerals important for nutrition (P, K, Na, Ca, Mg, Fe, Mn, Zn, Cu). It contains substances such as thiamin, riboflavin, niacin, tocopherol, vitamin D, flavor and taste compounds, antioxidants as well as organic compounds (lectin, adustine, carboxymethyl) and toxic elements (As, Hg, Cd, Pb) and ribonuclease and nicotine. It is possible to find fungi containing toxic minerals in large quantities depending on the growing and sometimes growing medium. Minerals in fungi compositions are not available in fungal compositions unless they have toxic-acting minerals in their compost compositions prepared from the environment in which they are grown. In the compositions of

Corresponding Author: HÜSEYİN GENÇCELEP, genccelep@hotmail.com

¹ONDOKUZ MAYIS ÜNİVERSİTESİ

the fungi, globulins, glutens, prolamins and other protein variants were also identified. The total free amino acid amounts of fungi in the dry matter content were determined to be between 1.5 and 72 g/kg. Glutamic acid was found in high amounts at 37.6 g/kg in dry matter, although methionine was determined to a very limited extent. Carbohydrates constitute half of the content of fungal dry matter. Carbohydrates are composed of various compounds: sugars (monosaccharides, derivatives and oligosaccharides) contain both reserve and building polysaccharides (glycans). As a result of studies on compositions of browned wild mushrooms, it has been determined that the compositions of the fungi vary widely depending on the medium they are grown, and that they contain very different substances in their composition. It has been shown that it is possible to produce foodstuffs with functional properties by joining alone or in combination with various foods, as it is possible to have a long shelf life with the operations to be carried out by drying.

NATURAL MEDICINE FOR THE TREATMENT OF OBESITY: SAFFRON (CROCUS SATIVUS L.)

JİYAN ASLAN CEYLAN¹, BÜŞRA BAŞPINAR¹, AYŞE ÖZFER ÖZÇELİK¹

ABSTRACT

Plants have been used to treat many diseases throughout the history of humanity. The World Health Organization (WHO) reports that they have been using herbal drugs in the first place to eliminate the health problems of nearly 4 billion people (80% of the world population) in the world. Grown in very narrow areas in Karabük (Safranbolu) and Şanlıurfa (Harran plain) in Turkey, saffron (*Crocus sativus* L.) is a cormous plant with a high economic value among medicinal and aromatic plants in world markets. Saffron has three main metabolites: picrococins, responsible for the bitter taste of saffron; safranal, a volatile oil responsible for aroma; and crocins, from carotene family that responsible color of saffron. Saffron, especially its crocin and safranal components, has important pharmacological characteristics such as antioxidant, anti-tumor, anti-diabetic, anti-inflammatory, and anti-atherosclerotic. Despite the large number of studies investigating various medical characteristics of saffron and its components, its potential for anti-obesity has not been adequately studied. It is thought that saffron and crocin might have significant clinical effects in terms of treatment and prevention of obesity since they help lose body weight due to the anorectic effect they have. This study aims to evaluate the potential role of saffron and its components on the pathophysiology of obesity.

ETHNOPHARMACOLOGICAL FEATURES OF ROSA CANINA L. (ROSACEAE)

NAGEHAN SALTAN¹, ÖZGÜR DEVRİM CAN²

ABSTRACT

ETHNOPHARMACOLOGICAL FEATURES OF ROSA CANINA L. (ROSACEAE)
Nagehan SALTAN¹, Özgür Devrim CAN² 1Anadolu University, Faculty of Pharmacy, Department of Pharmaceutical Botany, 26470, Eskişehir, Turkey 2Anadolu University, Faculty of Pharmacy, Department of Pharmacology, Eskişehir, Turkey (ndagdeviren@anadolu.edu.tr) Rosaceae is a family of flowering plants whose members are of great economic value and are traditionally used for the treatment of several diseases in Turkey. Rosa canina L. (brier, dog rose, hip tree) is a plant of Rosa L. genus belonging to this family. This plant is widely distributed in particular regions of Europe, Asia, the Middle East, and South and North America [1]. In these countries, Rose hip is used as a nutritional supplement especially due to its immune system strengthening effect [2]. In Turkey, R. canina is known as “kuşburnu, yabani gül, gül burnu, gül elması, it burnu, it gülü” and used for the treatment of digestive, urinary, circulatory, respiratory system disorders, of inflammatory diseases [3]. In this study, we reviewed the previous literature reporting the pharmacological effects of R. canina with the aim of evaluating its therapeutic potentials on various disorders. For this purpose, we searched the electronic databases to collect the data and reviewed more than 95 papers published between 1997 and 2017. We focused on in vitro studies, case reports, pre-clinical and clinical papers related to the pharmacological effects of R. canina. Results of our detailed search indicated that one of the well-known pharmacological effect of R. canina is its anti-inflammatory activity [4,5]. In addition, protective and therapeutic effects of this plant on diabetes and diabetes induced complications are also described, previously [6,7]. Furthermore, this plant has also been reported for its antioxidant [8], antiproliferative [8], anticancer [9], anti-obesity [10], anti-ulcerogenic [11], hepatoprotective [12], actinociceptive [13], and immunomodulatory [14] activities. In conclusion, results of the scientific reports seem to confirm that R. canina has a notable therapeutic potential on various diseases. However, further detailed clinical studies focusing on efficacy and toxicity of this plant, are strongly needed. Key words: Ethnopharmacology. Rosa canina, Rosaceae References [1] Nilsson O., Rosa. ANTIMICROBIAL ACTIVITY OF ESSENTIAL OILS EXTRACTED FROM THYME, ROSEMARY AND LAUREL AGAINST FISH PATHOGENIC MICROORGANISMS

SERPİL TURAL¹, YÜKSEL DURMAZ¹, EDA URÇAR¹, SADETTİN TURHAN²

ABSTRACT

In this study, the antimicrobial activity of thyme (*Thymus vulgaris* L.), rosemary (*Rosmarinus officinalis* L.) and laurel (*Lauris nobilis* L.) essential oils against *Yersinia ruckeri*, *Lactococcus garvieae*, *Pseudomonas fluorescens* and *Aeromonas sobria* were investigated. The essential oils were extracted by hydro-distillation using a Clevenger apparatus, and their antimicrobial activities were measured by paper disc diffusion method. All essential oils used in this study showed antimicrobial activity against test microorganisms. The highest antimicrobial activity against *Y. ruckeri*, *L. garvieae*, *P. fluorescens* and *A. sobria* was determined in thyme essential oil with zone diameters of 31.50, 29.50, 26.50 and 31.50 mm, respectively. The antimicrobial activity of rosemary and laurel essential oils against all test microorganisms (except *L. garvieae*) was similar. In general, *P. fluorescens* was less sensitive to the inhibitory activity of thyme, rosemary and laurel essential oils than other test microorganisms. These results suggested that thyme, rosemary and laurel essential oils can be used as antimicrobial agents against fish pathogenic bacteria.

PREPURIFICATION OF LIPASE ENZYME FROM CORIANDER SEED (CORIANDRUM SATIVUM)

DUYGU MERCAN¹, MÜGE GİDİŞ¹

ABSTRACT

Coriander (*Coriandrum sativum*) is an aromatic plant, and due to its therapeutic properties, it is widely used in many fields such as food, medicine, perfumery and cosmetics. Coriander is a medicinal and aromatic plant that is cultured in our country. It has been used for a long time due to appetising, , carminative and digestive properties in folk medicine. In recent years, studies on the pharmacological effects of coriander have gained intensity. Starch, tannins, sugars, fixed and essential oils are found in the seeds of coriander. in its fruit bearing seed. There is high incidence of coriandrol and low incidence of geraniol, borneol, pinene, phelladron and acetic acid in the essential oil of coriander. Lipases can be produced by animals, microorganisms and plants, and are enzymes that hydrolyze mono-, di- and triglycerides in the oil-water phase. Lipases have an important place in industry and medicine as they show activity in both aqueous and anhydrous solvent systems. Herbal lipases are preferred in industry and medicine because their accessibility and low cost. Lipases are pancreas enzyme that can digest lipids mechanically. Coriander seeds are used because of digestive properties colloquially. In this regard, whether coriander seed helps to digest lipids will be determined by the lipase activity. In this study, purification of lipase from coriander seed was done to add new literature of coriander. The plant was first degreased with acetone. After drying process, the phosphate buffer was applied in the refrigerator for 12 hours. The clear part of the centrifuged extract was saturated with ammonium sulphate up to 80%. Olive oil was used as substrate for enzyme activity measurements. The maximum activity in enzyme activity measurements was at the addition of 0.8 ml of base at 70% and 80% saturation. Enzyme activity results were found to be lower than the other medicinal aromatic plant seeds' lipase purification results.

DETERMINATION OF PHENOLIC COMPOUNDS IN FRAXINUS EXCELSIOR AND FRAXINUS AMERICANA LEAVES BY LIQUID CHROMATOGRAPHY-ELECTROSPRAY TANDEM MASS SPECTROMETRY

BUSE AYDOĐAN¹, MUSTAFA CİTTAN¹, ALI ÇELİK¹

ABSTRACT

Fraxinus (family Oleaceae) is a genus of approximately 50 species of hardwood trees and shrubs found in Europe, N. Africa, W. Asia and N. America. Important North American species include Fraxinus americana (white ash) [1]. Fraxinus excelsior, also known as the common ash, is a species that grows in our country. The leaves of the both species, like all other oleaceae family, contain significant amounts of phenolic compounds. Phenolic compounds are widespread secondary plant metabolites. The most important classifications of phenolic compounds in oleaceae family are secoiridoids, phenyl ethyl alcohols, flavonoids and phenolic acids. There is currently much interest in these phytochemicals as bioactive components of foodstuffs [2]. Many of these phytochemicals possess significant antioxidant capacities that are associated with lower occurrence rates of several human diseases [3]. The purpose of this study was to evaluate the phenolic contents of leaves extracts of Fraxinus excelsior and Fraxinus americana obtained with infusion (IE) and ultrasound-assisted extraction (UAE) techniques. IE and UAE were carried out with ultrapure water and methanol/water solution (70/30, v/v), respectively. 34 phenolic compounds were scanned by liquid chromatography-electrospray tandem mass spectrometry (LC-ESI-MS/MS) and 22 of them were quantitatively determined in the leaves extracts. Contents of phenolic compounds in the extracts varied from 0.59 $\mu\text{g g}^{-1}$ to 55.2 mg g^{-1} . Oleuropein, a secoiridoid, was the dominant compound in both extracts of two species. Other predominant compounds were identified as verbascoside and hesperidin. Oleuropein is a very powerful antioxidant and its amount in the leaves of Fraxinus species that reaches approximately 5.5% by weight is quite remarkable. Consequently, the high amounts of oleuropein, verbascoside and hesperidin extracted from ash leaves make this raw material a key source of these phenolic compounds. References [1] N. INVESTIGATION OF PHENOLIC COMPOUNDS AND TOTAL PHENOLIC CONTENT OF ISABELLA GRAPE (VITIS LABRUSCA L.) BERRIES IN BARTIN REGION

İBRAHİM TÜMEN¹, DİLEK ÜNEŞ¹, HASAN KESKİN¹, MEHMET KURTÇA²

ABSTRACT

Vitis labrusca L. which is known as “Aromatic grape, aromatic black grape, strawberry grape, isabella, American grape, black grape” grows in in Black Sea Region coastline. It has a wrapping body, a berry with special aroma, thick skin and seed. It grows very fast and it can grow up to 15 meters. It had been determined that. *V. Labrusca* berry and leaves has phenolic compounds, organic acids, vitamins and minerals, enzymes, monosaccharides, nitrogenous compounds, terpenes and lipids in phytochemical researches upon this plant. According to research upon *V. labrusca*, this plant has healing effects on respiratory tract infection, heart attack, cholesterol, digestive system disorders, some cancer species and Alzheimer. This also shows that *V. labrusca* is very important plant medically. In this study, berries of isabella grape (*V.labrusca* L.) which was collected from Bartın city, Serdarlı Village, were used. Three different samples were prepared as fresh, dried in outdoor, dried in drying oven. Phenolic compounds of Isabella grape (*V.labrusca* L.) were identified by HPLC. Total phenolic content was determined by Folin-Ciocalteu reagent (FCR). According to results of phenolic compounds analysis, in all of the fresh sample, sample dried in outdoor and sample dried in drying oven, the highest amount was determined as vitamin C (respectively; 11.205 mg/L, 15.191 mg/L, 15.160 mg/L). When compared these three samples, the highest total phenolic contents were calculated in sample dried in drying oven.

PLACE AND IMPORTANCE OF MEDICINAL AND AROMATIC PLANTS IN THE WORLD AND TURKEY

VEYSİ ACIBUCA¹, DILEK BOSTAN BUDAK²

ABSTRACT

In agricultural activities, as well as the production of the necessary products to meet the needs such as nutrition, dressing, and sheltering which are vital for mankind; there also produced products that are useful for human health. It is known that plants with therapeutic properties have been used in diseases since the beginning of human history. In the early days, only some of these plants, which were collected from nature for nutrition and treatment purposes, were cultured and produced for economic purposes. In addition to therapeutic uses of medicinal and aromatic plants; they are used in many areas such as food, cosmetics and aroma. As a result of agricultural products trade's gaining of international qualification, and the increase in demand for these plants; a rise in the production and collection of medicinal and aromatic plants has happened. According to the World Health Organization data, while 80% of the population uses traditional medicines for treatment in underdeveloped countries; this proportion is around 40% in developed countries. And it is expected that the rate of utilization of medical plants in the future will increase all over the world. Due to its location and climate conditions, our country has a wide variety of plant species and is one of the leading producer countries of many medical and aromatic plants. For this reason, medical and aromatic plants have an important economic potential for our country. In this study, production and trade of medical and aromatic plants in the world and in Turkey have been examined in line with the data obtained from national and international institutions and previous studies related to the subject. In addition, the support given directly and indirectly to the medical and aromatic plants in Turkey has been examined and suggestions have been presented to increase the share of our country in the world trade.

EVALUATION OF AVACADO (*PERSEA AMERICANA* MILL.) LEAVES IN TERMS OF PUBLIC HEALTH

GÜLSEN KENDİR¹, AYŞEGÜL KÖROĞLU¹

ABSTRACT

Persea americana Mill. (Lauraceae) originated in central and southern of South America, is a evergreen tree. The tree commonly known as avocado. Avacado is cultivated in all tropical and subtropical regions in the world. This tree has been usually grown in southern coastal region of Turkey due to its commercial importance. Its fruit is a drupe which consumed as food. Except this, the leaves are widely used for pass kidney stone and against the urinary tract infections as therapeutic among the people in Turkey and Cyprus. This study was made to determine if they have scientific drug characteristics which used for its therapeutic feature in folk and supplied from the market of avacado leaves. For this purpose, 13 different samples from 5 diverse cities (Ankara, Hatay, İstanbul, Kayseri and Aydın) were purchased. The sample to be used as standard was obtained from the culture form. The morphological properties of leaves, which are part of the plant used as drug, were determined both in the standard sample and in the purchased samples. Anatomical features of transverse and surface sections from standard avacado leaves with transverse sections from the petiole of natural avacado leaves were investigated and determined. Besides, the distinctive anatomical structures of the powdered samples (standard sample and samples purchased from the market) were demonstrated. The avacado leaf is bifacial. The hairs are only located lower surface of the leaf and mostly unicellular. Secretory cells and crytals were observed in the avacado leaf and petiole. Crystals are simple in various sizes, and small raphids. The stomata confined to the lower surface and anomocytic type (3-6 subsidiary cells). In tranverse section taken from the petiole, the hairs were observed to be gathered on the upper surface of petiole. References 1) Yasir, M., Das, S., Kharya, M. D. (2010). COMPOSITION OF THE ESSENTIAL OILS OF TWO INULA SPECIES (*I. SALICIANA* L. AND *I. DISCOIDEA* BOISS.) GROWING WILD IN TURKEY

*M. YAVUZ PAKSOY*¹, *EYÜP BAĞCI*², *FETHİ AHMET ÖZDEMİR*³

ABSTRACT

The *Inula* genus members are mostly herbs or subshrubs, but sometimes annual or biennial herbs and belongs to the Asteraceae family. Several species of *Inula* are used in traditional medicine as an extensively used primarily for treatment of abdominal pain, emesis, diarrhea, and threatened abortion. In addition, the roots are effective in the treatment of diuretic, diaphoretic, expectorant, and anthelmintic remedy. In this study, the essential oil composition of *Inula saliciana* L. and *Inula discoidea* Boiss. collected from Turkey were analyzed. The oils obtained by hydrodistillation using Clevenger apparatus from two *Inula* species and chemical composition were determined by GC and GC-MS system. The oil yield were determined as 0.3% and 0.4% (v/w) in the both essential oils respectively. Sixteen constituents were comprised the 94.5% of the total essential oil extracted from the *Inula saliciana*. The predominant compounds of the oil were determined as 2-pentadecanone (30.5%), tetradecanal (25.5%) and [+-]Epi-bicyclosesquiphellandrene (7.0%). On the other hand, tetradecanal (38.0%) and palmitic acid (19.0%) were found as the main compounds identified in the oil of *Inula discoides*.

A TRADITIONAL TURKISH DESSERT: PEKMEZ

ŞEMŞİ GÜL YILMAZ¹, ASLI UÇAR²

ABSTRACT

In Turkey, pekmez (liquid pekmez, LP) is one of the traditional food products and it is commonly produced from grape and can also be produced from fruits containing high amounts of sugar like apple, carob, plum, watermelon, apricot, sugar beet, mulberry and fig. For this reason in Turkey when the pekmez is called the first come to mind is grape pekmez. Pekmez is generally defined as boiling concentrated or shelf-life-preserved mulberry or grape juice without adding sugar or other food additives. Grape is the most commonly used fruit in pekmez production. Grape (*Vitis vinifera* L.) is one of the world's largest fruit crops, with an approximate annual production of 58 million metric tons. About 37% of harvested grapes are used in pekmez production in Turkey. Also, about 657,000 tons of grapes are processed into pekmez annually in Turkey. Grape pekmez is produced from grapes or raisins in an open kettle or vacuumed tank. Pekmez is traditionally made in rural areas. However, commercial pekmez production in small to mid-sized plants has been on the rise in recent years. Grape pekmez is a thick, concentrated product and is produced from grape or raisin paste by decreasing its acidity. Vacuum application may be applied to concentrate the product. The purpose of concentration is to extend the shelf-life by reducing the water content and to pasteurize the grape juice. Local pekmez generally takes its name from the place it is made such as Zile pekmez, the name of a Turkish town. Pekmez has been produced in Turkey for a long time in appreciable amounts and its production technology has changed very little since it was first produced. Pekmez made in Turkey is either in the liquid or in the solid form. Turkish standards classify pekmez as sweet (pH between 5 and 6) and sour (pH between 3.5 and 5.0). In the traditional production of sweet pekmez, grapes are washed and pressed to obtain grape must. The resultant must is cloudy and acidic. Grape must mainly contains tartaric, malic and citric acid, with tartaric acid being predominant. To neutralise acidity of grape must, pekmez earth can be used in percentages ranging from 0.1% to 1%. It is generally known as pekmez, and it is a healthy and natural product. Pekmez is consumed mainly for breakfast instead of jam or marmalade. Pekmez contains high amounts of sugar, mineral and organic acid, so, it is a very important food product in human nutrition especially for babies, children, and sportsmen and in situations demanding urgent energy. Pekmez has an important function in the working of the brain in which glucose is an energy source. Pekmez easily passes into the blood without digestion because most of its carbohydrate is in the form of monosaccharide like glucose and fructose.

A REVIEW OF NURSING THESES ON AROMATHERAPY IN TURKEY

İLK NUR MÜNEVVER GÖNENÇ¹, NAZAN ÇAKIRER ÇALBAYRAM¹

ABSTRACT

Purpose: This study aims to review the nursing theses carried out on aromatherapy in Turkey. **Method:** To collect the research data, first a literature review was conducted, and then a key word search was carried out with keywords such as ‘aromatherapy’, ‘aromatherapeutic’, and ‘of aromatherapy’ in the database of the National Dissertation Center of the Higher Education Council. As a result of the search, 23 theses from Health Sciences Institute, Nursing Department related to the subject in question were identified, and the citation details of these theses were obtained. **Findings:** Of the theses conducted on aromatherapy in the field of nursing, 5 were master’s theses, and 18 were doctoral dissertations. 10 of these theses were carried out in Internal Medicine Nursing Department, 3 in Surgical Diseases Nursing Department, 4 in Fundamentals of Nursing Department, 2 in the Department of Child Health and Diseases Nursing, 2 in Women's Health and Obstetric Nursing Department, and 2 in Public Health Nursing Department. The research data in 10 of the studies were conducted as randomized controlled study. In 11 of the theses, aromatherapy was administered cutaneously, by inhalation in 9, and both cutaneously and through inhalation in 3. Lavender was the most commonly used aromatherapy oil in these studies. The effect of aromatherapy on more than one factor was studied in these studies. The first five items in terms of aromatherapy use were found to be coping with pain, coping with anxiety, improving sleep quality, reducing fatigue, and boosting life quality respectively. All of the theses found that aromatherapy agents were effective. **Conclusion:** It is noteworthy that aromatherapy has been used in many areas of nursing, including mainly in internal medicine nursing. This indicates that aromatherapy is one of the major areas of interest in nursing research. It also reflects the fact that it has the capacity to be integrated into nursing care in many areas of nursing. That nearly half of the studies were conducted as randomized controlled study increases the reliability of the research findings. It is important to recognize aromatherapy in nursing practices and authorize nurses with this regard. It is predicted that research into this area might grow if the nurses are authorized. It is believed that the outcomes of this study will guide nurses and other health professionals who are interested in studying on aromatherapy.

DETERMINATION OF ZN(II) AND CD(II) CONCENTRATION IN WHEAT THAT GROWN AT KARAMAN WITH VOLTAMMETRIC METHODS

AYSEL ÇİMEN¹, ALI BİLGİÇ¹

ABSTRACT

Toxic and persistence substances in the environment continuously accumulate and increase owing to the anthropic activities. With reference to this, one of the major problems in ecology is related to the path of toxic metals contained in all matrices involved in foods and food chain, because of their irreversible deleterious effects on man [1]. The removal of these toxic materials is crucial for the living and the people. For this reason, heavy metals were determined using voltammetric methods on the wheat grown in Karaman. Three group of crop wheat were gathered from Karaman-Konya, Karaman-Organized Industrial zone motorway and some villages of Karaman, respectively. These samples were crushed at laboratory mill to obtain whole wheat flour and then sieved with 250 micron sieve. So, some whole wheat flour sample was converted into wheat flour for analyses. All samples were prepared after melting with mixture of 10 mL 98% H₂SO₄ + 10 mL 35% HNO₃ + 10 mL 30% H₂O₂ at microwave oven. Optimized conditions were determined for Anodic Stripping Voltammetry method. Calibration curves were plotted for analyses of Zn(II), Pb(II). After that, standard metal mixtures which were prepared with standard addition method were added in to both of whole wheat flour and sieved wheat flour. So those samples were analyzed. According to these results; those samples do not include Cd(II). Also determined amount of Zn(II) below to the limit of danger for human health.

DETERMINATION OF Pb(II) AND Cu(II) CONCENTRATION IN WHEAT THAT GROWN AT KARAMAN

AYSEL ÇİMEN¹, ALI BİLGİÇ¹

ABSTRACT

Plants pick up heavy metals from the ground with their roots and leaves from the air. Plants planted with industrial wastewater contain more heavy metals. Toxic effect occurs when the human body is exposed to heavy metals over certain quantities [1]. For this reason, heavy metals were determined using voltammetric methods on the wheat grown in Karaman. Three group of crop wheat were gathered from Karaman-Konya, Karaman-Organized Industrial zone motorway and some villages of Karaman, respectively. These samples were crushed at laboratory mill to obtain whole wheat flour and then sieved with 250 micron sieve. So, some whole wheat flour sample was converted into wheat flour for analyses. All samples were prepared after melting with mixture of 10 mL 98% H₂SO₄ + 10 mL 35% HNO₃ + 10 mL 30% H₂O₂ at microwave oven. Optimized conditions were determined for Anodic Stripping Voltammetry method. Calibration curves were plotted for analyses of Cu(II), Pb(II). After that, standard metal mixtures which were prepared with standard addition method were added in to both of whole wheat flour and sieved wheat flour. So those samples were analyzed. According to these results; those samples do not include Pb(II). Also determined amount of Cu(II) below to the limit of danger for human health.

EFFECTS OF GOJI BERRY (LYCIUM BARBARUM) EXTRACT ON EXPERIMENTAL TOXOPLASMOSIS

EROL AYAZ¹, FATMA PEHLIVAN KARAKAŞ¹, KEREM YAMAN¹, AYHAN ÇETİNKAYA¹, HAYRIYE ORALLAR¹, ENES EĞİLMEZ¹

ABSTRACT

Effects of Goji berry (*Lycium barbarum*) Extract on Experimental Toxoplasmosis Erol AYAZ¹, Fatma PEHLİVAN KARAKAŞ², Kerem YAMAN¹, Ayhan ÇETİNKAYA³, Hayriye ORALLAR⁴, Enes EĞİLMEZ⁵ 1 AİBÜ Medical Faculty, Department of Parasitology, BOLU 2 AİBÜ Agriculture and Natural Sciences Faculty, Division of Medical and Aromatic Plants, BOLU 3 AİBÜ Medical Faculty, Department of Physiology, BOLU 4 AİBÜ Agriculture and Natural Sciences Faculty, Division of Poultry, BOLU 5 AİBÜ Lab Animals Application and Research Center, BOLU Aim of our study is to examine the anti-parasitic effects of *Lycium barbarum* extract on the experimental model of toxoplasmosis. *Lycium barbarum* is known as goji berry or wolf berry and used in traditional Chinese medicine as an anti-oxidant, immunostimulator, relaxing and possible an additive agent against cancer. The polisaccharides of *L.barbarum* fruit is mostly responsible for these effects. *Toxoplasma gondii* is an intracellular Apicomplexan parasite which has got a worldwide spread. Toxoplasmosis isn't a symptomatic infection but it may threat life and cause severe conditions at immunocompromised individuals, fetuses and newborns. Separate from the known effects of *L.barbarum* , no study is accomplished as an anti-parasitic agent for this plant. Method: We used methanol evaporated and lyophilised essence of *L.barbarum* fruits. We applicate this extract to 40 mice aged 2-4 months old in this study. Mice were divided into five groups according to their situation of infection and intragastric application of extract. All mice in chosen groups were infected with 1X10⁵ tachyzoites of *T.gondii* RH strain. As an antiparasitic agent, 24 mg/ml dosage of co-trimoxazole in saline, is chosen and dispensed 0.1 ml by oral gavage . Dosage of *L.barbarum* extract was adjusted 100 mg/kg in saline and dispensed 0.1 ml by oral gavage too. Group I was the healthy group without any intervention. Group II was infected with *T. gondii* tachyzoites. Group III was infected and treated with co-trimoxazole. Group IV was infected and treated with *L.barbarum* extract. Last group was the group, we both appllied the plant extract and co-trimoxazole. After, chosen groups were infected, we observed the groups and examined the parasite load by counting tachyzoites in the intraperitoneal fluid of mice at Thoma chamber. Results: Significant difference is found in study groups compared with control groups. Number of parasites found close in study groups, thus resulting no significant difference between them. As a result of our study, we decided the extract of *L.barbarum* may be helpful for treatment of toxoplasmosis. As an advise, more elaborate research may progress through using different species of parasites.

CYTOTOXIC, MORPHOLOGIC AND APOPTOTIC EFFECTS OF PROTOCATECHUIC ACID ON DU145 CELL LINE

PINAR ÖZTOPCU-VATAN¹, EMINE İNAN¹

ABSTRACT

Protocatechuic acid (PCA) is a phenolic acid and widely found spread throughout in many plants as an aromatic secondary metabolites. Previous studies, have shown different biological and pharmacological activities PCA, as well as, suppression of proliferation of cancer cells. Prostate cancer is one of the most common cancer types in men and the treatment are very limited. In this study, we determinate the cytotoxic and apoptotic effects of PCA on human prostate cancer (DU145) line. The cytotoxic effects of PCA (0.5 to 3.5 mM) was examined in cells for 24 and 48 h by MTT and Neutral Red (NR) assay. All statistical analyses were performed using one-way analysis of variance (ANOVA) and followed up by Tukey's multiple comparison tests. Morphological changes in cells were evaluated by inverted microscope. Apoptotic cell death was assessed in cells treated with 1 and 1.5 mM PCA by DAPI staining. The cell viability started to decrease at 1 mM ($p < 0.001$) for 24 h, 0.75 mM ($p < 0.001$) for 48 h. The IC₅₀ values at 24 and 48 h were estimated as 1.29 and 0.90 mM by MTT and 1.23 and 0.88 mM by NR assay respectively. Increased PCA doses caused circular cell morphology, diminished the cell number as well as increased the nuclear condensation and fragmentation on DU145 cells. We reported for the first time that PCA possess cytotoxic and apoptotic effects on prostate cancer in a time and dose dependent manner. Further studies are needed to clarify the mechanism of PCA induced apoptotic death. *This study was supported by Eskisehir Osmangazi University, Scientific Research Projects Committee (Project number: 201219A104).

EFFECT OF GOJI BERRY FRUIT EXTRACT ON SOME VITAMIN LEVELS IN RATS FED HIGH FAT DIET

FATMAGÜL YUR¹, AHMET UFUK KÖMÜROĞLU², SINAN YILDIZ², AHMET CİHAT ÖNER²

ABSTRACT

Purpose: Goji berry has been traditionally used for centuries in Asia due to its positive effects on health. In this study, we aimed to investigate the effect of goji berry fruit extract on Vitamin D, Folic acid and vitamin B12 levels in rats fed high fat diets. Method: Forty Wistar-Albino healthy rats were used as study material. The rats were divided into 4 groups, with 10 rats per group. Group 1: control group given standard pelleted feed for 60 days, Group 2: fed with 60 days of standard pelleted feed and 100mg / kg goji berry fruit extract, Groups 3: fed on a high fat diet for 60 days, Group 4 was formed from rats fed a high fat diet for 60 days and 100 mg / kg goji berry fruit extract. After 60 days, the rats were taken to the cardiac blood gel tube, and the serum was separated. Serum Folic acid, B12 and D vitamin levels were measured on an Architect brand CD16000I model autoanalyzer. Result: Serum folic acid level was significantly lower in group 3 than in the other groups. B12 vitamin and vitamin D levels were significantly lower in Group 3 and Group 4 than Group 1 and Group 2 ($p < 0.05$). Conclusion: VitD deficiency and obesity are common health problems. It still has to argue which one is the cause of the other. Vit D suppresses lipolysis by increasing the Ca ++ transition from outside to inside the cells, it stimulates lipogenesis. The same mechanism also suppresses the expression of uncoupling protein 2 (UCP2), which allows the use of lipids in mitochondria in the cell, leading to lipid accumulation. In our study, we observed that there were no effects on the vitamin level of the goji berry extract, which was reduced by Vitamin D, in the groups we fed with the oily diet. When the folate level was lower in the group fed with the overfat diet than in the other groups, but there was no significant difference (p), we observed that vitamin B12 levels fell in the 3rd and 4th groups ($p < 0.05$). Goji berry fruit extract did not affect vitamin D, B12 and folic acid levels in rats fed high fat diets.

**STRUCTURAL INVESTIGATION OF THE GLANDULAR
TRICHOMES OF ENDEMIC MARRUBIUM CEPHALANTHUM BOISS.
& NOË SUBSP. MONTANUM AKGÜL & KETENOĞLU, A NEW
SUBSPECIES FROM TURKEY**

İLKAY ÖZTÜRK ÇALI¹, ARZU CANSARAN¹, CENGİZ YILDIRIM¹

ABSTRACT

The genus *Marrubium* L. (Lamiaceae) has more than 40 species in the world. Most of them i.e. 12 species are endemic to Turkey and more than half of them (i.e. 22 species) are found in Turkey. Except few species, most of them are perennial herbs. There are a few species in this genus that is known to be used for medical purposes. The genus *Marrubium* is characterized by erect or ascending stems and densely hairy, usually having many lateral branches, leaf with toothed margins, flowers usually arranged densely on the stems known as verticillaster, having broad bracts and small bracteoles, and having tubular calyx and corolla. *Marrubium cephalanthum* subsp. *montanum* is a new endemic subspecies from Turkey. The plant specimens were collected in its flowering period from Amasya on 20.05.2016. The plant materials were identified and deposit at Amasya University. Structural studies of the glandular trichomes were carried out on vegetative and reproductive organs of the plant that were fixed in 70% alcohol. Hand made superficial sections in leaves on upper and lower surfaces and cross sections in stem, petiole, calyx, corolla were obtained to determine the glandular trichome structures of the plant. *M. cephalanthum* subsp. *montanum* has two main types of glandular trichomes. These are peltate and capitate glandular trichomes.

**SPECIES OF GLAUCIUM FLAVUM CRANTZ (PAPAVERACEAE)
MORPHOLOGICAL CHARACTERISTICS AND SPREADING AREAS
IN TURKEY.**

FATMA MUNGAN KILIÇ¹, KEMAL YILDIZ², MURAT KILIÇ²

ABSTRACT

A bright, remarkable yellow color which belongs to the genus *Glaucium* Mill. it is known as "yellow horned poppy". Species spread on the sea side, river valleys (0-50 m). The medical use; antidiabetic, anti-cancer, antibiotic and cardioprotective effect. Field work was carried out in the vegetation period covering the May to August months between the years of 2011 and 2015. The species were collected from as many different locations. Records of the collected samples were kept, photographs were taken in natural growing environments and the specimens collected were dried according to standard procedures and transformed into herbarium specimens. Pollen and seeds of the species were analyzed by scanning electron microscopy (SEM). As a result of morphological examination, the stem is 23-42 cm length, hairless, branched, whitish green; the leaves are thick, very green-matte. Flower buds are hairless or slightly acute, ovate -rectangular, acute, petals usually yellow. As a result of the morphological investigations, parallelism was observed between the obtained data and the Flora of Turkey. In addition, the spreading areas and description have been improved and the obtained data has been transformed into a table. At the end of the palynological investigation, pollen grains usually were spheroidal in shape and tricolpate aperture, ornamentation microecinate and microperforate. Seed features; reniform, that surfaces alveolate and faveolate was observed.

GOLEVEZ (TARO, KOLOKAS)

AYLA ÜNVER ALÇAY¹, EKİN DİNÇEL¹, MERYEM BADAYMAN¹

ABSTRACT

Research into food-derived bioactive components for cancer prevention as well as cancer therapy is growing due to the relatively low or no detectable toxicity and better bioavailability. In this regard, it has been carried out scientific research on the plant called "golevez" in our country and "taro, old cocoyam, eddoe or dasheen" in other countries. Golevez [*Colocasia esculenta* (L.) Schott] is a tropical root vegetables from the family of the Araceae. Golevez, which is produced extensively in 43 states around the world, is grown in Alanya and Gazipaşa of Antalya, Bozyazı, Anamur districts of Mersin and is well known as "kolokas" in the Turkish Republic of Northern Cyprus and widely consumed. The primary use of golevez is the consumption of edible leaves and root corms. The corms can be cooked as vegetables with boiled. The leaves of golevez are eaten as vegetables by people and are evaluated as wrapping and soup. Gollevez's corms is cooked with boiled meat, beans and chickpea. It is used as canned food, flour, chips, noodle and frozen food in tropical and subtropical countries. Dried fine powder of the plant's corm is used as additives for bread, pastry, food and pasta. Mucilage of golevez participates in diet products. Oxalic acid can be present in the leaves and root corms. Because of this, the plant must not be defeated without cooking, the oxalate ion can cause high irritation in the digestive tract. Since the method of processing of the golevez is very unknown in our country, it is widely consumed only in the regions where it is produced. The pharmacological effects of the plant are also unknown in our country. However, it has been known in the world since ancient times for its medicinal properties and is being used to help treat various diseases such as asthma, arthritis, diarrhea, internal bleeding, neurological disorders and skin disorders. It has been found that the extracts obtained from this plant have various pharmacological activities. Antimicrobial, antioxidant, antiinflammatory and anticancer activity of *Colocasia esculenta* has been reported. It has been reported with the scientific studies made that extracts obtained from this plant inhibit certain tumor metastases strongly and specifically. As research on *Colocasia esculenta*'s corm and leaves is promising and encouraging, it is necessary to purify the active components and to carry out their clinical studies in the future in order to increase these activities. In this review, the traditional use and known pharmacological effects of *Colocasia esculenta* have been examined.

GRAPE SEED AS A FUNCTIONAL COMPONENT

MUTLU BUKET AKIN¹, ASLI ÇELİKEL¹, KAMILE BURCU BÜYÜKKILIÇ¹, MUSA SERDAR AKIN¹

ABSTRACT

Grape seed obtained after wine or juice making and contains 13–19% oil, about 11% protein, 60–70% of non-digestible carbohydrates, phenolic compounds, and non-phenolic antioxidants such as tocopherols and beta carotene. The phenolic compounds in grape seeds are essentially all flavonoids, flavan-3-ols (catechin, epicatechin and epicatechin-3-O-gallate monomers) and their polymers. Grape seed has been used as grape seed oil or grape seed extract in food industry. Grape seed oil (also called grapeseed oil or grape oil) is pressed from the seeds of grapes. The nutritional value of the grape seed oil is very high because of the rich unsaturated fatty acids, mainly linoleic and oleic acids of the oil. Grape seed oil also contains bioactive compounds including phytosterols, tocopherols, tocotrienols, flavonoids and phenolic acids with recognized biological importance due to their antioxidant activity. This components contribute to the beneficial effects of the grape seed oil. Particularly, grape seed oil is a rich source of vitamin E and contains high quantities of tocopherols and tocotrienols. The grape seed extract contains high levels of phenolic compounds including flavonoids, procyanidins and phenolic acid. It is reported that proanthocyanidins as plant-based health-beneficial components in the human diet have potential health beneficial effects depending on their structure and especially on their degree of polymerization. It has been demonstrated that proanthocyanidins possess a large spectrum of pharmacological and therapeutic benefits including antioxidant, antithrombotic, antibacterial and antiviral, anti-inflammatory, anti-allergic and anticarcinogenic activities. Thus, due to its composition and related properties, grape seed has emerged as a product with health-promoting effects and having the potential for use in pharmaceutical and food applications as a functional components.

ORGANIC COSMETIC PRODUCT USAGE PREVELANCE OF WOMEN WORKING IN TRABZON

NURHAN GÜMRÜKÇÜOĞLU¹, DIDEM SARIMEHMET¹, SEVILAY HINTISTAN¹, NIHAT BURAK ZİHNİ¹, GONCA SERDAR¹

ABSTRACT

In this study, it was aimed to examine the prevalence of organic cosmetic product usage in women working in Trabzon. The sample of the research made by the descriptive type is 154 women working in different institutions in Trabzon. Data were filled with face-to-face interview technique using the questionnaire form. When the prevalence of use of organic cosmetics in the survey is examined; 95.5% used hand soap every day, 69.5% used shampoo once a week, 57.1% used hair dye and hair once a month, and 3.2% used face lotion every year. Among the products that are never used; Makeup material (3.9%), nail polish (2.6%) and shower gel (1.9%) are in the first three ranks. Brand names (75.3%) were the most important factor in the purchase of organic cosmetics products by working women and internet environment (51.3%) was the preferred place to purchase. As a result, working women often use organic cosmetics.

SPECTACULAR FOOD-DRUG INTERACTION: ST. JOHN'S WORT (HYPERICUM PERFORATUM)

MUSTAFA FEVZİ KARAGÖZ¹, MAKBULE GEZMEN-KARADAĞ¹

ABSTRACT

St. John's wort, which is distributed in hot and temperate regions all over the world, has 89 species in Turkey, the most common being *Hypericum perforatum* L. species. The properties of St. John's wort, which has antiinflatuar, analgesic, antidepressant, antiviral, antimicrobial and antioxidant effects, are derived from hyperforine, flavonoids, procyanidins, essential oils, phenylpropanals, xanthenes and gamma aminobutyric acid (GABA). Hipericine and quercetin have the ability to bind to dopamine receptors, miquelianin and rutin bind to adrenergic receptors. Hyperforin inhibits synaptosomal reuptake of serotonin, norepinephrine, GABA and dopamine. Hence, *Hypericum perforatum* shows similar properties to some synthetic antidepressants (SSRI, MAO etc.). St. John's wort triggers the activity of cytochrome-P isozymes (CYP3A4, CYP2E1 fe CYP2C19) and the synthesis of a carrier membrane protein, P-glycoprotein (P-gp). St. John's wort has been shown to increase the metabolism of many medicines, mainly by increasing the activity of intestinal CYP3A4 enzymes. This is accomplished by activating the nuclear pregnane X receptor and inducing CYP3A4 expression. The increase in the synthesis of P-gp leads to a decrease in drug absorption and an increase in excretion. The hypericum extract reduces the plasma concentration of some antineoplastic agents (irinotecan) by triggering liver metabolism of P-gp and CYP3A4. Along with the use of St. John's wort, the half-life of oxycodone, which is used in the treatment of patients with chronic pain, is shortened, thereby the plasma concentration of drug is reduced. Finally, medicines used in the treatment of diseases should be carefully considered in terms of the interaction with the St. John's wort and other nutrients in order not to adversely affect the treatment.

POTENTIAL HEALTH BENEFITS OF CHAMOMILE TEA

BÜŞRA BAŞPINAR¹, JIYAN ASLAN¹, AYŞE ÖZFER ÖZÇELİK¹

ABSTRACT

Accepted as native to Europe and Western Asia, Chamomile (*Chamomillarecutita*) is widely found in all regions of Turkey, and it is used as a medicinal plant in Europe. One of the most popular herbal tea, chamomile tea is consumed more than a million cups a day worldwide. The beneficial effects of chamomile on health, determined to have more than 120 compounds, are generally divided into two classes: sesquiterpenic compounds such as α -bisabolol, bisabololoxides A and B, chamazulene and farnesene, and phenolic compounds, namely flavonoids including apigenin, quercetin, patuletin and luteolin, and their glucosides. In addition, coumarins are also considered to be an important bioactive component. Studies conducted so far have shown its antiparasitic, antioxidant and anticancer characteristics which support the use of the chamomile in the treatment of various diseases. Chamomile has been used to treat a variety of inflammation, irritation, and pain such as skin diseases, sores, eczema, ulcers, gout, neuralgia, and rheumatic pain. It has been determined in animal model studies that chamomile has strong anti-inflammatory effect, and antispasmodic and anxiolytic effects as well as some antimutagenic and cholesterol-lowering activities. Recent studies have focused on the anti-diabetic effects of chamomile tea. The purpose of this study is to investigate the effects of various bioactive compounds found in the content of chamomile tea.

CURE COMES FROM THE WATER “CHLORELLA AND SPIRULINA”

ASENA ÜNVER¹, SEVİM HAMZAÇEBİ¹, DİLCAN AKPINAR¹, FATMA ÖZTÜRK¹, HATİCE GÜNDÜZ¹

ABSTRACT

The need for new food supplies has arisen due to the increase in the population of the world. As the terrestrial sources are unable to cope with the increasing demand people have a tendency towards aquatic resources. One of the most important aquatic creatures is the algae. In addition to their being a nutrient, they are also used as medicine. Their importance comes not only from the fact that they are the nutritional source of a variety of aquatic creatures but also from their part in producing the two thirds of the world's photosynhate carbon and their function in maintaining the integrity of the ecosystem. As a nutrition and a medicine algae has a major importance in China, Japan and Korea. In many countries it is used in various fields such as medicine, pharmacology, cosmetics, chemistry, agriculture, food industry and energy sector Chlorella and Spirulina are the two most prominent algae species used in food supplement industry in our country as well as the rest of the world. If the fossil records are to be examined it could be noticed that Chlorella has a cell structure that has not been changed for almost 2.5 billion years.. Spirulina has become widely used throughout the world thanks to its being an essential food of the Aztecs. Spirulina is a protein source with its low level of fat and calories and it contains nearly all essential amino acids. These two species of seaweed are preferred due to their rich nutritional value and that they can be reproduced in labrotaries. These algae species are rich in vitamin B12, minerals, protein and iron and that makes them useful in the renewal of the heart cells and in fighting against diseases such as high levels of cholestrol, ulcer, cancer,flu etc. In Turkey, this two of algae are sold by many of companies as a food supplement.

EFFECTS OF COMMON DAISY (BELLIS PERENNIS) EXTRACT ON EXPERIMENTAL TOXOPLASMOSIS

FATMA PEHLIVAN KARAKAŞ¹, EROL AYAZ¹, KEREM YAMAN¹, AYHAN ÇETİNKAYA¹, MÜCAHİT ÇAKMAK¹,
GÖKÇE BOZAT¹

ABSTRACT

Effects of Common Daisy (*Bellis perennis*) Extract on Experimental Toxoplasmosis Erol AYAZ¹, Fatma PEHLİVAN KARAKAŞ², Kerem YAMAN¹, Ayhan ÇETİNKAYA³, Mücahit ÇAKMAK⁴, Gökçe BOZAT² 1 AİBÜ Medical Faculty, Department of Parasitology, BOLU 2 AİBÜ Agriculture and Natural Sciences Faculty, Division of Medical and Aromatic Plants, BOLU 3 AİBÜ Medical Faculty, Department of Physiology, BOLU 4 AİBÜ Lab Animals Application and Research Center, BOLU Aim of our study is to examine the anti-parasitic effects of *Bellis perennis* extract on the experimental model of toxoplasmosis. *Bellis perennis* is a herbal perennial plant used as an antimicrobial and anti-inflammatory agent in traditional medicine. Some researchs showed the diuretic, analgesic and anti-pyretic effects of this plant, especially the leaves. *Toxoplasma gondii* is an obligate, intracellular parasite which has got a high seropositivity around world. Although toxoplasmosis is not a clinically symptomatic infection, it gains importance at immunocompromised patients and fetuses. Dependent to the anti-microbial, anti-inflammatory effects, there is no research on the usage of *B.perennis* as an anti-parasitic agent. Method: We used ethyl acetate evaporated and lyophilised essence of *B.perennis*, We applicate this extract to 40 mice aged 2-4 months old in this study. Mice were divided into five groups according to their situation of infection and intragastric application of extract. All mice in chosen groups were infected with 1X10⁵ tachyzoites of *T.gondii* RH strain. As an antiparasitic agent, 24 mg/ml dosage of co-trimoxazole in saline, is chosen and dispensed 0.1 ml by oral gavage . Dosage of *B.perennis* extract was adjusted 100 mg/kg in saline and dispensed 0.1 ml by oral gavage too. Group I was the healthy group without any intervention. Group II was infected with *T. gondii* tachyzoites. Group III was infected and treated with co-trimoxazole. Group IV was infected and treated with *B.perennis* extract. Last group was the group, we both apply the plant extract and co-trimoxazole. After, chosen groups were infected, we observed the groups and examined the parasite load by counting tachyzoites in the intraperitoneal fluid of mice at Thoma chamber. Results: According to parasite load of study groups, we found significant decrease of tachyzoite levels in the groups III, IV and V, within comparison to control group II. Besides, no significant difference is indicated between groups III, IV and V. All mice but groups I and II, are found dead on day 7 post-infection. There is no change in normal life span of mice in group I and all mice in control group II are found dead on day 2 and 3 post-infection. As a result of our study, we concluded that the ethyl acetate extract of *B.perennis* is found beneficial for toxoplasmosis. We advise the usage of this herbal extract as an anti-parasitic agent could be helpful to cure toxoplasmosis.

A FRUIT PACKED OF HEALTH: TAMARIND (TAMARINDUS INDICA)

MUSTAFA FEVZİ KARAGÖZ¹, MAKBULE GEZMEN-KARADAĞ¹, HILAL YILDIRAN¹

ABSTRACT

Tamarind belongs to the family of Fabaceae and is one of the fruits used in ayurvedic medicine. This fruit, rooted in Africa, is then exported to Asian countries such as India and Indonesia, and to America countries such as Mexico and Costa Rica. Tamarind is rich in phytochemicals besides vitamin and mineral content. Tamarind leaves have antiinflammatory features that diclofenac (NSAID)-like effect. In diabetic rats, using tamarind seed extract by 120 and 240 mg/kg per day, the levels of NO were decreased by 22 and 43%, respectively. When compared to corresponding diabetic control rats, TNF- α levels were dose-dependent decreased, dramatically ($p < 0,05$). Tamarind has antidiabetic properties due to increasing pancreatic intracellular Ca⁺ levels by insulin-like action in pancreatic β cells. Tamarind shows laxative activity because of fiber, malic and tartaric acid content, and also its bark and leaves are used for wound healing. Due to acidic content longed-term use can lead to tooth decay. The content of tannin can make it difficult to digest tamarind, so it is recommended to consume it as boiled or in water. When tamarind consume with aspirin and ibuprofen, bioavailability of and blood concentration of drugs increase. Considering health effects such as antiinflammatory, antioxidant, antidiabetics etc., be careful for drug interactions and other potential adverse effects in the use of tamarind which is inevitable in the use of ayurvedic medicine.

USE OF HAWTHORN (CRATAEGUS SPP.) FOR DIFFERENT MEDICINAL USES

MURAT AYDEMİR¹, MEHMET NURI NAS²

ABSTRACT

The hawthorn is known in Turkey with different names such as yemisen, alic, aluc, erderan, beyaz diken or eksi musmula. There are up to 200 species of recipient of the Rosaceae family under the Crataegus genus in the world, and this number has been increased to 1200 by some taxonomists. There are 17 species of Crataegus in Turkey. Naturally the most spreading species is Crataegus monogyna at the same time Crataegus orientalis, Crataegus oxyacantha and Crataegus aronia species are also common. Hawthorn fruit and flowers contain many useful substances for human health, especially antioxidant flavonoids (flavanes), vitamins (especially vitamin C), saponins, organic acids, ether oils and sugars. In the field of medicine, the number of studies analyzing the effects of substances contained in hawthorn fruits on human health are increasing day by day.

NUTRITIVE VALUE AND FUNCTIONAL PROPERTIES OF CHIA SEED (*SALVIA HISPANICA* L.)

YELİZ SERİN¹, GAMZE AKBULUT¹, NILÜFER ACAR TEK¹, HATİCE BÖLÜKBAŞI¹

ABSTRACT

Salvia hispanica L., also known as chia, is a herbaceous plant cultivated semi-annually, and it belongs to the family Labiatae, division Spermatophyta, and kingdom Plantae. Chia is native to the region that stretches from North Mexico to Guatemala. Its seeds were widely used by Aztec tribes for food, medicine, and paints. Nowadays chia seeds are commercially grown in Mexico, Bolivia, Argentina, Ecuador, and Guatemala. The seeds are small with an oval, flattened shape and ranged in color from dark coffee to beige with small darker spots. The chia plant is sensitive to daylight and produces black and white seeds. Black colored chia seeds are more common. White seeds are larger, thicker and broader than the black seeds. The plant can grow in a wide range of well-drained clay and sandy soils with reasonable salt and acid tolerance. Different ecosystems have variable significant effects on the nutrient composition of *Salvia hispanica* especially its protein and oil content and also the fatty acid composition. The environmental factors which have been found to influence the composition of chia seeds include temperature, light, soil composition and type/variety. Chia seed contains a significant amount of lipids (approximately 40% of the total weight), with almost 60% of the lipids comprising Omega-3 fatty acids. Dietary fiber constitutes more than 30% of the total weight of the seed, and approximately 19% of the seed contains proteins of high biological value. The 25-g serving of chia seeds had 540 kJ, with 7.7 g total fat, 3.9 g protein, 11.0 g carbohydrate, 9.4 g dietary fiber, 4.4 g ALA, 1.4 g linoleic acid, and 158 mg calcium. Chia seeds possess many important functional properties (water-holding capacity (the chia seeds can absorb water up to 12 times their weight), oil holding capacity, solubility, viscosity, emulsion stability and foaming stability) which prove its potential to be used as a thickening agent, gel forming agent, chelator, foam enhancer, emulsifying agent, clarifying agent, rehydrating agent and as suspension formers in the formulation of food products at both home and commercial level. All these properties make chia a promising functional food for the future. From the past to the present day, possible therapeutic effects of chia (such as control of diabetes, dyslipidemia, hypertension, as anti-inflammatory, antioxidant, anti-blood clotting, laxative, antidepressant, anti-anxiety, analgesic, and immune improver) has been discussed in the scientific literature. Although not common in studies on humans, some research points to the consumption of chia having a positive effect on health. However, these studies vary a great deal in both sample size and the profiles of the individuals in the sample group, which may have created a discrepancy in the findings. Furthermore, the quantities and forms of chia seed —ie, milled, whole-seed, baked in bread— were different in the different studies. Also, studies of chia's intake in a human diet which take into consideration factors such as lifestyle and genetic variations are still limited. European Parliament and Council of Europe approved chia seeds as a Novel Food in 2009. Till date, no study has revealed any adverse toxic, allergic or anti-nutritional effects after ingesting whole or ground chia seeds. In 2015, García Jiménez S and co-workers described the first case of an IgE-

mediated anaphylactic reaction induced by chia seeds. The allergens involved are water-soluble and liposoluble and include a lectin, an elongation factor, and an 11S globulin as known allergens. So, more clinical trials on animals and humans need to be done to ascertain the safety aspects of chia seeds.

USE OF MICROELGAN'S AS PIGMENT SOURCE

DİLCAN AKPINAR¹, ASENA ASENA ÜNVER¹, SEVİM HAMZAÇEBİ¹, FATMA ÖZTÜRK¹, HATİCE GÜNDÜZ¹

ABSTRACT

Microalgae, which are abundant in nature, contain a wide variety of color materials in their structures. Some of those; Astaxanthin, beta-carotene, phycocyanin, xanthophyll and phytoerythrin. These pigments can be used as natural pigments in food, medicine, textiles and cosmetics instead of synthetic pigments thought to be carcinogenic. Phycocyanin is a natural coloring substance with strong fluorescence properties, blue color, odorless, non-toxic, water-soluble. Due to its fluorescent properties, it is used as a fluorescent probe in microscopic, cytometry, immunology, tissue chemistry studies. In addition, they are used in nutraceutical and pharmaceutical applications due to antioxidant and radical scavenging effects. In this review, the pigments obtained from microalgae, their uses and new technologies will be mentioned.

DETERMINATION OF ANTIOXIDANT AND ANTIMICROBIAL ACTIVITIES OF FIVE MULTIFLORAL HONEY SAMPLES FROM COLLECTED DIFFERENT REGIONS IN TURKEY

DUYGU ODABAŞ ALVER¹, ÖMER ERTÜRK², İLGINÇ KIZILPINAR TEMİZER¹, AYTAÇ GÜDER¹, SEVİM ÇİFTÇİ YEGİN¹

ABSTRACT

Honey possesses antioxidant and antimicrobial activities. Many chronic diseases are associated with increased oxidative stress caused by an imbalance between free-radical production and antioxidant level. For that purpose, the total phenolic contents, antioxidant potentials and antimicrobial activities of five multifloral honey samples obtained from Turkey were investigated. The world population living in rural areas have confidence in herbal traditional medicines as their primary health care, the work on features and uses of medicinal plants and honey are getting growing curiosity. The difference between them indicated the presence of antimicrobial substance in honey. The kinds of antimicrobial substances (inhibines) in honey are evaluated. Hydrogen peroxide is not the only inhibine in honey. In fact, inhibines in honey include many other substances. Two important classes of these inhibines are the flavonoids and the phenolic acids. In this study, five multifloral honeys were compared with using pollen analysis, different antioxidant and antimicrobial test methods. The antioxidant capacity of honeys was assessed through the hydrogen peroxide scavenging activity (in terms of SC50), ferric reducing antioxidant power capacity (FRAP), DPPH radical scavenging activity (in terms of SC50), metal-chelating activity (%), total phenol content (TPC), and total flavonoid content (TFC). Additionally, antimicrobial activities of honey samples were investigated by using disc diffusion assay method against four Gram positive bacterias (*B. subtilis*, *S. aureus*, *L. monocytogenes*, *C. perfringens*), four Gram negative bacterias (*P. aeruginosa*, *E. coli*, *S. enteritidis*, *K. pneumoniae*) and a fungus (*C. albicans*). The antioxidant capacities of multifloral honeys were found between 251.99-269.96 µg/mL(HPSA), 72.47-74.66% (FRAP), 599.95-633.75 µg/mL(DPPH), 34.45-72.90% (MCA), 26.66-112.8 mg GAE/100 g (TPC) and 5.39-9.32 mg CAE/100 g (TFC). For comparison of these results, butylated hydroxy anisole (BHA), butylated hydroxy toluene (BHT) and α -tocopherol (TOC) were used as standard antioxidant compounds. The antimicrobial activity of multifloral honeys were found against *B. subtilis*, *S. aureus*, *L. monocytogenes*, *C. perfringens*, *P. aeruginosa*, *E. coli*, *S. enteritidis*, *K. pneumoniae*, *C. albicans* between 9.78-14.44, 6.00-13.11, 8.64-13.12, 6.00-12.27, 10.32-14.10, 6.00-15.22, 9.78-13.85, 6.00-13.22 and 6.00 mm, respectively. As a result, it has been observed that multiflower honeys had antibacterial effects against the Gram (+) and Gram (-) bacteria activities but not the fungus. The result of this study indicates that antimicrobial and antioxidant activities of multifloral honeys can be varied based on pollen composition.

KONJAC GLUCOMANNAN AND HEALT BENEFITS

MUSA SERDAR AKIN¹, KAMILE BURCU BÜYÜKKILIÇ¹, ASLI ÇELİKEL¹, MUTLU BUKET AKIN¹

ABSTRACT

The konjac glucomannan (KGM) is a water-soluble polysaccharide (dietary fibre) isolated from tubers of *Amorphophallus konjac* K. Koch. It is a perennial plant belonging to the family Araceae. *Amorphophallus konjac* K. Koch has been cultivated for centuries in Asian countries as a source of food and as an ingredient for traditional Chinese medicine. Konjac products are regarded as one of the "top 10 health foods" by World Health Organization. The polysaccharide has been largely consumed as a nutritional supplement. The important health benefits of KGM includes in reducing cholesterol, normalizing triglyceride concentration in blood, promoting intestinal activity and immune function, improving blood sugar levels and wound dressing. KGM is considered as an indigestible dietary fibre being resistant to hydrolysis by the action of digestive enzymes in the human gut. In pharmaceutical industry, KGM is used in the preparation of hydrogel as a DNA-controlled release matrix. In addition, it has been used to improve glycaemia and other related risk factors for coronary heart diseases in Type II diabetic patients. Therefore, KGM is recognized as a safe biomaterial according to the FDA (Food and Drug Administration, USA) for therapeutic uses. In this review, health benefits of KGM have been investigated.

MINERAL AND FATTY ACID COMPOSITION OF NIGELLA SATIVA OIL

SERPİL KILIÇ¹, TIMUR TONGUR¹, MURAT KILIÇ¹, TANER ERKAYMAZ¹

ABSTRACT

Nigella sativa, is a widely distributed annual herbaceous plant. For many years, the plants use for protective and therapeutic purposes from diseases and the usage are increased for lesser side effects and more safe of plants. These kind of products are increased depends on these interests. The efficacy, stability and quality of these products are affected to the public health. In particular, *Nigella sativa* oil is considered as one among newer sources of edible oils and it is important role in human nutrition and health. *Nigella sativa* oil or extract has protective and curative actions. Therefore, this investigation was undertaken to obtain information about the mineral composition of cold-pressed *Nigella sativa* oil sample and to the determine fatty acid profiles. In this study, the concentrations of mineral composition (Cu, Fe, Mg, Mn, Se and Zn) were determined in *Nigella sativa* oil by inductively coupled plasma mass spectrometry (ICP-MS). The samples were digested with nitric acid and hydrogen peroxide in a microwave oven. The calibration was accomplished by adding the standards prepared in the concentrations of 2, 5, 10, 25, 50, 100 and 200 µg L⁻¹ from the 10 mg L⁻¹ stock standard solution. In sample levels of Cu, Fe, Mg, Mn and Zn were found to be 475 µg/L, 20 mg/L, 112 mg/L, 456 µg/L, 10 mg/L, respectively. Selenium could not be detected. Determination of fatty acid and the esters profiles were completed by using gas chromatography mass spectrometry (GC-MS). Prepared samples, for FAME analysis, a TRACE TR-Wax GC capillary column (30 m× 0.32 mm) was used. The gas chromatograph system was combined with Thermo Trace GC and ISQ mass selective detector. The GC oven was kept at 60 C for 3 min, heated at 8 C/min up to 300 C, where it was kept for 1 min, and a total analytical time was 34 min. The carrier gas was helium (1 ml/min). The analysis of a sample by GC was carried out by injecting 2 µl of the sample solution into the GC. The formed methyl ester was identified by a selected ion monitoring (SIM) method. The major components of fatty acids in *Nigella sativa* oil are linoleic (%41), palmitic (%24) and oleic acids (%17). % Levels of Myristic acid, Palmitoleic acid, Heptadecanoic acid, gamma-Linolenic acid (GLA), Elaidic acid, Stearic acid, dihomogamma-linolenic acid, Methyl Eicosenoate, cis-11,14-Eicosadienoic acid, Arachidic acid and Behenic acid were found to be 0.6, 0.2, 0.1, 2.3, 0.7, 9.5, 0.7, 0.5, 2.2, 0.4 and 0.1, respectively.

PSEUDO-CEREALS: BUCKWHEAT AND QUINOA

HILAL BETÜL ALTINTAŞ¹, YELİZ SERİN¹, GAMZE AKBULUT¹, NILÜFER ACAR TEK¹

ABSTRACT

Cereals such as teff and millet, which grows rarely and/or in specific places, are called “minor-cereals”; small-pieced cereals, which are seed-sized, are called “pseudo-cereals”. Botanically speaking, most cereals such as wheat, barley, and rye are monocots while pseudocereals such as amaranth, quinoa, and buckwheat belong to eudicots group. Buckwheat is an annual plant which belongs to Polygonaceae family. It is shown with 20-25 cm intervals at the end of March or at the beginning of April and harvested in September or October. The height of buckwheat to be harvested can change between 60-120 cm according to conditions and climate type. One of the most important features of buckwheat is that it can adapt to growing at high altitudes in a short time. Buckwheat grain of which glumes are removed are called groat. Those are the ones which haven’t gone through heat process; raw grains of buckwheat. Groats, fractured or whole, have no inedible black glue on. Unprocessed white grains are a bit bitter. For this reason, if they are roasted with some oil until they turn rustish red before cooking, this bitter taste will disappear and leave a nice flavor. Most common buckwheat types grown as a food source are “common buckwheat” (*Fagopyrum esculentum* Moench) and “Tatar Buckwheat” (*Tartary Buckwheat-Fagopyrum tataricum* Gaerth). Common buckwheat is usually preferred because it has a delicious taste and a big seed, while Tatar buckwheat is preferred less because it has a bitter taste and a glue which can be peeled difficultly. The color of buckwheat is among the quality criteria along with its taste. Freshly harvested buckwheat seeds are light green. The color of old seeds is reddish brown. Whereas the annual buckwheat production changes year to year worldwide, the average production is around 3.5 million ton at present. In last 40 years, China has been the biggest buckwheat-producing country. %73.5 of a buckwheat grain consists of starch and %33.5 of it consists of resistant starch. Glycemic index of nutrients which contains resistant starch are usually low and this condition is an advantage for healthy adults. Quinoa Quinoa (*Chenopodium quinoa* Willd), an annual plant, is a member of goosefoot family (*Chenopodiaceae*) which includes spinach and beet. This plant is an endemic plant which generally belongs to And Region of South America (Colombia, Argentina, Peru, Bolivia, Chile, and Ecuador). Moreover, it is resistant to unsuitable climate conditions (frost, drought, etc.) and soil conditions (such as saltiness). Quinoa, used as a traditional food by most South American natives, like rice, can be used as a pilaf or be putting in soup dishes. Also, quinoa flour can be used for production of bakery products such as cookies, bread, biscuits, crisps, and pancakes. Leaves of this plant can be consumed like spinach and its sprouts can be added to salads. Buckwheat and quinoa are commonly used especially in the gluten-free food industry. Buckwheat (*Fagopyrum esculentum* Moench) includes a high level of protein, diet fiber, vitamins, minerals, basic non-saturated fat acids and antioxidants such as rutin and quercetin. Likewise, quinoa includes important micro-nutritional compounds such as minerals, vitamins and bio-active elements in balanced amounts.

FUNCTIONAL FOOD AWARENESS OF VOCATIONAL HIGH SCHOOL STUDENTS

NURHAN GÜMRÜKÇÜOĞLU¹, DIDEM SARIMEHMET¹, SEVILAY HINTİSTAN¹, BAHAR CANDAŞ¹, GONCA SERDAR¹

ABSTRACT

Functional food; Is food or food components that reduce or mitigate some of the disease and health conditions as well as basic nutrition. In recent years, globalization, population growth, changing living standards with urbanization, increased health spending, increased elderly populations, and the emergence of various diseases have caused changes in the diet of individuals. Individuals are trying to take precautions by using health protective natural products as well as medicinal products such as medicines for the protection of diseases for healthy and quality life. The aim of this study is to determine the factors affecting the attitudes, knowledge levels and functional power consumption of the students attending to KTU Health Services Vocational School. A questionnaire consisting of various questions was applied to the students under the 7 sections heading. Within the scope of the research, the students were evaluated whether they were familiar with the term functional foods, consumed these nutrients, consumed them and their reasons, level of knowledge about health claims, in which situations they wanted to consume these foods and how they wanted to be informed. According to the results of the research, it has been determined that the three most functional foods consumed are mineral water (%76,8), herbal teas (%66,3) and Milk and dairy products that help digestion (%49,5). The aim of students to use functional foods for their favorite taste (%56,8), the second in order to be healthy (40.5%), in third place to assist in the digestion was determined as (%33.2). It has been determined that the least use is to reduce the risk of high blood pressure. As a result of the statistical analysis, it was seen that there was no meaningful difference between genders in terms of sources of information. In this study it was concluded that students did not know that functional foods were named as functional foods despite their definitions.

NATURAL MUSHROOMS CONSUMED IN TURKEY AND THEIR CONSUMPTION PATTERNS

YASIN UZUN¹, ABDULLAH KAYA¹, SEMİHA YAKAR¹

ABSTRACT

Introduction: Fungi are important organisms that serve many vital functions especially in terrestrial ecosystems. Those fungi producing large and easily observed fruiting bodies are referred as macrofungi. The best known examples of macrofungi are the mushrooms. Wild edible fungi are collected and consumed by people for thousands of years. There is a huge diversity of different types, from truffles to milk-caps, chanterelles to boletes. Current checklists and the contributory studies on Turkish higher fungi were traced and it is found that about 300 edible taxa belonging to 9 orders, 40 families and 72 genera have so far been identified in Turkey and almost 54 species of them are generally or locally collected and consumed or marketed. Compared to edible macromycota of Turkey, naturally growing mushroom consumption can be regarded as very low. The Turkish people are especially know; *Morchella esculenta* as "Kuzu Göbeği"; *Lactarius deliciosus* as "Kanlıca Mantarı, Çintar" ; *Terfezia boudieri* as "Dolaman, Keme"; *Agaricus campestris* as "Çayır Mantarı" ; *Pleurotus ostreatus* as "İstiridyeye Mantarı, Kavak Mantarı, Kayın Mantarı"; *Boletus edulis* as "Ayı Mantarı" ; *Cantharellus cibarius* as "Tavuk Mantarı"; *Craterellus cornucopioides* as "Borazan Mantarı, Huni Mantarı" and *Helvella leucomelaena* as "Çukur Çanak Mantarı". Some of the edible fungi especially *Agaricus bisporus*, *Pleurotus ostreatus*, *Pleurotus citrinopileatus*, *Ganoderma lucidum*, *Lentinula edodes*, *Grifola frondosa*, *Hericium erinaceus* and *Flammulina velutipes* are also cultivated in Turkey.

COMPARATIVE OF THEIR FUNCTIONAL PROPERTIES BY MIXING VEGETABLE OIL IN THE DIFFERENT RATIO

ŞEYMA ÇETİNER¹, BÜLENT BAŞYİĞİT², İBRAHİM HAYOĞLU²

ABSTRACT

Vegetable oils have an important role to regulate the body's functions. Vegetable oil prevent lots of health problem. They relax body as mental and physical. Vegetable oils are more preferred than animal oils because it is thought that animal oils have some health problems. Vegetable oils have low ratio of saturated oil, contain oil acids which is necessary for body and they can solve Fat-soluble vitamin as A, D, E, K. Vegetable oils have high nutrition values. The objective of this study obtained a functional product by mixing oil of sesame, soybean, mustard and cumin. Antioxidant capacity of body is fungible when people consume this oil mixture because they contain vitamin e, variety sterols and sesamin, sesamol. Average refractive index, L*, a*, b*, peroxide and free acidity of oils were found to be between 1.47-1.48, 21.88-26.85, -0.15-3.68, 7.10-12.62, 6-6.25 meqg 02 kg-1 ve 0.56-3.86 (as oleic acid).

UZERLIK (PEGANUM HARMALA L.)

EKİN DİNCEL¹, AYL A ÜNVER ALÇAY¹, MERYEM BADAYMAN¹

ABSTRACT

From past to present day plants are used in the treatment of many diseases. In addition to this, it is known that a variety of plants have been used for the purpose of protection from the whammy. Very commonly known as "Peganum harmala" is a plant species from the family Nitrariaceae that grows in the hot regions of Africa, Asia and America. In our country, it is found in all Central Anatolian steams, especially in Ankara, Konya, Sivas, Nigde, Erzincan, Kayseri and Şanlıurfa. This plant is also known as "uzerlik, nazar otu, wild pearl grass, sipend, cypendan, isfend, mahmurcegi, yellow garlic, ilezik, eldruks and ilruk". Uzerlik (Peganum harmala) is a perennial plant that blooms in May-July, with white flowers, 30-50 cm in length. The green cone-shaped fruit has brown seeds inside. The fruit is a flat globular capsule. Once the seeds of the uzerlik (Peganum harmala) are dried, the tea can be made. It can be consumed by mixing with honey and baked or mixed with water. Moreover, the amulets made from the Peganum harmala are hanged in the houses. In order to prevent hazelnut, grains of Peganum harmala or incense of this seed are widely used in Anatolia. The active components of the uzerlik are alkaloids, which are especially found in seeds and roots. The total alkaloid ratio is 4-7%. Among the alkaloids harmin, harmaline, harmol and blend are important. There are also glycosides called peganine and red dye in their seeds. This paint material is used for dyeing Turkish carpets. The alkaloids obtained from P. harmala seeds have a broad spectrum of pharmacological action. The seeds have hypothermic, hallucinogenic, antibacterial, antifungal, antiviral, antitumoral, vasorelaxan and analgesic effects. P. harmala extract is toxic at high-doses and can cause digestive problems (nausea, vomiting), liver degeneration, kidney lesions, paralysis, spongiform changes in the central nervous system, euphoria, convulsions, hypothermia and bradycardia. In high doses of intoxication, it can be fatal. However, therapeutic doses have been reported to be safe in some countries (e.g. Morocco), this plant has been reported to have been used at high doses for pregnancy termination rather than illegal abortion. Quinazoline alkaloids (e.g., vasicine and vasicinone), within P. harmala, have been attributed to the abortifacient effect of this plant. This study reviews the traditional uses and pharmacological effects of total extract and individual active alkaloids of P. harmala.

CIRIS (ASPHODELUS AESTIVUS L.)

MERYEM BADAYMAN¹, AYL A ÜNVER ALÇAY¹, EKİN DİNÇEL¹

ABSTRACT

Despite the fact that nearly 10,000 plants species grow naturally in our country, they are not utilized sufficiently. In order to benefit from Turkey's rich plant diversity, it is necessary to collect information on the use of plants in folk medicine cultures, to identify and separate chemical and biological methods and their active ingredients from natural sources, and to develop medicines for the treatment of diseases. Among the Asphodelaceae family, *Asphodelusaestivus* L. which is the genus of *Asphodelus* genus, is known among the population as *Asphodelusaestivus*. The leaves of the *Asphodelus aestivus* plant are similar to the leek leaf; However, it is rather small compared to leek and in most are as it is called "wildleek, Güllük, Yeling, grass and yellowlily". *Asphodelusaestivus* L. (Liliaceae), 50-150 cm in length, leaves in the form of swords, 35-45 cm in height, 3 cm in width; It is a green plant all year round with pea-shaped green fruits, 7 mm in size, flowering in April-May. It grows mainly in dry, poorly nutritious, sandy, non-cultivated soil. It is also used as an ornamental plant. It is a perennial plant that is found in some parts of Africa, Arab countries, Musar, Turkey and Europe. *Asphodelus aestivus* has been used as a foodstuff and traditionally because of its diuretic, wound healing, antihemorrhoidal, menstrual facilitating activities and therapeutic properties on alopecia and abscess. It is used as food for roots, flowering hulls and seeds, and also leaves and canned food. This plant grows in the high mountains in the spring in our country and the green leaves that come out of the soil are cut and sold as vegetables. Many dishes such as boiled, soup, salad, baked, yahnisi, rice and pie are consumed frequently during the season. There is also the use of dried grass in powder form by drying and grinding. There is a unique smell. Using this feature, the leaves of the plant are used in the production of Italian cheese "rignano garganico" and in the production of herbed cheese. *Asphodelus*'s apart from these yeast industry, In Erzurum, eham fabric is used to give firmness and shine. Many investigations have reported that *Asphodelus* contains valuable chemical compounds such as antracenes, flavonoids, steroids, triterpenes and arylcoumarins, anthraquinones and glycosides, and these gastroprotective, antimicrobial, antifungal, antioxidant, cytotoxic and apoptotic effects. It has been proven that the *Asphodelus* increases the white blood cells (WBC) and thus has an important feature for our defense system. The root extract of *Asphodelusaestivus* Brot has a potential acaricidal activity, and its use is thought to reduce unwanted side effects, health problems and environmental pollution related to synthetic chemicals currently used in harmful management programs. *Asphodelus aestivus* in Turkey is characterized by severe neuronal pigmentation with severe neural syndrome in sheep. In this study, traditional uses and pharmacological effects of *Asphodelus* plant were investigated. Key words: *Asphodelusaestivus* L, flavonoids. *İstanbul Aydın University, ABMYO, Food Technology Program, mbadayman@aydin.edu.tr, 4441428, Ext. 41803 1. DETERMINATION OF PLUMBAGIN PHENOLIC FROM PLUMBAGO EUROPA BY HIGH PERFORMANCE LIQUID CHROMATOGRAPH (HPLC)

EYYÜP KARAOĞUL¹, M. HAKKI ALMA²

ABSTRACT

The aim of the present work was to determine the extractable plumbagin phenolic compounds in the branches of *Plumbago europa*. The branches samples were obtained from Kahramanmaraş province of Turkey. The samples were extracted by using conventional extraction method for different types of extraction and solvent. For this purpose, methanol, deionized water and city tap water were preferred for solvent use. At the same time, the samples were extracted by boiling and without boiling procedure at 100 oC for 30 min and maceration method during 1 day at the 25 oC with deionized water and city tap water. The plumbagin phenolic in samples were determined as the concentration both mg/kg (ppm) and percent amount by using high performance liquid chromatography (HPLC). Moreover, it was found that the highest and lowest concentration of plumbagin in the *Plumbago europa* were determined for methanol extraction (%54.09, 267mg/L) and maceration with city tap water (%5.75, 11,96 mg/L), respectively. The results showed that methanol extraction has highest concentration potential than other methods and solvents. Even, deionized water showed great potential with boiling procedure in two methods than city tap water. Probably, inorganic compounds in city tap water could be prevented the increase in extraction efficiency of plumbagin. Most likely also, because of the increased penetration into the samples with boiling procedure, this method improved the efficiency of plumbagin concentration.

SOME MEDICINAL PLANT AND THEIR HERBAL DRUGS

TUĞBA BAYRAK ÖZBUCAK¹, ÖZNER ERGEN AKÇİN¹

ABSTRACT

According to World Health Organization (WHO), Herbal medicines are drugs which prepared from extracts or parts (root, leaf, flower, bark and seed) of plants for use in the treatment and to be protected from diseases. Usage of plants for treatment begins with history of humanity. Today, many drugs are derived from plants used in modern medicine. They are used as crude materials in the pharmaceutical manufacturing industry because of that they contain active ingredients. In Turkey, the plants used for medicinal is estimated to be around 500. The aim of this study was introduced some medicinal plant and their herbal drugs. For this purpose, list of herbal origin drugs were provided from pharmacies in our region. The most common 15 drugs of them were determined. In this study, general features of medicinal plants and herbal drugs (commercially) made from them will be presented together in a visual way. Some of them is *Cinchona officinalis* L. (Nuedexta), *Centella asiatica* L. (Madecassol ointment), *Cimicifuga racemosa* L.(Remifemine), *Aesculus hippocastanum* L. (Venotrex medicine), *Cassia* sp. (Sennalax medicine), *Camellia sinensis* (Veregen), *Capsicum annum* L. (Algowax Pomade), *Hamamelis virginiana* (Hametan ointment), *Papaver* sp. (Relistor), *Atropa bellodana* (Sanctura).

EFFECTS OF ELLAGIC ACID ON EXPERIMENTAL TOXOPLASMOSIS

EROL AYZAZ¹, KEREM YAMAN¹, AYHAN ÇETİNKAYA¹, ERSİN BEYAZÇİÇEK², MÜCAHİT ÇAKMAK¹, GÖKÇE BOZAT¹

ABSTRACT

Effects of Ellagic Acid on Experimental Toxoplasmosis Erol AYZAZ¹, Kerem YAMAN¹, Ayhan ÇETİNKAYA², Ersin BEYAZÇİÇEK³, Mücahit ÇAKMAK⁴, Gökçe BOZAT⁵ 1 AİBÜ Medical Faculty, Department of Parasitology, BOLU 2 AİBÜ Medical Faculty, Department of Physiology, BOLU 3 DÜ Medical Faculty, Department of Physiology, DÜZCE 4 AİBÜ Lab Animals Application and Research Center, BOLU 5 AİBÜ Agriculture and Natural Sciences Faculty, Division of Medical and Aromatic Plants, BOLU Aim of our study is to examine the effects of ellagic acid on toxoplasmosis. Ellagic acid is a natural phenolic anti-oxidant found in some fruits and vegetables, especially the red ones like cranberries, raspberries, strawberries and pomegranate. These fruits make ellagic acid via hydrolysis of tannins such as ellagitanin. Toxoplasma gondii is a worldwide spread obligate and intracellular parasite which has got a high seropositivity level. Toxoplasma gondii causes a disease called toxoplasmosis which is mostly asymptomatic. Depending to the immun system of the host organism, it will cause some serious conditions, like toxoplasmic encephalitis. Ellagic acid is used as an anti-parasitic against Plasmodium spp.; causative agent of malaria and Schistosoma species but no study is done with T.gondii. Method: We used commercially sold ellagic acid dihydrate from TCI company (cat. No: E0375). We applicate this substance to 40 mice aged 2-4 months old in this study. Mice were divided into five groups according to their situation of infection and intragastric application of ellagic acid. All mice in chosen groups were infected with 1X10⁵ tachyzoites of T.gondii RH strain. As an antiparasitic agent, 24 mg/ml dosage of co-trimoxazole in saline, is chosen and dispensed 0.1 ml by oral gavage . Dosage of ellagic acid is adjusted 50 mg/kg in saline and dispensed 0.1 ml by oral gavage too. Group I was the healthy group without any intervention. Group II was infected with T. gondii tachyzoites. Group III was infected and treated with co-trimoxazole. Group IV was infected and treated with ellagic acid. Last group was the group, we both apply the acid and co-trimoxazole. After, chosen groups were infected, we observed the groups and examined the parasite load by counting tachyzoites in the intraperitoneal fluid of mice at Thoma chamber. Results: Related to parasite load obtained from study groups, we found significant decrease of parasite numbers in the groups III, IV and V, within comparison to control group II. Also, no significant difference is indicated between groups III, IV and V. Life span of mice is increased within comparison to control. As a result, we advised that the ellagic acid is found an efficacious agent for toxoplasmosis and may use for treatment. Further research is recommended for dosage optimization and different ways of application.

DETERMINATION OF TOTAL PHENOLIC CONTENT, ANTIMICROBIAL, AND ANTIOXIDANT PROPERTIES OF ESSENTIAL OIL AND EXTRACT OF THYMBRA SPICATA

EZGİ METİN¹, GULSUM UCAK¹, MUHAMMED ZEKİ DURAK¹

ABSTRACT

Turkey is regarded as an important center for the family Lamiaceae (Labiatae). The family is represented by 45 genera, 546 species and 730 taxa in Turkey. The rate of endemism in the family is 44.2%. The members of the Lamiaceae are mainly found in the mountainous areas of the Mediterranean parts of Turkey. *Thymbra spicata* (Labiatae) is known as “Zahter” and “Karabaş Kekik” in the Southeastern Anatolia Region of Turkey. It grows wild in some eastern Mediterranean countries. Their dried leaves are used as a condiment, herbal tea and folk medicine. It is known as *Thymbra spicata* plant is used for diseases such as asthma, colic, coughs, bronchitis, rheumatism and diarrhea. In this study, total phenolic content, antimicrobial, and antioxidant properties of essential oil and extract obtained from *Thymbra spicata* medicinal plants were investigated as well as the efficacy of two different extraction methods. The scope of study, two different methods were used, one of them hydro distilled method for the essential oil and the other one methanol extraction method for extract of the plant. The antimicrobial activity of the essential oil and extract of the plant against nine bacterial strains (*Bacillus subtilis*, *Escherichia coli* ATCC 25922, *Pseudomonas aeruginosa* ATCC 27853, *Salmonella typhimurium* ATCC 14028, *Listeria monocytogenes* ATCC 13932, *Klebsiella pneumoniae* ATCC 43816, *Bacillus cereus* ATCC 11778, *E. coli* O157 H7 ATCC 43888, *Staphylococcus aureus* ATCC 25923) and one fungal strain (*Candida albicans* ATCC 10251) were researched using disc diffusion method. The amounts of total phenolic compounds in the essential oil and plant extracts were determined by the spectrophotometric Folin-Ciocalteu method. Total antioxidant capacities were determined according to the DPPH method. Essential oils of *Thymbra spicata* are more effective than extracts on all the tested bacteria. Essential oil of *T. spicata* showed the highest antimicrobial activity against *L. monocytogenes* ATCC 13932 while the extract of *T. spicata* showed the highest antimicrobial activity against *Bacillus cereus* ATCC 11778. The results of antioxidant activity showed that the percentage of inhibition values ranged from 30.49 to 87.90 %. The oil of *Thymbra spicata* showed that the lowest antioxidant capacity (30.49 %), while the extract of *Thymbra spicata* showed the highest one (87.90%). It is found that the total phenolic content of the essential oil of *Thymbra spicata* (2.70 mg/ml) is higher than the extract of plant (1.70 mg/ml). As a consequence, the data obtained suggests that different extract method of *T. spicata* plant possesses useful antimicrobial and antioxidant properties and may be utilized in the food industry and as a dietary supplement.

SOME HERBAL TEAS, USAGE AREAS AND PROPERTIES OF PLANTS USED AS HERBAL TEA

TUĐBA ÖZBUCAK¹, ÖZNUR AKÇİN¹

ABSTRACT

Herbal tea is beverage made from their fusion or decoction of herbs, spices, fruits or other plant material in hot water. Herbal teas are consumed cold or hot. Herbal teas are used in health and beauty purposes in the world and in Turkey. In this study, fifteen plants consumed as herbal tea and teas made from them will be discussed. Investigated plant and their teas are very popular and the most used in Anatolia. These plants: *Rosa canina* L. (Rosaceae), *Camellia sinensis* (L.) Kuntze (Theaceae), *Salvia* sp. (Lamiaceae), *Tilia* sp., *Thymus* sp. (Lamiaceae), *Cinnamomum verum* J.Presl (Lauraceae), *Zingiber officinale* Roscae (Zingiberaceae), *Melissa officinalis* L. (Lamiaceae), *Feniculum vulgare* Mill. (Apiaceae), *Echinacea purpurea* (L.) Moench (Asteraceae), *Rosmarinus officinalis* L. (Lamiaceae), *Hibiscus sabdariffa* L. (Malvaceae), *Mentha piperita* L. (Lamiaceae), *Matricaria chamomilla* L. (Asteraceae). Their morphological features, general information, parts used, methods of using, names of tea, scientific name and Turkish name were determined. Herbal teas can be made with fresh or dried flowers, leaves, seed sorroots, generally by pouring boiling water over the plant part and letting them steep for a few minutes. Green tea accelerates metabolism and also has antioxidant properties. Linden tea is an antiperspirant and a breast emollient. Rosehip tea increases body resistance. Sage tea opens appetite, facilitates digestion. Sage has antiseptic properties. For sores in the throat, cold gargle is made. Thyme and cinnamon accelerate blood circulation. Cinnamon digestion cures and has antioxidant properties. Rosemary strengthens the memory and increases concentration. Echinacea tea is used for the treatment of diseases such as colds and flu. *Matricaria chamomilla* is the most popular source of the herbal product chamomile. Chamomile tea can help to prevent and treat colds while protecting against bacterial-related illness and infection.

AROMATIC HERBS THAT USED DURING PREGNANCY

VESİLE KOÇAK¹, KAMİLE ALTUNTUĐ¹, EMEL EGE¹

ABSTRACT

Complementary and Alternative Medicine is a series of health approaches with a history of use other than medical treatments. It covers a broad range of therapy divided into five categories: alternative medical practices, mental and physical interventions, biological based treatments, manipulative-body based methods and energy healing therapies (NIHS, 2017; Strouss, Mackley, Guillen, Paul, & Locke, 2014). Complementary and Alternative Medicine (CAM) is a different collection of health care. Women at maternal age represent one of the biggest group of CAM users. The National Health Interview Study (NHIS) analysis in USA in 2007 reported that almost half of the women at the age of 18-49 used a kind of CAM in the previous year (Holden, Gardiner, Birdee, Davis, & Yeh, 2016). Many pregnant women throughout the world are increasingly using the alternative and complementary treatment methods for their pregnancy problems as they regard them to be natural and safe (Joa, Haeng Leeb, Moo Leea, Leec, Kwackd, & Kime, 2016). This ratio varies by 7% - 55% depending on the geographical location and socio-cultural structure (Cuzzolin, Francini-Pesenti, Verlato, Joppi, Baldelli, & Benoni, 2010). Pregnant women employ several methods to cope with the problems of pregnancy. One of these methods is the use of herbal products. The most common problems during pregnancy are nausea, heartburn, vomiting, skin problems, constipation and indigestion (Al-Ramahi, Jaradat, & Adawi, 2013). Moreover, there are other problems like toothache, other pains of various type, flue, stomach-ache and chest pain (Mothupi, 2014). The mostly used herbal products to cope with these problems are ginger, garlic, eucalyptus and tenaadam (Rutachalenssis) (Al-Ramahi, Jaradat, & Adawi, 2013, Mothupi, 2014, Mekuria etal. 2017, Bayisa etal. 2014, Laelago etal. 2016). Ginger is one of the best natural medicines known used for pregnancy nausea and vomiting. Ginger appears to be useful for morning sickness but it is not clear whether it is safe to use during pregnancy. Some studies indicate that ginger may potentially affect the foetal sex hormones (Al-Ramahi, Jaradat, & Adawi, 2013). The pregnant women start the use of herbal products on their own or by the recommendation of their families and they usually don't consult with health professionals (Ekrasarian, Rostami, Charati, & Abdollahi, 2016, Kissal, Çevik Güner, & Batkın Ertürk, 2017). Women like using these products despite the lack of sufficient evidence and safety measures for the use of herbal products. During pregnancy, many women consider herbs to be natural and risk-free, and they are not aware of their possible negative effects. (Kalder, Knoblauch, Hrgovic, & Munstedt, 2011; Strouss, Mackley, Guillen, Paul, & Locke, 2014). The use of herbal treatment may lead to abortion or premature birth, presence of malformation, intrauterine growth retardation and low neonatal birth weight (Cuzzolin L., Francini-Pesenti, Verlato, Joppi, Baldelli, & Benoni, 2010). In conclusion, pregnant women employ herbal products for their physiologic and psychological problems, and they usually decide on their own what herbs to be used. Most of the pregnant women believe that the herbal treatments are safe. The studies on the safety of herbal products are not sufficient. There is need for evidence based studies on the use of herbal products during pregnancy.

A RESEARCH ON MEDICINAL PLANT CYCLAMEN COUM SUBSP. COUM TAXA

TUĐBA BAYRAK ÖZBUCAK², GÜLAYCAN POLAT¹, ÖZNUR ERGEN AKÇİN¹, HAMDI GÜRAY KUTBAY²

ABSTRACT

Cyclamen coum subsp. coum Mill. (Primulaceae) is a perennial geophyte species which is used as medicinal plant (boils treatment, stains and sunburn, gout, emetic, poisonous animal bites, in lowering the cholesterol level in the blood and tinnitus). Local names of taxa which commonly used in public are Yersomunu, Danagöbeđi, Kızıl menekşe, Domuz ekmeđi, Domuz elması, Domuz turpu, Domuz avşadı and Tavşankulađı. In this study, some of morphological characters were determined in Cyclamen coum subsp. coum samples collected from different localities in Ordu province (Turkey) depending on the elevational gradient (from sea level to 1850 meters). The shoot length, number of nodes and branches, leaf length and width, living leaves, dead leaves, the number of flowers, root/shoot ratio, specific leaf area (SLA), leaf weight/leaf area (LMA) were calculated separately in the plant samples. According to statistically analyses there were found shoot length, bulb width, leaf width, leaf length, numbers of branches and flowers were found statistically significant, whereas the length of tubers, root-shoot ratio, number of living and dead leaves, number of node, the SLA and the LMA values were not significant. Knowing these morphological properties is important for protecting species and culturing.

THE CHEMICAL COMPOSITION OF MILK THISTLE (SILYBUM MARIANUS)

GÜLDEN DOĞAN¹, AZIZE DEMIRPOLAT², EYÜP BAĞCI²

ABSTRACT

Milk thistle purifies the liver from all toxic and harmful substances, supports the regeneration of liver cells. In this study, the chemical composition of Milk thistle (*Silybum marianum* (L.) Gaertner = *Carduus marianus* L.) from Turkey investigated. The chemical composition obtained by hydrodistillation of was investigated by GC and GC-MS systems. The essential oils yield is 1.1% (v/w). Eight constituents were comprised the 97.3% of the total oil extracted from the Milk thistle. The major compounds of Milk thistle were determined as oleic acid (45.6%), linoleic acid (29.0%), ethylbenzene (7.0%) and stearic acid (5.7%).

AN ECOLOGICAL STUDY ON MEDICINAL GEOPHYTE CYCLAMEN COUM SUBSP. COUM

TUĞBA BAYRAK ÖZBUCAK¹, GÜLAYCAN POLAT¹, ÖZNUR ERGEN AKÇİN¹, BURAK SÜRME²

ABSTRACT

Turkey is a very rich country in terms of wild plant species. 816 geophytes taxa were identified according to Tubives records. Geophytes are plants that survive part of their annual life cycle as a dormant, fleshy underground structure (bulb, rhizome and tuber). Geophytes have been used as food, medicinal, industrial and economic for many years. Geophytes were threatened by various activities (overgrazing, industrialization, agricultural struggles, forest fires, new road opening, and illegal collection) in our country. *C. coum* subsp. *coum*. Mill. (Primulaceae) is medicinal and ornamental geophytes plant. Plant has emetic, laxative and stimulating effects. Its tuber is preferred food by pigs. Local names are used in public are Alayaprak, Danagöbeği, Devetabanı, Domuzekmeği, Domuzelması, Domuzturpu, Kırmeneşesi, Kızılmenekşe, Köstüköpeği, Kuskusa, Tavşankulağı, Topalak and Yersomunu. Plant is in CITES (Convention on International Trade in Endangered Species of Wild Fauna & Flora) due to threatened by illegal collection. Therefore the ecological characters of this species are important for its conservation. The aim of this study was investigated Reproductive Effort (RE) values and soil properties of *Cyclamen coum* subsp. *coum* (Primulaceae) along an elevation gradient. Reproductive effort (RE) is an important trait for the adaptive ability of a particular species. RE1, RE2, RE3 and RE4 values were determined as RE value. RE values were calculated as follows; RE1= flower biomass/ above ground plant part biomass, RE2=flower biomass/total plant biomass, RE3=flower nitrogen concentration/above ground plant part nitrogen concentration, RE4= flower nitrogen concentration/total nitrogen concentration. According to the results of study, the lowest RE1, RE2 and RE3 values were found in 1850 meters while the lowest RE4 value was in 500 meters. The results of statistical analysis made for the reproductive effort values indicate that only RE3 values were found to be significant. In soil samples taken from different altitudes was carried out physical and chemical analysis. There were found sea level and 1850 m. localities have sandy-loam soils while 500 m. locality has sandy-clay-loam soil. In addition, it has been determined locality of 1850 meters has strongly acidic while the sea level locality has weakly acidic in character.

CHROMATOGRAPHIC AND SPECTROSCOPIC DETERMINATION OF PHENOLIC ACID AND FLAVONOID CONTENTS WITH RADICAL SCAVENGING ACTIVITY OF CUSCUTA CAMPESTRIS

EMİNE AKYÜZ TURUMTAY¹, EMİNE KILICKAYA SELVİ¹, HALBAY TURUMTAY², ADEM DEMİR¹

ABSTRACT

As a holoparasitic plant, *Cuscuta campestris* Yuncker (*C. campestris*) is being valorized for treatment of liver injury and cancer in traditional medicine. Phenolic acid and flavonoid content of *C. campestris* were evaluated in this study by analyzing its diethyl ether, ethyl acetate, methanol, n-butanol and water extracts. Antioxidant potential of these extracts were characterized with their total phenolic (TPC) and flavonoid contents (TFC) and 2,2-diphenyl-1-picrylhydrazyl (DPPH) free radical scavenging activities. The individual phenolic compounds of all extracts were analyzed by HPLC-DAD to illuminate the responsible antioxidants. Ethyl acetate extract revealed significantly highest antioxidant effect, and also had highest TPC and TFC contents. The most amount of phenolic compounds were quantified in methanol extract by HPLC-DAD analysis. Isorhamnetin, kaempferol and quercetin were the major compounds of the methanol, ethyl acetate and diethyl ether extracts. The most amount of rutin (quercetin-3-O-rutinoside) was found in the water extract. Ferulic acid was the highest phenolic compound in the butanol extract. As a result, *C. campestris*, a rich source of phenolic compounds, may be a reliable candidate for drug development.

DETERMINATION OF GERMINATION ABILITY OF BASIL IN INCREASING SALT CONCENTRATIONS

MAHMUT ÇAMLICA¹, GÜLSÜM YALDIZ¹

ABSTRACT

Salinity is one of the most environmental problems in arid and semi-arid region. It is an abiotic stress factor which restricts crop production and affects development of plants. One of the these plants is basil (*Ocimum basilicum*). It is an annual medicinal and aromatic plant from Lamiaceae family. The present study was carried out to determine the response of different salt concentrations from 0 to 240 mM which increasing 20 mM. The experiment was conducted with randomized complete block design with 3 replications and placed 20 number from seeds of each plant in petri dishes. 39 petris were used consisting from 1 plant x 13 salt levels x 3 replicats. Germination tests were made at constant temperature (29 ± 1 °C), dark field and drying oven in laboratory conditions. Appropriate test solution was placed at each petri dish being 5 ml and was renewed with an interval of two days. According to the study results, germination speed and power of basil seeds completed within 3-15 days. The results noted that root lenght changed between 0.08-5.07 cm, shoot lenght changed between 0.1-5.82 cm in the basil and they changed between 10-100% germination rate between the 0-240 mM salt concentrations. The lowest germination speed and power were seen in 240 mM and the highest germination speed and power were seen in 20 mM except control (pure water) condition. Germination percentage of basil seeds were decreased from 0 (control) to 240 mM. In addition to this, the highest shoot and root lenght were obtained from 20 mM and the lowest shoot and root lenght were obtained from 240 mM except control condition. Root lenght/shoot lenght was also determined changing between 0.43-1.27 cm. To results, it was determined that germination number and rate, shoot and root lenght were statistically affected by different salt doses. Considering different salt doses, the highest number of germination was obtained from 20 mM salt application, the lowest value was determined in 240 mM salt application compared to control application. It is suggested that salt tolerance studies should be preferred under 200 mM salt concentration to obtain the germination number and rate over 80% in different salt concentrations and in order to grow the basil under salted areas.

CHARACTERIZATION OF PHENOLIC COMPOUNDS AND THEIR INHIBITORY EFFECT OF ROSA CANINA ON BACTERIAL DNA POLYMERASES

HALBAY TURUMTAY¹, EMINE AKYUZ TURUMTAY², ADEM DEMİR², EMINE ESRA BUDAK², CEMAL SANDALLI

ABSTRACT

Investigation of novel plant-based agents might provide alternative antibiotics and thus fight antibiotic resistance. Here, we measured the ability of fruit and leaf extracts of *Rosa canina* to inhibit nonreplicative (Klenow Fragment-KF and Bacillus Large Fragment-BLF) and replicative (DnaE and PolC) bacterial DNA polymerases along with their antimicrobial, DPPH free radical scavenging activity (RSA), and chemical contents by total phenolic content and HPLC-DAD analysis. We found that leaf extracts had nearly 10-fold higher RSA and 5-fold greater TPC than the corresponding fruit extracts. All extracts had large amounts of chlorogenic acid (CGA) and rutin, while fruit extracts had large amounts of quercetin. Hydrolysis of fruit extracts revealed mainly caffeic acid from CGA (caffeoylquinic acid) and quercetin from rutin (quercetin-3-O-rutinoside), as well as CGA and derivatives of CGA and p-coumaric acid. Plant extracts antimicrobial activity against Gram-negative microorganisms. Thus, these species can be considered a potential source of novel antimicrobial agents specific for Gram-negative bacteria.

A REVIEW ON SAFFRON

MERVE ÖZDEMİR¹, SERAY AKALIN¹

ABSTRACT

From the family of Irisaceae (*Crocus sativus*), an onion plant, saffron is known as the world's most expensive spring. Moroccan, Indian, European, Arabic and Turkish cuisines are commonly used for the purpose of coloring and adding flavor to foods and for treating traditional diseases in various diseases. Recent studies have begun to focus on the important effects of saffron on metabolism. Research on the bioactivity of saffron has shown an antioxidant effect in living organisms. These studies, carried out in a wide range of, confirm that the genotoxic chemicals of the saffron can inhibit damage caused by it, suggesting that oxidative stress can be reduced in living organisms. It is a compound which gives the characteristic features of crocin, piccrocin and safranal plant. Along with many other effects such as antioxidants, anticancer agents, immunomodulators and antidepressants, saffron extracts, and potentially antitumor, antidepressant and memory healing properties of crocin, are also promising for Alzheimer's, one of the major problems of our time. At the same time, a certain amount of saffron consumption can be used to prevent the development of obesity thanks to digestive toxins are investigated. In recent years, saffron has been attracting attention due to the fact that it is a natural resource in the field of new drug development with different effect mechanisms on diseases.

ANATOLIA'S SACRIFICIAL WILD FRUIT PYRUS ELAEAGRIFOLIA (AHLAT) AND EVALUATION POTENTIALS

AYDIN UZUN¹, HASAN PINAR¹, YAŞAR ÇAKIROĞLU², ARIF KARAKAYA², MEHMET UYSAL², GÖKHAN ÖZTÜRK³,
RECEP ALI EMRE³, HAKAN KELEŞ⁴, MUSTAFA ÜNLÜ⁵, MEHMET YAMAN¹

ABSTRACT

Pyrus elaeagrifolia Pall. is a species of wild fruit that is found naturally in our country especially in the interior and passage areas. It has long been recognized that a wide variety of natural varieties, both in-species and interspecies, is considered to be a species that grows with seeds that are open pollinated in nature. It is foreseen that this rich diversity in the dialect, which is generally observed to conform to calcareous and arid areas, has characteristics of resistance to biotic and abiotic stress (drought, lime, salt, etc.) conditions especially for rootstock breeding studies. The existing *P. elaeagrifolia* populations are utilized for different purposes in the regions of Anatolia in practice. Some varieties of pears are grafted on *P. elaeagrifolia*, they can be used for afforestation purposes in rural areas in arid conditions, fruits are consumed fresh, pickled or dried. It is known that *P. elaeagrifolia* is a useful product for diarrhea cutter, heart and kidneys and is used among the people. The small, and very sandy structure, is regarded as an animal feed. In addition, the branches are utilized in cane construction. With these respects, ahlal can be used for the benefit of human beings and animals for medical and nutrition purposes as well as being developed and cultured. It is very important to protect and develop this kind of adaptation to the Anatolian steppes and guarding it.

DETERMINATION OF IMPORTANT FRUIT CHARACTERISTICS OF PYRUS ELAEAGRIFOLIA, A WILD FRUIT SPECIES SELECTED FROM KAYSERİ AND USE FOR HUMAN NUTRIENT

AYDIN UZUN¹, HASAN PINAR¹, YAŞAR ÇAKIROĞLU², ARIF KARAKAYA², MEHMET UYSAL², MEHMET YAMAN¹,
KAHRAMAN GURCAN³, MUAMMER COŞKUN²

ABSTRACT

The motherland of Anatolia, wild pear (*Pyrus elaeagrifolia* Pall.) is one of 22 *Pyrus* species and spread in Southeast Europe, Russia and Turkey. Natural spreading areas in our country are reported as Kütahya, Eskişehir, Bolu, İstanbul, Kastamonu, Sivas, Ankara, Antalya and Kayseri. The trees are medium-sized, rounded crowned, often branched and thorny. The fruit is small, round and very smooth. *Pyrus elaeagrifolia* is deeply rooted, fully xerophilic, well adapted to the arid climatic conditions. There are of this species is mainly used as fresh fruit in the countryside, dried and pickled and can be used for nutrition purposes, as it is beneficial to the heart and kidneys with diarrhea treatment firstly in the folk medicine. In addition, cultured pears are vaccinated on matrices and evaluated for rootstock purposes. On the other hand, sandy and small fruit that is not consumed by human beings is regarded as animal feed. The main factors for the consumption of *Pyrus elaeagrifolia* fruits are fruit size and sandy. There are important variations in the natural genotypes in this respect. In this study, which is one of the important spreading areas of this species, Kayseri region, fruit characteristics were revealed in different types of populations and it was aimed to determine the types that are more suitable for human consumption. The study presents beneficial results for the evaluation, development and conservation of this naturally grown population where people can evaluate for different purposes.

AN IMPORTANT FLAVONOID FOR NUTRITION: QUERCETIN

MUHAMMET ALI CEBİRBAY¹, NAZAN AKTAŞ¹

ABSTRACT

The increase in diseases such as cancer that have occurred based on oxidative degeneration in nutrition-related cells in the recent years has generated interest in the pharmacokinetic properties of various bioactive molecules, particularly the antioxidants in foods to reduce the effects of oxidative stress. Quercetin is important for nutrition because it is a well-known flavonoid which is very commonly found in plants and it has potential functional properties. This study aimed to compile the findings about the relationship of quercetin with nutrition, sources of quercetin, its biological activity and metabolism. As a result, it emphasized that quercetin has various positive effects (e.g., anti-inflammatory, antihistaminic) on cells, particularly on oxidative stress. Quercetin is found in many vegetables and fruits (e.g., citrus fruits, onions, tomatoes and capers) or foods obtained from them (e.g., wine) based on carbohydrates, ethers or phenolic acids as secondary metabolites. It is associated with many nutrition-related diseases, particularly with some cardiovascular diseases. Quercetin plays a metabolic role in glucuronidation, sulfation and methylation reactions in the human body. Further detailed studies which will determine the relationship of quercetin with nutrition should be conducted, and awareness about its effects on health should be raised.

THE FUNCTIONAL FOOD: WALNUT

BAŞAK ÖZDEMİR¹, SAADET SEVİL YÜCEL², FATMA YEŞİM OKAY¹

ABSTRACT

Walnut is a valuable nutrient in terms of human nutrition and health and also it is a source of energy because of its fat content (59 - 74%). It provides about 700 calories per 100 g. Due to walnut's several benefits to human health, it is remarkable precious nutrition which is wealthy with regards to fatty acids and tocopherols. Walnut oil is rich as unsaturated fatty acids and for this reason walnut has a great value in terms of health. Besides, walnut contains protein (14 - 24%), mineral compounds (1.5 - 2%), cellulose (5 - 10.5%), it is rich with B and D vitamins and also it contains A, C and E vitamins. Shelled walnuts are containing high amounts of potassium, phosphor, magnesium, calcium, sulphur and iron. Unsaturated fatty acids in walnut have an effect of decreasing the risk of cardiovascular diseases. Linoleic, oleic, linolenic, palmitic and stearic acids enable to increase HDL cholesterol and reduce LDL cholesterol, thereby walnut has an effect on cardiovascular diseases such as protector. Mineral compounds as potassium and magnesium regulate blood pressure. When consumed frequently, it provides protection from coronary heart disease. Juglone which is obtained from walnut roots has an effect of reducing gall deflection. Due to its antioxidant and phytochemical compositions, walnut avoids cell destruction of the free radicals. Besides, it enhances body resistance thereby walnut plays as a prohibitor against diabetes. It reduces cancer risk by means of its polyphenol content. High amount of omega-3 fatty acids make walnut a brain food and also it contains ready form of melatonin. Also walnut is accepted as functional food because it supplies special physiological effect in body requirement and displays activity in cure besides fulfills a need of basic nutrition. Walnut oil is used in pharmaceutical industry, its leaf, root and green shell are processed in various forms for using in some cures of diseases, also dye and tanin are obtained from walnut. After obtaining walnut oil, the rest of residue has a nutrient value for animal nutrition in terms of fat and protein content. It should not be forgotten that, in addition to walnut kernel, walnut kernel pellicle also has high nutritional and health values. There is increasing evidence that consumption of whole foods is better than isolated food components such as dietary supplements and nutraceuticals. It is emphasized that whole food such as walnut is more effective than dietary supplements in increasing LDL oxidation resistance, lowering DNA damage, and inducing higher repair activity in human volunteers.

ST JOHN'S WORT (*HYPERICUM PERFORATUM L.*): ITS COMPOSITION AND CLINICAL PROPERTIES

BİRSEN YILMAZ¹, GAMZE AKBULUT¹, NİLÜFER ACAR-TEK¹

ABSTRACT

There are about 400 species of St John's wort in the world belonging to the Hypericum genus Clusiaceae family and the Hypericoideae subfamily. It is reported that the herb has about 80 types. The most common types in our country are *Hypericum perforatum L.*, *H. Trigqetrifolium*, *Hypericum calycinum*, *H. empetrifolium Willd.* (heather, yellow heather), *H. scabrum L.* (mexican herb, kepir otu) and *H. tedrapetum Fries*. It is best grown in light acidic-neutral soils, mainly in Europe, Asia, North Africa and the United States. St John's wort is known in our country with different names such as tipton's weed and felty germander. It is a perennial plant with golden yellow flowers, ranging in height from 30 to 90 cm. The chemistry of St John's wort is quite complex and the available data on the active ingredients is not clear. It is also reported that the plant has different composition depending on its dry/wet status, and some components have intensified/decreased in certain areas. The major groups of dry extracts are phenyl propanoids, flavon glycosides, biflavones, oligomeric proanthocyanins as well as floroglucinols, xanthones and naftodiantrons. The phenylpropanoids in St John's wort include p-coumaric acid and caffeic acid. The anthracene derivatives especially in the hiperisin and pseudohyperaceous are found in the foliage and perforated parts of the flowers and give a red color to the oil of St John's wort. In general, when the components of the plant are evaluated, a number of compounds with biological activity are mentioned, especially anthracene derivatives (hypersecin and pseudohypercin), cholinergic acid, flavonoids, phenolic compounds (hyperforin), procyanidins, vitamin C, carotene, protein, resin and essential oils. St John's wort has been known with the healing effect of injuries for many years. Recently, the antidepressant effect has been proven and the use has become widespread. Accordingly, it is used particularly in the treatment of mild and moderate depression, cancer, diabetes, chronic rheumatism, some gastrointestinal diseases as well as throat infections, colds, antiseptic and burn wounds. In the treatment of mild and moderate depression, the daily dose is 500 mg extract (500 mg extract contains 1-2 mg of hypericin). It has been reported that hypericin, one of the major causative agents, may be effective in the treatment of AIDS as well as depression and cancer. However, as with many plant extracts, St John's wort also require extensive and long-term investigations to better understand the mechanisms of action and possible beneficial/deleterious effects.

SYNTHESIS AND CHARACTERIZATION OF SILVER NANOPARTICLES USING GREEN TEA EXTRACT

GÖNÜL SERDAR¹, CANSU ALBAY¹, MÜNEVVER SÖKMEN²

ABSTRACT

Synthesis and Characterization of Silver Nanoparticles Using Green Tea Gönül SERDAR¹, Cansu ALBAY¹, Münevver SÖKMEN² 1Karadeniz Technical University, Faculty of Pharmacy Department of Analytical Chemistry, 61080 Trabzon, 1Karadeniz Technical University, Faculty of Pharmacy, Department of Biochemistry, 61080 Trabzon, 2Konya Food and Agriculture University, Faculty of Engineering and Architecture, Department of bioengineering, 42080 Konya gonulserdar@ktu.edu.tr In this study, the synthesis and characterization of Ag nanoparticles from green tea collected the Eastern Black Sea region was investigated. Microwave extraction was applied to caffeine and catechin coextraction from tea samples. A household microwave system device was used for microwave extraction. 10 g of sample was shaken in 100 mL of water for 90 min at room temperature and then extracted in a household microwave device at 90 ° C, 3 minutes, 360 W. Ag nanoparticles were synthesized that the obtained aqueous solution was taken in different volumes by mixing 100 mL of 1mM AgNO₃ solution at room temperature of 0-60 min for different times. UV-Visible spectroscopy is one of the widely used techniques for the characterization of nanoparticles. A yellow coloration appeared, indicating the onset of Ag nanoparticle formation. The progress of the reaction was monitored by measuring the absorbance of the solution at regular intervals of time. Absorption spectra were measured on a Shimadzu UVP-1240 spectrophotometer. ISOLATION OF SECONDARY METABOLITES FROM AN ENDEMIC PLANT SPECIES 'TANACETUM ALYSSIFOLIUM' AND DETERMINATION OF ANTIOXIDANT-ANTI-PROLIFERATIVE PROPERTIES

YAKUP ULUTAŞ¹, EKREM KÖKSAL¹, AHMET ALTAY¹

ABSTRACT

Secondary metabolites, synthesized by plants, both during normal development and in response to stress conditions are phenolic compounds. The intake of these compounds is an important health-protecting factor. Reactive oxygen species responsible of oxidative stress are involved to the chronic diseases such as atherosclerosis, cancer, obesity, diabetes, and coronary diseases. Many studies with different type of species of tanacetum medicinal plant revealed many bioactive properties of these plant species such as antioxidant, antimutagenic and anti-carcinogen. The aim of this study was to isolate the available secondary metabolites in *Tanacetum alyssifolium* plants by column chromatography and determine their structures with spectroscopic methods as well as their antioxidant and antiproliferative activities. For this purpose, *Tanacetum alyssifolium* plants was collected from the foothills of Munzur Mountains in Erzincan province and dried at room temperature. The upper part of ground plant was extracted with ethyl acetate/ butanol solvent system. The butanol extract was subjected to the procedure of column chromatography. The structures of the isolated compounds were elucidated by spectroscopic methods (1 H-NMR, 2 D-NMR, HPLC-TOF) to reveal that luteolin 7-o-glycoside, umckaline and S-8-H29. The antioxidant activities of the isolated compounds were evaluated according to the DPPH and ABTS free radical scavenging and metal ion chelating capacities. Antiproliferative activities of the samples was investigated on HeLa (Human Rectum Cancer) and C6 (Rat Brain Tumor) cell lines and compared with 5-Fluorouracil (5-FU), which is used as an anticancer drug. In the antiproliferative activity tests, n-butanol extract, Umckalin, Luteolin 7-o-glycoside and S-8-H29) showed lower activity than 5-FU against both HeLa and C6 cell lines at four different concentrations (5, 25, 50 100 µg/ml). The antiproliferative activities of the samples against the HeLa cells at the highest dose of 100 µg/mL were; 5-FU> butanol extract> Umckaline> S-8-H29> Luteolin 7-o-glycoside, respectively. On the other hand, antiproliferative activities against C6 cells were observed as 5-FU> butanol extract> Luteolin 7-o-glycoside> Umckaline> S-8-H29, respectively.

EVALUATION OF INFORMATION AND REFLECTIVES OF COMPLEMENTARY AND ALTERNATIVE METHODS OF HEALTH SERVICE VOCATIONAL SCHOOL STUDENTS

DIDEM SARIMEHMET¹, NURHAN GÜMRÜKÇÜOđLU¹, SEVILAY HİNTİSTAN¹, BAHAR CANDAŞ¹, GONCA SERDAR¹

ABSTRACT

Objectives:The study was conducted as a descriptive study to determine the knowledge and thought of the students attending Karadeniz Technical UniversityHealth Services Vocational School (KTU SHMYO) on Alternative and Complementary Medicine Methods: The study group consisted of 230 individuals studying at KTU SHMYO. Data was collected from December 2016 to March 2017 using a questionnaire. Numbers of percentage test was used in evaluating the data. **Findings:** 70.8% of the students were found not to use the CAM methods at all. It was determined that the students who used CAM especially preferred to use these methods in order to decrease their stress (%30.9), for their health problems (%26) and hair and facial treatment (%11.6). Most of these methods were seen / heard via internet (39.9%) and friends (16.7%). The use of herbal products (59.2%) was found to be the generally recognised; while massive massaging (13.3%) was the most commonly known CAM method. **Results:** Students generally do not have detailed knowledge of CAM methods. It was found that the methods used more frequently in everyday life were even more recognised by the students

ASSESSMENT OF IN VITRO ANTIGENOTOXIC EFFECT OF α - TOCOPHEROL AGAINST MITOMYCIN-C INDUCED MICRONUCLEUS FORMATION

KÜBRA SEVİMLİ CAN¹, FATMA UNAL², ECE AVULOĞLU YILMAZ², DENİZ YÜZBAŞIOĞLU²

ABSTRACT

Alpha-tocopherol (AT), better known as Vitamin E (Vit-E), is an important compound in cell membranes and has specific biological effects on regulating gene expression, signaling, cell proliferation and reproduction. Alpha-tocopherol is present in a lot of different vegetables such as spinach, turnip greens, broccoli, asparagus, tomatoes, mango, and orange vegetables such as carrots. Many edible nuts such as almonds, hazelnut, pine nuts, peanuts, and pistachios are good sources of AT. Vegetable oils such as wheat germ oil, sunflower, safflower, grape seed, almond, corn, peanut and olive oils are another important sources of AT. Vit-E is a primer biological antioxidant and enables prevention of oxidation reactions. It also plays a role in the reduction of free radicals, in this way it provides protective property against potential toxic effect of highly reactive compounds. In this study, possible antigenotoxic effect of α -tocopherol, known as vitamin E, against Mitomycin C (MMC) (antitumor agent) induced genotoxic damage was investigated. For this purpose, micronucleus (MN) assay was performed in human peripheral lymphocytes in culture from two donors, a woman and a man. Different concentrations of α -tocopherol (25, 50, 100 and 200 $\mu\text{g}/\text{mL}$) were used in combination with 0.20 $\mu\text{g}/\text{mL}$ MMC. In the treatment of lymphocytes, the following groups were studied. 1) pretreatment with α -tocopherol 1 h before MMC; 2) simultaneous treatment with α -tocopherol and MMC; 3) post-treatment with α -tocopherol 1 h after MMC. Lymphocytes were treated with MMC alone or together with α -tocopherol for 24 h and 48 h. In all the treatments, α -tocopherol reduced the frequency of MN compared to MMC alone. In the 24 h pre-treatment group, the frequency of MN decreased significantly at the highest concentration of α -tocopherol compared to positive control. In the simultaneous treatment, a statistically significant reduction was observed at 50 and 200 $\mu\text{g}/\text{mL}$ concentrations of α -tocopherol compared to positive control. In the post-treated lymphocytes, none of the reductions in MN frequency was significant. In 48 h pre-treatment group, a significant reduction of MN frequency was observed at 100 $\mu\text{g}/\text{mL}$ concentration of α -tocopherol compared to the positive control. In simultaneous and post-treatment (except 100 $\mu\text{g}/\text{mL}$) groups, MN frequency decreased non significantly at all the concentrations. The result of this study showed that MMC increased the frequency of MN in lymphocytes. The antigenotoxic experiments indicated that α -tocopherol was able to ameliorate the genotoxic effect induced by MMC.

SAGE AND HYPOGLYCEMIC EFFECT

SERKAN ASLAN¹, EDA KÖKSAL¹

ABSTRACT

Sage (*Salvia officinalis*) is commonly located in Turkey produced medical aromatic plants. The genus *Salvia* is distributed all over the world, with belonging to the Lamiaceae family represented by over 900 species. *Salvia officinalis*, one of the *Salvia* species, is one of the important species due to its medicinal and aromatic character. The botanical name of sage is a clear reference to the plant of the genus name *Salvia* comes from the Latin *salvāre* meaning "to save" or "to heal" and *Officinalis* means medicinal. Studies on animals have shown that more than 400 plant species have a hypoglycemic effect. One of these plants is *Salvia officinalis*. *Salvia officinalis* has been used as a traditional treatment of diabetes in many countries, and glucose-lowering effects have been shown in animal studies. Diabetic patients have increased oxidative stress and impaired antioxidant defense systems, which appears to contribute to the onset and progression of diabetes-related complications. It is believed that the antidiabetic effect of the sage is caused by its high antioxidant content. Its flavonoids and polyphenolic compounds (Carnosic acid, rosmarinic acid, caffeic acid) have a strong antioxidant and radical cleansing role. A methanol extract of *Salvia officinalis* given intraperitoneally in diabetic rats significantly reduced blood glucose without any change in insulin levels in rats. In another study, Aqueous ethanol extracts of *Salvia officinalis* have been found to significantly reduce blood glucose in healthy rats and to significantly reduce hyperglycemia in mildly type 1 diabetic rats. Tea-infusions of *Salvia officinalis* have been shown to possess similar effects in vitro. *Salvia officinalis* administered by oral route showed significant hypoglycemic activity in diabetic rats. In a study conducted with humans, no effect was observed on fasting blood glucose of sage tea (300 ml twice daily). However, drinking sage has improved lipid profile and antioxidant capacity and has been shown to benefit indirectly from diabetes. In conclusion, many in vitro studies show that the antidiabetic effect of sage tea is insufficient to study on humans. More research is needed in this area to determine factors such as quantity, infusing type and duration that are effective on humans. It is important for diabetics to be warned about sage tea use and hypoglycemic effects.

MEDICINAL USES OF EVERNIA PRUNASTRI

CELALEDDİN ÖZTÜRK¹, HATİCE ESRA AKGÜL¹, GIYASETTİN KAŞIK¹, SINAN ALKAN¹

ABSTRACT

Evernia prunastri (L.) Ach. also known as oakmoss is a species of lichen that represents symbiotic organisms consisting of the mycobiont and photobiont. The use of lichens in medicine is based on the fact that they contain unique and varied biologically active metabolites. Oakmoss is used in medicine due to its antiseptic, demulcent, expectorant and restorative properties. Its essential oil is also used in certain perfume compositions. Here; we review the medicinal efficacy of Evernia prunastri which intends to explore the pharmaceutical potential of the lichen substances.

EFFECT OF DRYING TEMPERATURE AND AIR VELOCITY ON BIOACTIVE COMPOUNDS OF DRIED CORNELIAN CHERRY PUREE

İSMAIL TONTUL¹, EMRAH EROĞLU², AYHAN TOPUZ²

ABSTRACT

Cornelian cherry (*Cornus mas L.*) is a rich source of bioactive compounds such as anthocyanins, ascorbic acid and phenolics. Therefore, it has different health beneficial effects such as antioxidant activity, anti-inflammatory effect, cardioprotective, and lipid-lowering properties. According to Turkish Statistical Institute, the production of cornelian cherry in Turkey was higher than 10000 tons in 2015. The produced cornelian cherry used in production of jams, marmelades and nectar in Turkey. However, it is also used to produce different alcoholic and non-alcoholic beverages due to its astringent properties. Moreover, it is also used in cosmetic and ornamental industries. There are some studies on drying of whole cornelian cherry fruits using different drying techniques. However, usability of the dried whole fruit is limited. Therefore, in the current study, cornelian cherry puree was dried using hot air drying technique. By this way, a dried product which can be used as additive or colorant in different food formulation was produced. In the current study, the effect of drying temperature (50, 60 and 70°C) and air velocity (1, 2 and 3 m/s) on total monomeric anthocyanin content, radical scavenging activity and ascorbic acid content of the dried cornelian cherry puree was determined. The study was conducted according to factorial design and all drying experiments were carried out until moisture content of the final product reached 7.61-8.57 g/100g which corresponded 0.345-0.356 water activity. Total monomeric anthocyanin content of dried cornelian cherry puree was determined in the range of 213.2-304.4 mg C3G/100g dm. According to the statistical analyses, drying temperature, air velocity and their combination had significant effect on total monomeric anthocyanin content of the samples. The highest total monomeric anthocyanin content was determined at 3 m/s air velocity regardless of drying temperature. Radical scavenging activity of the samples were ranged between 751.3-885.6 mg trolox equivalent/100 mg dm. The highest radical scavenging activity was determined in the samples dried at 70°C at 2 m/s air velocity while it was lowest at 60°C at 1 m/s. Ascorbic acid content of the dried cornelian cherry puree was determined between 677.5 and 1462.8 mg/100g dm. Both factors and their interaction were found to be significantly effective on ascorbic acid content of the samples. Generally, increasing drying temperature had negative effect on ascorbic acid content. The air velocity showed huge differences according to drying temperature. Overall, drying at 60°C drying temperature and 3 m/s air velocity provided dried cornelian cherry puree with highest content of total monomeric anthocyanin, radical scavenging activity and ascorbic acid content. The product produced using these conditions had total monomeric anthocyanin, radical scavenging activity and ascorbic acid content of 297.3 mg C3G/100 g dm, 854.6 mg trolox equivalent/100 mg dm

ROSEMARY (ROSMARINUS OFFICINALIS L.): ITS COMPOSITION AND CLINICAL PROPERTIES

BİRSEN YILMAZ¹, GAMZE AKBULUT¹, NİLÜFER ACAR-TEK¹

ABSTRACT

Archaeological finds from the early ages indicate that people have benefited from many features of plants, especially in terms of obtaining nutrients and improve the health problems. Over the years, the interaction between man and plants has increased and now the ethnobotany field is born. The term "phytotherapy", which means treatment with medicinal plants, was first used by Henri Leclerc. The rosemary (*Rosmarinus Officinalis* L.) is also found in medicinal aromatic plants which are widely produced in Turkey. Rosemary is a valuable essential oil and spice plant from the Lamiaceae family and is in the form of a half-brier or brier. *R. officinalis* is the most important rosemary species cultured. Rosemary, a plant that remains green all seasons, is a strong antioxidant. Rosemary come out with leaf (*Rosmarini folium*) and volatile oil (*Rosmarini aetheroleum*) In European Pharmacopoeia has many effects on health as well as the commercial use of it. Rosemary essential oil is especially important in perfume, cosmetics and aroma therapy. A lot of research has been done about secondary metabolites of rosemary. As a result of these investigations, it has been reported that rosemary has anticancer, insecticide, antimicrobial and antioxidant effects. It is known that rosemary is used by people in various fields such as headache, diuretic, rheumatic diseases and wounds healing. Studies have concentrated on herbal antioxidants, as synthetically obtained antioxidants can have toxic effects. Antioxidant molecules in rosemary are defined as carnosic acid, carnosol, rosmaridifenol and rosmarinic acid in ethanol soluble fractions. Moreover, antioxidant properties are found in the essential oil fractions of the rosemary. In addition to the positive properties of antioxidants, it has been reported that they can be prooxidants and this can stimulate free radical reactions. It has been shown that the composition of the rosemary is influenced by environment, agronomic conditions, harvest time, storage period, age of the plant, developmental stage of the plant and harvested organ. For this reason, there is a need to study more about health effects.

**HELICHRYSUM SP.: KNOWN AND EVALUATED BY THE COMMON
FOLK EASTERN ANATOLIA AGRICULTURAL RESEARCH
INSTITUTE MANAGEMENT SOIL AND WATER RESOURCES
CAMPUS, TURKEY**

DR.SİBEL KADIOĐLU¹, DR BANU KADIOĐLU¹

ABSTRACT

Abstract In an ethno-botanic study carried out between 2013 and 2016 in Kop Pass, 14 villages were visited to record information about the plants used by the people. In 9 visited villages (Akduran, Kopk y, Tařađıl,  rence, Demirkař, Sıđırcı, Altıntař and Bařcımagıl, Kapıkale) it is recorded that people are utilizing one of the *Helichrysum* species which they call yellow flower as a medicinal herb. The *Helichrysum* species that are used to decorate the ceilings and the vases at the homes are known with the names such as yellow flower, grapefruit and amaranthus. It is commonly used as herbal tea. It is noted that the herb is used internally or externally for illnesses such as stomach ache, infection, ulcer, wound, cancer, kidney stone, urinary track infection and arthritis. *Helichrysum* sp. is a common plant in our country even though its originally from Europe. It has 34 naturally growing species half of which are endemic. Because of this reason it is known with different names in each region (Tr. Altın  i ek, Altın otu, Sari i ek, Mantuvar otu, Yayla  i eđi, Herdentaze, Solmaz  i ek, G neř  i eđi, G ve otu, Uludađ  i eđi, Kudama, Arı  i eđi, Dudiye  i eđi, Yahudi otu, Sarı kediayađı, etc.). Medicinal plants has long-lasting usage for treatment purposes. Even though they lost their importance to some extent due to development of synthetic medicines in this area of industry, raw materials of many medicines are obtained from plants. Therefore, ethno-botanic studies that gathers the folkloric information should be increased and the result of these studies should be evaluated in pharmacologic and pharmacognosy researches.

ETHICAL FRAMEWORK FOR THE USE OF VEGETABLE PRODUCTS

DIDEM SARİMEHMET¹, NURHAN GÜMRÜKÇÜOđLU¹, SEVİLAY HİNTİSTAN¹, GONCA SERDAR¹

ABSTRACT

The herbal products have been used for thousands of years in many different cultural histories. For reasons such as the increase of the expectancy of life, the fail of success in preventing and treating chronic diseases, economic inadequacy, pressure from media, ineffectiveness of modern medicine and fear or dissatisfaction from medical care; both health care providers and patients pursuit different approaches. The most familiar of these approaches is the use of herbal products. Supportive attitudes and proposals of individuals or institutions, whose identities are not sufficiently known in terms of "competence", that are not based on the scientific basis, the use of herbal products like "medicine" and collective use through written and visual media cause health workers to worry about this issue. Due to these discomforts, the development of an approach that draws the scientific and ethical aspects of the subject has become a matter of importance by the institutions and individuals working in this area. The aim of this compilation is to provide information on the importance of the use of herbal products, ethical aspects and the responsibilities of nurses in this subject

RHEUM RIBES L.: MIRACULOUS PLANT OF TURKEY (IN ERZURUM)

DR. BANU KADIOĐLU¹, DR. SIBEL KADIOĐLU¹

ABSTRACT

Abstract Rheum ribes is from Polygonaceae family that is one of the primary medicinal plants with distinctive aromatic taste and rich content. The plant that grows in may and june is found more in eastern regions of our country. It can grown in heights (1800-2800 or 2300-2700 or 1000-4000 meters), on rock and pebbled slopes. Rheum ribes is generally consumed fresh. Peeled stems of the flowers growing among wide and rough leaves of the plant that appears after snow melts are consumed. The versions of Rheum ribes known as ışgın or eşgın in Erzurum, in local language are ışkın, ıçgın, ıçkın, uçkun, uçgun, uşgun, uşkun, aşgın, aşkın, eşkin, eşgi. in Divanu Lügati't-Türk, Rheum ribes is defined as "a plant with a red flower whose sherbet is good for polio". The edible part of "Rheum ribes" of Anatolia is "stem of flower" whereas edible part of this plant growing in England "Rheum rhaponticum" is "stem of leaf". Today, in Erzurum Rheum ribes is consumed not only out of joy but also for medicinal purposes. It has common folkloric usage to treat diabetes and hemorrhoid. Rheum ribes that has rich Vitamin-C reserve contains Vitamins A, B1, B2, E and K. In scientific studies it is observed that Rheum ribes plays an important role for cell renewal and development. It can easily pollinate and interbreed with other species of its genus. Due to this feature, which is important for research studies, it has common usage in pharmacologic researches. However, in Anatolia there is a risk of extinction of Rheum ribes collected unconsciously and by inappropriate methods which cannot be ignored. Therefore, it should be protected and the studies on the plant should be increased.

MEDICAL AND AROMATIC PLANT PRODUCTION AND FOREIGN TRADE FROM 2000 TO TODAY

MÜKREMIN TEMEL¹, A. BIRCAN TINMAZ¹, MUSTAFA ÖZTÜRK¹, ORHAN GÜNDÜZ²

ABSTRACT

This study is a part of the Turkish Medicinal and Aromatic Plant Sector Analysis Project supported by General Directorate of Agricultural Research and Politics. This project aimed to give detailed information about the production, foreign trade amounts and changes of medicinal and aromatic plants from the year 2000 onwards. The research covers all medicinal and aromatic plants and takes place by using secondary data. Secondary data were obtained from TUIK records (foreign trade records) by screening, filtering and grouping methods and subjected to descriptive statistics. According to the findings, about 20 kinds of medicinal and aromatic plants are cultivated in the field of 1.3 million decares, and black tea, redbibber, poppy, cumin, mint, thyme, oil rose and anise are in the first place in terms of production amount. From 2000 to 2015, production sites increased by about 50%. On the other hand, more increases in the production quantities have occurred. There are dozens of plants in the foreign trade of medicinal and aromatic plants. Some of these plants are considered medicinal and aromatic plants, while they are found in industrial plants or oil seeds. Foreign trade of medicinal and aromatic plants was realized with export of 280 million dollars and import of 254 million dollars in 2015. The most important plants in export are thyme, poppy, laurel, tea, anise, caraway, sage, mahlep, redbibber and herbal teas. Thyme is in the first place with 25% share in exports. Thyme exports have increased by 300% compared to the past, reaching 56 million dollars and approximately half of them are realized in the Aegean Free Zone. Despite the increase in exports of many plants, red pepper, hemp, rosemary, peppermint, paint plants have decreased in exports. The most important plants in import are coffee, tea, linen, black pepper, carob, cumin, cumin, hops. Coffee constitutes 61% of imports. There are also many reeksports such as thyme, laurel, cumin, coffee, sage and carob. As a result, medical and aromatic plant production areas have increased, exports have increased, while imports have also increased. The foreign trade surplus is 25.3 million dollars while the coffee account includes 121.5 million foreign trade deficit.

TRADITIONAL USES OF MEDICINAL AROMATIC PLANTS OBTAINED FROM FOREST AREAS

GÖZDE SEZGİN¹, GÜLÇİN ÖZER¹

ABSTRACT

In recent years, there has been an increasing demand for wood raw materials produced from ornaments in the world market as well as for non-wood forest products. This increase is important not only for the purposes but also for the needs of the people. Turkey, which contains 20% of herbal products used for various purposes in the world, while many of the export of medicinal and aromatic plant is located in an important position in imports. In addition, our country is the ecological potential and one of the world's few countries. As in the rest of the world, the use of medicinal and aromatic plants found in natural flora in our country has become a part of our traditional cultural richness from centuries ago. For example, the treatment of people, food, tea, spices, dyes, treatment of animal diseases, resin, gum, benefiting from essential oils and use in the beverage-cosmetics industries. The transfer of medicinal aromatic plants that are used throughout the history for different purposes and their utilization patterns to future generations is very important in terms of not losing this information. In this study made for this purpose, the history of medicinal aromatic plants, the potential in the country, the traditional usage patterns of local people have been investigated.

**THE USE OF COMPLEMENTARY AND ALTERNATIVE MEDICINE
IN OUTPATIENTS OF ANKARA ÇANKAYA CEVİZLİDERE FAMILY
HEALTH CENTER: PRELIMINARY RESEARCH**

ÖZLEM AYNAOĞLU HAKVERDİ¹, ALEV ÖNDER²

ABSTRACT

The aim of this study is to examine the types and the use of Complementary and Alternative Medicine (CAM), as well as the factors affecting the use of CAM in Çankaya Cevizlidere Family Health Center, Ankara, Turkey. In the study, 75 respondents were selected randomly from the Family Health Center and questionnaires were applied. The results show that 65 % of the respondents use different types of CAM. Socio-demographic characteristics did not show any significant effect on the overall use of CAM.

EFFECTS OF PHYTOCHEMICALS ON AGING

BURCU DENİZ GÜNEŞ¹, NILÜFER ACAR TEK¹, GAMZE AKBULUT¹, HATICE BÖLÜKBAŞI¹

ABSTRACT

Aging is defined as a genetic physiological process associated with morphological and functional changes in cellular and extracellular components aggravated by injury throughout life and resulting in a progressive imbalance of the control regulatory systems of the organism, including hormonal, autocrine, neuroendocrine and immune homeostatic mechanisms. Aging includes a reduction in strength, endurance, the speed of reaction, agility, basal metabolism, sexual activity and hearing acuity. Aging is primarily caused by external or environmental factors that inflict cellular damage, ultimately leading to organ damage and death. The exact mechanisms underlying the aging process are not well understood, but increasing evidence shows that aging is highly associated with the chronic increase in reactive oxygen species (ROS), accumulation of a low-grade proinflammatory phenotype and reduction in age-related autophagy. Also, aging in humans is associated with a greatly increased incidence of a number of degenerative diseases including cardiovascular disease, Type 2 diabetes, cancer and Alzheimer's disease. Both aging and chronic diseases are highly associated with increased metabolic and oxidative stress, elevated chronic, low-grade inflammation, and accumulated DNA mutations as well as increased levels of its damage. All these factors may play an important role in the progress of aging. It was expressed that some phytochemicals present in the foods are antiaging molecules, and dietary intake of these compounds can promote health and extend lifespan. These effects can be associated with multiple mechanisms, including reducing oxidative stress, suppressing low-grade chronic inflammation, inducing autophagy, as well as regulating several important molecules involved in promoting mitochondrial function and energy homeostasis. Resveratrol, epicatechin, quercetin, curcumin and epigallocatechin gallate (EGCG) are anti-aging effective phytochemicals. It was reported that resveratrol improved insulin resistance, blood flow, and various cardiovascular events, as well as decreased oxidative stress and inflammation, may point to a promising antiaging action of this compound, given that cardiovascular disease is a major cause of age-related morbidity and mortality in humans. Dietary intake of epicatechin can improve blood vessel function, insulin sensitivity, blood pressure, and inflammation, all of which could be associated with the aging process. Quercetin, curcumin and EGCG are thought to play an important role in preventing aging, with antioxidant and anti-inflammatory properties preventing oxidative stress and inflammation. Additionally, other phytochemicals such as fisetin, butein, phloridzin, kaempferol, glaucarubinone and garlic extract, which contains s-allylcysteine, s-allylmercaptocysteine, allicin and diallosulfides were also found to be anti-aging effects in vitro studies. As a result, it can be said that phytochemicals are anti-aging effects due to the antioxidant, anti-inflammatory and other properties. But there is a need for more studies on people to clarify these effects.

SEASONAL EVALUATION OF MEDICINAL AND AROMATIC PLANT CONSUMPTION (SAMPLE OF ERZURUM PROVINCE)

DR. BANU KADIOĐLU¹, DR. SIBEL KADIOĐLU¹

ABSTRACT

Abstract: Turkey is a country where there are around 12.000 plant species whose 1/3 is endemic and 30% of this rate is aromatic. Among rich variety of plants, medicinal and aromatic herbs have a significant place and it is known that in Turkey about 500 plant species are used as medicine by the general public. In this study that intends to detect knowledge and consumption habits on medicinal and aromatic herbs of the consumers in Erzurum, sample size is determined as 384. Questionnaire is distributed to the neighborhoods proportionally. The main material of the research is the questionnaire data conducted with the consumers face to face. In the research results, consumers' medicinal and aromatic plant consumption habits are given by frequencies, percentages and cross tables depending on the seasons. The medicinal and aromatic plant consumption habits of the consumers vary depending on the season. In summer the most commonly used plant are coriander (*Coriandrum sativum*), mint (*Mentha sp.*) and nettle (*Urtica sp.*). These plants are used as spices, sweetening and for digestive system problems. During the winter months, cinnamon (*Cinnamomum sp.*), linden (*Tilia sp.*) and rosehip (*Rosa sp.*) are used for treating influenza and cold, strengthening of the immune system and the fulfillment of the need for vitamins.

VOLATILE OIL FOREIGN TRADE FROM PAST TO TODAY'S

MÜKREMİN TEMEL¹, A. BIRCAN TINMAZ¹, MUSTAFA ÖZTÜRK¹, ORHAN GÜNDÜZ²

ABSTRACT

This study is a part of the Turkish Medicinal and Aromatic Plant Sector Analysis Project supported by General Directorate of Agricultural Research and Politics. This project aimed to give detailed information about the production, foreign trade amounts and changes of volatile oil. This study covers all volatile oil and takes place by using secondary data. Secondary data were obtained from TUIK records (foreign trade records) by screening, filtering and grouping methods and subjected to descriptive statistics. According to findings, volatile oil foreign trade is realized as \$ 34 million export and \$ 27 million import in 2015. Exports were 11.6 million and imports were 5.3 million dollars in 2002. The most important essential oils in export are rose, thyme, stearopten, orange. In export, rose ranks first with 36% share. Rose exports was 8 million dollars in 2002 and 11 million dollars in 2015. France is the most important country with a share of 61% in volatile oil exports. Important essential oils in import are mint, orange, lemon, other citrus fruits, lavender. Mint is in the first place with a share of 14%. It reached \$ 2.8 million in 2015, while it was \$ 1.2 million in 2002. Important countries in importing essential oil are India, Germany and USA. Resinoids, by-products, oil resins and distilled water and concentrates of essential oils are also subject to foreign trade. As a result, exports are increasing, imports are increasing at the same rate, and there is a steady increase in foreign trade.

ETHNOBOTANICAL USAGE OF SOME PLANT TAXA SPECIES NATURALLY GROWING IN ESKİŞEHİR

KURTULUŞ ÖZGİŞİ¹, OKAN SEZER¹, İSMÜHAN POTOĞLU ERKARA¹, DERVİŞ ÖZTÜRK², ÖMER KORAY YAYLACI¹,
ONUR KOYUNCU¹

ABSTRACT

Eskişehir, with its approximately 220 endemic and over 1300 plant taxa, is one of the most important geographical regions of the Central Anatolia region in terms of floristic structure. Because of having neighbors in the north side such as Bolu and Bilecik where the European-Siberian phytogeographic region plant groups are dominate; the presence of large Central Anatolian steeps in the east, west and south side of the city where the Iranian-Turan phytogeographic region elements are dominate and having microclimate region around the Sakarya basin where the plant groups of Mediterranean phytogeographical region are dominate, Eskişehir hosts the plants of three kinds of phytogeographical regions. The usage of plants for different purposes by people in a region where the plant diversity is so high, is also quite common. Asteraceae (127 taxa) ; Fabaceae (94 taxa); Lamiaceae (83 taxa); Brassicaceae (70 taxa) and Caryophyllaceae (51 taxa) are in the top five in terms of the number of taxa which grown naturally in Eskişehir. When considered in terms of ethnobotanical usage, Lamiaceae (27 taxa) ; Asteraceae (21 taxa); Apiaceae (7 taxa); Rosaceae (5 taxa) and Fabaceae (4 taxa) are mostly used families. In this study which is based on both field and literature studies, ethnobotanical usage, usage methods, endemism, distribution patterns and phytogeographical characteristics of some plant taxa which are naturally grown in Eskişehir have been determined. It has been found that 65 different taxa belonging to 50 genus from 35 different families have been used for ethnobotanical purposes. 11.4% of these plants which are used by local people for ethnobotanical purposes are member of Mediterranean phytogeographic region element; 10.2% Iran-Turan phytogeographic region element and 9.23% Europe-Siberia phytogeographic region element. In addition, 4,61% of the plant taxa used for ethnobotanical purposes are endemic plant taxa.

MEDICINAL AND AROMATIC PLANTS OBTAINED AS NON-WOOD FOREST PRODUCT

A. BİRCAN TINMAZ¹, MÜKREMIN TEMEL¹, YASİN ÖZDEMİR¹

ABSTRACT

This study aimed to give detailed information about quantities and changes of medicinal and aromatic plants obtained as forest side product by years. The data are compiled from the records of the Ministry of Forestry and Water Affairs. According to findings, there are close to 30 medicinal and aromatic plant varieties collected as non-wood forest product, and laurel leaf, thyme and carob are in the first order. The amount of laurels, goat horns, lime increased when compared in the 1990's, while the amount of thyme, laden and steed decreased. It is seen that plants such as cantoron, cauliflower, lavender are obtained from forest areas and the quantities are not recorded properly in records.

ANTIOXIDANT ACTIVITY OF NEW APPLE CULTIVAR: MALUS COMMUNIS L. (PIRAZIZ APPLE)

AYTAÇ GÜDER¹, SEVİM ÇİFTÇİ YEGİN¹

ABSTRACT

Malus communis L., local cultivar is known Piraziz Apple by the local people, grown in Piraziz (Giresun). This cultivar was patented by the Turkish Patent and Trademark Office (No: 204 Patent' s Owner: Piraziz Ziraat Odası). According to the literature, beginning of the flowering, full flowering and harvesting period were May 25-30, 6th June and 15th November in 2011. On the other hand, these periods were determined as April 25-30; 6th May and 15th October in 2012. 160 days pass from the full flowering to the harvest. Apple samples were harvested in November, 2016. In this study, the antioxidant capacity of this cultivar' s apple was assessed by using different antioxidant test methods such as hydrogen peroxide scavenging activity, ferric reducing antioxidant power capacity (FRAP) at the 100 µg/mL concentration, DPPH radical scavenging activity, metal-chelating activity at the 100 µg/mL concentration, total phenol content (TPC), and total flavonoid content (TFC). These values were determined as 686.18 µg/mL (SC50), 6.44 (%), 273.12 µg/mL (SC50), 19.03 (%), 16.21 mg GAE/g extract and 12.91 mg CAE/g extract, respectively. Butylated hydroxy anisole (BHA), butylated hydroxy toluene (BHT) and α -tocopherol (TOC) were used for comparison of the data as standard antioxidant compounds. When antioxidant results of apple compare with standards, we can say that this apple cultivar don't show effective antioxidant activity as well as standard compounds. Although Piraziz Apple are used antidiabetic agent by the local community as ethnopharmacological material, it has no effective antioxidant activity. So this cultivar is generally used as antidiabetic agent. According to obtained results, we cay say that these activities can be related to active components in the Piraziz Apple. Consequently, this new cultivar' s biological properties can be investigated profoundly by the researchers because of the ethnopharmacological and ethnobotany properties.

**SOME AROMATIC PLANTS OF PHRYGIAN VALLEY
(ASTERACEAE, LAMIACEAE, APIACEAE)**

OKAN SEZER¹, ATILA OCAK¹, ÖMER KORAY YAYLACI², KURTULUŞ ÖZGİŞİ¹, DERVİŞ ÖZTÜRK³, ONUR KOYUNCU¹

ABSTRACT

Turkey is among the leading countries of the world in terms of its floristic diversity. Turkey, which has approximately 12,000 plant taxa has more higher floristic diversity than many other countries. Turkey is also among the few rare places on the World because of its high endemism ratio (31%). Moreover its gene center of the many plant taxa. Many plants that be in flora of Turkey have been used for traditional medicine purposes locally and globally. Numerous plant taxa belonging to various families which naturally distributed in our country are also used for commercial medicine and pharmacy fields. When family-based distributions of medicinal and aromatic plants in our country are examined, it is observed that plant taxa belonging to families such as Asteraceae, Lamiaceae and Apiaceae constitute the majority of these plants. In this study, Asteraceae, Lamiaceae and Apiaceae taxa of Phrygian Valley where located at the junction point of the Eskişehir, Kütahya and Afyon provinces and also getting popular in terms of ecotourism in recent years were determined. A total of 107 taxa belonging to the family of Asteraceae that includes 104 species and 3 subspecies were identified. Also 64 plant taxa (62 species and 2 subspecies) belonging to 20 genera from Lamiaceae and 37 plant taxa (35 species, 1 subspecies and 1 variety) belonging to 24 genera from Apiaceae were determined. Totally 208 plant taxa from these 3 families were identified from study area. 26 of these are endemic and the endemism rate is 12.5%. 43 of these taxa are Irano-Turian, 29 Euro-Siberian and 21 Mediterranean. 115 of these 208 taxa are multiregional or floristic region are unknown. This study aimed to determine the floristic diversity of Asteraceae, Lamiaceae and Apiaceae, which spread in the Phrygian valleys, and thus to guide the further studies which will be carried out on the taxa belonging to this family.

DETERMINATION OF SOME HEAVY METAL CONCENTRATIONS OF SAGE TEA WITH FAAS

FEVZI KILIÇEL¹, HACER SİBEL KARAPINAR¹, AYŞE UĞUZ¹

ABSTRACT

Herbal teas are blends based on the plant's roots, root hairs, branch shoots, aromatic parts of leaves, flowers, shells, fruits, or seeds that are prepared by drying aromatic parts in boiling water. Although plant teas are known to have many benefits in terms of health, they are an important threat to human life if they are exposed to some contamination due to misuse or overuse or uncontrolled production. A significant proportion of these exposures constitute heavy metals. The living environment of the plants is polluted with many harmful substances which arise from various sources. Factors such as the development of industry and increasing traffic, pesticides, industrial and household waste increase the heavy metal pollution. Considering the studies evaluating herbal teas in terms of heavy metal contents, it is seen that in herbal teas there are elements naturally found in plants such as Cu, Co, Zn, Mn, Fe and necessary for human health. However, some metals, such as Ni, Pb, Cd, As, Hg, which are poisonous, appear to be present when they reach certain levels (1,2). To prevent heavy metal accumulation and health problems caused by it, it is important to avoid heavy metal contamination in stages such as plant collection, production, packaging, storage and storage. If it is thought that the people use these unconsciously and uncontrollably, it is very important to make legal regulations and audits in this area. In this study, adequate quantities of sage tea (*salvia officinalis*) plants offered for sale in markets, and herbalist in Karaman were taken in sufficient quantities and analyzed by appropriate drying, milling and dissolution processes. The samples were prepared to be 2 parallel for each sample and were solutioned by wet burning method. For this purpose, one gram of the powdered sample washed and dried in a suitable manner is precisely weighed 16 ml HNO₃ (65%, w/w) and 4 ml HClO₄ (70-72%, w/w) are added to it and the solution is slowly heated in the drawer for about 5-6 hours. The heating process close to the end of the acids is cut off and the solutions are cooled. Then 5 ml H₂ O₂ (30%, w/w) was added and heating was continued until clear liquid was obtained. Heating was stopped when clear liquid was formed, and the solutions were allowed to cool. Cooling solutions were filtered through blue band filter paper and 15 ml of the obtained solutions were mixed with distilled water to prepare the analyzed. The concentrations of the determined elements were determined by Flame Atomic Absorption Spectrometry. The amounts of Co, Ni, Cu, Zn, Cd, Mn, Mg, Fe and Ca were determined in all of the foods determined according to the results. Cr was not detected in the samples. When the results were evaluated Co, Ni, Fe and Ca were found to be above the determined limits. Co, Ni, Fe element concentrations are above the normal range but below the toxic limits. It should be noted that these foods can easily be contaminated due to factors such as the physical and chemical structure of the soil, agricultural activities, storage and packaging conditions. Moreover, it is important to consciously consume and make the necessary quality controls not to adversely affect public health.

LAMIACEAE TAXA OF GYPSUM AND MARL SOILS IN ESKİŞEHİR

DERVİŞ ÖZTÜRK¹, ATILA OCAK², OKAN SEZER², ONUR KOYUNCU²

ABSTRACT

The investigation area covers gypsum and marl soils reside in the border of Eskisehir. It occurs in the B3 square according to the grid system of P.H. Davis. To investigate the flora, 1750 specimens have been collected during the field seasons of 2012- 2015. The floristic list follows the APG III. At the end of identifications of the specimens 47 taxa belonging to Labiate family have been determined. The endemism ratio of the areas is 17.5 %.

INVESTIGATION OF EFFECTS ON RIPENING OF DIFFERENT TYPES OF SPICES USED IN KASHAR CHEESE PRODUCTION

ZEKAI TARAKÇI¹, ENGIN AYDIN²

ABSTRACT

Investigation of Effects on Ripening of Different Types of Spices Used in Kashar Cheese Production* Zekai TARAKÇI¹, Engin AYDIN² 1Department of Food Engineering, Agricultural Faculty, Ordu University, Ordu, Turkey 2Department of Cooking, Vocational College, Giresun University, Giresun, Turkey *This research was supported with number TF-1624 by ODU-BAP. 1zetarakci@hotmail.com In this study, six types of Kashar cheese, one of them is control sample that was produced without adding any spices; the others samples were processed to cheese by adding dead nettle, mint, lemon balm, arugula and parsley as 0.5% according to the milk used. Then, all cheeses were vacuum-packed and ripened at 7±1°C during 3 months and dry matter, fat, pH, titratable acidity, salt, total protein, ripening rate, nonprotein nitrogen rate (NPN), amino nitrogen rate, textural properties and sensory analyses were performed by taking cheese samples during the 2nd, 30th, 60th and 90th days of ripening. The results were compared in terms of the types of cheese and ripening period, statistically. The values of adhesiveness, springiness and resilience parameters of texture profile analyses and also the values of structure-texture parameters of sensory analyses were founded importance difference. The values of fat and the values of springiness parameters of texture profile analyses were determined statistically significant. All of the other parameters were obtained statistically differences. As a result of sensory evaluation made by panelists, ripened kashar cheeses had more acceptability than fresh kashar cheeses. Keywords: Kashar cheese, spices, ripening criteria

ELEMENTAL COMPOSITION DIVERSITY OF SELECTED WILD EDIBLE PLANTS FOR ALTERNATIVE NUTRITION

M. KADRI BOZOKALFA¹, BÜLENT YAĞMUR¹, DURSUN EŞİYOK¹, TANSEL KAYGISIZ AŞÇIOĞUL¹

ABSTRACT

Vegetables and fruits in general are an important category in food based approaches a sources of multiple micronutrients. In addition to meeting nutrient intake levels, greater consumption of fruits and vegetables is associated with reduces risk of developing chronic diseases. Within this group, gathered wild vegetables deserve greater attention several research show how they are easily accessible, culturally accepted and inexpensive sources of vitamins and minerals to many rural population groups. Diversity and number of examples from different region indicate their importance at an aggregated level. The wild edible plants are consumed in many different ways but mostly eaten raw as a salad. However, widespread knowledge of wild edible plants not provide much information on their nutritional significance and their diversity. The objective of the present work was to evaluate variability for dry matter, protein and mineral composition of nutritionally important and widely consumed wild edible plants in Aegean region of Turkey. The plant material comprises 17 edible plants collected from naturally found and widely distributed in the experimental area of Horticulture Department of Ege University. In order to reduce environmental and edaphic factors on the composition of the plant samples and visualize genotypic differentiation, the plant material collected from the a total 500 m2 area where the soil that has not been cultivated for a long time, furthermore not use any chemicals such as fertilizer and pesticide in collection site. A total 17 edible wild species *Lactuca serriola* L., *Capsella bursa-pastoris* L. Medik., *Malva sylvestris* L., *Papaver rhoeas* L., *Urtica dioica* L., *Erodium cicutarium* (L.) L'Herit., *Chondrilla juncea* L., *Stellaria media* L. *Rumex patientia* L., *Taraxanum officinale*, *Allium ampeloprasum* L., *Plantago lagopus* L., *Sonchus oleraceus* L., *Daucus carota*, *Sinapsis arvensis* L., *Mentha pulegium* L., *Portulaca oleraceae* L. were evaluated for dry matter, protein, N (nitrogen), P (phosphorus), K (potassium), Ca (calcium), Mg (magnesium) composition. The data were subject to analysis of variance, and a Pearson correlation test was used to determine the correlations between dry matter, protein content and N, P, K, Ca, Mg compositions. Principal component analysis was performed on the result of examine compositions and the factor loadings, eigenvalues and percentage of cumulative variance were calculated, the patterns of relationships among nutritive element were shown two-dimension scatter plot. Dry matters, protein and mineral elements were found to vary widely depending on species. According to the results the wild edible species dry matter content ranged from 8.65-20.11% in the edible parts of plant, and the highest protein (29.94%) and N (4.79 mg 100 g⁻¹) values were observed in *C. bursa-pastoris* L. Medik., P content ranged between 0.19-0.37 mg 100 g⁻¹, where *P. rhoeas* showed the highest. K was found in the range of 2.24 to 4.24 mg 100 g⁻¹ respectively, for *M. pulegium* L. and *P. oleraceae* L. Ca was present good amount in *U. dioica* L. 3.47 mg 100 g⁻¹ while other species in the range of 0.64-2.64 mg 100 g⁻¹. Similarly, other micro minerals including Mg (0.14-0.43 mg 100 g⁻¹) and Na (0.04-0.86 mg 100 g⁻¹) were observed in the selected plant species. Multivariate analysis revealed considerable

¹EGE ÜNİVERSİTESİ ZİRAAT FAKÜLTESİ

variation for the most of concentration. The principal component (PC) analysis explained that 81.49% of total variation accounted for three PC axis. The first axis was mainly related to variation in protein, N and P compositions. The second axis was mainly concerned with dry matter, K, Ca, and Na, the third axis related to Mg. The data reveal that selected wild plant provide significant nutrition and genetic background of species can play role in the nutritional value.

INVESTIGATION OF NATURAL ADVERTISING OF SOME MEDICAL AND AROMATIC PLANTS IN THE GAP OF PEANUT PINE PLANTATION

A. BİRCAN TINMAZ¹, MÜKREMIN TEMEL¹, MUSTAFA ÖZTÜRK¹, MEHMET ÖZDEMİR²

ABSTRACT

There are hundreds of medical and aromatic plants in our country that are collected from nature and offered for sale or exported. In the process of nomination to the Mediterranean model forest network being established, work has been initiated to improve forest-peasant relations and to promote the cultivation of non-forest products in forest openings and to increase the participation of villagers in the system. In this study, organic farming possibilities of some medicinal and aromatic plants (Sage, Rosemary, Thyme, Lavender and Laurel) were investigated in the openings of pistachio pine plantation of Armutlu peninsula. At the end of the project, the optimal planting time and location of the plants to be planted in different ways (shaded view, sunny view, uninjured area) and at different times (autumn, winter, spring) were determined. Experiments that were established separately for each plant, 3 replications were set up in random parcel trial design in random blocks. The results were subjected to analysis of variance and significant averages were evaluated by the Lsd test. With the study, the new plant, Sage, Rosemary, Lavender planted in the forest openings, has been adapted to the newly formed ecosystem and it has come to the conclusion that the breeding can be done in such areas. Competition with other forest bushes and weeds was found to be weak due to the herbaceous structure of the Istanbul Thyme used in the study. It is observed that these areas where defnesin is planted are not suitable for uncontrolled cultivation and that their development is not good and they can not take place in the ecosystem. The study is a first for Turkey and a model for breeding.

PHYTOCHEMICAL ANALYSIS OF DIFFERENT PARTS OF SALVIA PAHYSTACHYS BY USING LC-MS/MS

MUSTAFA ABDULLAH YILMAZ¹, ELIF VARHAN ORAL², ABDULSELAM ERTAŞ³, HAVA BATIBAY⁴, MEHMET FIRAT⁵, ESRA YARIŞ³, HILAL SARUHAN FIDAN⁶, HÜSEYİN ALKAN⁶, HAMDI TEMEL¹, BERRİN ZİYADANOĞULLARI⁴

ABSTRACT

Salvia L. genus is member of lamiaceae family which exists approximately 220 genus and 4000 species on the world. Although it shows most natural distribution in Turkey and Mediterranean region on the world, almost it can be grown in all habitat types and heights. Salvia L. genus is represented about 89 species in Turkey and 45 of them are endemic. Salvia species are generally known for their multiple pharmacological effects including their antibacterial, antiviral, antioxidative, antimalarial, anti-inflammatory, antidiabetic, cardiovascular, antitumor, and anticancer. In this study, secondary metabolite profile (37 phytochemicals including 15 Phenolic acids, 17 flavonoids, 3 nonphenolic organic acids, 1 phenolic aldehyde and 1 penzopyrane) of ethanol extracts of different parts (stems, leaves, flowers, roots and mixed parts) of Salvia pahystachys was determined with LC-MS/MS. LC-MS/MS method validation was developed for the qualitative and quantitative analysis of 37 phytochemicals. The LC-MS/MS studied showed that S. pachystachys was including high amount hesperidin, caffeic acid, fumaric acid, malic acid, apigenin and especially rosmarinic acid.

ABSTRACT

The Lamiaceae family, which has an important place among medicinal and aromatic plants, is represented by about 250 genera and 7000 species in the world. Because of the aromatic oils, essential oils and a wide variety of secondary metabolites they have, great deal of these have been using as spice, food and medical purposes in our country and in the world since ancient times. Turkey is among the Lamiaceae-rich regions of the world. Moreover, Turkey is the gene center of many Lamiaceae taxa and is host in a large number of endemic taxa. Lamiaceae is among the largest families of The flora of Turkey and it is represented with near 574 species from 45 genera between about 12,000 taxa of Turkey flora. In this study, Lamiaceae specimens have been collected through the Pazaryeri (Bilecik) and its environs between 2013-2014 years. Totally, 50 Lamiaceae taxa (45 species, 5 subspecies) belonging to 18 genera were identified from study area. 13 of these taxa are Irano-Turanian, 8 Euro-Siberian and 6 Mediterranean. Other 23 taxa are multiregional or their distribution unknown. 9 endemic taxa (7 LC and 2 NT) determined from study area and endemism ratio 18%. This study aims to determine the Lamiaceae taxa which spread naturally in the vicinity of the Pazaryeri (Bilecik) and so reveal the medicinal and aromatic dimensions of these taxa.

EVALUATION OF THE ANTIOXIDANT CAPACITY AND PHENOLIC CONTENT OF JUNIAEA MESOPOTAMICA EXTRACT OBTAINED WITH DIFFERENT SOLVENTS.

ADEM NECİP¹, MESUT IŞIK¹, ABDURRAHMAN AKDAĞ¹, İSMAIL KOYUNCU¹, ABDULLAH AYKANAT, REŞAT DİKME¹

ABSTRACT

Antioxidant plays an important role in inhibiting and scavenging free radicals, thus, providing protection to human against infection and degenerative diseases (Ansari, 2013). Now the modern research is directed towards "Natural antioxidants" from the herbal plants due to safe therapeutic. In the present paper we have investigated antioxidant activity of extracts from *Juniaea mesopotamica* for its free radical scavenging activity by adopting various in vitro methods. The methanol and buthanol extracts of *Juniaea mesopotamica* exhibited significant antioxidant activities determined by different assays. This study shows that methanol and buthanol extracts of *Juniaea mesopotamica* have higher antioxidant activities than dichlorometane and hexane extract. Moreover, this plant showed antioxidant properties close to the standards. This suggests that *Juniaea mesopotamica* extract is a potential source of natural antioxidants, which could be added to dietary supplements to help prevent oxidative stress.

DETERMINATION OF ANTIOXIDANT PROPERTIES OF DRY ROSE TEA

DILAY KART¹, ÖZLEM ÖZLEM ÇAĞINDI¹

ABSTRACT

ABSTRACT Medical and aromatic plants that have been used since mankind have become, a focus of interest especially due to increased health concerns and safe food demand in recent years. It can be demonstrated that the pharmaceutical industry takes a large share in R & D expenditures made as a result of the increase in the importance of pharmaceuticals and aromatic plants. Data from the World Health Organization show that 70-80% of the world's population benefits from traditional medicine. In this direction, approximately 20,000 in the world; in our country, there are plants used for about 500 medical purposes. Medicinal and aromatic plants in traded is used in 50% food, 25% cosmetics and 25% pharmaceutical industry. The rose takes part the fragrant plant parts used in the field of medicinal and aromatic plants. It has an important role in food, perfumery and cosmetic industry. Besides this usage roses are curtained some benefits such as sedative, anti-stress property, hemostatic, stomach, liver, intestines, fever and skin disease therapeutic and anti-inflammatory functions. General usage areas of rose in our country; used as raw material in the production of products such as dried rose, rose oil, rose syrup, rose jam, rose water and the use of flavouring and colouring agents in the formulation of delight products etc. For this purpose, tea made by using 3 different dried bud roses and 3 different dried rose leaf purchased in Isparta and İzmir market were investigated in terms of antioxidant properties. The roses were kept in boiled water at 98 °C for 5 minutes and filtered at the end of the time. Total phenolic substance by Folin-Ciocalteu method, antioxidant capacity by TEAC method and total flavonoid determination were done in the samples which arrived at room temperature. When the results of the analyses are examined, the total amount of phenolic material 5,241-166,355 mg/200 mL tea, the total amount of flavonoids 2,019-14,825 mg/200 mL tea and the antioxidant capacity values 0.64-10.78 µM troloks/200 mL tea are found. In all analyzes, dry bud results were found to be lower than dry leaves. In addition, there was a statistically significant difference between the varieties (p<0.05). Besides its pleasant smell and comfortable drink, it also has antioxidant properties that rose tea can be an alternative to other herbal teas, it is thought that the consumption can be widespread and the usage areas can be expanded with the works to be done.

THE CYTOTOXIC AND APOPTOTIC EFFECTS OF THE YOUNG SHOOTS EXTRACT OF TAMMUS COMMUNIS ON HEPATOCELLULAR CARCINOMA

ÜNAL EGELİ¹, BESTE YURDACAN¹, HUZEYFE HURİYET¹, GAMZE GÜNEY ESKİLER², İŞİL EZGİ ERYILMAZ¹, HULUSİ MALYER¹, GÜLŞAH ÇEÇENER¹, TOLGA ÇAVAŞ¹, BERRİN TUNCA¹

ABSTRACT

Plants are an important sources as development of novel therapeutic agents in cancer treatments because most chemotherapeutic drugs have been improved or isolated from plants or their synthetic derivatives. *Tamus communis* L. (Dioscoreaceae, named "Sarmaşık" locally), a perennial herbaceous climbing plant, have some pharmacological effects including antioxidant, antiviral, anti-inflammatory and antimicrobial. However, the anticancer effect of *T. Communis* extract has not known well yet in the literature. In the current study, we aimed to determine the cytotoxic and apoptotic effects of young shoots extract of *T. communis* on hepatocellular carcinoma. The cytotoxic effect of *T. communis* extract on SNU-449, Hep G2 cells treated with different concentrations (50-250 µg /ml) was determined by WST-1 assay for 24,48 and 72h. The DNA damage and repair capacity in these cells treated with the most effective concentration of *T. communis* young shoots extract were analyzed by comet assay. Additionally, the morphology of apoptotic cells was examined by acridine orange/ethidium bromide staining to support comet assay. The young shoots extracts from *T. communis* displayed anti-proliferative activity on SNU-449 and Hep G2 cell lines ($p < 0.05$). The cell viability of Hep G2 and SNU-449 cells decreased to 58.6% and 80.0% at 250 µg/ml of concentration for 72 h, respectively. Hep G2 cells exhibited a higher sensitivity to the young shoots extracts than SNU-449 cells due to associated with a more aggressive tumor phenotype. The young shoots extract of *T. communis* exhibited less toxicity (12.7%) on HUVEC control cells. Additionally, the young shoots extract of *T. communis* induced DNA strand breaks and apoptosis in SNU-449 and Hep G2 cells. The cytoplasmic and nuclear shrinkage and chromatin condensation were observed on particularly Hep G2 cells. Consequently, young shoot extract of *T. communis* has displayed an anticancer properties due to its pharmacological profile. However, this study may be improved by extraction of antitumoral activity different plant parts (rhizome and stem) and determination in amount of phenanthrene or phenolic compounds

A STUDY OF ANTIMICROBIAL ACTIVITY OF CONSOLIDA ORIENTALIS AND SPARTIUM JUNCEUM

ERDOGAN GUNES¹, AHMET UYSAL¹, YUSUF DURAK¹, GOKHAN ZENGIN¹

ABSTRACT

For a long period of time, plants have been a valuable source of natural products for maintaining human health, especially in the last decade, with more intensive studies for natural therapies. The World Health Organization estimates that plant extracts or their active constituents are used as folk medicine in traditional therapies of 80% of the world's population. Therefore, such plants should be investigated to better understand their properties, safety and efficiency. The aim of this study are to determine the antimicrobial activities of methanol and water extracts from *Consolida orientalis* and *Spartium junceum* plants distributing in Turkey. Antimicrobial activity of the tested plant extracts were studied by the broth microdilution method. It was determined that *Consolida* methanol extracts showed antibacterial activity at doses ranging between of 6.25-3.125 mg/ml against *S. aureus*, *S. enteritidis* and *E. faecalis* standart bacteria. It was found that methanol extract of *Consolida* had antifungal activity at a dose of 6.75 mg/ml against *C. albicans* and *C. parapsilosis*. However water extracts of *Consolida* had an antibacterial effect only against *E. faecalis* at a dose of 6.25 mg / ml. When the methanol extracts of *Spartium* were evaluated it was seen that methanol extracts were effective at a dose of 6.75 mg/ml on the *S. lutea*, *E. faecalis* and *C. albicans*. However water extracts of *Spartium* showed no antimicrobial activity. It was concluded that methanol and water extracts of *Consolida orientalis* and *Spartium junceum* have weak antimicrobial activity.

THE ANTIMICROBIAL ACTIVITY OF ONOSMA ISAURICUM

ERDOGAN GUNES¹, AHMET UYSAL¹

ABSTRACT

In many developing countries antibiotic resistance, adverse drug reactions, and the high costs of antimicrobials have made management of infectious diseases ineffective. Natural products of higher plants may be a source of new antimicrobial agents with possibly novel mechanisms of action. In this study, it is aimed to investigate the antimicrobial activity of the extracts of methanol and water of *Onosma isauricum* on some microorganisms. The antimicrobial activity was evaluated according to the broth microdilution method by using *Escherichia coli*, *Pseudomonas aeruginosa*, *Staphylococcus aureus* (MSSA), *Klebsiella pneumoniae*, *Staphylococcus aureus* (MRSA), *Salmonella enteritidis*, *Sarcina lutea*, *Enterococcus faecalis*, *Candida albicans* and *Candida parapsilosis*. It was found that methanol extracts of *Onosma* had antimicrobial activity at a dose of 6.25 mg/ml against *S. lutea*, *E. faecalis*, *C. albicans* and *C. parapsilosis*. When the water extracts of *Onosma isauricum* were evaluated it was seen that water extracts were effective at a dose of 3.125 mg/ml on the *S. aureus* (MSSA) and *S. aureus* (MRSA). As a result, we concluded that methanol and water extracts of *Onosma isauricum* have weak antimicrobial effect.

INVESTIGATION OF EFFECTS ON RIPENING OF DIFFERENT TYPES OF SPICES USED IN WHITE CHEESE PRODUCTION

ZEKAI TARAKÇI¹, FAHRETTİN DEVECİ²

ABSTRACT

INVESTIGATION OF EFFECTS ON RIPENING OF DIFFERENT TYPES OF SPICES USED IN WHITE CHEESE PRODUCTION* Zekai TARAKÇI¹, Fahrettin DEVECİ² 1Department of Food Engineering, Agricultural Faculty, Ordu University, Ordu, Turkey 2Ordu Food Agriculture and Livestock Directorate, Ordu, Turkey *This research was supported with TF-1423 project number by ODU-BAP. 1zetarakci@hotmail.com In this study, six types of white cheese, one of them is control sample, were produced. While control cheese was produced without adding any spices; the others were processed to cheese by adding black cumin, dried mint, thyme rubbed, red pepper flakes and isot pepper as 3% according to the milk used. Then, all cheeses were vacuum-packed and ripened at 7±1°C during 3 months and dry matter, fat, pH, titratable acidity, salt, total protein, ripening rate, nonprotein nitrogen rate (NPN), amino nitrogen rate, electrophoretic casein fractions, textural properties and sensory analyses were performed by taking cheese samples during the 2nd, 15th, 30th, 60th and 90th days of ripening. The results were compared in terms of the types of cheese and ripening period, statistically. The values of adhesiveness, springiness and resilience parameters of texture profile analyses and also the values of structure-texture parameters of sensory analyses were not statistically significant (P>0.05). The values of fat and the values of springiness parameters of texture profile analyses were determined statistically significant (P<0.05). All of the other parameters were obtained statistically significant (P<0.01). As a result of sensory evaluation made by panelists, ripened cheeses had more acceptability than fresh cheeses. Also as cheese type, samples with black cumin, mint and thyme exceeded in common with control sample. Keywords: Spice, white cheese, ripening.

USE OF SOME NATIVE TREES WITH MEDICINAL QUALIFICATIONS IN URBAN GREEN AREAS: ANTAKYA (HATAY- TURKEY)

ELIF BOZDOĐAN SERT¹, ÖZGÜR KAHRAMAN², SEMA GÜLER¹

ABSTRACT

Trees have been important for human beings in terms of benefits as shelter, obtaining food and clothing materials, etc. from past to present. For this reason, some of the species have produced, growth and even its protection have provided. With the establishment of cities as living space, planting of green areas such as parks, streets, cemeteries and gardens have carried out within certain frameworks. At this time, initially plants with food and medicinal qualification have preferred to bring to the cities. By this way, use of many of the species with both aesthetic and functional qualities in planting urban green areas have leaded. Trees that are the main material of the plantation are indispensable elements of urban landscape with many functional features such as shadowing, orientation, focusing, and accumulation of pollutants. Especially, because of its easier adaptation to environment, native species have used often in urban green areas. With this study, it was aimed to determine native tree species with medicinal qualification used in the green areas of Antakya (Hatay). The study was conducted in parks (Atatürk Park, Vali Ürgen Park), public institutions gardens (Governorship, General Directorate of State Hydraulic Works, Provincial Directorate of Health), urban roads, and Mustafa Kemal University Tayfur Sökmen Campus in Antakya city center between April-May 2016. As a result, it was determined that native twenty tree taxa with medicinal qualification were used in urban green areas of Antakya. In this context, all taxa were studied in terms of aesthetic (color, texture, form) and functional (shadow, focus, orientation) qualifications important in landscape architecture and other qualifications such as medicinal.

BIOLOGICAL ACTIVITIES OF SALVIA PACHYSTACHYS FROM ANATOLIA TURKEY

ELIF VARHAN ORAL¹, HAVA BATIBAY², ABDULSELAM ERTAŞ³, MEHMET FIRAT⁴, HILAL SARUHAN FIDAN⁵, HÜSEYİN ALKAN⁵, ESRA YARIŞ³, BERRİN ZİYADANOĞULLARI², GÜLAÇTI TOPÇU⁶

ABSTRACT

Since ancient times, Salvia species have been used in folk medicine for the treatment of diabetes and skin diseases such as psoriasis and eczema. These species have been the subject of extensive pharmacognosic researches that were intended to identify biologically active compounds. Particular attention has been shown to the members of the genus Salvia due to their wide range of important biological activities such as antifungal activity, antitumor activity, antibacterial activity, antiviral activity, cytotoxic activity, antioxidant activity, treatment of heart disease, and antimycobacterial activity. The aim of this study was to determine the phenolic and flavonoid contents (determined as pyrocatechol and quercetin equivalents, respectively), antioxidant (DPPH free radical scavenging activity, β -carotene bleaching assay, CUPPRAC, ABTS cation radical scavenging activity) and anticholinesterase (acetyl- and butyrylcholinesterase enzymes) activities of these salvia species were tested. It was determined that working in all extracts not show acetylcholinesterase activity but show a moderate butyrylcholinesterase activity. Furthermore the ethanol extracts of all parts of (stems, leaves, flowers, roots and mixed parts) species showed high antioxidant activity in all antioxidant tests. Especially the flower of Salvia Pachystachys showed high antioxidant activity in ABTS assay.

DETERMINATION OF PHENOLIC AND MINERAL COMPOUND COMPOSITION IN SOME FRUIT JUICE MARKETED IN NİĞDE

EZGI KARAKAŞ¹, RIFAT BATTALOĐLU²

ABSTRACT

In this research, it is aimed to determine total phenolic and mineral contents of some kind of fruit juices (apricot, sour cherry, orange, peach and mixed) which was bought from markets in Niđde and to evaluate with the standards. Firstly, pH, total acidity and hydroxymethyl furfural (HMF) analysis of the collected samples were achieved. Then, total phenolic contents and some mineral and metal contents (potassium, iron, zinc, aluminium and copper) were determined and evaluated with standards of regulations. The average pH value of the samples was found as 3.78 ± 0.20 . The average of HMF concentrations of the samples was found as 4.99 ± 3.04 mg/L. Average of total phenolic material contents for all samples was found as 153.03 ± 42.93 mg/L. According to analysis of mineral and metal contents results, potassium, iron, zinc, aluminium and copper contents were between 219.88-425.98 mg/L, 0.025-0.056 mg/L, 0.588-1.965 mg/L, 0.004-0.014 mg/L, 0.187-0.557 mg/L for sour cherry juices,; 320.58-580.88 mg/L, 0.097-3.653 mg/L, 0.385-2.086 mg/L, 0.002-0.134 mg/L, 0.115-1.129 mg/L for apricot juices, 205.88 and 489.88 mg/L, 0.049 and 0.115 mg/L, 0.777 mg/L, 0.028 and 0.083 mg/L, 0.076-0.233 mg/L for orange juices, 230.08 and 371.78 mg/L, 0.128 and 0.137 mg/L, 0.389 and 0.734 mg/L, 0.066 and 0.110 mg/L, 0.114 and 0.258 mg/L for peach juices and 165.38-417.38 mg/L, 0.027-0.1112 mg/L, 0.359-1.087 mg/L, 0.025-0.073 mg/L, 0.049-0.561 mg/L for mixed fruit juices respectively.

GC-MS ANALYSIS OF ESSENTIAL OIL AND FATTY ACID COMPONENTS OF CENTAUREA PAPHLAGONICA PLANT

ALI RIZA TÜFEKÇİ¹, İBRAHİM DEMİRTAŞ¹, EBRU DERELİ TÜFEKÇİ¹, MUHAMMED ALTUN¹

ABSTRACT

Centaurea plant species that have medicinal properties are among the largest species of the asteraceae family. Because of these properties, it is used by human for therapeutic purposes. There are about 600 centaurea species in the world. There are about 187 species in Turkey. 120 of these species are endemic species. In this study, volatile oil in the plant was obtained by hydrodistillation method. Fatty acid of plant were obtained according to the method of mesagenization in the hexane organic solvent. Component analyzes in volatile and fatty acid were determined by GC-MS instrument. According to the results obtained, spathulenol and gamma-elemene compounds in volatile oil were identified as the main components. In fatty acid, hexadecanoic acid was identified as the main component.

IN VITRO NEMATOSTATIC ACTIVITY OF ALLIUM TUBEROSUM (ROTTL.) ON STEM AND BULB NEMATODE (DITYLENCHUS DIPSACI)

ELIF YAVUZASLANOđLU¹, ALI BILGIÇ¹

ABSTRACT

Allium tuberosum (Rottl.) (Alliaceae) is a native growing plant in Southern Asia named commonly as garlic chive. It produces small bulb and fast growing leaves. The leaves are cultured and used for treating abdominal pain, diarrhea, hematemesis, snakebite and asthma in China. The whole plant has also antibacterial, cardiac, depurative, digestive, stimulant, stomachic and tonic activity. The stem and bulb nematode (*Ditylenchus dipsaci*) is one of the important constraints of a wide range of plant species with main host of onion and garlic. It reproduces endoparasitically and damages plants. Nematostatic activity of garlic chive on *D. dipsaci* was tested in vitro. Leaves of garlic chive were dried at room temperature for two to three weeks. A one gram of dried leaves grinded and extracted in 10 ml methanol for 48 hours at room temperature on a magnetic stirrer. Dried methanol extract diluted with water to 3% concentration. Nematodes were treated with 0,5 ml, 1 ml and 1,5 ml of aqueous solution of garlic chive methanol extract. Negative control contained sterilized tap water. Each treatment contained averagely 50 nematodes. Total volume in each treatment was completed to 5 ml using sterilized tap water in 9 cm plastic petri dishes. Nematodes incubated at 15 °C for 48 hours. Moving and motionless nematodes were counted under microscope after 48 hours of exposure in the treatments. Motionless nematode rate increased significantly at garlic chive treatments. While motionless nematode rate was 6% in negative control treatment, it was recorded 35, 86 and 78% in 0,5, 1 and 1,5 ml garlic chive treatments, respectively. Preliminary results indicate that the methanol extract of garlic chive shows nematostatic effect on *D. dipsaci* at 48 hours exposure in vitro. The effective content of methanol extract of garlic chive and effect of active content under in vivo conditions are next step of the study.

AFYONKARAHISAR MEDICAL AND AROMATIC PLANTS CENTRAL OFFICE INTRODUCTION AND ACTIVITIES

EMEL YILDIZ¹, CAFER İLKAY YILDIRIM²

ABSTRACT

The centre was established in Afyonkarahisar in 2013 of Ministry Of Forestry And Water Management. The purpose of establishment increases identifying the medical and aromatic plants which are grown in our country and uses the national wealth potential the most productive. The Medical And Aromatic Plants Centre was established in 45000m² area. The centre has got 1200m² in door area and 5000m² growing area of plants. There are demonstration greenhouse, conference and assembly hall, laboratory, sales and working offices, production greenhouse in indoor area. From the opening day to this day there are a lot of visitors who are from different places of our country and interested in medical and aromatic plants. The visitors are acquainted with and making introduction of these plants. The scientific Project studies are developed with and applied to Afyon Kocatepe University. The growing conditions of the plants which are medical and aromatic and grown in our nature are produced in our introduction area.

ANTIMICROBIAL AND ANTIFUNGAL ACTIVITY OF FABRICS DYED WITH VIBURNUM OPULUS AND ONION SKINS

HANDAN ŐAPCI¹, FAZLIHAN YILMAZ², CEM VURAL², İBRAHİM BAHTİYAR², HÜSEYİN BENLİ²

ABSTRACT

Microorganisms such as bacteria and fungi that we can encounter almost everywhere in our daily life, and varieties that are pathogenic against special diseases can cause serious health and hygiene problems. The negative effects of hygienic artificial products on natural environment and ecological balance are also quite high. For this reason, place of various products with antimicrobial activity gains importance from day to day. As is known, textile products can provide a suitable environment for the development of microorganisms. In this context, we aimed to develop textile products which can provide antimicrobial and antifungal effect. For this purpose, woolen fabrics were dyed with onion (*Allium cepa*) skins and juice of *Viburnum opulus* plant fruit in our study. The dyeings were carried out without using of any mordanting agent and no prior extraction of the herbal sources were carried out in other words these natural dye sources (onion skins and juice of *Viburnum opulus* plant fruit) were directly added to the dye bath. Samples after dyeing with these natural dye sources were tested in terms of antimicrobial activity using two bacteria (*Escherichia coli*, *Enterobacter aeruginosa*) and a yeast strain (*Candida albicans*). As a result, it was observed that onion skin and *Viburnum* fruit juice had an antimicrobial effect. While the dyed fabric with *Viburnum* juice showed higher activity on bacterial strains, the onion skin had a higher effect on the yeast. *Viburnum* provided the highest activity on *E. coli*, whereas onion skins showed the highest activity on *C. albicans*.

EVALUATION OF WHEAT GERM OIL EFFECTS ON ERECTILE DYSFUNCTION INDUCED BY RESTRAINT STRESS IN RATS.

DR. EMRE ÖZTOPRAK¹, DOÇ. DR. MEHMET MESUT PIŞKİN², PROF. DR. AYŞE SAİDE ŞAHİN³, ECZ. MEVRA AL⁴, DOÇ. DR. BURAK CEM SONER³

ABSTRACT

Policosanols in wheat germ oil structure is used for increasing physical and sexual performance. Wheat germ oil has antioxidant properties because of its natural vitamin E ingredient. In this study we aimed to evaluate the effects of wheat germ oil; which is a traditional herbal medicinal product used for erectile dysfunction; on experimental erectile dysfunction model in rats. For this purpose; male Wistar Albino rats were subjected to restraint stress one hour per day for 10 days in a special tube with holes for air supply to perform erectile dysfunction model. Rats for divided to 2 groups. In control group (n=5), rats were treated with 3 ml/kg/day tap water for 10 days during restraint stress period by oral gavage. In wheat germ oil group (n=5), rats were treated with 3 ml/kg/day wheat germ oil for 10 days during restraint stress period by oral gavage. At 11th day; i.m. ketamine (80 mg/kg) and i.m. xylazine (8 mg/kg) were administered for anesthesia. Under anesthesia, intra cavernous pressure (ICP) and mean arterial pressure (MAP) from right carotid artery was measured after canulation. All data of systemic arterial and cavernosal pressure were recorded by MP36 computerized system. After 20 minutes of resting time; cavernous nerve was stimulated for 1 minutes by electrical stimulation (5 V, 20 Hz, 1 milisecond). During and after the stimulation ICP, MAP, ICP/MAP rates and corpus cavernosum detumescence time was evaluated. Mean ICP, MAP, ICP/MAP and corpus cavernosum detumescence time measured in placebo group were 35,5±5,01 mmHg, 97,6±12,73 mmHg, 0,36±0,05 and 133,4±16,03 seconds respectively. In wheat germ oil group these values were 45,1±7,6 mmHg, 106,2±8,23 mmHg, 0,51±0,06 ve 256,2±27,53 respectively. Statistical analyses between groups were evaluated by t-test. Our results showed that statistically significant difference between the groups was only found in detumescence time (p=0.01). Our limitation of this preliminary study is not having a group to evaluate normal ICP, MAP and detumescence values without stress but; according to the statistical significance in detumescence times between two groups; we can speculate that wheat germ oil may be a beneficial herbal medicinal product as a complementary medicine to improve erectile function.

DETERMINATION OF DEOXYNOJIRIMYCIN BY DEVELOPED AND VALIDATED AN HPLC-FLD METHOD IN LEAVES OF MULBERRY VARIETIES FROM TURKEY

NURANIYE ERUYGUR¹, EMRAH DURAL¹

ABSTRACT

1-deoxynojirimycin (DNJ), a piperidine alkaloid, is known to be one of the most potent a-glycosidase inhibitors. In previous studies, more than twenty polyhydroxylated alkaloids have been identified in leaves of *Morus* species. The leaves of *M. alba* and *M. nigra* used in diabetes mellitus patient's nutraceutical foods due to their antihyperglycemic activity in Korea and Japan. Therefore, it is necessary to analysis of 1-deoxynojirimycin contents in pharmaceutical preparations and herbal drugs made from *Morus* leaves in order to quality control. Hence, a rapid, sensitive and reliable high performance liquid chromatographic method for the determination of 1-deoxynojirimycin (DNJ) in *Morus alba* L. and *Morus nigra* leaves with fluorimetric detection after precolumn derivatization with 9-fluorenylmethyl chlorformate (FMOC-Cl) was developed. DNJ in *Morus alba* L. and *Morus nigra* L. leaves was extracted with 0.05 mol/L HCl, derivatized with FMOC-Cl, and analyzed by high performance liquid chromatography equipped with fluorescence detector. The separation was performed on GL Sciences Inertsil ODS-3 C18 column (4.6 x 250 mm, 5 µm), mobile phase consisted of acetonitrile - 0.1 % aqueous acetic acid (50:50, v/v) with a flow rate of 1.0 mL/min at 26°C. The calibration curve was linear in the range of 0.1- 30 mg/L, the correlation coefficient (r²) was 0.9985. The limit of detection (3s/b) and quantification (n=10) were 1.07 and 3,27 ng mL⁻¹, respectively. Intraday and interday method precision (n=5) were between 7.26; 3.98 and 7.03; 3.52 (RSD%), respectively. Intraday and interday method accuracy (n=5) were between (-6.68) - 2.80 and (-8.35) - 3.77 (RE%), respectively. The method recovery (n=3) was between 97,16% - 107,85%. The obtained robustness values from emission and excitation detection, mobile phase ingredients and flow rates changes were show that method was very strong. The results showed that the content of DNJ in leaves of *Morus alba* L. were between 0,9% - 1,1% and in leaves of *Morus nigra* L. was 1,0%.

ANTIMICROBIAL AND ANTIOXIDANT ACTIVITY OF ECHINOPS EMILIAE (ASTERACEAE)

HANDAN ŐAPCI¹, CEM VURAL²

ABSTRACT

The aim of this study was to investigate the antimicrobial and antioxidant activities of different extracts from *Echinops emiliae* Schwarz ex P. H. Davis. Antimicrobial activity was estimated against several common human pathogenic bacterial strains using the agar disc diffusion and minimal inhibitory concentration assays. Antioxidant activity was evaluated using the DPPH radical-scavenging assay and total phenolic content methods. On the light of these experiments, *E. emiliae* would seem to be an important natural antioxidant. Antimicrobial and antioxidant of *E. emiliae* have not been reported up to now. The results of this study obviously reported that the antimicrobial and antifungal activity could be change with used extracts. Also, the micro dilution method was more sensitive than disk diffusion. This study is first report on the biological activity of *E. emiliae* as regarded endemic species from Turkey. The results show that *E. emiliae* could use in the treatment of some illness.

FERULIC ACID AS A FUNCTIONAL FOOD COMPOUND AND ITS IMPORTANCE

ŞEYDA BOSTANCI¹, İLKAY KOCA²

ABSTRACT

Ferulic acid (4-hydroxy-3-methoxycinnamic acid) is one of the most abundant phenolic acid in plant kingdom. It occurs from metabolism of phenylalanine and tyrosine by Shikimate pathways in plants. It is present at high concentrations in many products, including vegetables, fruits, cereals, and coffee. It is mainly conjugated with mono- and oligosaccharides, polysaccharides, lipids, and polyamines, and seldom found in a free forms in plants. It can be absorbed along the entire gastrointestinal tract and easily metabolized by the liver. It has many therapeutic properties like antioxidant, anti-inflammatory, antimicrobial, anti-thrombosis, and anti-cancer activities. It protects against many disorders such as Alzheimer's disease, cardiovascular disease, diabetes mellitus, and colon cancer. Also, ferulic acid is used in the food industry. The raw material of the production of vanillin is ferulic acid. In this review, the chemistry, natural resources and human health effects of ferulic acid are discussed.

MILK THISTLE (SILYBUM MARIANUM), POSSIBLE CLINICAL EFFECTS AND SAFETY

DUYGU AĖAGÜNDÜZ¹, MAKBULE GEZMEN KARADAĖ¹, HILAL YILDIRAN¹

ABSTRACT

Milk thistle (*Silybum marianum*) is being used for the treatment of liver and gall bladder illnesses and for the protection of liver against toxins. Today, researches have focused on its effects as cytoprotective, antioxidant and anticarcinogenic effects as well as on its protective effects against death cup (*Amanita phalloides*). Its active substance is silymarin, which is mostly found in the seeds. Silymarin is a flavonoid complex, which also includes silybin, silychristin and silydianin. Milk thistle seeds include 1.5-3% flavonolignan, also known as silymarin, 20-30% non-volatile oil (60% linoleic acid, 30% oleic acid, approximately 9% palmitic acid), 25-30% protein, 0.038% tocopherol and 0.60% sterol. There are frequently 70-80% flavonolignan (silybin, silychristin and silydianin), which are also known as silymarin, in milk thistle. Silymarin enters into enterohepatic circulation in the body so its concentration in the liver is generally higher than serum. Absorption of silymarin in gastrointestinal system is rather low (%20-50). For that reason, production of extract with high concentrations of active substance has become popular. The clinical researches suggest that milk thistle extract has positive effects on Hepatitis A, alcoholic cirrhosis and liver illnesses caused by exposure to harmful chemical. It has been found out that, as an anti-fibrotic agent, it has reduced the collagen accumulation in liver caused by serum procollagen Type III-formation. In a number of other researches it has been stated that silymarin has shown anti-inflammatory effect and has regulated inflammatory mediators such as; tumor necrosis factor (TNF)- α , nitrous oxide, interleukin-6 and interleukin-1 receptor antagonist. Within this frame, it is considered that it has a role in the treatment of infectious diseases. In some studies, it has been found out that milk thistle has reduced free radical production and hepatotoxicity lipid peroxidation. Studies on its anticarcinogenic effects are still going on and there are studies suggesting that it is especially effective in the treatment of prostate cancer related with sex hormones. However, American Family Physicians Association (AAFP) states that the evidence regarding its effectiveness in its use in the clinic is poor. As for the assessments regarding its side effects, it is stated that it is generally well tolerated, but it has caused itchiness, eczema, skin eruption and anaphylaxis in some cases. However, effective and safe dose in clinic use is contradictor. US Food and Drug Administration (FDA) stated in 2001 that it is safe to be added in malt based drinks to support bitter aroma. However, evidence for its safety in clinical use is inadequate. Although it is not mentioned very significant interference in general in terms of drug interactions, in some studies it has been stated that it may form herb-drug interference by interfering with cytochrome P (CYP) microsomal enzyme. In some in vitro studies, it has been found out that it has significantly induced CYP3A4 isoform and in some other studies that it may inhibit the activities of enzymes by irreversibly binding to CYP3A4 and CYP2C9 enzymes. It has been found out that it may inhibit CYP2C9 enzyme in liver and it has reduced metabolite rate related with CYP2C as the result of use of Losartan with Milk Thistle. As a

result, although it has been stated in some studies that milk thistle has significant effects in protection from and treatment of some diseases in clinic, evidence for that is poor. Further studies are required on this subject. Attention should be paid for its safety and for its possible drug interactions and it should not be used without an advice from a physician. SALVIA SPECIES AND DRUG INTERACTIONS

MEVRA AL¹, AYŞE SAİDE ŞAHİN², ESRA BÜYÜK², BURAK CEM SONER²

ABSTRACT

Salvia belongs to the family of Lamiaceae (Labiatae), which has a cosmopolitan distribution with 200 genera and 3000 to 4000 species. There are about 900 species of Salvia, one of the widest generals of the family. The plants are herbaceous or bushy, perennial, rarely biannual or annual, mostly aromatic, with flowers in different colors. Salvia L. is widely distributed in various parts of the world such as the Mediterranean region, South Africa, Central and South America, and Southeast Asia. The main center of species in Asia is Anatolia. There are 43 endemic species in Anatolia. In addition to diversity of species, Salvia also has differences in bioactivity between species. There are very different pharmacological effects between species. For thousands of years, it has been used in the treatment of many diseases such as flu, bronchitis, tuberculosis, hemorrhage, oral cavity and throat inflammation. The main component of Salvia oil is volatile monoterpenoids. It has been reported that *S. officinalis* (Sage), *S. lavandulifolia* and *S. fruticosa* Miller species with high essential oil content have antibacterial properties. Dan-shen (*S. miltiorrhiza* root extract) is defined as a drug used in the Chinese Pharmacopoeia to treat heart and circulatory system diseases, insomnia and acute arthritis pain in patients with rheumatism. Salvianolic acid in Dan-Shen is a potent inhibitor of H⁺/K⁺ ATPase and has been shown to be effective in reducing gastric acid secretion. However, the antiulcer effect is less than the well-known antiulcer agent omeprazole. The antispasmodic effect of Salvia varies by species. Sage and *S. fruticosa* Mil. has antispasmodic activity while *S. verbenacea* L. species was observed to increase spasmolytic efficacy. Sage leaves show antioxidant properties due to its phenolic structure. Pharmacological studies show that *S. lavandulifolia* Vah., *S. fruticosa* Mil. and *S. aegyptiaca* species have strong hypoglycemic effects. The Mexican sage, *S. divinorum*, is well known for its hallucinogenic effect. The components thujone and camphor are responsible for volatile oil toxicity. α -thujone inhibits gamma-aminobutyric acid-A receptor and oral use of camphor even in small quantities may lead to serious adverse effects resulting in tonic-clonic seizures and death. Inhalation or oral consumption of Sage and its commercial products may result in convulsions. Essential oil can reduce the effects of central nervous system depressants such as diazepam and phenobarbital while potentiating the effects of stimulants. An experimental neurotoxicity study in rats showed that the subconvulsive limit for volatile oil is 0.3 g/kg dose. The anticholinesterase (AChE) activity observed in the components of the Salvia species has been investigated clinically in the treatment of Alzheimer's disease. Sage volatile oil (0.5 mg/ml) has been shown to inhibit AChE activity by 46%. Sage and *S. lavandulifolia* volatile oil may interact with AChE inhibitor drugs used in the treatment of Alzheimer due to AChE inhibitor effect. The Chinese herb 'Dan Shen' with antiplatelet activity has been reported to cause bleeding by increasing the anticoagulant effect of warfarin. *S. miltiorrhiza* increases plasma estrogen levels, ovarian and uterine prostaglandin-F₂ α levels, and this effect on the endocrine system has been shown in immature rats. The estrogenic effect of Salvia may potentiate the effect of oral

antidiabetics, folic acid antagonists and some corticosteroids and may induce hyperlipidemia and inhibit the effect of hypolipidemic drugs. Due to the antidiabetic effect of thujone, sage should be used with carefully antidiabetic drugs. Sage's aqueous extract is a specific inhibitor of CYP2C9, CYP2C19, CYP2D6 and CYP3A4 enzymes so prolonged uses of sage may interact with the substrates of these enzymes. Carnosol isolated from sage extract has been shown to reduce the minimum inhibitor concentration of aminoglycoside in vancomycin-resistant enterococci. Carnosol and carnosic acid show synergistic effect with gentamicin.

SCOPOLETIN: NATURAL SOURCES AND ITS EFFECTS ON HEALTH

İLKEY KOCA¹, DAMLANUR KÜBRA ÇAKIR¹, BELKİS TEKGÜLER¹

ABSTRACT

In recent years, coumarins, which are commonly used for preventing and treatment of many diseases, are one of secondary metabolites produced by bacteria, fungus and some plants under abiotic and biotic stress. The scopoletin, involved in coumarins, is important health-related substance, has been shown to exert biological activities such as antioxidant, anti-inflammatory, antihyperglycemic, anticancer, hypouricemic, enhancer of melanin synthesis. Until today, the presence of scopoletin has been found in many plants belong to Liliaceae, Asteraceae, Convolvulaceae, Loasaceae, Urticaceae, Apiaceae, Fabaceae, Portulacaceae, Malvaceae families. In this review, distribution of scopoletin in plant kingdom, its biological and pharmacological properties and benefits on human health were discussed.

THE UNKNOWN HEALING 'TAURUS CREAM'

AYŞE NUR ŞEN¹, PROF.DR. MUHİTTİN DİNÇ²

ABSTRACT

Turkey is like a continent about plants. According to the results of studies made until today, it's determined that Turkey has got so many plants as family, genus and species. Our country's flora is wealthier than its neighbours and other European countries. As its cultural treasure, besides this our country has a comprehensive information treasure about ethnobotany. But with migrations to big cities from villages and the development of technology; this knowledge is nearly disappearing. Medical and aromatic plants has a wide marketing all over the World especially for medicine and food raw material. Using of these plants from past until today and knowledge of their local names are so important for humanity and transferring these to next generation. Turkey has got 10765 flowering plant. In the world there are 800.000, in Turkey there are more than 9000 plants. The species which is cultivated for food is about 3000. But the wild plants used for food are above 10000. World Health Organisation determined nearly 20.000. Whereas the wild plants used for medical are at least 500. In this study, in Mersin, Anamur city's, Çarıklar village Havva SEZGİN (60 year old) called woman's 'Taurus cream' has been searched. She got it from her father İsa Salı and it's been a medicine for 21 years. She used in this cream these materials and plants; Juniperus oxycedrus L. subsp. oxycedrus, Cyclamen cilicium Boiss.&Heldr., Abies cilicica (Ant.&Kotschy) Carr. subsp. Isaurica Coode & Cullen, wax (bee houses), butter with no salt. She is determining the quantities according to the capacity of case and her need for the sick. For example, 2 kiloes of Juniperus oxycedrus L. subsp. oxycedrus 's – Abies cilicica's resin gum are boiled with wax and butter after mashed. Then she is adding the Cyclamen cilicium's tuber. After boiling these materials, she is leaving the mixture under the sunlight. She puts this medicine on the injured skin for 24 hours. If the injured skin has turned to white colour, it means that it had effected and healing is started. Havva Sezgin's neighbours in the village and people from Anamur city centre are visiting her and getting this 'Taurus cream' for healing. As the kind of illness; she is giving the cream, but not cancer people. Her father had said her 'Don't refuse anybody and help everyone with this medicinal mixture. In this study; this cream was also used for a woman Şerife K. (73 years old) who has got stained skin on face and burnt. The cream was practised to her face and has got good results of it in 24 hours. This medical mixture is used for these illnesses; skin injuries except cancer, foot&hand fungus illness, face acnes, hair illness, knife cuts, inflammated wounds, bullet wound. In the conclusion of this ethnobotanical search, this unknown medical cream can be brought in the science and by transferring next generations, positive and useful results can be got.

SENNA AND DRUG INTERACTIONS

AYŞE SAİDE ŞAHİN¹, MEVRA AL², AYTEN DEMİRCİ¹, BURAK CEM SONER¹

ABSTRACT

The senna fruit obtained from *Cassia angustifolia* is one of the most important herbal drugs for the treatment of constipation worldwide. It is one of the most popular laxatives, especially in geriatric patients. The major component of senna is anthraquinone glycosides. Senna leaf anthraquinones include sennosides A, B, C and D, and palmidin A, rhein anthrone and aloe-emodin glycosides. The fruit contains sennosides A and B and a closely related glycoside named sennoside A1. Senna is usually standardized according to the amount of sennoside B content. At therapeutic doses, sennosides provide relief from painful constipation by softening the consistency of the feces without disturbing the routine defecation frequency. Senna increases colonic transit rate and colonic peristalsism. The characteristic activity of senna usually occurs within 8-10 hours. So it is recommended to be used at night. The long-term use of senna can cause excessive water and potassium loss because of anthraquinones. Systemic corticosteroids with mineralocorticoid activity can cause water retention and potassium loss too. Theoretically, prolonged use of senna combined with systemic corticosteroids may increase the risk of hypokalaemia. Also, senna may increase the risk for digitalis toxicity including cardiac arrhythmias due to its hypokalemic effect. Theoretically, in patients taking senna with potassium-depleting diuretics cause excessive potassium loss. Also, laxative effect of senna reduces furosemide absorption in the intestine. In a study with 7 patients with cardiac arrhythmias taking sustained-release quinidine, senna reduced plasma quinidine levels, by about 25%. According to a case report, a 45-year-old female patient who used senna-based laxative was hospitalized because of diffuse abdominal pain. The patient was using warfarin regularly for six years. Blood tests showed a haemoglobin concentration of 84 g/L; the platelet count was normal, but INR was 11.9; the activated partial thromboplastin time was 92.4 s (control time 29.3 s). It has been reported that this effect was due to decreased vitamin K (which leads to the activation of factors II, VII, IX and X) by the laxative effect. Therefore, attention should be taken on concomitant use of warfarin with senna-based laxatives to prevent risk of bleeding. In a study with 40 premenopausal women, the decrease in intestinal transit time by senna significantly reduced serum oestrogen concentration. Theoretically, senna may reduce the effect of estrogen-containing contraceptives. Experimental evidences suggest that danthron that is anthraquinone found in senna reduces the absorptive permeability of ketoprofen by almost 30% and the senna leaf infusion enhances ketoprofen permeability by about 1,5-fold. In conclusion, care should be taken in patients using senna if patient has a concomitant drug use.

ANTIOXIDANT PROPERTIES OF FENUGREEK SEED

DAMLANUR KÜBRA ÇAKIR¹, İLKAY KOCA¹

ABSTRACT

Evaluating of natural antioxidant content of edible and medicinal plant materials are important for human health and food industry. The aim of this study was to determine antioxidant activity of fenugreek seed which is a spice and medicinal plant. Ten samples were analyzed in this study. The samples were extracted with 40% ethyl alcohol solution, and total phenolics content, 1,1-diphenyl-2-picrylhydrazyl (DPPH) free radical scavenging activity and ferric reducing antioxidant power (FRAP) analyses were carried out in the extracts. Total phenolics, DPPH and FRAP values were found as 3925-5950 mg Gallic acid equivalent (GAE)/100g (5125±605 mg GAE/100g), 215.25-558.64 µmol TE/g (418.02±107.55 µmol/g) and 4139.07-9519.87 µmol Fe²⁺/g (6800.87±1776.22 µmol/g) in dry matter, respectively. These results have showed that fenugreek seed is a good source in terms of antioxidant.

A BIOACTIVE COMPOUND IN TEA: GAMMA-AMINOBUTYRIC ACID (GABA)

ŞEYDA BOSTANCI¹, İLKAY KOCA¹

ABSTRACT

Tea is a manufactured from the buds and leaves of *Camellia sinensis*. Tea contains many chemical compounds such as catechins, alkaloids, polysaccharides, amino acids, vitamins, minerals, and volatile oils. The free amino acids are particularly interesting because they are not only responsible for the taste of tea infusions, but also have various beneficial effects. Gamma-aminobutyric acid (GABA) is a four carbon free amino acid found in tea plant. GABA is produced by the decarboxylation of L-glutamic acid that catalyzed by glutamate decarboxylase enzyme. There is GABA in all tea types, but in GABA tea, the amount of GABA is much higher because of its special production technique. GABA tea is known as Gabaron tea in Japan. GABA tea is manufactured by fermenting fresh tea leaves under nitrogen gas. The taste of GABA tea is like oolong tea's. GABA tea is rich in antioxidants. GABA and GABA tea have numerous physiological functions and positive effects on many metabolic disorders such as hypotensive effect, reducing anxiety and stress, helping to modify sleep and mood, and alleviating postmenopausal depression. In this review, the characteristics and beneficial health effects of GABA and GABA tea are discussed.

ECHINACEA: PHARMACOLOGICAL PROPERTIES AND DRUG INTERACTIONS

AYSE SAIDE ŐAHIN¹, MEVRA AL², MEHMET MESUT PIŐKIN³, HILAL KOŐ SONER⁴, BURAK CEM SONER¹

ABSTRACT

Echinacea is a group of American cone flowers from the Asteraceae (Compositae) family. Within the class, there are nine plant species. Three of these are usually found in herbal preparations: Echinacea purpurea (Purple Echinacea), Echinacea angustifolia and Echinacea pallida (Paleflowered Echinacea). Although E. purpurea is the most commonly used spicy, it is frequently combined with E. angustifolia. The active ingredients of the echinacea are polysaccharides, flavonoids, alkylamides, polyacetylenes and essential oils. Polysaccharides seem to be responsible for the immunostimulatory activity of the echinacea. The general preparations are prepared by fresh press or the ethanolic extract of the dried parts of the fibres, roots and flowers of the plant. Glycerol is used instead of alcohol, especially for children in flavoured liquid products. Echinacea increases the ability of granulocytes and macrophages to ward off the disease. Activated macrophages secrete interleukin-1, interleukin-6, and tumor necrosis factor- α , which stimulates the specific immune system and protects the cells from viral attacks. Caffeic acid derivatives such as chicoric acid and alkylamides are responsible for the antiviral effect of purple echinacea juice. Also, they inhibit hyaluronidase, thereby reduces the permeability of the blood vessels and inhibits the spread of local infection. Theoretically, echinacea may antagonize the effects of immunosuppressant medication. Animal studies have shown that the combination of powder extract of the root of E. purpurea and melatonin has an adverse effect on mature granulocyte levels in bone marrow and spleen. A potentially positive interaction between E. purpurea and phenytoin has been reported in mice. Phenytoin is known to increase the risk of cleft palate when used in pregnancy. According to this study, E. purpurea decreased the incidence of cleft palate caused by phenytoin. E. purpurea root has been shown to selectively modulate CYP3A activity in intestine (inhibition) and liver (induction) in a clinical study. This biphasic effect of E. purpurea root has been attributed to different ingredients in root content, differences in absorption rate of ingredients or a systematically formed metabolite. Echinacea purpurea root alters the metabolism of the probe drugs by the inhibition of intestinal CYP3A and hepatic CYP2C9 and CYP1A2. However, it has been shown that 400 mg Echinacea purpurea root treatment for 8 days resulted with hepatic CYP3A induction and increases clearance of intravenous midazolam. Echinacea may increase oral clearance of CYP3A substrates with a low clearance and high oral bioavailability such as alprazolam because of the hepatic induction of CYP3A. Conversely, for CYP3A substrates such as buspirone, simvastatin, and terfenadine, which have low oral bioavailability due to first-pass metabolism in the intestine, may result in increased serum concentrations of these substrates as a result of intestinal CYP3A inhibition when used with echinacea. Although details of the echinacea genus and its extract used are not specified, it has been reported that there may be an interaction between Echinacea and

etoposide (CYP3A4 substrate) with a case report. A 61-year-old male patient was diagnosed with cell lung cancer and chemoradiotherapy was initiated simultaneously with cisplatin and etoposide. He was admitted to the clinic on the 8th day of her first recurrence because of thrombocytopenia. Platelet transfusion support was given. Although researchers have not confirmed the interaction between echinacea and etoposide, they concluded that warnings should be given to the use of CYP3A4 substrates (antracyclines, etoposide, vinca alkaloids, taxanes) and echinacea in patients receiving chemotherapy. Theoretically, chemotherapeutics etoposide, epipodophyllotoxin, cyclophosphamide, ifosfamide, vindesine, vinblastine, vincristine, vinorelbine, paclitaxel, docetaxel, irinotecan, tamoxifen, tipifarnib which are metabolized by CYP3A4 and dacarbazine which is metabolized by CYP1A2 may also interact with echinacea.

KEYWORDS

Echinacea, drug interactions, CYP3A4 induction

GINKGO BILOBA: PHARMACOLOGICAL PROPERTIES AND DRUG INTERACTIONS

MEVRA AL¹, AYŞE SAİDE ŞAHİN², ESER YILDIZ², BURAK CEM SONER²

ABSTRACT

Ginkgo biloba, also known as a fossil tree, is the oldest living tree and leaf extracts have been used for centuries in the treatment of various diseases. In Chinese medicine tea is prepared for asthma and bronchitis treatment. In Germany and other European countries, it is frequently prescribed in form standard tablet or capsule form. Its major components are flavonoids, proanthocyanidins, terpene lactones including ginkgolide A, B, C and sesquiterpene bilabolides. The standardized Ginkgo extract contains 22-27% flavone glycosides and 5-12% terpene lactones which are main active ingredients. Flavonol glycosides, a component of the ginkgo leaf, improves blood circulation. Ginkgolid-B is a platelet activating factor antagonist. The main indications for Ginkgo are primary degenerative dementia, vascular dementia, absent state, confusion, lack of energy, fatigue, decreased physical performance, depressive mood, anxiety, vascular and dizziness and ear tinnitus, relieving the symptoms caused by the peripheral arterial occlusive disease. The most important interaction with Ginkgo biloba is the risk of spontaneous bleeding that can be observed when used with anticoagulants. A number of clinically significant cases of bleeding have been reported. A 70-year-old man started using 40 mg of standardized Ginkgo biloba extract twice a day. After one week he complained of recurrent blurred vision attacks in his right eye. He went to the clinic 2 days later and a red color change in the cornea was noticed. The only medication the patient used was a single dose of 325 mg aspirin, which is prescribed after coronary artery bypass surgery since 3 years. The patient did not have any eye trauma, ischemia or vascular occlusion in the past. The physical examination was entirely normal except for a fine stream of blood oozing down from the 12 o'clock position of the margin of the iris into the inferior angle, where a layering of blood was seen on gonioscopy. The patient stopped taking Ginkgo's extract but continued aspirin treatment. It has been reported that the bleeding did not recur during the three-month follow-up period. The injection of Ginkgo biloba extract to increase microcirculation due to anticoagulant effect with sodium aescinate obtained from horse chestnut seed approved by Chinese Food and Drug Administration for postoperative oedema treatment has resulted with severe nephrotoxicity. It has been reported that fetal intracerebral hemorrhage develops in a patient using nonsteroidal anti-inflammatory agent containing ibuprofen with Ginkgo biloba extract. The effect of Ginkgo biloba (daily 100 mg extract) was investigated with a placebo-controlled cross-blind study involving 21 patients receiving prolonged warfarin treatment, and it turned out that INR value did not change. Experimental studies show that Ginkgo biloba accelerated the onset of ototoxicity caused by amikacin and increases ototoxic adverse effect. Ginkgo biloba also increases the extrapyramidal adverse effects of haloperidol. Ginkgo biloba has been reported to cause priapism in a patient receiving risperidone treatment. The α -adrenergic properties of risperidone cause

priapism very rarely. Possible vascular effects of *Ginkgo biloba* may increase the adverse effects of risperidone. *Ginkgo biloba* increases omeprazole metabolism by CYP2C19 enzyme induction and similarly enhances the metabolism of other proton pump inhibitor drugs which are also CYP2C19 substrate. It has been reported that co-administration with efavirenz results with virological failure. According to researchers, terpenoid ingredients in *Ginkgo biloba* causes CYP3A4 or P-glycoprotein induction. However, clinical trials have shown that *Ginkgo biloba* does not cause significant changes in the CYP1A2, CYP3A4, CYP2D6, or CYP2E1 enzyme phenotype. It has been reported that a 55-year-old female patient with glucose-6-phosphate dehydrogenase deficiency who has 17.5 mg of *Ginkgo biloba* leaf extract injection for dementia prophylaxis without doctor's advice developed hemolytic anemia. In 2013, the *Ginkgo biloba* extract by the International Agency for Research on Cancer has been classified as possibly carcinogenic to humans (Group 2B).

GARLIC: PHARMACOLOGICAL PROPERTIES AND DRUG INTERACTIONS

ESER YILDIZ¹, MEVRA AL², AYŞE SAİDE ŞAHİN¹, TARIK ACAR³, BURAK CEM SONER¹

ABSTRACT

Allium sativum (garlic) have been used for medicinal purposes for a century. The active compounds of garlic include alliin, allinase, diallyldisulfide, ajoens. Alicin is major garlic constituent, which is also responsible for the aroma of fresh garlic, sulphur-like smell. When fresh garlic is chopped or crushed, the enzyme allinase converts alliin into allicin, The pharmacological effects of garlic are mainly linked to sulphur-containing components. Other sulphur compounds found in garlic are allylmethyltrisulfide, allylpropyldisulfide, diallyldisulfide, diallyltrisulfide, ajoene. It also contains glycosides, monoterpenoids, enzymes, flavonoids based on kaempferol and quercetin. Aged garlic extract (AGE) that prepared with the long-term extraction of fresh garlic (normally at 20 months) appears to be superior to normal garlic in its antioxidant properties. The most common known pharmacological effect is lowering total serum cholesterol levels, probably through the inhibition of cholesterol synthesis in the liver. Garlic's other pharmacological effects are its antibacterial, antiviral, antifungal, antihypertensive, hypoglycemic, antithrombotic, antimutagenic, and antiplatelet effects. Also in vitro studies have demonstrated that both garlic powder and garlic extract inhibit human lymphatic leukaemia cell growth. Garlic has been reported to have hepatoprotective effect against carbon tetrachloride induced acute hepatotoxicity model in rats. Interactions between garlic and warfarin (oral anticoagulant agent) may be clinically significant. Garlic reduces platelet aggregation and it may cause spontaneous bleeding even when used alone. Therefore, garlic may cause bleeding if concomitantly used with anticoagulant and non-steroidal anti-inflammatory drugs. Clinical studies showed that liquid, aged garlic extract inhibits platelet aggregation. Also, animal studies showed that ajoene and sulphur compounds derived from garlic possess antiplatelet and antithrombotic property. Studies suggest that AGE inhibits platelet aggregation via inhibition of GPIIb/IIIa receptor thus inhibits the binding of fibrinogen to platelet. Garlic ingestion should be stopped at least one week before surgeries. Although drug interaction of garlic and lisinopril has been associated significant hypotension and syncope has been reported, no interaction has been shown. When garlic is used with fish oil, it reverses the increasing effect of fish oil on low-density lipoprotein cholesterol (LDL) levels. Garlic supplements reduces LDL levels and fish oil reduces triacylglycerol levels but increases LDL levels. Combined use may be more beneficial in patients with high blood lipids. The effect of crude aqueous extract of garlic on the pharmacokinetic parameters of isoniazid and rifampicin was studied in rabbits. While oral administration of the garlic extract did not cause any changes in the pharmacokinetic parameters of rifampicin, it significantly reduced isoniazid bioavailability without causing any change in elimination rate. Crude aqueous extract of garlic reduced AUC and maximum serum levels of a single 30-mg/kg dose of isoniazid by about 55% and 65%, respectively, when

³KONYA BEYHEKİM DEVLET HASTANESİ

compared with the levels after a single 30-mg/kg dose isoniazid. The use of garlic with protease inhibitor saquinavir may significantly reduce saquinavir plasma levels. The mechanism of this interaction is uncertain but garlic may be reducing saquinavir bioavailability by increasing its metabolism in intestine. Care should be taken on concomitant use of garlic with other CYP3A4 substrate protease inhibitors such as amprenavir, atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, tipranavir.

THE MEDICINAL AND AROMATICAL PLANT POTENTIAL IN TÜRKİYE AND CONSERVATION STUDIES

BELKIS MUCA¹

ABSTRACT

It is known that approximately 12,000 plant taxa have been distributed according to the data obtained in recent years in Turkey. It has been determined that up to 500 of these plants (about 300 are sold in import shop) are medicinal and aromatic plants. However, it is noteworthy that the number of medicinal and aromatic plants of an country rich in plant diversity is so little. This study is prepared to show the diversity of medical and aromatic plants in our country, the areas they spread and the conservation studies suggested for these plants. In our country, medicinal and aromatic plants show more spread in less soil, rocky and especially in steppe fields. The more challenging the habitat conditions, the higher the amount of essential substance in medical and aromatic plants. For this reason, there are some clustering points for these plants in our country. Eastern Anatolia, Southeastern Anatolia and the Lakes Region are some of these points. The commercial importance and diversity of medical and aromatic plants in our country is also remarkable. Although commercially valuable medicinal and aromatic plants are cultivated in some regions, natural collection in the whole country takes place at a higher rate. This jeopardizes both our plant diversity and our medical and aromatic potential. The model studies of the Ministry of Forestry and Water Affairs are inadequate with their existence. In our work, methods are proposed to evaluate the natural distribution of medicinal and aromatic plants. The work is expected to provide a source for medical and aromatic plant collectors, traders, healthcare users and researchers.

CYTOTOXIC ACTIVITY OF THE ROOT AND FRUIT EXTRACTS OF NEOCRYPTODISCUS PAPILLARIS (BOISS.) HERRNST. & HEYN

FATMA TOSUN¹, FEYYAZ MIHOđLUGİL¹, MAHMUT MİSKİ²

ABSTRACT

The aim of the present study is to investigate the cytotoxic activity of *Neocryptodiscus papillaris* (Boiss.) Herrnst. & Heyn (Apiaceae). The roots and fruits of *N. papillaris* were collected from Aşığı Dilimli village, Viranşehir, Şanlıurfa in June 2013. The plant materials were separately and sequentially extracted with dichloromethane and methanol at room temperature. The extracts were individually concentrated in a rotary evaporator under reduced pressure to dryness. Furthermore, methanol extract was dissolved in methanol/water (10:90) and then partitioned with ethyl acetate in a separatory funnel, the resulting extracts were separately concentrated in vacuo to dryness. These extracts were subjected to the cytotoxic activity testing. The highest activity was found in the dichloromethane extracts against the colon cancer COLO205 and KM12 cell lines. The dichloromethane extract of the root of *N. papillaris* showed cytotoxic activity with IC50 values of 23.0 and 14.0 ug/mL against the colon cancer COLO205 and KM12 cell lines, respectively. Whereas, the dichloromethane extract of the fruit showed cytotoxic activity with IC50 values of 23.1 and 17.2 ug/mL against the colon cancer COLO205 and KM12 cell lines, respectively.

ROSEMARY: PHARMACOLOGICAL PROPERTIES AND DRUG INTERACTION

ESER YILDIZ¹, MEVRA AL², AYŞE SAİDE ŞAHİN¹, DURMUŞ ALI ASLANLAR³, BURAK CEM SONER¹

ABSTRACT

Rosmarinus officinalis (rosemary) is grown in the South and West Anatolian. The plant belongs to the family of Labiatae (Lamiaceae) which is a strong aromatic low evergreen shrub. Constituents include essential oil (1,8 cineole, α -pinene and camphor), diterpenes, rosmarinic acid that derivatives from caffeic acid, flavonoids and triterpenes. Rosemary is used for flavouring foods and in cosmetic products. In traditional medicine it is used as an antispasmodic in renal colic and dysmenorrhoea, in relieving respiratory disease, in supportive treatment of rheumatic disorder and for stimulating hair growth. Rosemary oil may irritate the skin and increases the circulation when applied topically. Major bioactive constituents of rosemary oil are rosmarinic acid, carnosolic acid and carnosol which are responsible from antioxidant, anti-inflammatory and anticarcinogenic effects. Rosemary oil possesses antibacterial and antifungal properties. Rosemary is an effective antimicrobial against *Staphylococcus aureus* when used as spices. It has been shown that the lyophilized aqueous extract of rosemary shows hepatoprotective effect by reducing t-butyl hydroperoxide induced malonaldehyde formation in rat hepatocytes in vitro. Also, it significantly decreases of the release of hepatic lactate dehydrogenase and aspartate aminotransferase. Carnosol, carnosolic acid and rosmanol in the diterpene structure of the lipophilic and hydrophobic fractions of rosemary shows inhibitory activity on superoxide anion production in the xanthine/xanthine oxidase system. The spasmolytic effect of 1,8-cineole and bornyl acetate in the ileum smooth muscle and atrium muscle was demonstrated in animal studies. It has been shown that rosemary extract treatment significant increases the uptake of radiopharmaceutical agent technetium-99m (^{99m}Tc) Sulphur Colloid in rat liver. These results indicate that rosemary extract or metabolites changes the biodistribution of ^{99m}Tc-Sulphur Colloid which is a commonly used radionuclide for diagnostic radiopharmaceuticals. The ethanol extract of rosemary and cefuroxime combination show synergistic activity against methicillin-resistant *Staphylococcus aureus*. It is speculated that the bioactive component in rosemary damages the cytoplasmic membrane of the bacteria and thus facilitates antibiotic influx. The rosemary is rich in phenolic acid and can cause a reduction in non-heme-iron absorption. Rosemary inhibits the binding of doxorubicin, vinblastine and azidopine to P-glycoprotein (P-gp) thus directly inhibits membrane P-gp efflux activity. This increases the intracellular accumulation of medicines by reducing P-gp mediated efflux. Theoretically, it is possible that rosemary can change the plasma levels of drugs that are P-gp substrates such as aliskiren, ambrisentan, colchicine, dabigatran, digoxin, everolimus, fexofenadine, imatinib, lapatinib, maraviroc, nilotinib, posaconazole, ranolazine, saxagliptin, sirolimus, sitagliptin, talinolol, tolvaptan, topotecan. Animal studies shows that rosemary has significant in vitro and in vivo antithrombotic activity. The antithrombotic mechanism can be

³ÇUMRA DEVLET HASTANESİ

explained by the direct inhibitory effect on platelets. Animal studies showed that oral rosmarinic acid reduces fibronectin and fibrin formation in the glomerulus. Theoretically, concurrent use of anticoagulant medications may increase the risk of bleeding. According in-vitro studies, the aqueous extract of rosemary can inhibit the angiotensin converting enzyme. In animal studies, it has been shown that rosemary has diuretic effects and lowers electrolyte levels. It has also been shown to increase permeability of furosemide in vitro in CaCO₂ monolayer cell-line. According to the case reports, rosemary treatment can induce lithium toxicity due to its diuretic effect.

CHEMICAL COMPOSITION AND ANTIOXIDANT ACTIVITY OF ESSENTIAL OIL OF ORIGANUM SIPYLEUM

MELTEM TAŞ¹, SELÇUK KÜÇÜKAYDIN², ÇIĞDEM KUŞ¹, MEHMET EMİN DURU¹, HASAN YILDIRIM²

ABSTRACT

Turkey has a rich flora, in terms of, medicinal and aromatic plant diversity. The genus *Origanum* is a member of Lamiaceae family and represented by 32 taxon in Turkey and 21 of them are endemic for Turkey. *Origanum sipyleum* is an endemic species to Anatolia. It used as herbal tea, spicy and folk medicine by people in Turkey. The purpose of this study was investigate to the chemical composition and antioxidant activities of the essential oil of *Origanum sipyleum*. The plant was provided from Muđla in 2015. For obtain essential oil, aerial parts of *O.sipyleum* was hydrodistilled for 3h using a Clevenger type equipments. The essential oil was analysed by using GC-GC/MS. Antioxidant activities of extracts were performed by five complementary tests systems i.e. β -carotene linoleic acid, DPPH free radical scavenging, ABTS cation radical scavenging, cupric reducing antioxidant capacity (CUPRAC) and metal chelating assays. Twenty five components were identified by GC-GC/MS in essential of *O.sipyleum*. β -caryophyllene (22.2 %) , γ -terpinene (18.3%), carvacrol (8.8%) were found the major components of *O. Sipyleum*. According to antioxidant activity results, *O.sipyleum* exhibited, $63.85 \pm 1.54\%$, $12.17 \pm 1.01\%$, $46.15 \pm 1.04\%$ inhibitions and 0.38 ± 0.05 absorbance value in β -carotene linoleic acid, DPPH free radical scavenging, ABTS cation radical scavenging and cupric reducing antioxidant capacity (CUPRAC) assays respectively at 800 $\mu\text{g/ml}$ concentration.

HERBAL MEDICINE IN CHRONIC RENAL DISEASES

ÖMER ARSLAN KALAFATÇILAR¹

ABSTRACT

Chronic renal diseases are important causes of morbidity and mortality. Here we report a case with glomerulonephritis who was treated with herbal medicine. A 62-year-old man was admitted to Nephrology Clinic with edema of lower extremities. Laboratory investigations and renal biopsy showed 'Membranoproliferative glomerulonephritis' (MPGN) disorder. His protein levels of 24-hour urine ranged from 8 to 15 gr/day under the treatment of diuretics and statins. An 2% infusion of *Solidago virgaurea* L. was given three times a day. At the fourth month of herbal infusion treatment, his 24-hour urine analysis for proteinuria was reduced to 2,5 gr/day. Thuji Q 6 homeopathy treatment was added after herbal infusion therapy and 24-hour urine analysis for proteinuria showed decreased protein levels to 1,5 gr/day. His clinical course is stabile for 13 years without any medical treatment. In conclusion chronic renal diseases have progressive course and herbal medicine and homeopathy are rarely being used in these disorders in Turkey. The aim of this case report is to point to the usage of *Solidago virgaurea* L. and homeopathy as an alternative treatment modality for MPGN disorder. Educational training programs need to be added in medicine schools in our country. By this way, further researchs will be done and these patients with chronic renal disease will have chance to use alternative treatment modalities like herbal infusions or homeopathy.

**DETERMINATION OF ANTIFUNGAL EFFECTS OF THYME,
ROSEMARY AND RED PEPPER AGAINST ASPERGILLUS NIGER,
PENICILLUM SSP. AND MUCOR SSP.**

ASLI ÇELİKEL¹, MUTLU BUKET AKIN¹, BÜŞRA GÖNCÜ¹

ABSTRACT

In addition to the taste and flavor characteristics herbal in the world is used for the treatment and protection during the long years. Herbal extracts and essential oils, which are derived from plants by various methods, has been proved by scientific studies to have antimicrobial effects. Thyme is a kind of spice that is widely used in food industry. Its composition contains 63.9% carbohydrate, 9.1% protein and 7.4% fat. It has been reported that thymol, carvacrol, p-cymene, α -pinene and camphene found in thyme essential oil, phenolic compounds and flavonoids of thyme have antimicrobial and antioxidant activity. The composition of rosemary (*Rosmarinus officinalis*), which has widespread use as a natural preservative, is 64.1% carbohydrate, 15.2% fat and 4.9% protein convenience. Rosemary essential oil generally contains 1,8-cineole, α -pinene, camphor, camphene, borneol, piperitone, linalol. Antimicrobial, antioxidant and antiviral effects of rosemary have been determined by many studies. Red pepper is a kind of plant species that grows annually depending on the genus *Capsicum* of the Solanaceae family. It is rich in ascorbic acid and carotene contents. Generally it is used as spice, feedstuff and antibiotic raw material in pharmaceutical industry. Mold is one of the types of microorganisms that can cause food spoilage. Some mold species produce secondary metabolites called "mycotoxins" that show toxic properties. *Aspergillus*, *Penicillium*, *Alternaria*, *Fusarium*, and *Mucor* are the most common molds that produce toxins In this study antifungal effects of mixtures of extracts and essential oils of thyme, rosemary and red pepper on *Aspergillus nigeri*, *Penicillium ssp.* and *Mucor ssp.* were investigated. According to the results, the highest antifungal effects were determined from the mixture of rosemary extract and rosemary oil against *Mucor ssp.* and from the mixture of thyme extract and thyme oil against *Aspergillus niger*.. It was also found that the lowest antifungal effect was shown from red pepper extract and rosemary extract and oils against *Penicillium ssp.*

SAFFRON (CROCUS SATIVUS L.): ITS COMPOSITION AND CLINICAL PROPERTIES

HAVVA ARIN¹, GÖKHAN DEGE², BİRSEN YILMAZ³, GAMZE AKBULUT³

ABSTRACT

In our country, *Crocus Sativus L.* is known with different names such as saffron, saffron flower, saffron crocus and zagferan. It belongs to the family of Iridaceae as well as it grows naturally in India, the Balkans, and the Eastern Mediterranean, a perennial, 20-30 cm long bulb with a purple flower blooming in the autumn. Besides carbohydrates, polypeptides, lipids, H₂O, minerals and vitamins, there are more than 150 different compounds in saffron. Also, it contains three main bioactive components: crocin, safranal and picrocrocin. Crocin, a water-soluble carotenoid, is the glycosyl ester of crocetin and consists of two sugars responsible for the color of the compound, giving a typical reddish-yellowish color to safran. Safranal is a monoterpene aldehyde that is responsible for the characteristic aroma and odor of the saffron, and the bitter taste of the saffron is due to picrocrocin, which is the safranal glycoside. Saffron is a plant mostly used in Asia for digestion, inflammation and cerebral disorders. Positive anxiolytic and antidepressant-like effects of this plant have also been reported. This effect is due to safranal and croc. As a result of clinical trials, daily dosage of saffron extract used as a supplement in the treatment of depression is 30 mg. Satiereal, another component of saffron, is effective in weight management. In the studies, it was observed that the effects of satieral improved mental condition, increased satiety feeling and decreased snack feeling. It is therefore argued that a combination of a balanced diet and satieral supplementation in weight loss programs may help achieve the target weight. However, studies on this issue are insufficient and more research is needed. Despite the recent information about properties of saffron, the mechanisms for reducing the feeling of snacking remain speculative. It is expected that the central and/or environmental factors involved in neuropharmacology will be clarified in order to explain this effect. The anti-cancer properties of saffron were also investigated and substantial results were obtained. However, researchers say that the dose used during treatment should be doctor-controlled to prevent food-drug interactions in chemotherapy. Apart from such health effects, saffron has many other therapeutic effects. There are positive impacts on the digestive, cardiovascular, immune, respiratory, genital-urinary and central nervous system. In addition to these, it has a role in radical scavenging, genetic protective properties, inhibition of cell proliferation, inhibition of lipid peroxidation and anti-inflammatory processes. Saffron is used as a prophylactic and therapeutic agent against gastrointestinal system disorders. However, further clinical trials are required to confirm these effects.

**DETERMINATION OF FACTORS AFFECTING ON AVAILABLE
ALTERNATIVES IN MEDICINAL NEEDS OF STUDENTS: CASE
STUDY OF ATATÜRK UNIVERSITY**

AHMET SEMİH UZUNDUMLU¹, MEHMET MUHAMMED SARI¹, ZEINAB MOKHTARİ, AYŞE SEZGİN¹

ABSTRACT

From time immemorial, medicinal aromatic plants have been one of the important treatment methods. People of our time because of their medicinal needs or in order to protect themselves from diseases alongside with going to a doctor or taking medicine without seeing a doctor refer to using medicinal plants. Similar situation is observed in university students too. The aim of this paper is determining factors influencing our future, university students', preferring one method over the other two when they have health problems. To achieve this aim, 445 students from 15 faculties representing Atatürk University were interviewed. Tobit method was used for identifying factors influencing student's choice of one method. It is necessary to do works for informing young people according to the results, obtained from this study.

CHAMOMİLE TEA; POTENTIAL EFFECTS ON HEALTH

HİLAL BETÜL ALTINTAŞ¹, NILÜFER ACAR TEK¹, GAMZE AKBULUT¹, TESLİME ÖZGE YÖRÜSÜN¹, BÜŞRA ATABİLEN¹

ABSTRACT

Chamomile tea is often preferred by consumers for consumption in tea. It is stated that chamomile was used in various medical treatments by ancient Egyptians, Greeks and Romans for thousands of years. Chamomile is said to be used for various skin diseases such as acne, eczema, colds, sore throat, abscess, gum inflammation, anxiety and mild burns. However, there is very little work done to determine this effect of the chamomile. In some studies in rats, it has been determined that chamomile is anti-inflammatory and anti-oxidant. There are some studies showing that it is effective in reducing the symptoms of mild to moderate severe anxiety disorder. Chamomile spread from Egypt to Europe. German chamomile are most commonly used in tea, with varieties such as German and Roman chamomile. The German chamomile tea contains apigenin, a flavanoid known to be a mild sedative effect. Chamomile flowers contain a large number of therapeutically active compounds, mostly categorized according to their polarities. The most important bioactive components are flavonoids. Anti-inflammatory effect of German chamomile is used to increase immunity against cancer, gastritis, chronic intestinal diseases. It also determined the effects of anxiety disorders and increased sleep quality. Camellias combined with valerian are a traditional plant that has been used since ancient times in the treatment of insomnia and many health problems. The chamomile flower has tea, extract and various forms of ointment. Chamomile is generally known as anti-inflammatory and emotional conditioner. Despite the calming effect of the calamus in studies, studies are needed to determine its effect on sleep quality.

LAMB BREAST MUSHROOM

MUSTAFA DEMİRBAŞ¹, REFIK ULUSOY¹

ABSTRACT

The Latin name is *Morchella esculenta*, a lamb breast mushroom with reddish yellow and irregular hollows. The lamb breast collected from the nature from the middle of spring is one of the most important fungus species exported in Turkey. It is a delicious mushroom species widely consumed in Turkey and in the world. It can be consumed fresh or dried. What kind of mantle is a jug? Lamb, which loves soils rich in nutritional components, grows in the openings of forests, on the sides of roads and water, in wildfires, under trees like maple, elm, hazelnut and beech. It is seen in the Aegean and Mediterranean regions, in the forested land, usually in the pine forests. The cause is not yet known but it is the most common type of fungus after forest fires. The growing season is between March and May. *Morchella conica*: It is a different breed with brown hats and regular cavities that are very similar to the lamb chest. In some regions, as a lamb breed, the genus is also the genus *Morchella esculenta*. Also known as lamb mushrooms, donut mushrooms. It grows in calcareous soil, in meadows and in bushes. It meets in April and May. How are lamb breasts grown? The fungi belonging to the genus *Morchella* belong to the mycorrhiza class. The ability of such fungi to survive depends on the presence of some trees and organic compounds. For this reason, despite the fact that they have been working on them for many years, the results of their cultural studies have not been successful. Culture studies of the lamb breast, which was first cultured in 1982, are carried out in order to increase the population of fungi in the natural environment today. **BENEFITS** - Kolesterol is good - Supports eye health - Supports thyroid health - Alleviate joint pain - Maintain side effects of drugs - Iron and phosphorus source -B and D are sources of Vitamin Supports liver health - Fights the cancer -He makes blood -The penalty is good Supports heart health

DRYING PROCESS IN MEDICINAL-AROMATIC PLANTS

RABIA SERPİL GÜNHAN¹, ASUMAN KAN¹

ABSTRACT

DRYING PROCESS IN MEDICINAL-AROMATIC PLANTS Günhan, R. S.1, Kan, A.1 1 Selcuk University, Vocational Higher School of Technical Sciences, Food Processing Department 42070, Campus, Konya rsgunhan@selcuk.edu.tr Phone:+90 533 6366616 Medical - Aromatic plants (TAB) constitute the most important inputs of herbal medicines, plant chemicals, food and additives, cosmetics and perfumery. These plants need to be in the required quantity and quality so that sustainable production and market potential can be adequately evaluated. One of the important process steps for quality and standard product is drying process after harvest. Drying is the heat and mass transfer event involving the transfer of the water in the dried product from the interior of the product to the surface and the evaporation from the surface. Drying is done to preserve the enzymatic and microbial activities and to extend shelf life of the product. Drying is to reduce the moisture of the product without harming the product quality to the final moisture content as soon as possible by consuming the least energy. Drying can be done naturally and artificially. The methods and conditions used in drying directly affect the quality of the product and the content of the active substance. In aromatic plants, the drying temperature should be kept low to prevent the loss of essential oil. For quality drying, thick and large drugs should be cut into pieces, branch pieces should be selected. One of the major risks during the drying of drugs is the occurrence of microbial activity, especially the formation of mycotoxin that is harmful to human health in the final product. In this context, the use of controlled drying systems is recommended. In addition, freeze drying is a recommended method for some drugs with low production volume and high economic value. As a result; The correct drying method should be selected and the correct drying conditions should be applied in order to have the product of the closest composition (phenolic compounds, volatile oils, resins, flavorings, colorants, vitamins, antioxidants and antimicrobial compounds etc.)to the fresh product after drying. THE ROLE OF HAWTHORN IN THE DEVELOPMENT OF FUNCTIONAL FOOD

RABIA SERPİL GÜNHAN¹, SUZAN YALÇIN¹

ABSTRACT

THE ROLE OF HAWTHORN IN THE DEVELOPMENT OF FUNCTIONAL FOOD
Günhan, R. S.1, Yalçın, S.2 1 Selcuk University, Vocational Higher School of Technical Sciences, Food Processing Department 42070, Campus, Konya 2 Selcuk University , Department of Food Hygiene and Technology, Faculty of Veterinary Medicine , Campus, Konya rsgunhan@selcuk.edu.tr Phone:+90 533 6366616 Hawthorn is an important Medicinal-Aromatic plant that attracts the attention of the scientific world. In developed countries, the production and consumption of functional food and beverage whose added-value are high are gradually increasing by using of fruits, leaves and flowers of hawthorn. With the investigations it has been found that hawthorn has many functional properties and has become one of the most popular herbal treatment tools. It is used in the treatment of disorders such as heart failure, vascular occlusion, angina, dysrhythmia, gastrointestinal disorders and hypertension. The hawthorn is rich in Vit C, sugars (fructose, glucose, sucrose), organic acids (malic acid, citric acid, quinic acid), anthocyanins, flavonoids and phenols. Also hawthorn fruit contains high amounts of mineral matter. Over the world, hawthorn is used in the production of fresh fruit, dried fruit, juice, compote, marmalade, jam, crush, tea (fruit, leaf, flower), molasses, vinegar, sauce, powder of hawthorn; cakes, biscuits, confectionery and ice cream. It is stated that consuming hawthorn powder reduces significantly the level of low density lipoprotein in the body. The hawthorn vinegar contains a high amount of phenolic material and has high antioxidant capacity. Especially It has a positive effect on cardiovascular patients. In addition, the hawthorn vinegar causes weight loss and reduces the blood pressure, cholesterol, blood sugar, triglycerides. Dried leaves, flowers and fruits of the hawthorn are prepared like tea and it is used against throat inflammation, coughing, heart attack and arteriosclerosis. Finger hawthorn and soudjouk hawthorn are produced by compressing hawthorn pulp. Besides, candied apple produced by being dipped into hawthorn syrup or hawthorn fruit skewered by being dipped into thickened hawthorn syrup like the formed of hawthorn sweet is sold in markets. Hawthorn chocolate should not be forgotten. As a result; although hawthorn is naturally overgrown in our country, the value of it is not fully understood. Producing hawthorn plant which is a functional food in desired quality and quantity, providing continuity, evaluating the market potential is very important. In this regard, producers, consumers and enterprises should be informed adequately and the necessary benefits should be provided. Keywords: Hawthorn, Functional Food, Health

COMPARISON OF ESSENTIAL OIL COMPOSITIONS OF FRESH AND DRIED PLANT OF SALVIA SCLAREA L. IN TURKEY

SÜLEYMAN DOĐU¹, YÜKSEL KAN², YAVUZ BAĐCI³, SADIYE AYŞE ÇELİK², İREM AYRAN²

ABSTRACT

In this study, essential oil compositions of *Salvia sclarea* L. (dried and fresh aerial parts) collecting from natural habitat was investigated. Essential oil was obtained by hydrodistillation for 3 h using Clevenger type apparatus and the compositions was determined in GC-MS. In this research, it was observed that the essential oil compositions varied with respect to be fresh or dry of the plant parts. The LSD test results revealed that the highest essential oil components were germacrene-D (46,62%), bicyclogermacrene (27,184%) and trans- β -caryophyllene (8,606%) in fresh aerial parts, while the highest components were germacrene-D (45,593%), bicyclogermacrene (19,741%) and α -copaene (3,997%) in dried part of the plant. Furthermore, some essential oil components were not found in the fresh aerial parts, while it was determined in dried parts of the plant. On the contrary, some components were observed in the fresh aerial parts, while it was not found in dried parts of the plant. The objective of the study was that the determination of the differences between the essential oil compounds and compositions varied according to be the plant fresh or dry.

COMPARISON OF CHEMICAL CONTENT OF WILD AND CULTIVATED FORMS OF HYPERICUM PERFORATUM L.

SÜLEYMAN DOĐU¹, YAVUZ BAĐCI², YÜKSEL KAN³, SADIYE AYŞE ÇELİK³

ABSTRACT

In this study, essential oil compositions of the dried and fresh aerial parts of *Hypericum perforatum* L. collected from wild and cultivated in the research field was investigated. Essential oil was distilled by using Clevenger type apparatus for 3 h and the chemical compositions were detected in GC-MS. The oil yields of the collected and cultivated plant materials were observed to be 0.2 ml and 0,13; 0,1 ml and in amount tr in fresh and dried aerial parts, respectively. Drying of the material had negative effect on the oil yield both in the collected and cultivated plant materials. Besides essential oil yields, in this research the differences with respect to composition and components were detected between the cultivated and collected plants. On the other hand, in this study, it was determined that the essential oil compositions varied with respect to be fresh or dry of the plant parts. There were 9 and 63, 36 and 73 of essential oil components were observed in the fresh and dried parts of the collected and cultivated plant materials, respectively. It was observed that the major essential oil components were germacrene D, n-hexadecanoic acid, trans-caryophyllene, pulegone, 12-crown-4, 2,2-dimethyl-4,4,5,5-tetramethoxybiphenyl, carvacrol and para-menth-3-en-8-ol. The aim of the research to detect the differences between the essential oil compounds and compositions varied according to be the plant fresh or dry and wild or cultivated.

THERAPEUTIC USAGE OF BLACK CUMIN (NIGELLA SATIVA) SEED AND OIL

DR. EMRE ÖZTOPRAK¹, DOÇ. DR. BURAK CEM SONER², PROF. DR. AYŞE SAİDE ŞAHİN²

ABSTRACT

Black cumin plant (*Nigella sativa*; kalonji, black caraway, schwarzkümmel) is a member of Ranunculaceae family that grows widely in many countries, especially in Middle East, Eastern Europe and Eastern Asia countries. However the chemical content of plants varies generally according to the harvest season of the plant, species and the cultivated climate; black cumin plants are generally grown in countries like Egypt, Sudan, Ethiopia, India, Turkey and Syria. There are many different species of the plant such as *Nigella sativa* L., *Nigella damascena* and *Nigella arvensis*. In particular, the seeds of *Nigella sativa* L. are widely used as folk medicines for traditional herbal treatment and spices. The parts used as drug are the seeds and oil that obtained from seeds. Black cumin seed is a rich source of carbohydrates, fats, vitamins, minerals, proteins and amino acids. Black cumin seed contains 16-20% protein, 33-34% carbohydrate, 0.4-0.7% essential oil and over 30% fixed oil. Analysis by high pressure liquid chromatography showed that there are 4 main active substances in *Nigella sativa* seed oil. These are thymoquinone, dithymoquinone, thymohydroquinone (nigellone) and thymol. Thymoquinone is 2-isopropyl-5-methyl-benzoquinone. Black cumin seed oil is also very rich in unsaturated fatty acids. While the linoleic acid constitutes the main part of the unsaturated fatty acids, the oleic acid constitutes the lesser part. Other unsaturated fatty acids are arachidonic acid and eicosadienoic acids. It has also saturated fatty acids such as palmitic, stearic and myristic acid. Because of the wide variety of substances in the composition of *Nigella sativa* and the different therapeutic effects of each other, *Nigella sativa* has many different pharmacological effects. Although more detailed informations are needed about its pharmacological effect mechanisms; black cumin seed and oil has antitumoral, analgesic, antiinflammatory, antipyretic, antiallergic, antimicrobial, antiasthmatic, immunomodulator, antioxidant, antidiabetic, gastroprotective, radioprotective, hepatoprotective, nephroprotective, neuroprotective, antihypertensive, antiepileptic, lactagogue and antihyperlipidemic effects. *Nigella sativa* seeds and oil have been used by ancient Egyptian and Greek physicians to improve headache, nasal congestion, toothache, diarrhea and also as an anthelmintic and lactagogue agent. They are used in Middle and Far East countries at traditional treatment in many diseases such as bronchial asthma, headache, dysentery, infection, obesity, back pain, hypertension and gastrointestinal problems. In addition their use in skin diseases such as eczema has been accepted all over the world. In Turkey, there is also a *Nigella sativa* seed oil agent which licensed according to the Ministry of Health Traditional Herbal Medicinal Product Regulation and received 3 indications. These indications are allergic rhinitis treatment, regulation of blood lipid levels and strengthening the immune system. Dosage in these indications are determined as 1800-3600 mg/day for adults and 40-80 mg/kg/day for children. When its side effect profile is considered, no undesirable effects have been reported other than nausea, vomiting and diarrhea with unknown frequency. When all these

SOME TEA PLANTS TRADITIONALLY USED IN ELAZIĐ

UĐUR ÇAKILCIOĐLU¹, RIDVAN POLAT², EBRU YÜCE BABACAN¹

ABSTRACT

This study was conducted for the purpose of determining the usage of plants used as tea by the local community in Elazığ and central villages. The study was conducted in April-September, 2015. Villages were visited in the region throughout the study. As a result of investigations being carried out in the region, 19 plants from 8 plant families being traditionally used were determined. The plants were scientifically named by using the Flora of Turkey. In the study, local names, localities of plants, as well as their parts being used as tea and other data were recorded and tabulated.

THE HERBAL DERIVED NATURAL ANTIMICROBIALS

AYŞE AKAN¹

ABSTRACT

In this study, the different studies about the components that has obtained from extracts of herbal and spices and essential oils which has antimicrobial activities, the antimicrobial activities in food borne pathogens, the experiments to extend shelf lives of food, has been researched. The food consumers started to show interest to natural compounds, so that the studies about natural compounds to increase shelf life and quality of food has been increased. The herbal and spices has antimicrobial activities with the components as phenolic acids, flavonoids, tannins etc. However, there can be different results when the studies was done on food. The antimicrobial activities of natural compounds could be increased, if several antimicrobial components are used together or by evaluating the factors likewise pH of food, storage conditions, process of production.

THE ROLE OF SPICES IN THE TREATMENT OF HELICOBACTER PYLORI

MEHMET KEMAL¹, SEVGI KOLAYLI², ŐENGÜL ALPAY KARAOĐLU³, NİMET BALTAŐ³

ABSTRACT

Helicobacter pylori, a gram negative pathogen bacterium, causes gastritis, reflux, ulceration in the stomach. This bacterium that colonizes in one out of every two individuals is quite resistant to antibiotics. Urease enzyme released by *H. pylori* converts urea into ammonia; thus, this bacterium survives in stomach inner wall thanks to formed ammonia which makes an alkaline environment. Therefore, inhibition effects of the bacterial urease are defined as an anti-bacterial activity. In this study was to be researched inhibition effect on the bacterial urease enzyme of some spices commonly used in human diet. For this purpose, inhibitory effects on the *Helicobacter pylori* urease of ethanolic extracts of spices such as thyme, clove, isot pepper, turmeric, mint, black sesame and cinnamon purchased from herbalist were investigated as a screening study. Enzyme inhibition was calculated with five different sample concentrations. It was found that all samples displayed inhibition effect at varying concentration on this enzyme and values of IC₅₀, defined as sample amount that reduces enzyme activity by 50%, ranged from 0.96 (mg/ml) to 5.05 (mg/ml). As a result, the highest activity from thyme and isot pepper samples were ascertained. Therefore, our studies proceed about antibacterial activity with thyme and isot pepper extracts.

**THE USE OF PHYTOTHERAPY AND ALTERNATIVE MEDICINE BY
CANCER PATIENTS OUTPATIENT CHEMOTHERAPY UNIT IN
USAK UNIVERSITY MEDICINE SCHOOL EDUCATION AND
RESEARCH HOSPITAL**

AYŞE ÖZDEMİR¹, DUDU BAYRAKTAR DÖNDER²

ABSTRACT

With hundred of thousands of plant species on earth, We are bestowed with an glorious richness of medicinal remedies from Earth- Mother. The Herbal Medicine (Phytotherapy) and Alternative Medicine have been most commonly used to treat diseases thousands of years in our country and in the world. The interaction of herbal product and cancer drugs are not exactly known. The treatment of cancer is an important treatment that needs to be interrupted. Most poeple especially cancer patients use herbal products as a cancer treatment. Complementary and Alternative Medicine in cancer patients in this study was conducted to examine the methods of use 100 cases at Outpatient Chemotherapy Unit in Usak University Medical School Education and Research Hospital(1 January 2017- 25 March 2017). Methodology: The the sample of the research of planned at identifier type consisted of 100 cancer patients treated at Outpatient Chemotherapy Unit in Usak University Medical School Education and Research Hospital (January 2017- March 2017). During the research process was used questionnaire personal information form and alternative treatment. Results: Only 23 of the 100 patients in the sample uses alternative treatment methods. While 20 patients use herbal treatment, 3 patients use acupuncture. 13 of the 23 patients is women, and 10 of their is male.77 patients are not using any alternative treatment methods . Most of the patients who use alternative treatment are women and have lung and breast cancer. Today reactions against the use of synthetic drugs due to their severe side effects raised the interest in herbal products. Although many cancer types can be almost fully cured in early stages with cancer treatment in modern medicine, especially complementary therapy plays an important role in cancer treatment.

DETERMINATION OF ESSENTIAL OIL COMPOSITION AND INVESTIGATION OF THE PHENOLIC SUBSTANCE AND ANTIOXIDANT EFFECT OF "HELICHRYSUM STOECHAS" FROM HATAY

MAHIR TİMUR¹, İSMAIL AKÇA¹

ABSTRACT

DETERMINATION OF ESSENTIAL OIL COMPOSITION AND INVESTIGATION OF THE PHENOLIC SUBSTANCE AND ANTIOXIDANT EFFECT OF "HELICHRYSUM STOECHAS" FROM HATAY Mahir Timur*, İsmail Akça Mustafa Kemal University, Altınözü Vocational School, Department of Food Process, Hatay, Turkey *E-mail: mahirtimur@gmail.com People traditionally benefit from medical herbs to protect themselves from diseases. Antioxidants are the protective or inhibiting compounds that help to heal in medical plants. Antioxidants can prevent or reduce oxidative damage even at low concentrations(1). It has been pointed out that compounds such as polyphenolic substances, vitamins and enzymes, which are found in the structure of plants consumed as food, are directly related to the antioxidant effects of plants. This antioxidant effect can significantly prevent the damages caused by reactive oxygen species and reactive nitrogen species which cause oxidative stress. (2,3). Helichrysum Stoechas is an expectorant and is used in the treatment of colds. [4] In this study, it was aimed to determine the essential oil composition, phenolic substance and antioxidant activity of Helichrysum Stoechas, locally known as kudama, growing in the region of HATAY Antakya Castle. Helichrysum Stoechas' essential oil was obtained by using Clevenger apparatus and found to be 0.3% on dry matter. The essential oil composition was determined by gas chromatography and the essential oil was found to be D-FENCHONE 0.77%, Caryophyllene 1.10%, 2-Naphthalenemethanol 2,3,4,4a, 5, 4.89%, benzene 1,2,3,4-tetramethoxy--5-(2-propenyl) %34.69, Benzene, 1,2,3-trimethoxy-5-(2-propenyl) % 3.24 Myristicin % 23.35, Lauric acid % 1.17, Apiol %27.38, Myristic acid % 1.38. Methanol extract was obtained for phenolic substance and antioxidant capacity assay. The portion of the plant dissolved in methanol was found to be 15.3% on dry matter. The total phenolic substance concentration was determined according to the Folin-Ciocalteu method and the total amount of phenolic substance in the methanol extract was calculated as 256 mg / g gallic acid equivalent (GAE). The free radical scavenging effect was determined according to the DPPH method and the results were compared with BHA and BHT. Plant extract; 94.28%, 94.49%, 92.16%, 67.80%, 34.11%, BHA; 91.13%, 90.67%, 89.61%, 86.01%, 78.60%, BHT; , 91.95%, 89.23%, 68.64%, 53.39% and 29.23% inhibition values, respectively. The DPPH removal activity of the standards and plant extract was found to decrease as plant extract> BHA> BHT. The effective antioxidant concentration EC50 values required for the 50% inhibition of the DPPH radical in the reaction medium were found to be BHA: 0.022, plant: 0.038 and BHT: 0.057 (µg / mL), respectively. The low EC50 value is indicative of the high radical scavenging activity. Total antioxidant activity was determined by beta-carotene linoleic acid method. Antioxidant activity values

Corresponding Author: MAHİR TİMUR, mahirtimur@gmail.com

¹HATAY MUSTAFA KEMAL ÜNİVERSİTESİ

were calculated as BHT: 73.33%, plant: 68.75% and BHA: 63.15%. Reductive Antioxidant Capacity was made according to CUPRAC Method (Güçlü et al., 2006). from the Trolox calibration curve CUPRAC activity TEACCUPRAC:71,65 µg / mL was found. It is obvious that the obtained result shows that Helichrysum stoechas has an effect close to the synthetic antioxidants BHT (Butylated Hydroxytoluene) and BHA (Butylated Hydroxanisole). Nowadays, as the tendency of natural treatment methods increases, the composition of medicinal and aromatic plants should be determined and their use efficiency will be increased according to active compounds. NOVEL METHODS FOR QUALITY ANALYSIS OF ESSENTIAL OILS PRODUCED AS FOOD SUPPLEMENT

KADIR GÜRBÜZ GÜNER¹, H. MURAT VELİOĞLU²

ABSTRACT

Recent trends of natural diet and curing have provoked the use of herbal products and food supplements in the society. Therefore, essential oils that are produced and consumed as food supplement are of great interest to the consumers. Turkey has a great biodiversity in the meaning of aromatic plant cultivation and many of essential oil plants grow naturally. The use of essential oils in food, medicine and perfume industries has been increasing in recent years. In this context, the number of exported aromatic plant species has reached to almost 100 in Turkey which yield an income of USD 100 million annually. Nowadays, consumers are increasingly concerned about the quality and safety of food products. Hence, the origin and health effects of food constituents are being discussed in public media. Essential oils are more expensive than the other vegetable oils and that is why the determination of fraudulent malpractices is important in these products. The addition of cheaper oil in expensive one is very well known adulteration for essential oils which affects not only the consumers' health but also causes an unfair profit. There is a need for rapid and economic analysis methods for determination of essential oil quality. Gas chromatography / mass spectroscopy (GC/MS) is still remain as a golden method. However, chromatographic methods are time consuming, costly and they need a specialist for the analysis which make them disadvantageous compared with spectrophotometric methods. Raman, Fourier transform infrared reflectance (FTIR) and near infrared reflectance (NIR) spectroscopies have been gaining great interest during the recent years. As rapid and sensitive techniques, spectroscopic methods can give biochemical finger prints of the material. Additionally, these methods are suitable for applications which require green chemistry limitations. In the present paper, the novel spectroscopic methods in determination of quality of essential oils were summarized and exemplified using literature studies.

A DIFFERENT PERSPECTIVE ON SAGE (SALVIA SP.): 'USAGE IN LANDSCAPE ARCHITECTURE'

MERT ÇAKIR¹, ŞİRİN DÖNMEZ¹

ABSTRACT

Turkey, with rich flora, reserves lots of medicinal and aromatic plants within its structure. The purpose of the plants with their therapeutic purpose is as old as history of humanity. Despite significant developments in medicine, today, the traditional usages of medicinal herbs are very important and are accepted as a scientific discipline. In the past centuries, medical and aromatic plants have been used in traditional house gardens for both ornamental and utility purposes. Today, medicinal and aromatic plants take place in parks and thematic garden designs and are very interesting. It is known that sage, which is widely used as a medicinal and aromatic plant, is close to 100 species naturally distributed in our country. Especially, because of their nice smells and flowers, they can be suitable for use in landscape areas. However, except for very special gardens, these plants are rarely used. Within the scope of this study, sage species which spread naturally in Turkey will be evaluated in terms of shape, form and flower characteristics and their use in plant design has been determined.

SCREENING OF ANTIOXIDANT, ACETYL- AND BUTYRYL- CHOLINESTERASE INHIBITORY ACTIVITIES OF ENDEMIC BUNIAM CRASSIFOLIUM BATT. GROWING IN ALGERIA

NABILA SOUILAH¹, ZAIN ULLAH², KUBRA ELİK², KAMEL MADJROUBI¹, SALAH AKKAL¹, MEHMET ÖZTÜRK²

ABSTRACT

Screening of Antioxidant, Acetyl- and Butyryl-Cholinesterase Inhibitory Activities of Endemic Bunium crassifolium Batt. Growing in Algeria Nabila SOUILAH¹, Zain ULLAH², Kubra ELİK², Kamel MADJROUBI¹, Salah AKKAL¹ and Mehmet ÖZTÜRK² 1Department of Chemistry, Faculty of Sciences, University of Constantine 01, 25000, Constantine, Algeria 2Department of Chemistry, Faculty of Sciences, Muğla Sıtkı Koçman University, Kötekli-48000, Muğla, Turkey zainullah@posta.mu.edu.tr The Bunium genus contains aromatic and medicinal plants such as Bunium crassifolium Batt. The Bunium genus contains aromatic and medicinal plants such as Bunium crassifolium Batt. This study evaluates the antioxidant and anticholinesterase activities of Bunium crassifolium, which is an extremely rare endemic species of the Bunium genus. The plant sample was collected at full flowering stage from Séraïdi (Annaba), in the north eastern of Algeria in May 2015. The aerial part of the plant was dried under shadow and grinded (65 g), afterwards macerated in methanol (100 %) at constant stirring rate (200 rpm) for 24 hours, then filtered by Whatman N01 filter paper and evaporated the solvents with rotary vacuum evaporator and named as B.C-100. For a 2nd extraction the grinded dried aerial parts of the plant (10 g), was macerated in boiling methanol and distilled water (70:30) followed by the same procedure and named as B.C-70. DPPH, ABTS, β -carotene-linoleic acid, acetyl- and butyryl cholinesterase activities were used to evaluate the antioxidant and enzymes inhibitory potential of the obtained extracts. The B.C-70 extract showed more potential against ABTS, β -carotene and butyryl choline esterase with an IC₅₀; 12.69 \pm 3.78, 68.15 \pm 1.02 and 19.41 \pm 0.41 μ g/mL respectively. Against DPPH and acetyl cholinesterase B.C-100 was more potential with an IC₅₀: 49.83 \pm 2.37 and 20.15 \pm 2.71 μ g/mL, respectively. Since Bunium crassifolium exhibited significant antioxidant and anticholinesterase activities, further studies by activity guided fractionation are necessary. Bunium crassifolium containing antioxidant and anticholinesterase compounds can be used in pharmaceutical and food industries. EFFECT OF THE ANTIOXIDANT PROPERTY OF EXTRACT OBTAINED FROM PAPAVER SOMNIFERUM LEAF

ELMAS ULUTAS¹, AZIZ BÜLBÜL¹, TUBA BÜLBÜL¹, MUSTAFA EVCİMEN¹, ÖMER YALINKILIC²

ABSTRACT

In this study, the antioxidant efficiency of poppy plant (*Papaver somniferum*) were analysed with different methods. For this purpose, the extractions of the papaver plant that reached to 10-15 cm of length and was ground by drying were carried out by using ethanol, methanol and ethyl acetate solvents. Afterwards, With Folin-Ciocalteu reagent the total phenolic compound, and with 1,1-Diphenyl -2- picrylhydrazyl (DPPH) free radical eliminating activity, superoxide radical eliminating activity and Beta-carotene bleaching method the antioxidant properties were identified. The results obtained were evaluated by comparing with ascorbic acid, butyl hydroxytoluene (BHT) and butylated hydroxyanisole (BHA) standard substances. It was specified that as gallic acid equivalent, the total phenolic substance amount changes between the ranges of 63,4 – 82,5 and is found to be maximum in the ethanol extract. It was seen that all the extracts show super oxide and DPPH radical elimination efficiency and at the same time the maximum efficiency is in the ethanol extract. Similarly, in the determination of antioxidant activity that was realized by using β -Carotene bleaching method, it was determined that all the extracts show antioxidant efficiency. As a result it was understood that although the *Papaver somniferum* extracts are weak in terms of phenolic substance content, they show antioxidant efficiency and ethanol is the most suitable solvent for antioxidant efficiency

DETERMINATION OF THE ANTIOXIDANT EFFICIENCY OF MYRTLE (MYRTUS COMMUNIS L.) ESSENTIAL OIL

ELMAS ULUTAS¹, AZIZ BÜLBÜL², TUBA BÜLBÜL²

ABSTRACT

In this study, it was aimed to identify the phenolic substance content and antioxidant property of Myrtle (*Myrtus communis* L.) essential oil. With Folin-Ciocalteu reagent the total phenolic substance content and with 1,1- Diphenyl -2- picrylhydrazyl (DPPH) free radical elimination, superoxide radical elimination activities and beta-carotene bleaching method, the antioxidant properties were identified. The results obtained were evaluated by comparing with ascorbic acid, butyl hydroxytoluene (BHT) and butylated hydroxyanisole (BHA) standard substances. The density of myrtle essential oil obtained by hydro distillation method was specified as 0.897 g/ml. It was found that as gallic acid equivalent, the total phenolic substance amounts in the oil is 128,12 µg/ml; and by DPPH free radical and superoxide radical elimination activities the antioxidant efficiency was respectively found as 33,8% ; 43,4% and 38,9%. In conclusion, while there is phenolic substance at a moderate level in the myrtle essential oil (*Myrtus communis* L.), it was also identified that it has strong antioxidant efficiency.

MUTAGENIC AND ANTIMUTAGENIC POTENTIAL OF SOME COMMERCIAL PHENOLIC COMPOUNDS (CATECHIN, EPICATECHIN, CAFFEIC ACID)

AHMET UYSAL¹, GÖKHAN ZENGİN¹, ERDOĞAN GÜNEŞ¹, MEHMET AKÖZ¹

ABSTRACT

There are approximately 300,000 documented species of higher plants on the planet, which synthesize an enormous number of chemicals of diverse structure and class (more than 200,000 isolated and identified individual chemical entities). These compounds can be further divided into primary and secondary metabolites. Secondary metabolites are structurally and chemically much more diverse than the primary metabolites and refer to compounds present in specialized cells that are not directly essential for basic photosynthetic or respiratory metabolism but are thought to be required for plants' survival in the environment. Secondary metabolites apparently act as defense (against herbivores, microbes, viruses, or competing plants) and signal compounds (to attract pollinating or seed dispersing animals), as well as protecting the plant from ultraviolet radiation and oxidants. In this study, catechin, epicatechin and caffeic acid obtained commercially and found in plants were evaluated for their potential of mutagenic and antimutagenic activities by Salmonella/microsome test system both in the presence and absence of metabolic activation enzymes (S9 mix). Chemicals were tested for their toxicity before and non-toxic doses (5000, 1000 and 500 µg/plate) of them were used in the test. Salmonella typhimurium TA98 and TA100 strains did not increase in the number of revertant colonies compared to the negative control when the bacteria were treated with three phenolic chemicals. In other words, catechin, epicatechin and caffeic acid were not found to be mutagenic for TA98 and TA100 strains in Ames test. Because of the compounds were not mutagenic, antimutagenicity of phenolics were determined. It was determined that catechin and epicatechin revealed strong antimutagenicity against 4-nitrophenylendiamine in the absence of S9 mix for TA98 at doses of 5000, 1000 and 500µg/plate (for catechin 69%, 73%, 49% inhibition; for epicatechin 68%, 56%, 53% inhibition, respectively). Caffeic acid manifested moderate antimutagenicity with rates of 36% and 33% inhibition at doses of 5000 and 1000 µg/plate. By the addition of S9 mix antimutagenic actions of the compounds decreased and showed weak antimutagenicity against 2-aminoflourene except for 5000µg/plate dose of catechin and epicatechin for TA98. Only epicatechin exhibited strong antimutagenicity against sodium azide with a rate of 46% at a concentration of 5000µg/plate for TA100 without S9 mix. The strongest antimutagenicity (88%) was revealed by catechin in the presence of metabolic activation enzymes for TA100 at a dose of 5000µg/plate. Also epicatechin and caffeic acid manifested strong antimutagenicity against 2-amino anthracene at the same dose with rates of 67% and 46% inhibition, respectively. It was concluded that catechin, epicatechin and caffeic acid, plant secondary metabolites, have moderate to strong antimutagenic action against well-known mutagens. Plant including this phenolics may be the natural source of antimutagens and used in pharmaceutical industry.

EFFECTS OF PUNICA GRANATUM PEEL POWDER ON HUMORAL IMMUNITY OF LAYER HENS*

UÇKUN SAİT UÇAN¹, TAHİR BALEVİ², ZAFER SAYIN¹, ASLI SAKMANOĞLU¹

ABSTRACT

Effects of Punica Granatum (Pomegranate) peel added to layers' rations with 1.5 % ratio on humoral immunity were investigated. A number of 24 Hy-line layer were used. Trial was carried out in Hümeyra Özgen Research and Application Farm, Veterinary Faculty of Selçuk. Some amount of fresh Punica Granatum was supplied by local market, peeled, dried in oven and then powdered by means of grinder. Except one of the control, the others were fed on ratios supplemented with 1.5% powder of Punica Granatum peel. The vaccine groups were administered by La Sota strain through drinking water at the beginning of the study against New Castle Diseases (ND) virus. Humoral immune response to ND virus were measured at d 30 and d 60 from serum samples by Hemagglutination Inhibition (HI) assay. In the trial, supplementation of ration with 1.5% powder of Punica Granatum peel suppressed the specific humoral response against ND virus ($P<0.01$). To detect effects of this supplement in lower quantities are subject of future work . *The results discussed by this presentation is a part of the research (15401148) supported by BAP (Selçuk Üniversitesi).

THE EFFECT OF CAPSAICIN ON HEALTH

İPEK KARADUMAN¹, RECEP PALAMUTOĞLU¹, CEMAL KASNAK¹

ABSTRACT

Red pepper bitter (*Capsicum annuum*) is cultivated for 7000 years in various parts of the world such as South Asian countries and South-East Anatolia region of South America, and belongs to the Solanaceae family and it is used as seasoning and sauce in foods due to its sharp and bitter flavor. Red Pepper has been widely used in the treatment of various diseases for a long time and used since ancient times to give flavor to food. Bitterness of capsicum fruits are due to their capsaicin content. Red pepper contains essential oil, fixed oil and pigments while fruits vitamin C content is rich in green. Pepper is also an important vegetable in terms of human health. It has been reported that capsaicin alkaloid is an important antioxidant against cancer diseases which gives bitter and spicy taste in hot pepper. It is stated that the hot pepper is good for digestion, appetizing, muscle pain and rheumatism, nervous system, red eye disease and seasickness. These effects are generally thought to originate from bitterness components. Briefly, it is investigated that the capsaicin has anticarcinogenic, antilipemic, antioxidant, energy balance, anti-dyspeptic, anti-bacterial, immunosuppressive effect. The purpose of this work is to compile studies on these properties of the capsaicin.

APHID (HEMIPTERA: APHIDIDAE) SPECIES DETERMINED ON SOME MEDICINAL AND AROMATIC PLANTS WITH NEW HOST PLANTS FOR TURKEY

N. ZÜLAL ELEKCİOĞLU¹, IŞIL ÖZDEMİR²

ABSTRACT

The aphids are fed by sucking the sap of host plants. Due to loss of juice, they cause wilting and drying out of young shoots and leaves. By preventing fruit growth, important crop losses occurs. They cause the spread of various plant diseases by carrying and infecting viruses. This study was carried out in 2015-2016 to determine the aphid species found on some medicinal and aromatic plants in Adana (Sarıçam, Karaisalı provinces). In the study, 26 plant species were examined and a total of 24 aphid species belonging to 4 subfamily and 18 genus were identified. *Cynara scolymus* L., *Mentha piperita* L., *Achillea asplenifolia* L., *Linum usitatissimum* L., *Thymus serpyllum* L., *Origanum majorana* L., *Perovskia atriplicifolia* Benth., *Dracocephalum moldavica* L., *Melissa officinalis* L., *Salvia officinalis* L., *Salvia fruticosa* Mill., *Origanum onites* L., *Origanum vulgare* L., *Matricaria chamomilla* L., *Coriandrum sativum* L., *Calendula officinalis* L., *Digitalis purpurea* L., *Origanum syriacum* var. *bevanii*, *Echinacea purpurea* (L.), *Rosa damascena* Miller, *Kitaibelia balansae* Boiss., *Pelargonium graveolens* L., *Artemisia annua* L. and *Trigonella foenum-graecum* L. are determined as the new hosts in Turkey for the aphid species which they have been detected on.

CHERRY LAUREL

SÜMEYYE ŞİMŞEK¹, RECEP PALAMUTOĞLU¹, CEMAL KASNAK¹

ABSTRACT

Free radicals cause serious problems such as cancer, cardiovascular diseases, Alzheimer's disease, aging. Antioxidants react with free radicals, making them ineffective and preventing them from harming the cells. Thus, deterioration of cell structure and cancer formation risk reduces. As they reduce cell destruction, they delay aging and provide a healthy lifestyle. While antioxidants neutralize free radicals, there is a constant need for antioxidants in the body because they will be oxidized. Some of the need can be met by dietary nutrients. Antioxidants can be obtained either synthetically from outside or naturally from fruits and vegetables. Especially the amount of antioxidants in fruits and vegetables that are consumed raw is quite high. With the increasing importance of healthy nutrition, there is an important trend in our country for herbal medicines and organic fruit and vegetable market. The different species of cherry laurel (*Laurocerasus officinalis*) that grows widely in our country in the east of the Black Sea, Toros, North and East Marmara are grown in different parts of the world. Cherry laurel leaf, fruit and kernel are used in different forms. In particular, the fruit is consumed raw, but also the dried, salted forms, marmelade, jam and pickles are often consumed by local people. Fruit is used among people because of eczema, stomach ulcer, treatment of digestive system problems. In this study, it is aimed to compile the health effects of the cherry laurel fruit.

CAPSAICIN AND ITS EFFECTS ON APPETITE

MERVE PEHLİVAN¹, NILÜFER ACAR TEK¹, GAMZE AKBULUT¹, DUYGU AĞAGÜNDÜZ¹

ABSTRACT

Capsaicin, which gives chili peppers their hot and pungent taste, is an alkaloid found in the genus *Capsicum*. Capsaicin is a naturally occurring phytochemical, which is an odorless, white crystal with harsh flaring pungency. Even a solution with 1 in 17,000,000 concentration causes pain in humans. Its effects on the human body have been studied for over a century. This compilation aims to study the effects of capsaicin on appetite. It is widely accepted that the main mechanism of action for capsaicin is through the activation of the TRPV1 receptor (Transient receptor potential vanilloid receptor-1) on sensory afferents. Transient receptor potential vanilloid receptor-1 stimulation in intestinal enteroendocrine cells with capsaicin causes the calcium dependent secretion of glucagon like peptide 1 (GLP-1), which facilitates sensation of fullness. Although the exact mechanism is still not clear, it is reported that capsaicin affects appetite by increasing the concentration of anorexigenic hormone GLP-1 and decreasing the concentration of orexigenic hormone ghrelin. In a study by Smeet et al. on 30 individuals in the Netherlands, the subjects were randomly divided into two groups. One group (CAPS) received capsaicin (1.03 g red pepper; 80 000 SHU) and the other was the control group. While lunch content for both groups was the same (60% of energy from carbohydrates, 10% from proteins and 30% from fat), the CAPS group also received a capsaicin tablet with their lunch. Fifteen minutes after lunch, GLP-1 was significantly higher ($p < 0.05$) in the CAPS group, while ghrelin showed a tendency to decrease ($p = 0.07$). In another study by Smeet et al. on 24 individuals, daily consumption of 2 red peppers containing 1030 mg of capsaicin increased sensation of fullness. In a study by Janssens et al. on 15 individuals, subjects consumed 1,03 g of red pepper (2,56 mg capsaicin, 39.050 SHU) at each meal. These subjects consumed 7,68 mg/day of capsaicin in total over three meals. Capsaicin consumption was shown to increase sensation of fullness and to inhibit the urge to overeat. In summary; although the daily dosage and method of consumption of red pepper and capsaicin differ in studies, it is evident that red pepper and capsaicin consumption suppresses appetite and increases sensation of fullness. However, due to the variations mentioned above, daily dosage of red pepper and capsaicin required to affect appetite is not exactly clear. Further experimental study is required to precisely declare the effects and dosage of red pepper and capsaicin.

NATURAL SWEETENER STEVIA

BEYZA MORAL¹, RECEP PALAMUTOĐLU¹, CEMAL KASNAK¹

ABSTRACT

One of the most fundamental objectives of the food industry is to guide the work aimed to the changing consumer needs. In recent years consumers have turned to sweeteners because of the expression that the negative effects of sugar on health in our country and in the world. Today, there are many sweeteners that are used instead of sugar. Stevia rebaudiana is a natural sweetener, belongs to the family of the Asteraceae (Compositae) and the motherland of the plant is Paraguay, and the Amami mountains on the border of Brazil. The plant used in the treatment of diabetes for a long time in South America. It has been reported that the plant contains diterpens which are the secondary metabolites that give the sweet taste. The main sweetening compounds are stevioside and Rebaudioside A. Other sweet compounds are present in Stevia at low concentrations. It has been found that stevia is more sweet 250-300 times than sucrose, and dont gives metallic taste in the mouth. Different products produced for consumers such as powder, liquid and dried forms of Stevia rebaudiana. Studies showed that extracts from dry stevia leaves contain flavonoids, alkaloids, water soluble chlorophyll and xanthophylls, hydroxycinnamic acid (caffeic, chlorogenic, etc.), neutral water soluble oligosaccharides, free sugars, amino acids, lipids, essential oils and trace elements (aluminum, iron, zinc, etc.). It is believed that Stevia has positive effects on diabetes, high blood pressure, constipation, depression and nervous disorders, and the stomach and intestinal flora preserve the acid alkali balance. It does not contain calories so its use has been the mainstay of dietary treatment in recent times. It has been reported that Stevia leaves used in the treatment of cardiovascular diseases, as well as plaque relief, anti-caries, pain relief. It has been stated that it is used as a garnet for the antibacterial effect by the people, participates in the combination of toothpastes, is used in eczema and acne treatment, is a calcium antagonist and has a positive effect on the nervous system. The aim of this study is to compile studies on the health effects of Stevia plant.

HERBAL THERAPIES IN HEMODIALYSIS PATIENS

FERAY GENÇER¹, HILAL YILDIRAN¹, MAKBULE GEZMEN-KARADAĐ¹

ABSTRACT

End stage renal disease is characterized by gradual deterioration of kidney function and is often associated with a wide range of complications, such as hypertension, anemia, malnutrition, and decreased quality of life. Hemodialysis is the primary treatment for patients with end stage renal disease, designed to replace kidney function, and it is the most extensively used technique worldwide. The increasing incidence of chronic kidney disease demands more effective treatment approaches. Herbal therapies, are extremely popular worldwide and have been important among hemodialysis patients from medical, sociological and economic perspectives. Herbal therapies may provide new therapeutic opportunities for hemodialysis patients with the target of enhancing quality of life and improving symptoms. There is increasing evidence that shows the potential benefits of these products for patients with chronic kidney disease. Some studies have shown the beneficial potential of these products in hemodialysis patients suffering complications such as muscle cramps, pruritus, and inflammation. It is considered that herbal therapies are an option to decrease health problems of hemodialysis patients, such as gastrointestinal, psychiatric and neurologic symptoms. Turmeric, garlic, linden, asparagus, parsley and stinging nettle are mainly used herbal products because of antiinflammatory, antioxidant and diuretic effects. Astragalus is another plant that is used in many countries and has been used for centuries in traditional Chinese medicine in combination with other herbs. Astragalus has been used as a dietary supplement for many conditions, including for diarrhea, fatigue, anorexia, upper respiratory infections, heart disease, hepatitis, fibromyalgia, and cancer. There are no high quality studies in people of astragalus for any health conditions. It suggested that astragalus may help infections for patients with health problems related to kidney damage are susceptible to infections. Pomegranate and pomegranate juice are another products used in this patient group because it is thought to improve inflammation. The use of herbal medicine in hemodialysis patients seems to have more risk susceptibility in comparison with that in the general population. It is mainly due to their loss of kidney function as the most important toxin excretion system, leading to accumulation of toxic material of herbal remedies. Volume overload and hyperkalemia are the other important considerations of herbal therapies in these patients. Oral herbal medication has certain limitations, such as the occurrence of side effects and potential herb-drug interactions. Multiple treatment approach incorporating herbal medicine may offer more benefit to patients. However studies on herbal therapy for starting multiple treatment are still inadequate.

ESSENTIAL OIL AND FATTY ACID COMPOSITION OF *CENTAUREA SOLSTITIALIS* SSP. *SOLSTITIALIS*

*BURCU SÜMER TÜZÜN*¹, *TUBA GÖNENÇ*¹, *PELİN TAŞTAN*¹, *TUĞÇE FAFAL*¹, *BETÜL DEMİRCİ*², *BIJEN KIVÇAK*¹

ABSTRACT

Centaurea is a widespread genus from Asteraceae family in Turkey(1). There are plenty of researches about fatty acid and essential oil profiles of Centaurea species(2,3). Essential oils were obtained using a Clevenger apparatus by hydrodistillation from Herba part of the plant. The essential oil composition of the plant was identified by GC-MS using FID detector. 31 compounds representing 91.5% were identified. Hexadecanoic acid (50.2%) and tetradecanoic acid(10.1%) were found to be the major compounds. For fatty acids, fatty acid methyl esters (FAMES) were prepared. The fatty acid compositions were analyzed by GC. Saturated fatty acids (SFAs) were totally 25.05%, monounsaturated fatty acids (MUFAs) were 19.60% and polyunsaturated fatty acids were 19.86%. The major compounds were found as oleic acid (18.54%), linoleic acid (10.07%), palmitic acid (8.28%), stearic acid (6.82%) and γ - linoleic acid (6.75%). 1. Davis PH. Flora of Turkey. COMPOSITION OF ESSENTIAL OIL AND FATTY ACID OF CENTAUREA PICHLERI SSP. PICHLERI

PELİN TAŞTAN¹, TUĞÇE FAFAL¹, BURCU SÜMER TÜZÜN¹, TUBA GÖNENÇ¹, BETÜL DEMİRCİ², BIJEN KIVÇAK¹

ABSTRACT

In Asteraceae family *Centaurea* genus is represented with 192 taxa in Turkey, 114 of which are endemic. Many species of the genus *Centaurea* have traditionally been used for their antirheumatic, diuretic, choleric, stomachic, astringent, cytotoxic, antibacterial, antipyretic and tonic properties. The essential oil compositions of some *Centaurea* species from Turkey have been investigated. Generally, germacrene D, hexadecanoic acid, caryophyllene and caryophyllene oxide were reported to be the major volatile components in the earlier studies. In *Centaurea* genus, *Centaurea pichleri* ssp. *pichleri* is known as “gelin düğmesi, peygamber çiçeği” in Turkey. In this study, the essential oil of *Centaurea pichleri* ssp. *pichleri* was obtained by hydrodistillation using a Clevenger-type apparatus. The oil was analyzed by GC and GC/MS system. The components were separated as for adherencing to column and evaluated as for relative rate. Mass spectrums of each component were taken. GC and GC/MS analyses of the essential oil from *Centaurea pichleri* ssp. *pichleri* were determined the identification of 48 components representing 86.9 % of the oil. With this analysis, the major component was found as hexadecanoic acid (31.4 %). Subsequent to this component, other major components were caryophyllene oxide (6.4 %), spathulenol (6.2 %) and dodecanoic acid (4.5 %). In addition to this, fatty acid methyl esters (FAMES) from *Centaurea pichleri* ssp. *pichleri* were prepared for analysis of fatty acids. By this test the amount of saturated fatty acid (SFA) was found as 47.79 % with major fatty acid was stearic acid (18.64 %). The amount of monounsaturated fatty acid (MUFA) was found as 16.88 % with major fatty acid was oleic acid (14.20 %). The amount of polyunsaturated fatty acid (PUFA) was found as 21.29 % with major fatty acid was linoleic acid (15.20 %). The results from this work were compared with the previous works in terms of essential oils and fatty acids. References 1. P.H. Davis, R.R. Mill and K. Tan (1988). P-CYMENE PRODUCTION FROM ORANGE PEEL ESSENTIAL OIL ON DIFFERENT CATALYSTS IN THE SUPERCRITICAL ETHANOL

EMRE YILMAZOĐLU¹, MESUT AKGÜN²

ABSTRACT

Orange is the most produced type of citrus fruits. Global orange production exceeded 64.9 million tons in 2010/2011 season. The large part of the product is used as fruit or juice. On the other hand, peel essential oil which is a by-product of the juice production is used in various fields like food, cleaning, cosmetic and pharmacy directly or indirectly. Essential oil content is 1.45 ± 0.16 ml per kg of raw orange peel. 90-95% of the oil consists of limonene that can be transformed into different compounds. In our study, it was worked that processing of orange peel oil which had been produced by cold pressure technique. Catalytic reactions of limonene carried out in a packed bed reactor using Pt/Al₂O₃, Ni/Al₂O₃ and Pd/Al₂O₃ catalysts in over supercritical conditions of ethanol that its critical point is $\sim 241^\circ\text{C}$ and ~ 62 bar. The effects of temperature, pressure and retention time on yield were investigated for each catalyst used. Isobaric pressure of experiments for temperature and retention time scanning was selected as 65 bar. All in all, Ni/Al₂O₃ was ineffective but Pd/Al₂O₃ was the most effective catalyst for conversion of limonene. In the Pt/Al₂O₃ used experiments, it was seen that 10 s retention time was not enough for difference of composition in the oil. In addition to that limonene transformation occurred over the 280°C , limonene ratio in the product decreased to 50% and 20% as the temperature was 340°C in the retention times of 30 s and 50 s, respectively. p-Cymene that was 0.02% in the raw material, came to nearly 40% at 340°C in the 50 s retention time. Thus, p-cymene was the main component at the last point. Owing to Pd/Al₂O₃, it was achieved that conversion of limonene was up to 100% in very short times. p-Cymene ratios were above the 80% at 340°C in the all retention times. It was detected that there was a special point for composition of the product in the midst of 280°C and 300°C . Consequently, thanks to this catalyst, p-cymene was gained as the most quickly and the most selectively in nearly all conditions studied. Points to consider about choosing the temperature and the retention time for the process are very important with regards to being suitable for purposes of using. Physical and chemical structures of the oil spoiled at the high temperatures. On the other hand, limonene conversion was not adequate at the short retention times. While it was studied at 80 bar in the conditions of 300°C and 50 s, it was found that conversion of limonene has a peak value with Pt/Al₂O₃ and Pd/Al₂O₃ catalysts. In the end of reactions on Pt/Al₂O₃ at that pressure, limonene ratio was 33% and p-cymene ratio was half of it. However Pd/Al₂O₃ was more effective and selective than Pt/Al₂O₃. Thus, limonene hardly ever was found in the product at the same conditions when p-cymene ratio was 80%.

THE USE OF THYME AND PEPPERMINT (MENTHA PIPERITA) OF THE LAMIACEA FAMILY, WHICH ARE OFTEN USED IN FOLK MEDICINE, AS DYE SUBSTANCES IN WOOLLEN TEXTILE PRODUCTS

HÜLYA KAYNAR¹, ASLIHAN GÜRBÜZER¹, ESRA UÇAR¹, NAZIRE GÜLŞAH KÜTÜK¹

ABSTRACT

All animals, plants and people live within a certain balance in nature. According to archaeological findings from ancient times, people have always used plants, not only as food but also in the treatment of health problems and for the dyeing of textiles. Due to the current intense use of synthetic dyes, the use of natural dyes has become secondary. However, the importance of natural dyes has increased with the emergence of the negative effects of synthetic dyes on human health. In this study, an examination was made of the dye properties and colour and friction fastness values of mint (*Mentha piperita*) and thyme (*Thymus vulgaris*) plants. According to the data obtained, the colours obtained as a result of the use of acetic acid, copper II sulphate, zinc chloride, iron II sulphate, potassium aluminium sulphate, potassium bi chromate, citric acid and tartaric acid mordants for thyme and mint plants were determined to be olive green, black olive, cumin, coffee bean, kiwi peel, white coffee, dark chocolate and cooked apple. The highest colour fastness values for mint were determined as copper II sulphate (7), iron II sulphate (7), and potassium bi chromate (7) mordants. The highest friction fastness value was obtained from iron II sulphate (5) mordants. The highest colour fastness value for thyme was obtained from iron II sulphate (7) mordants and the highest friction fastness value from iron II sulphate (5) mordants.

THE COLOURS AND FASTNESS VALUES OBTAINED FROM BASIL (OCIMUM BASILICUM) AND LEMON BALM (MELISSA OFFICINALIS) PLANTS OF THE LAMICIAEAE FAMILY

HÜLYA KAYNAR¹, NAZİRE GÜLŞAH KÜTÜK¹, ESRA UÇAR¹, ASLIHAN GÜRBÜZER¹

ABSTRACT

Until the invention of synthetic dye substances, natural dyes, most of which have medicinal and aromatic properties, were used for the purpose of dyeing in industries such as textiles, food, medicine and cosmetics. With the introduction of synthetic dyes, their use increased and the demand for natural dyes decreased. However, as a consequence of studies made, the carcinogenic properties of synthetic dyes were revealed and that they could create serious problems for human health. Therefore, plant dyes that do not have negative effects on humans and other living organisms have come to the fore again. Most plants which are known to have medicinal and aromatic properties also have a dye property. In this study, an examination was made of the dye properties and colour and friction fastness values of basil (*Ocimum basilicum*) and lemon balm (*Melissa officinalis*) plants. According to the data obtained, dyeing made with basil (*Ocimum basilicum*) and lemon balm (*Melissa officinalis*) with acetic acid, copper II sulphate, zinc chloride, iron II sulphate, potassium aluminium sulphate, potassium bi chromate, citric acid and tartaric acid mordants gave colours of boiled chickpeas, allspice, coffee bean, olive green, light green, arabic green, and potato peel. The highest colour fastness values for basil were seen to be obtained with copper II sulphate, iron II sulphate, potassium bi chromate and citric acid mordants. The highest friction fastness values were obtained with copper II sulphate, potassium aluminium sulphate and citric acid mordants. For the lemon balm, the highest colour fastness values were obtained with all the mordants and the highest friction fastness values with acetic acid and citric acid mordants.

PRODUCTION TECHNIQUES OF MADIMAK TEA (POLYGONUM COGNATUM MEISSN)

EMRE HASTAOĞLU¹, MERYEM GÖKSEL SARAÇ¹, BURAK DİNCEL¹

ABSTRACT

The production of medicinal and aromatic plants in the world and our country and the consumption of the products obtained from these plants are increasing day by day. Medicinal and aromatic plants are widely used in food industry, too. The main reason for these plants to be consumed directly as food products is that these plants have antioxidant, antimicrobial properties. One of these product groups is herbal teas used in immunotherapy or treatment of diseases due to factors that have been in existence since prehistoric times. It is known that plants selected as medicinal herb tea generally have high anticancer and antiaging properties in addition to their antioxidant activities. Madimak (*Polygonum cognatum* Meissn) belongs to Polygonaceae family and is widely grown in the inner Anatolia region. In middle Anatolia, it is collected from the nature and consumed as the basic nutrient. Madimak plant is rich in antioxidants, flavonoids, phenolic compounds and carotenoids. The polar and apolar antioxidant compounds found in ether, ethanol and water extracts have shown that madimak is a potential antioxidant source. Among these samples, water extracts were found to have the highest antioxidant activity. At the same time, it has been found that it is also effective against to Gram positive bacteria. Especially, ether and ethanol extracts were found to be effective on *Staphylococcus aureus* and *Bacillus subtilis*. In studies conducted on mice with colitis patients, the madimak plant extract has the effects of reducing regulatory and oxidative stress in the intestinal colon. Madimak tea can be used as an alternative to herbal teas. In this context; it is important to cultivate the madimak plant and to produce madimak tea to protect both the cultural richness and to create the regional market.

MACRO, TRACE AND TOXIC ELEMENTS OF 4 DIFFERENT EDIBLE WILD PLANTS FROM KARADENİZ REGION

ATILLA ŞİMŞEK¹, AYLIN ŞİMŞEK², MELİKE DEMİRKOL¹, EMRE TURAN¹

ABSTRACT

The study was conducted to assess the content (mg kg⁻¹ fresh wt.) of macro, trace and toxic elements in the 4 different edible wild plants. The percentage of dry matter and ash ranged from 6.77 to 20.56 and 0.79 to 2.26, respectively. The contents of Ca (1074), Fe (160.5), Mn (18.21), Ni (6.11), B (2.61), Cr (0.93), Co (0.50), Mo (1.80), Be (0.009) and Se (0.076) of *U. diocia* were richer than in other plants. Other hand, K (7742), Mg (954), Al (10.79), V (9.77) and Ag (0.109) in *T. orientalis*, Zn (12.47), Cu (9.98) and Ba (130.3) in *O. umbellatum* were taken the highest value. Also As, Hg, Tl, Cd and Pb were determined mg kg⁻¹ level in fresh plants. Conversely, antimony (Sb) in wild plants could not be detected by ICP-MS. The results of statistic analysis of forty plants showed that moisture, total dry matter, ash, K, Ca, Mg, Fe, Zn, Cu, Mn, Ba, Ni, Al, V, B, Cr, Co, Mo, Be, Se, Ag, As, Tl, Cd and Pb contents were varied significantly compared to plant species except for Na and Hg (P<0.05). Consequently, wild plants may be used as popular vegetables in many people diet as a source of minerals (Fe, Cu, Mn, Cr, Mo, K, Zn and Mg). Excessive plant consumption may be adversely affected human health with Cd, As, Hg, Tl and Pb.

ANTIOXIDANT ACTIVITY OF GILABURU

AYŞE FİDAN¹, RECEP PALAMUTOĐLU¹, CEMAL KASNAK¹

ABSTRACT

Plants are used for therapeutic purposes since very ancient times. In our country, some plants are referred as medicinal herbs among the people, also used in the treatment of many diseases. *Viburnum opulus* (gilaburu) belongs to *Caprifoliaceae* family. The stem, bark and fruits of *Viburnum opulus* has a wide usage in pharmacology. Gilaburu are naturally grown in the provinces of Kayseri, Bursa, Tokat, Sivas, in our country. Many compounds have been identified in the bark, shell and fruit of the gilaburu. Gilaburu has anticarcinogenic, antimicrobial and antioxidant activities because of the organic acids content. Antioxidants bind to free radicals in the body and stop many adverse health effects. Traditionally this fruit juice is consumed especially in the province of Kayseri. There are beliefs in this region that gilaburu is good for stomach discomfort and has the capacity to dissolve kidney stones. This fruit is also called "kidney doctor" in this region. The fruit is collected by hand, from October according to its maturity status. The aim of the study is to compile information about antioxidant capacity of gilaburu, its health effects and usage areas among the public.

plants have important effects in terms of water and soil retention of plants. In a study conducted on this purpose, various elements were analyzed from the upper and lower layers of the soil in which *Iris histrioides* Foster grew in the Black Sea Region, and it was reported that the % N, P and K components in the upper layer of the soil were high (Kandemir and Engin, 2000). Again, a study was conducted by Balak and Misra (2004), and it was reported that German chamomile played important role in breeding soil. In addition, the industrial wastes of medical and aromatic plants may be used as organic fertilizers (Bağdat and Karık, 2009). With the help of the chemicals released by medical and aromatic plants, it is possible to attract the harmful insects that are in a certain population intensity in a field to trap plants, and decrease their population intensity by mixing them with the soil (Güçlü et al., 1997; Hilker and Meiners, 2011). In previous studies, it was reported that mustard was used successfully both as a trap plant and as a green fertilizer in decreasing the intensity of grain and beet cyst nematodes in the fields. These plants are sensitive to these nematodes and ensure that cysts are activated and make the larvae invade the roots and when they are mixed with the soil in accurate time, they killed young nematodes (Özer et al., 2003; Hilker and Meiners, 2011). In this study, the data on the potential use of medical and aromatic plants in biological fight in organic agriculture have been compiled.

BIOTECHNOLOGICAL METHODS AND BREEDING IN MEDICAL AND AROMATIC PLANTS

TUĐBA ESERKAYA GÜLEÇ¹

ABSTRACT

The lack of adequate variety and seeds of medical and aromatic plants whose culture is performed makes it difficult to have them under culture studies and sustain them. For this reason, studies that will be conducted on plant breeding for these plants become extremely important (Baydar and Telci, 2015). However, the breeding of medical and aromatic plants has fallen back when compared with the other culture plants. One of its reasons is the difficulty in developing breeding methods that are specific to each plant due to the extensive variety of medical and aromatic plants. In addition, the data on quality parameters on agricultural properties and on relevant genes are extremely limited. The second important reason is the fact that these plants are grown in limited areas and for this reason, the final situation of the investments and the return of the breeder share are extremely low. Aside from these, the necessity for making the quality analyses, the expensive equipment and substances needed make it difficult to breed these plants (Arslan et al., 2015). Medical and aromatic plants are used as raw materials in food, medicine, cosmetics and many other industries. (Başer, 1997; 1998). For this reason, these industrial branches require the use of materials that are within certain standards, and therefore, in order to obtain high-yield and high-quality raw drug from medical and aromatic plants, there is a need to develop the variety of standards. In breeding medical and aromatic plants, not only the drug yield but also the active substance yield is important at a great deal. In breeding hashish (*Papaver somniferum*), breeding methods aim to improve the alkaloids like morphine, codeine, thebaine, noscapine and papaverin as well as improving the capsule yield (Gümüşçü and Arslan, 2008). In this way, higher-level alkaloid yield may be achieved without being dependent on cultivation areas (Baydar and Telci, 2015). Completely eliminating or decreasing the amount of substances that have negative effects on health in medical and aromatic plants is among the most important purposes of breeding works. As an example, it is possible to give the study conducted to breed species of medical sage (*Salvia officinalis* L.) that do not have camphor due to its toxic effects or that have camphor rates below 0.5% (Dudai et al., 1999). In plants like mint and melissa, the breeding works continue for the purpose of making these plants acquire endurance against disease factors, and in rosemary, the works are still being continued to make it acquire endurance against cold. In addition, it is also aimed to detect medical and aromatic plants that have stronger antimicrobial and antioxidant effects and to develop new genotypes with increased effects (Yarnell and Abascal, 2004; Altındađ and Aslım, 2005; Hussain, 2011; Baydar and Telci, 2015). The breeding works in medical and aromatic plants are close and similar to those applied in classical breeding methods. Aside from these, many works like genotype detection, adulteration and quality control, GDO test, genetic relations may be done by using DNA markers. In breeding works, natural plant populations that are extremely important in genetical terms and local (village) species are used. One of the most important advantages of the breeding of the plants is their having a wide variation and being prone to develop

Corresponding Author: **TUĐBA ESERKAYA GÜLEÇ**, tuba.eserkaya@gmail.com

¹KARAMANOĐLU MEHMETBEY ÜNİVERSİTESİ-TBMYO

with a simple selection. 70-80% of the medical and aromatic plants in the world are obtained from natural populations, local species or from introduction materials with simple selection method. (Pank, 2006; Arslan et al., 2015). Today, bio-technological methods are used for the purpose of performing plant production with higher quality and quantity in a more economical way by solving the problems, which are not solved with known traditional methods, in this process (Uçar and Turgut, 2009). In breeding medical and aromatic plants, bio-technological methods are also made use of as well as classical breeding methods. Detecting and improving the genotypes that can endure salinity, drought, diseases and hat will bring several benefits such as secondary metabolite production with plant cell cultures. Biotechnological methods are used successfully especially in the production of secondary metabolites in in vitro conditions, in eliminating environmental actors, producing crops in the desired amount and standard quality, or in producing semi or fully synthetic secondary metabolites (Baydar, 2013). In this study, the data on breeding methods and biotechnological methods applied on medical and aromatic plants have been compiled.

THE EFFECTS OF DIFFERENT CULTIVATION AND ECOLOGICAL CONDITIONS ON YIELD AND QUALITY OF *CARTHAMUS TINCTORIUS L. (SAFFLOWER)*

UMMAHAN ÖZ ARIK¹

ABSTRACT

Carthamus tinctorius L. (Safflower) is an industrial plant with a high medical potential. Safflower give positive results in the treatment of acute appendicitis, women's period, cardiovascular disease, fever reduction, asthma, osteoporosis, rheumatoid arthritis. The cultivation of the Safflower is important because of its industrial use and pharmacological properties. Cultural practices vary from region to region. Depending on the ecological conditions of each region, types of the cultivation changes. Sowing time and sowing frequency are effective on yield. Generally, the autumn planting is more suitable from spring planting for the development of plant characteristics and seed yield. Nitrogen , phosphorus and humic acid applications were positively effect oil yield . This review was carried out to determine the effect of different cultivation and ecological conditions on yield and quality of Safflower.

BIOACTIVE PROPERTIES AND ANTIMICROBIAL ACTIVITY OF SOME HYPERICUM SPECIES GROWING WILD IN BLACK SEA REGION OF TURKEY

LATİFE BETÜL GÜL¹, NILGÜN ÖZDEMİR¹, OSMAN GÜL², CÜNEYT ÇIRAK³, AHMET HILMI ÇON¹

ABSTRACT

The aim of this study was to investigate total phenolic contents, antioxidant and antimicrobial activities of some *Hypericum* species growing wild in Blacksea Region of Turkey. For determining all these functional properties, ethanolic extractions of both leaves and flowers of four wild *Hypericum* species (*H. perforatum* L., *H. aviculariifolium* Jaup. and *Spach* subsp. *depilatum* (Freyn and Bornm.) Robson var. *depilatum*, *H. organifolium* Wild. and *H. linarioides* Bosse) were performed separately by maceration method. Total phenolic contents of these flower and leaf extracts were found between 148.04-83.89 and 202.83-48.03 mg gallic acid equivalents (GAE) /g dry weight, respectively. *H. linarioides* was determined as the *Hypericum* specie getting highest total phenolic content. Antioxidant activities of both flower and leaf extracts were determined by DPPH assay. According to the results, antioxidant activities of the flower extracts were determined between 24.94-17.14 mg trolox equivalent /g dry weight and for the leaves, the values were found between 39.35-8.63 mg trolox equivalent /g dry weight. The highest antioxidant activity was observed on the leaf extract of *H. linarioides*. Antimicrobial activities of the extracts were evaluated by minimal inhibitory concentrations (MIC) against 9 pathogenic and/or food spoiling bacterial strains (*Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Bacillus pumilis*, *B. subtilis*, *B. licheniformis*, *Listeria innocua*, *Esherichia coli*, *B. cereus* and *L. monocytogenes*). MIC results show that the flower extracts generally exhibited higher antimicrobial activity than the leaf extracts. And especially, the flower extract of *H. perforatum* showed strong inhibition effect against all strains except *E. coli*.

EFFECTS OF DIFFERENT PLANT DENSITY AND CUTTING TIMES ON YIELD OF STEVIA

LEYLA SEZEN TANSI¹, ELNAZ SAMEDPOURRIGANI¹, SELİN GEDİK¹, AMİR SOLTANBEİĞİ²

ABSTRACT

Stevia (*Stevia rebaudiana*Bertoni) is perennial, shrub form plant, belonging to Asteraceae. It is indigenous to Paraguay and Brazil. Stevia is a natural sweetening, and it has using potential to diets of obesity patients with non-caloric speciality and treatment of diabetes with insulin secretagogue speciality. In this study, the effects of different planting spaces and two cutting times on yields of two-year old stevia plant were investigated. The highest dry leaf yield (515.96 kg/da) was obtained from blooming stage, cuttingsin spring and 30x60 cm planting density.

SOME FUNCTIONAL AND TEXTURAL PROPERTIES OF GUAR AND XANTHAN GUM UTILIZED EGGLESS CAKE

YUSUF DURMUŞ¹, ZEKAİ TARAKÇI¹

ABSTRACT

Cake; a ready-to-eat food product produced in many countries in a wide variety of shapes, formulations and high nutritional value. Eggs are often used in cake formulations, which can cause allergic reactions in some people, especially in children. In this study, eggless plain cakes were produced using guar (GG) and xanthan (XA) gums with ratios of 0.0%, 1.0%, 1.5% and 2.0% and some functional properties of cakes were examined. The cakes were stored for 48 hours and some properties were determined at 1., 24. and 48 hours. GG and XA gums did not significantly affect the cooking efficiency ($p>0.05$). It was observed that the pH value decreased with the addition of gums in all samples. It has been found that the pH value decreased during storage for GG 1.0% and XA 1.0% samples. According to acidity results acidity did not change in control samples during storage. The usage of gums has increased the acidity of all samples. Acidity generally increased during storage and it was found that acidity of GG samples was higher than that of XA samples. It was determined that brightness of samples slightly increased during storage according to color measurements. Gum addition showed an increase in brightness. With the use of gums, the a^* value is generally increased, while the maximum redness was reached by XA 2.0%. While b^* values of XA were found to be lower than that of GG samples, no significant changes were observed during storage in b^* values ($p>0.05$). According to the texture results it was determined that the GG samples were harder than the XA samples for each time period during storage. GG 1.5% and GG 2.0% were statistically higher than other samples at 1. hour ($p<0.05$). It has been recorded that flexibility increased during storage. The addition of XA resulted in more sticky cakes than GG. It was observed that the gummy property increased gradually during storage while the GG samples more gummy as average to the XA for each storage period. The chewiness of cakes increased during storage and it was determined that the use of gums increased the chewiness. Generally, chewiness values of GG samples were higher than those of XA samples. Gum added cakes were found to be more elastic than the control samples and it was determined that XA increased the elasticity more than GG. The lowest elasticity was determined in the control samples at the 1. and 24. hours of storage. According to the sensory evaluations, the control samples were most favored in terms of taste-aroma. GG and XA samples were similarly liked by the panelists. There were no significant differences in cake color, pore structure and odor evaluations among the cakes in sensory evaluations.

USE OF SOME ESSENTIAL OILS IN GRAPE STORAGE

UMMAHAN ÖZ ARIK¹, CUMA ARIK²

ABSTRACT

Medical and aromatic plants are generally used in fields such as food, spice , medicine, beverage and cosmetics. Nowadays , there are numerous studies on the antimicrobial and insecticidal properties of essential oils and extracts from these plants. The investigations indicate that medicinal and aromatic plants can be used to increase the shelf life, especially in fruit preservation. This studies show that the essential oils extracted from medicinal and aromatic plants such as thyme, caraway and carnation are effective in the suppression of fungi such as *Botrytis cinerea*, *Aspergillus niger*, *Alternaria alternata*, *Colletotrichum gloeosporioides*, *Lasiodiplodia theobromae*, *Penicillium digitatum*, *Phomopsis viticola* and *Rhizopus stolonifer* which reduce the shelf life in grape preservation, but it does not negatively effect the sensory properties of the grape. This review is intended to reveal the use of certain essential oils in grape storage.

AS A NUTRACEUTICAL: CHLORELLA

NURCAN ÇELİK¹, RECEP PALAMUTOĐLU¹, CEMAL KASNAK¹

ABSTRACT

Today, “nutraceuticals” is described as “The food that provides beneficial effects by generating one or more physiologic functions like enhancing healthy or creating decrease the risk of being exposed to some diseases”. Physiologic benefits of the nutraceuticals are determined and revealed the usage utility nutraceutical contributions that show the protection to any chronic diseases suchlike drugs-one of them is microalgae originating from sea. Because of including sufficient level of functional ingredients such unsaturated fatty acids, omega-3 fatty acid, B-caroten and other pigments, sulfates, polysaccharide(antiviral) and sterols(antimicrobial); the microalgae are used quite frequently. Chlorella is a type of microalgae, is known the most common species in this group by considering the farming. Also, it is used as a nutraceutical in medicine, cosmetics and pharmaceuticals. It is obviously seen from some scientists works that Chlorella which has 3 types “ellipsoidea, pyrenoidasa and vulgaris” has positive effects on human health like regulating blood pressure, decreasing the level of cholesterol, avoiding some viral diseases and reinforcement of immune system. Since Chlorella has these properties, it became popular almost all over the world as a functional and nutraceutical food.

EFFICACY OF SUCROSE AND THIDIAZURON ON IN VITRO SHOOT REGENERATION OF FENUGREEK (*TRIGONELLA FOENUM- GRAECUM* L.)

*BEHIYE BÜŞRA TAŞBAŞI*¹, *ESRA KAVCI*¹, *ARIFE KITRİO*¹, *SİBEL DAY*², *MUHAMMAD AASİM*³, *KAHLID MAHMOOD KHAWAR*⁴

ABSTRACT

Fenugreek (*Trigonella foenum-graecum* L.) is an important medicinal and edible legume which is also used as spice, forage and green manure. It contains important bioactive compounds like galactomannan, saponins, mucilage, alkaloids and volatile oil. Due to its highly economic value, there is need to apply biotechnological tools for variety improvement and obtaining secondary metabolites. Keeping in view, the present study was designed to develop an efficient regeneration protocol of fenugreek. Cotyledonary nodes and leaf explants taken from 18-20 days old seedlings were cultured on phytagel solidified MS medium enriched with different concentrations of sucrose (1.5, 3.0, 4.5 and 6.0%). Medium was also enriched with 0.40, 0.80 and 1.20 mg/l Thidiazuron (TDZ) and 0.20 mg/l NAA. 100% callus induction was recorded on both explants with no shoot regeneration from leaf explants. However, cotyledonary nodes generated 100% shoot buds which later turned into shoots. Maximum number of 18.75 shoot buds were recorded on medium supplemented with 0.40 mg/l TDZ+0.20 mg/l NAA with 1.5% sucrose concentration. Explants were subcultured after 6 weeks of culture to MS medium which turned the shoot buds into well developed shoots. Explants were left in Magenta vessels for further growth for other studies.

POTENTIAL USES OF ESSENTIAL OIL COMBINATIONS AS SURFACE DISINFECTANT

İLKİN YÜCEL ŞENGÜN¹, GÜLDEN KILIÇ¹, ŞEYDA GÜL¹

ABSTRACT

In the present work, the antimicrobial activity of essential oils including cinnamon, peppermint, oregano, nettle seed and clove oils, and different combinations of these essential oils were investigated. In the first stage of the study, the antimicrobial activity of essential oils against seven bacterial strains (*Listeria monocytogenes*, *Enterococcus faecalis*, *Bacillus subtilis*, *Staphylococcus aureus*, *Escherichia coli* O157:H7, *Salmonella Typhimurium*, *Escherichia coli*) was determined by minimum inhibitory concentration (MIC) and minimum bactericidal concentration (MBC) assays. MIC value was determined for each microorganism using a 96-well microtiter plates. Essential oils, except peppermint and nettle seed oils, exhibited inhibitive effect on all test microorganisms at concentrations ranging between 0.156 and 10% (MIC, v/v). The highest inhibitive effect on test cultures was observed in oregano oil with MIC values in the range of 0.156-0.625%. When the essential oils were used in combinations, the MIC values of both prepared formulations were ranged between 0.625-2.5% and 0.312-2.5%. In the second stage of the study, the most effective formulation containing oregano, cinnamon and clove oil (1:1:1) was used as the surface disinfectant at 10, 20 and 30% concentrations for 1 and 5 min treatment time. The analyze results showed that the selected formulation used at 10% concentration was effective against *E. coli* inoculated on working surface (4.59 log CFU/25 cm²), which reduced the cell numbers to an undetectable level for 1 min application. On the other hand, 96% alcohol application reduced the cell numbers by 1.15 and 1.30 log units for 1 and 5 min treatment times, respectively. When the effects of solutions were compared in terms of the numbers of total mesophilic aerobic bacteria that naturally found on surfaces, the disinfection effect of the prepared essential oil formulation was found higher than 96% alcohol. These results showed that essential oils used in combinations might be a good alternative in the disinfection of surfaces.

EFFICACY OF EXPLANT AGE, SUCROSE AND THIDIAZURON ON IN VITRO SHOOT REGENERATION OF FENUGREEK (TRIGONELLA FOENUM-GRÆCUM L.)

ESRA KAVCI¹, BEHIYE BÜŞRA TAŞBAŞI¹, MUHAMMAD AASİM¹, SIBEL DAY², ALLAH BAKHSH³, KHALID MAHMOOD KHAWAR⁴

ABSTRACT

Fenugreek (*Trigonella foenum-graecum* L.) belongs to Fabaceae family is an important medicinal plant that is used as vegetable and making pickles in Indo-Pak subcontinent. It contains important biologically active secondary metabolites like alkaloids, galactomannan, saponins, mucilage, and volatile oil that increase the value of the plant. However, there is need to use biotechnological tools in order to produce more elite plants and to isolate secondary metabolites. In this study, we used 10 and 20 days old cotyledonary nodes explants from in vitro grown seedlings and cultured on gelrite solidified MS medium fortified with 0.40, 0.80 and 1.20 mg/l Thidiazuron (TDZ)+0.20 mg/l NAA with different sucrose concentrations (1.5, 3.0, 4.5 and 6.0%). Callus induction followed by somatic embryogenesis (100 %) was recorded after 4 weeks of culture which later on turned into shoots or shoot buds. 20 d old explant regenerated more number of shoots compared to 10 d explant. Maximum number of shoots/shoot buds were achieved on medium fortified with 0.80 mg/l TDZ+0.20 mg/l NAA provided with 4.5 % sucrose. Explants were left for growth for further studies.

SOME MEDICINAL AND AROMATIC PLANTS VISITED BY BUMBLE BEES IN TURKEY

REFİKA GÜNALP¹, NEVIN KESKİN¹

ABSTRACT

Bumble bees (*Bombus* sp.) are large, colorful, ubiquitous pollinators which found throughout the Holarctic, Oriental, and Neotropical regions of the world, especially in alpine and arctic zones. They like to be found in open meadows, which provide abundant amounts of nutrients throughout the flight, and tend to go with long corolla bushes belonging to the family of Lamiaceae and Fabaceae in these habitats. Turkey is one of the richest countries in the world in terms of medicinal and aromatic plants, and there are about 12 000 plant taxa naturally grown. Of these, 3750 are endemic and the endemism rate is very high when compared to European countries. Hundreds of plant species naturally grown in Turkey, especially endemic plants that have high medicinal and aromatic value. About 500 plant species in Turkey are being utilized in the context of folk medicine or traditional medicine applications. In this study, 10 of the medicinal and aromatic plants that *Astragalus* sp., *Thymus fallax* Fisch.&Mey., *Salvia officinalis* L., *Centaurea solstitialis* L., *Lavandula angustifolia* Mill., *Rosmarinus officinalis* L., *Papaver somniferum* L., *Pimpinella* sp., *Acacia cyanaphylla* L., *Shymphytum* sp. were handled and their relation to bumble bees were compiled from various sources.

DIETARY FIBERS AND BIOACTIVE COMPOUNDS IN GRAPE POMACE

ALI SABIR¹, FERHAN SABIR¹, ALPER KÜÇÜKBASMACI¹, OMAR TURHAN JALIL JALIL¹

ABSTRACT

Lifestyle changes, including healthy diets and exercise, constitute the most powerful tools to fight against many chronic diseases (Urquiaga et al. 2015). Mediterranean diets are considered as valuable preventive measures as several studies have proven that their intake is associated with lower occurrence and prevalence of chronic diseases (Keys 1970) and longer life expectancy (Trichopoulou 2004). Antioxidants, fiber, unsaturated fats and phytochemicals are the bioactive components of Mediterranean diets that apparently support the human health (Simopoulos 2001). Grape pomace (GP), a rich source of antioxidant and fiber, is used as an ingredient for functional foods and as a dietary supplement to increase the intake of dietary fiber and bioactive compounds. Jiménez et al. (2008) found that fibers from GP show high reducing efficacy in lipid profile and blood pressure due to combined effect of dietary fiber and antioxidants. GP as antioxidant dietary fiber also helps to enhance the gastrointestinal health of the human by promoting a beneficial microbiota profile (Pozuelo et al., 2012). Antioxidant dietary fiber may be incorporated with flour for making high dietary fiber bakery goods, while the polyphenols in antioxidant dietary fiber could contribute as antioxidant for improving aroma, color and taste of the product. For example, GP was mixed with sourdough for rye bread (Mildner-Szkudlarz et al. 2011) and grape seed flour for pancakes and noodles (Rosales Soto, Brown and Ross, 2012). Aside from promoting human health, GP plays important role as antimicrobial agent to maintain the shelf-life of foods. Goni et al. (2009) and Sánchez-Alonso et al. (2007) revealed that GP added into minced fish and chicken breast delayed the lipid oxidation. Also, GP extract exhibited antimicrobial effect against foodborne pathogens when added into beef patties (Sagdic et al. 2011). There are increasing interests in applying GP, grape processing wastes, as functional food ingredients because they are rich source of dietary fiber, and most of the beneficial bioactive compounds are remained in the byproducts.

LATHYRUS CZEZOTTIANUS: CAN BE NEW SOURCE OF NATURAL ANTIMUTAGENIC AGENTS IN PHARMACOLOGY?

AHMET UYSAL¹, RAMAZAN CEYLAN¹, GÖKHAN ZENGİN¹, ERDOĞAN GÜNEŞ¹

ABSTRACT

Human environment consists mutagenic and carcinogenic agents. Moreover, several well-known mutagenic risk factors are closely connected with a modern lifestyle and their entire eradication appears to be very burdensome, even unattainable. Therefore, there exists a need to reduce genotoxic effects of mutagenic and carcinogenic factors by the regular intake of antimutagenic agents. Recently, it has been accepted that plants and their products represent one of the main sources for compounds with antimutagenic potential and, indeed, several secondary plant metabolites have demonstrated chemo-preventive activities. Thus, there is an increasing interest in the investigation of naturally occurring antimutagens from plants. So, *Lathyrus czechottianus* methanol and water extracts were evaluated for their potential mutagenic and antimutagenic activities by Ames test in the present study. *Salmonella typhimurium* TA98 and TA100 strains used for determining the frame shift and base pair exchange type of mutations, respectively. The Ames test was conducted both in the presence and absence of metabolic activation enzymes. The result of the mutagenicity test showed that methanol and water extract of *Lathyrus* did not increase the revertant colony numbers when compared with control plates. We concluded that plant extracts were not mutagenic in the Ames test. Because of these extracts were not mutagenic, so antimutagenic potentials of them were studied at doses of 10000 µg/plate, 5000 µg/plate, and 1000 µg/plate. For TA98 methanol extract was moderate antimutagenic (37%, 30%, respectively) at doses of 10000 and 5000 µg/plate, while water extract showed moderate antimutagenicity (33%) at the highest concentration. After addition of S9 mix, methanol extract revealed strong antimutagenicity (73%, 63%, 57%) at all test doses against 2-aminoflourene. Similarly water extract exhibited the greatest antimutagenic potential (85%) at a dose of 10000 µg/plate with S9 mix for TA98 and followed by 5000 µg/plate dose with 41% inhibition making the extract a very strong antimutagen. Associated with sodium azide, methanol and water extracts were moderate antimutagenic at a dose of 10000 µg/plate in the absence of S9 enzymes for TA100 strain. The methanol extract manifested strong antimutagenicity at concentrations of 10000 (78%) and 5000 µg/plate (54%), and it alleviated the mutagenic action of 2-aminoanthracene in the presence of metabolic activation system. It was observed that metabolic activation enzymes were increased the antimutagenicity of the extracts and it can suggested that *Lathyrus* extracts may be the natural source of antimutagenic agents against well-known mutagenic substances.

COMPARISON OF THE FLAXSEED OILS OBTAINED BY USING COLD PRESS AND SOLVENT EXTRACTION METHODS

ZIYA GEVREK¹, OSMAN KOLA¹, ŐEYMA İNCE¹, NURTEN CENGİZ¹, MURAT REİS AKKAYA¹, TUNAHAN ERDEM²

ABSTRACT

Flax (also known as common flax or linseed), *Linum usitatissimum*, is a member of the genus *Linum* in the family *Linaceae*. Flaxseed oil is widely used in food industry due to its high content of unsaturated fatty acids. In this study, oil was obtained by cold pressing and solvent extraction methods. Cold pressing is completely a mechanical process without chemical application. In cold pressing, the highest temperature which the product is exposed to, is 40°C. During cold pressing, flavor, aroma, nutrients and natural values of the plant are not lost. In the solvent extraction, solvents are used to extract oil from seeds. In the present work, oils extracted by two different methods, cold pressing and solvent extraction, were compared by analyzing several quality parameters of the oils such as free fatty acid composition, antioxidant capacity, total phenolic content, peroxide value and refractive index. Protein content of the flaxseed was found to be 14.5% While the yield of the cold pressing was 21%, and that of solvent extraction was 34.8%. Antioxidant capacity was determined as 2.126 mmol TE/L for the oil extracted by the cold pressing and 2.144 mmol TE/L for the oil extracted by solvent extraction. Total fenolic contents of the oil obtained by both cold pressing and solvent extraction were 132.42 mgGA/L and 153 mgGA/L, respectively. There was not a significant difference between the refractive indices of the oils extracted by both methods (determined as 1.48nd). There was no active oxygen in the oil because it was stored in a dark refrigerator at 3°C. According to the characterization of fatty acids, the oils obtained by cold pressing contained 9.98% SFA, 19.81% MUFA and 68.99% PUFA. Majority of these were α -Linolenic acid (54.91%), oleic acid (17.65%), linoleic acid (13.67%), palmitic acid (5.47%) and stearic acid (4.15%). SFA, MUFA and PUFA contents of the oils extracted by solvent extraction were 10.77%, 18.06% and 70.30% PUFA, respectively. Majority of the oils extracted by solvent extraction were α -Linolenic acid (54.08%), oleic acid (17.75%), linoleic acid (15.09%), palmitic acid (5.65%) and stearic acid (4.57%). This study shows that flaxseed oil is a health-promoting ingredient for food industry because it contains significant amounts of unsaturated fatty acids (especially α -Linolenic acid) and protein.

ESSENTIAL OILS AS NATURAL PRESERVATIVES IN MEAT AND MEAT PRODUCTS

SONGÜL ŞAHİN ERCAN¹, HÜSEYİN BOZKURT¹, ÇİĞDEM SOYSAL¹

ABSTRACT

Abstract Essential oils are aromatic and complex mixture of volatile compounds and can be obtained from different parts of plants: leaves, peels, roots, flowers, seeds, fruits and woods. Essential oils are substantiated to have antiviral, antimycotic, antiparasitic, antioxidant, and insecticidal properties in addition to the antibacterial action due to the phenolic functional groups. Production of safe and high quality meat and meat products is a growing thought over the worldwide. There has been increasing trend in essential oils as natural food preservatives in meat and meat products due to the concern about negative consumer perception of synthetic preservatives. Use of synthetic food preservatives can cause adverse health effects and remained a challenge to the meat industry. Unlike synthetic compounds, essential oils are rich in phenolics and they can enhance the overall quality of food by decreasing lipid oxidation, microbial growth and overall acceptability. This review is covers up to date literatures on essential oils used as natural preservatives in meat and meat products.

DETERMINATION OF TEA CONSUMPTION VARIETY AND FREQUENCY OF PEOPLE LIVING IN AKŞEHİR

ELMAS ERSÖZ¹, ALI EMRAH BIYIKLI¹, EZGI TOPTAŞ BIYIKLI¹, FATMA ŞEYDA KUTLUGÜN¹, MÜBERA ÇİL¹, FATMA GENÇ¹, ZAHİDE TUNCER¹, SINAN SİREN¹

ABSTRACT

Introduction Since time immemorial, tea is consumed frequently as curative and daily liquid intake. Black tea is one of the common tea type, hence it is the most consumed tea in Turkey. Preferability of tea is increased by people, as its positive effects on health issue became more topical. Herbal teas consumptionability and conservationability is practical, therefore its consumption rate has increased day by day. **Objective** In this study, the aim is to determine the tea consumption rate and frequency of people who live in Akşehir town center. **Method** The study is made between February 2017 and March 2017. 320 people randomly selected for the study as 265(82.8%) women and 55(17.2%) men. By the survey research, participants' demographic informations and habits related with tea consumption are investigated. In order to analyze the data collected, SPSS 22.0 statistic program is used. **Results** Age average of the people attended to the survey is 29.6±5.6. When the education level of the people is investigated, the highest percentage belongs to high school graduates by 82.2%. When the tea consumption rates in the survey are respectively sorted from high rate to low rate; black tea(84.4%), linden tea(44.7%), green tea(39.7%), sage tea(33.2%), rose hip tea(29.1%), mint tea(20.0%), chamomile tea(18.1%), apple tea(13.4%) and thyme tea(11.3%). Other teas consumptions rates are found below 10%. 75.6% of the people who consume black tea prefers bulk tea, 24.4% prefers tea bag. 32.8% of these people drink minimum 3 tea glass, 44.4% drink minimum 1 tea glass of black tea. 17.1% drink minimum 1 tea glass and 80.3% use green tea bag and 19.7% use bulk green tea of people who consume green tea. Along the people who consume linden tea, 11.1% drink minimum 1 tea glass and 69% of them use bulk linden tea and 30.7% use linden tea bag. **Conclusion** Black tea consumption is the top consumed tea type as like people who live in all around Turkey. The consumption rates of the other tea types after black tea are respectively, linden tea, green tea and sage tea. Tea has lots of positive effects on health, especially due to its polyphenol content. However, too much consumption of tea is not suggested, because it increases caffeine intake and has diuretic effects. When consuming herbal teas, attention should be paid to the consumption amounts according to the tea types.

HEALTH BENEFITS OF RESVERATROL; A PLANT PHYTOALEXIN IN GRAPES AS A FUNCTIONAL FOOD

ALI SABIR¹, FERHAN SABIR¹, ZEKI KARA¹, ALPER KÜÇÜKBASMACI¹

ABSTRACT

Functional foods, derived from plants that naturally contain compounds beneficial to human health (Boue et al. 2009), have been a developing area of food science research for the past decade since consumer interest has shifted toward achieving and maintaining good health. Studies on cardioprotective potential of dietary components supports the development of functional foods and nutraceuticals. Plant phytoalexins as nutritional components has opened up a new area of food science. On this point, resveratrol (3,5,4-trihydroxy-trans-stilbene), a natural phenol found in grapes, has a calorierestriction effect and influences energy metabolism by improving insulin sensitivity, lowering plasma glucose, and increasing mitochondrial (O’Riordan et al. 2009). Experiments revealed that this stilbenoid exerts antibacterial, antioxidant, anticancer and antiproliferative effects (Jang et al. 1997). It has also been shown to extend the life span of several short-living species of animals (Valenzano et al. 2006). Recent studies also revealed that resveratrol has curative effect for Alzheimer’s disease. Resveratrol is necessarily digested after ingestion and diffuses into blood rapidly. It maintains the active form in foods due to its high resistance to heat (Keskin et al. 2009). These studies on the health benefits of resveratrol spurred consumer interest in grapes as a functional food. Resveratrol is present at high concentrations in the skin of grapes, depending on the grape variety. Experimental studies have demonstrated that elicitor treatment can increase resveratrol concentrations of postharvest grapes. The ability of UV irradiation to induce the synthesis of the phytoalexin resveratrol was first reported by using leaf disks and immature grape berries (Langcake and Pryce 1977). In fact, many agents have been proven to be effective for increasing the resveratrol content of grapes. Thus, recent studies propose a new area within functional food research called phytoalexin-enriched foods that utilize induced plant compounds or phytoalexins created either pre- or postharvest that have been considered in terms of beneficial health effects.

ANTIMICROBIAL EFFECTS OF ESSENTIAL OILS

MUSA ACAR¹

ABSTRACT

Plant essential oils have been used for many purposes since many years, especially in scientific and commercial areas. At the beginning of these usage areas are cosmetics, medicine, food industry, aromatherapy and phytotherapy. Essential oils have recently attracted the attention of many scientists, because it has a wide use area, and the chemical structures of these essential oils have been a subject of curiosity about the investigated biological activities. Essential oils are obtained from various organs such as flowers, leaves, bark, branches or fruits of some plants and often referred to by the name of the plant. These substances, called essences, are essentially terpene blends. Water drifted with steam, insoluble in water, easily soluble in organic solvents. Essential oils are produced by the pressurization of plant parts by means of organic solvents, water vapor distillation or extraction. In recent years, the insufficiency of synthetic drugs and the detection of side effects against increasing diseases have increased the necessity of using natural products. For this purpose many plants are being investigated from microbiological and pharmacological aspects. Since essential oils are complex mixtures containing different compounds, they also differ in their biological effects. The effects are different according to the substances, many essential oils, have antimicrobial, carminative, coloretic, sedative, diuretic, antispasmodic effects. Due to the increase in antibiotic-resistant infections in recent years, studies on the search for new drugs in combating these infections are a great necessity. In this regard, the plant essential oils have a great precaution and have been reported by many researchers as antimicrobial agents. As in all the countries of the world, plants that are important in Turkey for medical purposes have been used for centuries as a treatment for diseases among the people. As a potential source of new antimicrobial compounds of these plants, which are traditionally envied, it is very important to investigate scientifically.

USAGE AND ECONOMIC IMPORTANCE OF MEDICINAL AND AROMATIC PLANTS IN THE LAST FIVE YEARS

TUĐBA AKDENİZ FIRAT¹, ZUHAL SAĐTI¹

ABSTRACT

With the developing world, the importance of medical plants is increasing considerably. According to World Health Organization (WHO) researches, the number of plants used for therapeutic purposes is around 20.000 and 80% of the population living in developing countries rely on traditional herbal medicines for essential health needs. A lot of drug, still used in medicine, are made of plants. For herbal product in intended property, quality medicinal plant is required. Turkey is one of the important countries where medicinal plants grow with its geographical position, climate, vegetation cover, agricultural potential for medicinal plants grow. Turkey has a lot of share in the trade of medicinal and aromatic plants because it has many aromatic plants in its flora. Since ancient times, these medicinal plants grown in our country have been benefited from various areas such as medicine, food, cosmetics. The current increase in the popularity of medicinal plants results from resistance developed by diseases. Extracts made from medicinal plants are effective against new breeds. For this reason, there has been a serious return to herbal preparations in recent years. In this study, the last five years and economic importance of medicinal and aromatic plants have been investigated because of their increasing value.

DETERMINATION OF FATTY ACIDS AND ELEMENTS IN CYCLOTRICHIMUM NIVEUM (BOISS.) MANDEN. ET SCHENG.

AHMET ÖZKAYA¹, AHMET ZAFER TEL², UMUT YILMAZ HAN¹

ABSTRACT

Cyclotrichium genus is a member of the Lamiaceae family and its six species present in Turkey. *C. niveum* and *C. organifolium* and *C. longiflorum* are endemic for Turkey. *C. niveum* is popularly known as "dag nanesi" (Gulcin et al., 2008). *C. niveum* is a perennial plant and is used in the treatment of traditional pain, flu, nausea and irregular muscle pain. The plant, which has mint flavor, is used in making soup, as a medicinal tea and as a spice in Turkish foods (Çetinus et al., 2007). In recent years, the chemical composition of *C. niveum* has been studied. Pulegon and isomenthol compounds are considered to be main ingredients in *C. niveum*. In addition, flavonoids and triterpenoids are detected in other *C. niveum* species (Gulcin et al., 2008). Baser et al. (1994) have reported essential oils of *C. niveum* for the first time (Başer et al., 1994). *C. niveum* has 32.5-56.1 g / 100 pulegon and 33.8-35.4 g / 100 isomenthol as the main ingredient in the essential oil (Gulcin et al., 2008). The chemical components of *C. niveum* have been antioxidant effected (Alim et al., 2009). In this study, we performed first literaturally known fatty acid and trace element analyses of the *C. niveum*. *C. niveum* plants were collected from Adiyaman/Nemrut mountain. After the plants were picked up, they were naturally dried in a shady. The levels of trace element and fatty acid of *C. niveum* endemic plant leaf in Turkey were determined by using ICP-OES and GC, respectively. Among fatty acid levels, caprylic acid, undecanoic acid, palmitic acid, stearic acid, oleic acid, linoleic acid and alfa-linolenic acid levels were determined as 11.19%, 10.27%, 14.01%, 3.58%, 8.14%, 6.54% and 15.69%, respectively. The plant leafs were found containing Ni, Pb, Zn, Cr, Ba, Al, Cu, Fe, and Mn with respective quantities of 3.00, 0.07, 30.54, 122.17, 66.90, 319.98, 5.60, 334.52, 72.72 µg/g, and K, Na at 47.47, 0.09 mg/g (dry matter) quantities, respectively. For the following medicinal studies, we think that the obtained result parameters may be valuable. REFERENCES [1] Gulcin, I., Tel, A. Z., Kirecci, E., (2008). SEVERAL PROPERTIES OF OILS EXTRACTED FROM TEREBINTH BY COLD PRESSING AND SOLVENT EXTRACTION

ŞEYMA İNCE¹, OSMAN KOLA¹, ZIYA GEVREK¹, NURTEN CENGİZ¹, MURAT REİS AKKAYA¹, HAŞİM KELEBEK¹, ALI EMRAH ÇETİN¹

ABSTRACT

Medicinal and aromatic plants are the botanical sources used for, maintaining human health, prevention and treatment of diseases. People have tried to cure diseases using plants or centuries. Because of the success in these attempts, the use of plants in treatment of disease has continued up to date. These medicinal plants are not only be used in medicine but they are also employed in nutrition, beverage and cosmetic industries, organic farming and animal breeding. Among 350,000 identified species, 35,000 are used for medicinal purposes. Only 5 % of these are chemically characterized. Turkey is the gene pool of several plants and it includes several geographical regions where endemic species grow. There has been special interest for the oils extracted by cold-pressing by consumers for the last decades. Oils which are generally used in pharmaceutical and cosmetic industries has now started to be consumed in our meals. Since oils extracted by cold pressing are not exposed to high temperatures (maximum 40-50 °C), solvents are not employed for oil extraction and higher amounts of natural antioxidants, phosphatides, cerebrosides, carotenoids and phytosterols which are partly lost due to refining in conventional oil production are present in cold-pressed oils, these oils has received special interest in term of nutritional properties. Trebinth, a most-widely grown wild type of Pistachia in Turkey, is a good candidate for consumption as food according to its properties. Among these properties the oil content of trebinth is the most important. In this study, oils from terebinth were first extracted from trebinth seed by cold-pressing and solvent extraction, several properties of extracted oils were then characterized. Saturated and unsaturated fatty acid ratios were determined by analyzing fatty acid compositions of the oils. The crude oil yield of terebinth was found to range between 30 and 35 %. Both protein and moisture contents of terebinth were determined as 5 % in average. Saturated, mono-unsaturated and poly-unsaturated fatty acid contents of terebinth oil obtained by cold pressing were 23.43, 38.08 and 28.26 %, respectively. Oil extracted by solvent extraction however had 9.99 % saturated, 23.81 % mono-unsaturated and 52.93 % poly-unsaturated fatty acids. Essential fatty acids in both oils obtained by cold pressing and solvent extraction were oleic (37.6 and 52.5 %, respectively), palmitic (21.1 and 20.4 %, respectively) and linoleic (26.9 and 15.5 %, respectively) acids. Additionally, free fatty acids, color, refractive index values were measured, antioxidant capacity and total phenolic contents of the oil were determined by DPPH and Folin methods. Total phenolic contents of oils extracted by cold-pressing and solvent extraction were found to be 289.7 mgGA/L and 244.1 mgGA/L in average while total antioxidant capacity of respective oils were determined as 653.5 µmol TE/L and 547.3 µmol TE/L, respectively.

THE USE OF AROMATIC PLANT OILS IN THE PROCESSING OF TROUT EGGS AND THEIR EFFECT ON SENSORY PREFERENCES

BIBI AAISHAH OLLEE¹, ÖZKAN ÖZDEN²

ABSTRACT

Today's consumers are more knowledgeable and careful about their health; this is why they avoid synthetic food additives (Mastromatteo et al., 2011; Holley and Patel, 2005). Therefore to reduce food borne pathogens new ways to reduce food borne illness must be put into practice, which can be used together with other hurdle technologies (Burt, 2004). Caviar can undergo pasteurisation but their taste is not well appreciated by consumers. Also, the salt concentration and storage temperatures are not always efficient to preserve caviar (Fioretto et al., 2005). The use of essential oils for food preservation has triggered a lot of interest (Holley and Patel, 2005). They are Generally Regarded as Safe (GRAS) and are good alternative to synthetic antibiotics (El et al., 2014). Essential oils have antimicrobial properties and can prolong the shelf-life of seafood alone or when used together with other processing techniques (Mejlholm and Dalgaard, 2002) and can inhibit food borne pathogens and spoilage microorganisms (Baydar et al., 2004). The fish roes were treated with thyme oil and lemon oil. To the control group, no essential oil was applied. Panelists were asked to evaluate the appearance, taste, texture and odour of the eggs. Out of the three groups, most of the panellists preferred the group which was treated with lemon oil. Using essential oils together with fish roe, both of which have functional properties ensures that the product is of the best quality and also might provide more benefits for human health by preventing some diseases. Furthermore, the taste of the product might also be enhanced and this might also create a new value added product.

THE USE OF ESSENTIAL OILS IN INCUBATOR DISINFECTION

İLKİN YÜCEL ŞENGÜN¹, BERNA ÖZTÜRK¹, ŞEYDA ŞENTÜRK¹

ABSTRACT

The aim of this study was to develop a novel disinfectant derived from natural sources. The formulation was prepared by combining equal portions of oregano, cinnamon and clove oils, which has fresh odor and previously confirmed antimicrobial properties. The solutions prepared at different concentrations (1%, 2%, 3%, 4% and 6%) were sprayed in incubators. To detect the microbial density of incubator air, settle plates (30 min exposure) and air sampler (flow rate: 100 L/min) were used together. Air sampling was performed before and 2 h after disinfection. Prior to disinfection, the total mesophilic aerobic bacteria counts of incubator air were ranged from 35-43 CFU/plate for plates sampled by air sampler and 13-28 CFU/plate for settle plates. Mold and yeast counts of incubator air sampled by settle plates and air sampler were ranged between 3-8 CFU/plate and 1.5-5.5 CFU/plate, respectively. No growth was observed on mold and yeast plates inoculated after disinfection application in incubators. On the other hand, the formulation was found less effective on the total mesophilic aerobic bacteria count (maximum reduction of 82.9%) than mold and yeast count. The results indicated that the combination of essential oils could be effectively used in reducing the microbial loads of incubator air. This application could be especially useful to prevent the mold contaminations and also applicable for room disinfection.

USING MEDICINAL AND AROMATIC PLANTS IN FUNCTIONAL EGG PRODUCTION

ZUMRUT ACIKGOZ¹, BANU YUCEL¹

ABSTRACT

Hen's egg is a cheap, healthy and nutritious conventional food supplying several essential nutrients, excellent protein quality and low energy content. In addition, egg contains some biologically active compounds (lysozyme, ovalbumin, ovomucoid, ovomucin, ovotransferrin, cystatin, avidin, phosvitin etc.) which might have a role in the therapy and prevention of chronic and infectious diseases. In many scientific reports, it was indicated that these compounds has antimicrobial, immunomodulator, bone growth promoting, antioxidant, anticancer and antihypertensive properties. Taking into account the presence of all these components, the use of egg is becoming increasingly widespread in cosmetic, pharmacology, medicine, biotechnology, nutraceutical. Egg has been described (defined) as a "Nature's original functional food" because of providing a number of beneficial nutrients to sustain life and growth. Nevertheless, in recent years, egg industry is developing new functional eggs to meet the growing demands of health conscious consumers. In these eggs, some of biological active compounds are enhanced by dietary manipulation. Eggs enriched with n-3 fatty acids, antioxidants, carotenoids and minerals have attracted a lot of attention in nutritional sciences. The content of n-3 fatty acids in eggs could be increased by adding fish meal/oil, flaxseed (linseed), canola (rapeseed) and marine algae to diet. In egg enhanced with n-3 fatty acids, oxidative sensitivity has increased and shelf life has been shortened. Thus, the antioxidant status should also be subjected in eggs altered fatty acid profile by dietary manipulation. Currently, natural antioxidants are in high demand because of their health-enhancing and disease-risk-preventing properties. Globally, medicinal and aromatic plants or their extracts has been supplemented to diets for improving the antioxidant capacity of eggs. In recent years, several in vitro and in vivo studies have been conducted to determine the antioxidant effects of aromatic plants and spices, especially in cinnamon, cumin, laurel, mint, oregano, rosemary and sage. In this review, it would be given information about medicinal and aromatic plants or their extracts using in functional egg production.

TRACE ELEMENT AND FATTY ACID LEVELS OF FRITILLARIA PINARDII BOISS. PLANT SEED AND BULB

AHMET ÖZKAYA¹, AHMET ZAFER TEL², Umut YILMAZ HAN¹

ABSTRACT

Plants are important food sources for the people. Therefore, many studies are devoted to quality and nutritional values of plant [1]. Fatty acids and trace elements are very important for human life [2, 3]. The levels of fatty acid and trace element of *Fritillaria pinardii* BOISS seed and bulb in Turkey were determined by using ICP-OES, and GC, respectively. In this study, we performed first literaturally known fatty acid and trace element analyses of the *Fritillaria pinardii*. These plants were collected from Adiyaman/Nemrut mountain. After the plants were picked up, they were naturally dried in a shady. Among fatty acid levels of the plant bulb, at highest rates, was found containing 18.30% palmitic acid, 15.01% stearic acid, 19.71% oleic acid, 9.23% eicosatrienoic acid and 8.74% docosahexaenoic acid. The plant bulb was found containing Ni, Zn, Cr Ba, Al, Cu, Fe, and Mn, with respective quantities of 1.17, 24.45, 1.89, 8.15, 5.94, 0.75, 8.57, 19.69 µg/g, and K, Na at 19.56, 0.01 mg/g (dry matter) quantities, respectively. The fatty acids contained in the seed of that plant were found to be 14.23% palmitic acid, 4.13% stearic acid and 17.01% oleic acid, 53.59% linoleic acid and 2.93% alfa-linolenic acid. In the seed of plant, the quantities of Ni, Zn, Cr, Ba, Al, Cu, Fe and Mn were determined as 2.22, 27.26, 1.39, 15.27, 40.95, 3.47, 79.81, 32.62 µg /g, respectively while the quantities of K and Na levels were at 43.47, 0.07 mg/g (dry matter). From these results, it can be important for the future medicinal studies. Key Words: *Fritillaria pinardii*, element, fatty acid

PHENOLIC COMPOUNDS CONTENT AND ANTIOXIDANT CAPACITY IN FRUITS OF SOME EGGPLANT (*SOLANUM MELONGENA* L.) CULTIVARS*

BELGIZAR KARAYIGIT¹, SEMA HAYIRLIOGLU-AYAZ¹, AYNUR KURT¹, NESRİN COLAK¹, FAİK AHMET AYAZ¹

ABSTRACT

Aim of the study: Eggplant (*Solanum melongena* L.) is one of the most commonly consumed vegetable crops worldwide, and one with important beneficial effects on human health. These benefits are mainly due to eggplant's highly bioactive antioxidant constituents, such as phenolic compounds including flavonoids and anthocyanins. The objective of this study was to determine and compare the phenolic compound content and antioxidant capacity of seven commercial eggplant fruits in Turkey. Materials and Methods: The seeds of seven common eggplant cultivars (Aydın siyahı, Pala 49, Super pala, Kemer 27, Kadife kemer, Topan, and Kadife) were grown in soil, and seedlings were obtained from each cultivar using standard cultivation techniques for eggplant. The fruits were harvested when they reached commercial market size. The fruit was treated with liquid nitrogen and stored at -80 °C until analysis. Standard methods were used to determine total phenolic compounds (TPC), flavonoid (TF) and anthocyanin (TACY) contents and antioxidant capacity (DPPH, FRAP, and CUPRAC) values. All results were expressed as dry weight (dw). Results: The TPC content (mg GA/100 g) in the cvs. ranged from 1019.51 to 613.20 (average, 862.58), and the TF content (mg QE/100 g) from 244.76 to 184.13 (average, 225.86). Super pala had the highest TPC and TF contents (1019.51 and 244.76 mg/100 g, respectively). The highest TACY content was determined in Kemer 27 (221.02 mg/100 g) eggplant. DPPH radical scavenging activity ranged from 54.30 to 37.31 $\mu\text{mol TEAC/g}$, FRAP from 106.93 to 53.83 $\mu\text{mol TEAC/g}$ and CUPRAC from 126.11 to 50.57 $\mu\text{Mol TEAC/g}$. Super pala had the highest DPPH radical scavenging activity (54.30 $\mu\text{mol TEAC/g}$), and FRAP (106.93 $\mu\text{mol TEAC/g}$) and CUPRAC (126.11 $\mu\text{mol TEAC/g}$) levels. In conclusion, eggplant can be beneficial to human health because of its high phenolic contents and antioxidant capacity values. *Acknowledgment: Financial support for this study was provided by the Research Fund of Karadeniz Technical University in Turkey (Project No: 2008.111.004.04).

DEVELOPMENTS IN MEDICINAL AND AROMATIC PLANT PRODUCTION IN TURKEY

SİBEL KADIOĐLU¹, BANU KADIOĐLU¹, GÖKHAN TAŞĐIN¹

ABSTRACT

Day by day attention to medicinal and aromatic plants increases causing rise in commerce and production of these plants. Turkey has features of three old continents and flora of three phytogeography. Turkey's flora includes many herbal products that constitute input for herbal medicine, herbal chemicals, food and additives, cosmetics and fragrance industry of developed countries. A significant part of rich plant diversity is used as medicinal and aromatic plants. Medicinal and aromatic plants that are collected from the nature and cultured have a lot of economic potential. Among agricultural plants, opium, cumin, anise, thyme and rose (for oil) take place on top. In addition, it is not possible to reach the data for the plants that have small breeding areas and production amount. According to the data of TUIK, in Turkey although the breeding area of medicinal and aromatic plants (poppy (seed/capsule), lupin hop, melissa, nettle, sage, rose (for oil), lavender, anise, cumin, thyme, blackcumin, fenugreek, fennel, coriander, heather, capers, dill, parsley, mint, purslane, rocket, water cress, sweet potato) was 93.633 ha in 2016 that is 2.401 ha less than the previous year, production decreased by 3.809 tones. For all that an increase is seen in the last five years. Poppy, cumin and thyme contributed a lot to the increase in the breeding area and production amount. Additionally, increase in blackcumin and fenugreek cannot be denied. When compared to other countries it is seen that Turkey cannot benefit economically from rich medicinal and aromatic plant diversity. For sustainable production of medicinal and aromatic plants, agriculture should become widespread.

HYALURONIC ACID EXTRACTION FROM KOMBUCHA SYMBIOSIS

SİBEL BAYIL OđUZKAN¹, İBRAHİM HALİL KILIÇ¹, SİNA AKAN GÜMÜŞBURUN¹, SAMİ SERHAT TOSUN¹, BEKİR SİDDİK KURT¹

ABSTRACT

Kombucha is a kind of mushroom tea which can be used to alternative drug in folk remedies. Kombucha was originated East Asian firstly and then coming to Russian. Kombucha mushroom is living a solution of sugar and varieties organism and produce continuously. Kombucha contains over 50 different kinds of probiotics, organic enzymes, amino acids and vitamins components. Especially, kombucha contains hyaluronic acid and glucosamine which is why it's so effective in relieving joint pain. Hyaluronic acid is a linner polysaccharide which used to be cilinically drug and dermatology. Previous studies were found to hyaluronic acid in kombucha symbiosis and generally using at cosmetic industry effectively. In our laboratories we produced the kombucha mushroom suitable fermatation and conditions so that we had so many kombucha teas for drinking and testing. In this project, we will be try to isolated from hyaluronic acid both of kombucha mushrooms and teas firstly. After that we are going to purity of hyaluronic acid from kombucha samples and prepare the most suitable extraction of hyaluronic acid. GC-MS and HPLC will be used for structure and quantities of samples How the hyaluronic acid will be determined in kombucha samples then need to compare with commercially hyaluronic acid. Also some biological parameters as DNA protection activity and antimicrobial activities will be find from this extractions. We believe that this project is very important for cosmetic and drug industry.

ESSENTIAL OIL COMPOSITION OF CHONDRILLA JUNCEA L. FROM İSTANBUL

MEHMET ÖZDEMİR¹, HÜSEYİN SERVİ²

ABSTRACT

Chondrilla juncea of Asteraceae is an invasive plant species native to Europe, Asia and North Africa. This plant finds edible use in the Mediterranean countries. However there is only few reports on the chemistry of this species. Previously isolation of triterpene, phenolic and sesquiterpene glycoside types of compounds were reported from *C. juncea*. To the best of our knowledge this is the first report on the essential oil composition of *C. juncea*. Chondrilla juncea was collected during the flowering period from İstanbul. Essential oil was obtained with a cleverger apparatus by 3h distillation. Yield of the essential oil was <0.01%. The GC-MS analysis of the essential oil was performed with an Agilent 5977 MSD system operating in EI mode. Essential oil sample was diluted 1:10 (v:v) with n-hexane. Injector and MS transfer line temperatures were set at 300 and 250°C respectively. Splitless injection was employed. Innowax FSC column (60 m x 0.25 mm, 0.25 µm film thickness) and helium as carrier gas (1 mL/min) were used in GC-MS analyses. Oven temperature was programmed to 60°C for 10 min. and raised to 220°C at rate of 4°C/min. Temperature kept constant at 220°C for 10 min. and then raised to 240°C at a rate of 1°C/min. Mass spectra were recorded at 70 eV with the mass range m/z 35 to 425. Relative percentage amounts of the separated compounds were calculated from integration of the peaks in MS chromatograms. Identification of essential oil components were carried out by comparison of their relative retention indices (RRI) obtained by series of n-alkanes (C5 to C30) to the literature and with mass spectra comparison. Thirty six compounds were identified representing 87.5% of the essential oil of Chondrilla juncea. The main components of Chondrilla juncea were identified as hexadecanoic acid 20.2%, heneicosane 18.2%, hexahydrofarnesyl acetone 5.4%, octadecane 5.2%, heptacosane 4.5% and phytol 3.7%.

ESSENTIAL OILS OF SOME SPICES AND MEDICINAL PLANTS

ASLI ÇELİKEL¹, M. SERDAR AKIN¹, K. BURCU BÜYÜKKILIÇ¹

ABSTRACT

Essential oils are generally volatile and odorous mixture that are liquid form in normally, which is obtained by, water, or water vapor distillation solvent extraction and presson method from plants or some parts. Many substances of essential oils are widely has been used in the food, pharmaceutical, paint, mining and cosmetic industries. Essential oils have anti-spasm, irritant, antiseptic, mutagenic, antimutagenic and antimicrobial properties. There are also many researches have been effects of essential oils against on the microorganisms which cause food spoilage and poisoning. The composition and amount of essential oils are cahged depends plant's type, plant's part, the region, the production place and production methods. Some of plant species widely produced in the World are sage, carnation, saffron, turmeric, cinnamon, etc., and contained essential oil. About 500 of Sage species have been identified so far. These species are distributed in tropical and subtropical regions. It contains essential oil components such α -tuyo of sage, β -tuyo of 1,8-cineol, camphor, borneol and β - pinene etc. Studies have shown that essential oils containing tuyen, camphor and caryophile in sage (*Salvia officinalis*) have antifungal activity. It was determined that $\rho + \beta$ tuyen, 1,8-cineol, limonene and camphor materials ,which constitute the main components of *Salvia officinalis* L. (sage) essential oil, did not show mutagenic properties when they used separately. But if they used together, they would give positive results except antimutagenicity tests (except camphor) Cloves have appetizing, digestive stimulant and antiseptic properties. Overall it have included essential oil components of eugenol, caryophyllene, eugenyl acetate, humulrn, ylang and methoxybenzaldehyde. Studies have shown that mixtures of cloves, thyme, mint and lemon essential oils reduce the number of *Clostridium perfringens*. Saffron is a dried stigma of *Crocus sativus* L species. It's the most important essential oil is safranal. Turmeric (*Curcuma longa* L. (saffron root, Indian saffron)) is commonly used instead of saffron plant as a spice. The most important components of turmeric essential oil are Turmeron, zingiberen, kurukumen, bizabolen, zingeron, atlaton, kurkumin, 1,8 cineol, α -felandren, caryophyllene, p-cymene and farnesen. It has been reported that the component of curcumin essential oil obtained from *Curcuma longa* L plant had strong antioxidant activity. Cinnamon is obtained from the dried shell of *Cinnamomum* (Lauraceae) type plant. Ibn-i Sina reported in the book *al-Kânûn fi't-Tıbb* that the effects of cinnamon are refreshing and heating up and eliminated the bad effects of diseases. Some important essential oil components found in cinnamon are cinnamic aldehyde, eugenol, cinnamyl, acetate and hydrocyanic aldehyde. Mint (*Menta*) plant contains significant amount of essential oil and main components of its essential oil are menthol, menthol, menthofuran, menthyl acetate, γ -terpinene, α - and β -pinene, 1,8-cineole, limonene, linalool, ethyl amylcarbinol, pulegone and piperidone. It has been reported that different types of mint have some positive effects on humans such as antimicrobial, antispasmodic, coleretic, carminative.

"KANLICA MASHROOM" THAT A WILD EDIBLE MUSHROOM VARIETIES FROM KASTAMONU: SPECIES, FUNCTIONAL PROPERTIES AND ALTERNATIVE USES

RABIA ATASOY¹, MÜGE HENDEK ERTOP¹

ABSTRACT

Wild edible mushrooms have been collected and consumed by people for their nutritional value and they are occasionally consumed for their supposed medicinal value. They are known as highly valued non-wood forest products today, thus wild edible mushrooms have played an important role in providing new sources of income in the whole World. Turkey has also very large variety of wild edible mushroom, especially in Black Sea Region. Kanlıca mushroom, also known as pine mushroom and Çintar mushroom, is from Russulaceae family. It has *Lactarius deliciosus*, *Lactarius deterrimus*, *Lactarius salmonicolor* and *Lactarius semisanguifilius* species. It is seen in leafy tree forests, pine forests and meadows in the world, after spring and autumn rains. It is grown in Kastamonu, Sinop, Bursa and Balıkesir in the interior parts of the West and Central Black Sea. It is among the wild edible mushrooms and has an important place among the non-wood forest products in Kastamonu. The mushroom has local consuming causes and consumption patterns around Kastamonu. The vast majority of harvest and consumption takes place in August and November by the local people from their natural environment. Moreover, conservation in saline water is quite common. The direct consumption is not appropriate since it has a bitter taste. It is usually consumed after boiling in water. The taste resembles meat. The mushroom boiling water is also used for facial treatment for acne treatment by the local people. Kanlıca mushroom is a protein source, and rich in amino acids, mineral substances and vitamins (B1, B2, C vitamins and niacin). Morphologically and visually it is quite different from cultured mushrooms and many wild mushrooms. It has 5-15 cm diameter and the middle part is concave. The mushroom hat is orange and yellow, the lamellas are reddish yellow and white, and the handle is wine red and turmeric. They are characterized by the unique ability to produce a red milky fluid, if cut or broken. The crumb of Kanlıca mushroom is fruit-smelling, soft, reddish yellow-white. In this study, the types of Kanlıca mushroom in Kastamonu region, food and non-food alternative consumption reasons and functional qualities have been investigated.

PHENOLIC COMPOUNDS CONTENT AND ANTIOXIDANT CAPACITY OF ENDEMIC TRIPLEUROSPERMUM BAYTOPIANUM AND T. REPENS (ASTERACEAE) FROM TURKEY*

BELGIZAR KARAYIGIT¹, HUSEYIN INCEER¹, NESRİN COLAK¹, SEMA HAYIRLIOGLU-AYAZ¹, FAİK AHMET AYAZ¹

ABSTRACT

Aim of the study: Many edible plants play a protective role in the maintenance of human health due to the antioxidant properties of their biologically active compounds known as “plant phenolics”. They also contribute an important part of plant secondary compounds with a significant impact on defense mechanisms in plants. The genus *Tripleurospermum* (Asteraceae) is of considerable medicinal value. Its phytochemical profiles, mostly consisting of volatile/oil components, exhibit a range of health benefits including anti-inflammatory, antiseptic, antifungal, antibacterial, antiulcer and antioxidant activities. This study investigated the phenolic compounds content (TPC) and antioxidant capacity (AC) of endemic *T. baytopianum* E. Hossain and *T. repens* (Freyn & Sint.) Bornm. for the first time in the literature. Materials and Methods: *T. baytopianum* and *T. repens* specimens were collected from different habitats in Turkey. The whole plant, including root, shoot and leaf, was fully dried in the shade at room temperature and low humidity and stored until analysis. The capitulum was separated and used in the extraction procedures. TPC and AC values assayed with DPPH radical scavenging activity, ferric reducing antioxidant power (FRAP) and cupric reducing antioxidant capacity (CUPRAC) were measured using standard methods published elsewhere. Results were expressed as dry weight (dw) units. Results: TPC and AC values differed significantly between the species. TPC content was 32.8 mg GA/g dw in capitulum in *T. repens*, higher than in *T. baytopianum* (14.1 mg GA/g DW). AC values ($\mu\text{mol TE/g dw}$, DPPH, CUPRAC, FRAP) also differed between the species. *T. repens* exhibited higher AC values (4.2 DPPH, 12.0 FRAP and 3.7 CUPRAC) than *T. baytopianum* (2.0, 8.1 and 2.8, respectively). *Acknowledgments: The authors thank the Scientific and Technological Research Council of Turkey (TUBITAK, project no: 102T162) for its financial support.

ESSENTIAL OIL COMPOSITION OF *SCILLA AUTUMNALIS* L. FROM İSTANBUL

MESUT TANDOĐAN¹, HÜSEYİN SERVİ²

ABSTRACT

Previously essential oil composition of *Scilla autumnalis* was not reported. However there is considerable amount of report on the chemistry of non-volatile secondary metabolites of *Scilla* species. Until now homoflavonoids, stilbenoids, alkaloids and cardiac glycosides were isolated from *Scilla* species. *Scilla autumnalis* was collected during the flowering period from İstanbul. Essential oil was obtained with a cleverger apparatus by 3h distillation. Yield of the essential oil was <0.01%. The GC-MS analysis of the essential oil was performed with an Agilent 5977 MSD system operating in EI mode. Essential oil sample was diluted 1:10 (v:v) with n-hexane. Injector and MS transfer line temperatures were set at 300 and 250°C respectively. Splitless injection was employed. Innowax FSC column (60 m x 0.25 mm, 0.25 µm film thickness) and helium as carrier gas (1 mL/min) were used in GC-MS analyses. Oven temperature was programmed to 60°C for 10 min. and raised to 220°C at rate of 4°C/min. Temperature kept constant at 220°C for 10 min. and then raised to 240°C at a rate of 1°C/min. Mass spectra were recorded at 70 eV with the mass range m/z 35 to 425. Relative percentage amounts of the separated compounds were calculated from integration of the peaks in MS chromatograms. Identification of essential oil components were carried out by comparison of their relative retention indices (RRI) obtained by series of n-alkanes (C5 to C30) to the literature and with mass spectra comparison. The GC-MS analysis of *S. autumnalis* essential oil presented the main components as heptacosane 21.5%, pentacosane 12.5%, nonacosane 7.3%, hexadecanoic acid 4.0%, hexahydrofarnesyl acetone 3.4% and hexadecanoic acid methyl ester 2.7%.

CORIANDER SEED OIL: THE BENEFITS ON SKIN REGENERATION

AHSEN SEVDE ÇINAR¹, ALEV ÖNDER¹

ABSTRACT

Coriandrum sativum L. belongs to the Apiaceae family, but its origins are still indefinite. The Coriander genus was represented in Flora of Turkey with two different species as *C. sativum* and *C. tordylium*. The major component was determined as linalool (% 60-70) in the essential oil of the coriander. It also contains fatty acids, coumarins, flavonoids, polyphenols in the extracts. Moreover, it is known as a medicinal plant used in many disorders. The coriander has been used in various fields especially in food and pharmaceutical markets. This current study is concentrated on methods of obtaining essential or fatty oils from coriander seeds for use in prescriptions. That is why, we believe that in this presentation we will put forward the features of the skin regeneration, derive the methods of obtaining and we will discover all the interesting effects of coriander, discover effects together with formulations.

SUGARS AND ORGANIC ACIDS IN BERRIES OF ERZINCAN BLACK GRAPE (*VITIS VINIFERA* □ KARAERİK □)*

AYNUR KURT¹, SEMA HAYIRLIOGLU-AYAZ¹, NESRİN COLAK¹, ERDAL AKPINAR², FAİK AHMET AYAZ¹

ABSTRACT

Aim of the study: Grapes (*Vitis* spp.) are one of the most important and nutritious horticultural crops. They are often used in diets and are widely regarded as beneficial for human health and as preventing various degenerative diseases due to their polyphenol content. Sugars and organic acids are natural components of black grapes and play a significant role in determining nutritional value and maintaining fruit quality, flavor and stability. The Erzincan black grape (*Vitis vinifera* 'Karaerik') is a patented and certified agricultural product in Turkey. The aim of this study was to examine some physicochemical (pH, TA, etc.) parameters and the sugars and organic acids in different parts of the black grape, which grows naturally in Erzincan province, Turkey. Materials and Methods: Grape berry samples, at commercial maturity stage randomly harvested from different locations in Erzincan, were immediately frozen in liquid nitrogen. Sugars and organic acids in the grape berry parts were separated and quantified using HPLC and the physicochemical parameters measured by using standard published methods (pH, TA, MC, DM, FD, etc.) All results were expressed as fresh weight (fw). Results: The pH values and TA contents in berries of the black grape were 3.50 and 0.59 g citric acid/100 g, respectively. The berry diameter (FD, 20.17%), moisture content (MC, 81.06%) and dry matter (DM, 17.51%) were also determined. Fructose (peel, whole grape and seed; 188.86, 126.05, and 13.69 g/kg fw, respectively) and glucose (peel, whole grape and seed; 152.6, 105.6, and 9.9 g/kg fw, respectively) were the most abundant sugars, and tartaric acid (peel, whole grape and seed; 6.78, 2.81, and 1.98 g/kg fw, respectively) and malic acid (peel, whole grape and seed; 2.6, 2.6, and 6.87 g/kg fw, respectively) were the major organic acids identified. In conclusion, the black grape contains high levels of fructose and can be used as part of a healthy diet since the consumption of fructose-rich foods is recommended. *Acknowledgment: Financial support for this study was provided by the Scientific and Technological Research Council of Turkey (TUBITAK- Project number: 115Z365).

HERBAL NUTRACEUTICALS

K.BURCU BÜYÜKKILIÇ¹, M. SERDAR AKIN¹, BÜŞRA GÖNCÜ¹

ABSTRACT

Nutraceutical, a portmanteau of the words “nutrient” and “pharmaceutical”, was coined by Stephen DeFelice, who defined nutraceuticals as “foods (or part of a food) that provide medical or health benefits, including the prevention and/or treatment of a disease”. The European Nutraceutical Association (ENA) defines nutraceuticals as substances that markedly contrast pharmaceuticals, which are “synthetic substances or chemical compounds formulated for specific indications”. Nutraceuticals are, hence, “nutritional products that provide health and medical benefits, including the prevention and treatment of disease”. There are numerous classifications and categorizations of nutraceuticals, functional foods and dietary supplements. In the case of nutraceuticals and functional foods, however, consumer acceptance is considered to be overwhelmingly positive throughout the US, Canada, Europe and Japan, though Europeans tend to be more critical of new food products and technologies. Functional foods and beverages for cholesterol and diabetes, cognitive functions, are those related to the digestive system. Most common nutraceuticals are dietary support products, minerals and vitamins, protein and herbal support. Another type of compounds commonly referred to as “nutraceuticals” which also present a nutritional value are pre- and probiotics. Tea, rosemary, soybean, flaxseed, yellow centaur, tomato, garlic, ginkgo, echinacea, ginseng, dietary fiber are some important herbal nutraceuticals. The effective components of tomato, grape seed, green tea and soybeans are lycopene, resveratrol, EGCG (Epigallocatechin gallate) and isoflavones, respectively, which are considered as nutraceuticals. Herbal nutraceuticals can be used as food supplements.

THE INVESTIGATION OF SOME YIELD AND YIELD COMPONENTS OF POPPY (*PAPAVER SOMNIFERUM L.*) CULTIVARS GROWN IN YOZGAT ECOLOGICAL CONDITIONS

HÜLYA DOĞAN¹, BELGİN COŞGE ŞENKAL², CÜNEYT CESUR², TANZER ERYILMAZ³, SELEN ALNIAK SEZER¹,
MURAT KADIR YEŞİLYURT³, TANSU USKUTOĞLU², CENNET YAMAN²

ABSTRACT

Poppy (*Papaver somniferum L.*), which is a member of the Papaveraceae, this is both a medicinal and edible oil plant. There are 5 genus in Turkey belonging to this family. The poppy plant (*Papaver somniferum L.*) is been the purple and white flowers, with a closed capsule, annual, and herbaceous plant with a length of 60-200 cm. Turkey which import oil seed sand crude oils every year for the Exchange pay sout over 1,5 billion dolar is a net importer of the oil seed sand crude oils. There is a great vegetable oil in our country and the amount of imported 755 thousand tons of raw vegetable oil per year is 1542 thousand tons imported from abroad. With increased demand for oil and vegetable oil for fuel needed in our country, increased the production of oil seeds is required. For the cultivation of poppy, Turkey has a very favorable climatic and soil conditions. Seed and oil yield, fatty acid composition and oil – fuel related characteristics, which are affected by variety and environmental conditions. In this study, registered in our country 2 poppy varieties (Ofis-8 ve TMO-1) aimed to determine in Yozgat ecological conditions the morphological characteristics such as plant height, capsule yield per plant, capsule width, capsule length, capsule yield, seed yield and weight of 1000 seeds and oil ratio in varieties were examined. The highest yield in this study, carried out between 2015 and 2016, was obtained from TMO-1.

USE OF GOJI BERRY AS FUNCTIONAL FOOD

K.BURCU BÜYÜKKILIÇ¹, MUTLU B. AKIN¹, ASLI ÇELİKEL¹

ABSTRACT

Goji berry is a perennial woody plant belonging to the family Goji berry solanaceae and has two species, *Lycium barbarum* L. and *Lycium chinense* L.. These are the two closest color box types found in Solanaceae, in the abstract family. The family includes potatoes, tomatoes, eggplant, belladonna, pepper and tobacco. Originated from the Asian continent, this plant is now produced in China's Tibetan region. Goji berry (Wolfberry, *Lycium barbarum*) grows about 1-3 meters in length. Goji berry is 1-2 cm long, bright orange-red elliptical fruit. The Goji berry contains 68% carbohydrate, 12% protein, 10% lipid and 10% fiber. Vitamins and minerals are also rich in Goji berry. It contains beta-sitosterol, Vitamin B complex, Vitamin E, Vitamin C, Zeaxanthin, Carotenoids, Beta-sitosterol, Cyperone, Solavetivone, Physalin, Betaine, and a large number of phenolic acids and. *Lycium barbarum* (Goji fruit or wolfberries, Solanaceae family) is a chemical rich resource with health promoting properties, Goji berry, used in liver, kidney and eye treatment in traditional Chinese medicine, has become very popular over the past few years with its nutritional value and content. As a result of the clinical studies, there was a decrease in the complaints of goji berry patients neurological / psychological features, joint / muscle functions, sleep quality, ability activities, gastrointestinal system problems, fatigue, headache, depression, diabetes, glaucoma, impaired concentration, memory loss and shortness of breath. These recent studies show that Goji Berry has anti-aging, anti-myelosuppression, pro-apoptotic, anti-tumor, neuroprotective effect, immunomodulation, blood sugar and serum lipid lowering effects besides antioxidant effect. While Goji berry offers many benefits and advantages in terms of health, it can have some side effects depending on the person's health conditions and consumption pattern. Goji fruit is harmful to diabetes patients because it affects the functioning of the pancreas and the production of insulin. Goji berry, blood thinner like warfarin, prevents blood clotting. It can negatively affect the body's blood pressure levels and cause hypertension. Excessive consumption can lead to severe side effects such as dizziness, eye disturbance, blurred vision and hallucinations. Since the beginning of the 21st century, interest in wolfberries has increased due to innovation and the value of the foreseen food. Goji berry plant can be widely consumed in the form of dried fruit, marmalade or fruit juice. Goji berry can be used as functional food because of its high antioxidant and phenolic content.

POLYAMINES AND PHENOLIC COMPOUNDS CONTENT IN THE FRUIT OF NATURALLY GROWING MALUS SLYVESTRIS L. IN GÜMÜŞHANE (TURKEY)*

AYNUR KURT¹, NESRİN COLAK¹, AHMET COLAK¹, YAKUP KOLCUOĞLU¹, FAİK AHMET AYAZ¹

ABSTRACT

Aim of the study: Antioxidants are disease-fighting compounds that help prevent and repair oxidation damage. Phenolic compounds and polyamines also exhibit various therapeutic effects (such as diuretic properties, toxin removal and reducing the risk of cancer). Apple is in great demand by consumers in all countries due to its high phenolic and polyamine content. The purpose of this study was to determine the polyamines and total phenolics of a wild type of increasingly cultivated apple (locally known as the □□Göbek□ apple) in the province of Gümüşhane in Turkey. Materials and Methods: Apple samples of the same maturity to be used in analyses were collected from different habitats in Gümüşhane. These were treated with liquid nitrogen and then stored at -80° C until analysis. Standard methods of analysis were used to determine polyamine and phenolic contents in the peel and flesh. Results: The polyamine (nmol per 1 g fw) with the highest content in the Gümüşhane apple was spermidine in the peel and flesh (188.27 and 79.45, respectively), while putrescine represented the least abundant polyamine in the fruit parts (35.17 and 21.61, respectively). The total phenolic compounds and flavonoid contents in the fruit evaluated were 3267.66 and 200.94 mg 100 g⁻¹ in peel and 1614.66 and 14.24 mg 100 g⁻¹ of fw in the flesh. Apple peel exhibited higher antioxidant activity (µM Trolox equivalents (TE)/g fw) than the flesh; antioxidant capacity values in peel were 0.37 for DPPH and 22.51 for FRAP. In conclusion, the apple cv that grows naturally in Gümüşhane and that is also increasingly widely cultivated has high polyamine and phenolic contents. It may also be beneficial to human health and have good commercial potential as a promising antioxidant for use in food preparation. *Acknowledgment: Financial support for this study was provided by the Research Fund of Karadeniz Technical University (KTU-BAP Project No: 6443).

ANTIMICROBIAL ACTIVITY OF POMEGRANATE PEEL EXTRACTS

AIŞE ÜNLÜ¹, ŞULE ŞAHİN ÜN¹, SAIM OK²

ABSTRACT

Mastitis is an intramammary infectious disease that is common in dairy cattle farming all over the world and causes major economic losses in the dairy industry. *Staphylococcus aureus* is one of the most prevalent contagious pathogens causing clinical and subclinical bovine mastitis [1, 2]. *S. aureus* has a great ability to acquire resistance to antibiotics, in particular to methicillin. Methicillin-resistant *Staphylococcus aureus* (MRSA) is a pathogen emerging in community and livestock as well as hospitals [3]. Even though pharmacological industries have produced a number of new synthetic antibiotics in the last three decades, antibiotic resistance of microorganisms against these drugs has also increased [4]. There has been an increasing interest in recent years on antimicrobial compounds obtained from natural sources that are not toxic and with lesser costs rather than developing new synthetic antibiotics to combat the disease. The use of plant extracts and phytochemicals, both with known antimicrobial properties, can be of great significance in therapeutic treatments in the last few years. Pomegranate is a good natural resource of pharmaceutical, nutraceutical and biologically active ingredients showing high antioxidant properties as well. Pomegranate peel methanol extract contains high concentration of tannins, like punicalin and punicalagin, elagic acid and gallic acid showing antioxidant activity [5]. In the current contribution, phenolic compounds of pomegranate peel were obtained using alcoholic and hydroalcoholic extractions. The antimicrobial effect of these extracts against five *S.aureus* strains, isolated from subclinical bovine mastitis, was also investigated using agar well-diffusion method and minimum inhibition concentration. It has been observed that the pomegranate peel extracts have antimicrobial effect on all microorganisms, giving inhibition zones ranging in size from 14 mm to 22 mm. The MIC values for active pomegranate extracts ranged between 0.0625-0.25 mg/ml. The current results show that pomegranate peel extracts have a potential to be used as an antimicrobial agent against MRSA. References: 1. ANTIMICROBIAL ACTIVITY OF MEDICINAL MACROFUNGI

ÜLÜYE DUDU GÜL¹, ÖZLEM COŞDAN¹, MERVE ERYILMAZ¹

ABSTRACT

Today, antimicrobial agents are commonly used against infections but the frequently usage of these substances caused that pathogens gain resistance to them and reduced the effect of these substances. In order to come over this problem, most of the researchers try to find new organisms that produce antimicrobial agents. Until today some studies have done about medicinal plants showing antimicrobial activity. Some fungal strains are investigated that produce antimicrobial agents. One study reported that the ethyl acetate obtained from extracts of macrofungi called *Russula delica* had antimicrobial activity on *Corynebacterium xerosis*. Another study showed that *Reishi* extracts had antimicrobial activity on fish pathogens called *Listonella anguillarum* and *Yersinia ruckei*. Another study investigated that the essential lipid chemical compound called *Levofloxaci* obtained from dried misels of *G. japonicum* fungi showed antimicrobial activity on methicilin resistant strains of *S. aureus* and *E. coli*. The results of these studies showed that some of the macrofungi produced agents showing antibacterial, antiviral, antifungal vs. activity. The agents obtained from macrofungi are useful for human to treat infections. The aim of this study is to examine the fungi that showed antimicrobial activity in literature. The results obtained this study showed that there is not enough study on this subject. New researches are needed for future about antimicrobial activity of macrofungi.

POLLEN MORPHOLOGY OF NATURAL DISTRIBUTED TWO DAUCUS (APIACEAE) TAXA IN TURKEY

İSMÜHAN POTOĞLU ERKARA¹, ONUR KOYUNCU¹, FILİZ SAVAROĞLU¹

ABSTRACT

This study aims to find out palynological properties of *Daucus broteri* Ten. and *Daucus guttatus* that are grown in Osmaneli (Bilecik). For palynological analysis of plant materials, pollen preparations of each taxon were prepared for light microscopy research according to the Wodehouse and Erdtman methods and measurement of the morphological characters of pollen were carried out. Pollen grains of each taxon ,which adhesive on the stap mounted directly, were also taken microphotography in Scanning Electron Microscope (SEM) for detailed exine ornamentations. It was revealed that the pollen of two *Daucus* taxa was infratectate, tricolporate type, prolate shaped and regulate ornamentation. In addition to the systematic features of the taxa pollen morphologies is also distinctive. It was also revealed that this study will help to sort out phylogenetic relationships of between studied taxa.

ANTIOXIDANT AND ANTIMICROBIAL ACTIVITY OF MESPILUS GERMANICA (L).

ELİF GÜLBAHÇE MUTLU¹, HATİCE TANER SARAÇOĞLU², NURSENA ARSLAN, EMİNE ARSLAN², GÖKHAN ZENGİN²

ABSTRACT

Mespilus germanica L. which has an edible fruit is a medicinal plant whose therapeutic effects have historically been emphasized. In this study, we determined antioxidant capacities of methanolic extracts obtained from *M. germanica* fruits and seeds by using DPPH assay and Folin-Ciocaltaeu method. It was revealed that the total phenolic contents of methanolic extracts of *M. germanica* seeds (22.94 mgGAE/g extract) were higher than *M. germanica* fruits (4.67 mgGAE/g extract). Also, the seed extract (9.33 mgTE/g extract) exhibited stronger free radical scavenging activity in DPPH assay as compared to fruit extract (6.67 mgTE/g extract). Moreover, we determined antimicrobial activity of methanolic extract obtained from *M. germanica* fruits and seeds against 16 different bacteria by the microdilution method. While the extract of *M. germanica* obtained from seeds used in study did not have any effects against bacteria, it was shown that the fruit extract was effective against five bacteria in 32 mg/ml concentration and against eleven bacteria in 64 mg/ml concentration. Our findings could provide a starting point for further studies on *M. germanica*.

ANTIMICROBIAL EFFECTS OF THYME OLEORESIN AGAINST *B. COAGULANS*

AHSEN RAYMAN ERGÜN¹, TANER BAYSAL¹

ABSTRACT

Oleoresins (OR) are defined as a mixture of oil and resin extracted from different plants containing essential oil. Oleoresin has characteristics flavor and aroma of spices which are the same as the original. Oleoresin extraction is generally done with organic solvents, such as ethylene dichloride, acetone, ethanol, methanol, hexane, ether and isopropyl alcohol. Rosemary, garlic, ginger, thyme, basil, cumin, dill, mustard, coconut, black pepper, red pepper, celery, clove, cocoa and coriander are among the commercial oleoresins. Oleoresins and essential oils are used in processed meat, fish, vegetables, sodas, sauces, cheeses and other dairy products, floury foods, candy, snacks and beverages. Natural essential oils and oleoresins have antimicrobial and antioxidant properties and are effective against microorganisms that cause food poisoning. Sauces are a permanent food media for fortification with all three of these plant materials or oils/oleoresins of these spices. Tomato sauce is an acidic product and is under risk of *B. coagulans* because spores of *B. coagulans* are able to germinate and grow at pH values as low as 4. This is an acidophilic and thermotolerant spoilage bacterium which causes foods to go flat and sour and is particularly reported for tomato based products. There is a lack of information in literature about the influence of these spice oleoresins and there are limited studies about the effects of the essential oil forms of these spices on this bacteria. Thyme (*Thymus vulgaris* L.) was preferred for providing the sensory properties of foods and also its antimicrobial effects are well known. In addition the antioxidant and antibacterial activities of thyme essential oil and oleoresin also have been previously mentioned several times. For this reason in this study, the antimicrobial activity of thyme (*Thymus serpyllum*) oleoresin against *Bacillus coagulans* in a tomato based sauce was investigated. The inhibitory and bactericidal effect of oleoresin against *B.coagulans* ATCC 7050 was tested in the sauce media (pH 4.2 and °Brix 10). As a result, thymol as a major component of thyme oleoresin similar to its essential oil was identified with gas chromatography-mass spectrometry (GC-MS). Minimum inhibition concentration (MIC) was found as 2.5 ml/100 ml sauce for the thyme. In addition at the the end of 8 hours, with thyme 3.20 log reduction was provided.

SOME MEDICINAL FEATURES OF SPIROGYRA MAJUSCULA AND ZYGNEMA PECTINATUM

KÖKSAL PABUÇCU¹, DERYA BAYER¹, TUĞBA DEMİRİZ YÜCER²

ABSTRACT

In this study, some medicinal features of *Zygnema pectinatum* and *Spirogyra majuscula* were investigated. Vitamin A, E capacity and antioxidant properties of *Z. pectinatum* and *S. majuscula* isolated from Ataköy Dam Lake (Tokat) were examined by HPLC and spectrophotometer. As a result of the research, *Z. pectinatum* was found to be richer than *S. majuscula* in terms of the amount of vitamins (A, E) and antioxidant properties.

THE ANTIMICROBIAL ACTIVITY OF LYNGBYA PORPHYROSIPHONIS

TUĞBA DEMİRİZ YÜCER¹, KÖKSAL PABUÇCU², YAVUZ BEYATLI³

ABSTRACT

In this study, the antimicrobial effects of extracts prepared with *Lyngbya porphyrosiphonis* produced in culture conditions were investigated. Extracts were prepared with 0.5 M Tris-HCL pH: 8.00, N-butanol and Ethanol. Antimicrobial activity tests were performed by disc diffusion method and the extracts were tested on microorganisms of *Staphylococcus aureus* ATCC 25923, *Bacillus subtilis* ATCC 6633, *Listeria monocytogenes* ATCC 7644, *Escherichia coli* O 157: H7, *Pseudomonas aeruginosa* ATCC 27853, *Salmonella typhimurium* CCM 5445 and *Candida albicans* ATCC 10239. The highest antimicrobial effect was recorded against *Escherichia coli*. Other test microorganisms were also affected at different levels.

GC-MS IDENTIFICATION OF ISOQUINOLINE ALKALOIDS IN GLAUCIUM LEIOCARPUM NATURALLY GROWING IN CENTRAL ANATOLIA

ÇİĞDEM ÇOLAK¹, GÜLEN İREM KAYA², MUSTAFA ALI ÖNÜR², NEHIR ÜNVER SOMER², BUKET BOZKURT²

ABSTRACT

Plants of the Papaveraceae family are distributed largely throughout north temperate and tropical regions of the world (1). The genus *Glaucium* Adans. is represented by seven species among the Papaveraceae genera found in Turkey and as known "boynuzlu gelincik" (horned poppy). *Glaucium leiocarpum* Boiss. is the most common species of the genus *Glaucium* in Anatolia (2). Isoquinolines are a widespread alkaloid class within the Magnoliales, Arostolochiales, Laurales, Piperales, Ranunculales and Papaverales with high number of biological activities (3). Glauicine, the most common alkaloid in *Glaucium* species, is used in some of the European countries in treatment, for its antitussive effect without creating depressing impact (4). GC-MS (gas chromatography mass spectrometry) has been proven a fast and reliable method for the investigation of the components in complex alkaloid mixtures. The present study deals with the GC-MS analysis of alkaloids in the aerial parts of *Glaucium leiocarpum* collected from Akşehir, Konya. The alkaloids were identified by comparing their mass spectral fragmentation with standard reference spectra from the NIST MS Search 2.0 (National Institute of Standards and Technology, Gaithersburg, MD, USA), or by GC/MS co-chromatography with previously isolated authentic standards. Moreover, data obtained from the literature were used for the identification of the alkaloids. Totally, nine isoquinoline type alkaloids were detected in the alkaloid extract prepared from *Glaucium leiocarpum*. Glauicine was found as a major constituent (% 78,42). Dehydroglauicine (% 10,83) and allocryptopine (% 4,37) were also detected as major components. Norchelidonine, N-methylaurotetanine and isocorydine are other important compounds found among the constituents. Acknowledgements This study was financially supported by TÜBİTAK (Project No: 315S064) and EBİLTEM (Project No: 2016/BİL/002). We thank Ege University, Faculty of Pharmacy, the Research Laboratory of Pharmaceutical Sciences (FABAL) for facilitating GC-MS analysis. References 1. Brummitt, R. K. 1992. EVALUATION OF HONEYCOMB CAPPING MATERIAL FOR APOPTOTIC, NECROTIC, AND CYTOTOXIC EFFECTS ON VARIOUS CELL LINES

ABDULLAH MELEKOĐLU¹, SEVAL BİRDANE², MUSTAFA TÜRK², SIYAMI KARAHAN²

ABSTRACT

The honeycomb capping material is natural protective biomaterial that are synthesized by bees and contains various active contents. Cytotoxic, necrotic and apoptotic effects of various concentrations of this material were evaluated on three different cell lines (L929, mouse fibroblast; DLD-1 colon adenocarcinoma cell line and H1299, lung carcinoma cell line). At the lowest concentration (0,0313mg/ml); the cell viability rates were 94.11±0.00%, 74.11 ±0.02%, and 68.3±0.01% for L929, DLD and H1299, respectively. Such rates dropped down to %30.58±0.01%, 20.76±0.02%, and 21.85±0.012% for L929, DLD and H1299, respectively at the highest concentration tested (1mg/ml). The honeycomb capping material caused cell death essentially by necrosis other than apoptosis. At the lowest concentration (0,0313mg/ml); the necrosis rates were 3.56±1.41, 10±2.21 and 14.43±1.14 for L929, DLD and H1299, respectively. Such rates increased up to 50.33±1.05%, 65.37±1.21% and 64.51±0.56 for L929, DLD and H1299, respectively at the highest concentration tested (1mg/ml). At the lowest concentration (0,0313mg/ml), the apoptotic rate was 0% for all three cell lines that increased at a limited rate as the concentration increased. At the highest rate used (1mg/ml), the apoptotic rates for L929, DLD and H1299 were 17.77±1.05%, 1.87±1% and 4.30±1.23%, respectively. As a result, the natural material honeycomb capping causes necrosis on DLD and H1299 cancel cell line, and it causes necrosis to a great deal and apoptosis to some degree on L929 fibroblast. The valuable honeycomb capping material, secreted by bees, should be further investigated for its effects and metabolism.

USE OF PROBIOTIC IN INFLAMMATORY BOWEL DISEASES

HİLAL DEMİREZEN¹, TUĞBA KUNDAKCI¹, EZGİ TOPTAŞ BIYIKLI¹, ALİ EMRAH BIYIKLI¹

ABSTRACT

USE OF PROBIOTIC IN INFLAMMATORY BOWEL DISEASES In sustaining a healthy life, nutrition has a great importance. For healthy nutrition, beside adequate and balanced diet, there is a need for a health digestion system. Just as any inflammation or disease in digestive tract affects digestion of nutrients, it also impedes the occurrence of many functions. Especially chronic diseases in digestion system affect the nutritional state of the individual in both short and long term. Inflammatory bowel diseases, among these chronic diseases, affecting the various place in digestive tracts, show flaming together with inflammation. Inflammatory bowel disease generally has two sorts as crohn disease that can hold from mouth to anus, and ulcerative colitis that holds colon. In both diseases, diet treatment has a great importance and this treatment should continue lifelong .It was seen that some specific nutrients and supplementary can provide benefit in inflammatory bowel diseases for treatment. In the recent years, the studies toward the effectiveness of probiotics have accelerated. Probiotics are useful microorganisms present in intestines. It shows positive effects on human health, modifying bowel microbiota. AIM: In this study, it was aimed to compile the studies examining the effect of use of probiotic in inflammatory bowel diseases. METHOD: In this compilation study, with examining the actual literature studies, the effectiveness of using probiotic in protecting from inflammatory bowel diseases and in treatment were evaluated. RESULTS: The studies examining the effectiveness of probiotics, known as useful basils in intestines, in treatment of inflammatory bowel diseases frequently showed positive results. In the studies, it was generally seen that probiotic supplementary was used instead of probiotic nutritional resources. In these studies, combining the various strains of probiotics or using only one strain, they were given to the individuals having inflammatory bowel diseases. In a number studies, it was observed that probiotics showed an effect improving bowel mucosa. In many studies, carried out on ulcerative colitis, a significant decrease was seen in remission and inflammations. In chron disease, in the studies toward the use of probiotic, it was frequently seen that the relapse and symptoms of disease significantly decreased. In a less number of studies, it could not be demonstrated that there was a significant effect of the use of probiotics on inflammatory bowel diseases. CONCLUSIOON: The studies carried out showed that probiotics frequently had the positive effects such as increasing emission, inflammation, and reducing symptoms on inflammatory bowel diseases. For the amount of probiotic strain that are necessary to be used, just as there is a clear suggestion, studies toward the use of natural resources of probiotics are also insufficient . For being able to offer clear suggestions on this subject, there is a need for further studies.

PHARMACOLOGICAL SEED OILS WITH NATURAL BIOACTIVE CONSTITUENTS: TOCOCHROMANOL PROFILING BY HIGH- PERFORMANCE LIQUID CHROMATOGRAPHY

FATMA NUR ARSLAN¹, İSMAİL TARHAN²

ABSTRACT

Recently, more attention has been focused on the utilization of pharmacological seeds and their byproducts as well as oils with bioactive constituents. As is known, Pharmacological seed oils are generally extracted by cold-pressing seeds with screw or hydraulic-press techniques that are able to retain bioactive compounds such as fatty acids, phenolics, sterols or tocochromanols. The tocochromanol homologues (α -, β -, γ - and δ -Ts and TTs) are the major natural bioactive constituents of human diet and are well-known for their strong antioxidant and anti-cancer activities. As well, numerous studies have demonstrated the potential health benefits which include hypolipidemic, anti-atherogenic, anti-hypertensive, allergic dermatitis suppressive, nephroprotective, neuroprotective and anti-inflammatory activities [1]. To the best of our knowledge, very little information has been reported on the tocochromanol profile of pharmacological seed oils. Therefore, the main goal of this study was to determine the tocochromanol profile of oils extracted by lab-scale screw-press machine in our laboratory, from black cumint (*Nigella sativa* Linn.), wheat germ (*Triticum vulgare*), poppy (*Papaver somniferum* L.), coriander (*Coriandrum sativum* L.), sesame (*Sesamum indicum* L.) and nettle (*Urtica dioica*) seeds. Tocochromanol analyses were performed in these seed oils by using the optimized high-performance liquid chromatography (HPLC) method parameters. The analyses were performed using a Develosil C30 (250×4.6 mm, 5 μ m; Phenomenex Inc., USA) stainless-steel column. For optimum HPLC separation condition, mixture of eluent A (methanol: water, 99:1, v/v) and eluent B (tert-methylbutylether: methanol: water, 80:18:2, v/v/v) with a modified gradient programme. The results showed that the major types of tocochromanols detected in all analyzed samples were α -T, α -TT, β -T, γ -T, and δ -T. The highest value was observed for total tocochromanol content in wheat germ oil sample (2590.06 mg/kg). The amount of individual isomers in wheat germ oil was as follows; 1894.44 \pm 0.36 mg/kg (α -T), 582.34 \pm 0.15 mg/kg (β -T), 4.63 \pm 0.01 mg/kg (δ -T), 24.74 \pm 0.05 mg/kg (α -TT), 81.17 \pm 0.04 mg/kg (β -TT) and 2.74 \pm 0.02 mg/kg (δ -T). Coriander seed oil also exhibited high amount of tocochromanol (1313.5 mg/kg) and the main homologues present in this oil were β -T (675.07 \pm 0.33 mg/kg), followed by δ -T (346.28 \pm 0.24 mg/kg) and γ -T (163.29 \pm 0.13 mg/kg). β -T occurred in highest concentrations in wheat germ, coriander seed, and nettle seed oil. Sesame and poppy seed oils were also established to be the excellent source of γ -T. Black cumint seed oil contained highest amount of tocotrienols, wherein tocotrienols were detected in levels of 98.43 \pm 0.04 mg/kg α -TT, 304.21 \pm 0.13 mg/kg β -TT, and 17.61 \pm 0.03 mg/kg γ -TT respectively. Thus, the total tocochromanol content ranged from 499.66 to 2590.06 mg/kg oil, significantly wider than the Codex and similar to several literature data. ANTIOXIDANT CAPACITIES OF TWO HALOPHYTE PLANTS

YAVUZ SELİM ÇAKMAK¹

ABSTRACT

Antioxidant capacities of methanol, and water extracts from *Nonea caspica* (Boraginaceae) and *Suaeda altissima* (Chenopodiaceae) were evaluated with UV-Spectrophotometer. Antioxidant capacity were evaluated using different assay including free radical scavenging (DPPH and NO), reducing power (ferric and cupric), phosphomolybdenum and β -carotene/linoleic acid bleaching. Total phenolic and flavonoid contents were also determined. Generally, *N. caspica* water and methanol extracts possess higher antioxidant activity compared to *S. altissima* water and methanol extracts. These findings showed that the *N. caspica* and *S. altissima* could serve as an important natural source of biologically active agents for using in food and pharmaceutical industry.

ANTIOXIDANT ACTIVITY, TOTAL PHENOLICS AND ANALYTICAL CHARACTERISTICS OF SELECTED PHARMACOLOGICAL SEED OILS

FATMA NUR ARSLAN¹

ABSTRACT

Pharmacological seed oils as a rich source of bioactive components have been used commonly as a potential nutraceutical. They have been involved in providing health benefits such as prevention of prostate, improvement of hypercholesterolemia, arthritis and bladder compliance, retardation of the hypertension, decreasing of bladder and urethral pressure, and alleviation of diabetes, lowering the levels of cancers, and possessing high-quality antioxidant potential. Due to their specific and positive health effects, there are several studies on these oil cultivars in different regions assessing the content of bioactive compounds. The aim of this study was to determine the basic analytical characteristics, total phenolic compounds and free radical scavenging activities as well as the antioxidant capacities of selected pharmacological seed oils. The oils were extracted by lab-scale screw-press machine in our laboratory, from black cumin (*Nigella sativa* Linn.), wheat germ (*Triticum vulgare*), poppy (*Papaver somniferum* L.), coriander (*Coriandrum sativum* L.), sesame (*Sesamum indicum* L.) and nettle (*Urtica dioica*) seeds. A lab-scale screw press machine (15 kg seed.h⁻¹ capacity, single head, 2hp, 1.5 kw power) in our laboratory was used for pressing of seed samples. 40 rpm screw rotation speed and 40°C temperatures were selected as process parameters. The free fatty acid (FFA) content, peroxide value (PV), iodine value (IV), saponification value (SV) and unsaponified matter (USM) content of seed oils were determined according to AOCS official methods, respectively. Conjugated dien and trien contents of seed oils were determined by measuring the specific extinction coefficients (K232 and K270) as well as their relation or R-values (K232/K270), according to the AOCS method. The oxidative stability index values were determined according to the Cd 12b-92 AOCS official method. Total phenolic compounds, radical scavenging activities and antioxidant capacities were detected by measuring the absorbance in Lambda-25 UV-Vis spectrophotometer at 765 nm, 517 nm and 695 nm, respectively. The measurements were expressed as milligrams of gallic acid equivalents (GAEs) per gram of samples. Physicochemical characteristics of the studied oils showed that the oils have high quality and potential to be used as nutrient rich pharmacological oil. Besides, obtained results indicate selected oils' excellent quality, with high contents of total phenolic compounds (42.950–74.230 mg GAE/kg oil), free radical-scavenging activity values (60.010–82.610 mg GAE/kg oil) and total antioxidant capacity values (269.160–520.380 mg GAE/kg oil). Thus, high content of these bioactive compounds and physicochemical characteristics make the analyzed seed oils, nutritionally and commercially valuable products. BORIC ACID EFFECTS ON PHOTOSYNTHETIC ACTIVITIES IN THE LEAVES OF SALVIA OFFICINALIS L.

ÖZLEM ARSLAN¹

ABSTRACT

Mediterranean basin where *Salvia officinalis* L. is mostly grown in, also contains toxic levels of boron. Toxic boron content has different effects on plant physiological and biochemical processes including disruption of growth, cell wall development, and cellular division as well as reduction in chlorophyll contents, photosynthetic rates, and lignin contents. *Salvia officinalis* L. is a medicinal plant containing several compounds with important pharmacological activity. Boron content of the soil is very important because it leads boron accumulation in the leaves. These accumulation causes abiotic stress in the plant and since dry leaves are drunk as herbal tea, the plant that accumulate boron would be toxic to human. The aim of this study was to evaluate the boron toxicity accumulation in the leaves, to compare toxicity levels and photosynthetic activity of leaves, to understand the deteriorative effects of boron on photosynthetic pigments and to find out the boron tolerance levels of *Salvia officinalis* L. In this study, photosynthetic performance and pigment contents and leaf boron content were measured after 10 days application of 2.5 mM, 5 mM and 10 mM of boron in half strength Hoagland solution at optimum conditions (at 25°C, 250 $\mu\text{mol m}^{-2}\text{s}^{-1}$ light intensity, 16 hour light/8 hour dark, %40-50 humidity) in the controlled growth chamber. High concentrations of boron resulted in chlorosis followed by necrosis from margin to center of leaves. Therefore, at higher concentrations the chlorophyll pigments levels and photosynthetic capacity of the leaves decreased. Boron content of the leaves were increased with elevated levels of toxicity. Boron accumulation in the leaves lead abiotic stress determined by chlorosis and lower photosynthetic activity. If *Salvia officinalis* L. grown in boron toxic soils, the productivity of the plant will decrease and higher accumulation of boron in the leaves will threaten the human health.

NEW SOURCES OF FUNCTIONAL OF FOOD INGREDIENTS: ALGAE

TUBA EDA ARPA¹, HURI İLYASOĞLU¹

ABSTRACT

Recently, the development of functional foods has gained much interest in the food industry since the interest of consumers for healthy foods has been raised. Functional foods can be defined as foods that provide one or more functional ingredients possessing health benefits as wells nutrients. Carotenoids, polyphenols and other antioxidants, phytosterols and omega-fatty acids can be given examples for functional ingredients. Plant foods are good source of these functional ingredients. The natural sources are preferred to the synthetic one. Therefore, new natural sources of functional food ingredients have been investigated. Nowadays, the possible usage of algae as potential sources of functional ingredients has been studied. Algae have good nutritional values due to their macronutrient and micronutrient contents. Microalgae have been reported to have a greater protein quality than vegetable sources (wheat, rice, and legumes etc). Algae also include compounds with biological activity. Bioactive metabolites showing cytotoxic, antitumor, nematocidal, antifungal, anti-inflammatory and antioxidant activities have been isolated from brown algae. Algae are valuable sources of polysaccharides referred as dietary fibers. Dietary fibers provide potential health benefits by reducing the risk of some diseases such as colon cancer, constipation, hypercholesterolemia, obesity and diabetes. Sulphated fucans from brown algae and carrageenans from red algae have been reported to show antithrombotic, anti-inflammatory, antioxidant, anticancer and antidiabetic activities. Soluble polysaccharides from algae can be utilized as prebiotic compounds. Algae include omega fatty acids that exhibit several health benefits such as prevention from atherosclerosis, protection against arrhythmias and reduction in blood pressure. Several different types of sterols (clinasterol, fucosterol etc) have been isolated from algae. These sterols are known to help prevent cardiovascular diseases. Algae are also good source of pigments (carotenoids, chlorophyll etc.). Carotenoids that show antioxidant activities can be used as natural food colorants. Astaxanthin is a high-value carotenoid synthesized by microalgae. Although algae provide a wide range of biologically active compounds, the presence of toxic compounds should be checked before they are used.

PHARMACOLOGICAL SEED OILS WITH NATURAL BIOACTIVE CONSTITUENTS: FATTY ACID METHYL ESTER PROFILING BY HIGH-PERFORMANCE LIQUID CHROMATOGRAPHY

GÖNÜL AKİN¹, FATMA NUR ARSLAN¹

ABSTRACT

Fatty acids (FAs) are the main bioactive constituents of naturally occurring lipids in both animals and plants. The FAs contained in natural samples are generally composed of a mixture of saturated and unsaturated FAs in cis- or trans- forms, with chain lengths varying from 4 to 28 carbon atoms. The variety of chain length, degree of unsaturation, geometry, and position of double bonds, render their composition the most descriptive characteristic of these lipids and their origin. The biological activities of FAs also greatly depend on the number of carbon atoms, chain branching and number, geometry and array of double bonds. Hence, the analysis of FAs profiles is of great importance in the control of industrial products, in medical diagnostics, and in the testing of purity, origin, or shelf life studies of food products. The main goal of this study was to determine the cis- and trans- isomers of unsaturated fatty acid methyl esters (FAME) contained in selected cold-pressed oils extracted by lab-scale screw-press machine in our laboratory, from black cumin (*Nigella sativa* Linn.), wheat germ (*Triticum vulgare*), poppy (*Papaver somniferum* L.), coriander (*Coriandrum sativum* L.), sesame (*Sesamum indicum* L.) and nettle (*Urtica dioica*) seeds. FAs of cold pressed oils were converted to FAME derivatives before analysis, and their relative content was calculated as the % of the total FAs. The analyses were performed by using Develosil C30 (25 cm×0.46 cm, 5 µm; Phenomenex Inc., USA) column. The mobile phases were acetonitrile/water (A) and acetonitrile (B) used through the following gradient; 0–25 min: acetonitrile/water and 25–110 min: acetonitrile. The optimum injection volume of samples was 25 µL and FAMEs were detected spectrophotometrically at 200 nm using a photodiode array detector. Obtained results showed that FA profiles are within the official ranges for cold pressed oils specified in the Codex Alimentarius; therefore, the results obtained do not need any further comments. Nettle seed oil was clearly distinguished by their FA profile due to their far greater Σ SFA contents (40.9%) than in the other oils. It is noteworthy that all cold pressed oils contain small amounts of SFAs, whereas Σ PUFA range between 18.46% and 88.22%. The cold pressed oils studied in this work also contain small amounts of Σ trans FAs (0.03%-0.16%); and, the content of Σ MUFA is relatively high (7.38%-74.21%). Thus, in terms of adequacy, accuracy and significance, proposed method appeared to be comparable to GC applications. References: [1] Lima, E.S., Abdalla, D.S.P., 2002. INVESTIGATION OF PHYSICOCHEMICAL AND TECHNOLOGICAL PROPERTIES OF JUJUBE (*ZIZYPHUS JUJUBA*) AND EVALUATION OF ALTERNATIVE USES

MÜGE HENDEK ERTOP¹, RABIA ATASOY¹

ABSTRACT

Ziziphus jujuba which is also called jujube, red date, Chinese date, or Indian date is a hard-core fruit in the Rhamnaceae family. The homeland is China. It can grow in natural environments in our country just as it is distributed in many regions of the world. Although grown in wild environments, it is also cultivated in gardens. It is an ancient fruit tree that grows in temperate regions all over the world. Moreover, it is a thorny tree with yellow fragrant flowers, which are locally harvested from its fruit. Whereas its' crumb is hard and greenish before the jujube fruit is mature, it turns to red, black and purple color after maturation. Jujube fruit is usually dried in the sun and consumed as a traditional snack. The leaves of the jujube plant are used as bait. The oil obtained from the seeds of Hünnap, which is also take place in alternative medicine applications traditionally, is used for the treatment of nerve diseases in Chinese medicine. It has been consumed as chest softener, cough cutter, urine and phlegm remover, laxative and blood cleanser since ancient times. Moreover, It is also used as a cholesterol and lipid lowering fruit. Due to its' potassium content, it also helps to lower high blood pressure. The low sodium content of the fruit is a healthy choice for people who need a low salt diet. It is rich in jujube fruit, high vitamin C and water-soluble vitamins, minerals, sugars, inorganic and organic substances. Its antioxidant activity is high. In terms of their nutritional content, they have an important influence on human nutrition. Fruits also contain sugar, tannin and mucilage (exopolysaccharide) substances. In this study, basic physicochemical properties such as ash, protein and mineral contents; technological properties such as water/oil binding capacity and grain weight and various nutritional attributes such as antioxidant activity, phenolic content and mineral/protein bioavailability of jujuba fruit grown in Mersin region have been determined. In view of the present findings, except local consumption as a snack food, alternative uses have been evaluated in the food industry.

ANTIOXIDANT PROPERTIES OF CHORISPORA TENALLA AND CAMPHOROSMA MONSPELIACA SUBSP. MONSPELIACA HALOPHYTE PLANTS FROM TURKEY

YAVUZ SELİM ÇAKMAK¹

ABSTRACT

Chorispora DC. and Camphorosma L. genus commonly grown halophyte soils, and are members of the Brassicaceae and Chenopodiaceae families, respectively. The genus Chorispora and Camphorosma consist of about 3 and 2 species, all of which grows wild in the Turkish flora. The objective of this study was to determine antioxidant activities of *C. tenella* (PALL.) DC. and *Camphorosma monspeliaca* subsp. *monspeliaca* L. aerial part methanol and water extracts. Antioxidant capacity were investigated using different assays including free radical scavenging (DPPH and NO), reducing power (ferric and cupric), phosphomolybenum, and β -carotene/linoleic acid bleaching. Total phenolic and flavonoid contents were also determined. The phenolic and flavonoid contents of *C. tenella* (PALL.) DC. and *C. monspeliaca* subsp. *monspeliaca* L. at a concentration of 2 mg/ml ranged between 40.38-113.77 mg GAE/g extract and 24.07-59.26 mg RE/g extract. Generally, *C. monspeliaca* subsp. *monspeliaca* methanol extract has effective antioxidant properties compared with other samples. The obtained results suggest that the studied samples may be considered as valuable candidate for new functional foods and drug formulations development.

THE EFFECTS OF RUTIN AND QUERCETIN ON APOPTOSIS IN 5-FU-INDUCED HEPATOTOXICITY IN THE RATS

SEMİN GEDİKLİ¹, EMİN ŞENGÜL¹, VOLKAN GELEN²

ABSTRACT

Chemotherapy is a widely used form of treatment in various types of cancer. However, the use of chemotherapeutic drugs results in some unwanted side-effects and toxicity in various organs and tissues. 5-FU is a drug used in the treatment of cancer and some studies have shown that 5-FU causes hepatotoxicity. The Quercetin and Rutin as polyphenolic flavonoids have been shown that to help protect tissues from diverse toxicities. The aim of this study is to investigate possible histopathological effects of Rutin and Quercetin (Q) on apoptosis in 5-FU-induced hepatotoxicity. In the present study, 48 adult Sprague Dawley male rats were randomly divided into eight groups of six rats each. The control group rats were given intragastric (ig) corn oil (1 ml) for 21 days. The 5-FU group rats were given ig corn oil for 21 days and 18th day injected intraperitoneally (ip) a single dose of 5-FU 50 mg/kg. Rutin50+5-FU and Rutin100+5-FU groups were given respectively ig corn oil 50 mg/kg and 100 mg/kg rutin for 21 days. These groups were injected single dose of 5-FU (50 mg/kg) in the 18th days of rutin application. Q50+5-FU and Q100+5-FU groups were given respectively ig corn oil 50 mg/kg and 100 mg/kg quercetin for 21 days. These groups were injected single dose of 5-FU (50 mg/kg) in the 18th days of quercetin application. The Rutin100 group was given rutin (100 mg/kg-ig) the Q100 group was given quercetin (100 mg/kg-ig) for 21 days. At the end of the experiment, all rats were sacrificed and their livers were removed. Then, tissue samples were performed according to routine histological procedure. The prepared 5-µm thickness sections were stained with Crossman's modified Mallory triple staining were evaluated for any structural changes under a light microscope. For hepatic immunohistochemistry, Bcl-2 and Caspase-3 staining were performed. Also, the Bcl-2 and Caspase-3 positive cell intensity were scored as follows: none = -; weak = +; moderate = ++; strong = +++; very strong = ++++. In the Crossman's modified Mallory triple staining sections, control group's liver had a normal microscopic structure. But, in the 5 FU treatment group's livers were observed significantly degenerated hepatocytes with nuclear condensation and were seen sinusoidal dilatation and an increase of connective tissue around the central vein and portal area. In Bcl-2 cell density estimation, there was lower density in 5 FU group than control group. Also, immunopositivity of Bcl-2 was significantly increased in Rutin 50-5FU, Quercetin 50-5FU, Rutin 100-5FU and Quercetin 100-5FU groups compared with 5 FU group. Intensity of Caspase-3 positivity was higher in the 5 FU group sections compared to the control group sections. Furthermore, immunopositivity of Caspase-3 was significantly decreased in Rutin 100-5FU groups compared with Rutin 50-5FU, Quercetin 50-5FU and Quercetin 100-5FU groups. According to our data, 5 FU can lead to apoptosis and cause evident damage in the microscopic structure of liver. In addition, these damages can be ameliorated by Quercetin treatment, especially Rutin treatment.

PLANT ESSENTIAL OILS USED AGAINST VARROA

HIDAYET TUTUN¹, LEVENT ALTINTAŞ², ASIM KART¹

ABSTRACT

Beekeeping is always vulnerable to many sanitary factors. Varroa destructor, an obligated ectoparasite for honey bees in beekeeping, not only causes economic loss but also causes ecological problems related to the role of honey bees, as the most important pollinators on Earth. In this mite control; special apiary practices, physical removal and synthetic acaricides are used. However, none of these methods can provide a fully effective protection. Use of conventional acaricides lead to the development of resistance to these drugs in mite, the detrimental effect on non-targeted organisms and the residue problem in products. For this reason, the need of alternative control methods has become compulsory in recent years. It has been known that some plant oils used widely in perfumery and food industry for flavor and smell have been used as a repellent to certain insects. Due to this, intensive studies have been carried out on plants with anti-varroa potential and these studies are still going on. Recently, studies in this area have shown that vegetable essential oils such as thyme, cloves, mint, lemon grass are lethal to some insects and fungi. It has been shown that these plant essential oils have antifeedant, repellent, oviposition deterrent growth regulatory and anti-vector activities on the varroa. As a result, in countries rich in biodiversity due to endemic plant species, the essential oils used in control of this pest should be favored instead of or in combination with conventional drugs in integrated pest management programs because of the lack of harmful effects of essential oils on non-target organisms and environment.

LICORICE: AN OVERVIEW OF HEALTH EFFECTS

MELAHAT SEDANUR MACİT¹, EDA KÖKSAL¹

ABSTRACT

Wild plants and natural products have been used for centuries for health. World Health Organization emphasized the necessity of natural products and plant derived drugs in primary health care. Licorice (*Glycyrrhiza glabra*) is one of these plants, belongs to Fabaceae family, has been consumed in traditional medicine since Prehistoric Ages. *Glycyrrhiza* genus has more than 30 species. *G. glabra*, *G. inflata* and *G. Uralensis* are the most important licorice varieties. The root and the juicy extract is obtained by boiling the roots, are mainly consumption types of the plant. Bioavailable components and flavor molecules involved in conical roots and rhizomes of the plant which are the main reasons the common usage of this parts. Main bioactive component of licorice: glisirehizin is 50 times sweeter than sugar and widely use as a sweetener in different kinds of products (gums, mouth spray, candies, health products, antacids, chewing tobacco, medicines, some alcoholic beverages and herbal teas). Licorice is originated from Russia and China however it is also produced in Mediterranean countries, Southeast Europe and parts of Asia. In Turkey, there is a higher consumption of licorice sherbet in east regions especially in summer and Ramadan. There are several clinical studies reported the positive health effects of Licorice. According to these study results: licorice has antiulcer, antioxidan, antiinflammatory, antiatherosclerotic, antiprotozoa, antitumoral, antifungal effects and has also positive effects on dyspepsia. Besides these, hepatoprotective effects of licorice were also reported. As well as health benefits, licorice has been reported about some adverse effects and interactions with cardiovascular drugs. According to case reports, long term consumption of licorice is associated with hypertansion, hypopotasemia, muscle weakness due to its glycyrrhizin content which inhibits 11- β hydroxysteroid dehydrogenase enzyme and cause a increase in mineralocorticoids. Studies have shown that consuming more than 95 mg/d glycyrrhizic acid causes an increase in blood pressure. The Scientific Committee on Food (SCF) declared the upper intake of glycyrrhizin as 100 mg/d. Licorice and its derivatives are listed at GRAS and accepted as safe by Food Drug Administration. However, there is no data for licorice consumption for pregnant, children and adolescents (<18 years). Guidelines for glycyrrhizic acid recommend 9.5 mg/d for an acceptable daily intake. This corresponds to a maximum of 10-30 grams of rootstock and a maximum of half a teaspoon per day of rootstock tea. In short, licorice has some health benefits such as antiulcer, antioxidan, antiinflammatory, antiatherosclerotic, antiprotozoal, antitumoral, antifungal based upon its bioactive properties. It has a wide usage of in food industry as a sweetener. However, some adverse effects such as hypertansion and hipopotasemia and food-drug interactions were also reported in case presentations by the reason of higher amounts and long-term consumptions. For this reason, it is important not to exceed its upper intake level and evaluate drug interactions.

MEDICINAL USES OF SOME AROMATIC PLANTS

TUBA EDA ARPA¹, HURI İLYASOđLU¹

ABSTRACT

The aromatic plants have been used in the Middle East since BC because of their flavour, preservative and medicinal properties. In both industrialized and non-industrialized countries, the demand of aromatic plants has been increased due to their antioxidant properties. More than 150 plants comprising of essential oils, oleoresins and natural extractives have been accepted as safe for human consumption. Origanum (*Origanum vulgare*), basil (*Ocimum basilicum* L.), bay (*Laurus nobilis* L.), parsley (*Petroselinum crispum* (Mill) Mansf.), peppermint (*Mentha piperita* L.) sage (*Salvia officinalis* L.), rosemary (*Rosmarinus officinalis* L.), tarragon (*Artemisia dracuncululus* L.) and thyme (*Thymus vulgaris* L.) are the examples of aromatic plants in the FDA list (FDA CFR Title 21) as generally recognized safe (GRAS). Aromatic plants contain protein, fibre, vitamins, and minerals. They also include phytochemicals and essential oils possessing antioxidant and antimicrobial properties. Phenolics are one of the major phytochemicals possessing antioxidant activities. The intake of phenolics is associated to a lower risk of diseases such as coronary heart disease and cancer. Essential oils are known to be therapeutic agents for rheumatism and dermatitis. The utilization of aromatic plants for medicinal purposes are widespread in the Middle East. The basil, bay, oregano and rosemary can be given as the examples of the most used aromatic plants for medicinal purposes. Basil is used for treatment of headaches, coughs, warts, worms, constipation, bronchitis, laryngitis, tonsillitis gastrointestinal and kidney disorder. The medicinal properties of bay leaves include the treatment of high blood sugar, migraine, headaches, bacterial and fungal infections and gastric ulcers. Its essential oil also is used for rheumatism and dermatitis. Origanum is used as diaphoretic, carminative, antispasmodic, antiseptic and tonic. Rosemary is digestive and diuretic agent. It is also used externally as antidermatologic, antipodalgic, for scurf, vaginal antiseptic, for furuncles, antiseptic, anti-infectious.

UHPLC-MS/MS DETERMINATION OF AFLATOXINS B1, B2, G1 AND G2 IN PUMPKIN (CUCURBITA PEPO L.) SEED OILS FROM CENTRAL ANATOLIA REGION OF TURKEY

GÖNÜL AKİN¹, FATMA NUR ARSLAN¹, ŞÜKRİYE NİHAN KARUK ELMAS¹, İBRAHİM YILMAZ¹

ABSTRACT

Cucurbita pepo L. is an economically important member of Cucurbitaceae family and among the ten leading vegetable crops worldwide with an annual product. For many years, the Cucurbita pepo L. Seeds products have been commonly used in the food industry, are utilized in the pharmaceutical and alternative medicine applications. Several health benefits from its regular dietary intake have been also reported, including cancer prevention, anti-inflammation, anti-diabetic and lowering of cholesterolemia. The determination of the characteristics is a very sensitive issue; hence, studies on the cold pressed pumpkinseed oils from different regions highlighted its physicochemical characteristics in respect to the oil quality. To our best knowledge, no data is available on the quality of pumpkin seed (Cucurbita pepo L.) oils cultivated in central Anatolia regions in detail and no investigation has been focused on the contamination of aflatoxins by UHPLC-MS/MS. Therefore, this study was aimed to determine the content of aflatoxin contamination by using validated UHPLC-MS/MS technique, for cold pressed pumpkin (Cucurbita pepo L.) oils cultivated in four different central Anatolia regions of Turkey. Thermo Quan. AccMax UHPLC-MS/MS system in combination with a coupled to triple quadrupole mass spectrometer was used for analysis. A Hypersil Gold C18 reversed phase column (50×2.1 mm; 1.9 µm) was used as a chromatographic column. The mobile phase consisted of (A) ultra-pure water and (B) methanol at a flow rate of 0.4 mL.min⁻¹. The injection volume was 20 µL and the column temperature was maintained at 25°C. The extraction with AflaTestP® immuno-affinity SPE cartridge columns for aflatoxin analyses was performed according to the Yang et al. [1]. Aflatoxin standard concentrations of 1–25 µg.kg⁻¹ in methanol were used for calibration curves. The correlation coefficients were obtained higher than 0.9900 for each standard. Aflatoxin contaminations were not detected in any of studied pumpkin seed oil samples. The maximum acceptable level of aflatoxin in food materials has been regulated in many countries and the legal limits may vary from one country to another, depending on the degree of development and economic consideration. The food and drug administration has set a maximum acceptable level of 20 µg.kg⁻¹ for total aflatoxin in foods for human consumption. Thus, the obtained results indicated that the cold pressed pumpkinseed oils from central Anatolia region of Turkey in this study are safe. The findings of present study are expected to increase the knowledge on the characteristics of these valuable medicinal seed oils and provide as valuable contributions to better assess their potential as a source of functional oils in the industry. THE EFFECT OF COMMERCIAL FOOD PAINS ON LIFE AND DEVELOPMENT OF DROSOPHILA MELANOGASTER

MÜESSER TURAN¹, OSMAN BURAK KELEŞOĞLU¹, GÖRKEM TEYİN¹, EDA GÜNEŞ¹

ABSTRACT

Food stuffs obtained by natural artificial means are additives which are generally used to increase the visibility of foods and to eliminate negative color differences that may occur during processing. In some studies, the effect of food colors such as Erythrocyte, Ponceu 4R, Sunset Yellow, Tartrazin, Amarant, Karmin, Patent Blue in model organism has been determined. In this study, it was aimed to determine the effect of the commercial food dye (0.01-0.1 mg / L) prepared at different concentrations to the survival and development of the model organism *Drosophila melanogaster* (ebony). When the rate of third stage larvae, pup and adult of insects are compared with controls, It was observed that there was no difference in the growth period of the bug, which was fed with the highest concentrations, and that the proportion of adults was decreased by half. According to these results, it has been understood that the use of overdose of commercial food colors may adversely affect the mature properties.

PU-ERH TEA: COMPONENTS AND HEALTH EFFECTS

MELAHAT SEDANUR MACİT¹, EDA KÖKSAL¹

ABSTRACT

Introduction: Tea consumption is very common in the worldwide and by two-thirds of population drink different types of teas. Teas are preferred due to their aromatic taste and several biological effects on health based upon their antioxidant, flavanoid, theabrownin and polysaccharid contents. There are 6 types of teas as green tea, yellow tea, dark tea (including brick tea and Pu-erh tea), white tea, oolong tea, and black tea. Pu-erh tea is belong to dark teas and it is a kind of fermented tea which is produced in a widepspread manner in Yunnan province of China. The indigenes consume it as medicine, tonic, beverage, and food for energy and wellbeing. In addition to China and Southern Asia, pu-erh tea also exist in Japan, USA, Britain. **Production:** In pu-erh tea's production process, tea plants' (*Camellia sinensis* var. *Assamica* (L.) O. Kuntze; Theaceae) buds and leaves are exposed heating, rolling and drying. Secondly its fermented with microorganisms which is a high temperature and high moisture process. *Aspergillus* spp. are the most widely-used of these organisms, altogether *Penicillium*, *Rhizomucor*, *Mucor*, *Cladosporium* and *Eurotium* are also found in pu-erh tea. Pu-erh tea is classified as raw and ripened pu-erh tea. In the production process, whether pu-erh tea leaves left for several years before fermentation at the room tempereture, it defines as raw pu-erh tea. It can be stored up to 50 years. In other case, it is held for several months and it is called ripened tea which has a shorter manufacturing time and lower the production cost. Production process influences chemical composition and quality in this manner aroma and taste and after all consumer acceptibility and choice. **Health effects:** Pu-erh tea is associated with several health benefits. Particularly teabrownins, the water soluble polymeric phenolic compounds derived from various polyphenols (catechins, theaflavins, thearubigins, polysaccharides, proteins, lipids, and caffeine via microbial action give the health protective properties to Pu-erh tea. Pu-erh tea contains higher amounts of polymeric polyphenols due to its longer fermentation process. In a study, it was revealed the antioxidant and hepatoprotective effects of Pu-erh tea on rats. Pu-erh tea has positive effects on steatohepatitis and insulin resistance by enhancing IL-6/STAT3 signaling in hepatocytes, downregulating expression of lipogenesis- and gluconeogenesis-associated genes, upregulating PPAR α . In another study, it reduced fat storage in worms by down-regulating the expression of the master fat regulator SBP-1 and subsequently decreased fat storage. It has also anti-constipation effects in mice. Neuro-protective effects by downregulating the transcription and translation of mGluR5. Pu-erh tea protected SH-SY5Y cells against apoptosis induced by L-glutamate and alleviated epilepsy behaviour by inhibiting the expression of mGluR5. Pu-erh tea has antihyperlipidemic effects and decreases body weight by suppressing diet-induced body fat accumulation in C57BL/6J mice by downregulating SREBP-1c. In a study, it was also found to decrease diabetes-induced accumulation of AGEs. There is no clear report or recommendation for the upper intake of pu-erh tea. However, in a study, 2500 mg/kg/day administraiton of it caused disturbances in embryo-to-foetus period. **Conclusion:** Pu-erh tea has become popular in recent years except its origin countries due to its attractive aroma and health

Corresponding Author: MELAHAT SEDANUR MACİT, sedanur.macit@gmail.com

¹GAZİ ÜNİVERSİTESİ

benefits such as antihyperlipidemic, anti-constipation, hepato-protective, neuro-protective, which was proven by several studies however especially on animals. Even so, consumption of higher amounts may cause health hazards. It should be emphasize to consume Pu-erh tea in relevant amounts. For this reason, future studies are needed to specify a dosage for adverse affects if there is any.

IS GREEN COFFEE EFFECTIVE IN WEIGHT LOSS?

TESLİME ÖZGE YÖRÜSÜN¹, YASEMİN AKDEVELİOĞLU¹

ABSTRACT

Green coffee is defined as raw and unroasted seeds of *Coffea Rubiaceae* fruits. Roasted coffee is produced when green coffee beans are processed in several stages. Significant changes occur in the color, texture and taste of the coffee beans due to degradation or conversion of some compounds found in green coffee beans by roasting. The green coffee beans contain carbohydrate, lipid, protein, chlorogenic acid (CGA), mineral, caffeine, trigonelline and free amino acids. After roasting, the content of carbohydrates, proteins, chlorogenic acids and free amino acids in the coffee bean decrease while the contents of lipids, minerals, caffeine and trigonellin do not change. In addition, the roasting of the coffee beans results in melanoids resulting from the Maillard reaction of the polysaccharides, proteins and chlorogenic acids present in the composition. With the formation of melanoids, the content of chlorogenic acid in the roasted coffee decrease. Significant differences between the composition of roasted coffee and green coffee arise due to this reason. Chlorogenic acids in the green coffee composition have been of great interest, in particular the weight loss functional effect. Studies have shown that chlorogenic acids are helpful in reducing visceral adiposity and body weight. The primary mechanism of action of chlorogenic acid on obesity is the activation of adenosine monophosphate activating protein kinase (AMPK), which regulates energy balance. AMPK activation increases fatty acid oxidation in liver and skeletal muscles. In addition, chlorogenic acid enhances hepatic expression of PPAR- α (Peroxisome proliferator-activated receptor-alpha), which increases β -oxidation of fatty acids, and carnitine palmitoyl transferase 1 (CPT-1) enzyme activity. Therefore, it is considered that chlorogenic acid will reduce lipogenesis by increasing the use of fatty acids. In the randomized double blind study on 109 obese Japanese subjects, 297 mg CGA/185 g green coffee was administered to the intervention group and 2 mg CGA/185 g green coffee was administered to the control group for 12 weeks. At the end of the study body weight, body mass index (BMI) and visceral adiposity decreased significantly in the intervention group according to the control group. In a rat study, it was observed that for 24 weeks, CGA and caffeine intake resulted in an increase in CPT-1 activity and a decrease in lipogenesis. Additionally, serotonin and its derivative melatonin which decrease the appetite and increase body weight loss were detected in green and roasted coffee beans. Studies examining the relationship between green coffee and obesity have generally used the green coffee extract called svetol. To observe only the effects of chlorogenic acids, eliminating the effect of caffeine, on obesity. Svetol is a decaffeinated green coffee extract standardized to contain about 45% CGA. In the case of obese individuals, 200 mg svetol was used 5 times a day for 12 weeks, resulting in significant reductions in body weight and body fat percentage compared to the control group. In another study, svetol supplements (400 mg/day) have been shown to reduce body weight and increase lean body mass in obese individuals. When the literature is examined, the consumption of green coffee effect on weight loss by various biochemical mechanisms due to chlorogenic acids compounds. However, caffeine amounts in green coffee is similar to roasted coffee, so it must be consumed

carefully. Side effects such as headache, stomach upset, nervousness, insomnia, anxiety and arrhythmia can be seen as a result of high caffeine intake. With fewer studies done with decaffeinated green coffee, no side effect has been found yet.

DISTRIBUTION OF PHENOLIC COMPOUNDS AND ANTIOXIDANT ACTIVITY OF BUCKWHEAT (*FAGOPYRUM ESCULENTUM* MÖENCH) SEEDS

İLHAMİ KARATAŞ¹, NUSRET GENÇ², RAHİME KARATAŞ³, MAHFUZ ELMATAŞ²

ABSTRACT

Buckwheat (*Fagopyrum esculentum* Moench) belongs to the family Polygonaceae is one of the field crops, cover crop and pseudocereal. Due to significant nutritional or health-promoting properties, it has been used both in food formulation and traditional medicine. Buckwheat is rich in nutrients, such as protein, essential amino acids, lipids, unsaturated fatty acids, mineral, vitamins B1, B2 and B6. The grain of this plant contains also valuable biologically active compounds especially phenolic compounds. They are important in scavenge of reactive oxygen species as an antioxidant and prevent the development of disease. The aim of this work was to determine the phenolic compound distribution, total phenolic content and total flavonoid content in buckwheat seeds. The distribution of phenolic compounds, vanilic acid, p-coumaric acid, ferulic acid, protocatechuic acid, chlorogenic acid, catechin, rutin, quercetin and kaempferol, were determined by high performance liquid chromatography equipped with diode-array detection (HPLC-DAD). Antioxidant activity of the plant seeds were assed scavenging activity test against 2,2-diphenyl-1-picrylhydrazyl (DPPH) free radical by spectrophotometric method. Total phenolic and flavonoid contents were present at levels of 1.48 mg GAE /g DW and 0.81 mg QUA/g DW respectively in buckwheat. According to HPLC results, individual phenolic compound contents were showed that the main phenolic compounds are rutin (170.16 µg/g DW), vanilic acid (22.03 µg/g DW), and chlorogenic acid (44.51 µg/g DW). The other phenolic compounds were found in low quantities. Buckwheat grains extract exhibited high DPPH free radical scavenging activity with the average IC50 (1.5 mg seed/mL) was described as the sample concentration that caused a decline in the initial DPPH concentration by 50%.

DOES THE MYCOTOXIN OF FUSARIUM FUNGI HAVE GENOTOXIC EFFECT IN IN VITRO?

SEVCAN MAMUR¹, FATMA ÜNAL¹, DENİZ YÜZBAŞIOĞLU¹

ABSTRACT

Does The Mycotoxin of Fusarium Fungi Have Genotoxic Effect in In Vitro? Sevcan Mamur*1, Fatma Ünal2, Deniz Yüzbaşıođlu2 (1) Life Sciences Application and Research Center, Gazi University, 06830, Ankara, Turkey (2) Department of Biology, Science Faculty, Gazi University, 06500, Ankara, Turkey Abstract Mycotoxins are naturally occurring toxic secondary metabolites of fungi that may be present in food and feed. These metabolites are widely produced by fungal genera: Fusarium, Penicillium and Aspergillus. The mycotoxins of Fusarium are mainly trichothecenes, fumonisins, zearalenone, fusaric acid, moniliformin, fusaproliferin, fusariosin, fusarin C, equisetin, enniatins, and beauvericin. Mycotoxins are common contaminants of many grains like wheat, corn, barley, maize, and rice that can be contaminated in the field during harvest or storage and, can cause economic loss. In addition, mycotoxins have nephrotoxic, hepatotoxic, carcinogenic, mutagenic, and immunosuppressive effects. These effects treat of human and animal health. For these reasons the evaluation of mycotoxin genotoxicity is important. Nowadays, because of the increasing exposure to mycotoxins directly or indirectly, studies have been started to determine the toxic effects of these substances. The aim of this study is to review genotoxicity studies of Fusarium fungi in various cells in vitro. The studies of the genotoxicity of Fusarium species including ochratoxin A, fumonisin B1, moniliformin, beauvericin have been determined to have positive results in different cells. Contrary to these findings, Enniatin B has not genotoxic activity. As a result, some mycotoxins have been found to be genotoxic in certain concentrations, however this effect should also be evaluated in in vivo tests.

MATHEMATICAL MODELING OF TOTAL POLYPHENOL COMPOUND KINETICS DURING SOLID-LIQUID EXTRACTION OF LINDEN (TILIA CORDATA) PLANT

DOđANAY YÜKSEL¹, AHMET LEVENT İNANÇ¹

ABSTRACT

Different plants and herbs were relied on as the only real medicine that people could rely on for years. Today, modern medicine has overtaken most of them and has managed to solve many health-related problems. While natural remedies certainly can't replace modern medical procedures, they can still help in a variety of ways. Mild health problems can often be relieved through their use and many other problems can be prevented when these remedies are used as preventatives. The flowers can be used to make herbal tea which is used to treat anxiety since the herb exerts a soothing effect on the body, helping calm the nerves and treat sleep disorders as well. There are several different subspecies of linden that can be used medicinally and all may have a slightly different taste. Linden tea is one of the most effective natural remedies and has been used for centuries. When it is administered regularly, it can help with a wide range of different health issues. Since plants of *Tilia* (Tiliaceae) genus show both antioxidant and antimicrobial activities, such functional properties are associated with polyphenolic compounds, including flavonoids. Therefore, time-temperature relation is important in the infusion of linden, which is rich in total phenolic compounds. In this study, the transfer times of polyphenols to liquid phase in solid-liquid extraction of linden plants that were brewed at different temperatures were investigated and kinetic modeling was carried out. linden plant (*Tilia cordata*) tea was prepared according to the conventional method. The dry linden leaves were milled and passed through a 3 mm sieve. The ground linden leaves placed on the steel brewing screen were immersed in deionized water at different 5 constant temperatures. A constant and low speed rotating magnetic stirrer was used for homogenized linden extraction. A sample of 5 ml extract was withdrawn at different time intervals and filtered. Extraction process was carried out until the extraction concentration at each temperature was not changed. The total phenolic compound of the sample was determined by spectrometric method and was expressed as gallic acid equivalents (GAE) g/L. Using differential method, the kinetics of solid-liquid extraction of total phenolic compounds were determined. The mean equilibrium concentration of the experimental total phenolic compound in the liquid phase at 60, 70, 80, 90 and 100 ° C was 41 g / L. The significant rate changes were observed depending on the temperature at the transfers from the solid phase to liquid phase. The best function models giving the mathematical equations of the concentrations-time changes of the of the total phenolic substance in the liquid phase at these temperatures are exponential rise to maximum; simple exponent, 3 parameters ($y= y_0 + a(1-bx)$). The coefficients of determination of these functions (R^2) were found between 0.9910-0.9829.

MORINGA OLEIFERA AND IMPORTANCE IN PHYTOTHERAPY

FILİZ CEYLAN¹, AHSEN SEVDE ÇINAR², ALEV ÖNDER²

ABSTRACT

The Moringa genus is known as a plant that can cope with all kinds of climate conditions and is therefore widely grown throughout the world. The Moringa oleifera, a species unique to India, is also grown in tropical and subtropical regions of the world. It is commonly known as a "drumstick tree" or "horseradish tree." This species is a fast-growing tree native to South Asia. When examined regarding both its content and its effects, M. oleifera has made a reputation as a species called "miracle tree." Minerals, vitamins and other phytochemicals are also very rich in this species, and it is very popular in Ayurvedic medicine. It can even provide all the needs of the human body. Other notable effects include antioxidant, anticancer, anti-inflammatory, antidiabetic, antimicrobial, hepatoprotective, antifungal, antiviral and milk boosting effects. Besides, it is mentioned economically, also used in water cleaning treatment. Especially in under-developed countries, it has a place as additional food. Moringa oleifera, which has such a significant effect, will be tried to be introduced to this preliminary study because it is evaluated as phytotherapy with the aid of this poster to be presented.

STEVIA REBAUDIANA: A POTENTIAL BOON FOR HUMAN HEALTH

KHAZINA AMIN¹, SENAY OZGEN¹, ZELIHA SELAMOGLU¹

ABSTRACT

A high potency low calorie bio-sweetener "Stevia" has been grown in many countries around the globe for its sweetening and health promoting properties. Besides of making the world a sweeter place, Stevia is well known for its efficient therapeutic and pharmacological agents which possess antimicrobial, antifungal, anticarcinogenic and antioxidant activity. Leaves of Stevia have been used from the ancient times to cure various chronic and non-chronic diseases such as diabetes, cancer, cardiovascular disease, obesity, renal disease, inflammatory bowel disease and dental cavities. The phytoconstituents of this plant, steviosides, rebaudiosides A-F, steviolbioside and dulcosides, were found to be nontoxic in many research studies. Stevioside is the main herbal sweetener that is 100-350 times sweeter than the sucrose. It has pleasant taste, good solubility in water and safely metabolized by the body without any toxic effect. High nutritional profile of Stevia leaves makes it superior to other sugar substitutes. There is an increased demand in Stevia production from past decade due to fast growing trend in diet foods or low calorie foods and beverages. Markets exist for Stevia but still there is lack in its efficient production strategies. The great interest in Stevia has fueled many studies on it to meet the rising food market demands. Research needs to be directed on Stevia and its metabolic pathways to explore full potential regarding benefits on human health. This review article summarizes the existing literature on Stevia cultivation, nutrition, therapeutic and pharmacological properties to provide a baseline for new research on Stevia and its metabolites.

ANTIMICROBIAL ACTIVITY OF SATUREJA HORTENSIS ESSENTIAL OIL ON MICROORGANISMS ISOLATED FROM DIABETIC FOOT ULCERS.

SABIHA AYDOGDU¹, ULKU ALTOPARLAK¹, SABAN KORDALI², ICLAL AGAN¹, DEMET CELEBI³

ABSTRACT

BACKGROUND *Satureja hortensis* is a well-known aromatic and medicinal plant. It has also been used as a folk remedy to treat various ailments such as indigestion, diarrhea and infectious diseases. The highest proportion of the chemical components of the essential oil are carvacrol and thymol. **OBJECTIVE** This study aimed to evaluate the antimicrobial activity of carvacrol extract of *Satureja hortensis* oil on microorganisms isolated from diabetic foot ulcers. **MATERIALS and METHODS** *Satureja hortensis* oil was isolated by hydrodistillation method. The oil composition was analyzed by Gas Chromatography - Mass Spectrometry (GC-MS), thus obtaining the crude essential oil extract used for antimicrobial tests. Microorganisms were obtained clinical isolates from Atatürk University Hospital. Microdilution and Disc Diffusion method were used to determine the antimicrobial activity of the extract against 9 diabetic foot agents including *Pseudomonas aeruginosa*, *Klebsiella pneumoniae*, *Proteus mirabilis*, *Staphylococcus epidermidis*, *Acinetobacter baumannii*, *Staphylococcus aureus*, *Enterobacter aerogenes*, *Candida albicans* and *Escherichia coli*. **RESULTS:** The minimal inhibition concentration (MIC) values ($\mu\text{g/ml}$) of the carvacrol extract of essential oil were determined for *P. aeruginosa* (33.75 $\mu\text{g/ml}$), *K. pneumoniae* (16.08 $\mu\text{g/ml}$), *P. mirabilis* (MIC <1.05 $\mu\text{g/ml}$), *S. epidermidis* (MIC <1.05 $\mu\text{g/ml}$), *A. baumannii* (MIC <1.05 $\mu\text{g/ml}$), *S. aureus* (MIC <1.05 $\mu\text{g/ml}$), *E. aerogenes* (8.4 $\mu\text{g/ml}$), *E. coli* (8.4 $\mu\text{g/ml}$) and *Candida albicans* (MIC < 1.05 $\mu\text{g/ml}$). In the disc diffusion method; the inhibition zones were measured as 8 mm for *P. aeruginosa*, 16 mm for *K. pneumoniae*, 15 mm for *P. mirabilis*, 30 mm for *S. epidermidis*, 30 mm for *A. baumannii*, 30 mm for *S. aureus*, 21 mm for *E. aerogenes*, 30 mm for *C. albicans* and 14 mm for *E. coli*. **CONCLUSION:** Carvacrol extract of *Satureja hortensis* showed antimicrobial effects on tested microorganisms. Plant extracts should be considered when used in part of replacement treatment.

EFFECTS OF MEDICINAL AND AROMATIC PLANTS ON INSECTS

ZÜHAL SAÇTI¹, TUĞBA AKDENİZ FIRAT¹

ABSTRACT

Our country has a rich flora and a large number of medical and aromatic plants. The number of species is about 9,000. While almost 20.000 species used for medical purposes in the world, this figure is about 500 in our country. In addition to the medical and pharmaceutical industry, these plants are benefited from many other areas. One of these areas is agriculture. Today, depending on the increase in the use of pesticides, environmentally friendly alternative methods which do not disturb natural balances are used in agriculture. Medicinal and aromatic plants are also benefited for this purpose. The important properties of plants on killing microorganisms and human health have been investigated in laboratories since 1926. Studies have been conducted on the use of extracts and essential oils against various insects and alternative methods of controlling weeds. However, due to the fact that there is a large amount of plants and insects, these studies will continue. In this study, in plant health subject, the positive and negative effects of medicinal and aromatic plants on harmful and beneficial insects, usage areas and experiments about these plants and pests have been investigated.

A-AMYLASE AND A-GLUCOSIDASE INHIBITORY ACTIVITIES OF THE EXTRACTS AND CONSTITUENTS OF FERULAGO PACHYLOBA ROOTS

SONGÜL KARAKAYA¹, SEFA GÖZCÜ², ZÜHAL GÜVENALP¹, HILAL ÖZBEK¹, HAFİZE YUCA¹, CAVIT KAZAZ³, CEYDA SİBEL KILIÇ⁴

ABSTRACT

Context: Ferulago species have been used since ancient times for the treatment of intestinal worms, hemorrhoids and as tonic, digestive, aphrodisiac and sedative. Apart from its medicinal uses, they have been used as salad or spice due to their special odors. Objectives: This study reports α -amylase and α -glucosidase inhibitory activities of extracts and bioactive compounds isolated from the roots F. pachyloba. Material and methods: The structures of isolated compounds through in vitro bioassay-guided fractionation processes from the roots of F. pachyloba were elucidated by detailed analyses of 1D and 2D NMR and ESI-MS data. Results: Eight known ones, osthole (1), imperatorin (2), bergapten (3), prantschimgin (4), grandivitol (5), xanthotoxin (6), felamidin (7), umbelliferone (8), and a sterol mixture consisted of stigmasterol (9), β -sitosterol (10) was isolated from the roots of F. pachyloba. Felamidin and osthole showed significant α -glucosidase inhibitory activity with 0.42 and 0.95 mg/mL IC₅₀ values, respectively, when compared to the reference standard acarbose (IC₅₀ 4.95 mg/mL). On the other hand, none of the tested extracts were found to be active on α -amylase inhibition. Discussion and conclusion: The present study demonstrated that among the compounds isolated from CH₂Cl₂ fraction of F. pachyloba roots, coumarins were determined the main chemical constituents of this fraction. This study aims to give first report on isolation and characterization of the bioactive compounds from root extracts of F. pachyloba and to report α -amylase and α -glucosidase inhibitory activities of this species.

CARDAMOM AS A FUNCTIONAL FOOD: ANTIMICROBIAL EFFECT

TESLİME ÖZGE YÖRÜSÜN¹, NILÜFER ACAR TEK¹, GAMZE AKBULUT¹, OSMAN BOZKURT¹

ABSTRACT

Cardamom is a tall, perennial herbaceous plants belonging to *Elettaria* and *Amomum* species of the Zingiberaceae family. Commonly grown and used species are *Elettaria cardamomum* Maton (green cardamom) and *Amomum subulatum* Roxburgh (black cardamom). The plants of these two species are known for their characteristic flavor of 15-20 black-brown seeds buried in the fruit. The sweet, spicy and citrusy flavor of cardamom is determined by the essential oil content. Volatile oil content in seeds ranges from 2% to 5% depending on storage conditions. Essential oil contains 1,8-cineol (36.3%), α -terpinyl acetate (31.3%) and limonene (11.6%) compounds. The content of 1,8-cineol and α -terpinyl acetate is the most important factor in the formation of the aroma of cardamom. Due to the volatile oils in its composition, the shelf life of the cardamom is short and the taste is directly influenced by the amount of these essential oils. Cardamom gives the most aroma to the food as powder. However, loss of fat and aroma is also rapid in this form. For this reason, it is necessary to protect the cardamom powder more carefully than in the form of seeds and capsules. It is stated in vacuum package that it can be stored at 5 ° and 90-180 days without losing aroma. As well as flavoring of nutrients, cardamom is also used in therapeutic and preventive curative in traditional medicine. It is generally used as a therapeutic agent in dental and gingival infections, tuberculosis, digestive and renal diseases. Due to antimicrobial effects against foodborne bacterial pathogens, interest in spices and aromatic herbs is increasing day by day in both industrial and scientific researches. Bacteria can develop resistance to drugs used in the treatment of bacterial infections. Therefore, new alternatives to these drugs need to be developed. When the antimicrobial effects of cumin, cinnamon, black cardamom and clove plants were examined, it was found that the black cardamom extract had the highest antimicrobial activity against *Escherichia coli* SS1 at the lowest concentration (2.83 mg/ml) and because of its eucalyptol content, it possessed good antibacterial effect on *Salmonella* spp. and *Bacillus licheniformis*. When evaluated according to extraction solvents, the aqueous extract inhibited all bacterial strains and showed the most effective extract on *Staphylococcus aureus*. Green cardamom extract was found to inhibit bacterial strains of *Pseudomonas aeruginosa*, *Mycobacterium smegmatis*, *Klebsiella pneumoniae*, *Staphylococcus aureus*, *Escherichia coli*, *Salmonella typhimurium*, *Enterococcus faecalis*, *Micrococcus luteus*, *Candida albicans*, *Salmonella typhi*, *Shigella flexneri* and *Staphylococcus aureus*. The type of bacteria in which the green cardamom extract was most effective was observed as *S. aureus*, an important cause of foodborne intoxication. It was found that black cardamom was effective against *Bacillus subtilis*, *Staphylococcus aureus*, *Pseudomonas aeruginosa* and *Escheria Coli* bacteria, and this effect on *Escherichia coli* and *Bacillus subtilis* was more effective than erythromycin, an antibacterial drug. The green cardamom was also effective against *M. luteus*, *S. aureus* and *B. cereus* bacteria after it is cooked. The use of 0.3 mg/g of green cardamom extract with high antimicrobial efficacy has been shown to induce toxic effects in rats by triggering inflammation, oxidative stress and cardiac cell necrosis in the brain. It is recommended

¹GAZİ ÜNİVERSİTESİ SAĞLIK BİLİMLERİ FAKÜLTESİ BESLENME VE DİYETETİK BÖLÜMÜ

that the amount of green cardamom be not more than 0.03mg/g. The methanolic extract of black cardamom seed is not toxic up to 3 g/kg. As a result, cardamom is a promising plant, especially due to antimicrobial effects on food-borne pathogens. It has been reported that high dose intake may be toxic as a result of rat studies, but more dose studies are needed.

DETERMINATION OF THE CURRENT SITUATION OF LAVENDER PRODUCTION IN TURKEY BY SWOT ANALYSIS

SELDA ARSLAN¹, MERVE GÜZEL², ŞAHİNDE ŞİLİ²

ABSTRACT

Lavender, one of the most tradable 15 essential oil plants in the world, has become the most popular plant of the cosmetics industry in recent years. Flowers are the part of lavender which has economic value. Essential oil is extracted from the flowers and flower stalks of the plant. According to TURKSTAT data; 747 tons of lavender was cultivated from 570 hectares of land in 2016, in Turkey. The cultivation of lavender and planting areas has been increased with its increased importance in cosmetic industry. However, this increase is still not enough to satisfy the demand. For this reason, Turkey imports essential oil extracted from lavender or lavantin, from the other countries such as Germany, France, England, Switzerland. According to TURKSTAT data; 6 tons of lavender or extracted essential oil, costed 192 thousand dollars, were imported in 2016, while only 194 kg of was exported and about 20 thousand dollars was earned. In this study, the strengths, weaknesses, opportunities and threats of lavender cultivation in Turkey have been determined. By this way, the current situation has been put forward by considering internal and external evaluation and targeted to bring forward proposals for reducing import. The lavender cultivation is quite suitable for the evaluation of unplanted, barren and irrigation limited lands, when the types of plants cultivated are considered in Turkey. For this reason, it has been pointed out the correct cultivation planning of lavender, a perennial plant, and precautions that should be taken before entering the lavender market. In addition that, the aim of the study is to acquire the unplanted land for agriculture and to make agricultural fields more efficient by encouraging the cultivation of lavender as an alternative crop.

PROBLEMS OF MEDICAL AND AROMATIC PLANT USE IN TURKEY

KASIM EREN TUNA¹, TUĐÇE UĐUR¹, NERMIN BAĐŞİ², DİLEK BOSTAN BUDAK¹

ABSTRACT

Medicinal plants” are identified and used directly or indirectly in the treatment of the humans and the animals, or are applied in order to avoid the diseases. The plants that produce and exude any aromatic substances are so called “aromatic plants”. They contain aromas, flavors, condiments and essential oils. The traditional and modern medicine utilize the medicinal and aromatic plants as remedies to prevent diseases, to maintain health and healing. They are useful as nutritional supplements, herbal teas, taste and flavor in feeding therewithal. In our country, the people are interested in using herbal remedies, day by day. The exposure to intense information through the television, internet and media has also raised the demand on medicinal and aromatic plants. It is significant and quite important to know the origin of the medicinal herbs (i.e. where and when they are collected) in terms of the effectiveness of the related plant in the treatment of diseases and for the human health. While we take precautions against harmful residues accumulated on an apple bought from the market, by washing thoroughly or peeling the crumbs before consuming it; this will not be as possible as in dried herbs that give off their flavor and active ingredients on the water. The plants collected from various areas where there is a high level of toxic gas emission such as neighboring highways, railway lines and factories, in gardens, fields and grasslands where chemical fertilizer are frequently used or sprayed, polluted waterside, etc. will also cause a risk for the human health. For medicinal and aromatic plants, the washing (made usually for root drogs), drying and storage process period is very important after the plant has been collected until being put to the shelves of the market. For example, the washing process must be done with cool water and the plants must not be wait wet before starting the drying process. Taking a long time contact with water can lead to a loss of the active substance, as well as increased risk of spoilage. The drying process is also of great importance for the protection of the active substance. In this case, direct contact with the sun's rays in a long-term should be avoided. The plant should not cause any loss of active substance while the plant loses water. On the other hand, we should also be sure that the plant has lost enough water and should not pave the way for the formation of bacterias and fungal growth. While storing and drying the medicinal plants, we should pay attention to the products which should not exceed the microbial activity limit because of the moisture they can have and simultaneously the loss of the essential oils in the extreme heat will be unfavourable as well. A dry and cool storage area should be selected. Another common problem in our country is the unrestrained sales of these herbs on internet and the weak control of herbalists. The seller of medicinal herbs, by other means the herbalist is "the person who prepares and sells spices, fragrance, healing and beneficial plants". When the pharmacies were not available in old times as they are today, the herbalists had not only sell fragrance, but also animal and vegetable plants used for pharmaceutical production. Various precautions can be taken to solve these problems. In this paper,

BIOACTIVE, PHARMACOLOGICAL PROPERTIES AND THERAPEUTIC USE OF CAPPARIS PLANT

LALE EREZER¹, ASIM KART¹, HIDAYET TUTUN¹

ABSTRACT

Cappari is a plant widely grown in the hot regions of the world, belonging to the genus capparidaceae from the family of Capparidaceae, consisting of 39 genera and 650 species. Among these species, Capparis spinosa, Capparis ovata and Capparis decidua are the most commonly investigated species in terms of pharmacological, therapeutic and nutritional properties. The presence of alkaloids, phytosterols, flavanoids and phenolic acids, glucosinolates, antioxidants, quaternary ammonium compounds and vitamins with different pharmacological activity were found in the caper plant. The capparidaceae species have significant anti-inflammatory activity, which is reported to inhibit the formation of prostaglandin and other inflammatory mediators in the cyclooxygenase pathway. Studies using different extracts have shown that these extracts exhibit partial and selective antimicrobial activity. The capparidaceae plant has a very rich antioxidant structure, mainly quercetin, phenolic compounds, glucosinolates, alkaloids, flavanoids, and rutosides. It has been reported that some glucosinolates such as benzyl-, p-hydroxybenzyl-, and 2-hydroxybutyl-3-enyl glucosinolate present in the capparidaceae plant are chemically protective against cancers. Antidiabetic, immunomodulatory, diuretic, antiallergic, antidiarrheal, antiviral, hepatoprotective, antiatherosclerotic, antifungal, antihypertensive, anthelmintic, diuretic and hypolipidemic effects of different capparidaceae species have been shown. Some studies have shown that the plant species belonging to the family Capparidaceae also have effects on the nervous system. In the recent years, therapeutic effects have been reported for capparidaceae species with sedative, antidepressant, anticonvulsant, analgesic, antiepileptic effects and for myelin loss seen in multiple sclerosis.

THE EFFECT OF BLACK MULBERRY (*MORUS NIGRA* L.) SYRUP ON ORAL BACTERIA ON BIOFILM FORMATION

ELİF AY¹, MERİH KIVANÇ¹

ABSTRACT

Black mulberry (*Morus nigra* L.) is a kind of flowering plant in Moraceae family, and is unique to southwest Asia. There are wild and cultivated species of mulberries in Anatolia, which have a significant change. The amount of mulberry production in Turkey is high. Black mulberry (*M. nigra* L.) is a very rich source of flavonoids, especially anthocyanins. It is stored in different forms, because it is a non-durable product. One of them is to make a mulberry syrup. Aphthous ulcers are very painful lesions, often surrounded by a pale yellow-red halo in the mouth on the buccal and lip mucosa, tongue, soft palate, pharynx, and gingiva. Mulberry syrup is commonly used for the treatment of lesions in the mouth. Microorganisms are protected by biofilm formation, from negative environmental conditions. They can survive and multiply in the biofilms. Biofilms are resistant to environmental conditions such as antibiotics and chemical substances. Various substances and antibiotics are used for preventing biofilm formation. Their use also leads to various problems; so in recent years the trend towards natural products has been increased. In this study, the effect of the mulberry syrup on biofilm formation of bacteria that was isolated from mouths, which containing aphthous ulcers was investigated. Previously isolated bacteria from patients' mouths with aphthous ulcers were obtained from the Department of Microbiology of the Biology Department of Anadolu University and used in studies. The minimum inhibitory effect of mulberry syrup on oral bacteria was determined by microtiter plate method. The effect of mulberry syrup on the formation of biofilm was investigated by 2 protocols. In the first protocol, mulberry syrup and bacteria were applied together. In the second protocol, the mulberry syrup is added after the formation of the biofilm. Biofilm formation was determined by microtiter plates and spectrophotometric method at 570nm with Krstal Violet dye. It has been found that black mulberry syrup inhibits biofilm formation when it was added before biofilm formed, but is not effective on preformed biofilm and even caused increase of the biofilm formation. As a result; the application of mulberry syrup inhibits biofilm formation. However, it is not effective after biofilm occurred. Further studies are needed especially with glucose-free preparations.

INVESTIGATION OF CYTOTOXIC AND GENOTOXIC EFFECT OF DR.HONEYWAX HEROVIC FOOD SUPPLEMENT IN VITRO

NİLÜFER ÇINKILIÇ¹, TOLGA ÇAVAŞ¹, ÖZGÜR VATAN¹, HUZEFYE HURİYET¹, HASAN ŞAHİNOĞLU²

ABSTRACT

Dr.HONEYWAX Herovic is a liquid form food supplement herbal product. This syrup product includes; propolis, kalonji, daisy, rosehip extracts, apple concentrate and honey. In the present study, we evaluated the potential cytotoxic and genotoxic activity of the Dr.HONEYWAX Herovic on human healthy lung epithelial cells Beas-2B. Potential cytotoxic effect was tested by XTT assay and potential genotoxic effect was tested by comet assay. Cells were treated with serial concentrations of Dr.HONEYWAX Herovic (0,142; 1,42; 14,2; 142; 1420 ppm) for 24h in XTT assay. Any cytotoxic effect was not identified even at dose 1420 ppm, which is ten thousand times upper from the dose of 0,142 ppm, which is the in vitro adaptation of recommended human daily therapeutic dose by XTT assay. Cells were treated with three doses of Dr.HONEYWAX Herovic (0,142; 142; 1420 ppm) for 24h in comet assay. Tail length, % Tail DNA and Olive Tail Moment parameters were evaluated in comet assay. Any genotoxic effect was not identified even at highest dose of 1420 ppm. Dr.HONEYWAX Herovic, which is a food supplement did not show any cytotoxic and genotoxic effect even at highest dose, which is ten thousand times from recommended human daily dose by XTT and comet assay on Beas-2B cells.

ALOE VERA: A MIRACLE PLANT WITH ITS WIDE-RANGING APPLICATIONS

KHAZINA AMIN¹, SENAY OZGEN¹, ZELIHA SELAMOGLU¹

ABSTRACT

Aloe vera, a plant of Liliaceae family, is not less than a blessing from centuries to date. It is native of hot and arid regions and widely grown as an ornamental plant. It has become a common household remedy for a variety of uses. This plant is also well known as medicinal herb. The leaves of plant contain mucilage tissue or aloe gel that is used for cosmetics and to cure mankind's ailments. Aloe vera has marvelous herbal remedy with defined clinical effectiveness. The active chemical constituents of Aloe vera include essential amino acids, anthraquinones, enzymes, minerals, vitamins, lignins, sugars, salicylic acid, folic acid, saponins, and sterols. There seems to be no single magic ingredient, all the nutritional ingredients work together in a synergistic way to create healing action and other health benefits. Aloe vera plays a role as complementary medicine to heal cutaneous wounds, burnings, and infections. Health promoting benefits of aloe vera are due to its anti-inflammatory, antibacterial, antifungal antiarthritis and hypoglycemic effects. Due to these marvelous attributes, this plant has the ability to reverse ailments and soothe human life in a myriad ways. With the gaining traction as an important ingredient in cosmetics, food and pharmaceuticals, many countries have started growing it commercially. Aloe vera farming is a very promising activity. There is a need to encourage Aloe vera farming as an alternative traditional crop to meet market demands. Efficient production technology along with well-established marketing channels for the distribution of leaves to processing units at a fair producer price is required for its economic sustainability.

MELATONIN ADSORPTION WITH L-TRYPTOPHAN GRAFTED POLY(HEMA) MEMBRANES FROM MEDICAL SEEDS

TÜLDEN INANAN¹, NALAN TUZMEN²

ABSTRACT

Melatonin (N-acetyl-5-methoxytryptamine) is an indoleamine synthesized from tryptophan which an essential amino acid. It is involved in the regulation of circadian rhythm (sleep–wake cycle) and the alleviation of insomnia arised from jetlag and shift work. Melatonin minimalizes neurodegenerative diseases, such as Alzheimer's and Parkinson's diseases and also acts as an anticancer agent. Also, melatonin may be used as a protective agent against to ocular diseases and headache disorders. In addition, potential antioxidative properties and anti-inflammatory effects of melatonin have been reported. Melatonin is widely distributed in the animal kingdom. High levels of melatonin have also been detected in several medicinal herbs and in the seeds of edible plants. Numerous studies have been reported about the presence of melatonin in plants with a wide range of concentrations from picograms to micrograms per gram of plant tissue. Due to their common usage in medicine and cosmetic industry, extraction and determination of melatonin selectively and with high purity using rapid and low-cost method from natural sources, such as high plants, have great importance. Radioimmunoassay (RIA), enzyme-linked immunosorbent assay (ELISA), high performance liquid chromatography (HPLC), and gas chromatography-mass spectroscopy (GC-MS) have been used for quantitative melatonin determination. The different methods such as liquid-liquid extraction, solid phase extraction (SPE) sorbents, microextraction by packed sorbent (MEPS) and combination of these methods were used for melatonin extraction. In recent times, affinity sorbents prepared by modification with several groups and methods draw attention for extraction of different biomolecules from higher plants. In the current study, L-tryptophan grafted poly(HEMA) membranes were used for melatonin adsorption from the extracts of medical seeds. Poly(HEMA) membranes were prepared by UV photopolymerization method and graft procedure was applied in the presence of L-tryptophan and sodium hydride. L-tryptophan grafted poly(HEMA) membranes were characterized by several methods and then, used in melatonin adsorption. Seeds of fenugreek (*Trigonella foenum-graecum*), fennel (*Foeniculum vulgare*), coriander (*Coriandrum sativum*), green cardamom (*Elettaria cardamomum*), flax (*Linum usitatissimum*) and sunflower (*Helianthus annuus*) were used for the extraction of melatonin with 3 different extraction solution. These commercially available seeds were obtained from herbalist in a grinded form. Each seed was extracted with ethyl acetate (EtOAc), EtOAc:MeOH (70:30) and EtOH, separately and used in melatonin adsorption studies. Melatonin amounts in the initial and final solutions of adsorption were determined by HPLC method with fluorescence detection. The results have shown that melatonin adsorption was performed with high recoveries (higher than 95 %) from all the extraction solutions of medical seeds.

EVALUATION OF CYTOTOXIC AND GENOTOXIC EFFECT OF SCORZONERA VERATRIFOLIA

AYFER BECEREN¹, MERT GEÇİM¹, OZLEM BINGÖL ÖZAKPINAR¹, TURGUT TAŞKIN¹, AHMET DOĞAN¹, SEMRA ŞARDAŞ¹

ABSTRACT

Primer and secondary metabolites of the natural products produced by the plants are the most basic products for drug candidates that can be used directly or indirectly in medicine today. Therefore, the number of scientific researches carried out on these compounds seems to increase day by day. In recent years people prefer to use natural antioxidants in their daily lives in order to prevent diseases and strengthen their immune systems. The Scorzonera genus (Asteraceae) is present by 39 species in Turkey and 17 of them are endemic, such as a perennial herbaceous plant Scorzonera veratrifolia. This plant is distributed in Eastern Anatolia and grows on dry rocky hillsides. Recent studies showed that Scorzonera species contain dihydroisoquinarine, bibenzyl derivatives, flavonoids, lignans, stilbene derivatives, quinic and caffeic acid derivatives, sesquiterpene, sesquiterpene lactones and triterpene compounds. Studies have shown that Scorzonera species exhibit antioxidant, analgesic, anti-inflammatory and wound healing activity. Although Scorzonera veratrifolia is widely used as a natural product in traditional medicine, up to our knowledge no study in the literature has been demonstrated until now. Therefore, the aim of the present study was to evaluate the possible genotoxic effect of Scorzonera veratrifolia in wistar albino rats by comet assay and cytotoxic effect on human colon cancer cell line HT-29, human lung cancer cell line A549, human cervical cancer cell line HeLa and human prostate cancer cell line PC-3 by MTT method. Wound model with incisional wounds was made on wistar albino rats and the extracts were applied for 10 days. At the end of the treatment, whole blood was collected to determine the genotoxic potency by using Comet assay. The cytotoxic effect of extracts at a dose of 100 micrograms on the proliferation of cancer cells was determined by MTT method on different human cancer cell lines. According to our results, heptan and methanol extracts from the aerial parts and roots of Scorzonera veratrifolia did not show any genotoxic effect in vivo model system, however, it was determined that no inhibition was observed on the cancer cell proliferation, in contrast the cancer cells were proliferated. This proliferative effect was found to be more significant on cervical, colon and prostate cancer cell lines. Therefore, the findings of this study recommend that Scorzonera veratrifolia plant should not be consumed especially in cancer patients because of its positive effects on cell proliferation and further studies are needed to highlight this important traditional plant.

ANTIBIOFILM EFFECT OF DIFFERENT ESSENTIAL OILS IN P.AERUGINOSA PAO1

EBRU ÖNEM¹, RAMADAN BILGIN AKALIN²

ABSTRACT

Biofilm is the life form of microbes attached to surfaces, which might be found in somewhere like medical, industrial and natural surfaces. Bacteria compose biofilm use the system which is named quorum sensing (QS) and it based on density-dependent cell to cell communication. In biofilm form, bacteria are more resistant to antimicrobial treatments. So new researches focus on blockage of this form and some chemical compounds and also plant extract have used for this aim. In this paper eight different commercial essential oils (Amyris balsamifera, Nerium oleander, Ormenis multicaulis, Citrus grandis peel, Citrus nobulis, Citrus nobilis, Styrax, Citrus sinensis) have been evaluated inhibition of biofilm formation against reference strain Pseudomonas aeruginosa PAO1. Inhibition effect of oils on biofilm was searched cristal viole (CV) assay. Biofilms were grown on LB medium in 96-well polystyrene plates in the presence and absence of 4 different concentrations of the oils. All tests repeated 3 times and evaluated for statistical. According to the result of this study significant reduction of biofilm composition were seen first concentration of Citrus nobilis, Citrus sinensis, Styrax. Inhibition rates are respectively 97%, 98%, 91%. The first concentration of Nerium oleander and Ormenis multicaulis showed antibacterial effect on P. aeruginosa PAO1. Citrus grandis peel and Amyris balsamifera showed low and also antibiofilm effect(25%, 17%). And other concentration of plant oils have different antibiofilm rate.

IMPORTANCE OF BERBERIS CRATAEGINA DC (HAWTHORN BARBERRY) FOR FOOD

BAYRAM YURT¹, LÜTFİ BEHÇET¹, ÖMER BEYHAN², NURULLAH DEMİR¹

ABSTRACT

Importance of *Berberis crataegina* DC for food Turkey is located in a region that has rich plant variety among the major regions of the World. A significant part of Turkey flora (1/3) is endemic to Turkey. Unfortunately, this richness of plant is not well exploited and the knowledge about wild plants is limited (especially in the application fields). We just have knowledge about chemical composition and usage culture of limited number of plants. The members of *Berberis* L. genus within *Berberidaceae* family are known as hawthorn barberry in Turkey. This genus includes four members (type) in Turkey. *Berberis crataegina* is common in Turkey and some countries around the world. *Berberis crataegina* is found in Inner Western Anatolia, upper sakarya, Konya province, Middle Kızılırmak region, Antalya region, Dicle and upside of Fırat Basin. Fruits of *Berberis crataegina* species are used for different purposes in Turkey. Fruits of *Berberis crataegina* have high antioxidant activity. Antioxidants are very important for health and have many important functions such as antimutagenic, anticarcinogenic and antiaging. Researches demonstrate that this natural wild plant possesses antitumor, antibacterial activity and positive effects on urinary tract disorders. Fruits of *Berberis crataegina* are generally collected in July-August, depending on climate conditions in Turkey. In early July, the fruit has sour taste and light purple but in ripening stage it turns to sweet taste and dark purple (August). Collected fruits are used for making home-made fruit juice, marmalade and jelly. The fruits of the hawthorn barberry are also could be consumed as tea. In addition, *Berberis crataegina* fruits are dried with sun and form daily diet of the local people as snack foods. Fruits of *Berberis crataegina* used in the production of ice cream are highly appreciated by the consumers because of the natural taste, aroma and color especially when added to ice cream thanks to its natural dark purple color. The greatest benefit of this wild plant is its potential use as natural color additive (dark purple color) in food products.

ANTIOXIDANT ACTIVITY OF *ACHILLEA CAPPADOCICA*

NUSRET GENÇ¹, HÜSEYİN AKŞİT¹, MAHFUZ ELMATAŞ¹, ZEYNEP AKŞİT²

ABSTRACT

Antioxidants can inhibit or delay the oxidation process in living organism and food stuff. The intake of naturally occurring antioxidants such phenolics and vitamins can play important role to fighting free radicals. A great interest came out to finding new natural antioxidants from natural sources to replace synthetic ones due to restricted side effects. The greatest source of natural antioxidants is medicinal aromatic plants. Plants have been used for a large range of purposes including medicine, nutrition, flavorings, fragrance and industrial uses. The aim of this study was to investigate antioxidant properties of *Achillea cappadocica*. Plant materials were collected from Refahiye, Erzincan at June 2016. Floral parts were separated and dried. In order to determine of antioxidant activity of *A. cappadocica*, two extraction systems were used. Floral parts of plant material were boiled in water for 30 min to mimic preparation aromatic plant decoction in folk medicine. The plant residue was removed by filtration. Filtrate dried using a lab-scale lyophilizer to give light yellow powder (Extract I). A methanol extract was prepared and suspended in hot water. The insoluble parts (mostly contain chlorophylls) were removed using filter paper. A small amount of filtrate dried as above to give dark yellow powder (Extract II). In order to remove water soluble carbohydrates and concentrate biologically active components, water phase partitioned with ethyl acetate and butanol in separation funnel respectively. Organic layers were concentrated to dryness to give Extract III (etOAc phase) and IV (butOH phase). The remained water layer after partition was lyophilized (Extract V). Total phenolic and flavonoid content of five extracts were determined using spectrophotometric methods. Antioxidant capacity of *A. cappadocica* was evaluated using DPPH and ABTS radical scavenging activity and reducing power tests. Extract III was found both phenolic and flavonoid rich extract (119.9 and 71.46 mg/g extract respectively). Also this extract was found most active when compared others. Extract V was found poor both active compound content and activity. Extract III contains 60 fold more phenolic compounds than Extract V. It means the partition process was success to extraction of phenolics from water extract. DPPH and ABTS radical cation assays, expressed as IC₅₀ value ($\mu\text{g/mL}$), were used for evaluation of radical-scavenging properties of obtained five extracts from plant material. DPPH radical scavenging ability of extracts calculated 18.84 $\mu\text{g/mL}$ for Extract III and 133.40 $\mu\text{g/mL}$ for Extract V. The reducing power of most active extract was found 369.22 $\mu\text{mol trolox equivalent activity/g extract}$.

TURKEY'S WILD ORCHIDS AND MARAS ICE CREAM

NAZLI TÜRKMEN¹, ÖZGE KINDIR UĞURLUOĞLU², AYŞE GÜRSOY¹

ABSTRACT

There are 10 different breeds and 80 different species of wild orchids in Turkey. An important part of these plants belonging to the Orchidaceae family is also endemic. Due to threats such as industrialization, urbanization, extension of agricultural areas, overgrazing and tourism activities, wild orchid species that grow in Turkey are threatened with extinction. The main reason why wild orchids are collected from nature is their use in the production of salep. The salep obtained by drying and milling the tubers of these plants is mostly used in the production of Maras ice cream in our country. Maras ice cream is a traditional product produced in Kahramanmaraş and consumed lovingly which is sold to various parts of the country and even abroad. It is known that the unique structure and flavor of Maras ice cream originated from the goat milk used in its production and especially from the wild orchids grown in the mountains. At least 10-20 million wild orchids are removed from nature every year for Salep production (Sandal and Söğüt, 2010). In order to obtain 1 kg of salep, approximately 1000-4000 tubers, ranging from 0.25 to 1 gram, are needed (Tekinşen and Güner, 2010). Thus, although the collection of wild orchids from nature is prohibited and serious sanctions are imposed on unauthorized gatherers, millions of wild orchid individuals are annihilated from the nature each year for the salep production. Due to the fact that the mentioned problem is still not fully resolved, various studies have been carried out on the reproduction of these species. Within the scope of the "Salep Action Plan" carried out by the General Directorate of Forestry of the Republic of Turkey Ministry of Forestry and Water Affairs; studies on the propagation of wild orchids in the natural environment, establishment of gene-source seed gardens, expansion of the spreading areas by transferring wild orchid members raised in nurseries to their natural distribution areas and preservation of wild orchids in their natural environment are still continuing. As a result of researches on the propagation of wild orchid members in the culture medium, it was determined that *Serapias vomeracea* (Burm. fill.) Brig, *Orchis sancta* L. and *Ophrys bombylifera* Willd. were the most prominent species in terms of their tubing ability, and the first two of these species were mentioned in terms of adaptation to culture conditions and widespread availability. *Orchis morio* L., *Orchis italica* Poiret. and *Orchis anatolica* Boiss. species were reported to have other promising species (Anonymous, 2014). Although it is generally accepted that salep from each species of wild orchid is not suitable for ice cream production, it is still unclear which species are suitable. Salep is known as a product having a high content of glucomannan, depending on the wild orchid species obtained, and the salep used in the production of ice cream is generally selected to have the highest content of glucomannan. Therefore, the salep obtained from any wild orchid species collected from nature without permission can not be used in the production of ice cream. It is thought that many wild orchids can be prevented from being collected from nature by the determination of wild orchid species suitable for use in the production of ice cream and the emphasis on studies on the reproduction of these species in the culture medium.

DETERMINATION OF ANTIOXIDANT PROPERTIES OF RUMEX CRISPUS AND SCROPHULARIA CANINA SUBSP. BICOLOR

SERHAT DEMİR¹, BUKET BOZKURT¹, MUSTAFA ALI ÖNÜR¹, GÜLEN İREM KAYA¹, NEHIR ÜNVER SOMER¹

ABSTRACT

Determination of Antioxidant Properties of *Rumex crispus* and *Scrophularia canina* subsp. *bicolor* Demir S.1, Bozkurt B.1, Önür M.A.1, Kaya G.İ.1, Ünver-Somer N.1 Department of Pharmacognosy, Faculty of Pharmacy, Ege University, 35100, İzmir The genus *Rumex* L. (Polygonaceae) consists of about 200 species growing worldwide and 23 species and 5 hybrids naturally growing in Turkey (1,2) *Rumex* roots have important traditional uses in relation to their laxative properties. Decoctions prepared from the underground parts have been claimed to be therapeutically useful as cholagogue, tonic and laxative and for blood cleansing. Fresh leaves are used to treat eczema and also consumed as vegetable in Anatolia (3). In the flora of Turkey, *Scrophularia* is represented by 59 species, 23 of which are endemic. Some *Scrophularia* L. species, especially *S. nodosa* L. are used in folk medicine as a diuretic and for the treatment of wounds and hemorrhoids (4,5). Different species of the genus *Scrophularia* (Scrophulariaceae) have been used in traditional medicine to treat some diseases, including dermatosis and inflammatory affections (6). In the present study, *Rumex crispus* L. and *Scrophularia canina* L. subsp. *bicolor* (SM.) Greuter collected from Soma, Manisa, were investigated for their antioxidant activity using the DPPH method. Methanol and ethyl acetate extracts were prepared from the above-ground parts of these plants. Significant antioxidant activity was determined for methanol (IC₅₀: 4.16 µg/mL) and ethyl acetate (IC₅₀: 8.71 µg/mL) extracts of *Rumex crispus* L. Moreover, methanol (IC₅₀: 60.78 µg/mL) and ethyl acetate (IC₅₀: 149.33 µg/mL) extracts of *Scrophularia canina* subsp. *bicolor* (SM.) Greuter were shown to have important free radical scavenging antioxidant activity. Key words: Antioxidant activity, *Rumex crispus*, *Scrophularia canina* subsp. *bicolor* References 1. INVESTIGATION OF CYTOTOXIC AND GENOTOXIC EFFECT OF DR.HONEYWAX VEROX FOOD SUPPLEMENT

TOLGA ÇAVAŞ¹, NILÜFER ÇINKILIÇ¹, ÖZGÜR VATAN¹, HUZEFYE HURİYET¹, HASAN ŞAHINOĞLU²

ABSTRACT

Dr.HONEYWAX Verox is a food supplement product. These capsule product includes; grounded Thistle, Carop, Ginger, Turmeric, pollen and Cinchona. In the present study, we evaluated the potential cytotoxic and genotoxic activity of the Dr.HONEYWAX Verox on human healthy lung epithelial cells Beas-2B. Potential cytotoxic effect was tested by XTT assay and potential genotoxic effect was tested by comet assay. Cells were treated with serial concentrations of Dr.HONEYWAX Verox (0,285; 2,85; 28,5; 285; 2850 ppm) for 24h in XTT assay. Any cytotoxic effect was not identified even at dose 2850 ppm, which is ten thousand times upper from the dose of 0.285 ppm, which is the in vitro adaptation of recommended daily human dosage by XTT assay. Cells were treated with three doses of Dr.HONEYWAX Verox (0,285; 285; 2850 ppm) for 24h in comet assay. Tail length, % Tail DNA and Olive Tail Moment parameters were evaluated in comet assay. Any genotoxic effect was not identified even at highest dose 2850 ppm. Dr.HONEYWAX Verox, which is a food supplement did not show any cytotoxic and genotoxic effect even at highest dose, which is ten thousand times the dose of recommended human daily therapeutic dose by XTT and comet assay on Beas-2B cells.

EFFECT OF OREGANO ESSENTIAL OIL ON THE QUALITY OF SUCUK

SONGÜL ŞAHİN ERCAN¹, HÜSEYİN BOZKURT¹, ÇİĞDEM SOYSAL¹

ABSTRACT

This study aimed to evaluate effect of oregano essential oil at concentration of 0.5% on pH, TBARS, overall sensory quality, colour (Hunter L, a, b, YI) of sucuk during the fermentation period. A sharp decrease ($P < 0.05$) in pH values were observed from 5.1 to about 4.3 during the first 3 days of fermentation. Control and 0.5% oregano oil added sucuks showed similarity in pH change and it reached to 6.8 at the end of the fermentation. Addition of oregano oil decreased ($P < 0.05$) the TBARS value. TBARS values increased from 0.29 mg/kg and 0.52 mg/kg to 1.0 mg/kg and 1.56 mg/kg for oregano oil added and control sucuks, respectively. Hunter L, b, YI values were affected both ($P < 0.05$) by fermentation period and sample, however, a-values changed significantly ($P < 0.05$) by fermentation period and was not affected significantly by sample ($P > 0.05$). Addition of oregano oil did not significantly ($P > 0.05$) affect the overall sensory quality. Overall sensory quality evaluated from color, flavor and ease of cutting scores increased ($P < 0.05$) from 5.7 to about 7.5.

RAPID QUANTITATIVE DETERMINATION OF CUMIN ADULTERATION WITH CORIANDER AND PEANUT HULL POWDER USING THE DSC TECHNIQUE

İHSAN BURAK ÇAM¹, HANDAN BAŞÜNAL GÜLMEZ¹, AYHAN TOPUZ¹

ABSTRACT

Cumin (*Cuminum cyminum* L.) is a flowering and annual plant of the family Apiaceae. Cumin powder is used to give flavor to foods and also has different medicinal properties. The most common adulterants are coriander and peanut hull since they are cheap ingredients. The similarities and differences in glass transition (T_g) and melting transition of cumin powder and adulteration materials were investigated. T_g values and melting transition of the powders were determined by differential scanning calorimetry (DSC). In the study, cumin, coriander powder, and peanut hull were collected from the local market and peanut hull was grinded prior to analysis. The coriander powder and peanut hull were blended individually with cumin powder at the ratios of 0/100 (adulterant:cumin), 30/70, 50/50, and 100/0. Mixing was on a weight basis. The DSC curves were obtained in the temperature range from -20 to 260°C under the dynamic atmosphere of N₂ (25 mL/min) heating rate of $\beta=10^\circ\text{C}/\text{min}$ using an Al capsule containing approximately 25 mg of each sample. The obtained result indicated that, T_g values of the cumin, coriander, and peanut hull powders were 26.54, 77.81 and 56.79°C, respectively. Additionally, melting heat value of the cumin powder were found to be 100.94 J/g and the values of the other samples were 77.81 and 89.76 J/g. The results of this study suggest that the DSC analysis may be available to determine adulteration of cumin with coriander and peanut hull powder.

IN VITRO ANTIMICROBIAL ACTIVITY OF ARTEMISIA ABSINTHIUM ESSENTIAL OIL

OZGUR CELEBİ¹, ICLAL AGAN¹, ULKU ALTOPARLAK¹, SABAN KORDALI², DEMET CELEBİ³

ABSTRACT

BACKGROUND The genus *Artemisia* has been utilized worldwide due to its immense potential for protection against various diseases, especially wound infections. Camphor is one of the main components of *Artemisia absinthium* oil. **OBJECTİVE** This study aimed to evaluate the antimicrobial activity of Camphor extract of *Artemisia hortensis* oil on microorganisms isolated from wound infections by disc diffusion and microdilution method. **MATERIAL and METHOD** *Artemisia absinthium* oils were isolated by hydrodistillation method. The oil composition was analyzed by Gas Chromatography - Mass Spectrometry (GC-MS). Microorganisms were provided by Ataturk University Research Hospital. Microdilution and Disc Diffusion Method were used to determine the antimicrobial activity of the extract against nine wound infection agents including *Pseudomonas aeruginosa*, *Klebsiella pneumoniae*, *Proteus mirabilis*, *Staphylococcus epidermidis*, *Acinetobacter baumannii*, *Staphylococcus aureus*, *Enterobacter aerogenes*, *Candida albicans* and *Escherichia coli*. **RESULTS** The minimal inhibition concentration (MIC) values ($\mu\text{g/ml}$) were determined for *P. aeruginosa* (MIC = 500 $\mu\text{g/ml}$) for *Klebsiella pneumoniae* (MIC = 500 $\mu\text{g/ml}$), *P. mirabilis*, (MIC = 500 $\mu\text{g/ml}$), *S. epidermidis* (MIC < 1.95 $\mu\text{g/ml}$), *A. baumannii* (MIC = 500 $\mu\text{g/ml}$), *S. aureus* (MIC <125 $\mu\text{g/ml}$), *E. aerogenes* (MIC = 500 $\mu\text{g/ml}$), *E. coli* (MIC = 500 $\mu\text{g/ml}$), *C. albicans* (MIC = 500 $\mu\text{g/ml}$). Anti-microbial activity of the camphor extract of essential oil was tested by the disc diffusion method. The inhibition zones were measured as 18 mm for *P. aeruginosa*, 22 mm for *K. pneumoniae*, 30 mm for *P. mirabilis*, 30 mm for *S. epidermidis*, 28 mm for *A. baumannii*, 30 mm for *S. aureus*, 18 mm for *E. aerogenes*, 30 mm for *C. albicans* and 21 mm for *E. coli*. **CONCLUSION** Camphor extract of *A. absinthium* oil showed antimicrobial effects on tested microorganisms by disc diffusion method. The MIC values of only two microorganisms tested were different. The MIC value of *S. epidermidis* (MIC < 1.95 $\mu\text{g/ml}$) and *S. aureus* (MIC < 125 $\mu\text{g/ml}$), while the others were measured (MIC = 500 $\mu\text{g/ml}$) by microdilution method. Plant extracts should be considered when used in part of replacement treatment.

FATTY ACID COMPOSITION, STEROL, TOCOPHEROL AND AMINOACID CONTENTS OF TRIGONELLA CARIENSIS BOISS.

ŞERİFE SELMA URAS GÜNGÖR¹, GAMZE KÖKDİL¹

ABSTRACT

The genus *Trigonella* L. (Leguminosae) includes about 135 species distributed from the Mediterranean regions, Southeastern Europe, Western Asia, North and South Africa (1,2). *Trigonella foenum-graecum* L. is the most widely used species in *Trigonella* genus and it is an annual herbaceous plant commonly called fenugreek; its seeds are used as food crops in India, to supplement wheat and maize flour for bread making in Egypt, and as one of the staple foods in Yemen. It is credited with many medicinal properties and is one of the oldest medicinal plants used in many Asian and African countries. Its seeds have been used as a carminative, tonic, aphrodisiac in Ayurvedic, Chinese and Unani systems of medicine. It was known that the plant contain flavonoids, alkaloids, saponins, fixed oil, polysaccharides, minerals and proteins. The seeds used in many traditional systems as aromatic, carminative, galactogogue, antibacterial, antidiabetic, hypocholesterolemic, diuretic and analgesic agent (1-3). In Turkey, the genus *Trigonella* represented by 54 taxa (4,5). *T. cariensis* is one of these taxa, which grows West and Soth West Anatolia, Greece and East Mediterranean area. *T. foenum-graecum* has been extensively studied but there is little information about other species of the genus in the literature (6,7). *T. cariensis* Boiss. have not been studied phytochemically. The aim of the present study was to determine fatty acid compositions, sterol, tocopherol and aminoacid contents of *T. cariensis*. The seeds contain 2.01 ± 0.12 g/100 g fixed oil. Linoleic acid (43.74 ± 0.24 %) and α -linolenic acid (18.38 ± 0.45 %) along with palmitic acid (14.16 ± 0.38 %) were the main fatty acids. The total sterol content was 2247.09 ± 0.06 mg/100 g, which consisted mainly of β -sitosterol (62.65 ± 1.53 %). α -tocopherol (233.54 ± 0.47 mg/100 g) was the dominant tocopherol. L-Glutamic acid (5801 ± 0.32 mg/100 g) was the main aminoacid. The results of the present study revealed that this species is important source of essential fatty acids, tocopherols and aminoacids. The oil rich in polyunsaturated fatty acids which play an important role in human health. Further studies are needed to evaluation of the plant in food industry and in health. BEEKEEPING ACTIVITIES IN MEDICAL AND AROMATIC PLANT PRODUCTION

ALI KEMALI ÖZUĐUR¹, H. AYLAR SARI¹, ALI GÖNCÜ¹

ABSTRACT

It was first described by the German Koelreuter and Sprengel in the years 1750-1800 that the bees were pollinators of plants. With this special feature of bees, beekeeping activities are now used not only for obtaining bee products but also for pollinating plants which are important for humanity. According to the information in the literature, it is stated that 82 cultivated plants are used for a large part of human food, 63 of these plants are pollination. Stated that 80% of the plants cultivated in Europe need to be pollinated by bees and some other creatures. Bees make pollinate that it has been an important source of income for beekeepers in the United States. In our country, 75% of the beekeeping activities are carried out in the form of "bee colonies", which are called migratory (traveler), to be kept in different regions in order to be injured by differences in flowering period between regions. This activity naturally also provides for pollination of the plants in the areas where the colon is left. It is seen how important beekeeping activities are for the natural equilibrium when it is thought that a bee circulates on average 1000 flowers per day. The production of medicinal and aromatic plants in our country is done in the form of collecting naturally grown plants. Cultural aquaculture sites for medical and aromatic plant cultivation have been opened with new legislation and incentives. Beekeeping activities are indispensable for the pollination and quality of the plant in whatever way. Many of the medically and aromatic plants that grow spontaneously from nature are valuable nectar resources for beekeeping. According to the flowering periods of these nectar sources, migrating beekeeping activities are also carried out in our country. Thus, both the beekeepers reach good honey resources and the continuity of medical and aromatic plant resources in our country is ensured. This study is intended to increase the knowledge of beekeepers in our country about medical aromatic plants and contribute to the emphasis of bee and apiculture activities on the medical aromatics and other plants.

SCAVENGING ACTIVITY OF REACTIVE OXYGEN SPECIES AND DETERMINATION ANTIOXIDANT PROPERTIES OF 'SIDERITIS MONTANA'

EMRE KOÇ¹, SELVI CİNGÖZ¹, FERDA CANDAN¹

ABSTRACT

Medicinal plants contain chemical component which show powerful antioxidant activity and they can be used as a safe source in industrial foods, crops and products. Recently, there has been reproducing interest in biochemistry of plants because of they can protect many diseases and health problems such as aging, heart diseases and chronic diseases in human body. The Lamiaceae is a plant family within that some species of them have potential therapeutic activity. The genus *Sideritis* which is a member of the Lamiaceae family, commonly known as "mountain tea" in Turkey. These plants are widely used to prepare herbal drug and traditional teas. In Turkey, the genus *Sideritis* contains 46 species, 31 of which are endemic. Plant materials of *S. montana* species were obtained from Yarıhisar, Hafik, Sivas-Turkey in 2011. The aim of this study was to investigate in vitro antioxidant activities of methanolic extracts of *Sideritis montana*. Also, our investigations included total phenolic content, total flavonoid content, total antioxidant capacity, scavenging of hydroxyl radicals, scavenging of DPPH radicals and scavenging non-free radical species such as hydrogen peroxide. The extract of *S. montana* showed that equivalent of phenolic content (157.29 ± 3.71 mg GAE/g DW), flavonoid content (403.99 ± 0.92 mg QUE/g DW) and total antioxidant capacities as (154.47 ± 4.12 mM α -tocopherol acetate / gram dry weight). IC₅₀ is the amount of extract supplying 50% inhibition of DPPH, hydrogen peroxide and hydroxyl radicals. The IC₅₀ values are presented in Table 1. Table 1 Scavenging of ROS and DPPH for the methanolic extracts of *Sideritis montana*. Sample Hydrogen peroxide H₂O₂ IC₅₀ (mg L⁻¹) Hydroxyl radicals (\bullet OH) IC₅₀ (mg L⁻¹) DPPH radicals IC₅₀ (mg L⁻¹) *Sideritis montana* 25.05 \pm 1.46 124.75 \pm 3.04 58.48 \pm 1.30 Values are mean of triplicates \pm SD The result of this study indicate that methanolic extracts of *S. montana* can be useful as an easily accessible source of natural antioxidants. By reason of in order to use these valuable *Sideritis* species in pharmaceutical products and food, their cultivation and conservation are of great importance.

TURKEY IN THE RAPID ALERT SYSTEM FOR FOOD AND FEED NOTIFICATIONS IN THE PERIOD OF 2006-2016: HERBS AND SPICES REVIEW

SAMI GÖKHAN ÖZKAL¹, SENEM TÜFEKÇİ²

ABSTRACT

Turkey in the Rapid Alert System for Food and Feed notifications in the period of 2006-2016: herbs and spices review Sami Gökhan ÖZKAL¹, Senem TÜFEKÇİ²* 1 Pamukkale University, Faculty of Engineering, Department of Food Engineering, Denizli, Turkey, 2 Pamukkale University, Vocational School of Acıpayam, Department of Food Processing, *Presenting Author: S. TÜFEKÇİ (stufekci@pau.edu.tr) Herbs and spices were used in traditional medicine, food preparation and preservation for thousands of years. Herbs and spices are vulnerable to biological, chemical and physical contamination and hazards during supply chain. The Rapid Alert System for Food and Feed (RASFF) database which is an effective tool to exchange information about measures taken responding to serious risks detected in relation to food and feed can be also a good source for investigating supply chain contaminations and hazards of herbs and spices. In parallel with this purpose RASFF database was investigated for herbs and spices categorized notifications originating from Turkey cover period from 2006 to 2016. RASFF notifications were divided into four groups as; alerts, information, border rejection, and news. A total of 59 notifications (alert – 21, information – 19, border rejection - 19) were reported for Turkey against a worldwide 1685 notifications. Oregano was the most border rejected herb. The number of notifications showed a descending trend chronologically. Germany, Italy and Netherlands were countries most notified about herbs and spices via Turkey. Listed 26 hazard categories were analyzed for herbs and spices and the major hazards categories were composition (45.76 %), pathogenic micro-organisms (35.59 %) and mycotoxins (11.86 %). The relation between hazard category and product was also examined, and mycotoxin hazards mainly seen in chilli pepper, paprika and red pepper. Salmonella spp. was only frequently reported pathogenic micro-organism in RASFF for Turkey with 20 notifications. In all categories the most notified products were oregano, chilli pepper, red pepper and cumin with 13.56 %, 11.86 %, 10.17 %, 10.17 % respectively. PLANTS USED AS COFFEE IN EASTERN MEDITERRANEAN REGION

SERTAN ÇEVİK¹, HÜSNIYE ÖZALP², MACIDE BURCU TİMUR³, RIZA BİNZET²

ABSTRACT

Coffee is one of the most important agricultural plantation crop. All cultivated species originate from Africa and belong to the genus *Coffea*. The genus *Coffea* comprises approximately 100 species and only two species (*Coffea arabica* L. and *Coffea canephora* Pierre ex A.Froehner) are commercially cultivated. It is grown in about 10.2 million hectares land spanning over 80 countries in the tropical and subtropical regions of the world especially in Africa, Asia, and Latin America (Mishra and Slater, 2012). Coffee is the most important commodity in international agricultural trade, generating over 90 billion dollars each year and involving about 500 million people in its management, from cultivation to final product for consumption (Dias et al. 2007; Cavatte et al. 2012, Praxedes et al. 2006). Coffee is the second most consumed drink in the world after water and it is known that approximately five hundred billion cups of coffee are consumed annually (Butt et al. 2011). In this study, 15 different plant species belonging to 9 families used as coffee in the Eastern Mediterranean Region were discussed. This species are respectively: *Prunus dulcis* (mill.) D.A Webb, *Nigella sativa* L. *Cichorium inthybus* L. *Gundelia tournefortii* L. *Onopordum illyricum* L. *Pistacia terebinthus* L. *Pistacia atlantica* L. *Cicer arietinum* L., *Abelmos chusesculentus* (L.) Moench *Echinops ritro* L. *Juniperus communis* L. *Ceratonia siliqua* L. *Elettaria cardamomum* (L.)Maton, *Phoenix dactylifera* L. *Taraxacum officinale* G. In which parts of these species are discussed, information is given on how to make and prepare them. Obtained information is usually obtained by interviewing elderly people and local counselors (The turkish name is Aktar) face to face. Family, genus, species, Turkish names and coffee preparation are given for each taxon.

DETERMINATION OF SLIMMING HERBAL TEA CONSUMPTION OF COLLEGE STUDENTS

ELMAS ERSÖZ¹, EZGI TOPTAŞ BIYIKLI¹, ALI EMRAH BIYIKLI¹, KÜBRA TOP¹, SIBEL YANAR¹, HATICE NUR TURAN¹, HİLAL DİKİLİTAŞ¹, OKAN GÜLER¹

ABSTRACT

INTRODUCTION Obesity is one of the increasing health issue of nowadays and due to this, attention to the herbal products increased. Persons who want to lose weight, have a false belief that these products could lose weight easily and swiftly. Especially the cost and availability of the herbal teas, let people to prefer them. Herbal teas could help to lose weight due to herbal teas caffeine content and effects on catechin thermogenesis. In addition to this positive influence, herbal teas have laxative, diuretic and sweating properties. **OBJECTIVE** This survey's aim is to determine the slimming herbal tea consumption of college students. **METHOD** The survey is made between February 2017 and March 2017 on randomly selected students at Selçuk University. 338 women and 35 male students are including for this study. Specially prepared survey is used for this study. In the survey, general characteristics, their herbal tea consumption for slimming in the last year and their choice reasons were asked. Besides the participants anthropometric measurements have measured. To evaluate the data, SPSS 22.0 program is used. Chi square test is applied for the relationship between the parameters and significance level is set as $p < 0.05$. **RESULTS** The average age of the participant students is 20.2 ± 1.5 . Body mass index of the students are found as low weight, normal weight and overweight, 11.8%, 70.0% and 18.2% respectively. 15% of the participants use herbal teas to lose weight. Women's use of slimming herbal tea rate is 15.7%. On the other hand, male's use of slimming herbal tea is 8.6%. 12.9% of the participants prefer green tea, 6.2% prefer form tea for losing weight. People with normal weight who drink green tea is 66.7% and the rest who drink green tea are over weighted people. There is a meaningful relationship ($p=0.000$) between body mass index and green tea consumption. 56.5% of the students who drink form tea is at normal weight and the rest is over weighted. There is a meaningful relationship ($p=0.002$) between body mass index and form tea consumption. **CONCLUSION** Obesity is a significant health issue and it is increasing in prevalence. Fast food, life style changes and sedentary life style causes obesity to increase among the college students. Importance for the body image at the teenagers, increases tendency towards slimming tea consumption. In this study, it is remarkable that, the rate of the students who use slimming herbal tea is too high whether the body mass index of most of the students are at normal levels. Over use of slimming herbal tea could show laxative and diuretic effects on health. Students should be informed about healthy nutrition and possible risks of the methods applied during weight loss diet.

IN VITRO ANTIOXIDANT ACTIVITIES OF METHANOLIC EXTRACT OF ONOSMA SERICEUM

MERYEM ORAKCI¹, EMRE KOÇ², FERDA CANDAN²

ABSTRACT

Onosma species (Boraginaceae) largely grow in Turkey. Eighty five species involving forty four endemic species has been represented by now. The genus has several usage in the traditional medicines worldwide. The aim of this study is to investigate in vitro antioxidant activities of methanolic extract of Onosma Sericeum. We examined the in vitro radical scavenging and antioxidant capacity of Ebenus Laguroides by using different in vitro analytical methodologies such as 1,1-diphenyl-2-picryl-hydrazyl free radical (DPPH) scavenging, 2,20-azino-bis (3-ethylbenzthiazoline-6-sulfonic acid) (ABTS) radical and N,N'-dimetil-p- fenilendiamin (DMPD) radical scavenging activity, total antioxidant activity determination by ferric thiocyanate, total reducing ability determination using by Fe³⁺→Fe²⁺ transformation method, hydrogen peroxide scavenging and ferrous ions (Fe²⁺) chelating activities. Also, The synthetic antioxidant butylated hydroxytoluene (BHT) and natural antioxidant such as curcumin and ascorbic acid were used as positive controls. The Table 1. represents the antioxidant potential of methanolic extract of Ebenus Laguroides by ferric thiocyanate method, 2,2-azino-bis(3-ethylbenzthiazoline-6-sulfonic acid) (ABTS) radical scavenging activity, 1,1-diphenyl-2-picryl-hydrazyl (DPPH•) free radical scavenging activity, N,N-dimethyl-p-phenylenediamine (DMPD) radical scavenging activity. Table 1 Results of the antioxidant potential of methanolic extract Onosma Sericeum by the different in vitro antioxidant assays Sample DPPH• scavenging activity (µg mL⁻¹) ABTS•+ scavenging activity (%) DMPD•+ scavenging activity (%) Metal chelating Activity (%) Onosma Sericeum 54.74±6.25 61.65±0.08 54.84±2.16 19.90±1.30 Values are mean of triplicates ± SD The results of the study have shown that the methanol extract of Onosma Sericeum is potentially a good source of free radical scavenging compounds. Acknowledgements: This research was part of the project number F-347 supported by the Research Council of Cumhuriyet University in Sivas / Turkey.

SOME CHEMICAL PROPERTIES OF RHEUM RIBES L. (UŞKUN) AND BENEFICAL EFFECTS ON HEALTH

MEHMET MURAT CEYLAN¹, MENEKŞE BULUT¹

ABSTRACT

Rheum ribes L. is a kind of edible wild that belongs to the Polygonaceae family, and also it is one of the perennial plants. R. ribes is locally known as "uşkun, ışgın, ravent, revas" and it is grown especially in the east part of Turkey, Iran, Lebanon and Iraq. R. Ribes is the only rhubarb species grown between 1800 m. and 2800 m. altitude rocky countryside of Turkey. According to some studies Rheum ribes is the source of one of the most important crude drugs in west asiatic regions. These plants contain vitamins A, B, C in abundance. Rhubarb root (Rhizoma Rhei ribi) is used traditionally to treat diabetes, hemorrhoids, ulcers and diarrhea. The plant is also used as a digestive and appetizer in Bitlis, Turkey. In some countries such as Iran, Rheum ribes has been used as sedative and mood enhancer. These traditional edible wilds were generally used in medicine for the treatment of anemia, anorexia, weakness, anxiety, depression and diabetes. On the other hand; there are some studies about mineral content of R. ribes. According to these studies; R. ribes a rich content of ferrous and phosphor. In this study, some chemicals properties of "uşkun" and beneficial effects on health have been reviewed.

SPECTROPHOTOMETRIC DETERMINATION OF REBAUDIOSIDE A IN AQUEOUS SOLUTIONS

SEMIH LATİF İPEK¹, ALI EMRAH ÇETİN¹, NURTEN KURT CENGİZ¹, HAŞİM KELEBEK¹, OSMAN KOLA¹, MEHMET SERTAÇ ÖZER²

ABSTRACT

Steviol glycosides are natural compounds found in the leaves of *Stevia Rebaudiana* Bertoni. Stevioside and Rebaudioside A are the major glycosides among the several steviol glycosides identified in the *Stevia*. They have received special interest in both scientific researches and industry due to their 150 to 570 fold sweetening power relative to sucrose. Steviol glycoside composition of *Stevia* leaves, solutions obtained during extraction and purification processes as well as the purity of the final products is determined by High Pressure Liquid Chromatography (HPLC). HPLC enables the separation and quantification of each steviol glycoside. Since the studies on the determination of solubility, adsorption-desorption, dissolution and crystallization kinetics usually employ aqueous solutions containing only Rebaudioside A as a solute, the use of a fast, cheap and easy-to-perform method will be appropriate for the determination of Rebaudioside A concentration. The goal of this study was therefore to evaluate spectrophotometry for the determination of Rebaudioside A concentration in aqueous solutions. In this study, two different sets of Rebaudioside A standard solutions (10 – 90 mg/L and 100 – 200 mg/L) were prepared and absorbances were measured at 210 nm for the construction of calibration curves. Five solutions with concentrations of 15, 25, 75, 130 and 170 mg/L were then used as control samples to evaluate percent recoveries and percent relative errors in the determination of Rebaudioside A. HPLC method was also selected as a standard method for comparison. Standard solutions and control samples were analyzed by HPLC equipped (Agilent 1260) with C18 column and diode array detector using water-acetonitrile mixture (70:30, v/v) as a mobile phase at 210 nm with an injection volume of 5 µL. Simple spectrophotometric measurements of absorbances of standard solutions gave linear calibration curves with correlation coefficients (R²) of 0.995 and 0.998 for 10-90 mg/L and 100-200 mg/L concentration ranges, respectively. HPLC method however yielded linear calibration coefficient of 0.999 for both sets of standard solutions. Percent relative errors calculated in the determination of Rebaudioside A concentration in control samples by spectrophotometric method were 46, 23, 8, 6 and 3 % while HPLC method gave percent relative errors as -26, -12, -10, -9 and -5 % for 15, 25, 75, 130 and 175 mg/L concentrations, respectively. The results of this study showed that the percent relative errors associated with spectrophotometric determination were high for lower concentrations. HPLC yielded lower percent relative errors for low concentrations when compared to spectrophotometric method. The percent relative errors associated with spectrophotometric determination of Rebaudioside A concentration over 75 mg/L were lower than those found in HPLC based method. As a result, simple spectrophotometric measurement can be used to determine Rebaudioside A in the aqueous solutions with concentrations over 75 mg/L.

OUR NATURAL ELIXIR: GANODERMA LUCIDUM (CURTIS) P. KARST.

HAKAN ALLI¹, BEKİR ÇÖL²

ABSTRACT

Introduction: Since ancient times, only emperors and their children in the Far East have been able to drink the juice of *Ganoderma lucidum* (Reishi). When someone finds this mushroom under a tree, he had to report it to the local court and hand it over to the authorities. It is known that the houses in the region where the mushroom is found are searched and the people possessing this mushroom were severely punished. The mushroom, which has been used in Far East traditional medicine for about 2000 years is also known as the "Queen of Fungi" and it was first cultured by the Japanese researcher Shigeaki Mori. After that, it has attracted the attention of many people from all parts of the world. **Material and Methods:** Specimens of macrofungi were collected from Muğla province during the routine field trips between 2015 and 2016. In the field, ecological and macroscopic features were recorded and photographed. After the field studies, the specimens were brought to the laboratory and identified morphologically using reference books. **Results:** *Ganoderma lucidum*, which has been used in some health problems since ancient times is very difficult to be spotted and identified in nature and it is significant for our country that this mushroom is found naturally in different locations of our country. **Discussion:** It is very risky to collect and use this mushroom that has the medicinal value by the people other than the mushroom experts. Moreover, it will not provide much benefit to use the by-products of this fungus, which are claimed by some people in the market to have some active ingredients. Therefore, it is best to consume the mushroom itself and not the side products. It is a very important step that Reishi mushroom has recently been started to being cultured in our country.

USAGE AREAS OF SOME SPICE PLANTS AND EVALUATION IN TERMS OF COUNTRY ECONOMY IN TURKEY

AYBÜKE KAYA¹, DILEK BOSTAN BUDAK², ERDAL DAĞISTAN¹

ABSTRACT

Turkey has different climate characteristics. It is a country rich in biological diversity. Turkey is the motherland of many plant species in terms of its position in the world. Medical and aromatic plants are also naturally grown in Turkey. Especially spice plants have been used all over the world for centuries both in local kitchen and in the health field. Health problems have increased in recent years. These problems are solved by using fewer chemicals. The demand for these plants has increased factors such as increasing health problems and solving these problems by using fewer chemicals, herbal teas used to prevent obesity, development of cosmetic industry and preference of different aroma substances in recent years. Many spice plants grow in Turkey. The most produced plants are red pepper, anise, thyme, cilantro and coriander. The planting area and production of these plants have shown fluctuations and have increased in recent years. Turkey was realized in 2016 approximately 12 500 ha area 228 531 tonnes red pepper, 9,491 tonnes of anise from 14 000 ha area, 18 586 tonnes of cumin from 27 000 ha area, 14 724 tonnes of thyme from 12 000, 2527 tonnes of black sesame from 2350 ha area, 2464 tonnes of fennel from 1750 ha area, 42 tonnes of coriander from 50 ha area and 1883 tonnes of broom from 1400 ha area. Production is mostly in rural areas. There are more female labor force in this area. Employment of women in this area increases the level of income, it also positively affects the level of regional development. In addition, with the effect of the increasing population, the demand for these plants is contributing to the demand, it is also developing foreign trade and contributing significantly to the economy of the country. Spice plants have an important place in Turkey. The aim of this study to determine the contribution of some spice plants to the economy of the country.

OPTIMIZATION OF DRYING MEDICINAL AND AROMATIC PLANTS BY RESPONSE SURFACE METHODOLOGY

SAMI GÖKHAN ÖZKAL¹, SENEM TÜFEKÇİ²

ABSTRACT

Optimization of Drying Medicinal and Aromatic Plants by Response Surface Methodology Sami Gökhan ÖZKAL¹, Senem TÜFEKÇİ^{2*} 1 Pamukkale University, Faculty of Engineering, Department of Food Engineering, Denizli, Turkey, 2 Pamukkale University, Vocational School of Acıpayam, Department of Food Processing, *Presenting Author: S. TÜFEKÇİ (stufekci@pau.edu.tr) Medicinal and aromatic plants are consumed as fresh but they have short shelf life due to environmental conditions limiting the long term consumption. Drying is one of the oldest used methods for preservation of medicinal and aromatic plants. Although drying process enables long shelf life by removal of water from structure, it has several advantages such as chemical, physical and nutritional losses, undesirable flavor, and color changes. Using a pre-drying treatment or combining different drying methods are some way of producing dried products at good quality with minimum losses. In order to obtain better quality dried products there is a need to understand drying process by determining drying characteristics of plants at different drying conditions. Optimization of drying process is essential for medicinal and aromatic plants. For this purpose optimization by response surface methodology can be used. Response surface methodology (RSM) is a useful method for evaluating the relationship between the responses (drying characteristics, quality parameters) and independent variables (drying conditions). RSM uses data evaluated from experimental designs and represents surfaces which describe the independent variables effects on responses. Interrelationships among the drying conditions and combined effect of all process conditions on quality parameters can be provided statistically and graphically by this method. The aim of this study was to investigate the optimum drying conditions for medicinal and aromatic plants such as; acerola, blackcurrant, blueberry, garlic, bitter gourd, ginger, green peppers, jackfruit, mango, mushroom, olive leaves, onion, pandan leaves, parsley, pink guave, spirulina, turmeric. IN this review drying and pre-treatment methods, conditions (air temperature, air velocity,etc.), experimental designs and effects of them on selected responses as quality parameters for these products will be explained briefly.

IN VITRO ANTI-INFLAMMATORY ACTIVITY OF *ACHILLEA* *SIPIKORENSIS* HAUSSKN. & BORNM.

*SELVİ CİNGÖZ*¹, *FERDA CANDAN*¹

ABSTRACT

Inflammation is an immediate response to many injuries produced by pathogens, noxious stimuli such as chemicals, or physical injury. Inflammation can cause various physical dysfunctions. Inflammatory disorders are treated using conventional anti-inflammatory drugs such as steroidal anti-inflammatory drugs and nonsteroidal anti-inflammatory drugs (NSAIDs). However, their prolonged use may produce adverse effects. Thus, it is important to develop new anti-inflammatory agents with fewer adverse effects. Natural products can be a source of active metabolites that can serve as an alternate approach to anti-inflammatory drugs. The search for natural products with anti-inflammatory activity has increased markedly in recent years. *Achillea* species have been used for their anti-inflammatory, antidiabetic, analgesic, hemostatic, spasmolytic, digestive and cholagogue effects in Turkish folk medicine. Dry materials of *Achillea sipikorensis* from Hausskn. & Bornm. were obtained Grn, Sivas in June 2012. This study was aimed to evaluate the anti inflammatory activity of both methanolic and aqueous extract of the flowers of *Achillea sipikorensis* Hausskn. and Bornm by human red blood cell membrane stabilization method and protein denaturation, using different extract concentrations. Both results are compared with standard diclofenac. The result obtained from this study suggests that extracts of *Achillea sipikorensis* has a natural source for anti-inflammatory activity. However, further studies must be conducted in order to clarify which constituent(s) of the extracts is responsible for these activities. Acknowledgements: This research was part of the project number F-501 supported by the Research Council of Cumhuriyet University in Sivas / Turkey.

SOME MEDICINAL AND AROMATIC PLANTS FROM ORDU VICINITY

ÖZNUR ERGEN AKÇİN¹, TUĞBA ÖZBUCAK¹, GÜLCAN ŞENEL¹

ABSTRACT

Some Medicinal and Aromatic Plants from Ordu Vicinity Öznur ERGEN AKÇİN¹, Tuğba ÖZBUCAK², Gülcan ŞENEL³ 1 2Ordu University, Faculty of Science and Art, Department of Molecular Biology and Genetics, Ordu, Turkey. 3 Ondokuz Mayıs University, Faculty of Science and Art, Department of Biology, Samsun, Turkey oakcin@gmail.com Many local wild plants have been used as traditional medicinal plants in Anatolia. Wild medicinal plants are very widespread in Black Sea Region of Turkey and people has been used wild plants as medicinal purposes. In this study, some wild medicinal plants which used in the treatment of diseases in Ordu were investigated and introduced. Specimens were collected from different locaties in Ordu. Their morphological features, parts used as medicinal plants, methods of using, scientific name and Turkish name were determined. There are about 80 wild medicinal plants in Ordu vicinity. In this study, common 15 wild medicinal and aromatic plants were investigated. These plant are Helichrysum sp., Hypericum orientale L., Hypericum bithynicum Boiss., Helleborus orientalis Lam., Tussilago farfara L., Ornithogalum sigmoideum Freyn et. Sint., Cyclamen coum ssp. coum, Arum italicum Mill., Urtica dioica L., Malva neglecta Wallr., Laurocerasus officinalis Roemer, Tilia rubra DC., Cichorium intybus L., Rhododendron luteum Sweet. and Chelidonium majus L. Generally leaf, stem and flowers of plant are used as medicinal purposes. Flowers and leaves of Hypericum orientale, Tussulago farfara and Rhododendron luteum are used as therapeutic. Arum italicum has expectorant and cough suppressant properties. Aboveground parts of Helichrysum are used diuretic. Chelidonium majus is used as diuretic and expectorant. Also the plant's sap is used against warts and corns. Cylamen is effective in treating arthritis and joint pain. Also used in the treatment of boils and burns. Ornithogalum sigmoideum is good for pimples and boils. This plant has diuretic and emetic effect. Urtica dioica is effective against rheumatic pain and eczema. ANTIDOTIC POTENCY OF BITTER GOURD (MOMORDICA CHARANTIA L)

MUHAMMAD YASIR NAEEM¹, SENAY OZGEN¹, ZELIHA SELAMOGLU¹

ABSTRACT

Both in developed and developing countries the people have been using herbal medicine since aging to cure several life-threatening diseases such as cancer, diabetes, obesity and heart disease. In recent years an herbaceous vegetable called Bitter gourd (*Momordica charantia* L) with tropical and subtropical distribution has been identified to be used effectively against these diseases. It is one of the most valuable marketable vegetable in south-eastern countries of the Asia and spread out all over the world due to its high nutritive and medicinal value. It is commonly called *Aci kabak* in Turkey, with various local names like *balsam pear*, *African cucumber* and *bitter melon* around the world. It is ever first domesticated in eastern India and carried to china near 14th century, while due to slave tradition in ancient world it spread out to some parts of the world for medicinal and food purpose. Bitter gourd is available in the natural of basket which offers excellent medicinal merits. The bitter gourd is specially used to control diabetes as well as several fungal diseases like *scabies*, *ring worm*, *psoriasis* and also blood disorder like *blood boils*. Leaves and roots of bitter gourd have different compounds which are using in traditional medicines for respiratory diseases. The leaves tips of bitter gourd are the good source of vitamin A. Fresh fruits of bitter gourd have compounds like *Charantin*, *Peptides*, *glycosides*, *triterpines* and *alkaloids* actively affects the blood and urine sugar level. Juices from the fresh leaves of bitter gourd also highly effective in diseases like *diarrhea* and *cholera*. Bitter gourd contains proteins like *MAP30* (exposed by American scientists in 1996) having great effect against diseases like *AIDS*, *tumor* and other viruses like *herpes simplex virus – 1 (HSV-1)* inhibiting its reproduction as well as reducing its ability to skin irritation. Bitter gourd has high contents of fiber in their fruit help in many stomach disorders by stimulating gastric juice. A-electrostatic acid and 15, 16-dihydroxy-a-eleostearic acid are the two compounds found in seeds and fruits of bitter gourd respectively, contribute great effect to health by preventing cancerous cell, help in production of red blood cells, leukemia disorder and also control blood pressure. Alpha and beta-momorchardin protein present in bitter gourd have constraining result on human immune deficiency virus (HIV) infection. It is inviting scientists across the world due to its high medicinal value in treatment of various diseases especially in diabetes mellitus and respiratory diseases.

IN VITRO ANTI-DIABETIC ACTIVITY OF AQUEOUS EXTRACT OF THE MEDICINAL PLANT BERBERIS CRATAEGINA DC. FRUITS

FERDA CANDAN¹, FERHAN CANDAN¹, EROL DÖNMEZ¹

ABSTRACT

Recently, some medicinal plants have been reported to be useful in diabetes worldwide and have been used empirically as antidiabetic remedies. Despite the presence of known antidiabetic medicine in the pharmaceutical market, diabetes and the related complications continued to be a major medical problem. Antihyperglycemic effects of medicinal plants are attributed to their ability to restore the function of pancreatic tissues by causing an increase in insulin output or inhibit the intestinal absorption of glucose or to the facilitation of metabolites in insulin dependent processes. More than 400 plant species having hypoglycemic activity have been available in literature. However, searching for new antidiabetic drugs from natural plants is still attractive because they contain substances which demonstrate alternative and safe effects on diabetes mellitus. The present investigation evaluated aqueous extract of *Berberis crataegina* DC was subjected to inhibitory effect of enzymatic α -amylase and α -Glucosidase inhibition assay using specific standard in vitro procedure. Acarbose was utilized as the positive control. The extract produced higher reduction of α -glucosidase activity than α -amylase. The findings indicate *Berberis crataegina* DC possess hypoglycemic effect and hence it can be utilized as an adjunct in the management of diabetes mellitus.

THE PROTECTIVE EFFECT OF GERANIOL AGAINST REMOTE TISSUE INJURY INDUCED BY SHORT TERM RENAL ISCHEMIA / REPERFUSION IN RATS

İŞİL TAN YILMAZ¹, MEDİHA CANBEK¹, HAKAN ŞENTÜRK¹, FATMA YILDIZ², SEREN DANIŞ¹, SENANUR CAN¹

ABSTRACT

In our study, the possible protective effects of geraniol, which is known to be an antioxidant, were investigated against liver injury induced by experimentally short-term renal ischemia/reperfusion (I/R) injury in rats. In the study, three to four month old, Wistar-albino type 28 rats were used (n=7). Four groups were designed randomly that Group I (Sham Group), Group II (I/R+normal saline), Group III (I/R+ 50 mg/kg geraniol), Group IV (I/R+ 100 mg/kg geraniol). Right nephrectomies were performed under xylazine (10 mg/kg) and ketamine (70 mg/kg) anesthesia in all group rats. Then, 2 ml physiological saline solution was injected to Group I and Group II; 50 mg/kg geraniol was injected to Group III and 100 mg/kg geraniol was injected to Group IV intraperitoneally one hour before ischemia. 45 minutes ischemia and 4 hours reperfusion were applied to all groups except Group I. At the end of the experiment, ALT, AST activities in the blood serum and the Catalase (CAT), Superoxide dismutases (SOD) and Glutathione peroxidase (Gpx), enzyme activities in liver tissue were measured. Histological sections were stained using Hematoxylin & Eosin and investigated by light microscope. According to the study results, when Group I and Group II's ALT and AST values were compared in serum and CAT, SOD, Gpx in tissue samples, belonging to Group II's serum ALT and AST value and SOD, Gpx activity increased and CAT activity decreased in liver tissue. While Group III and IV's SOD and Gpx activities decreased, CAT activity increased compared to Group II. Although histopathologically, in Group II's the liver tissue was shown that intense vacuolization, advanced necrosis, intense nuclear infiltration and congestion, this findings was not found in Group IV. Biochemical analyzes have supported by histological findings of our experimental study. The results of this study have demonstrated that geraniol (100 mg/kg i.p.) prevents distant organ injury because of renal I/R injury.

**IN VITRO ANTI INFLAMMATORY ACTIVITY OF METHANOLIC
EXTRACT OF ACHILLEA TERETIFOLIA WILLD. BY HRBC
MEMBRANE STABILISATION**

FERDA CANDAN¹, SELVI CİNGÖZ¹

ABSTRACT

Plants from the genus *Achillea* are used as folk medicine for treating various diseases including inflammatory and immune-related diseases. Numerous reports have suggested plant extracts and their constituents as possible anti-inflammatory agents. Here, in vitro evidence of *Achillea teretifolia* Willd. anti inflammatory activity and antioxidant properties is presented for the first time. In this study we found out that the methanol extract of the leaves of *Achillea teretifolia* Willd. possess a significant anti-inflammatory action comparing with diclofenac sodium as standard. Human red blood cell (HRBC) membrane stabilization was taken as the screening procedure for obtaining the results. In this particular method inhibition of membrane lysis was taken as the measure of anti-inflammatory property. The haemoglobin content in the supernatant solutions was estimated using spectrophotometer at 560 nm. The percentage haemolysis was calculated by assuming the haemolysis produced in presence of distilled water as 100%. The maximum membrane stabilization of *Achillea teretifolia* extracts was found to be 92.47 % at a dose of 1000 µg/ml. Therefore, our present in vitro studies on *Achillea teretifolia* extracts demonstrate the depression of inflammation.

KEYWORDS

Achillea teretifolia Willd., anti-inflammatory, HRBC membrane stabilization; diclofenac.

DETERMINATION OF THE THOUGHTS OF HEALTH SERVICE VOCATIONAL SCHOOL STUDENTS ABOUT PLANT USE AND HERBAL TREATMENT

GÜLSÜM YETİŞ¹, TURGAY KOLAÇ¹, PERİHAN GÜRBÜZ¹, ZEHRA DENİZ YAKINCI¹

ABSTRACT

Summary Objective: This cross-sectional study was conducted to determine the opinions of Health Services Vocational School students about the use of plants and the use of herbal remedies. **Materials and Methods:** The study was conducted with 342 students having education at İnönü University Health Services Vocational School. A questionnaire which was prepared by the researchers using the literature knowledge, consisting of questions about the socio-demographic characteristics of students and their thoughts about herbal treatment was used in the collection of the data. Analyzes of the obtained data were done by using SPSS 17.0 program, frequency and percentages were determined and q-square test was performed. For the realization of the research, written approval from the institution and the ethics committee, verbal approval from the students was obtained where the research was conducted. **Findings:** 69.3% of the students who participated the research were female, 73.5% had medium economic status and the average age was 20.33 ± 3.49 . 7.6% of the students had a chronic illness requiring medication. While 77.1% had a body mass index in the normal range, 7.0% was below and 16.0% was above the normal range. Among the students; 70.2% of them had used alternative treatment, 70.0% believed in alternative treatment, 52.4% had people using alternative treatment around them, 45.1% had no idea about alternative treatment to be correct or not, 14.8% did not find the alternative treatment correct, and 29.2% of those who did not find it correct expressed the reason of this condition by the unconscious use of the patients. The second reason of this condition was expressed by lack of training about herbal treatment (28,6%). 52.2% of the students stated that they found both drugs and plants safe, 21.3% said they found plants more reliable than drugs, and 44.1% of the students stated that they used herbal treatment. The order of herbal treatment use is; products that strengthen the body and the immune system (31.3%), skin care products (31.3%), hair care products (22.3%), pain relief products (21.0%), products for burn treatment (9, 4), perfume essences (7.6%) and slimming products (6.7%). It was found that 70.6% of the students using herbal products used the products in need, 40.9% bought them from the herbalists, 61.6% recommended the products they used to other people, 32.5% used herbal treatment to benefit from their complaint, 30.8% of the students had not investigated whether the product they used had another effect/usage purpose or not. 72.5% of the students stated that the product they used gave good results for their usage purpose, 13% stated the product to be harmful for themselves and 72.4% expressed that they did not consult doctor for the use of herbal treatment. The reason for not consulting a doctor has been defined as; they did not need it (81.5%), they thought the doctor would react negatively (5,2%), they were afraid to be criticized (3,0%). There was statistically significant difference between herbal treatment use and to find herbal treatment use correct, having benefit after the treatment and being

¹İNÖNÜ ÜNİVERSİTESİ SAĞLIK HİZMETLERİ MESLEK YÜKSEK OKULU

informed about herbal treatment ($p < 0,05$). The difference between the use of herbal treatment and the sex of the students was statistically insignificant ($p > 0,05$) Conclusion: Among the students it was detected that; 70,0% of the students believed in alternative treatment, only 14,8% found alternative treatment incorrect, 52,2% thought both the drugs and plants were safe, 44,1% used herbal treatment. The herbal products most commonly used by students are products that strengthen the body and immune system and skin care products. The rates of herbal treatment use has been found to be more in the groups who found the herbal treatment correct, saw the benefit of the treatment that had already been used and had been informed about the herbal treatment, and this condition was statistically significant.

INVESTIGATION OF BIONEMATICIDAL VALUE OF SOME ESSENTIAL OILS AGAINST MELOIDOGYNE INCOGNITA IN VITRO

FATMA GÜL GÖZE ÖZDEMİR¹, BEKİR TOSUN², ARIF ŞANLI¹

ABSTRACT

Nematicidal activity of essential oils extracted from 14 plant species representing Apiaceae family were evaluated in vitro experiments against root knot nematode, *Meloidogyne incognita*. Fruit essential oils of *Ferulago pauciradiata* (Boiss&Heldr), *Foeniculum vulgare* (Miller.), *Ferulago cassia* (Boiss.), *Daucus carota* (Linne.), *Coriandrum sativum* L., *Conium maculatum* L., *Artemisia annua* L., *Angelica sylvestris* L., *Anethum graveolens* L., *Scandix iberica* Bieb., *Kundmannia anatolica* (Boiss), *Heracleum platytaenium* Boiss., *Pimpinella anisum* L., *Smyrniolum connatum* Boiss&Kotschy were extracted via hydrodistillation and investigated by gas chromatography-mass spectrometry (GC-MS). High nematicidal activity was achieved with essential oils from *Ferulago pauciradiata* (Boiss&Heldr), *Angelica sylvestris* L. and *Heracleum platytaenium* Boiss. Good nematicidal activity was also obtained with the essential oil from *Anethum graveolens* L. On the other hand, *C. maculatum*, *S. connatum*, *S. iberica* and *D. carota* essential oils yielded weak nematicidal activity. All of the tested essential oils possessed nematicidal activity against *M. incognita* and nematode mortality rate ranging between 39-84.3% on the 3rd day and 59.7-91.7% on the 7th day by essential oil applications. The use of the crude oils provided satisfactory results at the laboratory level against *M. incognita*, and needs further evaluation in greenhouse and field trials.

MEDICINAL PLANT MELILOTUS INDICUS (L.) ALL. (FABACEAE) AND THEIR MICROMORPHOLOGICAL PROPERTIES

ÖZNUR ERGEN AKÇİN¹, ŞÜKRAN ÖZTÜRK¹, TUĞBA ÖZBUCAK¹

ABSTRACT

Medicinal Plant *Melilotus indicus* (L.) All. (Fabaceae) and Their Micromorphological Properties Öznur ERGEN AKÇİN¹, Şükran ÖZTÜRK², Tuğba ÖZBUCAK¹ 1 Ordu University, Faculty of Science and Art, Department of Molecular Biology and Genetics, Ordu, Turkey. ²University of Ordu, Ulubey Vocational School, Ordu, Turkey oakcin@gmail.com *Melilotus* L. (Fabaceae) is represented with 11 species in Turkey. *M. indicus* (L.) All. named as "taş yoncası, otuzlu yonca" in Anatolia. This species is used as medicinal, forage and nectarius plant. The plant contains coumarin, which is an anticoagulant. *M. indicus* species are discutient, emollient, astringent, strongly laxative and narcotic. The seed is made into a gruel and used in the treatment of bowel complaints and infantile diarrhoea. The scanning electron microscope (SEM) is an ideal instrument for examining the surfaces. In this study, we have aimed to investigate leaf, fruit and seed surfaces of *M. indicus* by SEM. Plant materials were collected from different localities of Ordu vicinity in flowering period. Taxonomical descriptions of the specimens were made according to Davis. Dried leaf, seed and fruit samples were mounted on stubs using double-sided adhesive tape for SEM. Samples were coated with 12.5-15 nm of gold. Coated samples were examined and photographed with a JMS-6060LV Scanning Electron Microscope. Taxonomical properties are very important to identification of plant. It is very important to collect the right plants for the use of medical plants. Close species or subspecies are very similar to each other. The collection and use of the wrong plant is very dangerous. This means that plants must be well-recognized and diagnosed correctly. Taxonomical properties are very important to identification of plant. Micromorphological properties of plant are important taxonomical properties. In conclusion, micromorphological features of leaves, fruit and seed surface were determined and to help recognize the *M. indicus*.

INVESTIGATION OF ANTI-CANCER ACTIVITY OF TEUCRIUM POLIUM L. SUBSP. POLIUM IN DIFFERENT CANCER CELLS

NURBAHAR ÇİFTÇİ¹, FERDA ARI¹, OĞUZHAN AKGÜN¹, HULUSI MALYER¹, SERAP ÇELİKLER KASIMOĞULLARI¹

ABSTRACT

Cancer is one of the most important public health problems in our country and in the world. Although some progress in cancer treatment, new treatments are needed. The vast majority of anti-cancer agents in clinical use are of plant origin. The research of plant resources that may have potential as an anti-cancer agent in our country which is rich in plant diversity is very valuable both in terms of health and country economy. Therefore, complementary therapies of herbal origin have gained importance in recent years. The aim of the study is to provide an herbal treatment method that can support cancer treatment. For this purpose, the cytotoxic effects of ethanol extract of *Teucrium polium* plant were investigated in vitro in human breast (MCF-7) and lung (A549 and H1299) cancer cell lines. Cytotoxic activities on the cells were determined by SRB viability test. The death mode (apoptotic or necrotic) in the cells was evaluated morphological by fluorescence dying. It was determined that *Teucrium polium* reduced cell viability as dose-dependent manner (12.5-200 µg / ml, 72h) in MCF-7, A549 and H1299 cells. It was determined that IC50 value were calculated as 92 µg/ml (MCF-7), 75.34 µg/ml (A549 cells) and 135.66 µg/ml (H1299 cells), respectively. According to these values, the anti-cancer potential of *Teucrium polium* ethanol extract is higher in A549 cells than the other. Further analysis is needed for explain the cell death mechanism.

SPECIES OF FLEABANE (CONYZA SPP.) IN TURKEY

ÇAĞLAR MENGÜÇ¹, DIDEM CANIK OREL¹, İBRAHİM ÖZER ELİBÜYÜK¹

ABSTRACT

Species of Fleabane (*Conyza* spp.) in Turkey Asteraceae family is the biggest family of the world 1600 genus and 23000 species. Fleabane species (*Conyza* spp.) are one of the most important types of Asteraceae family. There are 60 different species of the Fleabane that they generally distributed on temperate and subtropic areas of all the continents excluding Antarctica. *C. canadensis* (L.) known species of Fleabane in Turkey considering that the *C. albida* Willd. ex. Sprengel, *C. bonariensis* (L.) Cronquist ve *C. canadensis* (L.) Cronquist species exist. Besides the existing types are quite similar in our country, lamellar structure and inflorescence are the main differentiation criteria used for diagnosis. Those herbs are used in modern and public medicine because of their rich chemical metabolites. These plants are used as coagulant, diuretic, expectorant, hypoglycemic, tonic (as refreshing), antirheumatic, antifungal and antibacterial besides these effects also for dysentery and hemorrhoid treatment.

ANTI-MICROBIAL ACTIVITY OF SALIX BABYLONICA

ICLAL AGAN¹, ULKU ALTOPARLAK¹, SABIHA AYDOGDU¹, SABAN KORDALI², DEMET CELEBI³

ABSTRACT

INTRODUCTION Since the beginning of civilization, humans have used natural products for healing of different diseases. *Salix babylonica* (Babylon willow or weeping willow) is a species of willow native to dry areas of northern China, but cultivated for millennia elsewhere in Asia, being traded along the Silk Road to southwest Asia and Europe. *Salix* plant was used in the treatment of many conditions, including arthritis, menstrual, dental and back pain reduce fevers. and it is used as an anti-inflammatory drug. This study was conducted to investigate the antimicrobial activity of *Salix babylonica* ethanol and acetone extracts on *Escherichia coli*, *Proteus mirabilis*, *Enterococcus faecalis*, *Staphylococcus aureus*, *Staphylococcus epidermidis*, *Pseudomonas aeruginosa* and *Candida albicans*. **MATERIAL and METHOD** Minimum inhibitory concentration (MIC) of plant extracts were determined by the microdilution and disk diffusion method as described by Clinical and Laboratory Standards Institute. **RESULTS** Disc diffusion results were ineffective. The MIC values of both extract (ethanol and acetone) were same except *C. albicans*, *E. faecalis*, *S. aureus*. *E. coli*, *P. mirabilis*, *S. epidermidis*, *P. aeruginosa* (>12.500 µg/ml, 12.500 µg/ml, 97.6 µg/ml, >12.500 µg/ml for), respectively. The ethanol extract of *Salix babylonica* MIC values were determined for *C.albicans* 781 µg/ml, *E.faecalis* 781 µg/ml. While was ineffective for *S.aureus*. The acetone extract of *Salix babylonica* MIC values were determined for *C.albicans* 390 µg/ml, *E.faecalis* 1.562 µg/ml, *S.aureus* 97.6 µg/ml **CONCLUSIONS** Result of this study suggests that *salix babylonica* extracts can be effective in tested several microorganisms. Further studies in the effect of different dosages and duration are suggested. Future studies should elucidate the components responsible for antimicrobial activity of these extracts against target cultures.

ASSESSMENT OF THE ANTIOXIDANT AND REACTIVE OXYGEN SPECIES SCAVENGING ACTIVITY OF METHANOLIC EXTRACTS OF ACHILLEA SIIKORENSIS HAUSSKN. AND BORNM. AND ACHILLEA TERETIFOLIA WILLD.

SELVİ CİNGÖZ¹, FERDA CANDAN²

ABSTRACT

Oxidative stress is initiated by reactive oxygen species (ROS), which are responsible for majority of the diseases. However, antioxidants with ROS scavenging ability may have great relevance in the prevention of oxidative stress. The present study was undertaken, using a methanolic extracts of *Achillea sipikorensis* Hausskn. and Bornm. ve *Achillea teretifolia* Willd, to examine different in vitro tests in diversified fields including total antioxidant activity, scavenging activities for various ROS (radicals like hydroxyl, superoxide and hydrogen peroxide), phenolic and flavonoid contents. Hydrogen peroxide (H₂O₂) scavenging activity of the methanolic extracts were carried out following the procedure of Ruch et al. Hydroxyl radicals scavenging activity was measured with Fenton reaction. Superoxide anion scavenging activity was evaluated by the method of xanthine/xantine oxidase (XOD) system. Inhibition of reactive oxygen species were calculated for changing the concentration of plant extracts. IC₅₀ which is the amount of extract supplying 50% inhibition were calculated using the graph. The ability of the extracts of the *Achillea* in exhibiting their total antioxidant properties follow the order *Achillae sipikorensis* > *Achillae teretifolia*. The same order is followed in their phenolic content, whereas in case of flavonoid content it becomes *Achillae teretifolia* > *Achillae sipikorensis*. Miscellaneous results were observed in the scavenging of reactive oxygen species by the plant extracts, *Achillae teretifolia* > *Achillae sipikorensis* for hydroxyl and superoxide radicals, and *Achillae sipikorensis* > *Achillae teretifolia* for hydrogen peroxide. In a whole, the studied *Achillae* extracts showed quite good efficacy in their antioxidant and radical scavenging abilities, compared to the standards. In conclusion, it may be concluded that methanol extracts of *Achillae sipikorensis* and *Achillae teretifolia* as an antioxidant and ROS scavenger; which may be due to the presence of phenolic and flavonoid compounds. Acknowledgements: This research was part of the project number F-501 supported by the Research Council of Cumhuriyet University in Sivas / Turkey.

WHY FERULIC ACID ATTRACTS THE ATTENTION OF MANY RESEARCHERS?

FATMA UNAL¹, DENİZ YÜZBAŞIOđLU¹

ABSTRACT

Phenolic compounds possess one or more aromatic rings with one or more attached -OH groups, which may occur in free, combined, or bound forms that are considered to be part of the defense mechanisms in plants. Ferulic Acid (FA) (4-hydroxy-3-methoxycinnamic acid-hydroxycinnamic acid), an *Angelica sinensis* derived phenolic phytochemical, is a component of equisetum, angelica, and some Chinese herbal medicines. It is also present in various fruits and vegetables, such as citrus fruits, bananas, whole grains, spinach, broccoli, eggplants, and cabbage. It has been reported that FA has numerous physiological functions, including antiinflammatory, antimicrobial, antifibrosis, and antidiabetic functions. It has a strong antioxidant property which includes very high hydroxyl radical scavenging activity, superoxide radicals, nitric oxide, and peroxynitrite scavenging activity. FA has also been found to possess a lot of potential improved effects related to different diseases. FA can prevent cognitive deficits in mice, attenuate the symptom of Alzheimer's disease induced by chronic neuroinflammation and oxidative stress in rats, and protect rats brain after nerve injury induced by cerebral ischemia. Chemopreventive efficacy of ferulic acid in some kind of carcinogenesis has also been demonstrated. In addition, some publications indicated that FA produced the antidepressant-like effects. This study was designed to review the health benefits of phenolic compound FA in in vitro and in vivo studies.

INVESTIGATION OF ANTI-CANCER ACTIVITY OF ADANSONIA DIGITATA (BAOBAB) IN DIFFERENT CANCER CELLS

KEMAL ZORLI¹, NADIA RAYMONDE EMMA SAGNA¹, FERDA ARI¹, OđUZHAN AKGÜN¹, ENGİN ULUKAYA²,
SERAP ÇELİKLER KASIMOđULLARI¹

ABSTRACT

The Baobab tree (*Adansonia digitata*) is an indigenous vegetation of several countries in tropical Africa, including Botswana, Mozambique, South Africa and Namibia. Many parts of the plant, especially leaves, fruit pulp, seeds and bark fibers, have been used traditionally for medicinal and nutritional purposes. In addition, antibacterial, antiviral and anti-trypanosome activities have been reported. An important area of research in cancer treatment is to investigate the anticancer properties of herbal extracts. For this purpose, cytotoxic effects of ethanolic extract of *Adansonia digitata* (Baobab) plant were investigated in human breast (MCF-7) and lung (A549 and H1299) cancer cell lines in vitro. Cytotoxic activities on the cells were determined by SRB viability test. The death mode (apoptotic or necrotic) in the cells was evaluated morphologically by fluorescence staining. *Adansonia digitata* (Baobab) ethanolic extract was found to reduced viability in the MCF-7, A549 and H1299 cells as dose-dependent manner. Calculated IC₅₀ values were determined to be as 110.83 µg/ml in MCF-7 cells, 36.36 µg/ml in A549 cells and 116.41 µg/ml in H1299 cells, respectively. We think that the *Adansonia digitata* plant has anticancer potential in human lung cancer cells and that its mechanism needs to be elucidated.

A DIFFERENT UTILIZATION AREA OF OLIVE OIL: WOUND CARE

MERVE YURTTAŞ¹, KENAN GÜMÜŞ¹

ABSTRACT

A DIFFERENT UTILIZATION AREA OF OLIVE OIL: WOUND CARE Merve YURTTAŞ^{1*}, Kenan GÜMÜŞ² 1University of Amasya, School of Health, Department of Nutrition and Dietetics, Amasya/TURKEY 2University of Amasya, School of Health, Department of Surgical Diseases Nursing, Amasya/TURKEY merve.yurttas@amasya.edu.tr **ABSTRACT** Introduction: The fact that natural olive oil which is essential component of Mediterranean diet possess compounds with natural antioxidant properties such as monounsaturated fatty acids, vitamins, carotenoids, phytosterols, flavanoids, and phenolic compounds both increase its nutritional value and allows its use in medicine. Method: Literature review was presented extracting from the full texts and summarized articles reached via databases such as "Pub Med, Scopus, Scince Direct, Ulakbim, Google Scholar" by using key words such as olive oil, nutrition, and wound care. Results: Olive oil is a highly nutritious aromatic oil obtained from ripe olive fruits mechanically without applying any chemical treatment. Olive oil which is stated to have positive effects on health in the literature is also used for treatment purpose all over the world. It is reported that olive oil has been used in ancient times and today's folk medicine for wound care by utilizing from its antibacterial and anti-inflammatory effects. It is expressed to accelerate healing by stimulating the growth factors when it is applied to wound. The fact that olive oil has antibacterial activity enables olive oil to be an effective agent against bacterial species, like Klebsiella-Pseudomonas, causing wound infections and having antibiotic resistance. Conclusion: There are studies examining the effect of olive oil on wound healing and presenting evidence-based results about this issue. It comes to the forefront in the fields of conventional medicine and folk medicine due to its clinically important properties such as acceleration of wound healing and providing the clean environment required for the wound to heal. Key Words: olive oil, nutrition, wound care

USE OF SPROUT AS ENZYME THERAPY IN PHENYLKETONURIA

ÖZLEM KILIÇ¹, MUSTAFA ERBAŞ¹

ABSTRACT

Phenylketonuria (PKU) is a hereditary disorder of protein metabolism caused by the deficiency or absence of the phenylalanine hydroxylase enzyme (PAH) and/or the cofactor of this enzyme, tetrahydrobiopterin (BH₄). An essential amino acid phenylalanine is converted irreversibly into tyrosine by the PAH enzyme secreted from the liver in healthy individuals. In patients with PKU, phenylalanine cannot be converted to tyrosine due to the deficiency or absence of PAH and as a result it accumulates in body fluids and causes damage especially in nerve and brain tissues. Currently, phenylalanine-restricted diet is the basis of the treatment for PKU patients. In addition, new treatment approaches have been carried out such as oral phenylalanine ammonium lyase (PAL) enzyme therapy to improve the quality of life of patients with PKU. PAL converts phenylalanine to trans-cinnamic acid and ammonia by autocatalytic effect without cofactors. There are studies related to determine the activity of naturally encapsulated PAL enzyme in plant tissues from various sources such as fruits, legumes and cereals for patients with PKU. PAL contents and activity of cereals and legumes such as wheat, corn, green lentil and soybean could be very increased by germination. It was found that the highest PAL activity was the sprouts of red-spring wheat had on the seventh day of germination. The stability of PAL activity in wheat sprout during in vitro digestion was also investigated to determine the potential of enzyme to be used as a dietary supplement for patients with PKU. It is known that the PAL activity could be preserved to some degree in fresh sprout throughout digestion. Conclusion, fresh wheat and legume sprouts could be used in diet patients with PKU as oral enzyme therapy.

REVIEW OF IMPORTANT INTERACTIONS BETWEEN STATINS AND HERBAL PRODUCTS OR NUTRIENTS

ESRA BÜYÜK¹, AYTEN DEMİRCİ¹, MEVRA AL², AYŞE SAİDE ŞAHİN¹, BURAK CEM SONER¹

ABSTRACT

Herbal products have been used for thousand years by human being because of the effects they have with the purpose of treatment, protection from diseases or improving life quality. Today, usage of herbal products is still common in the world showing the differences by the aspect of community and district. A variety of interactions can be seen from the fact that the active components of the herbal products are the substrates, inducers, and the inhibitors of the same pathways as the drugs in the body. Also, carrier proteins such as P-glycoprotein (P-gp) and organic anion-transporting polypeptide (OATP) are assuming an active role on the pharmacokinetics of some xenobiotics; so that, potential of interaction increases with the drugs transporting through the same transport proteins. Drug interaction is the change of a drug's effect due to in the presence of another xenobiotic or being under its effect. Treatment interruption, hospitalization, temporary/permanent disabilities, congenital anomaly, life-threatening conditions, and death can be seen as a result of these changes. In our study, we are aiming to evaluate the current data on the interactions of HMG-CoA reductase inhibitors (statins), one of the group of hypolipidemic drugs, with herbal products and nutrients. Hypolipidemic agents are classified as statins, fibric acid derivatives, niacin, bile acid sequestrants, and ezetimibe. They are used to decrease the risk of coronary heart diseases and the other atherosclerotic cardiovascular diseases with the lifestyle changes by the means of retarding atherosclerosis development but also hindering the progress. Usage of statins widely and having important clinical drug interactions necessitate the safe drug use. It is known that statins cause myopathy, elevation on liver enzymes, rhabdomyolysis etc. and incident of these effects increases after concomitant use with drugs, herbal products or nutrients. Myopathy which is classified as a serious adverse effect can be seen 1 of 1.000 frequency and characterized by the elevation of serum creatine kinase at least ten-fold. An interaction that can cause elevation on the statin plasma levels can increase adverse effects that belong to muscle system such as myalgia, myopathy, more rarely seen rhabdomyolysis and hematuria. Grapefruit juice increases the quantity of atorvastatin passing to portal vein via inhibition P-gp and CYP3A4 of which atorvastatin is a substrate. It is reported that green tea inhibits enzyme CYP3A4, P-gp and OATP carrier proteins. When green tea is used with simvastatin (one of the substrates of these pathways), it is stated that an increase of simvastatin blood concentration. St. John's Wort (*Hypericum perforatum*)'s decreasing effect on atorvastatin plasma concentration via inducing CYP3A4 causes increase on plasma lipid levels. It is possible to get benefit from some drug-herbal products interactions as additive. In an experimental study that was conducted with rats, a significant cholesterol lowering effect with the combined use of ginger (*Zingiber officinale*) and atorvastatin was observed. While the levels of alanine aminotransferase and aspartate aminotransferase increase in the group taking atorvastatin alone, these enzyme levels are observed less in the combined treatment group. In the consideration of

this information by keeping in mind that drug interactions can cause serious results, patient-physician-pharmacist communication and in this context importance of informing shows up again for the patient to take the necessary cautions. Especially, almost 50% of patients tend not to indicate the herbal products or dietary supplements they use gives birth the obligation of assess to this subject more carefully. In this study, interactions of statins with herbal products and nutrients were searched on the aspect of clinical studies and case reports; and duration of use, doses/amounts, possible interaction mechanisms and adverse effects of drugs, herbal products and nutrients were presented as a summary.

THE EFFECT OF ESSENTIAL OILS ON GERMINATION RATE OF SOME SUMMERY AND WINTERY WEED SPECIES SEEDS

DERYA ÖĞÜT YAVUZ¹, BURCU BEGÜM KENANOĞLU², DERYA KÖKTAŞ¹

ABSTRACT

To start germination activity, seeds need water, temperature, oxygen and light depending on morphological, physiological properties and species. Light, temperature and nitrate ions that are in the land are alternative factors that can significantly affect seed germination. They are dominant factors in the environment. To speed up or promote germination with organic or inorganic treatments do positive effects to the seed or seedling. Recently, eco-friendly, clean, cheap, and most important herbal origin (seaweed extract, medical plant extract, vinegar priming, volatile oils and propolis) treatments use alternative to chemical-intensive applications. Especially in terms of medicinal and aromatic plants in our country one of the richest countries in the world. In this study, to determinate different volatile oil's (*Mentha longifolia* L., *Pimpinella anisum* L., *Carthamus tinctorius* L., *Citrus limon* L., *Eucalyptus globulus* Labil., *Lavandula stoechas* L. and *Prunus dulcis* Mill.) effects on some wintery *Sinapis arvensis* L., *Galium tricornutum* Dandy, *Melilotus officinalis* L. and some summery *Amaranthus retroflexus* L., *Portulaca oleraceae* L., *Chenopodium album* L. weed species's seeds germination rate. Wintery species seeds germinated at 15-20 0C and summery seeds germinated at 25-30 0C in 1 month with petri dishes. At the end of treatments normal-abnormal germination rate (%), mean germination time (day) determined. Generally, control (untreatment with volatile oil) group's weed seeds germination rates were between %20-100. The most effective treatments groups are bitter almond, anise and safflower volatile oils effect on *Melilotus officinalis* L. ve *Amaranthus retroflexus* L. seed's germination rates.

INVESTIGATION OF TOTAL PHENOLIC AND FLAVONOID COMPOUNDS OF GİRESUN REGION'S PLANT ORNITHOGALUM UMBELLATUM WHICH COOKED AND FRESH

ELİF APAYDIN¹

ABSTRACT

It is the study of the total phenolic compounds and total flavonoid compounds of the fresh and diet of the *Ornithogalum umbellatum* plant which grows abundantly in Giresun region. Besides, it is analytical to reveal how much fresh and cooked plant samples are, if there is any difference in the analysis results. In this study, some of the *Ornithogalum umbellatum* collected from the nature of Giresun was cooked by boiling water. The cooked and fresh plant samples were shredded by hand and extracted with Soxhlet in methanol. Subsequently, total phenolics were determined by Folin Ciocalteu method and total flavonoids were determined by aluminum nitrate method. Qualitative and quantitative analysis of gallic acid and quercetin as standard in these two methods was determined by High Performance Liquid Chromatography (HPLC) method. Plant extracts were determined to contain a high rate of flavonoids and phenolic substance. In addition total phenolic and total flavonoid compounds in fresh and cooked plant extracts were observed differences. It was concluded that, temperature is the reason to be difference in sample result. The results are consistent with studies in the literature.

ANTIMICROBIAL AND ANTIBIOFILM ACTIVITY OF DIFFERENT EXTRACTS OF CONYZA CANADENSIS L. AND RHODODENDRON PONTICUM L.

TUĐÇE ÖNBAŞ¹, SEDAT SEVİN², ÇAĐLAR MENGÜÇ³, ENDER YARSAN²

ABSTRACT

The emergence of multi-drug resistance in human and animal pathogenic bacteria as well as undesirable side effects of certain antibiotics has gained attention in the search of new and natural antimicrobial drugs for controlling the infections. Based on the fact that, development of plant based antimicrobial drugs has great importance in pharmaceutical industries. In the present study, the antimicrobial and antibiofilm activities of different extracts of *Conyza canadensis*(leaves)collected from Ankara (Türkiye) and *Rhododendron ponticum* L. (flowers) collected from Ordu (Türkiye) during the flowering period, were evaluated against clinical isolated microorganisms as well as food borne pathogens such as *Bacillus cereus*, *Bacillus licheniformis*, *Bacillus subtilis*, *Candida albicans*, *Enterococcus faecalis*, *Escherichia coli*, *Listeria monocytogenes*, *Pseudomonas aeruginosa*, *Salmonella enteritis*, *Staphylococcus aureus*. Dried powdered plant materials were extracted with different solvents (methanol, ethanol, chloroform, acetone and water) and further concentrated to dryness using a evaporator for comparative analysis. The antimicrobial tests were fist performed using agar-well diffusion assay. The minimum inhibitory concentration (MIC) and the specific biofilm formation index (SBF) was then evaluated. Extracts of different solvents showed antibacterial activity against one or more test bacteria. However, activity against Gram positive bacteria was found more effective than Gram negative bacteria. Significant differences ($p < 0.01$) in the activity between the solvent and water extracts were evaluated. The extracts of organic solvents obtained from *Rhododendron ponticum* found to be more effective in the case of bacteria than against fungus. These differences in potency may be due to the different sensitivity of the test strains. *Rhododendron ponticum* caused the major reduction on SBF in dose-dependent manner. The results obtained in this study appeared to confirm the antibacterial and antibiofilm potential of the plants investigated which can be an alternative to control strategies or can be used as a model to the search for new drugs. However, further pharmacological evaluation of refined extracts are needed before they can be used as therapeutic antimicrobials.

DETERMINATION OF MEDICAL ALTERNATIVE TREATMENT APPROACHES AND USAGE STATUS OF INDIVIDUALS

**PINAR SÖKÜLMEZ KAYA¹, CANAN ASAL ULUS¹, BAHTINUR TAŞCI¹, TUBA ÖDÜBEK, TÜLAY BOZKURT,
TOLGAHAN AYHAN**

ABSTRACT

Aim: This study was made for the purpose of evaluating information, attitudes and behaviors of the patients admitted to Samsun's 19 Mayıs University Hospital for the sake of alternative medical treatment. **Method:** In this descriptive study, 150 individuals (108 women, 72%; 42 men, 28%) who voluntarily agreed to participate were included in the patients who applied to the Internal Medicine Clinics at Samsun Ondokuzmayıs University Hospital. The data were evaluated by the percentage and chi-square test in the SPSS 20.0 statistical program and $P < 0.005$ was considered significant. **Results:** It was determined that 62.7% of the individuals used alternate medical treatment at least once. 30.7% of the individuals after their illness progressed; 24% after using the medicines recommended by the doctor, and 22.6% after the use of medicines; 22% reported that they also applied various herbal remedies without any complaints. According to their declarations, 55.4% reported benefiting from vegetable products, 34.5% had no effect and 10.1% had negative effects. While 23.3% of the individuals regarded the herbal products as harmless because they are natural, 1.7% stated that they think that the herbal products are harmful. The most known alternative non-medical treatment method was determined as 26.4% of herbal cures and the most used herbal product was ginger with 19.8%. This was followed by garlic with 18.1%, slimming tea with 14.9%, nettle with 10.9%, ginseng with 9.7%, echinacea with 6.6%, ginkgo with 5.7% and ginkgo with 4.9%. It was found that there was no statistically significant difference in the frequency of females compared to males (66.6% in females and 52.4% in males). Again, there was no significant difference between age and educational status and alternative treatment orientation ($p > 0.05$). The use of herbal products is 5% in cancer patients, 12% in diabetic patients, 14% in obese patients, 11% in gastric patients, 9% in inflammatory bowels, 16% in skin patients, 2% in urological patients, 11% in female patients, 8% in bile patients and in other diseases (colds, influenza) 13%. There was a statistically significant difference ($p = 0.04$) between the use of herbal products and the presence of any complaints in the digestive system or liver; It was determined that as the use of plant product increased, the liver disease increased proportionally. **Conclusion:** It was a significant number of individuals used alternative treatment methods. In recent years, non-medical alternative treatments became increasingly commonly used. In this study, it has been seen that alternative treatment methods of a significant part of individuals are becoming increasingly accepted and widely used. For this reason, health workers should be prepared to discuss these methods with patients in order to minimize the risks and reduce the misconceptions and doubts of the patients. An environment in which individuals can obtain accurate information about alternative treatment methods should be established.

NEUROPROTECTIVE EFFECTS OF THE FRUITS OF LYCIUM BARBARUM ON ALZHEIMER DISEASE

DEMET ÖNEN¹, NILÜFER ACAR TEK¹, GAMZE AKBULUT¹

ABSTRACT

Alzheimer's Disease(AD) is a neurodegenerative disease which involves the degeneration or death of the nerve cells(1). As the average lifespan increases, AD has already become the fourth leading cause of death in high-income countries(2). One of the main pathological hallmarks of this disease is the accumulation of the amyloid protein aggregates in the brain that leads to oxidative stress and inflammation, and cholinergic depletion and excessive glutamatergic neurotransmission are others(1). And AD highly related to environmental stress, experience of head trauma, daily diet and exercise, quality of sleep, and air pollution(2). Bioactive food components are physiologically active constituents in foods or dietary supplements derived from both animal and plant sources, including those needed to meet basic human nutrition needs, that have been demonstrated to have a role in health and to be safe for human consumption(3). Lycium barbarum polysaccharide (LBP) has long been considered to possess anti-apoptotic activities and antioxidant, anti-inflammatory and fertility-enhancing properties in traditional medical practices in China(4). As a food, dried wolfberries are traditionally cooked before consumption, used as herbal tea, as well as in Chinese soups, or in combination with meat and vegetarian meals. Goji fruits are also used for the production of juice, wine and tincture(3). The chemical composition of goji berry includes monosaccharides(arabinose, rhamnose, xylose, mannose, galactose, glucose), galacturonic acid and eighteen amino acids, carotenoids (zeaxanthin, beta-carotene, neoxanthin, cryptoxanthin), flavonoid(quercetin-3-O-rutinoside, kaempferol-3-O-rutinoside, chlorogenic acid, caffeic acids), taurin, betaine, vitamins(thiamin, riboflavin, ascorbic acid) potassium, sodium, phosphorus, magnesium, iron and calcium(3). LBP, the most biologically active fraction of wolfberry, possesses significant antioxidative and anti-inflammatory effects on multiple tissues(5). Dicafeoylspermidine derivatives are beneficial bioactivity constituents responsible for the anti-AD and antioxidant effects of wolfberry. Antioxidant activities of these constituents could also contribute to antiaging, neuroprotective, and anti-AD effects of wolfberry(6). Some researchers have demonstrated that a fraction of polysaccharide from Lycium barbarum provided remarkable neuroprotective effects against beta-amyloid peptide-induced cytotoxicity in primary cultures of rat cortical neurons(7). Significantly more research is needed but recent studies suggest that lycium barbarum treatment can be useful for treating memory impairment induced by several neurodegenerative diseases such as alzheimer disease.

USE OF DIFFERENT CUMIN DOSES TO IMPROVE THE CHEMICAL AND SENSORIAL CHARACTERISTICS OF COATED AND FRIED CHICKEN MEAT

ELIF AYKIN DİNÇER¹, ATIKE NUR DURAK¹, ÖZLEM KILIÇ¹, ANDAÇ KOÇ¹, MUSTAFA ERBAŞ¹

ABSTRACT

In this research, it was aimed to determine the effect of different cumin doses (0, 1, 2, 3 and 4 g/100 g raw material) in the coating batter formula on quality characteristics of coated fried chicken meat. The titration acidity, pH, thiobarbituric acid reactive substances (TBARS), total antioxidant activity (TEAC and ORAC), cooking loss, dimension changes, color parameters (L*, a*, b*) and sensorial characteristics were determined in the samples. Titration acidity were affected significantly (P < 0.05) by the cumin dose and it decreased with the increase of cumin dose from 0% to 4%. The increasing addition of cumin was also efficient for reducing TBARS content and the lowest TBARS content was determined as 2.13 µmol MA/kg in the samples with 4% cumin. Moreover, the TEAC values of samples significantly increased from 11.07 to 45.02 µmol equivalent Trolox/ g dry matter, while the ORAC value of samples showed only descriptive increase with increasing doses of cumin from 0% to 4%. Furthermore, the samples with 4% cumin were significantly less yellow and darker (P < 0.05) (lower L* and a*) than the control group (with 0% cumin) which is thought to be sourced from increasing cumin dose. In conclusion, the use of 2% cumin in batter formula of coated fried chicken provides high quality with acceptable sensorial properties because of the highest sensorial points and is suitable to obtain healthy meat products.

MEDICINAL AND AROMATIC PLANTS USED IN MENOPAUSAL COMPLAINTS

YEŞİM ANIK¹, KAMİLE ALTUNTUĞ¹, EMEL EGE¹

ABSTRACT

Climacterium is a Greek word and means step of a ladder. This period is a transitional period, taking place between productivity period and old age, characterized with the symptoms revealing as a result of differentiating hormonal balance depending on morphological and functional changes in ovaries. The most important phenomenon in this transition period when various physiological, psychological and social changes come up is Menopause. Menopause is characterized with decrease in estrogen secretion, permanent end of menstruation and disappearance of fertility following loss of ovary functions depending on ageing of ovaries and atresia of follicles. Sudden decrease in production of estrogen in ovaries in menopause causes vasomotor hot flushes, cardiovascular and gastro-intestinal changes, cognitive and emotional instability, sleep disorders, changes on skin, urogenital atrophy and osteoporosis. Life quality, welfare and health perceptions of women may negatively be influenced due to hormonal originated psychological and physiological changes come up in this period. Hormone replacement therapy is used to prevent vasomotor symptoms arising in period of menopause and to prevent short and long term problems of menopause. However, the findings about the fact that hormone replacement therapy causes increase in the risk of breast cancer, cerebrovascular accident and cardiovascular disease have reduced use of hormone replacement therapy and directed women to use alternative treatment methods. The conclusions of the study show that ratio of alternative treatment usage directed on symptoms of menopause varies between 22% and 83%. Anise, basil, licorice, dill, parsley, red salvia, dandelion, daisy, Humulus Lupulus, Dong Quai and Hypericum Perforatum L. and suchlike medicinal and aromatic plants are among the natural estrogen resources having significant place in reducing menopausal complaint. It is detected that Humulus Lupulus reduces hot flushes and other menopause signs (sweating, insomnia, heart throb, nervousness) frequency. Moreover, it is specified that it provides decrease in vaginal dryness when used with E vitamin combination for urogenital atrophy. It is stated that Dong Quai which is a plant specific to China, has a supportive effect in menopausal complaints thanks to its efficiency in easing hot flushes and its moderate estrogenic and vasodilator effect. It is set forth that Hypericum Perforatum L. is effective in treatment of mild to moderate depression. At the same time, it is ascertained that it considerably provides decrease in the severity and incidence of psychological, psychosomatic and vasomotor symptoms for the women with pre and postmenopausal symptoms. In conclusion; being an important period of life, menopause affects every women in different severities and directs some to seek treatment. Several women prefer non-pharmacological treatment methods for menopause complaints because of concerns on side-effects of hormone replacement therapy. It is observed that medicinal and aromatic plants, efficiency of which is detected with evidence-based studies, are beneficial for healing menopausal complaints and increasing life quality. Improper and unconscious use of medicinal and aromatic plants may cause toxic effects. Clinicians need to pursue contemporary

THE HEALTH EFFECT OF THE CAROB

DEMET ÖNEN¹, NILÜFER ACAR TEK¹, GAMZE AKBULUT¹

ABSTRACT

The Carob tree grows in many parts of the Mediterranean region. The fruit of carob production is nearly 14.000 ton/year and consumed in variously as raw fruit, pekmez or flour in Turkey(1). The chemical composition of the carob fruit changes vary by two major parts: the pulp(90%) and the seeds(10%) and depends on cultivar, origin and harvesting time. Carob pulp is rich in carbohydrate content (35-45% sucrose, 2-4% glucose, 6-7% fructose, 18% cellulose-hemicellulose), low protein(2-7%), lipid(0,5-1%) and lots of polyphenols, especially highly condensed tannins(proanthocyanidins), composed of flavan-3-ol groups and their galloyl esters, gallic acid, (+)-catechin, (-)-epicatechingallate, (-)-epigallocatechingallate and quercetin glycosides(3). Raw carob pulp's mineral composition is rich in calcium, phosphorus, potassium, magnesium, sodium, manganese, iron, copper and zinc(4). Carob's nutritional and bioactive composition(dietary fiber, polyphenols, cyclitols) with trace elements that act as cofactors of antioxidant enzymes to protect the body from oxygen free radicals that are produced during oxidative stress have been linked with the health-promoting effects such as anti-hyperlipidemia anti-diabetes, anti-diarrheal and anti-cancer(5). Some studies have found that the concentrated polyphenols extract from carob have beneficial effect on serum lipids in humans who have hypercholesterolemia. Zunft et al. noted that 15g/day of carob consumption during 6 week reduction of 10.5 \pm 2.2% in LDL cholesterol(6) and 7.1% in mean total cholesterol and 10.6% in LDL cholesterol(7). Ruiz-Roso et al. found that 4g twice a day carob fiber intake reduced the total cholesterol(17.8 \pm 6.1%) and LDL cholesterol(22.5 \pm 8.9%) level after 4 weeks(8). Zavoral et al. determined that 30g/day consumption during 2 weeks reduction in cholesterol 17% and LDL-C 19% in familial hypercholesterolemic children(9). One study found that total cholesterol (CT), HDL-cholesterol levels significantly increased with the consumption of 20g/day a non-extractable-tannin-rich carob-fiber for 4 weeks in hypercholesterolemic patients(10). Carob bean has been used to treat diarrhoeal diseases in Anatolia since ancient times and standard oral rehydration solution provides effective rehydration but does not reduce the severity of diarrhoea so Akşit et al. tested the clinical antidiarrhoeal effects of carob bean juice(CBJ) and conclude that CBJ may have a role in the treatment of children's diarrhoea after it has been technologically processed(11). It has also been shown that the tannins in carob normalized defecation, body temperature, and weight and cessation of vomiting were reached more quickly by the infants who received 1.5g/kg/day a tannin-rich carob pod powder (40% tannins or 21.2% polyphenols and 26.4% dietary fiber)(12). The presence of low glycemic load, high fiber mainly high levels of insoluble fiber and D-pinitol in carob products could be responsible for the anti-diabetic effects as it regulates blood sugar level in patients with type II diabetes mellitus by increasing insulin sensitivity(5,13). Banuls et al. study supports that consumption of carob pod inositol-enriched beverage in prediabetic subjects produces a response that is dependent on BMI, with a clear improvement of insulin resistance and postprandial and nocturnal glycemia in non-obese subjects and a marked anti-inflammatory response in obese(14). Rtibi et al.

Corresponding Author: **DEMET ÖNEN**, demetonen@gmail.com

¹GAZİ ÜNİVERSİTESİ SAĞLIK BİLİMLERİ FAKÜLTESİ BESLENME VE DİYETETİK BÖLÜMÜ

found that carob pod aqueous extract inhibits intestinal glucose absorption, improves glucose tolerance and protects against alloxan-induced diabetes in rat(15). Carob is rich in phytochemical compounds(e.g. quercetin, gallic acid, theophylline etc.) that have antitumor, anti-proliferative and proapoptotic activity(5). Carob pod and leaf extracts contained antiproliferative agents could be of practical importance in the development of functional foods and/or chemopreventive drugs(16). Studies have shown that carob may have health benefits including protecting cancer, reducing cholesterol, regulating blood sugar level and treating diarrhea symptoms although more studies needed. The public should be informed and consumption of the raw carob fruit or manufactured products (e.g. carob pods can be used as a cocoa substitute or coffee cause of not containing caffeine and theobromine) should be supported.

ANTIOXIDANT CAPACITY, CHEMICAL COMPOSITION AND MELISSOPALYNOLOGICAL CHARACTERIZATION OF CHESTNUT AND RHODODENDRON HONEYS IN TURKEY

NAZLI MAYDA¹, ASLI ÖZKÖK¹, KADRIYE SORKUN¹

ABSTRACT

Introduction: Chestnut (*Castanea sativa* Mill.) and Rhododendron (*Rhododendron* sp. L.) honey are produced generally in Black Sea Region in Turkey and both of them are the special honeys for their organic component content and known their high antioxidant capacity. Chestnut plant is one of the important nectar and pollen resources for honey bees. Chestnut honey with dark color and bitter taste, can stay in a liquid state for a long time because of its slow crystallization rate. Rhododendron honey, produced by honeybees from the nectars of Rhododendron genus (*R. ponticum* and *R. luteum*) flowers, which are belongs to Ericaceae family. This honey's taste is bitter because of its slightly sharp taste and most of them contains toxins which are called grayanotoxins and they can be toxic when their consumption. So people use generally "Mad Honey" name for this honey due to subsequent consumption effects. On the other hand this honey is widely used in indigenous medicine. In the first step of this study we researched the melissopalynological differentiation of the chestnut and rhododendron honeys and then in the second step we determined the chemical and antioxidant capacity of the rhododendron, chestnut and mixed chestnut&rhododendron honeys characterization. **Materials and Methods:** Total 15 honey samples were collected from 5 different districts [Bartın (n=8); Kastamonu (n=1); Şile (n=1); Amasra (n=2); Düzce (n=3)] from Black Sea Region of Turkey. Melissopalynological analysis was done by microscope (Olympus CX41). Total phenolic and total flavanoid capacity were made via UV-Spectrophotometer (Genesys 10S UV-VIS Spectrophotometer). Chemical composition (Fructose&Glucose and HMF content) was determined by HPLC (Agilent 1200 Series) and GC-MS (Agilent 5973). **Results and Discussion:** After melissopalynological analysis were obtained 10 monofloral chestnut, 2 monofloral rhododendron and 3 mixed chestnut&rhododendron honeys. As a result of antioxidant capacity analysis, Total Phenolic contents was determined between 84.0271 ± 0.0764 and $312.6152 \pm 0,1921$ mgGAE/kg \pm SD; Total Flavanoid contents were determined between 9.6746 ± 0.0244 and 42.6331 ± 0.1732 mgQE/kg \pm SD. According to sugar analysis with HPLC, F/G rates were found between 0.9 and 1.71. GC-MS chemical substance analyses of honeys revealed aldehydes, aromatic acids, aromatic alcohols, flavanones, esters, aromatic amines and other chemical substances.

CYTOTOXIC EFFECT OF DIFFERENT EXTRACTS OF SALVIA CANDIDISSIMA VAHL. SSP. CANDIDISSIMA ON LUNG CANCER CELLS

İMREN ALIOĐLU¹, SERAP ÇELİKLER KASIMOĐULLARI¹, OĐUZHAN AKGÜN¹, AYŞEGÜL CEBİ², ENGİN ULUKAYA³, FERDA ARI¹

ABSTRACT

Lung cancer is one of the cancer types that are common in the world today and have a high mortality rate. More than one million people die each year due to lung cancer. The survival time is 60-70% (5 years) in the early stage and falls below 5% in the advanced stages. The search for new anti-cancer compounds is continuing, as there is still no satisfactory success in the treatment of lung cancer. Several plant-derived drugs are currently used in cancer therapy. In this study, the anticancer activity of the methanol and ethanol extracts of *Salvia candidissima* was investigated in human lung cancer cells (A549 and H1299). The effects of plant extracts on cell viability were determined by SRB viability test. The apoptotic effect in the cells was observed morphologically by fluorescence staining. The IC50 values of *Salvia candidissima* were calculated as 42.9 µg/ml in methanolic extract while in ethanol extract as 32.04 µg/ml in A549 cells. In the H1299 cells, the IC50 value of methanol extract was found as 182.2 µg/ml and ethanol extract as 195.8 µg/ml. As a results, it will be promising to investigate the potential of *Salvia candidissima* extracts to be used as anticancer agents in A549 human lung cancer cells

DETERMINATION OF TOTAL ANTIOXIDANT ACTIVITY AND FLAVONOID CONTENT OF AUBRIETA EKİMİİ

BURCU ARIKAN¹, RABIYA MERVE CEYLAN², İBRAHİM SIRRI YÜZBAŞIOĞLU³, NESLİHAN TURGUT KARA⁴

ABSTRACT

Aubrieta, a genus of the Brassicaceae family, is spreading from southern Europe to the Middle East to Asia. Introduced to the scientific world in 2015, Aubrieta ekimii is an endemic, ostentatious rock plant in the northwestern Anatolian region with a limited area spread. A. ekimii blooms between April and May and between the end of May and the month of July it gives fruit. The aim of the study is to determine the antioxidant activity and flavonoid content of methanol extract prepared from A. ekimii plant. Antioxidant activity was determined by the TAC Assay kit based on the reduction of copper. As a result, the total antioxidant activity of methanol extracts of A. ekimii plant was determined as 786.54 CRE (equivalent to μM copper reduction) and the total flavonoid amount was 20.11 ± 2.93 mg catechin equivalent / g sample (KE / g sample). With this recent study, antioxidant activity and flavonoid content of A. ekimii plant were determined for the first time.

INVESTIGATION OF THE TOTAL PHENOLIC AND TOTAL FLAVONOID CONTENT OF DIFFERENT FRACTIONS OBTAINED FROM LIQUIDAMBAR ORIENTALIS MILL. STORAX, FRUIT AND LEAF

SÜMEYRA ÇETİNKAYA¹, EDA BÜKER², İLKNUR ÇINAR¹, H. GÜL DURSUN¹, İPEK SÜNTAR³

ABSTRACT

Liquidambar species (*L. orientalis* var. *orientalis*, *L. orientalis* var. *integriloba* ve *L. orientalis* var. *suber*) belong to the family of Hamamelidaceae. Liquidambar orientalis tree is commonly known as ‘Sıđla ağacı’ or ‘Gunluk ağacı’ in Turkey. *L. orientalis* is a herbaceous plant known to have medicinal and cosmetic properties and is widely used in phytotherapy in the Mediterranean region (Hafizođlu 1982). The storax produced by injuring *L. orientalis* has antiseptic properties (Fernandez 2005). Also it is used as a topical parasiticide, expectorant and for the treatment of some skin diseases in Turkish folk medicine (Hafizođlu 1982). Medical plants which are yielding valuable natural products are often used in the treatment of various disease (Skrovankova vd. 2012). Many constituents of medicinal plants are include large amounts of antioxidants such as phenolic compounds, flavonoids, terpenes, tocopherols, and other endogenous metabolites (Zheng ve Wang 2001). In our study, we are investigated total phenolic and flavonoid contents of different fractions obtained from *L. orientalis* storax, fruid and leaf. Total phenolic content with Folin-Ciocalteu colorimetric method and total flavonoid content with aluminium chloride method carried out. As a result, storax chloroform, fruid n-hexane and storax methanol fraction have most high level of total phenolic content, respectively. Fruid n-hexane, storax chloroform and leaf n-hexane fraction have most high level of total flavonoid content, respectively. References 5. Hafizoglu H. IN VITRO ANTIBACTERIAL ACTIVITY OF ESSENTIAL OILS AGAINST FOODBORNE PATHOGENIC BACTERIA

NAZAN TOKATLI DEMİROK¹, MEHMET ALPASLAN¹

ABSTRACT

Essential oils are well known volatile oily liquids. They have recently got scientific interest owing to their antibacterial, antifungal, antiviral insecticidal and antioxidant properties. Gram- positive organisms are believed to be more resistant to essential oils than gram-negative bacteria. The purpose of the present study was to evaluate antibacterial effectiveness of the four essential oil samples which are Black seed oil (*Nigella sativa* oil), peppermint oil (*Mentha piperita* oil), rosemary oil (*Rosmarinus officinalis* leaf oil), thyme oil (*Thymus vulgaris*). The essential oils were obtained by hydrodistillation using a Clevenger type apparatus. The agar disc diffusion method was employed for the determination of antibacterial activity of the essential oils and a broth microdilution broth susceptibility assay was used, for the determination of the minimum inhibitory concentration (MIC). The essential oils were individually tested against five pathogenic microorganisms: two strains of gram-negative bacteria; *Escherichia coli* ATCC 25922, *Salmonella Enteritidis* ATCC 13076 and three strains of gram-positive bacteria; *Listeria monocytogenes* DSM12464, *Staphylococcus aureus* ATCC6538, *Enterococcus faecalis* ATCC51299, containing 10⁸ colony-forming units (CFU) ml⁻¹ of bacteria cells. Almost four oils showed remarkable antibacterial activity against test microorganism. Among the essential oils, *Thymus vulgaris* oil and *Mentha piperita* oil have significant antibacterial activity 38 and 34 mm zone against *Staphylococcus aureus* and *Salmonella Enteritidis* and the lowest MIC value 2.25 mg/ml. These results suggest the potential of studied these essential oil inhibit microbial growth and they have potential preserving foods.

THE USE OF OAK ACORNS AS A FUNCTIONAL FOOD IN FOOD INDUSTRY

HALUK ERGEZER¹, RAMAZAN GÖKÇE¹

ABSTRACT

The oak is a kind of hardwood forest tree with 30-35 m heights. There are around 30 oak species in 18 of them are native to our country. The fruit of all of the oak is called "acorn". Acorns contains some compounds such as phenolics and tocopherols, as well as tannins as main components, which can be used in the production of functional foods which vary with the growing period. The acorn is a nutritious food for humans and animals with approximately 55% starch, 2.75-8.44% protein and 0.7-7.4% fat content. It has been reported that more than 53-65% the fatty acid profile of acorns were contained oleic and linoleic acid mixture. Phenolic compounds and tocopherols are the most important natural antioxidants of acorns. The main tocopherol of acorn was γ -tocopherol, forming almost 90% of the total tocopherol content. In addition, 32 different phenolic compounds were isolated from the acorns, and all of them were reported as ellagic and gallic acid derivatives. It has been determined that the antiradical scavenging activity values of the isolated phenolic materials were very high. In some Mediterranean countries, oak acorns are used to give flavor to dessert, ice cream and some liqueurs. In addition, in Algeria, Morocco and the United States, acorn oil is added to the oil mix to extend the shelf life of cooking oils. In Spain and Italy, roasted acorns are also used to give an astringent flavor to breads, cakes and coffee. There are some researches that acorns can be used as a substitute for synthetic antioxidants, especially in meat, due to high antioxidant capacity of acorns. As a matter of fact, pigs to be used for Iberian ham production which is specific to Spain have to be fed with oak acorns. It is known that the antioxidant compounds found in the acorn structure used for the pig fodder are transferred to the meat structure, thus preventing the product from being oxidized during the prolonged maturation period.

CHARACTERISTICS AND EFFECTIVE USAGE AREAS OF ROSEMARY

GÜLŞAH ÖZEL¹, ELIF FEYZA TOPDAS¹, MEMNUNE ŞENGÜL¹, HACER ÜNVER¹

ABSTRACT

Rosmarinus officinalis (rosemary) is a small needle-tipped, leafy plant belonging to the Labiatae family. Flowers of rosemary which are white, light blue and blue blooms in spring and summer. Rosemary does not plow its leaves in winter and has a strong aroma resembling camphor or eucalyptus odor. It is one of the spices commonly used in European and North American countries due to its pleasant aroma resulting from its essential oil. Rosemary used as antioxidant or natural preservative in foods and it is also used in soap, room odor, deodorant, perfume and lotion. Its essential oils or extracts can be used in meat products, oil-containing foods and oils against oxidation and rancidity. Antioxidant properties of rosemary are due to carnosol, carnosic acid and rosmarinic acid. It is reported that the antioxidant activity of carnosic acid is three times higher than carnosol and seven times higher than butylated hydroxy toluene (BHT) and butylated hydroxy anisole (BHA). It is recommended that rosemary can be dried and used as an antioxidant source. But besides this usage areas of rosemary are limited because of intensive taste and odor which are felt even in very diluted extracts. This problem has been solved by some methods developed in recent years. Especially commercial rosemary preparations are produced in USA and Japan with colorless, tasteless and odorless but strong antioxidant effect.

KOMBUCHA, THE FERMENTED TEA: ANTIBACTERIAL EFFECTS

NAZAN TOKATLI DEMİROK¹

ABSTRACT

Kombucha, is a traditional refreshing beverage that made actually from tea extract supplemented with sugar and fermented a powerful symbiosis of acetic bacteria and yeasts. The yeast cells and Acetic acid bacteria use sucrose and glucose and they produce ethanol and acetic acid. Both ethanol and acetic acid have antimicrobial activity against pathogenic bacteria. This metabolism also produces vitamins C, B1 B2, B3, B6, B12 and folic acid. The present study was undertaken to determine the efficacy of Kombucha, a fermented beverage of sugared black tea, [Kombucha was prepared in a tea broth (10% w/v) supplemented with sucrose (20% w/v)] against five pathogenic microorganisms: two strains of gram-negative bacteria; Escherichia coli ATCC 25922, Salmonella Enteritidis ATCC 13076 and three strains of gram-positive bacteria; Listeria monocytogenes DSM12464, Staphylococcus aureus ATCC6538, Enterococcus faecalis ATCC51299. The agar disc diffusion method was employed for the determination of antibacterial activity of the Kombucha and a broth microdilution broth susceptibility assay was used, for the determination of the minimum inhibitory concentration (MIC). Almost Kombucha showed remarkable antibacterial activity against test microorganism although Kombucha, showed strong activity against Listeria monocytogenes DSM12464 which is the highest sensitivity with the largest inhibition zone (20 mm) and the lowest MIC value (6.25 mg/ml) These overall study results recommend that Kombucha can be used as a potent antibacterial agent.

TOTAL PHENOLIC CONTENT OF SUBMERGEDLY CULTIVATED MUCOR MYCELIA

BURCU ATLI¹

ABSTRACT

Mucor miehei is commonly used as a producer of aspartic protease and lipase enzymes in food industry. The aim of the present study was to determine the antioxidant potential of the water extract of submergedly cultivated *Mucor mycelia*. The *Mucor miehei* extract was evaluated for total phenolic content by Folin's Ciocalteu method and ascorbic acid (vitamin C) concentration by a redox titration using iodine. Total phenolic content of the *Mucor miehei* extract was found 546.32 mg/100 g gallic acid equivalents (GAE). The concentration of ascorbic acid which has antioxidant properties was 1.6 g/100 g. These results indicate that *Mucor miehei* extract can be considered as promising candidate for use in medicine and cosmetic industries.

SOME PROPERTIES AND USAGE AREAS OF BASIL (OCIMUM BASILICUM)

MEMNUNE ŐENGÜL¹, ELIF FEYZA TOPDAS¹, NESLİHAN KAVAZ¹, GÜLŐAH ÖZEL¹

ABSTRACT

Basil is known as Basilic by Frenchs and Basilicum by Germans. Also in international trade Basil, widely used with this name, is used in the ancient Greek with the name 'Basilicos' which means 'king'. Genus *Ocimum* contains single or perennial species which are belonging to the family of Lamiaceae. Basil spreads in tropical and temperate regions. In Turkey, it is mainly grown in Western and Southern Anatolia. Spice or volatile oil of basil has various uses areas in food industry such as non alcoholic beverages, bakery products, candies, ice creams, wines and meat products. Also its volatile oil which ranges from 0.3% to 1% used in perfumery. The amount of volatile oil and its composition varies with the species, climate, soil and harvest time. Aromatic compounds found in basil are linalool, citral, methyl chavicol (estragol), eugenol and methyl cinnamate. Species grown in Africa generally contains camphor. It has been determined that the basil's most common phenolic substance is navedensin (5,7-dihydroxy-6,8,4'-trimethoxy flavone). This is followed by ladanin, pilosin, genkwanin, salvigenin, cirsiliol and apigenin. This plant which is rich in phenolic substances also has a strong antioxidant activity. So it can be used for impart functional properties to some foods. It has been shown in various scientific studies that basil exhibits antimicrobial activity against *Escherichia coli*, *Pseudomonas aeruginosa*, *Bacillus subtilis*, *Staphylococcus aureus*, *Salmonella sp.*, *Serratia marcescens*, *Klebsiella pneumoniae* and *Proteus vulgaris*.

BIODEGRADABLE AND EDIBLE FILM-FORMING PROPERTIES OF SALEP AS A NEW SOURCE

MÜGE HENDEK ERTOP¹, RABIA ATASOY¹

ABSTRACT

The plastic materials made from petroleum are widely used in many industry field because of their availability, resistance to oxygen, barrier to moisture and reasonable price. However, packaging materials made from petroleum are not biodegradable and edible. The edible biopolymers obtained from renewable plant resources are the best option to replace synthetic plastics. Edible films can be defined as a thin layer placed on or between food components or surface. Edible and biodegradable films can be used to reduce the migration of O₂, CO₂ and moisture. Therefore, they improves appearance and extend the shelf-life of food products. The utilization of edible and renewable sources from various plants for edible films has been a remarkable issue due to its economic and environmental impact of them. The ingredients used with this aim can be divided into three categories: synthetics, lipits and hydrocolloids such as proteins and polysaccharides. Hydrocolloids obtained from different resources are also the main sources of edible films. Salep is the roots or tubers of Orchidaceae species which is largely collected in Eastern Mediterranean countries included Turkey. The tubers of naturally grown orchids are dried and then ground to produce salep powder. Salep is commonly used as a traditional beverage and a stabilizer for ice cream. Because the glucomannan is the most important polysaccharide constituent in salep, it is thought to be that salep is very appropriate raw material for edible and biodegradable films. The film-forming properties of salep is very newly concept for food industry. Furthermore, there is very limited information about this issue. The main objective of this review study were to evaluate the edible film-forming properties of salep as a new source.

CYTOTOXIC EFFECTS OF RHODODENDRON PONTICUM L. EXTRACT ON RAT GLIOMA CELL LINE (F98)

EMINE KÜBRA BİLİR¹, SEDAT SEVİN¹, HİDAYET TUTUN², ERAY ALÇIĞIR³, ENDER YARSAN¹

ABSTRACT

Aim: The genus *Rhododendron* used in traditional medicine for the treatment of inflammation, pain, cold, asthma, skin and gastro-intestinal disease, is distributed widely around the world. *Rhododendron ponticum* L., contains grayanotoxins with diterpene qualities. Increased incidence of cancer, treatment is costly and create serious side effects applied to people, it becomes necessary to investigate a scientific alternative treatment and supportive way. The aim of the study was to investigate in vitro cytotoxic effects of *Rhododendron ponticum* L. extract whose known amount of grayanotoxin I and III on common glioma tumors in rat glioma cell line (F98). **Methods:** During the flowering period of common rhododendrons gathered from the Altinordu District of Ordu and dried under suitable conditions, extracted with distilled water and lyophilized. The content analysis of the common rhododendrons was carried out by the Chromatographic Method at Marmara Research Center Food Institute of the Scientific and Technical Research Council of Turkey. In our study, cytotoxic activity of different concentrations of the extract of *Rhododendron ponticum* L.; through mitochondrial (MTT) and lysosomal (Neutral Red) was evaluated in common glioma tumors using rat glioma cell line (F98). **Results:** It was determined that the *Rhododendron ponticum* L. extract with grayanotoxin I amount of 55.75 µg / kg and grayanotoxin III amount of 7.4 µg / kg; had a dose-dependent cytotoxic effect. IC50 were found as MTT 122,8 and by Neutral red 79,61µg/ml, respectively. **Conclusion:** Cytotoxicity in glioma indicate that *Rhododendron ponticum* L. is expected to be a potential anticarsinogenic activity. Our research on *Rhododendron ponticum* L. continues on other cancer cell lines with cytotoxicity tests

MARINATION TECHNOLOGY IN SEAFOOD, SOME AROMATIC PLANTS USED AND IMPACT MECHANISMS

MEHTAP BAYKAL¹, AYGÜL KÜÇÜKGÜLMEZ YANDIM², HÜLYA SAYGI³, MEHMET ÇELİK²

ABSTRACT

Marination is the application of fresh, frozen, salted fish or fish parts by treating them with acetic acid or other organic acids and salt without heat effect. In addition to the development of new products with the improvements in food processing methods, it is also aimed to extend the durability of the products obtained and to protect the qualities. Through the marination, food products that are abundant in certain periods are provided for human consumption even during periods when they are less frequent. These products can be served to consumers with flavors such as sauce, cream, mayonnaise, oil, as well as various spices and herbs. In the marination technology, it is widely used such as bay laurel, dill, estergon, mustard seeds, whole cloves, black pepper, red pepper, allspice, cumin, ginger, rosemary, thyme, basil, tarhun and capari. The acid taste of marinades is softened with herbs and spices and thus a balanced taste is being tried to be formed. The herbs used in the marinating process are used to the products not only to add taste, flavor and aroma but also to minimize the negative odors that may occur. Spices and herbs used have protective effect or minimized lipid oxidation. Spices also mask color and smell rather than inhibition of deterioration. In some studies it has been found that these herbs stabilize the quality of the product and prevent the development of harmful bacteria. It is also necessary to pay attention to the qualities of the spices added to the solution, because at this stage some bacterial and proteolytic enzymes in the solution are still effective. Depending on the storage temperature, it can cause bad odor development, color loss, softening. In this review emphasizes the importance of various herbs that enhance taste and endurance in marination technology.

EFFECTS OF ETHEPHON TREATMENT AS SOIL DRENCH ON PLANT HEIGHT AND QUANTITATIVE PROPERTIES OF NATIVE NARCISSUS GROWN IN POTS

SEVİM DEMİR¹, FISUN GÜRSEL ÇELİKEL¹

ABSTRACT

In this study, the effects of ethephon treatment as soil drench on plant height, quantitative and other properties of native narcissus (*Narcissus tazetta* L.) grown in pots were investigated. When plants were 7-10 cm tall, ethephon at 0, 250 and 500 ppm were applied as soil drenches. The effects of ethephon treatment on plant length, leaf length, the time of flowering, number of flower and the flower life were determined. In addition, quantitative measurements (leaf area ratio, specific leaf area, leaf thickness, leaf weight ratio and stem weight ratio) were analyzed in native narcissus. When narcissus were grown in pots in the greenhouse reached to the sale stage plants were taken to the laboratory at 20 °C to evaluate the postproduction life and quality of pot plants. The shortest plant height was obtained from the 500 ppm ethephon treatment, plant height was 7.67 cm with %51 shorter than untreated control. Ethephon application also shortened the leaf length up to %20. The shortest leaf length (14.55 cm) was obtained from 500 ppm ethephon treatment. The ethephon treatment decreased leaf area ratio and specific leaf area, but increased the leaf thickness and leaf weight ratio compared to the control plants. The effects of treatments on plant height continued in laboratory (home-office) conditions after production. The shortest plant height (12.62 cm) was obtained from 500 ppm ethephon treatment whereas the height of untreated control plants were 24.25 cm during the post production life of pot plants.

INVESTIGATION OF THE TOTAL PHENOLIC AND FLAVONOID CONTENT OF SOME FRACTIONS OBTAINED FROM ROOT AND STEM OF RHEUM RIBES (LIGHTED)

ILKNUR ÇINAR¹, EDA BÜKER², SÜMEYRA ÇETINKAYA¹, HATİCE GÜL DURSUN¹, İPEK SÜNTAR³

ABSTRACT

In order to struggle metabolic diseases and cancer cases, it is becoming necessary to use complementary medicines, phytotherapeutics and appropriate food supplements besides dietary and lifestyle intervention. The incorporation of phytochemical complex mixtures of different chemical structures, such as phenolic acids, polyphenols, flavanoids and terpenoids, often has the advantage of targeting a number of molecular pathways involved in the pathobiology of complex diseases, with a significant reduction in toxic side effects. Rheum Ribes belongs to the family Polygonaceae, which is called as "lively, fluffy or fuzzy" among the people, especially in the subtropical and temperate regions of the world, especially in the east of Turkey, Iran, Iraq, Lebanon to Afghanistan and Pakistan, Is a plant species that spreads between slopes. R. Ribes (juvenile shoots and leaf stalks) are commonly used against diarrhea, stomach aches and nausea, as well as measles, flowers, hemorrhoids and bile removers. It is thought that strong active compounds possessed by this plant are based on all these properties. The total flavonoid content of root methanol, root ethylacetate, root hexane and stem methanol, stem ethylacetate, stem hexane fractions of Rheum ribes were studied by aluminum chloride colorimetric method. According to the results obtained, the highest values were found in the hexane fraction of stem, methanol, ethylacetate, trunk hexane fractions, and root ethylacetate fractions in root methanol, root ethylacetate and root hexane fractions. Total phenolic content was determined by Folin-Ciocolteu method. According to these test results, the highest value was found in the fraction of methanol, stem ethylacetate, trunk hexane fractions, fraction of ethylacetate, fraction of methanol, radical ethylacetate, and fraction of radical hexane fractions

NEMATICIDAL ACTIVITY OF ESSENTIAL OILS DERIVED FROM APIACEAE FAMILY AGAINST ROOT LESION NEMATODE, PRATYLENCHUS THORNEI

BEKİR TOSUN¹, ARIF ŞANLI¹, FATMA GÜL GÖZE ÖZDEMİR², HAMİDE BAKIRKAYA¹

ABSTRACT

Pratylenchus spp. is a plant pathogenetic nematode which is migratory endoparasites that feed and reproduce in the root and move around, responsible for root lesion disease on many host plants in temperate regions around the world. Fruit essential oils of *Heracleum platytaenium* Baiss, *Hippomarathum microcorpum* (Bieb.) Fedtsch., *Ferulago cassia* Boiss and *Chareophyllum byzantinum* Boiss belonging to Apiaceae family of Turkey flora in Isparta, were screened for their in vitro nematocidal activity against the Root Lesion Nematode, *Pratylenchus thornei*. The essential oils were isolated by hydrodistillation and investigated by gas chromatography mass spectrometry (GC-MS). A total of 37, 42, 38, 47 components of the *H. platytaenium*, *H. microcorpum*, *F. cassia* and *C. byzantinum* essential oils were identified, respectively. High nematocidal activity was achieved with essential oils from *F. cassia* and *C. byzantinum* which caused 93.46% and 90.93% mortality. *H. microcorpum* was found to be more effective than *H. platytaenium*. The dominant components of the effective oils were chrysanthenyl acetate (17.4%), mesitaldehyde (5.8%), limonene (15.3%) and α -pinene (13.6%) in *F. cassia*, Methylebenzoate (44.9%), 1-Limonene (38.4%) in *C. byzantinum*, beta-Myrcene (21.9%), cis-Ocimene (17.8%), beta-Phellandrene (12.0%), bicyclogermacrene (8.2%) in *H. microcorpum* and 2-ethylhexyl acetate (41.4%) and E4-dodecenylacetate (17.0%), octilin (7.7%) in *H. platytaenium*. Nematocidal activity of the essential oils investigated in the research against *P. thornei* is reported for the first time. The essential oils and their main components described here in merit further study as potential nematocides against the Root Lesion Nematode.

USAGE OF COLORANT PLANTS IN KONYA'S FELTMAKER ART

ÇETİN ÖZTÜRK¹, SALİH GİRGIÇ²

ABSTRACT

Due to its climate and geographical position, the fact that the livestock breeding has been carried out in Konya plain for centuries has enabled the development of carpets and plain weaving. The fact that Konya is a very rich region in terms of colorant plants and insects is also an important influence on the formation of these arts. The first raw materials of natural colorant are some stone, soil and mining varieties and some molluscs and insect varieties with staining properties. However, awareness of color diversity in plants has led to the use of whole or a part of the plant in dyeing. Hundreds of different varieties of colors and shades of different colors have been used in carpet art, Felt art, Ceramic art and many other cultures. The colors of the plant, which are obtained by using different regions and applying different methods, have been preserved as a secret and the generations are transferred with great confidentiality. In this study, the use of plant dyes and coloring methods in Konya Felt art were investigated.

EVALUATION IN TERMS OF HABITAT FEATURES OF SOME TRUFFLE SPECIES : CASE OF ÇAKILLI, VIZE

HÜSEYİN KABA¹, HÜSEYİN HİLESİZ²

ABSTRACT

Truffle exploration activities is done in collaboration of Marmara Forestry Research Institute and İstanbul Regional Directorate in terms of «General Directorate of Forest Truffle Action Plan 2014-2018" and "Projectless Works". It is protected founding in the truffle as without dogs and with trained dogs at Çakıllı town, Vize Subdistrict Directorate, Vize Forest District Directorate in terms of Action Plan. Natural Truffles is usually found at altitudes about 250 m, at age of development of 'bc', inside mixed stands of Cedar (*Cedrus libani* A.Richard), Oak (*Quercus petraea* (Matt) Liebl and *Quercus robur* L.), Black pine (*Pinus nigra* J.F. Arnold) and Hornbeam (*Carpinus betulus* L.), at Çakıllı town. According to soil analysis result in plot at points natural truffle, it is found pH 6,00-7.85 ; EC ($\mu\text{S}/\text{cm}$) 295-769 ; CaCO_3 % 0,22-33,44 ; N % 0,14-1,96 ; C % 7,73-19,03. *Tuber aestivum* Vittad. was detected in July of 2015 and in Çakıllı town. Species of *Tuber burumale* Vittad. and *Tuber borchii* Vittad. were found at the beginning of February and March of 2017 in the forest of Çakıllı town.

COMPOSITION AND ANTIMICROBIAL ACTIVITY OF THE ESSENTIAL OIL OF ONOSMA MALATYANA BINZET FROM TURKEY

GÜN BİNZET¹, RIZA BİNZET², ERSAN TURUNC³, AYLIN DOĞEN⁴, HAKAN ARSLAN⁵

ABSTRACT

Onosma malatyana Binzet is an endemic species growing in Turkey. This work aimed to investigate the chemical composition of essential oils obtained from *Onosma malatyana* Binzet roots and their antimicrobial activities against *Staphylococcus aureus* (ATCC 25923), *Streptococcus pneumoniae* (ATCC 10353), *Bacillus subtilis* (ATCC 6633), *Enterococcus faecalis* (ATCC 29212), *Escherichia coli* (ATCC 25922), *Pseudomonas aeruginosa* (ATCC 25853), *Candida albicans* (ATCC 10231) and *Candida glabrata* (ATCC 4322). The essential oils from roots were obtained by two different methods, which are hydrodistillation and Soxhlet extraction. Soxhlet extraction was carried out in three solvents with different polarities such as petroleum ether, methanol and ethyl acetate. The essential oils and volatile components of roots were identified by Gas chromatography-mass spectrometry system. We used the Kovats indices, mass spectra and standard compounds to determine the essential oils. The major constituents were: for hydrodistillation, abietatriene (16.97%), manool (15.44%), (Z,Z)-10,12-hexadecadienyl acetate (12.42%), geranyl acetone (9.06%); for Soxhlet extraction in petroleum ether, 2-isopropyl-1H-permidine (21.26%), eicosanal (11.84%), sertindole (8.32%); for Soxhlet extraction in methanol, isopimpinellin (15.91%), methyl dihydromalvalate (12.00%), butanoic acid (8.87%), palmitin,2-mono- (8.00%), 2-propylfuran (7.63%); and for Soxhlet extraction in ethyl acetate, xanthatin (15.28%); manool (12.60%). Furthermore, the antimicrobial activity of the extracts was evaluated using modification microdilution methods. According to the antimicrobial results, all extracts were more susceptible to *Candida albicans*. Acknowledgement: This study was supported by the Research Fund of Mersin University in Turkey with Project Number: 2015-AP3-1199.

INVESTIGATION OF THE EFFECIENCY OF NATURAL ANTIOXIDANTS IN DOGS FOOD

FATMA İNAL¹, MUSTAFA SELÇUK ALATAŞ¹, OĐUZHAN KAHRAMAN¹, ABDULLAH ÖZBİLGİN¹, MUSTAFA ULUDAĐ², ŞEREF İNAL³

ABSTRACT

This study was conducted to determine the efficacy of natural antioxidant substances in dog food. Food was prepared in extruded form, balanced with vitamins and minerals containing poultry meal, rice, barley, corn, vegetable and animal fat. On the dry matter basis, 25% crude protein, 8% ether extract, 3% crude fiber and 6% ash were found in food. Seven antioxidants were added food with oil. 10mg/kg BHA was used as control. Vitamin C(E300), vitamin E(E306) and citric acid(E330) 20mg/kg, rosemary essential oil 1.5g/kg, Meat Plus (YUMESA; black cumin, allspice, fennel, thyme, ginger, cumin, salt) and mixture of special spices (Bilyem; sumac, garlic, cumin, red pepper, etc.) 0.5g/kg. Each group food was divided into 12 pieces and placed in airtight bags. Half of the foods were kept in refrigerator and other half was kept in closet, which was'nt exposed to light at room temperature. At 1st, 2nd, 3rd, 4th, 5th, and 6th months of incubation period, a part of each antioxidant group that were kept at room temperature and in refrigerator, was ground. TBA and peroxide value analyzes were performed as 2 replicates. It was concluded that TBA and peroxide value analyzes in determining oxidation level in food were parallel and foods kept in refrigerator less oxidized. It was observed that oxidation levels were similar in foods kept in refrigerator during 1st and 2nd months, and the oxidation level gradually increased in groups added with rosemary essential oil, vitamin C and Vitamin E after 3 months. It was determined that the oxidation levels of rosemary essential oil, Vitamin C and Vitamin E added groups which were kept in room temperature were very high compared to others from 1th until 6th month. From third month on, oxidation levels in BHA and citric acid groups increased. It was determined that addition of 2 herbal mixtures was able to maintain oxidation level at low level for 6 months at room temperature(P<0.01). As a result, it was concluded that YUMESA and Bilyem herbal mixtures can be successfully used as antioxidants in dog food

APPLICATIONS OF PRIVATE FORESTRY IN TURKEY AND USAGE POSSIBILITIES OF NON-WOOD FOREST PRODUCTS IN THIS CONTEXT

HAMİDE GÜBBÜK¹, SADETTİN GÜLER², RECEP BALKIÇ¹

ABSTRACT

Forests covers 27% of the surface area of Turkey and almost all of them are owned by state. Only < 0.1% of all forest areas (about 18 000 ha) were owned by privately. This is mainly due to different geographical and ecological characteristics of forests and approximately 7.6 million villagers whose life dependency to forest products. This dependency complicates direct privatisation of forest areas and transition to private forestry. On the other hand, there are some applications that can be considered in Forestry Privatization. These applications are forests owned by private or legal persons, Private Afforestation Areas, Forests Recreation areas, Forest areas suitable for utilization of natural Non-wood Forest Products (NWFP) and urban forests can be accepted among these applications. Natural forest areas that are rich in NWFP and privatization of forests established via private and industrial afforestation may support the transition to private forestry. Within this concepts, in addition to the rapid growing species such as poplar, alder, and eucalyptus, walnut, chestnut, pistachio, almond, spruce, terebinth, carob and olive are also used as NWFP. These circumstances have continued to increase in recent years. In this review study, the current status of Turkey's forests, changes in the understanding of private forestry from past to present and recent applications on private afforestation have been investigated and comments and suggestions on the process to private afforestation have been made.

ANTIOXIDANT AND PHENOLIC CHARACTERISTICS OF AIR DRIED GINGERS (ZINGIBER OFFICINALE): EFFECT OF ULTRASOUND PRE-TREATMENT.

AYSUN YURDUNUSEVEN YILDIZ¹, SAMI GÖKHAN ÖZKAL¹, ÖZLEM ZAMBAK¹

ABSTRACT

Antioxidant and Phenolic Characteristics of air Dried Gingers (*Zingiber officinale*): Effect of Ultrasound Pre-treatment. Aysun YURDUNUSEVEN YILDIZ, Sami Gökhan ÖZKAL, Özlem ZAMBAK* Pamukkale University, Engineering Faculty, Food Engineering Department, Denizli, Turkey *Presenting Author: Ö. ZAMBAK (ozambak@pau.edu.tr) Abstract The objective of this study was to discover the effect of Ultrasound (US) pre-treatment application before drying on antioxidant and phenolic characteristics of ginger (*Zingiber officinale*). For this purpose, ultrasonic probe with 20 kHz frequency was used. Before US application, ginger samples were cut into size of 1 cm x 1 cm x 0,5 cm. Ultrasound pre-treatment was carried out in distilled water with 100 % amplitude during 5, 10 and 20 minutes. The ratio of sample to water was 1:4 (w/v). After ultrasonic pre-treatment ginger samples were placed in drying oven trays. Drying experiments were carried out in hot air drying oven. Drying was performed at 0.3 m/s air velocity and at 60°C drying temperature. For determination of antioxidant activity and phenolic compounds, ginger samples were collected at every 10 min during the drying period and the collected samples were stored at -18°C until being used in the analyses. For the extraction of phenolics, 1 g of ginger samples was mixed with 10 mL of aqueous methanol. The ratio of water to methanol was 50:50 (v/v). The mixture was sonicated for 10 min in an ultrasonic bath, followed by mechanical shaking for 15 min at room temperature. After the centrifugation of the mixture at 9000 rpm at 4 °C for 15 min, supernatants were collected into amber vials. Total phenolic content and antioxidant capacity of these extracts were performed. Total phenolic contents of ginger extracts were determined with the Folin- Ciocalteu reagent using gallic acid as a standard. Results were expressed as milligrams of gallic acid equivalent (GAE) per gram of dried ginger weight. 2,2-Diphenyl-1-picrylhydrazyl (DPPH) assay was used to determine the antioxidant activity of ginger extracts. Results were expressed in mmol Trolox equivalent (TE)/g dried ginger weight. Antioxidant capacity of the ultrasound pre-treated samples was found higher than the untreated samples in the first 40 minutes of the drying. After that time antioxidant capacity of ultrasound pre-treated samples was found lower than the untreated samples. Generally antioxidant capacity of the all samples was decreased during drying, but antioxidant capacity of the ultrasound pre-treated samples was decreased fast in compared to untreated sample. It is thought that the ultrasound pretreatment breaks down the cells and allows the antioxidant substances to be released from the cells. So antioxidant capacity of ultrasound pre-treated samples was high in first minutes of drying, but antioxidant substances released are considered to be tending to oxidation and may have been oxidized during the drying, therefore the antioxidant capacity of the ultrasound pre-treated samples decreased fast. On the other hand phenolic compounds of US pre-treated ginger samples were found less than the untreated samples. The

deformation of the cell structure by the application of ultrasound resulted in the phenolic components released and degraded more rapidly by the effect of heat.

MODELLING OF ANTIMICROBIAL CHANGE IN SOME HERBAL TEA BAG DURING THE BREWING

ENGİN DEMİRAY¹, HALİL İBRAHİM KAYA¹, ELİF TAŞDELEN¹, TÜLİN YILMAZ¹

ABSTRACT

In this study, Sage, linden and chamomile herbal tea bags purchased from national markets were used. The herbal tea bags are first placed in cups and freshly boiled hot water is added. Brewing time for herbal tea bags was determined as 10 minutes and samples were taken for kinetic studies at specific times (1.min, 3.min, 5.min, 7.min and 10.min). Well diffusion method was used to determine antimicrobial activity. *Micrococcus luteus* was used as the indicator bacteria. As a result of the analyzes, it was determined that the change of antimicrobial activity was first kinetic model.

EFFECTS OF SOME ESSENTIAL OILS ON GERMINATION AND SEEDLING GROWTH IN DRY BEAN (*PHASEOLUS VULGARIS* L.)

MUHARREM KAYA¹, RUZIYE KARAMAN¹, EBRU DİNLER¹, AYKUT ŞENER¹, NAZMI ÇELİK¹

ABSTRACT

This study was carried out field experiments in SDU Agricultural Research and Application Center and germination experimentals in laboratories of Field Crops Department in 2016/2017. The aim of study is to determine the effects of some essential oils on the germination and some seedling growth characteristics in dry bean varieties. It was carried out field experiments according to completely randomized blocks design split plot; laboratory experiments according to completely randomized plots split plot design with 3 repetitions. It was used Şeker, Sarıkız and Burgan of bean varieties as seed material; commercial essential oil preparations derived from fennel, garlic and thyme plants as essential oils in the study. When the aphids were started to show on plants in the field experiments, the solutions prepared with origanum (*Origanum onites*) (3 ppm), fennel (*Foeniculum vulgare*) (10 ppm) and garlic (*Allium sativum*) (10 ppm) were sprayed to the green plants. Also, insecticide containing Deltamethrin (at 50 ml / da dose) was used as a chemical control. In the laboratory experiments, germination tests were carried out seeds of the bean varieties with the solutions containing the thyme (0, 1, 2 and 3 ppm), fennel and garlic (0, 2, 4, 6, 8 and 10 ppm) essential oils. The germination rate, mean germination times, seedling and root lengths and seedling and root weights were examined in seeds obtained from field experiments (only pure water was applied) and laboratory tests. While the application of thyme oil in seeds obtained from field experiments is negative in relation to germination and seedling growth characteristics in Sarıkız and Şeker varieties; it effects the positive in the Burgan variety. It is determined that garlic and fennel oils showed a positive increase in the germination and seedling growth characteristics of the varieties except Sarıkız variety. In laboratory tests, doses of 1 and 2 ppm of thyme oil and doses of 2, 4 and 6 ppm of garlic oil were found having positive effects on the examined properties in all bean varieties. All doses of fennel oil caused reduced on germination and seedling growth.

EFFECTS OF PLANTING TIMES ON SURVIVAL RATE AND PLANT DEVELOPMENT OF CAROB (*CERATONIA SILIQUA* L.) SEEDLINGS IN MARGINAL AREAS

RECEP BALKIÇ¹, SADETTİN GÜLER², HAMİDE GÜBBÜK¹

ABSTRACT

There are no reports and apparently studies on planting times of carob plants for non-irrigated marginal lands in the world. Therefore, in this research, the effects of planting times on survival rate and performances in terms of growth of stem diameter and plant height in field conditions were examined. The study was conducted in marginal land located in Antalya-Hurma region and observations were carried on between 2014 and 2016. One year old carob seedlings propagated from wild locust seeds were used in this study. Seedlings were planted in two different months, December and January and no irrigation were made throughout the research including time of planting. Planted seedlings were taken into plastic shelters for protection from hot summer droughts in June. Measurements for plant diameter (mm) and height (cm) were made at planting and thereafter with 3 months periods. Plant survival rate of plant were determined in October 2016. There was no planting time effect determined on survival rate of seedlings statistically. Although it was not statistically significant, the survival rate was higher in December planted seedlings compared to that found in January planted ones. Similarly, plant diameter and height values were higher in December planted ones as well.

NEW EXTRACTION METHODS USED IN THE PRODUCTION OF MEDICINAL AND AROMATIC PLANT EXTRACTS

ÖZLEM ZAMBAK¹, SAMİ GÖKHAN ÖZKAL²

ABSTRACT

New Extraction Methods Used in the Production of Medicinal and Aromatic Plant Extracts
Özlem ZAMBAK, Sami Gökhan ÖZKAL* Pamukkale University, Engineering Faculty, Food Engineering Department, Denizli, Turkey *Presenting Author: S.G. ÖZKAL (sgozkal@pau.edu.tr)
Medicinal and aromatic plants have become very important in recent years and our country has an important place in terms of medicinal and aromatic plants. These plants are used in many sectors such as; pharmacology, medical science and food science due to their benefits. Extracts of these plants can be obtained by various methods and these extracts can be used in many sectors. Extraction process is applied in different forms according to the final product to be obtained from these plants. In generally extracts is obtained from medicinal and aromatic plants by passing a solvent through the solid raw material. In these methods, solvent penetrates into the plant material during extraction to dissolve the components having similar polarity. The main factors affecting the quality of extracts are; part of the plant used, solvent used and extraction method. When these factors are correctly selected, the yield of extraction increases. In recent years some researches has been carried out on new extraction methods to increase extraction efficiency. Supercritical and subcritical fluid extraction, Microwave assisted extraction, Ultrasonic extraction, Pressurized liquid extraction, Solid-phase extraction methods are some of these new extraction methods. In this study these new extraction methods used in the production of medicinal and aromatic plant extracts were discussed.

THE USAGE OF PLANT EXTRACTS AS ANTIOXIDANT AND ANTIMICROBIAL AGENT IN MEAT AND MEAT PRODUCTS

SAMI GÖKHAN ÖZKAL¹, HALUK ERGEZER¹, ÖZLEM ZAMBAK¹

ABSTRACT

The Usage of Plant Extracts as Antioxidant and Antimicrobial Agent in Meat and Meat Products Sami Gökhan ÖZKAL, Haluk ERGEZER, Özlem ZAMBAK* Pamukkale University, Engineering Faculty, Food Engineering Department, Denizli, Turkey *Presenting Author: Ö. ZAMBAK (ozambak@pau.edu.tr) Lipid oxidation and microbial spoilage are the are the main factors that determine food quality loss and shelf-life reduction. The growth of microorganisms in meat products may cause spoilage or foodborne diseases. On the other hand lipid oxidation leads to loss of flavor, texture and color of meat products. Although synthetic additives have been widely used in the meat industry to inhibit both, the process of lipid oxidation and microbial growth, the trend is to decrease their use because of the growing concern among consumers about such chemical additives. In recent years different strategies have been developed in order to improve the quality of meat and meat products so the formulations of meat products are modified by different methods. One of these methods is the addition of natural plant extracts to the product. In that way lipid oxidation can be delayed and microbial safety can be provided. In recent years there has been an increase in the number of researches on natural additives. It is reported that in many cited literature tea, green tea, rosemary, artichoke, sage, onion, citrus bark, pomegranate, carob, white grape etc. extracts are used as antioxidant or antimicrobial agents in meat and meat products. The use of natural additives as antioxidants and antimicrobials will be beneficial in terms of improving quality of meat and meat based products. In this study plant extracts used as antioxidant and antimicrobial agent and their effects on the quality of meat and meat products are discussed.

PANAX GINSENG: PHARMACOLOGICAL PROPERTIES AND DRUG INTERACTIONS

BURAK CEM SONER¹, MEHMET MESUT PIŞKIN², MEVRA AL³, AYŞE SAİDE ŞAHİN¹

ABSTRACT

Ginseng is one of the most popular herbal products used for thousands of years. Many species and varieties of ginseng are used. Asian ginseng (*Panax ginseng*) and American ginseng (*Panax quinquefolius*) are two of the best-known species in the world. Both contain different groups of the steroidal saponins called ginsenosides or panaxosides, as the major component. However, Siberian ginseng (*Eleutherococcus senticosus* Maxim.) that is also marketed as ginseng is a completely different plant of the Araliaceae family and its constituents are chemically different. Ginseng is used to enhance the body's resistance to stress and to improve mental and physical performance. It has also been used for diabetes, insomnia, sexual inadequacy, for degenerative conditions associated with ageing, to improve healing and as a stimulant. In vitro studies using isolated pancreatic islet cells have shown that ginsenosides stimulate insulin secretion independent of extracellular calcium. In addition, in vivo studies in rats showed that *P. ginseng* extract increases the number of insulin receptors in bone marrow and reduces the number of glucocorticoid receptors in the rat brain. Ginsenosides inhibit the reuptake of many neurotransmitters into brain synaptosomes in rats (in descending order: gamma-aminobutyrate, noradrenaline, dopamine, glutamate, serotonin). *P. ginseng* has been shown to increase interferon production in vitro and in vivo and increases killer cells and antigen-dependent cytotoxic activity in human peripheral lymphocytes. Ginseng saponins have (-) chronotropic and (-) inotropic effects with a similar mechanism of action to verapamil. Some in vitro studies has also reported increased coronary blood flow and (+) inotropic effects. Theoretically, ginseng may interact with cardiovascular system drugs. According to experimental studies, *P. ginseng* inhibits angiotensin-converting enzyme activity but does not affect nitric oxide production. The effects of ginseng about opioids are confusing. Ginseng blocks the analgesic effect of opioids. However, it potentiates the antinociceptive effect of pentazocine and aspirin. Also, it has been shown that ginseng prevents tolerance to opioids and psychostimulants in rats. In a mice study, it has been shown that saponins in ginseng increased pain threshold significantly. In their study they have speculated that saponins in ginseng might be opioid like peptide receptor agonist without addiction side reactions. *P. ginseng* may interact with monoamine oxidase inhibitors. *P. ginseng* has been reported to cause fever, headache, tremors and insomnia when used in combination with phenelzine. According to in-vitro and animal studies, ginseng preparations can show synergistic activity with cytotoxic drugs, chemotherapy and radiation. In vitro studies suggest that panaxytriol obtained from *P. ginseng* can produce a synergistic effect with mitomycin-C. According to in vitro studies, *P. ginseng* can synergistically interact with paclitaxel and reduce cisplatin-induced nausea and vomiting. Ginseng is a nonspecific central nervous system (CNS) stimulant and theoretically, increases the effects and adverse effects of prescription and

³KTO KARATAY ÜNİVERSİTESİ TIP FAKÜLTESİ TIBBİ FARMAKOLOJİ AD.

non-prescription CNS stimulant medications. Also, it may interact with sedative drugs. According to a clinical study in 36 patients with type-II diabetes, ginseng significantly reduces blood glucose and hemoglobin-A1c levels. Therefore, attention should be taken when used with antidiabetic drugs. Ginseng may stimulate the release of the adrenocorticotrophic hormone, which may increase plasma cortisol levels. Theoretically, *P. ginseng* may have an additive effect when taken with sildenafil. Based on in vitro studies, camphor ingredient of ginseng is able to inhibit drug efflux and CYP3A4 mediated metabolism of HIV protease inhibitors. Ginseng preparations may have additive effects when used in combination with antiviral drugs such as rimantadine, amantadine, zanamivir and oseltamivir. Ginseng has side effects such as diarrhoea, loss of appetite, nausea and vomiting. This may alter the efficacy of gastrointestinal agents.

ANTI MICROBIAL EFFICACY OF CURCUMIN AND ITS POTENTIAL CONTRIBUTION TO THE ECONOMY

SERKAN ŐEN¹, MERVE ŐEN², SEFA ŐELİK³

ABSTRACT

Curcumin is a natural compound which grows in India and South East Asian regions and is obtained from the rhizomes of *Curcuma longa* plant. Curcumin is commonly used as anti-inflammatory. Curcumin has been studied for a variety of clinical practices for many years. According to researches, it has therapeutic effects on many inflammatory diseases, including diabetes, and different types of cancer. Curcuminin fungi have been shown to have antimicrobial potential against a broad spectrum of microorganisms including numerous Gram positive and Gram negative bacteria. Curcumin has been demonstrated to exhibit anti-infective activity against virulence, quorum sensing and biofilm formation in *Pseudomonas aeruginosa* infections. According to the official report published by the Association of Research-based Pharmaceutical Companies (AIFD) in 2006, the total drug market in our country has reached 9.9 billion dollars and antibiotics are ranked as the first by 20% within this cost. Similarly, according to the intellectual property rights protection index for the year 2015 of the Property Rights Alliance (PRA), Turkey is ranked as the 58th among 129 countries. As it is understood from this report, the drug in Turkey is behind the world in terms of competition with the number of local patents. In the light of all this information, the development of national antimicrobials is important in limiting the cost of antibiotics that are ranked as the first among our national drug expenditure expenses.

FOENICULUM VULGARE: PHARMACOLOGICAL PROPERTIES AND DRUG INTERACTIONS

AYTEN DEMIRCI¹, MEVRA AL², AYŞE SAİDE ŞAHİN¹, HILAL KOÇ SONER³, BURAK CEM SONER¹

ABSTRACT

Foeniculum vulgare Mill. is a medicinal and aromatic plant with a lifetime of two years and belongs to the family of Apiaceae (Umbelliferae). The oil (Foeniculi aetheroleum) and seed like fruit (Fennel fruit/ Foeniculi fructus) of Foeniculum vulgare Mill. are used in medicine. Fennel fruit includes sweet fennel (Foeniculum dulce) and bitter fennel (Foeniculum vulgare). They both contains trans-anethole, fenchone, and estragole in different proportions. Fennel fruits are used as carminative, Fennel oil is used as an aromatic carminative. The main properties of fennel and fennel oil are derived from their carminative and expectorant activities. Anethole effects smooth-muscle motility in digestive tracts; higher doses have antispasmodic effects. A dose-dependent reduction in the density of respiratory secretions (bronchosecretolysis) occurs. Fenchone has antimicrobial and fungicidal effects in vitro. Fennel seed has a spasmolytic effect on the smooth muscles and accelerates the vibration rate of the ciliary epithelium of the bronchial mucosa (secretomotor action). In vitro studies shows that fennel has antimicrobial, gastric motility enhancing, antiexudative, and presumably antiproliferative effects. Fennel also shows estrogenic activity which seems to have some benefits in amenorrhea and dysmenorrhea. Fennel changes the oral absorption of quinolone antibiotics due to metal cation ingredients. Concurrent use with ciprofloxacin significantly changes absorption, distribution and elimination of ciprofloxacin after oral administration. Fennel reduces bioavailability of ciprofloxacin. In an in vitro study, 13 components that has an inhibitory effect on human CYP3A4 enzyme were isolated from methanol extract of fennel. From these, 5-methoxypsoralen (5-MoP) showed the strongest inhibition. Also, 5-MoP is an important component of grapefruit juice that has in vivo inhibitory effect on CYP3A4 which is well studied. Fennel can cause inhibition of intestinal CYP3A4 which is the most expressed CYP enzyme in the intestine. Intestinal CYP3A4 inhibition has been shown to cause a clinically significant increase in plasma concentrations of drugs such as felodipine and midazolam. Co-administration of birth control medicines containing estrogen (ethinyl estradiol, levonotgestrel ethinyl estradiol and estradiol/norethindrone) with fennel may reduce the efficacy of contraceptives. Tamoxifen is a nonsteroidal antiestrogen used in breast cancer. Combination with fennel may reduce the effect of tamoxifen. Long-term use of the fennel as a laxative may result with hypokalemia thus it may potentiate the effect of cardiac glycosides and may interact with antiarrhythmic drugs that restores sinus rhythm such as quinidine and medicinal products that prolong QT. Using with other drugs that causes hypokalemia (eg, diuretics, adrenocorticosteroids) may increase the risk of electrolyte imbalance.

USING OF POPLAR (*POPULUS SPP.*) SEED HAIR FIBERS FOR SEA PETROLEUM SPILL

ERCAN VELİOĞLU¹, FILİZ TÜRKSEVEN VELİOĞLU²

ABSTRACT

Sea route transportation is more preferable way because of economic and environmentally friendly than other options but sea route may cause environmental accident that is increasing of polluted sea. Naturally sea water is ripple and flowy so oil spill is easily spread water surface. Sea water pollutions are not only effect the pollutant starter point but can easily pollute far places of accident. Principal sea pollutants are liquid petroleum and oil product. Petroleum and oil products have exhibited hydrocarbon features so sea water characteristics spoil and sea ecosystem affect badly from oil pollutant. Sea life is damaged from oil spill as well pollution is quickly spreaded of sea surface by winds and sea flows. Such as oil spill of Deepwater Horizon in 1989 and 2010 at Alaska. Main oil producing countries of north and south hemisphere use Turkey Bosphorus route for oil trade. The İstanbul and Çanakkale Bosphorus are vital important status for The Black Sea and The Mediterranean Sea countries. 9006 Tankers passed the Bosphorus of Turkey in 2013. 2292 Tankers were lading 117.1 billion ton petroleum and oil product. In 1979 and 1994 two big sea accident were occurred at Turkey Bosphorus. The accidents were cause heavy pollution. Oil absorbents are hydrophobic and preferable oil absorbents substrates which can be organic, inorganic and synthetic. Absorbents can change depend on the aim of environmental disturbance. Generally absorbents use effectively at sea side and small roundup poll. Absorbent substance not suitable for the open sea. Absorbent substance which use scramble petroleum pollution can cause secondary pollutant for environment. Absorbents are use carefully and limited. Choosing of absorbent is important for buoyancy, saturation, oil retention, strength and durability, fermentation, costs and availability, storage and transportation properties. The genus Poplar, which includes poplars are world wide known visual and fast growing tree species. Poplar seeds can cause some problems at city life. A tree have 280 000- 14 850 000 seed that can cause problem. Seeds have good properties as a petroleum and heavy oil absorbance. The absorption values of 180-211 g heavy oil/g fiber and 55-60 g heavy oil/g fiber respectively, surpass all known natural absorbents. Poplar seed hair fibers and cotton are obtained an extremely promising natural source for the production of oil super absorbents. Because of cotton is a hydrophilic substance, it can be sang in water. Poplar seed hair fibers is hydrophobic. Hydrophobic substance is preferable for petroleum and heavy oil pollutions. Slovenian National Building and Civil Engineering Institute tested poplar seed hair fibers and other polar and apolar substance. Poplar seed hair fibers can treat polar solvents (diesel fuel, row petroleum, hexane, petroleum ether, chloroform, tetrahydrofuran) from water surface. It has patent international. Poplar seed hair fibers are not harmful for human and environment.

AQUATIC PLANTS AS ALTERNATIVE SOURCES TO MEDICAL AND AROMATIC PLANTS

HATICE TEKOĐUL¹, AYSUN KOP¹, ALI YILDIRIM KORKUT¹, HÜLYA SAYĐI¹, HARUN DIRAMAN²

ABSTRACT

Usually aquatic plants (macrophytes) are photosynthetic organisms in microscopic (algae) and macroscopic (macro algae) structures that live in fresh water and sea. Aquatic plants have been used as human food from antiquity to daily life and in our time they have begun to be used as alternative sources in various fields such as health, industry and agriculture by introducing different characteristics through scientific researches. Spirulina and Chlorella are used in the health food market as powders, capsules, tablets, or pastilles, while marine macroalgae are used as antibiotics, antiviral, anti-inflammatory, cytotoxic and antimycotic besides their use as nutrients. As in marine plants, freshwater plants are also used as human food, aquaculture and animal feed, and all parts of these plants (root, rhizome, tuber, seed etc.) are evaluated in various fields such as medicine, compost and building materials. For example; Watercress (*Nasturtium officinale*) is used as diuretic, antiscorbutic, laxative and Water spinach (*Ipomoea aquatic*) is also used for food poisoning, headache, hematuria, hemorrhoids and cough. The purpose of this study is to evaluate the information on the use of aquatic plants spreading in fresh waters, particularly in the field of medicine, by examining previously published national and international publications.

ZINGIBER OFFICINALIS: PHARMACOLOGICAL PROPERTIES AND DRUG INTERACTIONS

BURAK CEM SONER¹, MEHMET MESUT PIŞKIN², MEVRA AL³, AYŞE SAİDE ŞAHİN¹

ABSTRACT

Ginger has been widely using as a cooking spice and medicinal plant from ancient times in India and in China. Today ginger is part of the folk medicine as well as in modern medicine. It is used for the treatment of nausea and vomiting in pregnancy and for prevention of travel and sea sickness. Many countries have approved ginger as a nonprescription drug for the prevention of motion sickness. It is also recognized with its anti-inflammatory effect in treatment of rheumatoid arthritis and osteoarthritis, being on par with many steroidal preparations. The essential oil of Rhizoma Zingiberis (Ginger) include α -zingiberene, ar-curcumene, α -bisabolene, neral, geranial, (E)- α -farnesene and zingiberol. Pungent compound (gingerols and shogaols), diarylheptanoids (gingerenones A and B), vitamins and %50 starch are also present. Fresh ginger root contains gingerols, shogaols, 6-dehydrogingerdione, and galanolactone as the major constituents. 6-gingerol is the main pungent component of dried ginger. 6-gingerol can convert to 6-shogaols due to dehydration of 6-gingerols. Fresh ginger is used as antiemetic, antitussive, expectorant, and for inducing perspiration and dispel cold, whereas dried ginger is used for stomachache, vomiting, and diarrhoea accompanied by cold extremities and low pulse, resolve phlegm retention, for cough and dyspnea with copious frothy expectoration and for abnormal uterine bleeding. In vitro studies have shown that fresh ginger extract inhibits both cyclooxygenase and lipoxygenase. Inhibition of arachidonic acid metabolism results with platelet aggregation and inhibition of prostaglandin and leukotriene production. 6-gingerol, 10-dehydrogingerdione and 10-gingerdione are the main ingredients responsible from these effects. According in vitro studies, these components inhibit prostaglandin synthesis more potently than indomethacin. The chemical structures of gingerols shows partial similarities with prostaglandins. Gingerols have been found to be potent inhibitors of prostaglandin biosynthesis. 6-gingerol reduces nausea and vomiting by increasing motility. Galanolacton, similar with ondansetron, has an antiemetic effect via serotonin (5HT-3) receptors located in ileum. Antiserotonergic activity of ginger including 6-, 8- ve 10-gingerols has also been shown by in vitro studies. Dried ginger is shown to be useful in rheumatoid arthritis. More than 75% of arthritis patients who consumed ginger rhizome powder experienced analgesic effects and reduction in joint swelling. Gingerols have been reported to be hypoglycemic in diabetic rats. Ginger can interact with antacids, H₂ antagonists and proton pump inhibitors by its potential in increasing stomach pH. The high dosage of ginger may cause central nervous system (CNS) depression and theoretically increases the effect of barbiturates, benzodiazepines and CNS depressants. Ginger may have a dose-dependent inotropic activity and theoretically may interact with positive inotropic agents and beta-blockers. In diabetic rats serum glucose levels are significantly lowered due to the hypoglycemic effect of ginger, which may

theoretically increase the effects of hypoglycemic drugs. Ginger is a potent thromboxane synthase inhibitor, which prolongs bleeding time. Patients using warfarin and other medicines that affect platelet activity should avoid taking ginger supplements. Ginger may prevent clotting. Concomitant use with drugs like aspirin, clopidogrel, diclofenac, ibuprofen, naproxen, dalteparin, enoxaparin, heparin, warfarin may further reduce clotting and may increase risk of bleeding. Ginger may increase the absorption, bioavailability and elimination half life of metronidazole so combined use may increase side effects of metronidazole.

ETHNOBOTANICAL USES OF SOME MEDICINAL PLANTS ON THE ASTERACEAE FAMILY FROM HATAY (TURKEY)

FARUK KARAHAN¹, AHMET İLÇİM¹

ABSTRACT

Hatay city hosts rich biodiversity, including about 225 taxa of belonging to Asteraceae family. The present study reveals the ethnobotany and traditional medicinal uses of 23 taxa belonging to 16 genera of the Asteraceae family in Hatay province (East Mediterranean of Turkey). The study was mainly focused on the medicinal plants used for treatment of various ailments/diseases by the local people in the city. The data on plants included botanical names, vernacular names, the parts used and specific purpose of use. The richest genus are; *Centaurea* L. (4 taxa), *Achillea* L., *Anthemis* L., *Artemisia* L. and *Taraxacum* F. H. Wigg. (2 taxa each). Local people generally use herbals as areal parts (45.1%), flowers (16.1%), capitulum and leaves (12.9% each). The common preparation of the medicinal plants in the museum are drink as tea (48.8%), external (20.9%) and infusion (16.3%). Local people in the region commonly use for the remedy of gastrointestinal system disorders, respiratory system disorders, genital-urinary system disorders, skin diseases and metabolism disorders. Our results were comparatively discussed with the other literatures. We believe that finding of this study will significantly contribute to the ethnobotanical studies at local or regional scales.

CAMELLIA SINENSIS: PHARMACOLOGICAL PROPERTIES AND DRUG INTERACTIONS

ESRA BÜYÜK¹, MEVRA AL², AYŞE SAİDE ŞAHİN¹, BURAK CEM SONER¹

ABSTRACT

Green tea is produced without fermentation from the leaves of *Camellia sinensis* belonging to Theaceae family. Black tea or red tea is processed by fermentation and heating, whereas oolong tea is partially fermented. Green tea contains more catechin than black tea and oolong tea. The presence of high amounts of catechins, essential minerals and vitamins are responsible for high antioxidant potential of this tea. Tea contains 5% caffeine and 24% tannins with minor amounts of other xanthines such as theophylline and theobromine. Its tea also contains flavonoids. Green tea appears to contain greater quantities of the flavonol-type flavonoids than black tea. Minor flavonols (10%), polymeric flavonoids (20%) and epigallocatechin-3-gallate (EGCG) are the major constituents of about 50-80% of the green tea catechins. Leaf buds and fresh tea leaves are used as stimulant and diuretic due to its caffeine content. Also they are used as an astringent for gastrointestinal disorders which they effect via polyphenols and tannins they contain. In addition, green tea extracts are used in the treatment of genital warts. Tea is generally preferred as a drink. Green tea extract is a rich polyphenol source. The phenolic components of green tea extract have strong antioxidant activity. The combined use of green tea with hydrochlorothiazide (HCTZ) showed myocardial protection by reducing the adverse effects of HCTZ. This finding may be important for cancer patients with hypertension and ischemic heart disease who can not undergo HCTZ monotherapy due to potential myocardial side effects. A study in rats has shown that green tea reduces myocardial toxicity induced by cyclofosamide in a dose dependent manner. Adenosine is used for arrhythmia and green tea may inhibit the effects of adenosine. Caffeine found in green tea reduces the sedative effect of benzodiazepines. Also, it can increase blood pressure in patients using metoprolol and propranolol. Patients using warfarin should not use green tea. Moderate quantities of K vitamin in green tea can reduce the effect of warfarin. Green tea and aspirin should not be used together because they both increase the risk of bleeding by acting as an inhibitor on the platelets that provide clotting. Laboratory tests involving the use of green tea in combination with chemotherapeutics such as doxorubicin and tamoxifen have been shown to improve the efficacy of these drugs. It has been shown that green and black tea extracts decreases the sensitivity of prostate cancer cell to chemotherapy drugs. Because of this potential for interaction, black and green tea (extracts of these teas) are not recommended especially for patients who receive chemotherapy for prostate cancer. If clozapine is used less than 40 minutes after green tea ingestion, the antipsychotic effect may reduce. If green tea is used in combination with ephedrine, it can increase agitation, tremor, insomnia and weight loss. Green tea has been shown to reduce lithium blood levels. The use of green tea with monoamine oxidase inhibitors such as phenelzine and tranylcypromine may cause a hypertensive crisis. The combination of phenylpropanolamine and caffeine can result with serious increase of blood pressure and mania. Clinical trials have showed that green tea and black tea

extracts reduces folic acid bioactivity even at low concentrations. Because of its phenolic content, green tea can reduce the absorption of non-iron preparations. The inhibition of non-hem iron absorption is a potential side effect. Two important flavonols of green tea (EG and EGCG) have an important effect on organic anion-carrier polypeptides (OATP) that are expressed in enterocytes and hepatocytes. ECG and EGCG inhibits uptake by OATP1A2, OATP1B1, and OATP2B1 in a concentration-dependent way. However, OATP1B3-mediated uptake is strongly stimulated by EGCG. Therefore, they can alter the pharmacokinetics of OATP substrates such as statins.

GARLIC AND ITS EFFECTS ON HEALTH

MERVE NUR GIZLİCİ¹, RUMEYSA KAMALAK¹, EZGI TOPTAŞ BIYIKLI¹, ALI EMRAH BIYIKLI¹

ABSTRACT

GARLIC AND ITS EFFECTS ON HEALTH Garlic (*Allium sativum*) is used as flavoring since very old ages. In some societies, it is seen the healing source. It is suggested that garlic has the antioxidant, antibacterial, and antifungal effects and provides positive effects via sulfur and phenolic substances present in its content. The positive effects it shows on the health has made a current issue to use it supplements beside the use of it nutrition and flavoring. A great majority of thiosulphates (70%) the plant garlic has consist of allicin. This substance becomes active when garlic is mashed. It is stated that allicin has a strong antibiotic and antifungal feature. In addition, it was demonstrated that it was effective in gastrointestinal motility and regulation of the secretion of digestive enzymes. **AIM:** In this study, it was aimed to study the studies examining the effects of garlic on the health. **METHOD:** Studying the studies examining the effects of garlic consumption on general health condition and some chronic diseases by means of a comprehensive literature review, a compilation study was prepared in the light of actual data. **RESULTS:** In the studies carried out, it was found that the substances such as diallyl sulfide, diallyl disulfide, 5-ethyl cysteine, n-acetyl cysteine present in garlic showed significant antioxidant activity. In addition, it was seen that garlic consumption, increasing the effectivity of microphages killing pathogens, was effective in strengthening immune system. In the studies carried out on garlic and cardiovascular health, it was identified that garlic consumption reduced the level of LDL cholesterol and increased the level of HDL cholesterol in individuals, and thanks to this, lowered the risk of cardiovascular disease. In the similar studies, it was suggested that garlic consumption, reducing the formation of fibrin and plaque in the blood, could also significantly lower the risk of heart attack. In the studies, examining the relationship between garlic consumption and blood pressure, in the people having both high and low blood pressure, the positive effects of garlic consumption were frequently identified. In the studies, examining the relationship between garlic consumption and Type 2 Diabetics, in addition to the diabetic medications, it was seen that garlic consumption exhibited positive effects in the regulation of blood sugar. In the studies examining the relationship of garlic with cancer, it was suggested that frequent garlic consumption may be protective against especially breas, esophagus, gastric, colon, and rectum cancers and the studies on its use in cancer treatment are limited. **CONCLUSION:.** Garlic, its antioxidative, antithrombotic, hypolipidemic, and hypoglycemic effects, can be effective in reducing the morbidity and mortality of the disease. However, the actual literature is evaluated, particularly about its quantity used as supplementary, there are no clear suggestions and there is a need further studies. It should not be forgotten that higher dosages may show negative effects for the hearth, liver, and renal functions.

RESVERATROL AND CANCER

ELİF BEYZA ÇELEBİ¹, HÜDA ZEYNEP KAYA¹, EZGİ TOPTAŞ BIYIKLI¹, ALİ EMRAH BIYIKLI¹

ABSTRACT

RESVERATROL AND CANCER Cancer is a fatal disease showing increase tendency at the present days. In this increase, unchangeable genetical factors as well as changeable environmental factors play important role. It is stated that diet among the environmental factors has important effects. In cancer process, on understanding of diet, the interest toward using some nutrients and supplements has increased. This interest has also reflected to the literature. Resveratrol, which has a phytoalexin structure and is synthesized as a response to stress factors in some plants, is one of the most studied components with its cancer -protective feature. It is put forward that resveratrol shows its antioxidative effect, removing free oxygen radicals from the environment. Resveratrol, present in higher rates in the roots of plant, named Polygonum cuspidatum, grape, peanut, and ananas, is also used as supplement. AIM:In this study, it was aimed to compile the actual studies examining the relationship between resveratrol and cancer. METHOD:In the study, with examining the actual literature data, the protective and therapeutic effect of resveratrol against cancer were evaluated in detail. RESULTS:In the studies, in which the biological benefits and action mechanisms of resveratrol are examined, its anticarcinogenic and antioxidative effects were emphasized. It is considered that resveratrol shows its anticarcinogenic effect by modulating enzymes making carcinogens ineffective. Depending on its modulating these enzymes, it was seen that it could provide the positive effects on the metabolism of some medications. Some studies suggest that resveratrol makes slower the tumor development, inhibiting prostaglandin synthesis. In the studies, its antioxidative effects are examined, it was emphasized that it effectively cleaned free oxygen radicals and other oxidative molecules and prevented LDL oxidation. In the studies, in which the effect time of resveratrol was evaluated, due to its rapidly metabolizing, that its time of being kept in the body is a short time like approx.. 1 hour was remarkable. It was stated that this situation can impede to form a long term response. In the studies examining the relationship between resveratrol intake and cancer formation, it is frequently seen that there is a significant opposite relationship between resveratrol intake and cancer formation. In the literature, rather than the use of resveratrol in the use of cancer treatment, its effects preventing cancer were dealt with. Especially in preventing the formation of the colon, breast, and prostate cancer, it is suggested that it is more effective. CONCLUSION: There are the studies showing the effect of resveratrol to prevent cancer, regression its formation step, and suppress it in the early period. The dosage and time of resveratrol used in these studies show a large variability according to the sorts of cancer and there is no clear recommendations toward using it with the foods and supplements. For being able to offer the suggestions about the consumption quantity and become clear its effectivity in treatment, there is a need further studies. Keywords:Resveratrol, diet, cancer, , antioxidant

GROWING AND HARVESTING OF ANATOLIAN SAGE (SALVIA TRILOBA L.) ON BUROR TERRACES IN THE FORESTRY AREA.

MESUT TANDOĐAN¹, MEHMET ÖZDEMİR¹

ABSTRACT

Anatolian sage (*Salvia triloba* L.) which is medical and aromatic plant exported and collected from forest areas is located in Marmara ireland, Turkey. In recent years, soil treatment during afforestation practices are made in the form of grado (Buror Teras) with tracked or wheeled mini-excavators in the fields having % 60 or more slope, in Turkey. In this study, Anatolia Sage (*Salvia triloba* L.) seedlings produced in nursery conditions from seed Yalova originated is discussed development and harvest of sage planted in the spring period of 2014 on "Buror Terraces" created in the Kızılcaterzi Village, in the forest compartment number 261, in Şarköy district, Tekirdađ province of Marmara region. Sage seedlings in this area having 45-50 % slope planted in staggered with 40x40 cm. spacing and found soil tests positive reached to 40-45 cm heigh of annual sprout and harvested so that the bottom 20 cm height. According to this result, it is possible to ensure success to grow Anatolian sage as medical and aromatic plant on Buror terraces and in forested areas other forest tree species or curved empty forest areas ecologically.

THE USE OF PROBIOTIC AND PREBIOTIC IN OBESITY

TUĞBA ERDOĞAN¹, NEZİRE MERT¹, ALI EMRAH BIYIKLI¹, EZGİ TOPTAŞ BIYIKLI¹

ABSTRACT

Obesity is defined as excessive fat accumulation in the body due to the fact that the energy taken in the body is more than the energy spent. It is a serious problem of public health, which shows increase in the developed and the developing countries. Obesity is a process ranging with inflammation in the body and brings together with it a number of complication such as hyperlipidemia, hypertension, Type 2 diabetics, metabolic syndrome, fatty liver disease, coronary heart disease, and the premature death. In the recent years, the view that in the development of obesity and its complications, intestinal microbiota will also be effective revealed. Intestinal microbiota includes different sorts of microorganism more than 500 and the number of these microorganisms is affected by age, genetics, and environmental factors. The composition of intestinal mucosa of individual and effect of bacteria here on energy transformation can form personal differences in weight loss and gain of the individual. While Bacteroidetes decreases in the intestines of obese individuals, Firmicutes increases, and also, the diversity of the other bacteria in intestines also decreases. There are some studies showing that probiotics and prebiotics regulate intestinal flora. The resources of probiotics are fermented milk products, pharmacologic products, prepared from the live cells of the probiotic bacteria, and foods and drinks, enriched with probiotics. The resources of prebiotics, which form a feeding place for probiotics, are the nutrients such as onion, garlic, wheat, leek, banana, escarole, earth apple, artichoke, soya, dry legumes, asparagus, and tomato. AIM: In this study, it was aimed to compile the studies examining the relationship between the use of probiotic and prebiotic and energy balance in obesity. METHOD: In the study, actual literature studies were evaluated, which examines the effect of the use of probiotic in obese people on both body weight and fat mass and complications of obesity as a result of both variations of intestinal flora. RESULTS: The studies carried out showed that intestinal bacteria had the different effects in the decomposition of energy from nutritional elements and in its usability and storage. In especially obese people, the increasing Firmicutes filum producing in high amount of short chained fatty acid from the fibers, causes more energy production in the body. A number of studies were met, which show that the use of probiotic and prebiotic use in obese people provides decreases in body mass index, thickness of skin curl, and serum glucose, In similar way, there are also some studies showing that significant improvements were provided at the level of insulin resistance, lipid, and adipokine, There are also studies showing that the use of prebiotic provides increase in the feeling of saturity, weight loss, and decrease at the level of LDL cholesterol level. In the studies examining the effect of prebiotic use on the complications of obesity, it was seen that it showed positive effect on intestinal permeability, metabolic endotoxemia, adiposity, and insulin resistance. CONCLUSION: In the treatment of obesity, in addition to the behavioral change, physical activity, and diet treatment, the use of pro-prebiotics can be an alternative. For intestinal flora playing role in energy balance, it is necessary for the use of pro-prebiotic to be important. The studies on

USE OF PHYTOTHERAPY IN SURGICAL NURSING

CEYDA UZUN ŞAHİN¹, DILEK ÇİLİNGİR²

ABSTRACT

Today; -in spite of fast advancements in diagnosis, care and treatment in diseases- such factors as people's wish to have more control and responsibility over their treatments, to use relieving interventions against symptoms, health care team's inability to spare enough time, cost of traditional treatment modalities and psychologically feeling better have increased interest in complementary and alternative treatments. In this sense, phytotherapy –deriving Greek words “phyton (herb)” and “therapeia (therapy)”- means curing and healing with herbs. Phytotherapy is considered as the practice of pharmacognosy into modern treatments and is also called as “phytopharmacy”. Phytotherapy –used in the care and treatment of diseases, promotion and maintenance of health by all cultures since the beginning of civilization- has used every kind of herbs as medication. For example; all of the medication systems that include Native Americans' healing methods, Indian Ayurveda system and traditional Chinese medicine have placed herbs into their treatment modalities. Today; in the developed countries, Turkish and Asian medicine; numerous individuals utilize herbal products alone or mixed treatment products as a treatment modality in order to cure many diseases without consulting any medical experts. When some of the herbal medicines often used are examined in relation to surgical nursing; there may occur some side effects among patients. Use of some of these -like garlic, ginkgo biloba, ginseng, echinacea and St. John's wort surgical- should be quitted before surgeries. As a result; although herbs are frequently used for therapeutic purposes they may be omitted by health care personnel. Therefore; nurses should be aware of effects, side effects, drug interactions (drugs that should not be used together) of herbal medicines very well.

PHYTOESTROGENS EFFECTS ON MENOPAUSE SYMPTOMS

BÜŞRA GÖZ¹, GÜLİZER ÇELİK¹, MÜBERRA ÇİL¹, EZGİ TOPTAŞ BIYIKLI¹, ALI EMRAH BIYIKLI¹, ELMAS ERSÖZ¹

ABSTRACT

Menopause period which is hormonal, physiological, psychological changes on women, starts at 45-55 years old, after the end of menstruation. Estrogen hormone is the most effective factor during menopause. Due to the decreasing estrogen level, the symptoms occurring after the menopause are related with the estrogen. Therefore phytoestrogens are thought to be helpful to cope with these symptoms. Phytoestrogens are used for estrogen replacement cure for menopause women. Phytoestrogens structure and functions are similar like endogen estrogen 17- β estradiol hence it makes them to connect to estrogen receptors more easily. **OBJECTIVE:** In this review, the studies related with phytoestrogens effects on menopause symptoms are investigated. **METHOD:** Phytoestrogens nutrition and supplementation properties and their effects to the menopause symptoms are investigated through literature. **RESULTS:** Use of phytoestrogens as nutrition and supplementation on healthy women which are on menopause, shows positive results on the symptoms of menopause. When phytoestrogens are used as nutrition for the women which are on premenopausal or postmenopausal stage is helpful for constriction, sleeping pattern, anxiety, depression and irritability. Also, phytoestrogens use as nutrition and supplementation have positive effects on vaginal dryness, libido, hirsutism on facial area and dryness on the skin. On the other hand, use of phytoestrogens as supplementation have positive effects on vasomotor menopause symptoms and life quality. On some of studies made it is provided that, women who use phytoestrogens as supplementation, the menopause symptoms are significantly decreased. **CONCLUSION:** Menopause symptoms have negative effects on premenopausal and postmenopausal women's life quality. Phytoestrogen supplementation could decrease menopause symptoms as an alternative for hormone replacement cure. However, there should be more studies to be made for the amount of phytoestrogen consumption during the menopause.

SOME CHEMICAL AND SENSORY PROPERTIES OF GRISSINI PREPARED WITH GARDEN CRESS (*LEPIDIUM SATIVUM* L.) SEED POWDER

ÜNKAN URGANCI¹, ALI GÖNCÜ², FATMA IŞIK¹, İLYAS ÇELİK¹

ABSTRACT

Yet, thanks to the inception and upcoming of the science of Foods and Nutrition, a number of non- conventional food stuffs have been explored, analyzed, processed and used up in the development of food products, all in a bid to end their oblivion on one hand and accruing benefit to the masses on the other. Garden cress (*Lepidium sativum* L.) is such a food stuff that abounds not only in nutrients but also in health enhancing phytochemicals. Garden cress is an annual erect herbaceous plant, growing up to 30 cm. It belongs to Cruciferae (Brassica) family, widely grown in Europe, South West Asia and US. The plant requires minimal agricultural resources, grows well in semi-arid regions and low fertility soils. The seeds can be harvested in 70–90 days and the yield is calculated to be 800–1000 kg/ha. It is a well known culinary herb and the leaves are widely used as garnish and are consumed raw in salads. The plant is known to possess varied medicinal properties. Leaves of this plant are diuretic and gently stimulant. The seeds are traditionally used in the diet of lactating woman to induce milk secretion. The seeds are aperient, antibacterial, gastrointestinal stimulant, diuretic, tonic, demulcent, aphrodisiac, carminative, galactagogue and emmenagogue. It is also reported that the plant possess antihemogglutinating, hypoglycemic, antihypertensive, fracture healing properties and significant bronchodilatory activities. Also a preliminary pharmacological study on seeds of garden cress has suggested the presence of cardioactive substance and is shown to have probable action through adrenergic mechanisms. Aqueous extract of garden cress was found to have antihypertensive and diuretic effect when studied both in normotensive and spontaneously hypertensive rats. It is useful in hiccup, dysentery, diarrhea and skin disease caused by impurities of blood as well. The oil of the garden cress seeds is rich in alpha linolenic acid, and contains an ideal ratio of x-3 fatty acids (n-3) and x-6 fatty acids (n-6). Recent studies have proved the preventive effect of x-3 polyunsaturated fatty acids, especially alpha linolenic acid, on different types of cancer, including breast, in both animals or cell line models, and in the treatment of cancer. Bakery products are the most consumed foods in the world and among these products. Grissini are long, thin pieces of crispy, dry bread. They are better known in many English speaking nations as breadstick or bread sticks, and they are a popular accompaniment to many Italian meals. It is originated in Torino in Piemonte, a region of northwest Italy. Grissini were actually invented around the end of the 17th century to cure the health problems of young Duke Vittorio Amedeo II of Savoy. In this study, grissini were produced by the addition of 0.5, 1 and 2% of garden cress seed powder to grissini formulations, texture characteristics, color values, some chemical properties such as oil and ash content and some sensory properties of grissini were determined. It was found that the ash and oil contents of the grissini increased significantly ($p < 0.05$) by increasing the amount of garden crees seed powder in the formulation. In color analysis, it was seen

Corresponding Author: ÜNKAN URGANCI, unkanurganci@hotmail.com

¹PAMUKKALE ÜNİVERSİTESİ

²ADNAN MENDERES ÜNİVERSİTESİ

that increasing the addition rate caused decreases in Hunter L value, and increases in a value. In the sensory evaluation, the panelists gave scores for crust color, hardness, smell, chewiness, flavor, and overall acceptance. Grissini having 1% and 2 % of garden cress received the best liking scores ($P<0.05$) in color. The samples having 0,5% of garden cress seed powder recieved lower score than other samples, although they have been received sensory scores higher than 3.5, which was the midpoint of hedonic scale.

**DETERMINATION OF SOME PHYSICAL, TEXTURAL AND
SENSORY PROPERTIES OF CRACKERS PRODUCED BY ADDITION
OF ZAHTER (THYMBRA SPICATA)**

ALİ GÖNCÜ¹, ÜNKAN URGANCI², İLYAS ÇELİK², FATMA IŞIK²

ABSTRACT

Plants and spices are generally used to bring aroma and colour in foods. In addition, they provide antioxidant and antimicrobial properties to the products. They also have therapeutic and / or preventive effects for many disorders, especially heart, vascular, diabetic and cancer diseases. With these features they are extremely important in human diet. Zahter (*Thymbra spicata*), also known as "Karabaş kekiği", "Karakekik" or "Dağ kekiği" in Turkish is a plant specie belonging to the family of Lamiaceae. It is a plant that has pink flowers and it has a height of about half a meter. It includes essential oils and tannins. It can be grown almost everywhere in our country with the consumption is mostly in Gaziantep and Hatay. It is consumed with its unique flavor in meals, in teas, in salads, in olive oil and with different spices at breakfast or raw. In this study, crackers were produced by substituting 1%, 2% and 4% of milled zahter instead of wheat flour. Moisture, ash, colour values and textural and sensory qualities of the crackers were determined. It has been determined that by increasing the zahter rates in the formulation, the amount of ash increased and the hardness decreased. In sensory analysis, panelists evaluated cracker samples with respect to external colour, odor, hardness, flavor, chewiness and overall acceptance. In color analysis, Hunter L and a values were decreased and b values were increased by increasing zahter ratios. In sensory evaluation, crackers produced with 2% of zahter received best liking scores in overall acceptance.

DETERMINATION OF SOME QUALITY CHARACTERISTICS OF MUFFIN PREPARED WITH RIPENED HEMP SEED (*CANNABIS SATIVA L.*)

ÜNKAN URGANCI¹, ALI GÖNCÜ², FATMA İŞİK¹, İLYAS ÇELİK¹

ABSTRACT

Industrial hemp (*Cannabis sativa L.*) has been an important source of food, fiber and folk medicinal preparations for thousands of years in the Old World. Both the ripened seed of hemp and seed meal are excellent sources of dietary oil, fiber and protein. It contains 20–25% protein; the storage proteins consist mainly of edestin (globulin) and albumin, with a superior essential amino acid profile and high digestibility. It also has 20–30% carbohydrates, 25–35% oil (composed primarily of linoleic and α -linolenic acids) and 10–15% insoluble fibre and a rich array of minerals. The hemp seed, in addition to its nutritional value, has demonstrated positive health benefits, including the lowering of cholesterol and high blood pressure. The increased utilization of hemp seed for edible oil production has caused abundant amounts of protein-rich meal, which serves as a suitable raw material for production of peptide products, because of the presence of high levels of residues, especially arginine and branched chain amino acids, which are desirable components of bioactive peptides. Studies of hemp seed oils are expected to follow and may be extended to include clinical studies, such as arthritis, hypertension, diabetes, cancer, gastrointestinal disorders, ulcers, chronic fatigue syndrome, lupus, and more. Bakery products are the most consumed foods in the world and among these products; cakes are the most popular products due to their deliciousness and special organoleptic characteristics. Among different types of cakes, Muffin cake has a special position due to its deliciousness. In this study, muffin cakes were produced by the addition of 2, 4 and 6% of hemp seeds to cake formulations and color values, some chemical and sensory properties of cakes were determined. It was found that the ash and oil contents of muffin cakes increased by increasing the amount hemp seeds in the formulation ($P < 0.05$). In color analyses, it was seen that increasing the addition rate caused decreases significantly ($p < 0.05$) in the all Hunter L,a,b values in crumb color. In the sensory evaluation, the panelists gave scores for crust color, crumb color, crumb cell structure, texture, smell, chewiness, flavor, and overall acceptance. The samples having 2% of hemp seeds received best liking score on overall acceptance. All the muffin samples received sensory scores more than 3.5 which was the midpoint of hedonic scale.

UTILIZATION OF BUCKWHEAT (FAGOPYRUM) IN CEREAL TECHNOLOGY

ALİ GÖNCÜ¹, ÜNKAN URGANCI², İLYAS ÇELİK², FATMA IŞIK²

ABSTRACT

Buckwheat is a plant species of the genus *Fagopyrum* from the family Polygonaceae. Unlike the important grains such as wheat, corn, oats, rice and barley, it can be adapted to develop in a short time at high altitudes (0-4200 m). Buckwheat is one of the most important alternative crops that can be grown without using artificial fertilizers, pesticides and other chemicals. It is a one-year-old plant that can grow even in cool climates and in poor soils. Although it is in the Pseudocereal class, it is mostly classified in cereals. Because its chemical composition and utilization areas are similar with cereals. Nine varieties of buckwheat can be cultivated, but two varieties of them are cultivated mostly. The buckwheat species most commonly used in bakery products is *Fagopyrum esculentum* moench. Buckwheat seeds are in the form of a triangular pyramid. Seed hulls are bright or matt and brown, black or gray in colour. It has been reported that it can be cultivated everywhere in our country and government pays financial incentive for its cultivation. Unlike wheat, buckwheat does not contain gluten. Buckwheat flour is commonly used with other gluten-free cereal flours and starches in the world for the development of new dietary products for celiac disease. Buckwheat is an important source for gluten-free products with its unique taste and aroma. The aim of this review is to give some information about buckwheat using in breads, pasta, noodles, biscuits, cakes, tarhana, cookies, chips and wafers.

THE EFFECTS OF GINKGO BILOBA ON ALZHEIMER DISEASE

GÖZDE ÇALIŞKAN¹, GÜLSEREN AVCI¹, AYŞE İŞLER¹, EZGİ TOPTAŞ BIYIKLI¹, ALI EMRAH BIYIKLI¹

ABSTRACT

Ginkgo biloba, is a 30-40 m high tree, which takes place in the class of ginkgoales, and can live more than thousand years. It is a sort of the oldest tree still living on the earth and it is accepted as a "living fossil". Besides that it naturally grows in North China and Japan, it is also grown as decorative plant in mild regions and parks and gardens. In order to use it as medication, the extract of ginkgo biloba was first developed in Germany in 1965 and was introduced with the name of "EGb761". Later, it was registered in France (IPSEN, Paris) and started to be produced in series. Today, the extract of Ginkgo biloba takes place among the supplements often used. The extract of standardized ginkgo biloba foliage contain flavonoid glycosides (quersatin, kaempferol,, isorhamnetin, etc.) in the rate of 24%; terpenoids in the rate of 6%; and organic acid in the rate of 5-10%. Thanks to terpenes and flavonoids, accepted pharmacologic active components in the content of its leaves, it is considered that it has effect on especially cerebral vascular. This effect of it became widespread the use of ginkgo biloba in weak memory depending on age and dementia. AIM :In this study, it was aimed to compile the studies examining the effect of using the extract of using ginkgo biloba for Alzheimer disease on cognitive disorders METHOD: In this compilation study researching the relationship of the use of ginkgo biloba and Alzheimer, the actual literature data was examined and the effect of using the extract of ginkgo biloba on Alzheimer diseases were examined by utilizing the secondary study data. RESULTS: It is put forward that the pharmacologically active component EGb761, used in a number of study, are flavonoid and terpenoids. In a number of studies, EGb761, thanks to flavonoids in the content, reduced free radicals preparing ground for neuronal damage. It is also emphasized that the components of ginkgolide and flavonoid have the inflammation preventive effect seen in Alzheimer pathology. Troubles in mitochondrial functions are also associated with the pathological changes seen in Alzheimer and it is considered that EGb761 has a protective effect on mitochondrion. Besides that there are some studies showing that administrating the extract of ginkgo biloba to Alzheimer patients significantly has an effect in positive direction, there are also some studies, where its effect is not observed at all. Provided that high dosage is not used, since it is not possible to see the useful effects of ginkgo biloba, it is emphasized that it is necessary to use, instead of the plant itself, its extract. Dosage effect ranges between 240-720 mg per day and it was not dealt with a net quantity. CONCLUSION: Due to its antioxidant activity and antiapoptotic and antiinflammatory effects, its protective effects against amyloidogenes and A β regeneration, it was considered that Ginkgo biloba, can be used in Alzheimer treatment but this claim was not scientifically verified and/or the contradictory results about the subject were reached. For being able to be better understood of the effect mechanism, there is a need more comprehensive studies.

DETERMINATION OF ANTIMICROBIAL ACTIVITIES OF SAGE AND LINDEN HERBAL TEAS WHICH ARE SOLD BY TEA BAG AND UNPACKED

DUYGU ZEHİR¹, HALİL İBRAHİM KAYA¹, ÖMER ŞİMŞEK¹

ABSTRACT

In this study, four sage and four linden herbal tea bags purchased from national markets and four unpacked sage and four unpacked linden herbal teas purchased from herbalist were used. The herbal tea bags and unpacked teas are first placed in cups and freshly boiled hot water is added. Brewing time for herbal tea bags was determined as 3-5 minutes and samples were taken for antimicrobial activity studies. Well diffusion method was used to determine antimicrobial activity. *Micrococcus luteus* was used as the indicator bacteria. As a result of the analyzes, it was determined that antimicrobial activity of unpacked sage herbal teas were higher than sage herbal tea bags and antimicrobial activity of linden herbal tea bags were higher than unpacked linden herbal teas.

SOME ORGANOLEPTIC PROPERTIES OF BISCUITS FROM ADDING TO CAROB (CEROTONIA SILIQUA) POWDER

FATMANUR BÜYÜKSARAÇ¹, AYDIN YAPAR¹, CANSU TOPKAYA¹

ABSTRACT

Carob (*Cerotonia siliqua*), also called locust, is an oldest plant of the world. It belongs to the family of Fabaceae and grows in many parts of the Mediterranean region. Carob pod characterized by a high content of carbohydrate, appreciable amount of protein, low levels of fat. Apart from carbohydrates, high amounts of dietary fibre and polyphenols are characteristic of this Mediterranean food. Dietary fibre itself or a diet rich in dietary fibre is known to exert a variety of physiological effects, including improved digestion and attenuation of blood cholesterol and glucose levels. Moreover, raw carob pods and carob pod flour contain substantial amounts of polyphenols especially condensed tannin. Polyphenols exhibit a wide range of biological properties, and among these, the antioxidant activity is the best known. Also, carob pods are rich in K, Ca and Mg. Pods of the carob fruit have long been used as a raw material for food additives production. Due to its sweetness and flavor similar to chocolate, as well as its low price less carob pods milled into flour are widely used in the Mediterranean region as cocoa substitute for sweets, biscuits, and processed drinks production. Additionally, the advantage of using carob powder as a cocoa substitute is that it does not contain caffeine and theobromin. Biscuits are one of the most popularly consumed bakery products by people all over the world. Traditional bakery products are produced from suitable materials, following the classic procedure and using the proper equipment. The most common materials are flour, water, yeast, sugar, vegetable fats or oils, eggs, starch, milk or milk products etc. Some of the reasons for such wide popularity are their ready to eat nature, affordable cost, good nutritional quality, different varieties, availability in different tastes and longer shelf life. Most of bakery products are used as a source for incorporation of different nutritionally rich ingredients for their diversification. The aim of this study was to determine the effect of carob powder on some sensory properties of biscuits and produce a functional food by adding carob powder to the biscuits formulation. Biscuits samples were prepared by using 4%, 6% and 8% of carob powder that were replaced with wheat flour. And also one party was produced without carob powder as control. Color of biscuits samples were determined by HunterlabMiniScan XE. L (lightness) and b (yellowness) value were decreased by increasing ratio of carob powder whereas a (redness) value was increased. Sensory parameters such as color, smell, taste, crunchiness and overall acceptability were evaluated by a panel of 26 persons using 7-point hedonic scale. All of the biscuits received sensory scores higher than 4.2 point. The biscuits having 6% carob powder in the formulation were more liked than other samples having carob powder, in all criteria.

IN VITRO CLONAL PROPAGATION OF A MEDICINALLY IMPORTANT SPECIES: MUSCARI NEGLECTUM GUSS. EX. TEN

ÇİĞDEM ALEV ÖZEL¹, DENİZ YÜZBAŞIOĞLU², FATMA ÜNAL²

ABSTRACT

Muscari neglectum Guss. Ex. Ten is both a vegetable and an ornamental, herbaceous perennial plant that grows in the Mediterranean region with attractive and scented blue colored flowers. It is rich in total phenolics, flavonoids, monomeric, and anthocyanin contents with high antioxidant and antimicrobial activity. In this species, germination, propagation and seed formation is difficult due to high seed dormancy. The aim of this study was to develop a protocol for rapid and efficient multiplication of this plant which is rich in medicinally important metabolites under in vitro conditions. Mass propagation of surface sterilized *M. neglectum* bulbs was achieved using 4 weeks cold stored bulbs by vertically slicing them in to four. Each quarter of the bulblets was used to obtain twin bulb scales. These were cultured on MS medium containing different concentrations of BAP+NAA. Single bulblet bud noted on MS medium without plant growth regulators used as control. Mean number of bulb buds per explant excluding control ranged 1.5-17.50. The bulblet regeneration percentage ranged from 33.33 to 100%. MS medium containing 8.88 µM BAP-10.74 µM NAA and 17.76 µM BAP-10.74 µM NAA induced 100% regeneration. Mean number of bulblets per explant ranged from 1.25 to 8.00 per explant with bulblet diameter of 0.10 to 0.30 cm. These bulblets grew in the form of laminal out growths without callusing. Maximum number of bulblets per explants was noted on MS medium containing 17.76 µM BAP+2.685 µM NAA. These bulblets had mean bulblet diameter of 0.25 - 0.30 cm. These bulblets post subculturing for eight weeks, increased their diameter in range of 0.31 to 0.48 cm. MS medium containing 8.88µM BAP+10.74µM NAA showed maximum increase in the bulblet diameter. Variable axillary regeneration in range of 25-100% was also noted on each concentration of plant growth regulators post sub culturing. Mean number of axillary bulblets on the mother explants ranged 1-3.04 with bulblet diameter of 0.12 to 0.30 cm. The largest axillary bulblets were noted on MS medium containing 8.88 µM BAP-10.74 µM NAA. Following 3-4 weeks, these bulblets induced spontaneous root initials variably. These developed into visible roots at the end of 8th week. In vitro cultured plants did not differ from normal plants growing in the wild and were uniform in their morphologic characteristics. A novel protocol for micropropagation of this plant has been established. It can be concluded that in vitro production of *M. neglectum* bulbs with significant medicinal value is more advantageous, compared to its propagation under wild conditions; where it takes 4 -5 years to grow to the desired size.

ANTIBACTERIAL ACTIVITIES OF THE ESSENTIAL OIL OF THYMUS SPP., LAVANDULA SPP. AND SALVIA SPP.

CEREN YAVUZ¹, SEVGI MARAKLI¹, TUBA YILDIRIM¹

ABSTRACT

Many naturally occurring essential oils from medicinal plants and herbs have been shown to possess antimicrobial properties and could serve as antimicrobial agents against pathogens [1]. Herbs and their essential oils are the most efficient natural antimicrobial agents have long been used to traditional drug [2]. The objective of this study was to investigate the antibacterial activity of essential oils found in Thymus spp., Lavandula spp., Salvia spp. The essential oils of the these plants were produced by the Clevenger hydrodistillation method. Plant materials (50 g) with small pieces placed in a distillation apparatus with double distilled water and hydrodistilled for 3 h [3]. The antibacterial activities of plant essential oils were determined by disc diffusion method and were tested against standard strains of Staphylococcus aureus ATCC 25923, Escherichia coli ATCC 35218, Klebsiella pneumoniae ATCC 70603, Pseudomonas aeruginosa ATCC 27853, Salmonella enteritidis ATCC 13076 and Proteus vulgaris ATCC 13315. Experiments were performed at three times. Consequently, some of the essential oil investigated in this study showed varying levels of antibacterial effects against the six bacteria. According to the results of disk diffusion method, the highest antibacterial effect was identified essential oil of Thymus spp., Lavandula spp. and Salvia spp., respectively. To evaluate the antibacterial activity of the all essential oil against the test bacteria, the essential oil of Thymus spp. was effective on all test microorganisms. Antibacterial activity of the essential oil of Salvia spp. against Staphylococcus aureus, Escherichia coli, Klebsiella pneumonia and Pseudomonas aeruginosa was found to be less effective than Salmonella enteritidis and Proteus vulgaris. Klebsiella pneumonia and Pseudomonas aeruginosa was the most resistant strains in the test bacteria.

PLANTS FROM ASTERACEAE AND LAMIACEAE USED TRADITIONALLY AGAINST GASTROINTESTINAL DISEASES IN TURKEY

MELTEM GÜLEÇ¹, SEÇİL YAZICI TÜTÜNİŞ¹, HAKAN BAĞRIAÇIK¹, NUR TAN¹

ABSTRACT

Turkey is rich in medicinal plants and still need more research to explore its treasure. Medicinal plants and natural products are widely used by indigenous people. Historically developed ethnobotanical heritage should be protected for new generations and further studies. As known there are a large variety of plants used to manage different gastrointestinal problems; such as ulcers, gastritis, reflux, indigestion, constipation, diarrhea, nausea, vomiting, hemorrhoids, intestinal parasites, loss of appetite, halitosis; in Turkey. This study aims to report the herbs of most used Families (Asteracea and Lamiaceae) among Turkish folk to treat gastrointestinal problems. Related studies were reviewed. Consequently 24 plants belonging to Asteraceae and 38 plants belonging to Lamiaceae have been identified (1, 2, 3). Literature studies on these plants have been carried out. Totally usages of 39 plants were consistent with previous literature (4). Due to the lack of literatural studies the purported medicinal usages of 15 plants cannot be confirmed. Usages of 8 plants are conflicting use of the information in the literature (4). This study might be useful for the researches about these species. 1) Sargın S.A., Akçiçek E., Selvi S., 2013. SUGAR COMPOSITION IN THE ACHENES OF THREE MEDICINAL MATRICARIA L. (ASTERACEAE) TAXA

KEMAL VEHBİ İMAMOđLU¹, HÜSEYİN İNCEER¹, SEMA HAYIRLIOđLU-AYAZ¹, MELAHAT ÖZCAN², FAİK AHMET AYAZ¹

ABSTRACT

Matricaria L. is a genus of the tribe Anthemideae of the family Asteraceae and it is mostly distributed in Europe, northern Africa, Macaronesia, western, south-western and central Asia, and western North America. This widespread distribution and the diversity of habitats, such as vacant lots, disturbed meadows, areas along roads and railroads, and waste and dry areas, in which *Matricaria* occurs may result in different adaptations to diverse environments. Soluble sugars vary in tissues and organs within and among taxa in the plant kingdom. They are essential to the maintenance of plant-animal interactions. In this respect, carbohydrate reserves in leaves, fruits and seeds etc. are potential food sources for organisms. In this study, we have investigated sugar composition in the fruits (achene or cypsela) of three *Matricaria* taxa (*Matricaria aurea*, *M. chamomilla* var. *chamomilla* and *M. chamomilla* var. *recutita*) for the first time in the literature. Soluble sugars in the achene samples (0.5 g) were separated and quantified. Fructose, glucose, sucrose and maltose were identified on chromatograms. *Matricaria chamomilla* L. var. *recutita* exhibited a higher fructose (1.39 ± 0.12) and glucose (1.44 ± 0.12) content, while *M. aurea* had lower fructose (0.33 ± 0.02) and glucose (0.46 ± 0.05) content. *Matricaria aurea* exhibited higher sucrose (5.07 ± 0.89) content, while *M. chamomilla* var. *recutita* had lower sucrose (2.91 ± 0.73) content. *Matricaria aurea* exhibited higher maltose (0.66 ± 0.09) content, while *M. chamomilla* var. *chamomilla* had lower maltose (0.34 ± 0.06) content. This research was supported by the Scientific and Technological Research Council of Turkey (TUBITAK Project No. 106T162).

PHARMACOPOEIA AND MONOGRAPH ANALYSIS OF CYNARA SCOLYMUS (ARTICHOKE)

SEVDE ESRA SERT¹, DUYGU KAYA BILECENOĐLU¹

ABSTRACT

Herbal monographs are guides that contain comprehensive information on the common names of plants used for medicinal treatment, their botanical properties, chemical compositions, geographical distributions, clinical characteristics, pharmacological properties, pharmacokinetic properties, indications, contraindications, safe use data, clinical research data, etc.. There are many sources that record the efficacy, quality criteria and safety of medicinal plants. Herbal medicines also have to be manufactured according to the principles of good manufacturing practices (GMP), as well as modern medicine. If the drug containing the correct characteristics of the correct plant source is supplied and used, it can be ensured that the effect of the produced drug is always the same. This is possible with standardization. The standards of pharmaceutical raw materials and auxiliary substances are registered in pharmacopoeias. Pharmacopoeia is the official book that defines the most accurate raw materials by the monographs which are constantly renewed by the specialist staff and that the pharmaceutical industry is obliged to comply with in the countries where it is valid. *Cynara scolymus* L. (Artichoke) is a plant species that is mostly grown in the eastern Mediterranean region of Turkey and consumed as food. It is used as an appetizer, urine and bile extractor in infusion (2-3 %) for medicinal purposes. Flowers of the plant carries no toxic compounds and thus are edible, while extracts prepared from fresh leaves are frequently used in liver diseases. Artichoke is also known today as an aphrodisiac. Artichoke has records in pharmacopoeia and monographs such as the worldly accepted European Pharmacopoeia, Martindale, ESCOP Monographs, Commission E monographs, French Pharmacopoeia. In this study, the features of the artichoke will be presented as appeared in the existing monographs.

ABSTRACT

Although oregano essential oil has common use in the cosmetics, pharmaceutical and food sectors, information available on its effects on meat quality and shelf life, when incorporated into lamb feed rations, is scarce. This study, the effects of oregano essential oil (OEO) in feed on the water activity, pH, lipid peroxidation, colour parameters and microbial counts of the *Musculus longissimus dorsi* (MLD) were investigated. The control group was fed on a basal ration and the OEO1 and OEO2 groups were fed on a basal ration added 200 mg/kg and 400 mg/kg oregano essential oil, respectively. Akkaraman lambs were fed on experimental rations for a period of 56 days and were slaughtered at the end of the fattening period. Meat quality parameters were investigated in the longissimus dorsi muscle of the slaughtered lambs. Lipid peroxidation of the MLD was significantly affected by storage time (ST), group (G) and ST*G, whilst pH was affected by ST. Lightness (L*) was significantly affected by ST, G and ST*G; redness (a*) by ST and G; and yellowness (b*) by ST and ST*G. The *Micrococcus/Staphylococcus*, total mesophilic aerobic bacteria and total psychrophilic aerobic bacteria counts were significantly affected by ST, G and ST*G; *Pseudomonas* spp. counts by ST; and coliform bacterial counts by ST and ST*G. The antioxidant and antimicrobial effects of oregano essential oil were confirmed.

MEDICINAL PLANTS SOLD IN THE HERBAL MARKETS IN AđRI

KADIRIYE URUÇ PARLAK¹, ÖZKAN SEVİM

ABSTRACT

As result of this research carried out to determine the plants which were used for medicinal aims by local people and sold in herbalists' in Ađrı, local names of 85 species belonging to totally 42 families and medicinal uses were detected. The biggest 5 families in terms of their number of taxon were found as Lamiaceae (12 taxa), Asteraceae (9 taxa), Rosaceae (8 taxa), Apiaceae (6 taxa) and Poaceae (5 taxa), respectively. The most frequently used parts of the plants were found respectively as leaf (18 taxa), fruit (13 taxa), whole flower and plant (9 taxa each), seed and root (9 taxa each). Distribution of taxa to phytogeographical regions were as Euro-Siberian 11, Irano-Turanian 12, Mediterranean 6, and 56 taxa were found as multi-region or region-unknown. Ađrı local people generally used medicinal plants for cough, asthma, bronchitis, and influenza, digestive disorders and kidney stone and disorders. The most common use of plants was as tea.

DETERMINATION OF ENVIRONMENTALLY SENSITIVE AREAS IN SEMIARID FOREST AND AGRICULTURE LAND USES

EBRU GÜL¹, SABIT ERŞAHİN¹, MELDA DÖLARSLAN¹

ABSTRACT

In recent years, land degradation and decrease in biological productivity have made it necessary to take measures for combating desertification. This study was carried out in a semi-arid forest and agricultural area with a size of 1000 ha located in the Sarıkaya region of Yapraklı district, approximately 45 km north-east of Çankırı province. Environmentally sensitive areas (ESAs) in forests (pine and oak) and agricultural lands have been determined using the 'Desertification Indicator System for Mediterranean Europe (DIS4ME)' system developed for the Mediterranean countries. Soil samples were taken at 632 predetermined sites (252 from agricultural areas, 122 from oak forests and 258 from pine forests) and a desertification survey form was filled at each sampling site. ESAs sensitivity score types were calculated using the DIS4ME model system. Model calculated and field observed desertification risk values were compared to evaluate successes of DIS4ME. Significantly high correlation coefficient ($r = 0.88$) was found between observed and scored values calculated with DIS4ME. The ESAs type sensitivity score surface maps were created for the entire study area and the corresponding land uses by geostatistical methods. The DIS4ME-calculated ESA type sensitivity scores values range from 1.18 to 1.61. The majority of the study area (597.29 ha) was categorized as fragile, and 370.61 ha in critical sensitivity class. The agricultural areas are more vulnerable to desertification than oak and pine forests, respectively. Land use change from forest to agriculture should be avoided to prevent further degradation of the study area.

INVESTIGATION OF ANTIDEPRESSANT EFFECTS OF GENTIANA OLIVIERI IN THE CHRONIC UNPREDICTABLE STRESS MODEL OF DEPRESSION IN THE RAT

AHMET BERK¹, İSMET YILMAZ², NURETTİN ABACIOĞLU³, MERVE GÖKŞİN KARAASLAN², EBRU KUYUMCU SAVAN², MUSTAFA BAHADIR KAYMAZ²

ABSTRACT

PURPOSE: Flowering herbs of *Gentiana olivieri* known with a local name as “Afat”, is traditionally been used in south-east Anatolia to combat some mental disorders including depression in the different regions of Turkey. The aim of this study is to investigate the antidepressant effects of *G. olivieri* ethanol extract and the possibility of synergistic interactions with imipramine in combinations of different doses on chronic unpredictable stress (CUS) -induced depression. **MATERIAL AND METHOD:** Male Sprague dawley rats (n=8) were subjected to an experimental setting of CUS. The herbal extracts administered orally (1000 mg/kg, 500 mg/kg and 200 mg/kg) alone and in combination of imipramine (10 mg /kg) for 3 weeks during the CUS model; imipramine at 10 mg/kg/day given orally as a positive control. CUS-induced depression was examined by measuring serotonin, noradrenaline, dopamine and monoamine oxidase A (MAO-A) levels in brain tissue, changes in total body weight and serum corticosterone levels and the behavioral parameters of depression. **RESULTS:** Higher dose (1000 mg/kg) of *G. olivieri* and imipramine produced beneficial effects on the stressed rats by effectively improving CUS-induced low sucrose consumption, increasing brain serotonin and noradrenaline levels, reducing serum corticosterone and brain MAO-A levels in rats. *G. olivieri* at doses of 500 mg/kg also increased the brain serotonin levels on the stressed rats. There was no significant difference in body weight among the treatment groups. Our results also showed, unlike the positive control imipramine, *G. olivieri* did not affect the brain dopamine levels. The combination use of *G. olivieri* with imipramine did not show synergistic interactions. **CONCLUSION:** These findings demonstrate the antidepressant effects of *G. olivieri* within a CUS model of depression and the mechanism of action might be attributed to its attenuating abnormalities in monoaminergic system functions in brain and improvement in hypothalamic–pituitary–adrenal axis, although underlying mechanism still remains to be further elucidated.

FORMULATION AND EVALUATION OF A GEL CONTAINING NATURAL INGREDIENTS FOR THE TREATMENT OF CELLULITE

EBRU ALTUNTAŞ¹, BURCU ÖZKAN², GÜLGÜN YENER¹

ABSTRACT

Cellulite is a cosmetically unacceptable problem that most women experience at some point in their lifetime. Cellulite, also called as edematous fibrosclerotic panniculopathy and local or gynoid lipodystrophy is characterized by irregular relief alterations to the skin surface of the affected areas, giving orange peel, cottage cheese, or mattress aspect. It is frequently found on the thighs and buttocks of women. Approximately 85–90 % of women over 20 years are believed to have some degree of cellulite. On the one hand, it has been recently described as a physiological condition aimed to maximize adipose retention in order to ensure adequate caloric availability during pregnancy and lactation, but cellulite is also a complex problem, involving several different factors and mechanisms, such as metabolic imbalances, alterations in connective tissue structure, genetic factors, inflammatory conditions, reduced microcirculation and hormonal factors. Regardless of the number of women affected by cellulite, only a limited number of studies have been published in the scientific literature so far, botanical derivatives being one of the main groups of evaluated compounds for its treatment. A multi-target/multi-component strategy has been recently recognized as one of the best approaches to counteract the main cellulitic symptoms and signs. The objective of this study was to develop a stable gel type formulation including a variety of natural ingredients (Centella asiatica extract, Coleus forskohlii extract, Aesculus hippocastanum extract, Paullinia cupana oil, caffeine, L-Carnitine, alpha tocopherol) which can be considered as a cosmetic product and evaluate its anti-cellulite efficacy and safety against placebo with non-invasive biophysical techniques (Skin-ph-meter 900®, Corneometer® CM 825, Aramo TS skin diagnosis system, Laser Doppler flowmeter, Infrared thermometer), clinical assessments, a dermatological test and a subjective questionnaire over a period of four weeks. In this content, twenty female volunteers (ages: 18–65 yrs), affected by fat accumulations and/or slight-to-moderate edematous-fibrosclerotic panniculopathy in the lower limbs were selected for the study. The trial was conducted in a single-blind method with the comparison within subjects (each subject being its own control), and volunteers were required to apply the test products on the thigh twice a day, unilaterally, for a period of four consecutive weeks. They underwent two medical examinations, a baseline evaluation at T0 before the beginning of the test and an evaluation at the end of the treatment period T4.

USE OF ESSENTIAL OILS IN SEAFOOD PRESERVATION

AYŞE ÖZYILMAZ¹, SEVİL DEMİRCİ¹, ŞÜKRAN ÇAKIR ARICA¹, ABDULLAH ÖKSÜZ², DİLŞAT BOZDOĞAN KONUŞKAN³

ABSTRACT

Essential oil is one of the many occurring compounds naturally found in plants and find their application in pharmaceutical, sanitary, cosmetic, agricultural, and food industries. There is an increasing interest in natural products, intended not only to prevent some diseases, but also to prevent the deterioration of fats and other constituents of foodstuffs. Essential oils can be identified as natural food additives which can find useful application in food preservation. Some scientific studies either *in vitro* or *in vivo* have clearly shown that essential oils have some components such as carvacrol, *p*-cymene, and *c*-terpinene which provide natural preservation effects in food. Among the essential oils, for example thyme and oregano essential oil, either by itself or with other combinations, oil has been tested for antimicrobial, antifungal, and antioxidant effects for different types of seafood such as, anchovy, red porgy, gilthead sea bream, ready-to-eat squid rings, Mediterranean octopus, sea bream and Asian bass fish. Based on the data of all those previously reporting, results were found out to be very promising.

ASSESSING THE ANTIDEPRESSANT EFFECTS OF GENTIANA OLIVIERI IN THE FORCED SWIM TEST IN RATS

AHMET BERK¹, İSMET YILMAZ², NURETTİN ABACIOĞLU³, MERVE GÖKŞİN KARAASLAN², EBRU KUYUMCU SAVAN², MUSTAFA BAHADIR KAYMAZ²

ABSTRACT

PURPOSE: The aim of this study was to investigate whether *Gentiana olivieri* herbal extracts in different doses exert antidepressant effects, and the possibility of synergistic interactions with imipramine in combinations of different doses in experimental animal models: the forced swimming test (FST), and the open field test. **MATERIAL AND METHOD:** Male Sprague dawley rats were administered the ethanol extract of *G. olivieri* orally (1000 mg/kg, 500 mg/kg and 200 mg/kg) alone and in combination of imipramine (10 mg /kg) for 7 days before the FST. Imipramine was used as positive control in this study and the behavioral parameters were examined. **RESULTS:** The results showed that orally administration of the imipramine (10 mg/kg), ethanol extract of *G. olivieri* (200, 500 and 1000mg/kg) alone and in combinations of imipramine (10 mg/kg) significantly reduced the duration of immobility in FST, which was not due to the alteration in the locomotor activity. *G. olivieri* did not show any synergistic interactions with imipramine. **CONCLUSION:** This study suggests some evidence of antidepressant therapeutic potential of *G. olivieri*.

THE ESSENTIAL OIL COMPOSITON OF HYPERICUM LYDIUM AND H. HYSSOPIFOLIUM VAR. ELONGATUM

MEHMET AKDENİZ¹, ABDULSELAM ERTAŞ², İŞİL AYDIN³, MEHMET FIRAT⁴, FIRAT AYDIN⁵

ABSTRACT

The genus *Hypericum* a member of Hypericaceae family, is represented by 100 taxa, 45 being endemic to Turkey. In Turkish folk medicine, the genus *Hypericum* is known as “sarı kantaron, kantaron, binbirdelik otu, mayasıl otu” and most of them, especially *H. perforatum*, have been used for the treatment of burns, wounds, hemorrhoids, diarrhea and ulcers. Aqueous extracts of the flowering aerial parts of the *Hypericum* species are used in the treatment of neuralgia, anxiety, neurosis and depression. The essential oil compositions of about 50 different *Hypericum* species have been identified in the previous studies. In this study, the essential oil contents of *H. lydium* and *H. hyssopifolium* var. *elongatum* was analyzed by GC-MS/FID. The dried aerial parts of species were cut into small pieces and subjected to hydro- distillation with water for 4 h, using a Clevenger-type apparatus to produce essential oils which were dried over anhydrous sodium sulphate and stored at 4°C until required. The essential oils were diluted by dichloromethane (1:3, v/v) before the GC run. Identification of the compounds was based on the comparison of their retention times and mass spectra with those obtained from authentic samples and/or the NIST and Wiley spectra as well as the literature data. The major components of the essential oils were identified as α -pinen, caryophyllene, β -eudesmene, α -silenene, β -elemene and caryophyllene oxide for *H. lydium* and β -ocimene, α -pinen, β -pinen, caryophyllene and germacrene D for *H. hyssopifolium* var. *elongatum*. Acknowledgements: “This work was supported by Research Fund of the Dicle University FEN.15.012 ”

RESEARCH REGARDING WITH COOKING VEGETABLE OIL CONSUMPTION HABITS OF STUDENTS

NURAN ERDEM¹, DIDEM ÖNAY DERİN², MEHTAP GÜRSOY³

ABSTRACT

This research is a situation determination and it was planned and executed for determining cooking vegetable oil consumption habits and frequencies of vocational higher education students. 360 students who attend 1. and 2. grades of Aksaray University Güzelyurt Vocational School form the universe of this research. (Total number of students who are enrolled to school is 550). Random sampling method was used in research and total 227 students consisting of 125 voluntary male student and 102 female students participated to study (participation rate is 63.06%) Research data were collected between October 2016- November 2016 by using questionnaire form. Questionnaire form consists of several questions for determining cooking vegetable oil consumption frequencies and habits of students and general information about students. SPSS package program was used for evaluation of data and necessary statistical analysis was made. Ages of students change between 17 and 38 and average age is 19.59 ± 1.97 years. Average body weight of students who had participated to research is 63.20 ± 11.71 kg, their average height is 169.19 ± 8.70 cm, average Body Mass Index (BMI) is 21.99 ± 3.08 kg/m². It was determined that 61.7% of students mostly use sunflower seed oil. It was observed that Majority of students (77.5%) spread butter over bread more than half of them (56.4%) prefers food with normal oil. It was observed that Majority of students use sunflower seed oil (78.4%), butter (60.8%), and olive oil (51.1%), the sometimes consume margarine (47.1%), tail fat (45.9%), corn oil (%45.4), semi fluid margarine (65.2%), they never consume cotton seed oil (75.8%), canola seed oil (68.3%), hazelnut oil (63.0%), lard (%56.4). Consumption of oils which are sources of energy should not be avoided provided that they are balanced. Vegetable oils should be used alternately for getting omega-3, omega-6 and omega-9 fatty acids and awareness of people should be increased.

KEYWORDS

Cooking vegetable oil, oil consumption, fatty acids, omega-3.

EVALUATION OF COLOR AND CHLOROPHYLL CONTENT OF PARSLEY, DILL, CORIANDER AND CHERVIL LEAVES SUBJECTED TO MICROWAVE AND NATURAL DRYING

İLKNUR ALIBAŞ¹, ASLIHAN YILMAZ¹

ABSTRACT

Parsley, dill, coriander and chervil leaves, which weigh 20 ± 0.06 g with moisture of $83.70 \pm 0.06\%$, $86.96 \pm 0.10\%$, $82.05 \pm 0.02\%$ and $77.99 \pm 0.01\%$, respectively, were subjected to microwave and natural drying. Drying continued until the moisture of parsley, dill, coriander and chervil leaves was decreased to $8.18 \pm 0.01\%$, $8.39 \pm 0.08\%$, $8.23 \pm 0.01\%$ and $8.08 \pm 0.06\%$, respectively. Drying trials in microwave drying were 900 and 400 W. Drying periods for parsley, dill, coriander and chervil leaves lasted for 11-23, 16-26, 18-30 and 12-22 min, respectively, at microwave drying. Moreover, the duration of natural drying trials for parsley, dill, coriander and chervil was 4.5, 3, 5.5 and 5 days, respectively. Energy consumption of parsley, dill, coriander and chervil leaves during 400 W and 900 W at microwave drying were measured as 0.153 - 0.165, 0.173 - 0.240, 0.200 - 0.270 and 0.147 - 0.180 kWh, respectively. Measured values of moisture were compared with predicted values obtained from five thin-layer equations. The best model was selected for each trial according to coefficient of determination (R^2) as well as standard error of estimated (SEE), root mean square error (RMSE) and Chi-square (χ^2). The highest R^2 and the lowest SEE, RMSE and χ^2 were used as the deciding factor in all thin layer equations. Hue angles of fresh parsley, dill, coriander and chervil leaves were 113.92, 107.73, 104.37 and 109.60, respectively. The best color parameters of parsley and dill leaves were determined for microwave drying at 900 W, while the worst color parameters were obtained for natural drying. Furthermore, the closest color parameters to fresh chervil were found in microwave drying at 400 W, whereas the furthest color parameters were determined in natural drying. Also, microwave drying at 900 W provided the best color parameters following fresh coriander, while microwave drying at 400 W gave the worst color parameters of coriander leaves. The highest chlorophyll concentration of parsley and chervil leaves was measured in microwave drying at 400 W unlike dill and coriander leaves in microwave drying at 900 W. Consequently, for all products, not only drying parameters such as drying period and energy consumption but also quality parameters related to color and chlorophyll concentration were used in decisive factors in choosing the best drying method.

KEYWORDS

Chlorophyll, color, chervil, coriander, dill, microwave drying, natural drying, parsley.

STANDARDIZATION OF EDUCATION PROGRAMS OF HERBAL MEDICINE AND AROMATIC PLANTS TRAINING IN TURKEY

ÖMER ARSLAN KALAFATÇILAR¹

ABSTRACT

The aim of Herbal Medicine and Aromatic Plants Programs in universities of Turkey includes; 1. To prevent uncontrolled picking of plants and to prevent consumption of these special herbs and plants. This can be achieved by culture of plants in appropriate situations and standardization of procedures. 2. To provide hygienic circumstances and standardization of places where these herbs and plants are being sold. 3. To train members who can work with medical doctors and pharmacists to produce drugs from herbs and plants. Standardization of education programs in Herbal medicine and Aromatic Plants training, Turkey should be done to reach these purposes.

**EFFECT OF POLYHERBAL FORMULATION (IMMUPLUS AFS) ON
THE HEMATOLOGICAL AND BIOCHEMICAL PARAMETERS OF ;
FIRST FINDINGS.**

FATİH MEHMET BIRDANE¹, DURMUŞ FATİH BAŞER¹

ABSTRACT

The purpose of this study was to determine the clinical, hematologic and biochemical side effects of herbal mixture ImmuPlus AFS (*Tinospora cordifolia*, *Withania ashwagandha*, *Embllica officinalis*, *Ocimum sanctum*, *Andrographis paniculata*, *Azadirachata indica*, and *Magnifera india*) in newborn holstein calves (n: 22). ImmuPlus AFS were given daily at a dose of 0.05 gr / kg for 15 days starting from the day of birth. Clinical examinations were carried out daily by veterinarians. At the same time, on days 0, 7, and 20, some biochemical parameters and hematological examinations were performed on days 0 and 20. Although some differences were found in biochemical parameters, it was seen that it was within the normal accepted limits (some of them were ALT, AST, ALP, LDH, GGT, Urea, Total Biluribin, Direct Biluribin, Calcium, Phosphorus, Total Protein, CK, Glucose). In terms of measured serum and hematological values, Initial findings indicate that ImmuPlus is not an important side effects in newborn calves.

HERBAL STORAGE MEDIA IN MAINTAINING THE VIABILITY OF AVULSED TEETH

BURCU GÜÇYETMEZ TOPAL¹, ZUHAL KIRZIOĞLU²

ABSTRACT

Dental traumas can be seen in various forms, such as crown fracture, root fracture or tooth avulsion. The avulsed teeth must be stored in a suitable environment in which the viability of the teeth can be maintained. Many natural and laboratory solutions have been used to maintain the viability of the avulsed teeth. There have also been studies in which some plants such as teas, medicinal aromatic plants, fruits, which are frequently used in the medical and pharmacological field, have been evaluated and found to be effective as a storage medium for the viability of avulsed teeth, as a result of the popularity of the natural products. In this study, it is aimed to review the easily accessible herbal storage media such as green tea, wild sage, coconut, red mulberry, rice, propolis, aloe vera in order to maintain the viability of the avulsed teeth.

FATTY ACID COMPOSITION OF SOME HYPERICUM SPECIES BY USING GC/MS

MEHMET AKDENİZ¹, ABDULSELAM ERTAŞ², İŞİL AYDIN³, MUSTAFA ABDULLAH YILMAZ⁴, YETER YEŞİL⁵, HAMDI TEMEL⁶, FIRAT AYDIN¹

ABSTRACT

Hypericum L. is a relatively large genus of the Hypericaceae family that includes about 484 species of trees, shrubs and herbs. Recently, a growing market niche for Hyperici herba products and thus an increasing demand for crude material have resulted in considerable research into the pharmacological activities of the Hypericum genus. Most of this research has focused on Hypericum perforatum L. (Hypericaceae), which is the most common and best known member of this genus and has been certified for marketing as a traditional medicine in many European countries. Although several other Hypericum species are also used as traditional medicinal plants to treat a variety of ailments, comparatively few studies have been reported for other members of the Hypericum genus. Hypericum lydium Boiss. (Hypericaceae) is a perennial herb that can reach a height of up to 60 cm and has yellow flowers and characteristic translucent glandular dots on the sepal margin. Known in Turkish as sancı otu ("cramp herb") and mayasıl otu ("hemorrhoid herb"), H. lydium has traditionally been used in folk medicine to treat menstrual disorders, stomach pains, wounds, hemorrhoids and indigestion. In this study, the fatty acid composition of aerial parts and root of H. orientale, H. pruinatum, H. lysimachioides var. spathulatum and H. hyssopifolium var. elongatum were analyzed by GC-MS/FID. A hundred milligram of the petroleum ether extract was refluxed in 0.1 M KOH solution in 2 mL of methanol during 1h, the solution was cooled and 5 mL of water was added. The aqueous mixture was neutralized with 0.5 mL of HCl solution, it was extracted with diethyl ether: hexane (3.5: 1: 1 mL). The separating organic phase was washed with 10 mL water, and dried over anhydrous Na₂SO₄. The solvent was evaporated in vacuum and then fatty acid methyl esters were obtained. The major components of the fatty acid composition were identified as arachidic and cis-13,16-docosadienoic acids for H. orientale, stearic and cis-13,16-docosadienoic acids for H. pruinatum, H. lysimachioides var. spathulatum and H. hyssopifolium var. elongatum.

EVALUATION OF THE QUALITY PROPERTIES OF MINT SAMPLES DRIED AT DIFFERENT TEMPERATURES IN CARBON FIBER ASSISTED CABIN DRYER

SERPİL PEKDOĞAN GÖZTOK¹, HANDE ÖZGE GÜLER¹, ORHAN KAYA¹, MUTLU ÇEVİK², SERDAL SABANCI², ÖMER FARUK ÇOKGEZME¹, FILİZ İÇİER³

ABSTRACT

Mint (*Mentha piperita*), a medicinal and aromatic plant, is rich in bioactive compounds. In addition to wet and dry production of mint, it is widely used as dried due to not be keeping fresh for long times. Drying temperatures in medical aromatic plants are important to maintain its aroma, etheric oil, total phenolic content, antioxidant activities and color properties. This study was carried out to investigate the effect of different drying temperatures on the bioactive (total phenolic content, antioxidant activity) and color characteristics of the mint samples dried in the carbon fiber assisted cabinet dryer (CFCD), which has a heat source different from the dryers mentioned in open literature. For this purpose, mint samples were dried from initial moisture content of 81-83% to 10% in CFCD system at different drying temperatures (45, 50 and 55 ° C) with an air velocity of 0.8 m/ s. In order to determine the antioxidant activity, the EC50 value was taken into consideration which is determined by the DPPH radical reduction capacity method. L * value indicating the brightness of fresh and dry mint samples were found between 33.06 and 46.14, and a* values indicating green value were found between -7.04 and -1.08. It was also observed that as the temperature increased the green color (a* values) of the samples decreased. The brightness of samples were different than that of raw mint samples at the temperatures of 45°C and 50°C, statistically (p <0.05). Besides, it was determined that the total phenolic content (TPC), which was 103.16± 2.66 (mg/g dry matter) in raw material, decreased to 96.95± 2.8, 95.88± 1.65, 66.32± 3.09 mg / g drymatter for 45, 50, 55°C, respectively. It was found that the drying temperature has an effect on the antioxidant activity (AC) value in the dried samples; and the highest AC value was observed at 50° C It has been determined that the increase in temperature for the drying process of mint samples had negative effects on total phenolic, antioxidant activity and color values. It was recommended that the drying of the mint samples in CFCD should be conducted below 50°C.

THE EFFECTS OF NITROGEN ON GROWTH AND PHYSIOLOGICAL FEATURES OF LAVENDER

SARA YASEMIN¹, ASLIHAN OZKAYA², NEZİHE KOKSAL², BEKİR GOK²

ABSTRACT

Lavender, in the Lamiaceae family, is an aromatic shrub cultivated worldwide owing to lavender oil of commerce and is used as an ornamental plant. It is also traditionally believed to be antibacterial, antifungal, carminative, sedative, treat headaches, antidepressive, diabetes and effective for burns and insect bites. Plant nutrient requirement is essential for a healthy plant development and, obtaining high yields. Nitrogen is the most necessary element for the plant growth. In the present study we focused on determining the effects of different nitrogen treatments on plant growth and physiological parameters of lavender. For this purpose, 6 different nitrogen concentrations (0, 50, 100, 200, 400 and 800 mg l⁻¹ N; NH₄NO₃) were treated to lavender plants. Root length, shoot height, number of branch, stem diameter, root collar diameter and dry and fresh weights of plant biomass were investigated as plant growth parameters. Leaf chlorophyll concentration (SPAD readings), relative water content and loss of turgidity were evaluated as physiological parameters. As a result, root length, thickness of stem and, root collar, fresh weight of shoot and, total plant, leaf chlorophyll concentration, relative water content and loss of turgidity were significantly affected by nitrogen treatments, statistically. It was determined that up to 200 mg l⁻¹ N nitrogen levels could apply for fertilization of lavender plant in pot. Some adverse effects were observed related to growth parameters in 400 and 800 mg l⁻¹ N treatments while the similar negative effects in terms of leaf chlorophyll concentration, relative water content and loss of turgidity were detected in 800 mg l⁻¹ N. At the end of the study, some results were obtained which will form the basis for future studies to determine the requirement of plant nutrition in lavender plant.

ESSENTIAL OIL COMPOSITION OF 5 ACHILLEA SPECIES BY GC-FID-MS

MUSTAFA ABDULLAH YILMAZ¹, ABDULSELAM ERTAŞ¹, OĐUZ ÇAKIR¹, ENES ARICA², YILMAZ AYDIN¹, MEHMET AKDENİZ³, İSMAIL YENER¹, HAMDİ TEMEL¹

ABSTRACT

The genus *Achillea* L. belongs to Asteraceae (Compositae), which is the largest family of vascular plants and distributed throughout the world. *Achillea* is represented by more than 140 perennial herbaceous species worldwide and forty-seven species, 24 of which are endemic, grow in Turkey. *Achillea* species, commonly known as "yarrow", have been used in folk medicine for thousands of years due to their numerous medicinal properties. Today, several therapeutic applications, such as anti-inflammatory, wound healing, spasmolytic and choleric uses, are approved by scientific experimental results. In Turkey, various species of the genus are used in wound healing; abdominal pain; stomachache; symptomatic relief of colds, ulcer, and diarrhea; as diuretic; emmenagog; appetizer; carminative; and insecticidal agent. In this study, essential oil composition of 4 *Achillea* species (*Achillea nobilis* L., *Achillea goniocephala* Boiss. & Balansa, *Achillea sintenisii* Hub.-Mor., *Achillea coarctata* Poir.) growing in Turkey were investigated by GC-FID-MS. As a result of the GC analysis; eucalyptol, chrysanthenone, 1R-a-pinene, o-cymene, isoborneol and spathulenol were the main components of *A. nobilis* L.; eucalyptol, endo-borneol, (-)-camphor, piperitone, terpineol and 4-terpineol were the main components of *A. goniocephala*; Beta-eudesmol, piperitone, caryophyllene oxide and endo-borneol were the main components of *A. sintenisii*; 2-bornanone, eucalyptol, endo-borneol and viridiflorol were the main components of *A. coarctata*.

COMPLEMENTARY AND ALTERNATIVE TREATMENT METHODS IN MALE INFERTILITY

ŞENAY TOPUZ¹, İLKNUR MÜNEVVER GÖNENÇ²

ABSTRACT

Objective: Increasing infertility cases cause more and more people to try alternative treatment methods. Aim of In this study determining which alternative ways people tried in case of infertility due to man. **Materials and Methods** The data were scanned in the Turkish and English databases from the Ankara University Library by entering key words such as male infertility, complementary alternative medicine, infertility treatment. The articles from the last 10 years were evaluated. **Results** When studies are examined, it is seen that the use of CAM is increasing day by day in all of the world, the usage prevalence among women is higher but the prevalence of men infertility is high. When the studies are examined, it is seen that men try to lose weight with diet and exercise, Alcohol and smoking stopped in order to increase the number and quality of sperm. In randomized controlled trials with small groups, some studies of acupuncture, vitamin C, vitamin E, saffron and scrotal cooling suggested that a combination of coenzyme Q10, glutathione, Korean red ginseng, omega-3, selenium, zinc and folate and Menevit antioxidant supplementation had a positive effect But it is emphasized that there is no work at the level of evidence. In a very large review study (scanning of textbooks between 815 and 1901) it was stated that 180 plant species were effective on the male reproductive system, but when it was shown that toxic effects were reached, 36 plants were reached and the common feature of these 36 plants was to increase libido . Some of these plants (*Boswellia carterii*, *Chlorophytum borivianum*, *Alternative viagra*, *Phyllanthus emblica*, *Withania somnifera*, *Black cumin*, *Ferula Assa-foetida*, *Crocus sativus* (saffron), *Commiphora mukul* (guggul)) are recommended in the treatment of varicocele induced conditions. **Conclusion:** Studies done with selenium especially in infertility treatment are excessive. After selenium-rich diet, there was a decrease in sperm motility and thyroid hormone levels. However, there are studies that indicate that they have increased. While there are studies showing that acupuncture is effective, it is very limited for yoga. **Conclusion:** It is a fact that complementary and alternative medical practices have been used for men's sexuality and infertility treatment since the past, including many agents and pathways. However, evidence-based work is limited. For this reason, there is a need for evidence-based studies on large groups.

PHYTOCHEMICAL PROPERTIES OF GRAPE SEED OIL AND THE EFFECTS ON HEALTHY LIFE

NAZAN BALBABA¹

ABSTRACT

Our country has an important share among other countries with regard to grape growing. Grape seeds are by-products of wine industry with fruit juice and molasses industry. Grape seeds contain fiber, oil, protein, carbohydrate, phenolic compounds and mineral substances. Grape seeds are quite rich in terms of the phytochemicals which contains. The phytochemicals provide protection from many diseases by strengthening the immune system. The amount of oil in grape seeds is between 11-22% to varies with the cultivars. 90% of grape seed oil is composed of mono- and polyunsaturated fatty acids. The highest level of fatty acid is linoleic acid. This is followed by oleic acid, palmitic acid, stearic acid and linolenic acid, respectively. Which are rich in linoleic acid, grape seed oil, LDL (low density lipoprotein) as the cause of the fall is help protect cardiovascular health. Obtained by different methods and very useful for health of grape seed oil is also used in the cosmetic industry and aromatherapy. The amount of vitamin E found in grape seed oil is dependent on variety and environmental factors. Due to the high antioxidant effect of vitamin E has preservation of vascular health, Alzheimer's disease and cancer risk and therapeutical effects of tumors. Therefore, the use of grape seed oil has been suggested as anti-aging and for the prevention of chronic diseases.

DEVELOPMENT OF A NEW PERFORMANCE TEST METHOD TO EVALUATE THE EFFICACY OF HERBAL SHAMPOO FOR HAIR GRAYING

EBRU ALTUNTAŞ¹, BURCU ÖZKAN², FEDA DALO¹, GÜLGÜN YENER¹

ABSTRACT

Hair is one of the most important components for the general appearance of each of us. Hair has been regarded as an expression of the personality and the social role for centuries. In many civilizations throughout history, hair has been mentioned positive attributes such as beauty and power. Today, everyone wants to get well-groomed hair without the gender difference. Hair graying, one of the leading hair problems, is associated with ageing and assessed negatively. The psychology of persons experiencing this problem is affected negatively and results in the decrease of confidence. The hair graying may occur due to factors such as heredity, thyroid problems and malnutrition. Hair graying is the whitening of hair as a result of the decrease of the colouring agent in the hair roots called melanin, which provides the hair its colour, the deceleration and even stagnation of its synthesis mechanism (1). When the melanin in the hair structure decreases, air sacs are formed instead of pigment that gives color to the hair and this condition leads to graying of the hair. One of the reasons that reduces melanin is the deficiency or lack of vitamin B. Disorders such as stress, depression, irritability, too much consumption of excessive sugary products, white flour products and animal nutritions are known to increase vitamin B deficiency. Animal nutritions make difficult of the absorption of vitamins due to causing excessive lipoidosis. All these factors lead to an accumulation of hydrogen peroxide that is known to be a major cause of hair graying in hair follicles. Air sacs accumulate from the roots towards the ends of the hair and the hair gets gray since the accumulated hydrogen peroxide at the hair roots prevent the melanogenesis mechanism (2). The hair cosmetic industry has undergone a revolutionary change over the last two decades. One of the new type of hair cosmetics is gradual hair dye. This is home-use product which give the desired color after several days of use. The product has to be applied daily on the hair strand till the desired shade is reached (3). The objective of this study was to develop a new method in order to measure coloring efficacy of an anti-gray shampoo containing natural ingredients. For this purpose, we developed an in-vitro performance test method to compare this product against a commercially available anti-gray shampoo (Alpecin Tuning shampoo). White Caucasian hair swatches were used for the test. To determine melanin content, color measurements were taken with Mexameter MX16 before washing process as a reference and after five washes. After color measurements with Mexameter MX16, photos were taken from the hair tresses for comparison.

UTILIZATION OF TARHANA HERB (ECHINOPHORA SIBTHORPIUNA) IN TARHANA PRODUCTION

AYLA SARI¹, ALI GÖNCÜ¹, ALI KEMALİ ÖZUĞUR¹

ABSTRACT

Tarhana is a nutritious food substance that is produced by mixing wheat products with yoghurt, some vegetables and spices, fermentation of both lactic acid and ethyl alcohol, and drying after fermentation to increase the storage time. Tarhanan's production pattern is similar to most countries and regions, but may vary in composition depending on tradition, custom and nutrition habits, as well as grain, legumes and vegetable varieties that vary from region to region. Tarhana herb is also used in some regions to provide flavor and aroma to tarhana. Tarhana otu (Echinophora sibthorpiuna) is a plant with yellow flowers, 20 to 45 cm in length and a perennial plant. A total of six species, three of which are endemic, are also known as tarhana otu, which is grown in Turkey, with the names "Çörtük", "Çördük" and "Turşu Otu". They are fresh or dried in the production of meat, pickles, helvardas, soups and tarhana. It is useful in the digestive system. Stomach is good for ulcers. It treats mental and psychological diseases. It gives positive results in asthma, bronchitis, hay fever, kidney stones, rheumatism and eczema treatments. In addition, they are also considered as drugs in the treatment of fungi. Due to the essential oils it contains, it has its own aromatic taste and is used as a flavor for this purpose in tarhans. They increase the amount of ash in the food that they are contributing to the nutritional value. In Tarhana, they are used between 0,5% and 1% of total tarhana dough mass.

THE ESSENTIAL OIL COMPOSITION OF HYPERICUM SCABRUM COLLECTED FROM DIFFERENT LOCALITIES

MEHMET AKDENİZ¹, FIRAT AYDIN¹, İŞİL AYDIN², MEHMET FIRAT³, İSMAİL YENER⁴, MUSTAFA ABDULLAH YILMAZ⁵, LEYLA BALUR⁶, MEHMET VEYSİ ÇAĞLAYAN⁶, ABDULSELAM ERTAŞ⁷

ABSTRACT

Hypericum (Hypericaceae) is one of the 100 largest genera that comprise an estimated 22% of angiosperm diversity) with the presence of 484 species from 36 taxonomic sections. Hypericum species are wellknown healing agents in traditional medicine due to various medicinal properties. Despite the large number of Hypericum species, only Hypericum perforatum L. has been studied in depth as pharmaceutically important medicinal crop plant which extracts widely used in Europe as a drug for the treatment of mild and moderate depression. Turkey is an important prevalence centre of Hypericum species. According to the most recent count by Güner et al. (2012), there are a total 96 Hypericum species in the flora of Turkey, 46 of which are endemic. All Hypericum species have been used in Turkish folk medicine under the names “kantaron, peygamber çiçeği, kılıçotu, kanotu, kuzukıran and binbirdelik otu” as sedatives, antiseptics and antispasmodics. Curative value of Hypericum plants have been mainly attributed to the phytochemicals, namely phloroglucinol derivatives, naphthodianthrones, different phenolic compounds and essential oils which possess a great variety of bioactivities. In this study, the essential oil contents of H. scabrum collected from different was analyzed by GC-MS/FID. The dried aerial parts of H. scabrum species were cut into small pieces and subjected to hydro- distillation with water for 4 h, using a Clevenger-type apparatus to produce essential oils which were dried over anhydrous sodium sulphate and stored at 4°C until required. The essential oils were diluted by dichloromethane (1:3, v/v) before the GC run. Identification of the compounds was based on the comparison of their retention times and mass spectra with those obtained from authentic samples and/or the NIST and Wiley spectra as well as the literature data. The samples collected from the four different localities these all shows similar varieties as essential oil content. But when we looked at α -pinen contents, the samples specially collected from Kahramanmaraş have quite higher α -pinen contents than the samples collected from Nevşehir, Van and Elazığ.

NURSING STUDENTS USAGE STATUS AND OPINIONS ABOUT MEDICINAL AND AROMATIC PLANTS

ALIYE ÇAYIR¹, HAMIDE AYGÖR¹

ABSTRACT

OBJECTIVE: Increase in diseases that are difficult to maintain and treat has been observed in parallel with the increase in human life span. The high cost of new technologies used in the treatment of these diseases, obscurity about current care and treatment methods and fears about possible side effects have significantly increased the tendency to use medical and aromatic plants. Turkey has a wide variety of medical aromatic plants and many medical and aromatic plants which have been used for the protection, maintenance of health and therapeutic purposes. Therefore this study was planned to determine the use of medicinal and aromatic plants by nursing students and their opinions on these plants. **METHOD:** This descriptive research was conducted at Necmettin Erbakan University in the spring semester of 2016-2017 academic year. The universe of the research consisted of 370 students who are in 1st, 2nd, 3rd and 4th classes of Department of Nursing in Faculty of Health Sciences of Necmettin Erbakan University in 2016-2017 academic year. Sample selection was not made in the study and it was completed with 257 students who volunteered to participate in the survey. The research data were collected by a questionnaire consisting of 21 questions prepared by the researchers as a result of literature review. The data was analyzed with the use of percentage and mean. **RESULTS:** The average age of the students was 20 ± 1.82 , 80.2% of them were female, 61.5% of them resided in student residence and 90.7% of them did not have any chronic disease. 93% of the students stated that medicinal and aromatic plants are beneficial and 72.8% of them stated that they prefer the use of medicinal and aromatic plants when they are sick, and 84% of them stated that they use medicinal and aromatic plants with the advice of their mother, father or other elders in their families. The most common medicinal and aromatic plants used by the students were determined as linden (61.1%), mint (43.6) and sage (42.8%). It was found that 78.2% of the students stated that medical and aromatic plants strengthen the immune system, 86.4% of the students stated that sufficient research was needed to use these plants, 66.9% of the students stated that these plants increase motivation while studying, 73.5% of the students stated that these plants decrease the psychological stress in the classes and exams and 81.3% of the students stated that these plants can be used as sedative. **CONCLUSION:** It has been determined that students often use medicinal and aromatic plants with the advice of their elders. It is recommended to raise awareness of the community on such issues as getting recommendations from reliable sources for access to these plants and using them on appropriate criteria.

USE OF SOLVENT-FREE MICROWAVE METHOD FOR EXTRACTION OF ESSENTIAL OILS

AYSUN YURDUNUSEVEN YILDIZ¹, HAKAN KARACA¹

ABSTRACT

Essential oils are complex mixtures of volatile compounds with strong odor that are extracted from different parts of plants, for example, leaves, peels, barks, flowers, buds, seeds, roots etc. So far, approximately 3000 essential oils have been discovered, about 300 of which are commercially important. Essential oil components are synthesized in plant by the secondary metabolisms and stored in glandular trichomes, oil cells or ducts in plant tissue. In general, essential oils are mixture of terpenes, aromatic compounds, and terpenoids. Essential oils have been widely used for bactericidal, virucidal, fungicidal, antiparasitical, insecticidal, medicinal, pharmaceutical, agricultural and food fields. The conventional methods for extraction of essential oil widely used by the industry are steam distillation, hydrodistillation and solvent extraction. These methods have various disadvantages which greatly effects the yield and quality of the essential oil. Although these methods have been used for many years for essential oils extraction, these applications have some disadvantages in the product such as losses of some volatile compounds, low extraction efficiency, possible toxic solvent residues and damage or alter the action of chemical structure of the bioactive compounds. Therefore, researchers are in search of new technologies, which use less solvent, time and energy. Recently several new techniques like supercritical fluid extraction, pressurized liquid extraction, pressurized hot water extraction, membrane-assisted solvent extraction, solid-phase microextraction, solvent-free microwave extraction, microwave-assisted, and ultrasound-assisted extraction have been developed. Green extraction methods suggest the use of non-toxic solvents for more natural products. Among them, solvent-free microwave extraction (SFME), have become a good option in research on essential oil extractions from plants. The advantages of using SFME are faster energy transfer, shorter time and more environmentally friendly compared to conventional extraction methods. SFME is a combination of microwave heating and dry distillation, performed at atmospheric pressure. In this method, plant material is placed into a microwave reactor, without addition of any solvents including water. Essential oil is evaporated by the in situ water of the plant material. A cooling system outside of the microwave oven condenses the distillate. In this review, a short theoretical background of SFME and the basic principles of the method have been presented. Finally, the potential of the SFME technique has been compared with conventional methods in terms of the extraction of essential oils from aromatic plants.

THE DPPH FREE RADICAL SCAVENGING ACTIVITY AND ABTS CATION RADICAL DECOLORISATION ACTIVITIES OF ETHANOL EXTRACTS OF AERIAL PARTS AND ROOT OF HYPERICUM PERFORATUM COLLECTED FROM DIFFERENT LOCALITIES

MEHMET AKDENİZ¹, FIRAT AYDIN¹, İŞİL AYDIN², YETER YEŞİL³, KEREM ŞENTÜRK⁴, SERKAN YİĞİTKAN⁵, ABDULSELAM ERTAŞ⁵

ABSTRACT

Synthetic and natural antioxidants are of particularly importance in maintaining the oxidative stress level under the critical point in human organism. Previous in vitro and in vivo studies reported the antioxidant capacity of several species of medicinal plants, acts at cellular level, through cell growth stimulation, membrane potential stabilizing or at molecular level, through ROS scavenging, lipid peroxidation, etc. These roles have been attributed, in part, to their biological active constituents, such as liposoluble and watersoluble vitamins (E and C, respectively) and polyphenolic substances. As plants produce a significant amount of antioxidants to prevent oxidative stress, they represent a potential source of new compounds with antioxidant activity. Some of these plants are those of the Hypericum genus, (Clusiaceae Lindley, syn. Guttiferae A.L. de Jussieu). They include a large number of species distributed worldwide. Several of the botanical species belonging to the genus are used in folk medicine and among them Hypericum perforatum L., also named St. John's Wort, is especially known as a traditional remedy for the treatment of melancholia, abdominal and urogenital pain and ulcerated bums. Over the last two decades, it has been demonstrated that H. perforatum is effective as an antidepressant, an antiviral, and an antimicrobial. The drug contains peculiar chemical constituents such as naphthodianthrones (hypericins), acylphloroglucinols (hyperforin), flavonol glycosides (quercetin derivatives) and biflavones and all the metabolites seem to contribute to its pharmacological activity. Current use of H. perforatum is mainly for the treatment of mild to moderate depression, and drug extracts for antidepressant applications have become increasingly popular. During the recent years, several phytochemical studies on other species of Hypericum have also been performed, leading to the isolation of new molecules, some having biological activity. The ethanol extracts of aerial parts and root of H. perforatum species collected from different localities (Nevşehir, Diyarbakır, Van, Kahramanmaraş and Siirt) were tested for antioxidant (DPPH free radical scavenging activity and ABTS cation radical decolorisation) activities in this study. Studied ten extracts were found quite on

GUNDELIA (KENGER) SPECIES NATURALLY GROWN IN TURKEY AND USED FOR MEDICAL PURPOSES

EBRU YÜCE-BABACAN¹, RIDVAN POLAT², UĞUR ÇAKILCIOĞLU¹

ABSTRACT

In Turkey, the naturally spreading Gundelia genus is represented by 3 varieties (Gundelia tournefortii L. var. tournefortii L. var. Freyn et Sint, var. tenuisecta Boiss.). With the studies made in recent years, 9 species belonging to this genus have been identified in Türkiye. Of these species, 7 are endemic (G. munzuriensis Vitek, Yüce & Ergin, G. dersim Vitek, Yüce & Ergin, G. vitekii Armagan, G. komagenensis Fırat, colemerikensis Fırat, G. cilicica Fırat ve G. anatolica Fırat) and 2 are new record (G. glabra Mill. ve G. rosea M.Hossain & Al-Taey) for Turkey. In this review, information is given about 9 Gundelia species which are naturally distributed in Turkey.

USE OF THYME, BAY, PEPPERMINT AND ROSEMARY ESSENTIAL OILS AS NATURAL ANTIMICROBIAL AGENTS FOR FOOD PACKAGING

AYSUN YURDUNUSEVEN YILDIZ¹, HAKAN KARACA¹

ABSTRACT

Aromatic plants are used since ancient times due to their flavor, preservative, and medicinal properties. Aromatic plants synthesize many compounds with complex molecular structures by their secondary metabolisms. These secondary metabolites are alkaloids, flavonoids, isoflavonoids, tanins, cumarins, glycosides, terpenes and phenolic compounds. Essential oils are obtained from aromatic plants such as oregano, rosemary, thyme, lavender, or peppermint. Essential oils are natural, volatile and complex compounds characterized by a strong odor soluble in lipid and organic solvents. Essential oils have various bioactivities including antibacterial, antiviral, antiinflammatory, antifungal, antimutagenic, anticarcinogenic, and antioxidant activities depending on the quality and quantity of their components. In general, essential oils have two or three major components in high concentrations and other components present in trace amounts. These major components of essential oils provide their biological activities. For instance, usually the main components in essential oils are carvacrol and thymol in thyme oil, 1,8-cineole in bay oil, menthol, menthone and menthofuran in peppermint oil and 1,8-cineole and α -pinene in rosemary oil. Thyme (*Thymus vulgaris* L.), bay (*Laurus nobilis* L.), peppermint, (*Mentha piperita* L.) and rosemary (*Rosmarinus officinalis* L.) are generally used in dishes for their flavors. They are also among the most commonly investigated plants for their preventive properties against microbial and chemical deterioration. The number of studies showing the possibility of using essential oils in food systems to prevent the growth of foodborne bacteria and to extend the shelf life of the food. The antimicrobial activity of essential oils is mostly due to the presence of phenols, aldehydes, and alcohols. Essential oils affect the cell membrane of the pathogenic microorganism. The plants themselves or their extracts can be included into the formulation of food products. One of the main problems about using essential oils of the plants are their negative effects on the sensory properties of the product. In many cases, they make the food undesirable due to their dominant aroma. This problem can be overcome by using the essential oils in the food packaging material rather than including them directly to the formulation of the food. By this way, the release of the bioactive compounds in the essential oils can be controlled and products with acceptable sensory properties and extended shelf life can be obtained. The aim of this study is to provide an overview of the studies concerning the food packaging applications including essential oils of aromatic plants.

ANTIMICROBIAL ACTIVITY AND BIOCHEMICAL ANALYSIS OF IBERIS HALOPHILA

ÖZCAN ŞİMŞEK¹, ALI YETGİN², KEREM CANLI³, ERGİN MURAT ALTUNER⁴

ABSTRACT

Iberis halophila is rare endemic species in Central Turkey, so related research doesn't exist. Antimicrobial activity was investigated against 17 bacteria and 1 fungi by using disk diffusion method. These microbial strains include *Bacillus*, *Enterobacter*, *Enterococcus*, *Escherichia*, *Klebsiella*, *Listeria*, *Pseudomonas*, *Salmonella*, *Staphylococcus* and *Candida* genuses. Twelve of them are standard species and they are important for exact determination of antimicrobial activity. 4.94, 9.87 and 19.74 mg samples were prepared by using ethanol extraction method. Also, bioactive composition of this sample was determined by Gas Chromatography-Mass Spectroscopy and National Institute of Standards and Technology (NIST) library was used for mass spectra analysis. The results were presented that *I. halophila* has antibacterial activity against eight of the tested strain. Several active metabolites were identified, but some composition of this sample is not match with library. Unknown molecule should be analyzed by NMR spectra for 3d structure determination and identification. These results are the first report for the antimicrobial potential and chemical composition of *I. halophila*.

**MUNZUR GARLIC (ALLIUM TUNCELIANUM (KOLLMANN)
ÖZHATAY, B.MATHEW & SIRANECI) AND TRADITIONAL USE**

EBRU YÜCE-BABACAN¹, RIDVAN POLAT², UĞUR ÇAKILCIOĞLU¹

ABSTRACT

The most important feature of Munzur Garlic is that it is single-threaded or rarely two-threaded. It blooms in June and July. The garlic is collected by local people for use in their homes and marketing in August and September. It is traditionally used for food, medical and insect repellent. Munzur Garlic grows naturally on the slopes of Munzur Mountain, Tunceli /Pülümür, Erzincan and Sivas. The plant is under protection because of unconscious and excessive use. It is a kind of economic support to the people of the region when cultural studies are increased. In this review, we will be given information about the medical and economic value of Munzur garlic.

ANTIMICROBIAL ACTIVITY AND BIOCHEMICAL ANALYSIS OF FRANKENIA HIRSUTA

ÖZCAN ŞİMŞEK¹, ALI YETGİN², KEREM CANLI³, ERGİN MURAT ALTUNER⁴

ABSTRACT

Frankenia hirsuta is widely located in Turkey, but antimicrobial potential of it wasn't determined. Broad range of microorganisms was used for this determination. By using disk diffusion method, 17 bacteria and 1 fungi susceptibility was analyzed and these microbial species are *Bacillus subtilis* ATCC 6633, *Candida albicans* ATCC 10231, *Enterobacter aerogenes* ATCC13048, *Enterococcus durans*, *Enterococcus faecalis* ATCC 29212, *Enterococcus faecium*, *Escherichia coli* ATCC 25922, *Escherichia coli* CFAI, *Klebsiella pneumoniae*, *Listeria monocytogenes* ATCC 7644, *Salmonella enteritidis* ATCC 13075, *Salmonella infantis*, *Salmonella kentucky*, *Salmonella typhimurium* SL 1344, *Staphylococcus aureus* ATCC 25923, *Staphylococcus carnosus* MC1.B, *Staphylococcus epidermidis* DSMZ 20044 and *Streptococcus agalactiae* DSMZ 6784. 0.77, 1.54 and 3.08 mg samples were prepared by using ethanol extraction method. Also, bioactive composition of this sample was determined by Gas Chromatography-Mass Spectroscopy and National Institute of Standards and Technology (NIST) library was used for mass spectra analysis. The results were presented that *F. hirsuta* has antimicrobial activity against all of the studied study except *E. aerogenes*, *E. coli*. Two of them have high susceptible (higher than 15 mm); eleven of them have moderate susceptible (14-10 mm) and only three of them have low susceptible (9-7 mm). Several active metabolites were identified, but some composition of this sample is not match with library. Unknown molecule should be analysed by NMR spectra for 3d structure determination and identification. These results are the first report for the antimicrobial potential and chemical composition of *F. hirsuta*.

QUINOA (CHENOPODIUM QUINOA WILLD.) AS FUNCTIONAL FOODS

BELKIS TEKGÜLER¹, İLKAY KOCA¹, SEBIHA KİTAN¹

ABSTRACT

Quinoa is a plant crop in the Andean mountains in South America. Recently, there has been increased interest for the product in the United States, Europe, and Asia. Quinoa, which is called as *Chenopodium quinoa* Willd. in Amaranthaceae, is commonly mentioned as a pseudo-cereal. Both leaves and seeds of quinoa are used in human nutrition. Its leaves are consumed as a vegetable. Its seed is used like cereal crops, and can be milled into flour. Quinoa is an excellent example for functional food. The functional properties are originated from its proteins, antioxidants, fatty acids, minerals and vitamins. Quinoa has a high quality protein content and well-balanced amino acid composition. It is rich in lysine and methionine. Quinoa has not gluten. It is recommended for celiac patients because of its gluten-free nature. It is rich in saponins and antioxidants such as phenolics. Its composition particularly gives a strong contribution to human nutrition. It reduces the risk of various diseases. In this review, the functional potential and nutrient components of quinoa are discussed.

DETERMINATION OF BIOACTIVE COMPOSITION AND ANTIMICROBIAL ACTIVITY OF RANUNCULUS FICARIA

KEREM CANLI¹, ALI YETGİN², ILGAZ AKATA³, ÖZCAN ŞİMŞEK³, ERGİN MURAT ALTUNER⁴

ABSTRACT

Medical herbs have many bioactive component and they are used in microbial treatment since ancient time. *Ranunculus ficaria* one of them and it is important for folkloric medicine in Turkey. It is also called lesser celandine and it is native species of west Asia and Europe. *Ranunculus ficaria* investigation were applied against 17 bacteria and 1 fungi by using disk diffusion method. These microbial strains include *Bacillus*, *Enterobacter*, *Enterococcus*, *Escherichia*, *Klebsiella*, *Listeria*, *Pseudomonas*, *Salmonella*, *Staphylococcus* and *Candida* geniuses. Twelve of them are standard species and they are important for exact determination of antimicrobial potential. Bioactive composition of this sample was also determined by Gas Chromatography-Mass Spectroscopy and National Institute of Standards and Technology (NIST) library was used for mass spectra analysis. 5.2, 10.4 and 13 mg samples were prepared by using ethanol extraction method. The results were presented *R. ficaria* has antimicrobial activity against nine tested species. Three of them have high susceptible (more than 15); three of them have moderate susceptible (14-10 mm) and three of them have low susceptible (9-7 mm). Several active metabolites were identified, but some composition of this sample is not match with library. Unknown molecule should be analyzed by NMR spectra for 3d structure determination and identification.

ANTIMICROBIAL ACTIVITY SCREENING OF PLAGIOMNIUM ELATUM

KEREM CANLI¹, ALI YETGİN², ILGAZ AKATA³, ERGİN MURAT ALTUNER⁴

ABSTRACT

In the East Asia, bryophytes are mostly used as economical purpose and their cultivation is applied in moss gardening. Although bryophytes antimicrobial potential is known, most of them are not determined. Bryophyte contain active substances which are significant for healing of pathogen infection. The antimicrobial activity of *Plagiomnium elatum* was investigated against 17 bacterial and 1 fungal species with disk diffusion method. These microbial strains include *Bacillus*, *Enterobacter*, *Enterococcus*, *Escherichia*, *Klebsiella*, *Listeria*, *Pseudomonas*, *Salmonella*, *Staphylococcus* and *Candida* species. Standard species is crucial for antimicrobial screening, therefore twelve of the tested microorganisms are selected from standard species. 0.34, 0.68 and 1.13 mg samples were acquired with ethanol extraction method. Our present study has shown that the ethanol extract of *P. elatum* has antimicrobial activity against nine of the studied strains. This analysis is the first report for the antimicrobial potential of *P. elatum*.

SOME NATURAL PLANTS USED MEDICINALLY BY THE PUBLIC IN BOLVADIN, ÇAY AND SULTANDAĞI (AFYONKARAHISAR)

MUSTAFA KARGIOĞLU¹, NURGÜL GÜRBÜZ¹

ABSTRACT

This oral presentation is on medicinal uses of natural plants spreading on districts of Afyonkarahisar: Bolvadin, Çay and Sultandağı, which are located in Inner-Western Aegean region of Turkey. The subject of this presentation is a part of our ongoing master's thesis in which we investigate traditional uses of natural plants in Afyonkarahisar. In our study we identified 50 plant species belonging to 20 plant families as medicinal and here we included some of them. For the study we interviewed with 57 people from 10 villages, 8 towns and 3 district centers. From these people, information on the uses of plants was obtained.

ANTIOXIDANT PROPERTIES OF FLAVOURED BAGGED TEA AND FLAVOURED ICE TEA

BELKIS TEKGÜLER¹, İLKAY KOCA¹

ABSTRACT

Black and green tea are produced with aromatized or without aromatized. In our country, for flavoured tea production process, some aroma compounds like mint, bergamot, jasmine and lemon are used. In this study, the total phenolic contents and antioxidant activities of flavoured bagged tea and flavoured ice tea samples were analyzed. For this purpose, bagged tea samples, including 9 flavoured green and 5 flavoured black tea samples, and 15 flavoured ice tea which are ready to drink were evaluated. Total phenolics were determined by Folin-Ciocalteu method. Ferric reducing/antioxidant power (FRAP) and 1,1-diphenyl-2-picrylhydrazyl free radical scavenging activity (as EC₅₀) methods were used to analyze the antioxidant activity. In the bagged tea samples, the total phenolic contents were between 36.89 mg GAE/g (green tea with jasmine) and 88.29 mg GAE/g (green tea with bergamot), FRAP values were between 60.44 $\mu\text{mol Fe}^{2+}/\text{g}$ (black tea with bergamot) and 557.18 $\mu\text{mol Fe}^{2+}/\text{g}$ (green tea with jasmine). The lowest EC₅₀ values were determined as 1.69 $\mu\text{g}/\mu\text{L}$ for green tea with lemon, while the highest EC₅₀ values were 104.25 $\mu\text{g}/\mu\text{L}$ in black tea with bergamot. In the flavoured ice tea samples, the lowest total phenolic, FRAP and EC₅₀ values were 170.81 mg GAE/L (ice tea with lemon-ginger), 279.43 $\mu\text{mol Fe}^{2+}/\text{L}$ (ice tea with lemon-ginger) and 5.45 $\mu\text{g}/\text{mL}$ (ice tea with lemon), respectively. The highest total phenolic, FRAP and EC₅₀ values were 872.06 mg GAE/L (lemon ice tea), 8445.08 $\mu\text{mol Fe}^{2+}/\text{L}$ (ice tea with lemon) and 86.85 $\mu\text{L}/\text{mL}$ (ice tea with lemon-ginger), respectively. According to the results of the analysis, the consumption of flavoured bagged tea and flavoured ice tea contribute to the daily intake of antioxidants.

DETERMINATION SOME ORGANOLEPTIC PROPERTIES OF BISCUITS SUPPLEMENTED WITH FREEZE-DRIED STRAWBERRY POWDER

CANSU TOPKAYA¹, FATMA IŞIK¹, FATMANUR BÜYÜKSARACI¹

ABSTRACT

Strawberry fruits, namely *Fragaria*, is a member of the Rosaceae family. The garden strawberry or modern commercial strawberry is also known as *Fragaria×ananassa*. Strawberries are popularly consumed not only in fresh and frozen forms but also as processed and derived products, including yogurts, beverages, jams, and jellies. Regarding their nutritional and phytochemical composition, strawberries are extremely rich fruit in bioactive compounds such as vitamins A, E, and C and dietary sources of phytochemicals, mainly represented by phenolic compounds. Strawberries have immune regulator, blood-sugar regulator, anti-inflammatory and anticarcinogenic effects thanks to their phenolic content. Fresh consumption of these fruits provides a significant benefit to health. Different drying methods can be used in order to provide longer shelf life for fresh fruits and vegetables. Freeze-drying is one of the best methods to dry fresh vulnerable fruits by protecting their nutrient value. Demand of processed foods, having functional property at least one, is increasing with urbanization. Bakery products have longer shelf life than other fresh foods, easy available and have many different sorts like cakes, breads, biscuits, crackers etc., including other basics protein such as milk, eggs, flour, for human body. Besides these products are so improvable with some other foods or compounds to obtain functional food. Since ancient times biscuit is one of the basic bakery products that is widely-consumed by many people, among all ages, all over the world because wheat flour is one of the easy reachable materials to cook or to consume. Furthermore, biscuits have low humidity that is reason why has long shelf-life so it has a special place in human diet as snack food. Basic ingredients of biscuits are wheat flour, sugar, margarine, water or milk. It may contain trace amount salt, baking powder or any other ingredients depending on recipe or according to taste. The objective of this study to determine some organoleptic properties of biscuits which were fortified with freeze-dried strawberry. Biscuits were produced by replacing freeze-dried strawberry powder with wheat flour. Substitution rates of freeze-dried strawberry 4%, 8% and 12%. Color of biscuits were determined via HunterlabMiniScan XE. L (lightness) and b (yellowness) value were decreased by increasing ratio of freeze-dried strawberry powder. However, a (redness) value increased with ratio of freeze-dried strawberry powder. Color, smell, flavor, crunchiness and overall acceptance were evaluated by sensory panels. Sensory panel was done with participation of 32 people. The biscuits having 4% strawberry was more liked in terms of color and crispiness while control samples were more liked in terms of smell, taste and overall acceptance. The biscuits having 4% strawberry powder in the formulation were more liked than other added-biscuits when only added-biscuits were evaluated among themselves, in all criteria.

DETERMINATION OF LAURUS NOBILIS L. FROM HATAY REGION BY TRIPLE QUAD GC/MS

MUSTAFA KEMAL SANGÜN¹, SEVGİN ÖZDERİN², GÜRAY KILINÇEKER³

ABSTRACT

Laurus nobilis L. is from the family of Lauraceae, which comprises numerous aromatic and medicinal plants (Hogg et al., 1974). *Laurus nobilis* L. is also known as sweet bay, bay laurel, Grecian laurel, true bay, and bay. The dried leaves are generally used in cooking, and the essential oil is used in the flavourings industry (Bauer and Garbe, 1985). Laurel essential oil, also called laurel leaf oil or sweet bay essential oil, is also used for the preparation of hair lotion due to its antidandruff activity and for the external treatment of psoriasis. *Laurus nobilis* L. fruits are generally utilized for the production of perfumed soaps and candle manufacture because of their fatty acid content (Hafizoglu and Reunanen, 1993). The essential oil of leaves has antibacterial, antimicrobial properties and a potential natural agent for breast cancer therapy. (Ozcan and Erkmen, 2001,). Different studies made on the essential oil show influence of the area of culture, of variety and harvest season on the chemical composition (Flamini et al., 2007). 1.8-Cineole has been identified as the major component of many plant essential oil as well as *Laurus nobilis* L. (Sangun et al., 2007). *Laurus nobilis* L. leaves were harvested in October 2015 respectively from Antakya, Hatay region. Air-dried leaves were related to water distillation for 4 hr using a Clevenger-type apparatus to produce the essential oils. The oils were dried over anhydrous CaCl₂ and stored in sealed vials at low temperature in refrigerator before analysis. The essential oils were analysed by triple quad GC-MS using Agilent (7000 series) and compared with GC-MS Hewlett Packard GCD (model 6890) and (model 5972) equipped with a mass selective detector (MSD). In this study, the composition of the essential oil from the leaves has high content of 1.8-Cineole, Sabinene and α -Terpinyl acetate, but a low content of α -Pinene, α -Phellandrene and trans- β -osimen. 1.8-Cineole was found major component of the leaves essential oil obtained from *Laurus nobilis* L.

PLACE OF MEDICAL AND AROMATIC PLANTS ORGANIC AGRICULTURE

HÜLYA SAYĞI¹, NURGÜL TÜREMİŞ², MEHTAP BAYKAL¹, AYHAN SAYĞI¹, CELAL ERBAŞ¹

ABSTRACT

Production is the process of shaping nature in order to meet people's needs. Natural resources used unconsciously in eliminating the needs in this process caused irreparable devastation in the balance of nature. As in all areas, the agricultural production process, in which all of its activities are carried out in accordance with the nature, has suffered great damage to nature. In this process, negative impacts on human and environmental health of chemical plant protection inputs used unconsciously in agriculture to increase production led to the search for new plant protection products alternative to these inputs. Medicinal and aromatic plants, which find use in the food and cosmetic industry in a multifaceted way in coordination with the medical and pharmaceutical industries, also have an important potential in combating diseases and pests. Pyrethrum, Artemisia, Mentha, Thymus, Salvia, Origanum, Ocimum, Urtica, Melissa essential oils and extracts are harmful to organic farming with herbal medicines such as azadirachtin, nicotine, pyrethrum, rotenone, allethrin, sabadilla and ryania and some medicinal and aromatic plant species. Can be used against the fight against. Allelopathic effects of secondary metabolites produced by medicinal and aromatic plants in weed control can also be utilized. However, repellent, deterrent and antifeedant properties of these secondary compounds are now seen as an advantage for organic farming. It is stated that plants belonging to the family Lamiaceae, which contain plants with economical prescriptions such as lavender, mint, sage, thyme, reyhan, are the plants most commonly used for plant disease pest and weed control. The major producers of lavender in the world are England and France. France's Provençal region accounts for 60% of its production. A few years ago, the disease that took place in lavender fields reduced production to half. Bulgarian producers have increased their production at this point, and Bulgaria is known as the 'new lavender sovereignty'. In recent years, the effects of synthetic pesticides used in our country and in the world have come to the fore to negative effects on human beings, people and animals, and alternative methods for combating agricultural pests have begun to be preferred. Considering the developments in organic farming in particular, chemical products based on vegetable origin which are friendly to the environment have been preferred instead of chemical products. These can be in various forms, such as unprocessed plant materials, plant extracts, and pure compounds isolated from plants. Lavender plantation is being done intensely in and around Isparta province in Turkey, but it can not meet the needs of the country. It has been observed that root leaves, hulls and extracts of lavender are preventing germination and seedling formation of some weeds. In addition, medicinal and aromatic plants are potential plants that can be taken into alternative sowing seasons, and the extracts and essential oils obtained from these plants can be used to fight against some insects. In the long run, this great mistake was made when most of the people began to suffer from the consequences of this destruction. Now a new and vital constraint has emerged. This is the natural

THE IMPORTANT MEDICAL PLANTS CONSUMED AS FOOD IN THE CENTRAL ANATOLIAN REGION

ASUMAN KAN¹

ABSTRACT

Human being have been using the medicinal plants grown in the environment in food, medicine, feed, fuel and handicrafts since they exist. The most important place among these plants is the medicinal plants. Information on the use of medicinal plants for food and medicine is transmitted from generations to generations. Our country is one of the richest countries in the world in terms of its diversity of medicinal plants due to its geographical position and climate conditions. It is known that the Central Anatolia region in Turkey is the region with the most endemic plant species with about 50%. The collected of various edible medicinal plants from Anatolia and their consumption as food plays an important role in the healthy life cycle of rural areas. Edible plants also have endemic medical plants. The medicinal plants consumed by the people of Central Anatolia as food within the nutritional system based on carbohydrates such as oat, wheat, and tarhana which are mainly cereals constitute an important place. Important medicinal plants that can be cooked and renewed in the Central Anatolian Region are *Malva sylvestris*, *Rumex patientia*, *Urtica dioica*, *Polygonum cognatum*, *Ferula elaeochytris* and *Asparagus acutifolius*. The phenolic compounds contained in these plants are rich in protein, A, C and E vitamins, nutritional fibers, mineral substances and essential fatty acids, thus increasing their potential for use as vegetables in our daily diet. In the face of the nutritional problems that arise in our country, it is necessary to transfer the generations of the medicinal plants, which are extremely important in terms of healthy and balanced nutrition consumed for food, and to protect them as cultural identity.

FUNCTIONAL PROPERTIES OF RICE BRAN

RACIYE MERAL¹, BURCU ERTÜRK¹

ABSTRACT

Rice (*Oryza sativa*) is one of the most important cereal product in the developing world especially Asian countries and it is the staple food of over half the world's population. It is grown in more than 100 countries and there are around 18,000 varieties accounting for about 25% of the world's food grain production. About 610 million metric tons of rice are produced annually in recent years. More than half of the production belongs to Asian countries such as China, India, Indonesia, Bangladesh, Vietnam, and Thailand. One of the major by-products is rice bran which is accounted for 8% of milled rice. Rice bran is a waste product in the milling process and obtained when it is removed from the starchy endosperm in the rice milling process. Rice bran is a source of proteins, oil, nutrients, and calories. It is high in oil content (15–25%), has a low moisture content (6–7%) and possesses a powdery consistency. It has been used as a feedstock and has the potential to be used as a food ingredient and oil source. Rice bran, which was earlier used primarily as animal feed, is now finding major application in the form of rice bran oil. India and Thailand have been the most successful countries in rice bran oil production. Rice bran has several unique properties. One such feature is the presence of significant levels of minor-elements such as oryzanol, tocotrienol and phytosterols that have a large nutraceutical application. It is a rich natural source of vitamin E, containing up to 300 mg/kg. The major components of vitamin E in rice bran are, γ -tocopherol, and γ -tocotrienol. Rice bran also contains about 3000 mg/kg γ -oryzanol. The studies confirm that rice bran has more than 20% dietary fibre and it is also an excellent source of protein, minerals, unsaturated fat and vitamins. Rice bran protein is higher in lysine content than rice endosperm protein and other cereal bran proteins. Rice bran has great potential in food applications, especially in development of functional foods. They are used in the production of healthy products. Several studies reported the minor components of the rice bran such as gamma oryzanol, phytosterols and other phytosterol conjugates have antioxidant property against the free radicals. Rice bran contains large concentrations of several compounds and has the potential to prevent a range of chronic diseases. It is believed that rice bran serves as an important functional food that has cholesterol lowering properties, cardiovascular health benefits and anti-tumor activity. The gamma oryzanol of rice bran reduced a prominent amount of elevated serum levels in hypothyroid patients. Rice bran fractions prevent high blood pressure, hyperlipidemia, and hyperglycemia.

ANTIOXIDANT ACTIVITY AND PHENOLIC PROFILES OF GRAPE SEED

RACIYE MERAL¹, BURCU ERTÜRK¹

ABSTRACT

Grape (*Vitis vinifera*) is one of the world's largest fruit crops, which approximates an annual production of 58 million metric tons. Grapes (*Vitis vinifera*) have been used for their medicinal and nutritional value for thousands of years. Grape seed extract has an incredible antioxidant potential with its flavonoid phytonutrients. These polyphenols include resveratrol and unique oligomeric proanthocyanidin complexes. Grape seeds are a rich source of (+)-catechins, (-)-epicatechin and (-)-epicatechin-3-O-gallate, and dimeric, trimeric and tetrameric procyanidin. There are antimutagenic and antiviral agents of these compounds and these compounds prevent cardiovascular diseases. Today, standardized extracts of grape seed may be used to treat a range of health problems related to free radical damage, including heart disease, diabetes, and cancer. Recognition of such health benefits of catechins and procyanidins has led to the use of grape seed extract as a dietary supplement. Studies have been reported of the procyanidin composition of grape seeds. Grape seed extract may help with a type of poor circulation and high cholesterol. Grape seed extract also reduces swelling caused by injury and helps with eye disease related to diabetes. Many people are interested in grape seed extract because it contains antioxidants. There are several studies reported grape seed may be alternative to synthetic antioxidants. It was determined grape seed promote oxidative stability of cooked meats and fish filets. According to another study the addition of grape seed improved the rheological properties by increasing dough development time and stability of the dough. The results obtained from this study indicate that grape seed can be successfully used in the bread formulae both to improve rheological properties of the dough and to increase antioxidant activity of the bread. In this study, antioxidant activity, total phenolic content (TPC) and phenolic composition of grape seed were determined. Antioxidant activity was determined by DPPH free radical-scavenging assay and TEAC assay. Vitamin C and BHT were used as positive control. DPPH scavenging activity of grape seed was 93 % at a concentration of 50 mg/mL. This value is comparable with vitamin C and higher than BHT. TEAC was calculated as 490 $\mu\text{mol Trolox}$. TPC was determined using the Folin-Ciocalteu method and results were expressed as gallic acid equivalent (GAE) in mg/100 g material. The result of the analysis showed that grape seed has phenolic content of 87 mg/100 GAE. HPLC analysis demonstrated grape seed included 9.4 mg/100g gallic acid, 160 mg/100g catechin, 2.20 mg/100g ferulic acid, 4.60 mg/ 100g rutin, 2.30 mg/100g o-coumaric acid, 1.20 mg/100g p-coumaric acid, 0.80 mg/ 100 g quercetin.

EFFECT OF SINAPIC ACID ON SOME METASTASIS GENES IN LNCAP HUMAN PROSTATE CANCER CELL LINE

CANAN EROĐLU¹, ERCAN KURAR¹, EBRU AVCI¹, HASIBE VURAL¹

ABSTRACT

Prostate cancer is also an important disease in terms of chemopreventive strategies due to late age of onset, slow progression, high incidence, identified preneoplastic lesions, and risk groups. A result of the studies demonstrating that synthetic antioxidants can be toxic and carcinogenic, public interest in fruits, vegetables, spices and herbal drugs that are sources of natural antioxidants has increased. Phenolic compounds found in foods are usually identified as inhibitors and potential antioxidants of harmful oxidative processes related to cancer and anti-inflammatory diseases. Sinapic acid (3,5-dimethoxy-4-hydroxycinnamic acid), is a phenolic compound and found in various vegetables (potato and artichoke etc.) and fruit (apples, cherries, strawberries and plums etc.) species, is a derivative of hydroxycinnamic acid. The aim of the study was to investigate the anti-metastatic effect of sinapic acid, in the LNCaP human prostate cancer cells. Cytotoxic effect of sinapic acid was determined by using XTT assay. Total RNA isolation of control and dose groups (IC₅₀ dose of sinapic acid) was conducted using TRIzol Reagent. Expressions of important genes in metastasis including MMP2, MMP9, TIMP1, TIMP2, CDH1 and CDH2 were investigated in the control and the dose groups by qPCR. IC₅₀ dose of sinapic acid was detected as 1 mM for 72h in LNCaP cells. According to qPCR results, significant decreases in the expressions of CDH2, MMP2 and MMP9 genes were determined as 3.23, 3.25 and 2.92 folds, respectively, compared with the control group cells. It is thought that sinapic acid demonstrates antimetastatic activity by regulating expression of important genes in metastasis on LNCaP cells. Furthermore, more detailed studies should be conduct to illuminate molecular mechanism of antimetastatic activity of sinapic acid on prostate cancer. Financially supported by N.E.U. Scientific Research Projects (BAP #151218023).

COMPOSITIONS AND HEALTH BENEFITS OF POMEGRANATE PRODUCTS

EMİNE ERDAĐ¹, VILDAN UYLAŞER²

ABSTRACT

Pomegranate is a fruit that use for traditional treatment methods among society where is homeland Asia minor. It is also known since ancient times and including in many sacred book. As it consumed fresh, also used anyway like pomegranate juice, pomegranate juice concentrate, as color an flavoring agent in various nutrient; by processing the wine, liquer and vinegar; as dehydrated , which fruit is produced widely in Turkey. Some studies are reported that pomegranate prducts change in some blood value (like HDL, LDL and cholestrol), prevent the prostate cancer, be effective with Alzheimer and increase sperm quality in male patients. Especially phenolic component content of pomegranate products are very effective in preventing the occurrence some disease, causing premature deaths, like cancer, vein and hearth disorders. This article provided information on the content of pomegranate and pomegranates products and it's utility to human health.

NIGELLA SATIVA AND ITS EFFECT ON THE HEALTH

MEKIYE ÖNCÜ¹, BÜŞRA BEKAR¹, EZGI TOPTAŞ BIYIKLI¹, ALI EMRAH BIYIKLI¹

ABSTRACT

Nigella Sativa, known one of three species of the genus Nigella from the plant family Ranuncula, is one of frequently consumed plants and has a rich historical past. It generally grows in West Asia, Middle East and Europe in the world and around Konya in Turkey. It has been used as protective and flavoring for long years. The active components of the plant take place in the seeds of Nigella sativa. In the recent years, in both our country and Middle East, it has become one of the popular spices of alternative medicine. Since it is believed that it showed positive effects on health in Middle East countries, it is also known as blessed seed. Thymoquinone, among active components of Nigella sativa, is important in terms of its effects on health.. AIM:. With this study, it was aimed to compile the studies examining the effects of Nigella sativa on health RESULTS: Some in vivo and in vitro studies carried out suggest that the active components in the seed of Nigella sativa showed effectivity inhibiting tumor formation. In the studies examining the effect of Thymoquinone, one of the active components of Nigella sativa on cancer cultures, in similar way, was showed that the growth of cancerous cell was reduced. But, there are also some studies showing that a significant effect was not provided. In a number studies carried out, it was seen that the seed of Nigella sativa provided positive effect on immune system and it was met its inhibitor effect on allergy formation and inflammation process. In a number of similar studies, it was claimed that the use of fat of Nigella sativa on allergic diseases such as allergic rhinitis, bronchial asthma, and atopic asthma may have positive effects. In addition, it was reported that it may make contribution to controlling hypertension, providing diuretic effect. In the studies examining its antibacterial effect, it was revealed that it frequently showed protective effect against many species of bacteria such as .coli, Bacillus subtilis, Streptococcus faecalis, Staphylococcus. In a number of studies carried out on the individuals with Type 2 diabetics, it was identified that Thymoquinone among the components of Nigella sativa significantly reduced HbA1C and also with antioxidative effect, its protective effect against neuronal damage was met. But there are some studies suggesting that it did not show positive effects on diabetics. Although Anticonvulsant effects of use of Epilepside Thymoquinone are met, there are no numerous supportive studies. CONCLUSION: Current literature data related to the Nigella sativa concentrated on antioxidative, antibacterial, anti-inflammatory, anticonvulsant, immune system supportive, and hyper glycaemia reductive effects and its positive effects were frequently met. But the studies carried out are frequently based on the administration of Nigella sativa as supplement, the amount of daily consumption is not clear. Any adverse effect regarding its use in high doses were not reported. But since its long term effects are not completely known, consumption in high quantity should be avoided and comprehensive studies on the subject should be carried out. Keywords: Nigella sativa, health, thymoquinone

ELLAGIC ACID

FATMA GÖNÜL SOLMAZ¹, ERKAN YALÇIN¹

ABSTRACT

ELLAGIC ACID Fatma Gönül SOLMAZ, Erkan YALÇIN Ondokuz Mayıs University, Faculty of Arts and Sciences, Department of Biology, 55139 Samsun, Turkey E-mail: gonul.solmaz@omu.edu.tr ABSTRACT Ellagic Acid (EA, 2,3,7,8-tetrahydroksi-chromeno; C₁₄H₆O₈) has been characterized as a natural dimeric derivative of gallic acid. It is found in various fruit and vegetables including strawberry, mulberry, pomegranate and walnut. Ellagic Acid, which is a phenological plant compound, has been studied extensively in various experimental cancer models. Besides a decrease in the incidence of chemically induced lung, small intestine, breast and esophagus tumors, decreases have been observed in rat esophagus tumors, chemically induced mutagenesis and tumor diversity. Ellagic Acid can be observed in different tissue and cells of mammals, such as liver, endothelial cells, immune cells, kidney and lung and it is also an anti-inflammatory agent and antioxidant. As a result of the assessment of the effects of ellagic acid on rat C6 glioma cell cultures when two dimensional culture models are used, it was found that ellagic acid decreased tumor cell viability, caused impairment in cell structure and inhibited cell proliferation. Ellagic Acid also heals oxidative damage following renal ischemia/reperfusion damage and histopathological changes that occur. In another study conducted in 2006, it was found that in patients who drank a glass of (200-250 ml) pomegranate a day following radiotherapy or surgery, the doubling period of PSA increased to 54 weeks from 15 weeks. Pomegranate juice contains polyphenols, gallotannins and anthocyanin and it has been reported to prevent prostate cancer in vitro. In our country, compounds, which are obtained from flowers, leaves, shells or other parts of various plants through different methods, are used in the treatment of almost all kinds of diseases from cancer to diabetes. For a molecule to be a drug, first of all there should be a hypothesis which predicts it can be useful in a specific disease or a symptom. According to the results of all these studies, ellagic acid is a healing compound with antioxidant effects and it prevents cell proliferation. With these properties, it is in line to become a drug. Aspirin, which is well known today (active ingredient, acetylsalicylic acid) was discovered with the observation that shells of willow tree reduced fever. Accordingly, fruit such as pomegranate, mulberry, raspberry and strawberry, which are distributed in our country with a rich flora, should be assessed effectively in terms of ellagic acid active ingredient. Ethnobotany studies should be stepped up in our country. Biologists, pharmacologists and pharmacists should assess the results obtained and their contributions to both the field of health and to the economy of the county should be increased by making the necessary attempts about the subject.

MERSİN (MYRTUS COMMUNIS L.) HERBS

FÜSUN TEMAMOĞULLARI¹

ABSTRACT

Myrtle (*Myrtus communis* L) is a medicinal and aromatic plant from the Myrtaceae family. It is found in coastal regions of our country whereas it is often grown in Mediterranean countries, Asia, America and in other countries such as Southern Russia, Iran, Tunisia and New Zealand in the world. The plant, which has got evergreen leaves, is a chick pea-sized, blackish bush with purple seeds. Myrtle is consisted of rich volatile oils, phenolic compounds, flavonoids, tannins, anthocyanin pigments and fatty acids. The plant has antiseptic, deodorant, constipating, appetising, sedative, antihemorrhagic, antioxidant, antimicrobial, antifungal, antiinflammatory, antimutagenic, insecticidal, antinociceptive, antiviral, analgesic, molluscicidal and antigenotoxic effects as well as antiprotozoal properties against *Trichomonas vaginalis* and antiparasitic properties against *Leishmania* and *Plasmodium*. *M. communis* fruit was used in Traditional Medicine in the treatment of many different infectious diseases such as diarrhea and dysentery, and its leaves were benefited as an antiseptic and antiinflammatory agent in the treatments of urinary infections, wound healing and antifungal diseases (Candidiasis) as well as an antidiabetic or an antitussive agent and were used in the management of stomachache. Although its rare incidence, toxicity of myrtles might lead nausea, vomiting and diarrhea; besides respiratory distress and asthma attacks in infants and children. In this review the traditional use of myrtle plant will be informed along the pharmacolog

USAGE OF LINSEED FOR FUNCTIONAL MILK PRODUCTION

SAKİNE YALÇIN¹, MUHAMMAD SHAZAİB RAMAY¹, SUZAN YALÇIN²

ABSTRACT

In recent years consumer demands concerning food have changed significantly and concept of functional food has been growing extensively. Functional foods are modified foods for certain physiological functions other than providing nutrient requirements. Milk fat consists mostly of saturated fatty acids resulting in negative consumer perception due to health concern related to saturated fats. Thus, there is an opportunity to alter the milk fat content and its fatty acid composition according to the consumer needs. It is very difficult to modify milk fatty acid composition for human health. Linseed contains about 36-48% oil rich in unsaturated fatty acids. Alpha linolenic acid constitute of approximately 50-55% of total fatty acids in linseed. Linseed is an important feedstuffs that can be used as an energy and protein source in lactating dairy cattle. It has high antioxidant activity due to high content of secoisolariciresinol diglucoyside as a precursor of lignans in linseed. Dietary linseed supplementation can increase the content of alpha-linolenic acid and conjugated linoleic acid, decrease the ratio of omega 6/omega 3 and saturated fat content and increase the proportion of stearic and relative to other saturated fatty acids. These enhancements in the fat profile of milk give consumers food with a healthier fat profile.

DETERMINATION OF PHENOLIC CONTENTS OF CYCLAMEN ALPINUM BY HPLC

MURAT TURAN¹, RAMAZAN MAMMADOV¹

ABSTRACT

Cyclamen genus belonging to the family Primulaceae, is used as an ornamental plant as well as a medicinal plant. Antifungal, antiinflammatory and antinociceptive activity properties have been determined in studies and are also used in folk medicine. Cyclamen alpinum Dammann ex. Sprenger was identified by Schwarz as endemic under the name Cyclamen trochopteranthum O. Schwarz in 1975 but nowadays although it is again called C. alpinum, its endemism is controversial. Phenolic compounds and quantities were determined by HPLC from C. alpinum. 9 standard phenolic compounds were performed and the amounts indicated in C. alpinum plant were determined; gallic acid (10.01 µg/g), 3,4 dihydroxy benzoic acid (33.65 µg/g), 4 hydroxy benzoic acid (125.33 µg/g), chlorogenic acid (2.73 µg/g), vanillic acid (121.35 µg/g), caffeic acid (0.13 µg/g), p-coumaric acid (5.78 µg/g), ferulic acid (3.25 µg/g), cinnamic acid (2.25 µg/g). The amount of phenolic substances at the end of the HPLC may vary according to the method of extraction of the plant and the conditions of the region it is growing.

HOPS (HUMULUS LUPULUS)

ÇIĞDEM ÇEBİ ŞEN¹, FÜSUN TEMAMOĞULLARI²

ABSTRACT

Humulus lupulus, also known as "Maya Herb" or "Beer Flower", is widely grown around in Bilecik-Pazaryeri, Turkey. Hops plant is a plant with a stout root, heart-shaped leaves and cone-like flowers. It is an indispensable raw material of beer production since the desired bitterness, aroma and taste is provided with hops depending on the beer. In recent years, hops, which have begun to be used in pharmaceuticals and cosmetics as well as beer making, are a multi-year industry plant. Hops preparations are used as sedatives, especially for the treatment of sleep disorders, and for activating gastric functions. It has also antibacterial and antifungal effects. A potent phytoestrogen in hops, 8-prenylnaringenin (8-PN), has an activity greater than other established plant estrogens. Although some researchers have reported no estrogenic effect of the hops, other researchers have found a high estrogenic effect. In another study conducted, the prenyl flavonoids obtained from the hops were investigated effect on cancer, menopausal temperature pressures and osteoporosis, and as a result they were found to slow down the bone erection and reduce the temperature pressures. It has also been suggested that these compounds may be responsible for a variety of reproductive disorders, including a decline in sperm concentration in men with negativ effects on sexual desire. In this review, the effect of hops on sexual activity was investigated.

THE USE OF AROMATIC PLANTS, ESSENTIAL OILS, AND THEIR ACTIVE COMPONENTS IN BROILER NUTRITION AS PHYTOGENIC FEED ADDITIVES

FİGEN KIRKPINAR¹, ÖZGÜN IŞIK¹, SELİM MERT¹

ABSTRACT

In recent years, products containing essential oils derived from several spices and herbs could be used feed additives as growth promoters in animal nutrition. The ban on the use of antibiotics as feed additives has accelerated the investigation of alternative feed additives for animal nutrition especially broiler nutrition. Herbs, spices and products derived from them are mainly essential oils. Great amounts of these active components can also be found in essential oils (EO) of the associated aromatic plants. Hence, the chemical composition and concentration of active components varies greatly dependent on their source. These phytogetic additivites may have more than one mode of action, including improving feed intake and flavour, stimulating the secretion of digestive enzymes, increasing gastric and intestinal motility, endocrine stimulation, antimicrobial, anti-viral, anthelmintic and coccidiostat activities, immune stimulation, anti-inflammatory and anti-oxidative activity and pigments. Natural feed additives of aromatic plant origin, also referred to as phytogetic substances are healthier, less regarded as chemical hazards and generally regarded as safe. Aromatic plants, essential oils, and their active components are incorporated in broiler diets to replace synthetic feed additives in order to stimulate or promote the effective use of feed nutrients which may subsequently result in better growth performance and improved feed efficiency. Moreover, active components of aromatic plants may improve digestion and stimulate the immune function in broilers. Therefore, the purpose of this review is to give an overview on and definition of aromatic plants their EO and active components as phytogetic feed additives, chemical composition and mode of action, as well as on the use of these ingredients in broiler diets with particular attention paid to broiler performance characteristics.

EFFECTS OF IRRADIATION AND MODIFIED ATMOSPHERE PACKAGING ON THE QUALITY OF THYME DURING STORAGE

CELALE KIRKIN¹, GÜRBÜZ GÜNEŞ²

ABSTRACT

The aim of this study was to evaluate the effects of gamma-irradiation and modified atmosphere packaging on the quality properties of thyme during storage. Dried and ground thyme (*Thymus vulgaris*) was packaged under 100% N₂ (modified atmosphere packaging, MAP) or air (aerobic packaging, AP), and gamma-irradiated at 0 kGy (as control), 6 kGy or 14 kGy. The changes in total mesophilic aerobic bacteria and yeast-mold counts, sensory properties (odor, color intensity, overall acceptability), essential oil yield, total phenolic content (TPC), 2,2-diphenyl-1-picrylhydrazyl (DPPH) radical scavenging activity and antimicrobial activity were evaluated during 6-month storage. Total mesophilic aerobic bacteria and yeast-mold counts of thyme were approximately 4.7 log/cfu (MAP) and 4.5 log/cfu/g (AP) in control and decreased to below 1 log/cfu after irradiation at 6 and 14 kGy at the beginning and did not change during storage. The color intensity of 14 kGy irradiated thyme in MAP was lower compared to the control at the beginning of the storage, but the difference was not significant after 6-month storage. Irradiation under MAP increased essential oil yield and DPPH radical scavenging activity at time zero; however, the differences due to irradiation were lost after 6 months of storage. Color intensity and overall acceptability of the spice were decreased after 6-month storage. There was an increase in total phenolic content in AP, but a reduction in DPPH radical scavenging activity in the essential oil of thyme during 6-month storage. An increase in antimicrobial activity against *Bacillus cereus* was noted after 14 kGy irradiation at the beginning of the storage period. The antimicrobial activity against *Escherichia coli* and *Staphylococcus aureus* was higher in MAP than AP. The antimicrobial activity of the thyme essential oil was decreased during 6-month storage. In conclusion, Irradiation under both types of packaging was highly effective on decontaminating thyme. Irradiation under MAP had a positive contribution to essential oil yield, antioxidant and antimicrobial activity of thyme, but a negative effect on color intensity compared to irradiation under AP. The effects of MAP on the irradiation-induced changes were generally become insignificant after 6-month storage.

ONOSMA MALATYANA BINZET EXTRACT MEDIATED BIOSYNTHESIS OF AG DOPED ZNO NANOPARTICLES AND ITS SENSING APPLICATION

ERSAN TURUNC¹, RIZA BİNZET¹, HAKAN ARSLAN¹, OSKAY KAHRAMAN¹, GUN BİNZET¹, İLKAY GUMUS¹, EBRU KESKİN¹, UMMUHAN SOLMAZ¹, BIRDAL ARSLAN¹, ALI NAIL SELCİK¹

ABSTRACT

The fabrication of nanostructured materials have gained much attention in the field of catalysis in recent years by virtue of their unique properties, large surface area, and strong interaction with other materials. Semiconductor-based heterostructures play an important role in nanodevices and sensors applications. ZnO nanostructures are technologically important material and are used in a wide range of applications such as catalysis, photocatalysis, sensors and other industrial applications [1-4]. Similiar to other semiconductors, ZnO has poor selectivity or sensor response. ZnO is also doped with nobel metals (Ag, Au and Pt) to achive selectivty and enhance sensor response. In this study, we report a facile, simple and low cost synthesis of Ag doped ZnO nanoparticles using Onosma malatyana Binzet root extract. The synthesized Ag doped ZnO nanoparticles were detailed characterized by scanning electron microscopy, X-ray powder diffractometer, UV-vis spectroscopy and dynamic light scattering. In addition we fabricated Ag-ZnO modified carbon paste electrode (AgZnO-CPE) for detection of paracetamol (Figure 1). Figure 1. Typical cyclic voltammogram of bare CPE, ZnO-CPE, Ag-CPE and AgZnO-CPE electrode with 0.1 mM paracetamol in 0.1 M phosphate buffer solution (pH = 7.20) at scan rate 50 mV/s. Inset show magnification of bare CPE and ZnO-CPE response. EFFECTS OF DIETARY OREGANO OIL ON NUTRITIONAL QUALITY OF BROILER MEAT

FİGEN KIRKPINAR¹, SELİM MERT¹, ÖZGÜN IŞIK¹

ABSTRACT

The general consumer rejection to synthetic additives has been increasing in recently. For this reason, in recent years interest has arisen in the use of natural essential oils with the intention to improve meat quality, without leaving residues in the meat or the environment. Broiler meat has many desirable nutritional characteristic such as low lipid content and relatively high concentrations of polyunsaturated fatty acids (PUFA) such as n-3 PUFA's [eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA)]. Physicochemical and sensory properties of broiler meat as well as its storage life is very important. The addition of oregano essential oil in broiler diets could effective in delaying lipid oxidation. The better oxidative stability of broiler meat receiving the diets supplemented with oregano oil may probably the result of antioxidant constituents of the oregano oil that entered the circulatory system and were distributed and retained in meat. Furthermore, the strong smell of oregano oil may penetrate into muscles and organs, which would improve their composition, colour, pH, lipid oxidation and sensory properties as well as storage and processing values. The essential oil of oregano mainly consists of carvacrol, thymol, and their precursors, c-terpinene and q-cymene it has already been used with the intention to improve the quality and quantity of broiler meat. Furthermore, oregano oil improves meat storage stability after slaughter in poultry, protects against the negative effects of stress on broiler meat quality characteristics. Thus, the addition of oregano oil to broiler diets could significantly positive affect chicken meat quality. The purpose of this review is to provide an overview of the published data on the potential of oregano oils in broiler meat productin and to describe their possible modes of action with particular attention paid to carcass characteristics, meat composition, colour, pH and sensory quality of broiler meat.

IMPORTANCE OF BLACK SEED (NIGELLA SATIVA) ON LOW- CHOLESTEROL EGG PRODUCTION

SAKİNE YALÇIN¹, İLYAS ONBAŞILAR², S. SONGÜL YALÇIN³

ABSTRACT

Egg as one of the animal products is an important food source. Eggs that highly consumed in the World contain many essential amino acids, fatty acids, vitamins and minerals for healthy nutrition. Egg consumption has been reported to decrease the blood glycemic index and increase the high-density lipoprotein cholesterol level. However the most important factors for not reaching an adequate level of egg consumption are consumption habits, egg cholesterol level and factors leading to arteriosclerosis and coronary heart failure of high cholesterol foods. To prevent coronary heart diseases daily cholesterol consumption is limited to 300 mg according to the reports of National Cholesterol Education Program and American Heart Association's Nutrition Committee. Egg consumption decreases in the developed countries due to the cholesterol level of 200-300 mg in an egg. Because of those reasons, low cholesterol egg production is of great importance for public health. For this purpose dietary supplementation of additives especially probiotics, various plant and plant extracts has been used. Black seed (*Nigella sativa*) from these natural additives has been widely used in traditional for respiratory health, gastrointestinal health, kidney and liver functions, circulation and immune system. Egg yolk cholesterol concentration decreased with dietary black seed. This reduction may be due to a decrease in the concentration of triacylglycerol and phospholipid in the serum. Black seed plays an important role in functional egg production by reducing cholesterol synthesis by inhibiting the lipogenic pathway of acetyl CoA in the liver.

GİNSENG AND CANCER

ESRA CAN¹, SALİHA NUR ERYİĞİT¹, EZGİ TOPTAŞ BIYIKLI¹, ALİ EMRAH BIYIKLI¹

ABSTRACT

GİNSENG AND CANCER The concept health affecting lifetime and quality of life is defined as wellbeing of the individual from the physical, emotional, and social aspect. The factors such as changing life conditions, unhealthy diet, sedentary life time, and stress, negatively affecting health, prepare a ground for the various diseases. On the prevalence of cancer, which shows rapidly increase in the present days, the effect of unhealthy diet is highly important. With understanding of importance of diet, the interests of people have increased to the various nutrients and supplements to protect their health. One of these plants is also ginseng. Ginseng makes effect on health with its components such as ginsenoside, triterpenic saponosides, polysaccharides, peptides, polyacetylenic alcohols, and fatty acid. In the recent period, particularly on the diseases such as cancer and diabetics, the studies toward the effects of ginseng have increased. **AIM:** In this study, it was aimed to compile the relationship between ginseng intake and sort of cancer. **METHOD:** In the study, the effect mechanism of ginseng in being protected from cancer were scrutinized. By examining the actual literature data studying the relationship of ginseng consumption and cancer, the effects of ginseng on cancer formation and course of cancer formed were evaluated in detail. **RESULTS** Just as there are a number of studies showing that ginseng has a protective effect against cancer, there are also a lot of publications showing that it is not effective. It was suggested that ginseng, with saponosides and ginsenosides, which present in its content, showed anticarcinogenic effect against the various sort of cancer. However, its molecular mechanism is not clear. Thanks to ginsenosides, the studies were met, which showed that it reduced cytokines and provided an effect strengthening immune system in cancer patients. It was reported that ginseng may be effective on the various sorts of cancers such as lung and liver cancers, particularly prostate and ovarian cancers on women. In addition, also in liver fibrosis with its antioxidative feature and by supplying fat destruction, its effects toward reducing fat accumulation were seen. The amounts of ginseng used in the studies differ from each other and the suggestions regarding the amount of use are not clear. **CONCLUSION:** It was seen that ginseng may be effective on the different sorts of cancers. It was identified that it had positive effects on especially prostate, ovarian, and lung cancers. However, some studies were also met, which showed that it was not effective on cancer. The studies on the use of ginseng for cancer treatment were less and it is stated that its effect mechanism is not clear. There is a need for further studies on this subject. In addition, for being able to offer clear suggestions about the amount of use, the number of studies should be increased. **Keywords:** Ginseng, cancer, diet, antioxidant

INVESTIGATION OF LINDEN (*TILIA SPP.*) AND ROSEHIP (*ROSA CANINA*) SAMPLES SOLD IN TEKİRDAĞ PROVINCE IN TERMS OF AFLATOXINS

*NURAY CAN*¹, *SERAP DURAKLI VELİOĞLU*²

ABSTRACT

Linden (*Tilia spp.*) and rosehip (*Rosa canina*) are widely consumed as alternative herbal tea by adults and children in order to benefit from healthy components they contain or prevent various diseases. However, studies have shown that herbal tea including linden and rosehip can be contaminated with toxigenic molds as well as pathogenic bacteria, and under favorable conditions molds can produce mycotoxins which have negative effects on human health. The presence of aflatoxins, known to be carcinogenic, teratogenic, mutagenic and hepatotoxic, and classified as "Group I: Carcinogenic to humans" by the International Agency for Research on Cancer (IARC), in these products is a threat to public health. However, the number of studies on the presence of aflatoxins in linden and rosehip is limited. For this reason, the aim of this study was to investigate the presence of aflatoxins in these products using HPLC method. 15 linden and 15 rosehip samples sold as unpackaged were used as the material of the study. The samples were provided from Tekirdağ province in Turkey in February and March 2015. In addition to aflatoxin content, moisture and water activity values and total mesophilic aerobic bacteria and total yeast-mold counts were also determined. 0.158 µg/kg AFG1 and 0.168 µg/kg AFG2 were determined in one of the linden samples and 0.162 µg/kg AFG2 was determined in another linden sample. Aflatoxin levels of these samples were not higher than the maximum permissible levels. The rest of the linden and rosehip samples were determined to be contaminated with at least one of the four aflatoxins with the levels below the limit of quantification (0.155; 0.168; 0.156; 0.162 µg/kg for AFB1, AFB2, AFG1, AFG2, respectively). The mean moisture content of linden and rosehip samples were found to be 10.97% and 14.58%, respectively. The mean water activity values were determined as 0.58 and 0.62 for linden and rosehip samples, respectively. Total mesophilic aerobic bacteria counts of the linden samples ranged between $1.0 \times 10^3 - 4.3 \times 10^6$ cfu/g and the rosehip samples ranged between $1.0 \times 10^3 - 6.4 \times 10^4$ cfu/g. Total yeast-mould counts of the linden samples ranged between $1.0 \times 10^3 - 1.2 \times 10^5$ cfu/g and the rosehip samples ranged between $1.0 \times 10^3 - 3.6 \times 10^5$ cfu/g. As a result, yeast-mold and mesophilic aerobic bacteria contamination were detected in linden and rosehip samples, and aflatoxin was detected at low levels. This results suggest that toxigenic molds can grow in linden and rosehip and under sufficient conditions aflatoxins can be produced in these products. Acknowledgment The authors thank to Namık Kemal University Scientific Research Projects Committee for the support of this study having the project number NKUBAP.00.24.YL.14.18.

EFFECTS OF CITRONELLOL, GERANIOL AND NEROL ON VIOLACEIN PRODUCTION

HALİME ÇEVİKBAŞ¹, SEYHAN ULUSOY¹

ABSTRACT

Quorum sensing (QS) is a cell to cell communication system. Bacteria co-ordinate the gene expression of many bacterial behaviors including violacein, antibiotic, virulence factors production and biofilm formation using this system. Violacein is a purple pigment by produced *Chromobacterium violaceum* with controlled QS. In this study, inhibitory effects of citronellol, geraniol, nerol were tested on the production of violacein using *Chromobacterium violaceum* CV026 and *C. violaceum* VIR07 biomonitor strains. The results showed that citronellol, geraniol and nerol inhibited violacein production by 75%. Therefore, citronellol, geraniol and, nerol might be suitable for development into antivirulence agents.

THE EFFECT OF CORNELIAN CHERRY ON THE RISK OF CANCER

ESRA CAN¹, ALİ EMRAH BIYIKLI¹, EZGİ TOPTAŞ BIYIKLI¹

ABSTRACT

THE EFFECT OF CORNELIAN CHERRY ON THE RISK OF CANCER In sustaining a healthy life, the role of adequate and balanced diet is relatively more. In the recent year, one of the factors kept responsible for the increase of the prevalence of cancer is also unhealthy diet. It is known for long years that providing adequate and balanced diet and give more place to antioxidative nutrients in diet had a protective effect against cancer. It was suggested that cornelian cherry, one of the antioxidative nutrients, with the strong phenolic substances in its content, could be effective against cancer. **AIM:** In this study, it was aimed to evaluate the relationship between cornelian cherry consumption and risk of cancer. **METHOD:** In this compilation study, by examining the actual literature data studying the relationship of cornelian cherry consumption and cancer, the effects of the fruit cornelian cherry toward the risk of cancer were evaluated in detail. **RESULTS:** It is known that the antioxidative effect of cornelian cherry arises from the phenolic substances in its content. It is reported that, cornelian cherry, preventing free radical formation, is protective against cancer. In addition, with components of flavonoids and amino acid, affecting lipid mechanism, it supports its antioxidative effect. In a number of studies, it was observed that the fruit cornelian cherry provided a protective effect against a number of sort of cancer at the significant level, particularly prostate cancer, breast, uterine, and liver cancers. In the individuals consuming high amount of cornelian cherry, the risk of cancer formation was found to be significantly lower compared to the individuals consuming less cornelian cherry. But there are also studies identifying that cornelian cherry consumption showed no effect on cancer. It is stated that giving place to cornelian cherry in daily diet may be protective against cancer and the amount suggested to the consumers are not clear in the studies. **CONCLUSION:** It was seen that cornelian cherry, an important antioxidant, can provide protective effects against cancer by means of the different mechanisms. Its positive effect in being protected from prostate cancer is remarkable. However, the effect of the fruit cornelian cherry on the studies toward using it in cancer treatment is not clear and there is a need for further studies on this subject. It is suggested that its consumption should be increased and the number of the studies on the amount of effective intake should be increased.

AN ANALYSIS OF THE ANTIMICROBIAL ACTIVITY OF CASTANEA, RHODODENDRON AND ASTRAGALUS HONEYS

DUYGU ODABAŞ ALVER¹, ÖMER ERTÜRK², SEVİM ÇİFTÇİ YEGİN¹

ABSTRACT

This study aims to compare the antimicrobial activities of different honeys collected from different regions. Honey is a sweet substance that honeybees store in honeycombs after collecting flowers nectars and secretion of plants and certain living beings on the plants, and converting them by adding their unique substances. Honey consists of around 400 components. Honey has been used for medical purposes by numerous cultures since the antiquity. In this study, pollen analyses, which are compliant with the literature, were conducted on the total of 9 honey samples collected from different places, and it was detected that 3 of them were Castanea (*Castanea sativa*), other 3 were Rhododendron (*Rhododendron* sp.) and the last three were Astragalus (*Astragalus* sp.). The pH, % Brix values and antimicrobial activities were studied. Antimicrobial activities of honey samples were investigated by using disc diffusion assay method against four Gram positive bacterias (*B. subtilis*, *S. aureus*, *L. monocytogenes*, *C. perfringens*), four Gram negative bacterias (*P. aeruginosa*, *E. coli*, *S. enteritidis*, *K. pneumoniae*) and a fungus (*C. albicans*) also. pH and % Brix values were measured by pH meter and refractometer. It was established that the lowest pH value was those of G1 and G2 honey samples as 3,62, the highest pH value was detected as 4,55 on K3 sample. The lowest %Brix values was in K2 sample as 55,76 and the highest was 78,1 in R3 sample. The highest antimicrobial activity among the samples was demonstrated by K3 sample against *L.monocytogenes* (13.77 mm), while the lowest average antimicrobial activity was performed by R1 sample (8,41 mm). R2, R3, K1, K2 and K3 samples showed antifungal activity on *Candida* type fungi, while no antifungal activity was observed in R1, G1, G2 and G3 samples. The highest antifungal activity was seen on R3 sample (11.79 mm). The pH and %Brix values observed in the study have similar properties with those of previous studies. Also, the honey samples have been observed to have similar antimicrobial activities.

THREATENED STATUS OF MEDICINAL PLANTS COLLECTED FROM NATURE IN TURKEY

**ELIF BOZDOĞAN SERT¹, GÜLBİN ÇETINKALE DEMIRKAN², SEMA GÜLER¹, GÜLDEN SANDAL ERZURUMLU³,
ZERRİN SÖĞÜT⁴**

ABSTRACT

Association between people and native plants are constituted from traditional uses and collecting from nature in Turkey where is in a rich region with a total of 12 000 plant taxa. Many of the plant species take their place in different forms in markets depending on the regional or local resources. Number of plants on the list which are obtained in different studies on this subject are also high. Collected part of 500 taxa in this group also known as non-wood forest product is also different each other. Damage level may change depending on the collected organs and collecting density. For instance, collected flower and leaf parts from linden species (*Tilia* sp.) doesn't cause a significant damage to the plant. However, collected some plants together with roots will always constitute a danger for these plants. Regular collecting of species that are widespread in Turkey and have high market value slow down the process of extinction. This situation can change depending on the ability of regeneration, rate of reproduction. According to IUCN data, 15 000 medicinal plants in worldwide are at risk in different categories. Approximately 350 plant species traded by collected from nature in Turkey, and 35 of these plants are endemic. Among the most important reasons in damage of medicinal plants are change in land use except for the collection process. In this study, threats of species that are traded by collecting from nature in Turkey are revealed; some insights have been made on this subject by taking into consideration to distribution areas. For instance, *Liquidambar orientalis* is not yet reported as endangered, but it's just on the verge of danger. While the area of this plant's distribution in 1949 is more than 6 000 hectares; it is now below 1 500 hectares. It's also seen that *Juglans regia* is in danger at near threatened status; while *Cedrus libani* is also at vulnerable status. In case these species are formed with large groups in certain areas such as valley or forests, are in danger of extinction. The danger level may increase in the shrubs or herbaceous plants that are spread in smaller areas or open into different uses. For instance, *Tchihatchewia isatidea* native endemic in East Anatolian Region is within the vulnerable status.

DIETARY THYME (THYMUS VULGARIS L.) USAGE TO IMPROVE SHELF LIFE OF POULTRY MEAT

SUZAN YALÇIN¹, SAKİNE YALÇIN², İLYAS ONBAŞILAR³

ABSTRACT

Poultry meat has an important food among animal food sources. Meat is an important food for human health due to having protein, essential amino acids, lipids, minerals and vitamins. Poultry meat has many desirable nutritional properties such as low lipid content and relatively high concentration of polyunsaturated fatty acids. Increasing the degree of unsaturation of meat by dietary manipulation increases susceptibility of meat lipids to oxidative deterioration. Lipid oxidation affects colour, odour and flavor negatively and a reduced shelf life. In recent years researchers have focused on increasing shelf life of meat. For this reason plant and plant extracts having antioxidant activity have been used extensively. Thyme (*Thymus vulgaris* L.) has been studied by several researchers. Thyme oil contains phenolic compounds such as thymol, carvacrol and γ -terpinene having important biological activities and pharmacological properties. Thyme can improve the oxidative stability of meat due to having these phenolic compounds. Considering the consumer preference for natural antioxidants, thyme could be used as natural antioxidant for improving shelf life of meat.

ANTIMICROBIAL ACTIVITY OF SOME SPICES

ŞENOL KÖSE¹

ABSTRACT

In this study, antimicrobial activities of methanol extracts of some packaged and unpackaged spices including thyme, cumin, mint, cinnamon were investigated against *Escherichiacoli* ATCC 11303, *Pseudomonas aeruginosa* ATCC 19429, *Salmonella typhimurium* ATCC 13311, *Enterococcus faecalis* ATCC 33186 and *Bacillus cereus* ATCC 11778. For determination of antimicrobial activity, different concentrations of these spice extracts were tested against bacterias by agar diffusion method. It was examined that the extracts of unpackaged spices exhibited higher antibacterial activity against *Enterococcus faecalis* ATCC 33186 and *Bacillus cereus* ATCC 11778 in comparison to packaged spices. Methanol extracts of all spices showed variable degrees of antibacterial activity against the other bacterias. The *Enterococcus faecalis* ATCC 33186 was determined as the most resistant strain for antimicrobial activity of packaged and unpackaged spices of methanol extracts. Also Ampicillin (10µg) and Tetracycline (30µg) were used to determine sensitivity of the tested bacterias and comparison.

PHYTOCHEMICAL AND PHARMACOLOGICAL PROPERTIES OF SUMAC SEED

MURAT KARAAĐAÇ¹, SUZAN YALÇIN¹, YUSUF BİÇER¹

ABSTRACT

Sumac (*Rhus coriaria* L.) seed has long been used as an important spice in traditional medicine. Sumac is rich in B vitamins, gallic acid, benzoic acid, ascorbic acid, hydrolysable tannins, volatile oils, anthocyanins and flavonoids. The major volatiles are aliphatic, aldehydes, hexahydro farnesyl acetone and oxygenated terpenes. Due to the presence of these bioactive compounds sumac has properties of antibacterial, antifungal, antioxidant, anti-inflammatory, anticancer, hypoglycemic and hypolipidemic activities. Sumac is rich in oleic and linoleic acids. Myricetin is the major flavonol in sumac seed. Water extracts of sumac seeds have a strong antioxidant and antimicrobial activity against food-born pathogenic bacteria. Xanthenes and aromatic components have been active properties against *Candida albicans* and *Aspergillus flavus*. The sourness of sumac is due to the presence of organic acids such as malic, citric and tartaric acids, whereas the astringent taste is due to its tannin. Therefore sumac has an economic importance due to a source of functional food, nutraceutical ingredients, its also increasing use in cosmetic and pharmaceutical industries.

IN VITRO ANTIBACTERIAL ACTIVITY OF ESSENTIAL OILS FROM MEDICINAL PLANTS AGAINST BACTERIAL FISH PATHOGENS

ÖZNUR DILER¹, ÖZNUR GÖRMEZ¹

ABSTRACT

During the last decades, there has been a continuous growth of aquaculture industries all over the world and such intensive production would experience disease problems. Various synthetic chemicals and antibiotics have been used to prevent or treat fish diseases with a partial success. However, continuous use of antibiotics leads to drug resistance and thereby to a reduced efficacy of the drugs. In recent years, the ability of medicinal plants to antimicrobial effective has been studied. The objectives of this study were: to investigate the in vitro antibacterial effect of Oregano (*Origanum vulgare*), St. John's-wort (*Hypericum perforatum*) and Nettle (*Urtica dioica*) essential oils against bacteria species (*Yersinia ruckeri* and *Lactococcus garviae*) by disc diffusion test. The essential oils except to *U. dioica* that was most antibacterial effect against *Y. ruckeri* and *L. garviae* microbial strains.

INVESTIGATION OF RHEOLOGICAL BEHAVIOR AND PHYSICAL PROPERTIES OF THYME ESSENTIAL OIL AT DIFFERENT TEMPERATURES

FILİZ İÇİER¹, DENİZ DÖNER¹, SERDAL SABANCI², DERYA TEZCAN¹

ABSTRACT

Essential oils usually economically important plant-sourced oils. They are widely used in food industry because of their aromatic and antimicrobial effect. They also have great economic importance. In food industry, thyme essential (TEO) oil is used as an antimicrobial agent and some food product used as a flavouring agent. In this study, rheological properties of TEO was investigated at different temperatures (20°C, 30°C, 40°C, 50°C and 60°C), and the best model describing the rheological characteristics of this oil was determined. In addition, the physical properties (optical rotation, refractive index, solubility ratios (v/v) with 96% ethanol, and relative density) and color analysis of TEO were evaluated at different temperatures (20°C to 40°C and 60°C). It was determined that rheological characteristics of TEO were best described with Newtonian model. For the same shear rate, shear stress values and viscosity values decreased as the temperature increased. It has been identified that color values of the essential oils were different depending on the temperature. As temperature values increased L* values decreased while a*, b* values increased. Physical property results of TEO were given depending on temperature (20°C, 40°C and 60°C) respectively, as follows; optical rotation values were 64.63±0.21, 65.84±0.22 and 86.56±0.16, refractive index values were 1.49±0.0015, 1.476, 1.4753±0.0047, solubility ratios (v/v) with 96% ethanol were 6, 3.33 and 3.83, relative density values were 0.966±0.38, 0.943±0.02 and 0.713±0.01 g/cm³. It was obtained that physical and rheological properties of TEO depends on temperature. Higher process temperatures adversely affected physical and quality properties of TEO. Low temperature process conditions are recommended to be applied to provide higher quality products including thyme essential oil. It is thought that results of these study could contribute valuable information for industrial handling of TEO especially in pumping lines and heating processes. Further study on the shelf life of TEO and its use in innovative applications should be conducted. This study was financially supported by Scientific and Technical Research Council of Turkey (TUBITAK, 2209-A Undergraduate Students National Research Funding Program).

FUNCTIONAL FOOD: QUINOA

MUSTAFA AKTURFAN¹, SUZAN YALÇIN¹, YUSUF BİÇER¹

ABSTRACT

Quinoa (*Chenopodium quinoa*) seed has excellent nutritive value due to having high and good quality protein and essential amino acids. Essential amino acids are higher in quinoa than wheat. Lysine in quinoa is two times higher in that of wheat. It is a good source of energy and rich in mineral, vitamin and bioactive compounds. Quinoa has bioactive compounds such as polyphenols, saponins, flavonoids and phenolic acids. These bioactive compounds decrease blood cholesterol level, prevent the development of cancer cells, eliminate toxins, improve immune system and prevent cardiovascular disease. The quinoa, which has its own unique aroma, has attracted a lot of attention recently in terms of its suitability for Turkish taste as it is preferred in world cuisines. Quinoa has a wide range of uses. Quinoa seed flour can also be used in bread making alone or mixed with other cereal flours. Pilaf can be made from rice with quinoa seed. Beer-like beverages and breakfast cereals can be produced from quinoa seeds. Since it has high nutritional value, it is also used in baby food production.

THE USE OF MEDICINAL AND AROMATIC PLANTS AS A FUNCTIONAL FOOD COMPONENT IN MEAT PRODUCTS

AZİM ŞİMŞEK¹

ABSTRACT

Functional foods are defined as foods that are formed by the addition of bioactive ingredients obtained from fully natural sources, to the foods we consume. Functional foods should provide additional benefits on human physiology and metabolic functions, as well as meeting the basic nutrient needs of the body. Essential oils, powders and extracts obtained from medicinal and aromatic plants, also conjugated linoleic acid, dietary fiber and probiotic microorganisms are widely used in meat products as a functional food components. Powders, essential oils and extracts used in meat products are obtained from seeds, leaves, stems, fruits and roots of medicinal and aromatic plants such as culinary herbs, spices, fruits and vegetables. Medicinal and aromatic plants have many functional properties (antioxidant, antimicrobial etc.) in meat products due to their secondary metabolites such as phenolic acids, flavonoids, alkaloids, terpenoids and tannins. In addition, medicinal and aromatic plants used in meat products improve sensory properties such as taste, odor and color. Different solvents (ethanol, methanol, acetone etc.) and extraction methods (maceration, percolation, soxhlet, microwave etc.) are used to obtain essential oils and extracts. It has been reported in literature studies that antioxidant activity is more effective in extracts obtained from solvent extraction, whereas antimicrobial activity is more effective in essential oils obtained from water extraction. Furthermore, medicinal and aromatic plants, and their powders, essential oils and extracts have the potential to become new generation substances for human and animal nutrition and health. In this study, information about functional properties of powders, essential oils and extracts obtained from medicinal and aromatic plants used in meat products were given, and studies about on this subject were compiled.

ANTI-FUNGAL EFFECTS OF SOME MEDICINAL PLANT ESSENTIAL OILS ON *ARUM ITALICUM* UNDER IN VITRO CONDITIONS

HAVVA DİNLER¹, HUSSEIN ABDULLAH AHMED AHMED¹, SERKAN URANBEY²

ABSTRACT

Geophytes, which constitute a significant part of our biological diversity, have a considerable potential in food, perfumery, pharmaceutical industry, and ornamental plant industry owing to their rich secondary metabolites, starch contents and ostentatious leaves and flowers. It is extremely critical to produce and export of the plant *A.italicum* free from other pathogens, particularly fungal diseases. In this study, anti-fungal effect of some medicinal plant essential oils (sage, thyme, lemon, peppermint, and cinnamon) which were added into shoot regeneration medium following the sterilization procedure was examined by using shoot explants on tubers of *Arum italicum*. Explants taken from *Arum italicum* plant were washed by keeping under tap water for 30 minutes. Tubers were firstly kept in 95% ethanol for three minutes and then were exposed to sterilization process in 15% commercial bleach for 10 minutes. Sterilized shoot tips were rinsed with sterile bidistilled water 3 times for 5 minutes in each. MS medium containing plant growth regulators (1-4 mg/L BAP and 0.25-1 mg/L NAA) 2% sucrose, and 0.8% agar in different combinations of shoot regeneration hormones was prepared, essential oils in rates of 0 (Control), 125, 250, and 500 ppm were added into MS medium. Essential oils were dissolved by using 0.1 % Tween 20 and 10% n-hexane. Sterilized explants were inoculated into MS medium. They were cultured under controlled conditions in 16/8 hour illumination period, at 24±1 oC for 4 weeks. As a result of the study, it was determined that essential oils of thyme, cinnamon, and peppermint inhibited fungal contaminations (*Aspergillus* sp., *Penicillium* sp., and *Fusarium* sp.) occurring in MS medium compared to the control and increasing concentrations had a fungicidal effect.

ANTIOXIDANT EFFECTS OF SOME AROMATIC PLANTS USED IN MEAT AND MEAT PRODUCTS

EBRU BAYRAK¹

ABSTRACT

Lipid oxidation is one of the most important changes in meat and meat products that reduce quality and limit shelf life. Lipid oxidation causes negative changes on sensory attributes such as color, flavor, odor and nutritive value of the product and potentially toxic compounds. The oxidation of lipid-containing foods can be delayed or slowed down by the use of antioxidants. The antioxidants can be of synthetic or natural origin. Although synthetic antioxidants have been widely used in the meat industry to inhibit lipid oxidation, the trend is to decrease their use because of the growing health concerns among consumers about such chemical additives. In recent years, some aromatic plants have been commonly used in meat and meat products due to their antioxidant effects. These plants, which are used as natural antioxidants, are important in terms of phenolic compounds. The antioxidant activity of phenolic compounds is due to their ability to scavenge free radicals, donate hydrogen atoms or electron, or chelate metal ions. Tea, various spices (rosemary, thyme, sage, etc.), grape and kernel, berries and citrus fruits have high phenolic content and can therefore be used as natural antioxidant in meat products. In this review, antioxidant effects of some aromatic plants used in meat and meat products were discussed.

ORTA ANADOLU BÖLGESİ TIBBİ ADAÇAYI (*SALVIA OFFICINALIS* L.) ISLAHI ARAŞTIRMALARI

REYHAN BAHTIYARCA BAGDAT¹, NURETTİN ÇINKAYA¹, KADRIYE YUKSEL², CIGDEM BOZDEMİR¹, EMEL ÇAKIR³

ABSTRACT

Salvia officinalis, Lamiaceae, known as Dalmatian Sage or common sage has been gaining popularity in food and drug industry worldwide, recently. Even the existence of many sage species on the World, the genus *officinalis* has medicinal common use. Indigestion and inflammation disorders, excessive sweating, including that associated with peri-menopause; relief of pressure spots that result from the use of a prosthesis; and as a flavoring for foods are the main areas where the plant is mainly consumed. Sage oil has also been employed as a fragrance in soaps and perfumes. Wide adaptability and non-selective climatic requirements of the plants made it possible to receive high biomass, and several harvests during the same plantation period. Present study was conducted in Ankara, during the successive two growing seasons of 2014 and 2016. Thirty-three spontaneous hybrid common sage lines (*Salvia officinalis*) were evaluated regarding their biomass production and essential oil characteristics employing 4 different standard sage cultivars and lines. Following yield parameters were recorded as; the plant height was ranged 50.3 to 97.5 cm, canopy diameter was 36.0 to 95.0 cm, fresh herb yield was changed 59.9 to 593.4 g/per plant, drug herb yield was 12.6 to 183.9 g/per plant, drug leaf yield was 16.1 to 74.5 g/per plant and the leaf ratio was around 53.42-67.01%. The essential oil components of the lines were determined by GC-MS at Western Mediterranean Agricultural Research Institute, Antalya. The essential oil ratio was changed between 0.88 and 2.42%. All the yield parameters of the lines were found statistically significant. α -thujone, 1.8 cineole, borneol, camphor, β -thujone, camphene and viridiflorol were the main components. More than ten lines had less than 20% of α -thujone. *Phytophthora cryptogea* was identified as devastating pathogen confirmed by molecular characterization, besides some other *Fusarium* species.

OVERDOSE OF CINNAMON BARKS IS THE CAUSE OF POISONING IN THE GEDIATRIC PATIENT: CASE REPORT

ÇIĞDEM ÇOLAK¹, ELIF ELİBOL², TÜRKAN DEMİR, BIJEN KIVÇAK⁴

ABSTRACT

The use of herbal medicine has existed since the beginning of human history and interest in alternative medicine has increased in the last two decades. The use of these methods has increased in treatment. Also, drug interaction, toxicity, overdose and side effects are increasing. Approximately, 70 percent of the herbal drug users continue to use another drug at the same time. The fact that the use of herbal remedies is usually unconsciously recommended by others and the herb is not mentioned in the anamnesis when the herb is being used. Moreover, the doctor is not informed and plant-drug interaction does not take place. Therefore, the prospectuses affects drug use negatively. There are many physiological changes that may affect the herbal pharmacy and the pharmacokinetics of older people. For example; the reduction of the gastrointestinal motility and the surface of the absorption, the reduction of total body water, the decrease in serum albumin depletion and protein binding, the decrease in biotransformation, the decrease in renal blood flow drug abstinence, the decrease in receptor sensitivity and the change in cellular response. Due to these factors, side effects due to herbal treatment and more intoxications are observed in the elderly. Cinnamon, also known as "Darçın", "Loğusa", "Şerbet Kokusu" among the people, is the dried shell of some *Cinnamomum* (Lauraceae) species. There are two main varieties of cinnamon bark, namely Chinese Cinnamon (*Cortex Cinnamomi cassiae*) and Ceylon Cinnamon (*Cortex Cinnamomi zeylanici*). Both cinnamon contains tannin and 1-2% volatile oil in its composition. Both plants are grown in places like Japan, Ceylon, South America, Sumatra. Cinnamon is anti-skidding, gas extractor and antiseptic properties (1,2). Apart from that, it is also used as a spice and fragrance. The cinnamon oil obtained by distillation from its shells has a pleasant smell and taste; and in the composition, cinnamic aldehyde and eugenol (3). It has been used for thousands of years in terms of health. It is used in folk medicine with psychological distress, cramenage, heart weakness, influenza, cold, flu, anorexia, indigestion, diarrhea, stomach laxity, low body resistance and intestinal worms. The use of overdose is indicated to cause agitation, hypoglycemia, tachycardia, to increase the level of the used coumarin and abortion, tachycardia and arrhythmia in pregnancy. In this article, we present a case of emergency history of hypoglycemia, agitation and tachycardia, history and clinical follow-up and a 76-year-old female patient admitted to acute poisoning of cinnamon and honey mixture. It is our goal to present this case, it should be known that with the recommendation of others and the use of an overdose of herbal medicines unconsciously will cause intoxication, especially in the elderly and doctors need to consider the use of a medicinal product in the etiology of causes such as tachycardia, agitation, hypoglycemia in patients with urgent care. THE EFFECT OF ULTRASONIC PRETREATED MACERATION PROCEDURE ON SOME PROPERTIES OF AROMATIZED OLIVE OIL WITH THYME

ŞÜKRAN KULEAŞAN¹, HATICE DEMİROK¹, HİLAL BEDEL¹, SEDA ALDEMİR¹, AYŞE ÇINAR¹, BURAK KÖSE¹,
MERYEM CİHANGİR¹

ABSTRACT

In the study, natural extra virgin olive oil was aromatized with thyme by ultrasonic pretreated maceration. It was aimed to the shortening of the duration of maceration by ultrasonic pretreated application. Since mass transfer is faster and better during maceration in ultrasonic pretreated samples, a more intense in flavor and volatile components of aromatized product was obtained in the end of maceration period. The maceration procedures were carried out for 30 days in amber colored glass bottles with and without ultrasonic pretreatment with equal amounts of oil and thyme. The ultrasonic pretreated maceration process was performed in an ultrasonic bath at 20% power (253 W, 40 kHz) for 5 min and 10 min. At the end of the sonication procedure, the ambient temperature of the water bath was measured as 27 °C with an increase of 3 °C. The percentage of free fatty acids and peroxide value analysis was performed on the samples taken from ultrasound treated and non treated groups at 15th and 30th days. Alterations in the amounts of volatile components of aromatized oils (p-cymene, thymol and carvacrol) were determined by GC-MS. The percentage of free fatty acids of virgin olive oil was determined as 0.5% and the peroxide value was 14 meqO₂/kg in pre-maceration process. In all applications, the percentage of free fatty acids and peroxide values were not changed after 30 days of maceration period. The amount of p-cymene, thymol and carvacrol in the aromatized oil which macerated for 30 days and were not subjected to ultrasound, were found as 2.06 (µg/g), 391.26 (µg/g) and 585.28 (µg/g) respectively. The highest values for these components were found as 2.66 (µg/g), 614.18 (µg/g) and 1044.06 (µg/g) respectively in the maceration group which was ultrasonicated for 10 mins. The amounts of p-cymene, thymol and carvacrol of the olive oils which were ultrasonic pretreated and subjected to maceration under the same conditions were higher as much as 1.3, 1.6, and 1.8 times respectively when their amounts compared to that of untreated ones.

IS ALGAE OIL ALTERNATIVE TO FISH OIL?

FERİDE AYYILDIZ¹, MERVE SEYDA KARACIL ERMUMCU¹

ABSTRACT

Algae are usually found in damp places or bodies of water. Microalgae are the primary sources of docosahexaenoic acid (DHA) and eicosapentaenoic acid (EPA) for zooplankton, fish. It was known that EPA and DHA in fish oil have a lot of positive effects on human health such as cardiovascular diseases, hypertension, insulin sensitivity, neurological diseases etc. Recently algae oil is a new field for using as an alternative to fish oil. Several photosynthetic (*Nannochloropsis* sp., *Hibberd*, *Phaeodactylum Bohlin*, *Nitzschia Hassall*, *Porphyridium Nægeli* etc) and heterotrophic (*Schizochytrium* sp., *Ulkenia* sp., *Cryptocodinium Cohni* etc) marine microalgae are considered as a good source of omega-3 fatty acids (EPA and DHA) for production of algae oil. While photosynthetic microalgae is usually used for production of EPA rich algae oil, heterotrophic microalgae is usually used for production of DHA rich algae oil. A lot of studies indicated that DHA and EPA from fish oils and algal sources provide health benefits to human. Algal-based supplements has led to a large industry effort towards developing alternatives to fish oil. In addition algae oil is very good alternative for vegetarian who intakes low essential fatty acids. But the health benefits of algae oil are uncertain according to natural fish oils. There is a limited understanding of nutritional composition across algal species. It is needed more studies about dose of algae oil to examine the protective effects of human health. ANTIFUNGAL EFFECT OF SOME ESSENTIAL OILS AGAINST FACTORS OF SEEDLING ROOT ROT IN STRAWBERRY

HAVVA DİNLER¹, SONER ŞEHERLİ¹

ABSTRACT

This study was conducted under in vitro conditions to determine antifungal effects of essential oils from sage (*Salvia officinalis*), carnation (*Dianthus caryophyllus*), thyme (*Thymus vulgaris* L.), peppermint (*Mentha piperita* L.), and eucalyptus (*Eucalyptus* sp. L.) plants against factors (*Fusarium oxysporum*, *Rhizoctonia solani*, *Macrophomina phaseolina* and *Cylindrocarpon destructans*) causing root rot in seedlings of strawberry. 7 day-old cultures of pathogenic isolates which grew in PDA medium were used. Mycelium discs of growing cultures in 5 mm diameter were inoculated into PDA medium including different doses (5,10, and 20 µl/petri) of plant essential oils and incubated at 24 °C for 7 days. Trials were conducted with 3 repetitions for each of the essential oils. PDA medium which did not include essential oil were kept as control. After trial, diameters of fungal colonies were measured and % inhibition rates of essential oils compared to controls were calculated. According to result obtained, it was found that essential oils from sage, peppermint, carnation, and eucalyptus did not show a fungistatic effect on mycelial development of *Rhizoctonia solani* and *Macrophomina phaseolina*; and increasing doses of essential oil from thyme had fungicidal and/or fungistatic effect on *Rhizoctonia solani* (93% - 100%), *Macrophomina phaseolina* (16.5% - 74%), *Fusarium oxysporum* (46% - 84%), and *Cylindrocarpon destructans* (74% - 96%). Essential oils of sage, carnation, peppermint, and eucalyptus were determined to inhibit mycelial development of *Fusarium oxysporum* at the low rate. Essential oil of peppermint had a fungistatic effect on *Cylindrocarpon destructans* (20.5% - 25.4%) and sage had a fungicidal effect by inhibiting 100% of mycelia development.

ESSENTIAL OIL COMPOSITION OF LEAF, FLOWER AND STEM OF STYRAX (STYRAX OFFICINALIS L.) GROWING IN ANTAKYA

ELİF ÇATIĞKAŞ¹, ALİME EBRU AYDIN²

ABSTRACT

Styrax officinalis L. (Styracaceae) grows around the Mediterranean region and in East and South-Eastern Asia [1]. *S. officinalis* was used in folk medicine in the Mediterranean region as antiseptic and against respiratory diseases [2]. *Styrax officinalis* L. samples (flower, leaf and stem) were harvested in May, September and November 2015 in Antakya. First of all, collected materials were air-dried at the room temperature and then powdered. Later, oil samples were obtained by hydrodistillation for 4h, by using a Clevenger-type apparatus. Essential oils were obtained in a low yield of 0.015 %, 0.008 % and 0.005 % for leaf, flower and stem oils, respectively. The composition of the essential oils of *Styrax officinalis* L. was determined by GC/MS as below; [1] In the leaf of samples, (E)-2-hexenal (17.5%), linalool (11.8 %) and geranial (5.6 %) [2] In the flower of samples, linalool 26.7 (%). [3] In the stem of samples, Tridecanal (9.9 %) and dodecane (9.3 %), while α -terpineol (16.0 %) and eugenol (10.0 %) References: [1] Fritsch, P.W., 1999. Phylogeny of *Styrax* based on morphological characters with implications for biogeography and infrageneric classification. *Syst. Bot.* 24, 356-378. [2] Kim, Y.S., Shin, D.H., 2004. **DETERMINATION OF ANTIOXIDANT AND ANTIRADIAL
ACTIVITIES OF A NEW IDENTIFIED UNDERGROUND ORCHIDS
(RHIZANTHELLA GARDNERI) PLANT FOR THE FIRST TIME IN
TURKEY**

NAZAN DEMİR¹, SEDEF AŞIK¹, HAYRUNNISA NADAROĞLU²

ABSTRACT

The plant was collected by Prof.Dr. Nazan DEMİR from Mugla Sıtkı Kocman University, Faculty of Science, Department of Chemistry, and this plant was diagnosed as a different kind of underground orchid (*Rhizanthella gardneri*) by the lecturers of Atatürk University, Department of Biology. This orchid species have undergone, this plant development are underground. Also, it has opened red-fuchsia flowers and has been found to have a highly effective odor. The underground orchid species that bloomed in May-June are continuing their work on the registration and identification as *Nazdemir gardneri*. In order to evaluate the antioxidant and radical scavenging activities of this plant, total phenolic compound amount determination, cupric ions (Cu²⁺) reduction capacity by the Kuprak method, Fe³⁺ reduction capacity by FRAP method, superoxide anion radical scavenging activity (O₂^{•-}), 1,1-diphenyl-2-picrylhydrazyl free radical (DPPH[•]) scavenging activity, 2,2'-azino-bis-(3-ethylbenzthiazoline-6-sulfonic acid) (ABTS^{•+}) radical scavenging activity was determined in water and alcohol extracts. BHA and α -tocopherol were used as standard antioxidants in the study. It was observed that the *Nazdemir gardneri* plant from the obtained findings exhibited antioxidative reduction activities in an effective manner. It can be thought that it contributes to the protection of the soil since it is grown under the soil. Our studies on the bioactivity and protection of this plant, which is accepted as one of the most valuable flowers in the world, continue.

TOTAL POLYPHENOL CONTENT OF METHANOLIC EXTRACT FROM ARUM DIOSCORIDIS SM. VAR. DIOSCORIDIS

ERDAL YABALAK¹, ÖZKAN GÖRMEZ¹, AHMET MURAT GİZİR¹

ABSTRACT

Arum L. is a genus of flowering plants which belongs to Araceae, represented by 26 species and distributed in Northern Africa, Mediterranean Region, Western Asia, and Europe [1]. Arum dioscoridis Sm. Var. Dioscoridis (A. dioscoridis) which is traditionally used in the Mediterranean gastronomy is a member of Arum L. [2]. Phenolic compounds which belong to phytochemical substances, are secondary metabolite that are generally produced in various plants [3]. In the last few years, they have gained common attention due to their positive impact on human health. Some of the benefits of phenolic compounds are antioxidant activity, antimutagenic, anticarcinogenic activities, anti-inflammatory and neuro-protective effects [4]. In this study, we have investigated total phenolic content of A. dioscoridis. Total polyphenol content was determined as 221.5 mg GA/100 g dried weight. MUCOSAL BURN ASSOCIATED WITH GARLIC IN A PATIENT WITH DENTAL PAIN: A CASE REPORT

ÖZLEM GÖRMEZ¹, MELIKE BAŞARAN²

ABSTRACT

Herbal products has been used in many cultures for treating various health problems for centuries. Garlic (*Allium sativum* L., Fam Liliaceae) which has widespread pharmacological effects, has been used as an alternative treatment method by patients in dentistry. But uncontrolled used of it may lead adverse effects. The aim of this report is to draw attention for the adverse effect occurred on the oral mucosa associated with uncontrolled used of garlic. A 38 year-old male patient was admitted to our clinic complaining of severe pain on the right mandibular posterior teeth. It was learned from the anamnesis that the patient had applied garlic topically around his teeth due to the pain. Intraoral examination revealed a broad mucosal burn which has white plaque appearance with eritematous area on the right buccal mucosa, gingiva around the right maxillary and mandibular posterior teeth. Also it was noticed that profound caries at mandibular second and third molar and, maxillary third molar. Dentists should enquire the patient about the use of herbal products while taking the patient`s history and be aware of adverse effects can occur from uncontrolled use of herbs like garlic.

ETHNOBOTANICAL USES OF SOME SALVIA L. (LAMIACEAE) SPECIES FROM HATAY (TURKEY)

FARUK KARAHAN¹, AHMET İLÇİM¹, BERNA DEMİR¹

ABSTRACT

Since ancient times, Salvia L. species have been used in traditional medicine for the treatment of diabetes and skin diseases. Salvia species are commonly used in Anatolia for colds, stomach aches, and sore throats. It is the largest genus of the family Lamiaceae, including over 900 species in the world and represented in Turkey by 94 taxa belonging to 89 species with 50% endemism. This plant is represented by 15 taxa and locally called "Ballık otu", "Hint Adaçayı", "Dağ Reyhanı", "Misk adaçayı" and "Dadırac" in Hatay city. The present study reveals the ethnobotany and traditional medicinal uses of 12 species of Salvia natural distributed in Hatay province (East Mediterranean of Turkey). The data on plants included botanical names, vernacular names, the parts used and specific purpose of use. The common preparation of the medicinal plants in the city are drink as tea and external. Local people commonly use for the remedy of respiratory system disorders, gastrointestinal system disorders, skin diseases and antimicrobial. Our results were comparatively discussed with the other literatures. We believe that finding of this study will significantly contribute to the ethnobotanical studies at local or regional scales.

THE PROFILE OF VOLATIL OILS OF MENTHA SPP. COLLECTED FROM DIFFERENT LOCATIONS OF TURKEY

HARUN DIRAMAN¹, AMIR SOLTANBEIGI², AYŞEGÜL TÜRK BAYDIR²

ABSTRACT

Mentha species have been consumed for many years in oriental and Mediterranean culture as tea and nutritional food addition due to their special flavour and aroma properties coming from its volatile oil. The volatile oil of the various types of the Mentha and the components of these various oil indicate main variation under effect of the type, variety, ecological conditions, management and harvesting time. These compositions are mainly used in food, pharmaceutical, cosmetics and perfumery industries. In this study, the volatile oils obtained by a hydro-distillation method from dried leaves of mint grown various locations (Afyon, Kahramanmaraş and Erzincan) of Turkey are investigated by gas chromatography-mass spectrometry (GC-MS, Agilent Technologies, 7890B) with an HP-Innowax column (Agilent 19091N-116: 60 m×0.320 mm internal diameter and 0.25 µm film thickness). MS scan range was (m/z): 35-450 atomic mass units (AMU) under electron impact (EI) ionization (70 eV). Identifications of the mint compounds were confirmed by using the MS database of US National Institute of Standards and Technology (NIST), Wiley libraries and literature data. The volatile oil contents of mentha samples were 0.5 – 1.25 % and refractive indexes were found 1,48148 - 1,49160. The major volatile compounds of dried leaf of Mentha samples were identified D-Carvone (47.83 – 26.93 %), 18-Crown-6 (12.38- 12.45 %), 1,8-Cineole (10.03 – 12.25 %), dl-Limonene (3.19 - 10.76) for three locations and in addition, Linalool, (16.09%), Linalyl acetate (6.87 %), 18-Crown-14 (6.83 %) and β-Cubebene (4.25%) for Afyonkarhisar sample with representing 99.9%. The high D-Carvone compound was determined 47,83 % in Kahramanmaraş sample when the lowest dl-Limonene 3.19 % in Afyonkarhisar sample. There were a remarkable variations among compounds of locations due to Mentha sub-species, different agro-ecological conditions and various harvest techniques, storage conditions. This project is supported by Afyon Kocatepe University AKÜ-BAP (Project No: 16.MÜH.05)

DETERMINATION OF CHARACTERISTICS OF INSTANT TEA PRODUCED FROM THYME (THYMUS VULGARIS)

CEMAL KAYA¹, ZEYNEP AKŞİT², SEMRA TOPUZ¹, HÜSEYİN AKŞİT¹, MUSTAFA BAYRAM¹

ABSTRACT

Herbal teas are prepared by brewing of dried plant leaves, flowers, fruits or roots in warm or hot water. Thyme (*Thymus vulgaris*) is widely consumed as spice in Turkey. Thyme which has essential oil, is used as natural antioxidant. In this study, it was aimed to determine some important properties of water soluble herbal tea powders produced by spray drying and freeze drying techniques from extracts obtained by applying the classic brewing and boiling method of thyme plant. Instant tea powders were obtained by spray drying and freeze drying techniques from watery extract of thyme. Some physical and chemical properties of these tea powders were investigated. Solubility in water, moisture content, yield, Hunter colour values (L*, a*, b*), total phenolic compounds and total sugar quantities were determined. The antioxidant activity of instant tea powders were evaluated with FRAP and TEAC tests. Some individual phenolic compounds and flavor compounds of thyme tea powders were determined by HPLC and GC-MS, respectively. Moreover, instant thyme tea powders were evaluated for their sensory properties. The results were compared with traditional brewing method. Solubility in water of thyme tea powders by using freeze drying and spray drying techniques were found 96,00; 98,67 and moisture content were found 7,31; 0,18%. Yield of tea powder produced from thyme plant (traditional; freeze dried; spray dried) were found 14,66; 22,10; 21,27 %. Moreover, the hunter colour values of thyme teas prepared by using traditional method, freeze dried powder, spray dried powder were 27,43; 26,12; 25,27 L*, 4,01; 4,70; 5,28 a*, -3,25; -2,44; -2,18 b*. Total phenolic content of tea produced from thyme (traditional; freeze dried; spray dried) were found as 18,90; 30,85; 34,60 mgGAE/100 mL and total sugar quantities were found as 33,93; 37,27; 47,06 mgGE/100mL. FRAP activities were found as 1301,27; 1573,59; 1794,51 µmolTE/100 mL and TEAC activities were found as 3807,15; 3949,70; 3967,52 µmolTE/100 mL, respectively. Spray dried herbal tea powders had less flavoring agents because of heat application during drying. Thyme contains volatile oil, carvacrol. The boiling point of carvacrol is 237.7 ° C. Due to the high boiling point, the presence of carvacrol residue in the powdered thyme tea is an expected result. But; other thyme volatile components with lower boiling point are lost during the thermal process applied in production. But, other thyme volatile components with lower boiling point were lost during the thermal process in the production process. When the results of the sensory analysis were examined, the highest average was obtained by traditional method and followed by freeze drying techniques, spray drying, respectively. In this sense, the most important factor may be preservation or losing of volatile aroma components during processes. Because of the unique aroma of the most important feature of thyme tea, it is suggested to add flavor to the thyme tea produced by the spray drying technique.

DETERMINATION OF İSTANBUL BELGRADE FOREST PHARMACOLOGICAL OPTION VALUE BY PEARCE- PUROSHOTHAMAN (P & P) MODEL

MEHMET ALAN¹, ALI GÜREL², MEHMET ÖZDEMİR², AHMET TUTAR³

ABSTRACT

The Belgrad Forest is located on the European side of Istanbul, north of the residential areas, between 28 ° 53'25"29 ° 00'55 " east latitude and 41 ° 09' 44'-41 ° 14'40'th latitude . The forest begins to descend in the southeast direction of the Yıldız Mountains as a land structure, resulting in a slight fluctuation in the Istanbul Strait. The highest point is Kartaltepe in the northern part with a rise of 230 meters. Another notable elevation is Kokmuştepe in the north-east of the forest with an elevation of 219 meters. The lowest point within the forest (Kurudere) is 40 meters above sea level. The Belgrade Forest, a natural and cultural heritage, has a flora and variety of plant taxon varieties. It can be seen that the plant contains not only the Balkan Flora in terms of geography but also colchic, mediterranean and central european flora elements which are also in character. In this direction, there are approximately 400 plant taxa and 6 endemic plant taxa in the Belgrad Forest, which has an area of only 5524 hectares. Because of Istanbul's special position, the Belgrad Forest, which has a wide variety of climate, soil and ground forms, allows this variety to live in a wide variety of different species of plants and animals within the forest. The Belgrad Forest, which is the closest forest area to the city center in Istanbul, has been subject to numerous scientific researches due to its importance for the past and present day. One of the most researched forests in Turkey has come into existence. Until now, however, no study has been conducted on the pharmacological option value of this forest, which is the source of this rich biodiversity. The Pearce and Puroshothaman model is based on the rental income approach of Ruitenbeek (1989). This approach is based on the assumption that countries with herbal genetic material that will be necessary for the pharmaceutical sector in the future will need to obtain these assets - rent income, or annuity, in exchange for using the firm, and that this lease value will reflect the pharmacological value of plants. Pearce and Puroshothaman (1992), based on the rental income approach, expressed the medical (pharmacological) value of a plant in a protected biodiversity field that could produce the drug "D" in the future. In this study, pharmacological substances and drugs that can be obtained from Belgrade forests, pharmacological option value according to Pearce and Puroshothaman model; The low estimate was set at 70.60 per unit area, 905.14 with the medium estimate, and \$ 12671.97 / ha / year with the high estimate.

THE CHERRY LAUREL: COMPOSITION AND İMPACT ON HUMAN HEALTH

ŞENOL KÖSE¹, YAĞMUR ERİM KÖSE¹

ABSTRACT

Cherry laurel (*Laurocerasus officinalis*) is a typical summer fruit from the eastern Black Sea Region of Turkey and locally called Karayemiş or Taflan. It is consumed as fresh, dried, marmalade, jam, canned and pickled forms in Black Sea Region. Cherry laurel is used in cosmetics industry and treatment of some diseases for example stomach ulcers, bronchitis, eczemas, hemorrhoids and etc. Also it is used food additives as flavoring agent. The annual consumption of this fruit is not known precisely because it is sold in local markets in Black Sea Region. It is getting popularity at a commercial scale in the United States, Europe, Asia and Turkey. These fruits contain high levels of micronutrients and phytochemical constituents. Although individual phytochemical constituents of cherry laurel have been studied for their biological activities, the effects of these compounds on human health are not entirely clear. The aim of this review is to outline some physical, mechanical, chemical properties, and bioactive compounds and impact on human health of cherry laurel.

MINERAL COMPOSITION OF SOME MEDICINAL MUSHROOM SPECIES GROWN IN VAN PROVINCE (TURKEY)

SEMA SEZGİN¹, ABDULLAH DALAR¹, YUSUF UZUN¹

ABSTRACT

Minerals are vital chemical compounds for humans which have crucial functions such as maintaining acid-base balance, the osmotic regulation of fluid and oxygen transport in the body and also playing important roles in the catalytic processes within the enzyme system associated with the metabolic, endocrine and immune systems (Koyyalamudi et al., 2013). Mushrooms have been used as important dietary supplements because of their pleasant tastes, nutritional and pharmaceutical properties such as rich protein, low-fat content, secondary metabolites, vitamins and minerals. *Tricholoma scalpturatum* (Fr.) Qué. (Tricholomataceae), *Neolentinus cyathiformis* (Schaeff.) Della Maggiora & Trassinelli (Polyporaceae), *Chlorophyllum agaricoides* (Czern.) Vellinga (Agaricaceae), *Tricholoma populinum* J.E. Lange (Tricholomataceae) and *Lycoperdon utriforme* Bull. (Agaricaceae) are five edible-medicinal mushroom species consumed for their nutritional and therapeutic properties by local people of Van province. The aim of the present study was to evaluate the mineral composition of five edible-medicinal mushrooms naturally grown in Van province, Turkey. The mushroom samples (fruiting bodies) were collected from wild areas on October 2016. Different extraction methods were applied in order to reveal the mineral composition of the samples comprehensively. The extractions were analyzed by Inductively Coupled Plasma Optical Emission Spectroscopy (ICP-OES) and Atomic Absorption Spectroscopy (A.A.S). Within this presentation the concentration of Ag, As, B, Ba, Be, Cd, Co, Cr, Cu, K, Mg, Mn, Mo, Ni, Pb, Sb, Se, Si, Ti, V, Zn, Na, Ca and Fe of the extracts prepared from five edible-medicinal mushroom species will be presented in light of scientifically proven physiological activities if available will be presented. DETERMINATION OF ANTIOXIDANT PROPERTIES AND VOLATILES IN RAW AND PICKLED GREEN/BLACK OLIVES

ZEHRA KASIMOĐLU¹, HİLAL ŞAHİN-NADEEM²

ABSTRACT

Olive (*Olea europea*), a member of Oleaceae, is native tree of the Mediterranean climate. Its pickled fruits are consumed in daily diet, especially in the breakfast. Olive oil obtained from fruits is also frequently used in the world. The olive may be green or black according to the degree of ripening at harvest. Ripening of olive is a long process that takes place in 6-8 months. The optimum harvesting time differs according to the purpose of the olive processing. If the green table olives are to be processed, the fruits should be harvested when their color turns to yellowish-green (September-October). On the other hand, if black olive is desired, the fruits are harvested after the fleshy part become darker (November-December). To get oil, the olives are to be harvested when there is no green fruit in the tree. In this study, dry matter (gravimetric method), total phenolic content (spectrophotometric by using Folin Ciocalteu assay), antioxidant activity (spectrophotometric by using DPPH radical scavenging assay) and volatile components (by SPME-GC-MS) were determined for the Memecik type green and black olives. The samples were obtained from the local processor of Milas (Muđla province, Turkey) during the pickling period of 0, 12, and 25 days. At the end of pickling, dry matter content of the green and black olives increased from 22.89 to 44.71% and from 41.78 to 69.66%, respectively. Total phenolic content and antioxidant activity decreased during the pickling. The total phenolic content of the raw green and black olives, which were initially 230.22 and 202.51 mg/100g, respectively, decreased to 190.12 for green olives and to 192.21 mg/100g for black olives after 25 days of pickling. Similarly, the EC₅₀ values of 0.36 and 0.44 g/mg DPPH of the raw green and black olives, respectively, increased to 0.40 in the green olive and 0.52 g/mg in the black olive after 25 days, so that the antioxidant activity decreased. GC chromatogram showed 13 volatiles in the raw green olive while 12 were found in the raw black olive (peak areas greater than 1 %). The main volatile compounds extracted from raw green olive by SPME method (using PDMS / DVB fiber) were 3-O-methyl-D-fructose (19.50%), hexanal (16.52%), butanol (13.96%), butan-2-one (11.76%) and 2-propanamine (8.65%) while butanol (18.11%), n-pentanal (14.23%), carbamic acid (9.52%), hexanal (9.32%) and formic acid (8.35%) were the main volatiles in the raw black olive. At the end of pickling, the major volatile components in the green olive were acetic acid (31.79%), mannopyranose (10.76%), D-fructose (10.23%), pentanal (7.25%) and 1,3-propanediol (7.05%) whereas ethanol (31.99%), butanol (18.25%), acetic acid (8.84%), D-mannofuranoside (8.50%) and 1,3-propanediol (4.56%) were in the pickled black olive.

EFFECTS OF DRYING TECHNIQUES ON SOME QUALITY PROPERTIES AND LIMONENE CONTENT OF ORANGE PEEL

HAMZA BOZKIR¹, YELİZ TEKGÜL², TANER BAYSAL³

ABSTRACT

Excessive amounts of solid waste occur in fruit processing plants and consumption of fruit. When these wastes are released directly to the environment, they can cause environmental pollution, besides, wastes that can be used for the production of valuable biomass and nutrients will be lost. For this reason, utilization of food industry wastes provides added value in economic terms. Moreover, it also provides benefits in terms of health and nutrition because the mentioned wastes contain valuable components for human metabolism and enrichment of foods. As a result of orange peel contains ingredients that are important for nutrition, the free radicals that build are strengthening immune system. The orange peel with high bioavailability can be dried and used in the food, pharmaceutical and cosmetic industries. The purpose of this study is to investigate the effects of drying techniques on some quality characteristics (color, vitamin content, total phenolic content, anthocyanin content, bulk density, rehydration capacity) and limonene content of the orange peel. Vacuum microwave dryer (877 mbar, 50 °C, 334 watts) and tray dryer (50 °C, 1.5 m/s) were used. It has been found that the vacuum microwave dryer reduces the drying time compared to the tray dryer. Limonene content of orange peel increased with drying process. It has been found that the vacuum microwave dryer significantly preserves color (L*, a*, b*, ΔE, Hue°, and ΔC), vitamin C content, aroma components and total phenolic content more than tray dryer.

KONJAC (AMORPHOPHALLUS KONJAC) FLOUR

YAđMUR ERİM KÖSE¹

ABSTRACT

Although Konjac (*Amorphophallus konjac*) is an unknown plant in Turkey, it has been used in countries like China, Japan, Indonesia and South East Asia for many years as a food source and as a traditional medicine. It is a large, perennial exotic plant with large starchy corms (underground storage organ) and a single large leaf. Konjac flour is obtained from the corm which is washed, peeled, sliced, dried and ground. The flour is known to be a valuable source for glucomannan; a high-molecular weight and water-soluble polysaccharide (dietary fibre). The flour is used as a functional food in the form of noodle, spaghetti, rice, tofu and snacks. These foods lower blood sugar in patients with diabetes due to konjac glucomannan delays glucose absorption. Furthermore these foods may help weight loss by filling the stomach and promote colonic mucosal health due to increase fecal weight and reduce transit time by dietary fiber. It is also widely used in food and pharmaceutical industries as a emulsifier and stabiliser because of its valuable properties for example it is easily dispersed in water, it is a favorable thickening agent and it has high water absorption. Konjac gel is a well-known traditional medicine in China for more than 2000 years. It is prepared from konjac flour and it is used for the treatment of asthma, breast pain, infection, burns, atopic skin disorders etc. The purpose of this paper was to introduce the konjac flour in a larger scale. Thus, use of the konjac plant in both food and pharmaceutical industry may increase.

THE USE OF MEDICAL AND AROMATIC PLANTS AND SOCIO ECONOMIC LIFE

AYHAN SAYĞI¹, HÜLYA SAYĞI¹, MEHTAP BAYKAL¹, CELAL ERBAŞ¹

ABSTRACT

Our country, which has a rich biodiversity, is home to countless medical and aromatic plants. Since the early days of human history, plants have been characterized as a fundamental resource for the production of medicines used to protect human health, as well as providing the nutrients that humans need for the continuation of human life. Therapeutic use of plants has begun with the history of mankind, and people have used the therapeutic power of plants to solve their health problems and stay healthy. Herbal medicines, which are common in local medical practices, also called alternative medicine, have been produced at the end of long experiences and are widely used today. Many medicines used in modern art are also derived from plants. It was unthinkable that medicinal and aromatic plants with so much precaution did not fall within the scope of economic activities that produced solutions for human needs. As a result, medical and aromatic plants are estimated to reach \$ 95 billion in 2015, while the market is expected to reach \$ 110 billion by the end of 2016. Turkey's medical and aromatic plants are worth \$ 2.5 billion (Source: Dünya Gazetesi 16.03.2017). These figures are proof that our country's medical and aromatic plant diversity is a new opportunity for our people to survive in the countryside. The employment provided in the production process for the medical and aromatic plants of our country will improve the socio-economic situation of the people living in the rural areas by providing justice in the income due to the high income to be provided while being a solution to the problem of unemployment. In this study, it is aimed to investigate the advantages provided by the production of medicinal and aromatic plants and socio-economic development effects.

INVENTORY OF MEDICAL AND AROMATICAL PLANTS

DERYA MUMCU KÜÇÜKER¹

ABSTRACT

Interest in medicinal and aromatic plants has greatly increased recently due to their commercial, nutritional and medical importance. These plants derived from natural forests are used as pharmaceuticals, herbal remedies, flavourings, perfumes and cosmetics, and other organic products. Utilization from medicinal plants as traditional remedies is very common for rural population in developing countries. World Health Organization (WHO) decelerated that about 80% of world population still is used medical plants for remedies. Medicinal and aromatic plants play a critical role for health service and rural development because of their additional income. Turkey is considered to be a rich country in terms of plant diversity. Of the estimated 11,707 plant species as well as sub species and varieties (Güner et al. 2012) naturally occurring in the country, about 1/3 are considered as aromatical plants. While about 347 medical and aromatical plants with their parts of leaves, roots, bark, flowers or fruits are consumed in the domestic markets, about 100 plants are exported to the international markets (Başer, 1997). The high economic value in national and international markets caused to increase harvesting of these plants by rural people. Remarkable amount of medical and aromatic plants belonging to about 100 species are being harvested. The urgent need for sustainable utilization from medicinal and aromatic plants is characterizing their species diversity, spatial distribution, abundance and ecology with suitable inventory methods. Because these studies are difficult to measure or time and money consuming for all species, these information should be prepared for economically priority plants. Beside inventory methods, inventory time, sample size and shape for each medicinal and aromatic plants and their beneficial parts have serious deficiencies. This paper tries to highlight all the important aspects in inventory of medicinal and aromatic plants and identify some useful inventory methods for these products.

STEM AND LEAF ANATOMY OF FOUR MEDICINAL REPRESENTATIVES OF CREPIS L. (ASTERACEAE)

KEMAL VEHBİ İMAMOđLU¹, HÜSEYİN İNCEER¹, ÖZGE DUMAN¹, SEMA HAYIRLUOđLU-AYAZ¹, NURSEN AKSU-KALMUK¹

ABSTRACT

The genus *Crepis* L. belongs to the tribe Cichorieae of the Asteraceae family. Most of this genus's members have "Crepin" matter. *Crepis foetida* subsp. *foetida*, *C. foetida* subsp. *rhoeadifolia*, *C. vesicaria* and *C. zacintha* are medicinal plants which are used in the folk medicine. However, no stem and leaf anatomy of these medicinal plants have been studied till now. Anatomical studies were performed in the stem and leaf. Transverse sections from middle parts of the stem were taken by hand using commercial razor blades. The leaf anatomy has been observed both side of the leaves. The anatomical characters were measured using an ocular micrometer under the light microscope. The stem structure of *Crepis foetida* subsp. *foetida*, *C. foetida* subsp. *rhoeadifolia*, *C. vesicaria* and *C. zacintha* is composed of epidermis, collenchyma, parenchymatous cortex and pith. These species have anomocytic stomata in both the upper and the lower surface of the leaves. This study was supported by the Scientific and Technological Research Council of Turkey (TUBITAK, Project no. 112T132).

THE INVESTIGATION OF BIOLOGICAL ACTIVITIES AND HPLC-DAD-MS ANALYSIS OF MAJOR PHENOLIC COMPOUNDS OF HELICHRYSUM PLICATUM DC. SUBSP. PLICATUM

TUĐBA GEZMİŐ¹, TURGUT TAŐKIN¹, DUYGU TAŐKIN², BERNA ÖZBEK ÇELİK³, İSMAIL ŐENKARDEŐ¹, SEVDA SÜZGEÇ SELÇUK¹

ABSTRACT

The tribe Gnaphalieae of Asteraceae comprises 185 genera and more than 1240 species. Helichrysum Mill. is the largest genus of this tribe, including approximately 600 species occurring in Europe, Asia, Africa and Madagascar. This genus which is represented by 24 species, 30 taxa of which, 17 are endemic, has been recorded in the Flora of Turkey (1). Helichrysum species are largely known as "ölmez çiçek, altınotu or mantuvar" in Anatolian folk medicine. Helichrysum species have been used as folk medicine for at least 2000 years against gall bladder disorders in the form of medicinal teas, because of their bile regulatory and diuretic effects. In Turkey several Helichrysum spp. are used in folk medicine for removing the kidney stones and as diuretics. The diuretic and bile regulatory effects of the Helichrysum spp. are due to the flavonoids that they contain (2). In Turkish folk medicine, H. plicatum DC. subsp. plicatum has been used as a diuretic, antidiabetic, lithagogue and for stomach ache (3). The aim of this study was to investigate phenolic composition and compare evaluation of biological activities of H. plicatum subsp. plicatum. In the present study, The total flavonoids contents, antioxidant, anti-urease, antimicrobial activities of different extracts from H. plicatum subsp. plicatum were compared. The extracts were quantitatively analyzed for total flavonoid contents using aluminium chloride colorimetric assays. Antioxidant activity of the extracts was measured using the DPPH., ABTS.+ scavenging activities and FRAP assay. The urease inhibitory activities of the extracts were determined according to a reported method (4). In addition, antimicrobial activities of extracts were investigated using microdilution methods (5). The methanol extract obtained by using Soxhlet method of H. plicatum subsp. plicatum had the highest amounts of total flavonoids and showed the highest DPPH. radical scavenging and ferric reducing activity. Subsequently, we tried to identify the major phenolic compounds in methanol extract by HPLC-DAD/ESI-Q-TOF LC/MS. The major phenolic compounds were identified as: chlorogenic acid, dicaffeoylquinic acid, luteolin, luteolin 7-O-glycoside, naringenin-O- hexoside and isoquercetin. References: 1. SUSTAINABLE PLANNING OF MEDICAL AND AROMATICAL PLANTS

DERYA MUMCU KÜÇÜKER¹

ABSTRACT

Turkey forest ecosystems have abundant resources of medicinal and aromatical plants. In case the forest ecosystems are managed based on sustainable production, these natural resources provides economic, ecologic and social-cultural benefits to the people. Medicinal and aromatical plants and mushrooms with their various parts of fruit, leaf, root, flower and bark are vital forest resources and have to be integrated into multiple-use forest management plans. However, these economically important plants is being threatened with forest destruction, land use changes and excessive collection from their natural habitats. Therefore, there is an urgent need to integrate these products into multiple-use forest management plans both conservation and utilization. The initial step towards the integrated management is to perform the inventory and documentation of existing medicinal and aromatical plants. All information on quality and quantity of population as well as their location. It would be necessary to identify priority medicinal and aromatical plants and to decide priority interventions and policies on conservation and harvesting. The second one is to estimate the relationship between these valuable products and climatic, topographic and stand parameters and to develop empirical models to predict the annual yield of these products. The last step of medicinal and aromatical plants integrated management is to use decision support systems enabling decision making process with trade of analysis of both timber and related non-wood forest products (NWFP). Though much information exists on the species diversity in medicinal and aromatical plants in the country, relatively very little is known about the spatial distribution, productivity and ecology of the great majority of medicinal and aromatic plants. This study explains the fundamental components of joint production of timber and medicinal and aromatical plants and conceptional framework of the integration of medicinal and aromatical plants into multiple-use forest management plans. In addition, this paper presents some examples of integration of medicinal and aromatical plants into forest management plans.

APOPTOTIC EFFECT OF FERULIC ACID ON MCF-7 HUMAN BREAST CANCER CELL LINE

CANAN EROĐLU¹, EBRU AVCI¹, HASIBE VURAL¹, ERCAN KURAR¹, MÜCAHİT SEÇME², YAVUZ DODURGA²

ABSTRACT

Breast cancer is the second considering the most common cancer-related mortality in women. In the worldwide, about 1 million people are diagnosed with breast cancer each year. In recent years, studies have been focused on investigating anticancer features of various phytochemical compounds. These compounds can be used as complementary or alternative therapeutic agents. Ferulic acid (FA; 4-Hydroxy-3-methoxycinnamic acid) is known as an abundant phenolic compound found in various fruits and vegetables. It has been described to act as a potent antioxidant and the anticarcinogenic effect of FA has been demonstrated through studies involving various cancer cell lines. The aim of study was to investigate the effects of FA on apoptosis in MCF-7 human breast cancer cell line. The effect of FA on cell viability was determined by using XTT method. Total RNA was isolated with TRIzol Reagent. Expressions of genes are important in apoptosis including BAX, BCL2, CASP3, CASP7, CASP8, CASP9, CYCS and FAS were evaluated in control and dose groups by qPCR. IC50 dose of FA was found as 600 μ M for 72h in MCF-7 cells. When compared with the control group, qPCR results illustrated that a significant increase was observed in the expressions of FAS, CASP3, CYCS and CASP9 genes as 1.85, 2.35, 2.67 and 5.82 folds respectively, whereas there was a decrease in the expression of BCL2 gene as 1.91 fold. In conclusion, it is thought that FA demonstrates apoptotic effect by regulating expression of important genes in apoptosis on MCF-7 cells. However, further molecular and functional analyses are required to clarify its effect on breast cancer.

DETERMINATION OF SOME BIOACTIVITIES AND CHEMICAL COMPOSITION OF TULIP (TULIPA ARMENA) PLANT & INVESTIGATION OF USABILITY AS HOMEOPATHIC DRUGS

NAZAN DEMİR¹, ÖZGE AKIN¹, YAŞAR DEMİR¹, FATİH UÇKAYA²

ABSTRACT

Tulip (*Tulipa armena*) plant is from family of Liliaceae. It is a perennial herbaceous plant. The tulip has a special place in eastern culture and mythology. Also it has a unique place in our culture. It has name after a historical period. More than 100 tulip cultivars naturally grow in our soil and a large part of them is endemic. The tulip, a kind of national flower, therefore it has specially selected in our study and it has been investigated whether it can be used in the production of homeopathic medicines by getting some information from the public. Homeopathy is based on the principle of "heal similar alike". A disease is treated only with the substance that produces an indication similar to the patient's complaints. Homeopathy was found by German physician Samuel Hahnemann in the early 18th century and it is an alternative treatment system that helps the body develop itself naturally. According to the data of the World Health Organization, it is the most commonly used complementary medicine method. In Europe, more than 50% of people are treated with homeopathic treatment. Furthermore more than 50% of doctors recommend homeopathy together with other treatment modalities. Homeopathic medicines are produced by the original material being stored in water or alcohol followed by a series of dilution and mixing methods. For this purpose, the tulip were collected from Mugla countryside, defined as botanical followed by content analysis was performed with LC MS. Moreover, this research include investigation of protein, phenolic component and some enzyme activities (protease and peroxidase). Three-phase partitioning method was used for purification of enzyme from flowers of Turkish tulip. The values of optimal pH and optimal temperature were determined. The SDS-PAGE technique was used to check the purity of the purified enzyme and determine the number of subunits, if any. The molecular weight was also calculated using gel filtration chromatography. As a result, the protease enzyme was purified from Turkish tulip flowers and its phenolic components were determined. It has been found that the purified protease enzyme has high activity. The plant extracts were prepared in different organic solvents and water. Furthermore Dilution grades of extracts were determined for animal experiments. As a result of preliminary surveys and content analyzes, it is understood that the plant is a flower that can be used in homeopathy. It is planned that it is submitted to the approval of The Ministry of Health as a traditional and complementary product by optimizing usability as a medicine. REFERENCES [1] Lehninger, A. L. NATURAL ANTIMICROBIAL SUBSTANCES OF VEGETABLE ORIGIN

TUBA BÜYÜKSİRİT¹, HAKAN KULEAŞAN¹

ABSTRACT

The main goal of food technology is to prevent food spoilage, thereby ensuring food safety in foods is to take control of microorganisms. Therefore, adding additives to the product of microbial activity declines biggest advantage, which can maintain stability for a long time after opening the package of the food. Food industry, competition for the market share to be effective and must meet the demands of consumers. Consumers too much untreated, naturally, at least at the level of protective foods containing chemicals are wanted. Investigate the possibility that new types of antimicrobial drug use is encouraged. Artificial preservatives due to their adverse effects on the health of consumers has increased the interest for natural antimicrobial substances. In recent years, for medicinal purposes and the use of plant nutrients kept focused on the research and therefore the importance of using plants as natural antimicrobials is increasing every day. Natural protection systems of animal, plant or microbial origin are used in the protection of foods. Antimicrobial agents obtained from natural sources such as plants has managed food safety and plant extracts naturally in foods can be used as an antimicrobial has been proven by scientific research. More than 1340 types of plants formed about 80 of them from spices and herbs, most of them have a small molecular weight is known to be a source of potential antimicrobial agents. Studies made until today proved antimicrobial effect of plant extracts such as *Parmelia furfuracea* L. Zopf. (lichen), *Crocus chrysanthus* Herbert (crocus), *Myrtus communis* L. subsp. *communis* (mersin), *Asphodelus aestivus* L. (çiris) *Eugenia caryophyllata* Thunb. (carnation), *Artemisia absinthium* L. (wormwood herb), *Ornithogalum Umbellatum* L. (akyıldız), *Hedera helix* (ivy), *Datura stramonium* (pipeflower), *Ficus carica* (fig), *Avena sativa* (oat), *Xanthium strumarium* (pıtrak grass), *Nicotiana tabacum* (tobacco) etc.

ABSTRACT

Algae take an important place in the ecosystem because of their protecting effect on the balance of the ecosystem, generating almost one-third of total photosynthetic carbon on Earth, and also feeding aquatic creatures [1]. Enteromorpha genus is a common macrophytic green alga with a tubular thallus found mainly in salty waters. It is often possible to observe some species in from different types of freshwater habitats to the coastal region where photosynthetic light is available. Enteromorpha intestinalis have a wide range of acceptable salinity, temperature and light conditions, meaning that it can be found frequently. Enteromorpha intestinalis have approximately 20-26% protein, some oil ,and 19-23% mineral. They contain low level of sodium and high level of iron and calcium. The level of vitamin B and vitamin A in Enteromorpha intestinalis is higher than that of most plants [2]. In this study, Enteromorpha intestinalis that were gathered from Trabzon-Sürmene in March (2017) were used. Antioxidant activity of methanolic extract of the algae and phenolic profile were investigated. As antioksidant parameters, total amount of phenolic components, 2,2-diphenyl-1-picrylhydrazil (DPPH) and Iron(III) reduce/antioxidant capacity (FRAP) were performed [3][4][5]. The total amount of polyphenol in Enteromorpha intestinalis was seen as 240 mg GAE/100g. Via Reversed phase-High Performance Liquid Chromatography(RP-HPLC-UV) and liquid- liquid extraction, phenolic components in Enteromorpha intestinalis were analyzed. The amount of gallic asid, p-OH benzoic asid, vanilic asid, coumaric asid, epicatechin, rutin, daidzein, and luteolin were determinated. Protocatequic acid, catechin, caffeic acid, syringic acid, ferulic acid, and t-cinnamic acid were not determinated. As results of the study, it is seen that Enteromorpha intestinalis have considerable amount of phenolic components and high level of antioxidant capacity. References; 1. Özdemir, N., & Erkmn, J. USE OF AROMATIC AND MEDICINAL PLANTS BY LOCALS IN SOUTH ASIA

HILAL SAHİN-NADEEM¹, SAİD NADEEM²

ABSTRACT

Plants, both aromatic and medicinal, have been used in different forms by humans throughout the history. Various civilizations have used these plants in different forms; single or a formulation. In Indo-Pak, they are used in the form of Yunani medicine, Ayurveda and other folk medicines. In Ayurveda medicinal system, the formulation may be derived from roots, leaves, seeds, fruits and barks of various plants. Purified opium is used in eight Ayurvedic preparations to cure diarrhea, dysentery, as well as to increase the sexual and muscular ability. Yunani medicinal system is based on the teaching of Greek physicians Hippocrates and Galen. This medicinal system is mostly used in Pakistan and muslim cultured central Asia as an alternative to chemotherapy. This system was practiced in Mughal India for treatments of different diseases. Various plant extracts are prepared in the form of syrups and pastes for oral administration. In addition to the medicinal plants, there are various locally prepared perfumes in the market that are used in the religious activities by Muslims and Hindus.

FOLK MEDICINAL AND AROMATIC PLANTS OF TOKAT

SEMRA TOPUZ¹, MUSTAFA BAYRAM¹, CEMAL KAYA¹, MEHMET GÜLDANE¹

ABSTRACT

Tokat which take part in Karadeniz region, is flanked by Samsun to the north, Amasya to the northwest, Yozgat to the southwest, Sivas to the southeast, and Ordu to the northeast. Yeşilyurt and Sulusaray districts of Tokat remain in Central Anatolia Region. Tokat is located between 39° 51'- 40° 55' north latitudes and 35° 27'- 37° 39' east longitudes. Surface area of Tokat is 10,071 km² and elevation from sea level of agricultural land varies between 230 m and 1500 m. Climate type of Tokat has transition characteristic. Tokat has considerably rich flora of medicinal and aromatic plants due to convenient of climate and soil characteristics. Some of the medicinal and aromatic plants grown in Tokat are peppermint (*Mentha piperita* L.), thyme (*Thymus vulgaris*), basil (*Ocimum basilicum* L.), sage (*Salvia officinalis*), madımak (*Polygonum cognatum* Meissn), sorrel (*Rumex acetosella*), yarrow (*Achillea filipendulina*), couch (*Agropyron repens*), mahaleb cherry (*Prunus mahaleb*), hollyhock (*Alcea rosea*), wormwood (*Artemisia absinthium*), daisy (*Bellis perennis*), lavandula (*Lavandula* spp.), echinacea (*Echinacea* spp.), parsley (*Petroselinum crispum*), garlic (*Allium sativum*) haw (*Crataegus aronia*), herba equiseti (*Equisetum arvense*), fumitory (*Fumaria officinalis*), tipton's weed (*Hypericum perforatum*), mallow (*Malva sylvestris* L.), caper (*Capparis* spp.), lemon balm (*Melisa officinalis* L.), rosehip (*Rosa canina*), holunder (*Sambucus nigra*), butterbur (*Tussilago farfara*), nettle (*Urtica* sp.), mullein (*Verbascum pyroliforme*), fenugreek (*Trigonella foenum-graecum* L.) coriander (*Coriandrum sativum* L.), poppy (*Papaver somniferum* L.), sorb (*Sorbus* L.), linden (*Tilia* L.), black sesame (*Nigella sativa*), cornelian cherry (*Cornus mas* L.), goji berry (*Lycium barbarum*), jujube (*Ziziphus zizyphus*), etc. Increasing interest of consumers in health care, herbal medicines and organic, natural foods reawaken medicinal and aromatic plants in the world. Medicinal and aromatic plants can be used against high blood pressure, kidney ailments, rheumatism, urinary system diseases stomach ailments, diabetes, anaemia etc in folk remedy. For instance, Madımak (*Polygonum cognatum* Meissn) is widespread in agricultural areas or non-agricultural areas such as cropland boundaries, roadsides, slopes and the cliffs in Tokat. Besides being consumed as food, Madımak is used diuretic and against nephrolithiasis and diabetes mellitus in folk remedy. Medicinal and aromatic plants which has wide field, are used mainly at pharmaceutical, cosmetic, food and chemical. There are some private establishment on medical and aromatic plants in Tokat and its region. Studies for improving the cultivation of medicinal and aromatic plants are being carried out in Tokat.

USE OF SEVERAL MEDICAL AROMATIC HERBS WITH ANTI- OXIDATIVE AND ANTI-MICROBIAL EFFECT IN FOODS

FADİME SEYREKOĐLU¹, SULTAN ACUN¹

ABSTRACT

Medical and aromatic herbs and the products such as essential oils obtained from those herbs are widely used in medicine, cosmetic, and food industries, as well as they meet the food requirement of humans in our country and throughout the world. Various antimicrobial and anti-oxidative materials used in order to maintain the physical, chemical, and biological properties of foods may be exposed to various sorts of deterioration during the storage period. Since it was determined that the use of synthetic preservatives causes various diseases, their use in food was limited. In food industry, the researches on natural materials to be used in order to prevent the oxidation and microorganism-origin deteriorations were initiated. In such studies, many of medical and aromatic herbs were found to contain high level of antimicrobial and antioxidant effects. It was determined that the herbs such as thyme, sage, rosemary, black sesame, ginger, and marjoram were found to have antimicrobial effect on microorganisms such as *E. coli*, *L. monocytogenes*, and *S. aureus*. Moreover, the essential oil components such as Carvacrol p-cymene were found to have preventive effect on lipid peroxidation. Prevention of oxidation positively affects maintaining the sensorial qualities of foods such as taste and color, and this contributes to the higher quality of products to be served to customers after a storage period. The medical and aromatic herbs being used may also be utilized in order to flavor the foods. Furthermore, some of the plants might be used as tea. In performed studies, the bee balm plant used as additive in food industry was found to have antioxidant effect on gels, fruit salads, and cold beverages and to neutralize the free radicals. Beside the use of medical and aromatic herbs in foods, they are also used in feeding the animals, and they were reported to contribute to increasing the quality of layer hens and broilers. In recent years, when the use of natural materials in food products instead of using synthetic antioxidant or antimicrobial agents increased, these natural herbs having positive effects on human health should be corroborated and encouraged via the researches.

THE ROLE OF NUTRACEUTICALS ON HEALTH

SEMRA TOPUZ¹, MUSTAFA BAYRAM¹, CEMAL KAYA¹, MEHMET GÜLDANE¹

ABSTRACT

The nutraceutical term is combination of ‘‘nutrition’’ and ‘‘pharmaceutical’’ words. Nutraceuticals which have strong physiological functions and bioactivitie, can protect health and restrain some diseases, is regulated as drug, dietary supplement, food ingredient or food. They show protective or physiological benefits against chronic diseases, but they are not considered as medicines. Gamma-aminobutyric acid (GABA), hyaluronic acid (HA), glucosamine (GlcN), N-acetylglucosamine (GlcNAc), glutathione (GSH), alpha-ketoglutaric acid (α KG), vitamin B12, folate, riboflavin, carotenoids (β -carotene, lycopene, lutein, zeaxanthin etc.), glutathione (GSH), oleic acid, docosahexaenoic acid (DHA), eicosapentaenoic acid (EPA), arachidonic acid (ARA), conjugated linoleic acids (CLAs), γ -linolenic acid, coenzim Q10, β -glucan, ascorbic acid, caffeic and gallic acid, catechins, phytosterols, minerals (zinc, calcium etc.), resveratrol, quercetin, oleuropein, hydroxytyrosol, capsaicin, inulin, fructooligosaccharides (FOS) can be given as example of nutraceuticals. Nutraceutical have shown therapeutic effects. For instance, caretenoids have capacity to quench oxidative radicals, They exhibit anticancerogenic effect. Lycopene which reduces the risk of prostate, breast, digestive tract, bladder, skin and cervix cancer, is found tomatoes, watermelons and red grapefruits. Phytosterols reduce serum cholesterol levels in humans. When foods containing β -glucan is consumed, blood cholesterol, LDL cholesterol levels and the risk of coronary heart disease are reduced. Hyaluronic acid which extracted from animal tissues, stimulate fibroblast proliferation and collagen synthesis. CLAs reduces plasma lipoproteins, strengthens immunity and inhibits cancer cells. α -KG induces procollagen and protein synthesis, regulates blood sugar level, helps treated to nervous system diseases and acute lung injury. Nutraceuticals have many more effects such as hypolipidemic, antiinflammation, antiaging, antidepression, antiulcer, immunity booster, detoxifier, etc. Nutraceuticals are usually obtained by chemical synthesis and extraction from natural sources. Microbial synthesis is more convenient for nutraceutical production due to the fact that chemical synthesis and extraction from natural sources have some disadvantage such as requirement high energy, occurrence of toxic by-products. GRAS (Generally Regarded As Safe) strains are used for microbial synthesis of nutraceuticals. Lactic acid bacteria, propionibacteria, Saccharomyces cerevisiae, Yarrowia lipolytica, Spirulina from GRAS strains used production of common nutraceuticals such as hyaluronic acid, trehalose, folate, riboflavin, carotenoids, conjugated linoleic acids (CLAs), γ -linolenic acid, gamma-aminobutyric acid (GABA). Nutraceuticals are generally considered safe, but they can be harmful if taken at high doses. Moreover, People which posses special conditions such as chronic patients, pregnants should consult their doctor or pharmacist before using nutraceuticals.

AN ETHNOBOTANICAL STUDY ON THE HERBALISTS IN TRABZON

ÖZGÜR EMINAĞAOĞLU¹, HAYAL AKYILDIRIM BEĐEN¹, ELİF AYGÜN¹, SONGÜL ÖZKAN¹

ABSTRACT

The study area was in Trabzon province which has a rich structure for ethnobotany and floristic studies with its history and cultural values. The study was conducted with data of questionnaire performed in urban, 10 herbalist and local people used this herbalist in Trabzon. The study aimed to reveal the utilization of medicinal and aromatic plant of urban and rural people. The rates of plant utilization, the plants they use and the problems they have encountered and their suggestions were determined. Information regarding latin name, public name, medicinal and other uses, opinion and problems were collected with this questionnaires. Demographic characteristics of participants also recorded. As a result of this study, we took an inventory of these plants, classified the plant species into their respective families. The plants with the most sales are, linden, carob, rosehip, daisy, corn tassel, nettle, sage and ginger. It was determined that local people use more medicines and they prepare their herbal medicines by themselves. Native people used medicinal plants most frequently for the treatment of sedative problem, diuretic, constipation problem, diarrhea, blood pressure disorders, respiratory tract problem and intestinal disorders. This research therefore, specifically determined the ethnobotany of plants for reproductive health conditions;

THE USE OF ST. JOHN'S WORT EXTRACT IN PRODUCTION OF PROBIOTIC AYRAN

FADİME SEYREKOĐLU¹, HASAN TEMİZ², SULTAN ACUN¹

ABSTRACT

Use of St. John's wort in depression and treatment of cancer and diseases originating from certain viruses increases its use value. Although it is widely used for medical purposes, its use in food products is not that wide yet. Given the literature, the use of this plant in foods is very limited. Total phenolic matter content of the extract of this St. John's wort (*Hypericum perforatum* L.) used in this study was determined using various solvents, and the values obtained were compared. Moreover, some of the characteristics of probiotic ayrans prepared using St. John's wort extract (*Hypericum perforatum* L.) were analyzed. In this study, 3 types of ayrans were prepared by adding 3 concentrations of St. John's wort extract (0.1, 0.01, and 0.005%). While preparing the extracts, total phenolic content was 677.85 g/kg GAE in case of using ethanol as solvent and 656.6 g/kg GAE in case of using methanol. In this study, the effects of addition of St. John's wort extract into the ayrans on titration acidity, pH, dray matter content, taste/odor, and general hedonic scale scores were examined. According to the results obtained, it was determined that, of the probiotic ayrans, dry matter content of Ayran A (added with 0.1% St. John's wort extract), Ayran B (added with 0.01% St. John's wort extract), and Ayran C (added with 0.005% St. John's wort extract) to be 12.0301%, 11.9586%, and 11.9511%, while the acidity values were found to be 0.648, 0.594, and 0.639, respectively. pH values were also determined to be 5.46, 5.64, 5.63. While statistically significant differences were observed in acidity and pH parameters, no significant difference was found in dry matter content ($p < 0.05$). From the aspect of taste-odor and hedonic scale scores, the samples added with 0.005% extract were appreciated at most. The use of this plant, use of which is difficult and not preferred in general, can be increased by using it in food products appreciated by people. As in this study, its extract can be made in beverages such as ayran that is widely consumed by young individuals, and thus a new, alternative and healthy product can be obtained. Use of such a plant in a food that we widely consume in our daily lives may improve its usability.

MICROWAVE ASSISTED EXTRACTION OF POMEGRANATE PEEL

HACER İÇEN¹, ARIF CAN KILIÇ¹

ABSTRACT

The pomegranate peels are rich in terms of ellagitannins which are valuable pharmacologic components (ellagic acid, gallic acid, punicalin and punicalagin (A and B)). It can be obtained these chemicals with pomegranate peel extraction, as well as it can also solve waste problem of pomegranate processing plants. In this study, pomegranate peels were extracted by microwave assisted extraction method to investigate the effect of extraction time, solvent /solid ratio, solvent type and ratio and particle size on extraction yield. Ellagic acid in the extract was determined by HPLC. Experimental studies are under way.

OBTAINING LEMON PEEL OIL WITH SOLVENT-FREE MICROWAVE ASSISTED EXTRACTION

HACER İÇEN¹, HAVVA MUMCU ŞİMŞEK¹, HANDE NUR ERGEN¹

ABSTRACT

Lemon peel which is food and beverage production processes' waste, includes many pharmacologic components such as fatty acid esters, phenols, coumarin derivatives such as osthole, hexadecane and squalene, terpene derivatives. The aim of this study is obtaining lemon peel oil with solvent-free microwave assisted extraction which is eco-friendly. The effects of microwave power and extraction time are investigated. The most extraction yield as 0,128 g oil/g lemon peel were obtained 360 W microwave power and 12 minutes extraction time.

NEXT GENERATION DNA MARKERS IN SALVIA L. FOR ENGINEERING OF HIGH-QUALITY PLANTS WITH ENHANCED ACTIVE INGREDIENTS

MEHMET KARACA¹, AYŞE GÜL İNCE², ADNAN AYDIN³

ABSTRACT

An ideal DNA maker system is expected to have: (i) high level of polymorphism, which is the simultaneous occurrence of allelic variability for a trait within the same population; (ii) co-dominant inheritance to allow discrimination of homozygote and heterozygote locus; (iii) frequent occurrence in a genome to assay more genomic regions or genes; (iv) selective neutral to environmental conditions, developmental stage of the organism or management practices; (v) easy access (availability); (vi) easy, sensitive and fast assay; (vii) high reproducibility within and between experiments and (viii) easy exchange of data between laboratories. The second and third generation sequencing (NGS) methods greatly affected the ways of DNA marker development and utilizations. Among the second generation DNA sequencing method, 454 pyrosequencing, Solexa deep RNA sequencing (RNA-seq), Illumina RNA-seq have been utilized to identify genes involved in pathways of secondary metabolism in *Salvia L.* Data obtained from these experiments are used to aid in the selection and engineering of high-quality plants with enhanced active ingredients. These data obtained in these experiments have also been used DNA marker development studies. Several emerging and established next generation approaches including restriction site-associated DNA sequencing (RAD-seq), specific length amplified fragment (SLAF) sequencing and genotyping by sequencing analyses are breakthrough technologies that enable scientists to efficiently discover and genotype large amounts of genetic information, in any plant species. Genotyping by sequencing seems to have advantages over to RAD-seq and SLAF-seq techniques in terms of sample preparation, amplification, analyses and reduced cost. Next generation DNA marker techniques could be used in single nucleotide polymorphism and microsatellite identification, genome wide association studies, construction of high-density genome maps, phylogenetics studies, identification of candidate genes and genetic linkage analysis. In comparison to conventional DNA markers such as RFLP, CAPS, SCAR, SNP, SSCP and SSR, next generation DNA markers do not need sequence information, many sample handling, PCR and purification steps. They have efficient bar-coding system and capable of high-throughput, mass parallelisation of simultaneous marker discovery and genotyping. Also these techniques do not require high cost per marker analysis. The genus *Salvia L.* consists of about 1000 species, most of which have not been genetically characterized at the DNA level. Sufficient DNA markers in the genus have not been developed, and the most of species in the genus *Salvia* do not have high-density genetic linkage maps. Thus next generation DNA marker technologies could be very helpful for genetic studies of *Salvia*. Among these next generation marker technologies, SLAF-seq has already used in *Salvia miltiorrhiza Bunge*, also known as "danshen". In a previous study researchers extracted from two parents and their 96 F1 individuals of *Salvia* and subjected to high-throughput SLAF-seq studies. A total of 155.96 Mb of data

Corresponding Author: ADNAN AYDIN, aydina@akdeniz.edu.tr

¹AKDENİZ ÜNİVERSİTESİ

contained 155,958,181 pair-end reads. The final linkage map consists of 5,164 SLAFs in 8 linkage groups and spans 1,516.43 cM, with an average distance of 0.29 cM between adjacent markers. In this study, step by step comparison of next generation DNA marker technologies are made and advantages and disadvantages of these technologies in comparison to old and next generation methods are discussed.

KEYWORDS

DNA markers, marker development, Next Generation Sequencing, Salvia, SNP

MICRONUTRIENT MINERAL COMPOSITION OF PLANTAGO ANATOLICA TUTEL & R. MILL.

MUZAFFER MÜKEMRE¹, ABDULLAH DALAR¹

ABSTRACT

Plantago anatolica Tutel & R. Mill. is an endemic medicinal plant species which is growing in Eastern Anatolia Region and extensively used in the treatment of various disorders by indigenous people. Plant species belong to *Plantago* genus have been extensively used in folk medicine worldwide and in our country. Although the phytochemical composition and various health attributing properties of these species were partly investigated, there is no or relatively limited study in the scientific literature regards to *Plantago anatolica*. Within this study, investigation of *Plantago anatolica* plant in the respects of micronutrient mineral composition was targeted. Plant materials were extracted by using 4 different extraction methods: sequential extraction (using different organic solvents sequentially including n-hexan, chloroform, ethyl-acetate, acetone, ethanol and pure water), infusion, decoction and pure water extraction. Micronutrient mineral compounds were analyzed by Inductively Coupled Plasma Optical Emission Spectroscopy (ICP-OES) and Atomic Absorption Spectroscopy (A.A.S). Within this presentation the amount of Ag, As, B, Ba, Be, Cd, Co, Cr, Cu, K, Mg, Mn, Mo, Ni, Pb, Sb, Se, Si, Ti, V, Zn, Na, Ca and Fe of different lyophilized extracts obtained from plant materials will be discussed with the updated scientific literature.

EFFECT OF AIR DRYING TEMPERATURE ON DRYING KINETICS, ANTIOXIDANT CAPACITY AND TOTAL PHENOLIC CONTENT OF CELERY LEAVES

SEDEM TFEKI¹, EZGI ZGREN², SAMI GKHAN ZKAL²

ABSTRACT

Effect of air drying temperature on drying kinetics, antioxidant capacity and total phenolic content of celery leaves Senem TFEKI¹, Ezgi ZGREN², Sami Gkhan ZKAL²* 1 Pamukkale University, Vocational School of Acipayam, Department of Food Processing, Denizli, Turkey, 1 Pamukkale University, Faculty of Engineering, Department of Food Engineering, Denizli, Turkey, *Presenting Author: S.G. ZKAL (sgozkal@pau.edu.tr) Drying of spices and herbs is a common method for producing of flavoring ingredients. Celery leaves have characteristic aroma and odor that makes them a potential flavoring agent. It also have medicinal usage against asthma, bronchitis, and rheumatism. In this study, it was aimed to investigate the effect of drying temperature on dehydration kinetics, antioxidant capacity and total phenolic components of celery leaves. For this purpose, celery leaves dried in a hot air oven and drying temperature was chosen as 40 °C, 50 °C, and 60 °C. Drying temperature effected drying rate of celery leaves and shortened drying time significantly. Time to reduce moisture ratio of samples to 0.05 for drying experiments at 40°C, 50 °C and 60 °C air temperatures was found as 140, 80 and 60 minutes, respectively. Five different thin layer drying models were fitted to experimental drying data. Page and Modified Page models gave the higher R² (0.9903-0.9982) and lower χ^2 (0.000089-0.001073) and RMSE (0.002579-0.007279) values, and therefore these models were found to be the most suitable models for describing drying characteristics of celery leaves. The transport rate of water during drying was described by effective moisture diffusivity (Deff) based on Fick's equation and its value was found as 2.74×10^{-10} , 4.56×10^{-10} and 7.30×10^{-10} m²/s for samples dried at 40 °C, 50 °C and 60 °C, respectively. The values were in agreement with the general range of 10⁻¹² – 10⁻⁸ m²/s for drying of biological material. Dried celery leaves were analyzed for antioxidant activity and total phenolic content using 1,1-diphenyl-2-picrylhydrazyl (DPPH) and Folin-Coicalteu methods. Both antioxidant activity and total phenolic content of the samples dried at 40°C had higher values. Results suggest that there is no significant (p>0.05) difference in antioxidant activity and total phenolic content between dried samples. Antioxidant activity and total phenolic content showed a slight reduction for 50°C dried sample in comparison with 60°C sample. Therefore, 60°C can be selected as a drying temperature for celery leaves by considering the short drying time and negligible losses of antioxidant activity and total phenolic content.

ANTIMICROBIAL ACTIVITY SCREENING OF FRANGULA ALNUS

ALI YETGİN¹, KEREM CANLI², ILGAZ AKATA³, ERGİN MURAT ALTUNER⁴

ABSTRACT

According to traditional medicine of America and Europe knowledge, some species of Frangula genus are widely used. Frangula alnus bark extracts have anticancer, antifungal, antioxidant, antiviral and antibacterial activity, so it is significant for official and folk European medicine. Barks of this medical plant investigation were applied against 17 bacteria and 1 fungi by using disk diffusion method. These microbial strains include Bacillus, Enterobacter, Enterococcus, Escherichia, Klebsiella, Listeria, Pseudomonas, Salmonella, Staphylococcus and Candida geniuses. Twelve of them are standard species and they are important for exact determination of antimicrobial potential. 6.32 and 21.06 mg samples were prepared by using ethanol extraction method. The results were presented that F. alnus has antimicrobial activity against all tested microbial strains. Six of them have high susceptibility (higher than 15 mm); nine of them have moderate susceptibility (14-10 mm) and only three of them have low susceptibility (9-7 mm).

COMPARATIVE EVALUATION OF THE INHIBITORY EFFECT OF SOME ESSENTIAL OILS ON ACETYLCHOLINESTERASE ACTIVITY IN HUMAN LUNG CARCINOMA (A549) CELLS

EMINE TORAMAN¹, YELİZ DEMİR¹, HAMİD CEYLAN¹, ORHAN ERDOĐAN¹

ABSTRACT

Current therapeutic strategies for Alzheimer Disease (AD) focus on increasing acetylcholine (ACh) bioavailability at the synapse. Therefore, revealing enzyme response against therapeutic agents that alter acetylcholinesterase (AChE) activity is extremely important for orienting treatment strategies. Today, there is an increasing considerable interest in the use of essential oils as alternative therapeutic. In this study, we investigated the biological activity (acetylcholinesterase inhibition) of some essential oils (*Helichrysum italicum* and *Rosmarinus officinalis*) in A549 cells. For this purpose, human lung cancer cells (A549) were treated with different concentrations of *Helichrysum italicum* (1-10 μ l/well) and *Rosmarinus officinalis* (1-5-10 μ l/well) essential oils. *Rosmarinus officinalis* essential oil was found the active AChE inhibitor followed by *Helichrysum italicum* essential oil. Decreased AChE activities in A549 cells were observed in a dose-dependent manner. We aim that the results to be obtain from this study is considered to be contribute for further researchs that may result in the annotation of therapeutic drugs improvement or treatment strategy for AChE related diseases.

COMPARISON OF ANTIOXIDANT CONTENTS OF DIFFERENT SOLVENT EXTRACTS FROM A FRESHWATER ALGAL SPECIES

BÜLENT AKAR¹, ZEYNEP AKAR², BÜLENT ŞAHİN³

ABSTRACT

Algae, including both microscopic and macroscopic organisms are photosynthetic organisms that develop in all environments except extreme drought place. Especially, they are the main source of primer productivity in all aquatic ecosystems. Generally, to supply both medicine and food for people are used organisms which easily cultivated and accessed. However, in recent times due to the increasing needs, use of algae having rich biological diversity are also increase in these areas. Algae are used in many industries such as food, medicine, cosmetics, construction, textile, paper, biofuels and microbiological media. *Microspora sp.* (Chlorophyta = Green Algae) was collected from localised a lake at an altitude of 2730 meters in the district of Torul in Gümüşhane province in Turkey. Algal samples were collected at a depth of 0-0.5 m from the surface of the lake during the summer when the biomass was high (algal bloom present). The obtained sample was washed several times with distilled water, dried, then ground, and methanol, ethanol, acetonitrile, acetone and ethyl acetate extracts were prepared. Antioxidant activity of each extract was determined by three different antioxidant assay methods: DPPH cleaning, iron (III) reduction / antioxidant power (FRAP) and copper (II) reducing antioxidant capacity (CUPRAC). When the calculated test results were compared, similar results were observed in all three methods. While the highest antioxidant activity was determined in methanol extract (31.15%), the lowest activity was measured in acetonitrile extract (8.97%). In conclusion, *Microspora sp.* has antioxidant activity in different solvents. Therefore, studies can be made for its use in many fields, such as mainly food and medicine.

ANTIMICROBIAL ACTIVITY SCREENING OF RHYNCHOSTEGIUM MEGAPOLITANUM

ALI YETGİN¹, KEREM CANLI², ILGAZ AKATA³, ERGİN MURAT ALTUNER⁴

ABSTRACT

In North America, Europe and China, bryophyte have been used as medicinal purpose since 400 years ago. Although antifungal and antibacterial potential of some bryophyte species are determined, most of them are not investigated. Broad range antimicrobial activity of bryophyte species is became a crucial, therefore related research must be applied. In this research, antimicrobial potential of *Rhynchostegium megapolitanum* against a wide range of microorganisms was analyzed. The analyses contain ethanol extract of *R. megapolitanum* against 17 bacterial and 1 fungal species. These microbial strains include *Bacillus*, *Enterobacter*, *Enterococcus*, *Escherichia*, *Klebsiella*, *Listeria*, *Pseudomonas*, *Salmonella*, *Staphylococcus* and *Candida* geniuses. Twelve of them are standard species and they are important for exact determination of antimicrobial screening. 0.34, 0.68 and 1.13 mg samples were prepared and their activity was analyzed by using agar diffusion method. Our present study has shown that *R. megapolitanum* has antimicrobial activity against eight of the studied species. Antimicrobial potential of *R. megapolitanum* are being investigated for the first time.

USAGE OF NUTRITIONAL SUPPLEMENTS IN TURKEY

NAZAN AKTAŞ¹, EBRU BAYRAK¹

ABSTRACT

Dietary support and nutrient enrichment for the treatment and prevention of nutritional problems are interventional methods commonly used in both developed and developing countries. Nutritional supplements are defined as vitamins and minerals can be used in the form of pills, capsules, syrups in quantities corresponding to high doses. These generally have a wide array of including vitamins, minerals, amino acids, essential fatty acids, fibre, various plants and their extracts. The purpose of this study was to evaluate the use of nutritional supplements according to age, gender, settlement and NUTS 12 regions in Turkey. In this review, data was obtained from Turkey Nutrition and Health Survey (TNHS)-2010 about the use of nutritional supplements. At the TNHS-2010, the participants were asked about the nutritional supplements they had used in the last week; were evaluated according to the variables such as age, gender, settlement and NUTS 12 regions. In Turkey, 23.9% of children aged 0-5 use at least one nutritional supplement. When the use of nutritional supplements was examined according to the region, it was seen that the highest usage rate was in Western Marmara (34.1%) and the least used region was Middle East Anatolia (15.6%) for this age group. The most commonly used nutritional supplements for children in this age group were vitamin D and iron supplements. The rate of use of food supplements in children aged 6-11 years was low (3.1%) and it was determined that they did not use vitamin D, folic acid and iron as nutritional supplements. When the age of 12 years and over were examined, the most commonly used nutritional supplements were reported as vitamin B12 and zinc as the least used. When evaluated in terms of gender, it was determined that the highest amount of calcium (3.4%) and vitamin B12 (3.3%) were used in women, and vitamin B12 (1.6%) was the highest in men in Turkey. When nutritional supplements are used, the amount of consumption and type of these supplements must be determined by the experts. Determining the rates of these products is important at the point of setting the strategies for producers, the state and related non-governmental organizations.

COMPARISON OF ANTIOXIDANT ACTIVITY OF BAKED AND RAW MATERIALS OF GYROMITRA ESCULENTA

KÜBRA ELİK¹, MEHMET ÖZTÜRK¹, ERHAN KAPLANER¹, ZAIN ULLAH¹, YUSUF SICAK¹, MEHMET EMİN DURU¹, ABDULSELAM ERTAŞ², RIADH BEN MONSOUR³, MEHMET HÜSEYİN SİNĞEÇ⁴

ABSTRACT

Comparison of Antioxidant Activity of Baked and Raw Materials of Gyromitra esculenta Kübra ELİK, Erhan Kaplaner, Zain Ullaha, Yusuf SICAka,b, Abdulsalam ERTAŞc, Riadh Ben Mansour, Mehmet ÖZTÜRKa, Mehmet Emin DURUa E-mail: kubra_elikk@hotmail.com aDepartment of Chemistry, Faculty of Sciences, Muđla Sitki Koçman Üniöersitesi, Mentese-Muđla, Turkey bDepartment of Herbal and Animal Production, Köyceđiz Vocational School, Muđla Sıtkı Koçman University, Koycegiz-Muđla, Turkey cDepartment of Pharmacognosy, Faculty of Pharmacy, Dicle University, Sur-Diyarbakır, Turkey dEcole Nationale d'Ingénieurs de Sfax, Route de la Soukra km 4 - 3038 Sfax, Tunisia Abstract Gyromitra esculenta (Pers.) Fr. is delicious food consumed in Scandinavian countries to Anatolia. Gyromitra esculenta is found in temperate coniferous forests, especially in coniferous trees, which grow on sandy soil; It is a mushroom species that has a red-brown cover under pine trees and sometimes poplar trees and darkens as it gets older. Locally, it is called false morel and when consumed raw it poisons. Despite poisonous in raw form, Gyromitra esculenta is very popular and has been consumed in Scandinavia and North America. It is sold in the market with attached cooking instructions; and consumed in omelets, soups, salads and other common food. Before consume, required cooking should be even necessary. The active constituent of this mushroom exhibiting toxic effects is gyromitrin which is hydrolyzed to monomethylhydrazine during cooking. In giromitrin hydrochloric acid and ethanol catalysis the input is converted to monomethylhydrazine (MMH) This toxin affects liver, central nervous system and sometimes kidneys. Because of its consumption and widely growing in Anatolia it was aimed to study the antioxidant activity of extracts of both raw and baked materials. Gyromitra esculenta (Pers.) Fr. was purchased from local market and divided in to two parts. One part was baked in an oven at 200°C for 30 minutes. The other part was left raw. Then both cooked and uncooked materials were airdried under shadow. The dried both samples were grinded and extracted with petroleum ether, acetone and methanol and water, successively. The extracts were studied for their antioxidant activity using complimentary assays; for this purpose, CUPRAC experiments were carried out based on measuring the total antioxidant amount based on β -carotene-linoleic acid chromophore method, DPPH free radical scavenging activity method, ABTS cation radical scavenging antioxidant activity method and copper (II) reduction capacity. For each antioxidant activity assay, the extracts were dissolved at concentrations of 4000 ppm, 2000 ppm, 1000 ppm and 500 ppm, respectively. These solutions were chosen as the control solution. The initial absorbance was adjusted according to each method by

means of a spectrophotometer. For example, the initial absorbance at 517 nm for the DPPH assay was chosen as 490 nm for the β -carotene linoleic acid decolorization method. The absorbance values of the control solution in the cuvettes and the absorbance values of the sample substances in the test result were compared and the results were calculated. The total phenolic content of the extracts was determined as pyrocatechol equivalents. The results in β -carotene lipid peroxidation and DPPH radical scavenging experiments, it was shown that the *gyromitra esculenta* mushroom samples cooked for each of the petroleum ether, acetone, methanol and water extracts had higher antioxidant capacity than the raw extracts. **Keywords:** *Gyromitra esculenta*, Antioxidant activity, Baking effect

THE INVESTIGATION OF ANTIOXIDANT AND ANTI-UREASE ACTIVITIES AND PHENOLIC COMPOUNDS OF THYMUS PRAECOX SUBSP. SKORPILII VAR. SKORPILII

ABDULKADIR UÇMAN¹, DUYGU TAŞKIN², TURGUT TAŞKIN²

ABSTRACT

Thyme species (genus *Thymus*, family Lamiaceae) are well known aromatic perennial herbs used extensively throughout the Mediterranean basin. This genus is represented by 38 species and altogether 64 taxa, 24 of them are endemic in Turkey. Members of this genus are called “kekik” in Turkish and are used as herbal tea. Several thyme species are used as medicinal remedies against a variety of diseases as well as for aromatic, culinary, and food preservative purposes. A wide range of biological and pharmacological properties have been reported for these species, such as antiseptic, antitussive, expectorant, antispasmodic, and anti-inflammatory activities. These biological and pharmacological properties have been mainly attributed to the rich essential oils contained in the majority of thyme species as well as nonvolatile compounds including polyphenols and flavonoids (1,2). *Thymus praecox* subsp. *skorpilii* var. *skorpilii* essential oil was found to contain thymol and o-cymene as the major components (2). The aim of this study was to investigate phenolic composition and compare evaluation of antioxidant and anti-urease activities of *Thymus praecox* subsp. *skorpilii* var. *skorpilii*. In the present study, The total phenolic contents, antioxidant and anti-urease activities of different extracts from *Thymus praecox* subsp. *skorpilii* var. *skorpilii* were compared. The extracts were quantitatively analyzed for total phenolic contents using FCR assays. Antioxidant activity of the extracts was measured using the DPPH., ABTS.+ scavenging activities and FRAP assay. The urease inhibitory activities of the extracts were determined according to a reported method (3). The methanol extract of *Thymus praecox* subsp. *skorpilii* var. *skorpilii* had the highest amounts of total phenolics (0.070±0.0001 mgGAE/mg extract) and showed the highest biological activity (ABTS radical scavenging activity: 98%; FRAP: 17.40±0.004 mM FeSO₄/mg extract). Subsequently, we tried to identify the major phenolic compounds in methanol extract by HPLC-DAD/ESI-Q-TOF LC/MS. The major phenolic compounds were identified as: chlorogenic acid, luteolin 7-O-glycoside, quercetin hexoside, apigenin 7-O-glucuronide and feruloylquinic acid. SOME CHARACTERISTICS OF INSTANT TEA PRODUCED FROM MINT (*MENTHA PIPERITA* L.)

ZEYNEP AKŞİT¹, SEMRA TOPUZ², CEMAL KAYA², MUSTAFA BAYRAM², HÜSEYİN AKŞİT²

ABSTRACT

Mint (*Mentha piperita* L.) is widely consumed as herbal tea in Turkey. Mint which is a very old culture plant, take parts among the medical plants due to its biological effects such as anti-inflammatory, cardioprotective, antioxidant, antibacterial. In this study, it was aimed to enhance alternative methods for instant mint tea production. Instant tea powders were obtained by spray drying and freeze drying techniques from watery extract of mint. Some physical and chemical properties of these tea powders were investigated. Solubility in water, moisture content, yield, Hunter colour values (L^* , a^* , b^*), total phenolic compounds and total sugar quantities were determined. The antioxidant activity of instant tea powders were evaluated with FRAP and TEAC tests. Some individual phenolic compounds and flavor compounds of mint tea powders were determined by HPLC and GC-MS, respectively. Moreover, instant mint tea powders were evaluated for their sensory properties. The results were compared with traditional brewing method. Solubility in water of mint tea powders by using freeze drying and spray drying techniques were found 96,23; 98,33 and moisture content were found 5,56; 0,24%. Yield of tea powder produced from mint (traditional; freeze dried; spray dried) were found 13,77; 23,53; 23,28%. Moreover, the hunter colour values of mint teas prepared by using traditional brewing, freeze dried tea powder, spray dried tea powder were 26,04; 26,19; 26,56 L^* , 3,81; 4,06; 4,48 a^* , -3,65; -2,45; -1,82 b^* . Total phenolic content of tea produced from peppermint (traditional; freeze dried; spray dried) were found as 12.01; 30.85; 34.24 mgGAE/100 mL and total sugar quantities were found as 36,07; 40,98; 44,94 mgGE/100mL. FRAP activities were found as 2936,73; 3774,64; 4323,66 $\mu\text{molTE}/100$ mL and TEAC activities were found as 2854,18; 3398,69; 4008,85 $\mu\text{molTE}/100$ mL, respectively. Hesperidin, rosmarinic acid, linarin, didimin, nevadensin, retusin were identified and quantified of peppermint teas by using high performance liquid chromatograph (HPLC). The amount rosmarinic acid (major phenolic of mint) determined 5,73; 15,17 and 15,58 mg/100 mL, respectively. The amount of phenolic compounds obtained by spray drying and freeze drying techniques are higher than traditional brewing method. However, spray dried herbal tea powders had less flavoring agents because of heat application during drying. When the results of the sensory analysis were examined, the highest average was obtained by traditional method and followed by freeze drying techniques, spray drying, respectively. In this sense, the most important factor may be preservation or losing of volatile aroma components during processings.

AMINO ACID COMPOSITIONS OF SOME IMPORTANT AROMATIC PLANTS

MEHMET FATİH CENGİZ¹, NILDA ERSOY¹, TIMUR TONGUR¹, TANER ERKAYMAZ¹, ONUR BASANÇELEBİ¹

ABSTRACT

The goal of the research was to determine the similarities and differences in the compositions of amino acids in some important aromatic plants grown by Good Agricultural Practices (GAP) in Turkey. In the study, *Pimpinella anisum* (anise), *Nigella sativa* (blackcumin), *Papaver somniferum* (poppy), *Coriandrum sativum* (coriander) and *Foeniculum vulgare* (fennel) samples were examined. Chromatographic separations of amino acids were achieved by an Hypersil Gold 100 mm x 2.1 mm x 1.9µm C18 column with 5mM ammonium acetate in water: MeOH (95:5) %0.1 formic acid (A) and MeOH (B). Separated amino acids were identified by liquid chromatography tandem mass spectrometry (LC MSMS) without the need for derivatization. A total of 15 amino acids (arginine, aspartic acid, cysteine, glutamic acid, histidine, isoleucine, leucine, lysine, methionine, phenylalanine, proline, serine, threonine, tyrosine and valine) were analyzed. The method was found to be selective, linear ($r^2 > 0.99$) and precise for all of interested amino acids. The limits of the quantifications (LOQ) were found to be in the range from 0.53 to 1.20 mg kg⁻¹. Results showed that the amino acid contents of anise, blackcumin, poppy, coriander and fennel were found to be 2511.04, 422.54, 666.96, 594.19 and 579.05 respectively. None of the analyzed samples was contained cysteine. Threonine, histidine and valine amino acids were detected in only anise samples. In addition, the highest concentration of lysine, arginine, aspartic acid, proline, methionine, tyrosine, leucine + isoleucine and phenylalanine amino acids were found in anise samples. Fennel has the highest concentration of serine. In conclusion, anise has the most valuable aromatic plant in tested samples due to its high content of amino acids. Therefore, it can be preferred in medicinal and healthcare treatment which amino acid compositions are accepted as important.

INVESTIGATION OF FIELD CROPS AND SOME QUALITY CHARACTERISTICS (*SIDERITIS CONGESTA* DAVIS ET HUBER-MORATH) OF CULTIVATED MOUNTAINS

EMİNE BİLGİNOĞLU¹, YÜKSEL KAN¹

ABSTRACT

This research has been conducted under Konya ecological conditions to determine the effect on yield and quality of some characters of nitrogen fertilizers applied at the different doses of *Sideritis congesta* in Medicinal Plants laboratory and Medicinal Plants Experimental Farm of Agriculture Faculty, Selçuk University. Experiment was designed and applied in randomized complete plot design with three replications in the year of 2012-2013. According to results of this research; the plant height of *Sideritis congesta* 58.66-64.33 cm, the number of flowering branches 49.00-55.00, fresh flowering yield 446.66-623.33 kg / da, essential oil yield 0.24-0.33 % and major essential oil component (β -pinene) was varied between 43.245 and 48,459. The highest dry flower yield and essential oil yield for mountain tea in Konya and similar ecology 10 kg/da nitrogen fertilizer application is reasonable.

HERBAL MEDICINES USED IN THE TREATMENT OF DIABETES IN VAN PROVINCE (TURKEY).

ABDULLAH DALAR¹, MUZAFFER MÜKEMRE¹, SEMA SEZGIN¹

ABSTRACT

Diabetes is a group of metabolic diseases characterized by hyperglycaemia resulting from defects in insulin secretion, insulin action, or both. (American Diabetes Association, 2012). The prevalence of diabetes for all age-groups worldwide was estimated to be 2.8% in 2000 and 4.4% in 2030. The total number of people with diabetes is projected to rise from 171 million in 2000 to 366 million in 2030 (Wild et al., 2004). Commercially available antidiabetic drugs (acarbose, metformin, miglitol and voglibose) used in the treatment and/or management of diabetes have potentially hazardous side effects (liver problems, diarrhoea etc.). Phytopharmaceuticals are seen as complementary medicines or an alternative to conventional medicines with fewer side effects. Phytochemicals identified from traditional medicinal plants present an exciting opportunity for the development of newer antidiabetic agents. Some natural herbal sources which have extraordinary antidiabetic potential are tea polyphenols, pine bar extract, and kotalanol. Local people of Van province have been used various medicinal plants in the treatment of diabetes for a long time. Antidiabetic preparations have been used as valuable alternative and/or complementary agents to conventional medicines in the province. We have detected several antidiabetic herbal medicines in this region such as *Diplotaenia* sp., *Ferula* sp., *Heracleum* sp., *Artemisia* sp., *Centaurea* sp., *Helianthus* sp., *Helichrysum* sp., *Astragalus* sp. and etc. Within this presentation scientific and local names of these plant species used in the treatment of diabetes, their preparation and utilization methods will be presented. ANTIOXIDANT ACTIVITY, TOTAL PHENOLIC AND FLAVONOID CONTENTS IN SOME HERBAL TEAS

İLHAMİ KARATAŞ¹, NUSRET GENÇ², RAHİME KARATAŞ³, MAHFUZ ELMATAŞ²

ABSTRACT

Medicinal and aromatic plants are widely used as herbal teas for the prevention or remedy of many diseases because of their high antioxidant activity and secondary metabolite contents. Antioxidant activity and metabolite contents of plants are analyzed in different solvents and extraction methods in scientific research; however they are widely consumed from peoples in boiling water infusion. The aim of this study is to determine total phenolic, total flavonoid contents and antioxidant activity of some herbal tea including, mint (*Mentha piperita*), lemon balm (*Melissa officinalis*), marshmallow (*Althea officinalis*), chamomile (*Matricaria chamomilla*), green tea (*Camellia sinensis*), sage (*Salvia officinalis*). The antioxidant activity of these six medicinal and/or aromatic plants were evaluated by measuring 1,1-diphenyl-2-picrylhydrazyl (DPPH.), ferric reduction power (FRAP) and 2,2-azino-bis (3-ethylbenzthiazoline-6-sulfonic acid radicals (ABTS+). The samples (1 g) were brewed in boiling water (100 ml) for 5 minutes and the extracts were used for estimation of these parameters. The extraction method was specially selected in the form of widespread use by people. Total phenolic content of the extracts ranged from 6.71 ± 0.29 to 89.82 ± 0.78 mg GAE /g DW. The extract of *Camellia sinensis* exhibited the highest total phenolic content. The flavonoids concentrations of the extracts ranged from $0.292 \pm 0,003$ to 0.965 ± 0.02 mg QUA/g DW from which the extract of *Salvia officinalis* had the highest flavonoids content. Among the plants studied, *Camellia sinensis* showed the highest antioxidant activity in terms of the three parameters. After the green tea, the highest ABTS and FRAP activities were observed in *Mentha piperita* and *Salvia officinalis* respectively, but the DPPH activity of the *Salvia officinalis* is higher than *Mentha piperita*.

EFFECTS OF PLANT-DERIVED COMPONENT TRANS FERULIC ACID, RESVERATROL AND COMBINATION ON RAT BRAIN CANCER GLIOMA (C6) CELL LINES

NEBIYE PELİN TÜRKER¹, AYTEN BOSTANCI¹

ABSTRACT

Resveratrol (trans-3,5,4'-trihydrocystilbene), a polyphenolic compound, is a natural phytochemical found in many plant species including red grapes, blueberries, peanuts, various fruits and herbs as well as in processed products such as wine. Resveratrol, which acts as an antioxidant to prevent DNA damage that can lead to tumor formation in healthy cells, induces the onset of apoptosis in cancer cells. Ferulic acid (4-hydroxy-3-methoxy-cinnamic acid, FA) is a compound commonly found in plants. It is synthesized from phenylalanine or L-tyrosine and is formed essentially as a trans isomer. Ferulic acid, which is known to effectively cleave free radicals, is known to have a number of physiological functions, including a strong anti-oxidant, anti-inflammatory and anti-cancer properties, by increasing the stress response. In this study, the effects of trans ferulic acid, resveratrol and combinations on time and attenuated rat brain cancer, Glioma (C6) cell line, were investigated in phenolic compounds with high antioxidant capacity in shells, roots and hips of fruits and vegetables. Rat brain cancer cell culture (C6); Cells grown with Dulbecco's Minimum Essential Medium (DMEM), HAMS F 12 (1: 1) + 5% FBS and containing trans ferulic acid, resveratrol and combinations between doses 0.19-100 μ M were incubated for 24 hours at 37 ° C, 5% CO₂ incubator. Cell proliferation was determined by MTT method (3- (4,5-dimethylthiazol-2-yl) -2,5-diphenyltetrazolium bromide). The IC₅₀ values of the working materials were determined by PROBIT analysis of SPSS 18 statistical program and applied to C6 cell lines and intracellular metal determinations were made by DNA-RNA isolations, fluorescence staining and apoptotic cell images and ICP-MS. cDNAs were obtained from the obtained RNAs and gene expression levels were examined. The IC₅₀ values of the substances administered in the C6 cells at the 24th hour were determined as 100 μ M. The application of trans ferulic acid, resveratrol and combinations led to DNA damage (Sod: 23.5 fold, 8.8 fold, 4.0 fold, CAT: 5.4 fold, 1.9 fold, 1.3 fold) by inducing increases in oxidative stress genes in C6 cells. When trans ferulic acid alone was applied, the cytochrome c in the inner surface of mitochondria with a 2.8-fold increase in BAX gene was cytosolic and complexed with APAF-1, resulting in a 12.0-fold increase in the amount. In addition, the tumor suppressor is suppressed by the increase in the p53 gene and apoptosis begins. In resveratrol administration, a 5.8-fold increase in BAX gene resulted in a 29.9-fold increase in the amount of cytochrome-c and initiated apoptosis with the apoptosis inducing protein APAF-1. In addition, the combination of trans ferulic acid and resveratrol has been tumor suppressed by a 16.1-fold increase in p53 gene expression in glioma cells. Furthermore, in the RAPD-PCR results, the combination of trans ferulic acid and resveratrol in combination resulted in more deaths than those performed alone, suggesting that this death may be due to oxidative stress when considered in changes in real-time PCR results. As a result;

THE ANTICANCER AND ANTIOXIDANT EFFECT OF L-DOPA, GALLIC ACID AND MIXTURES OF THESE SUBSTANCES ON RATTUS NORVEGICUS BRAIN CANCER CELL LINE (C6)

AYTEN BOSTANCI¹, NEBIYE PELİN TÜRKER¹

ABSTRACT

The dopamine, a neurotransmitter substance and released from the brain, provides communication between nerve cells. Dopamine deficiency causes Parkinson's, Alzheimer's and cancer. It is thought that L-DOPA, an amino acid used as a substitute for dopamine that does not break the blood-brain barrier, exhibits dopamine metabolism in the brain and thus exhibits an action mechanism. It is known that L-DOPA, which is used in the absence of dopamine, is found in bean plant. Gallic acid (3,4,5-trihydroxybenzoic acid, GA), a natural antioxidant, is a polyhydroxyphenol compound with many fruit types such as green tea, grape, strawberry, and banana. It has been observed that GA induces apoptosis in cancer cell lines but does not have a cytotoxic effect on healthy cells. In this study, we aimed to assess single and combined effect of l-dopa and gallic acid on rattus norvegicus brain cancer (C6) cell lines. C6 cells were grown in cell media (Dulbecco's Minimum Essential Medium (DMEM), HAMS F 12 (1:1)+ % 5 FBS). Cells, were treated with single and combined in 0.78 to 800 μ M doses of octopamine, naringin, p-coumaric acid, and then incubated 5% CO₂ incubator in 37°C for 24 hours. Cell viability were observed by MTT assay (3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide). IC₅₀ values of the studied substances were determined by PROBIT analysis of SPSS 18 statistical program and applied to C6 cell lines. DNA-RNA isolations, intracellular metal determinations by ICP-MS and apoptotic cell images by fluorescence staining were performed. CDNA libraries were generated from the obtained RNAs. The IC₅₀ values at 24 hours of the substances administered in C6 cells were determined as μ M. The application of L-dopa, gallic acid, and combinations caused oxidative stress in C6 cells, leading to DNA damage by bringing 2,5 fold, 12,2 fold, 3,6 fold, 1.4 fold, 8.7 fold, 4.8 fold increase in SOD gene respectively. Bcl-2, which is an apoptosis inhibitor, was broadly suppressed in the administration of the combination of L-Dopa and Gallic acid to glioma cells and showed a 3.0-fold increase in BAX compared with the control. This increase in BAX gene disrupted the mitochondrial membrane and initiated apoptosis by providing cytosolic release of cytochrome-c. L-dopa and Gallic acid alone did not inhibit the activity of BCL-2 but increased the mitochondrial ion balance. Furthermore, in RAPD-PCR results, it is thought that application of the combination of l-DOPA and gallic acid alone is more effective on cancer cells than antagonistic effect in cells. As a result; The herbal origin of l-DOPA and gallic acid showed an anticancer effect on the brain cancer cell line glioma C6 cell lines and it has also been determined that gallic acid induces cell death by producing more oxidative stress in C6 cells compared to l-Dopa and combination alone.

FULVIC ACID POTENTIAL OF HUMUS CREATED IN LOCATIONS OF THE RHODODENDRON (RHODODENDRON PONTICUM L.) IN WEST BLACK SEA REGION

ALİ GÜREL¹, MEHMET ÖZDEMİR¹, AHMET TUTAR³

ABSTRACT

The aim of this work is to reveal the potential of fulvic acid of humus formed at Rhododendron (*Rhododendron Ponticum L.*) locations in West Black Sea Region. It is thought that humic substances occurring in these locations will constitute an important resource for fulvic acids. Fulvic acids are macromolecular compounds found application area in wide range as agriculture, industry, environment and biomedicine. Plot areas was taken from humus created on O2 (organic) horizon in 27 different locations with 3 replicates in the spreading area of Rhododendron in this work. It was used 35 ml (25,25 gr) from the resine of XAD-8 for the extract of 100 ml fulvic acid in the purification of fulvic acid. It was utilized various spectroscopic methods as FTIR and UV for the characterization of the purified fulvic acid structures. Structural and combination properties related fulvic acids is obtained using the methods of UV-Visible, IR methods and some decomposition. The results found from this research were compared with values of 3 different Turkish leonardite. According to this, the amount of fulvic acids in its content of the humic substances in locations of Rhododendron in Black Sea region is found as 7,12 % while fulvic acid content of humic substance originated from leonardite is average 0,2 % . Bu durum ormanlardaki humusun fulvik asit için önemli bir potansiyel oluşturduđunu göstermektedir. This situation, it is seen that humus in the Rhododendron forests is an important fulvic acid source.

INVESTIGATION OF FIELD CROPS AND SOME QUALITY CHARACTERISTICS (SIDERITIS STRICTA DAVIS ET HUBER-MORATH) OF CULTIVATED MOUNTAINS

EMİNE BİLGİNOĞLU¹, YÜKSEL KAN¹

ABSTRACT

This research has been conducted under Konya ecological conditions to determine the effect on yield and quality of some characters of nitrogen fertilizers applied at the different doses of *Sideritis stricta* in Medicinal Plants laboratory and Medicinal Plants Experimental Farm of Agriculture Faculty, Selçuk University. Experiment was designed and applied in randomized complete plot design with three replications in the year of 2012-2013. According to results of this research the plant height of *Sideritis stricta* 118.33-138.66 cm, the number of flowering branches 14.30-32.60, fresh flowering yield 513.33-743.33 kg / da, essential oil yield 0.06-0.10% and major essential oil component (β -pinene) was varied between 27.8 and 38.666%. According to the results of this research; The highest drug floweryield and essential oil yield from mountain tea in Konya and similar ecology 10 kg/da nitrogen fertilizer application is reasonable.

**THE ANTIOXIDANT CAPACITY OF THE ACETONE, METHANOL
AND WATER EXTRACTS CRATAEGUS MONOGYNA JACQ SUBSP
MONOGYNA COLLECTED FROM THE EASTERN ANATOLIA
REGION OF TURKEY**

ÖZEL ÇAPIK¹, MERYEM ŞENGÜL KÖSEOĞLU¹, RAHIMEH JABERİ¹, GÜLERAY AĞAR¹

ABSTRACT

The genus *Crataegus* is the largest genus among the subfamily in the family Rosaceae which comprises 2830 species in 95 genera, which are generally known as the hawthorns. *Crataegus monogyna* (C.M) is one of the most common species used as the “hawthorn” of traditional herbalism. In traditional medicine, hawthorn has been widely used to treat human diseases. The *Crataegus monogyna* has enough research on the biological activities such as antimicrobial, antioxidant, antitumor, antiviral, cardioprotective, neuroprotective, nephroprotective, hepatoprotective and anti-inflammatory. The clinical studies have shown that there are no significant adverse effects associated with hawthorn consumption. There are a great number of studies that suggest the huge potential of *Crataegus monogyna* fruit extract in the treatment of various toxicities due to the presence of various bioactive natural compounds, such as flavanoids and triterpenic compounds. But up to now there are limited number of investigations related to *Crataegus monogyna* Jacq subsp *monogyna* species antioxidant activity. In this working was aimed to determine antioxidant activity of acetone, methanol and water extracts of *Crataegus monogyna* Jacq subsp *monogyna* fruits in different concentrations (5; 10; 20; 40 and 80 µg/mL) that collected in the eastern Anatolia, Turkey by DPPH(2, 2-Diphenyl-1-picrylhydrazyl) radical scavenging method. The fruit extracts are used as fresh due to their broad pharmacological effects and minimal adverse effects. Extracts at different concentrations were added to 0.5 mL of methanolic DPPH solution (0.1 mmol). The estimated time of reaction (30 min) was determined by considering the reduction of the absorbance at 517 nm. The absorbance was measured at room temperature, in darkness, against a blank. The absorbance of the control (3ml of methanol in 0.5 mL of DPPH solution) was measured. According to the results of the study, *Crataegus monogyna* Jacq subsp *monogyna* has antioxidant activity. The strongest antioxidant activity of acetone and methanol extract could be due to the presence of flavonoids and phenols. The 40-80 µg/mL doses of fruit extracts were more effective than other doses. As a result, *Crataegus monogyna* Jacq subsp *monogyna* can be recommended for future clinical trials and chemotherapeutic drugs aimed at examining its beneficial effects.

USE OF AROMATIC PLANTS TO REDUCE RUMINAL METHANOGENESIS AND AMONIA CONCENTRATION

SEMA YAMAN¹, SIBEL CANOĞULLARI DOĐAN², MUSTAFA BOĐA³, İLKNUR UÇAK³

ABSTRACT

Aromatic plants, also known as herbs and spices, have been used in the Middle East since approximately 5000 BC for their preservative and medicinal properties, in addition to enhancing the aroma and flavour of foods. Currently, there is an increasing interest in using herbs and spices in animal nutrition, in order to replace the use of antibiotics and ionophore anticoccidials, after the ban of antibiotics used as feed additives in 2006 by EU. The aromatic plants, their extracts and their essential oils have been examined due to their advantages over the antibiotics as growth promoters. They are residue free and generally recognized as safe. Aromatic plants and its essential oils have been used to manipulate ruminal metabolism in order to improve feed efficiency and animal productivity. Some promising results have been obtained from in vitro batch culture studies that essential oils or their components have the potential to improve nitrogen and/or energy utilization in ruminants. It has shown that some aromatic plants derived substances had a strong bactericidal activity against pathogenic bacteria. This has prompted some researchers to study potential of aromatic plants derivatives to reduce ruminal methanogenesis for limiting the release of this gas into the atmosphere. In vivo research using novel aromatic plants in rumen nutrition has the potential to benefit animal production and health, as well as the environment. In this review effect of aromatic plants and its essential oils on reducing ruminal methane and ammonia and its mode of action in the rumen will be focused.

USE OF LICORICE ROOT (GLYCYRRHIZA GLABRA) IN ANIMAL FEED AS ACTIVE INGREDIENT

SİBEL CANOĞULLARI DOĞAN¹, SEMA YAMAN¹, MUSTAFA BOĞA¹, İLKNUR UÇAK¹

ABSTRACT

Interest in aromatic plants and extracts has been increased following the ban of antibiotics use in animal nutrition in 2006 due to the risk of animal and human health. These plants and extracts are natural and reliable substances and they have been used widely for medical purposes and as spices for centuries. Since food safety is at the forefront nowadays, the use of natural additives and extracts have gained of importance. For this reason, great emphasis is placed on the use of plants and extracts containing antioxidant active compounds in their structure. As a matter of fact, these plants and extracts have some characteristics such as antimicrobial, antioxidant, antilipidemic, antifungal, antiviral, digestive system stimulator and also have some positive effects on organism such as optimizing performance, improving feed efficiency and vitality. Licorice root (*Glycyrrhiza glabra*) is among the oldest and most widely known medical plants in the world. A large number of pharmacologically active compounds have been isolated from the Licorice root plant. The main components of these bioactive compounds are triterpenoid saponins and various types of phenolic compounds. Experiments on animals have shown that the bioactive substances contained in the plant caused significant decreases in plasma total lipid, cholesterol, triglyceride, LDL, VLDL and increases in the HDL-cholesterol content. It has been shown that licorice root causes an increase in antioxidant enzyme activity. This review provides a brief overview on general structure of the Licorice root and its use as an active ingredient in animal nutrition.

MEDICINAL USES AND CHEMICAL CONTENTS OF MARIGOLD (CALENDULA OFFICINALIS) PLANT

CAHİDE YETİŞ¹, ŞAHANE FUNDA ARSLANOĞLU¹

ABSTRACT

It is as old as human history that people meet their clothing, food and treatment needs from natural products. The increase in the world population and the development of the industry have rapidly increased the availability of the active substances from the plants found in the ending country, and the demands of the countries of the world have also increased. When the origins of the drugs developed between 1981-2006 were examined, 32% of them were proved to be natural or semisynthetic. In addition, the fact that nearly half of the drugs are based on natural resources, prompts drug development efforts to the nature. The effect of herbal medicines on human health is extremely important. Herbal remedies for the prevention and treatment of various diseases have been used since ancient times. Marigold (*Calendula officinalis*) used for the treatment of external and internal wounds is not cultured for any purpose except being an ornamental plant in our country. . For this reason, cultural studies and evaluation as a herbal drug in our country at the scientific level of work is almost not to be tried. The plant, which is unique to the Mediterranean, is a single annual and perennial varieties and has 20-30 varieties. The plant is green every season. It is called as “pot marigold”, “calendula”, “ringerblume” and “souci des jardins” in various countries of the world,. It is known in our country with the names as “aynısafa”, “kadife çiçeđi” and “tıbbi nergis”. It is also used medically in addition to giving color to desserts. Chemical ingredients include triterpenes, flavonoids, essential oils and sesquiterpenes. As a detox in chronic skin disorders such as eczema, acne, in bowel and liver diseases, bed wounds, antiseptic, hepatitis (a, b, c), in the treatment of foot wounds, baby creams, wound healing, diuretic, diarrhea, antibacterial and antifungal effect is used as a medicinal plant for the purpose. In this study, the chemical content of *Calendula officinalis* plant and its use as medicinal plant will be investigated.

NATURAL DYES FROM PLANTS

MERVE YÜZBAŞIOĞLU¹, AYŞE KURUÜZÜM-UZ¹

ABSTRACT

NATURAL DYES FROM PLANTS Merve Yüzbaşıođlu, Ayşe Kuruüzüm-Uz Hacettepe University Faculty of Pharmacy, Dept. of Pharmacognosy, 06100, Ankara, TURKEY Plants in modern society are valued for their flavor, fragrance, medicinal and healthful qualities, economic and industrial uses, pesticidal properties and colorizing materials (dyes). Natural dyes are derived from naturally occurring source such as plants, insects, animals, clays and minerals. The range of colors is limited, but lovely. Due to their non-toxic properties, less side effects, more medicinal values and eco-friendliness, natural dyes are suitable for dyeing textiles, drugs, foods, cosmetics etc. They can also provide extra properties such as UV protection, skin moisturizing, anti-aging, antimicrobial, insect repellent and deodorizing (1). Most natural dye colors are found in the roots, bark, leaves, flowers, fruits, skins and shells of plants. The well-known ancient dyes include red dye from roots of *Rubia tinctorum* L. and leaves of the plant *Lawsonia inermis*, blue indigo dye from leaves of *Indigofera tinctoria*, yellow dyes from stigmas of saffron (*Crocus sativus*) and rhizome of turmeric (*Curcuma longa*). Flavonoids (flavonols, flavones, flavanones, chalcones/ aurones, anthocyanins), hydroxycinnamic acids, carotenoids, tannins, naphthoquinones and anthraquinones are the phyto-colour compounds found in the plants. As synthetic dyes develop, they cause several kinds of pollution in the environment. Likewise some dyes can cause allergic dermatoses, respiratory diseases, contact dermatitis and mutagenicity. Synthetic dyes are so problematic because the families of chemical compounds that make good dyes are also highly toxic and carcinogenic to humans. In recent times natural dyes has regained importance due to the environmental awareness about health problems caused by synthetic dyes. But contrary to this popular opinion, natural dyes are often neither safer nor more harmful than synthetic dyes. They are less permanent, more difficult to apply, wash out more easily, and often involve the use of highly toxic mordants. Mordants help make the dye colour fast by chemically bonding the dye to the fabric. Not all natural dyes require toxic mordants to create light and wash fast colorways. Also, garments dyed with lichens, onion skins etc. don't always have a mordant, which could be good for people with sensitivities because they are substantive dyes- that is, they don't require the use of a mordant. But, some natural dyes, such as the hematein derived from logwood (*Haematoxylon campechianum*) are themselves significantly poisonous. It is very important that to improve the quality and quantity of dye yielding plants and to detect their toxicological characters are required. References: Ashis KS, Konar A. 2011. THE SUSTAINABILITY, PRODUCTION AND QUALITY FROM SOME OF BLACK CUMIN SPECIES IN TURKEY

IREM AYRAN¹, HAKAN VATANSEV², YÜKSEL KAN¹

ABSTRACT

Black cumin (*Nigella sativa* L. and *Nigella damascena* L.) is a annual, herbaceous that is plant belongs to Ranunculacea family. The origin of black cumin extend to from Eastern Mediterranean countries to Eastern and Southern Europe. *Nigella sativa* L. is widespread cultivated in Afyon, Burdur, Isparta, Kütahya and Konya regions in Turkey. *Nigella damascena* L. species is not yet cultivated in our country. The parts of the black cumin used are seeds and have a very important place due to fixed oil, volatile oil and nutrients constant obtained from its seeds. The oil obtained from the seeds of the plant is used in the treatment of many diseases with medical purposes as well as being used as a spice and flavor in food products. *Nigella sativa* L. and *Nigella damascena* L. are commercially available varieties of plants in Turkey. Known the name of black cumin species commonly used in Turkey is *Nigella sativa* L. whereas the use of *Nigella damascena* is not common. In this study, information about the biology, chemical structure, production and evaluation of every both species will be given.

EFFECTS OF GREEN TEA IN THE TESTICULAR TISSUE

MUSA TATAR¹, TUĐBA TATAR²

ABSTRACT

Tea is commonly consumed beverage in the world. Tea can be categorized into three main types, depending on the level of oxidation, as green tea, oolong tea and black tea. Tea polyphenols are important due to the positive association between tea consumption and beneficial health effects. Green tea extract contains polyphenols which make up 25–35% of the dry weight of green tea leaves. Green tea polyphenols including epigallocatechin-gallate (EGCG), epigallocatechin (EGC), epicatechin-gallate (ECG), and epicatechin(EC) show antioxidant properties. Many investigations have been performed on the antioxidant activity of tea catechins on testicular tissue stimulated with agent which causes oxidative stress. Messarah M. et al. report that green tea has protective effect on toxicity of testis tissue via arsenic. In a study, green tea extracts show ameliorative effects on nicotine-induced oxidative stress as well as the reproductive effects by improving the oxidative status, semen quality and the testicular histological damage. In another study, it is observed similar results, and also an increase number of Leydig cells in nicotine stimulated rats. Awoniyi DO. et al. report that green tea supplementation causes an increase in GSH levels, in the superoxide dismutase activity, and a decrease in lipid peroxidation in testicular tissue of rats stimulated with oxidative stress agent. Oxidative stress increases in diabetes due to overproduction of reactive oxygen species (ROS) and decreased efficiency of antioxidant defenses. Therefore diabetes mellitus causes harmful effects on male sexual and reproductive functions. It is observed that administration of green tea to diabetic rats improves the testis structure, induces the proliferation index and reduces apoptotic index. Green tea affects in the protection of testicular tissue against oxidative damage by possibly increasing the antioxidant defense mechanisms in rats. Excess amounts of ROS have adverse effects on sperm motility and fertility due to damaging to lipids and DNA of spermatozoa. Administration of green tea supplements to rats which stimulated with oxidative stress causes increasing the antioxidant defence mechanisms and thereby improving the sperm quality and function. In conclusion, antioxidant property of polyphenols in green tea has beneficial effects on testicular tissue damages due to oxidative stress.

SPICES IN POULTRY NUTRITION: ANTIOXIDANT EFFECT AND MODES OF ACTION

ZEYNEP ŐAHAN¹, FATMA YENILMEZ², UđUR SERBESTER³, LADINE ŐELIK³

ABSTRACT

In recent years, spices and their components have received attention as antioxidant source. Some spices exert antioxidant properties, and may enhance immune status. The mode of action of spices on poultry contain high concentrations of phenolic compounds that have strong H-donating activity. The aim of this paper is to provide an overview of the published data on the potential of spices and their components in poultry nutrition, and to describe their possible modes of action. The current knowledge on potential antagonistic and synergistic effects is presented and areas for future research are proposed.

EXTRACTION METHODS OF ESSENTIAL OILS FROM MEDICINAL AND AROMATIC PLANTS

HATICE BETÜL KAPLAN¹, SEBAHATTIN NAS¹

ABSTRACT

Essential oils are used in a wide variety of consumer goods such as detergents, soaps, toilet products, cosmetics, pharmaceuticals, perfumes, confectionery food products, soft drinks, distilled alcoholic beverages (hard drinks) and insecticides. The world production and consumption of essential oils and perfumes are increased very fast. And also the use of alternative/herbal medicine for the prevention and treatment of various illnesses has been increasing interest worldwide in recent years. A wide range of technologies is available for the extraction of active components and essential oils from medicinal and aromatic plants. Production technology is an essential element to improve the overall yield and quality of essential oil. The traditional technologies pertaining to essential oil processing are of great significance and are still being used in many parts of the globe. The extraction methods are traditional technics such as distillation, expression (cold pressing), solvent extraction and modern (non-traditional) technics such as Supercritical fluid extraction, Microwave-assisted extraction, Solid phase micro-extraction, Simultaneous distillation extraction. All methods has advantages and disadvantages. The choice of extraction method depends on the economic feasibility and suitability of the process to the particular situation. The various extraction methods of essential oils from medicinal and aromatic plants oils are reviewed in this presentation.

COMPARISON OF ANTIBACTERIAL ACTIVITIES OF GRAPE SEED, BLUEBERRY POMACE AND FOX GRAPE POMACE EXTRACTS ON GRAM POSITIVE AND GRAM NEGATIVE BACTERIA

MELIKE DEMİRKOL¹, ÖMER FARUK ÇELİK¹, ZEKAI TARAÇI¹

ABSTRACT

Many in vivo and in vitro studies suggest that flavonoids possess a variety of biological functions including antiallergic, anticarcinogenic, antihypertensive and antimicrobial properties. They are potential antioxidants thus may play an important role in the persistence of health. There are many plant based compounds exhibiting antimicrobial activity against pathogen microorganisms due to the presence of hydroxyl groups and conjugated double bonds in the reactive groups such as flavonoids. Berries and grapes are regarded as rich fruits in terms of their flavonoid contents. In this study, the antibacterial activities of extracts of dried grape (*Vitis vinifera*) seed, fox grape (*Vitis labrusca*) and blueberry (*Vaccinium myrtillus*) pomaces will be investigated. Grape seeds were sun-dried while both pomaces were lyophilized. After grinding, the extracts of regarding powders will be prepared using methanol as the solvent. All extracts will be applied at different concentrations in order to observe and evaluate their antibacterial activity. *Escherichia coli* and *Staphylococcus aureus* will be used as model microorganisms representing gram negative and gram positive bacteria, respectively. Antibacterial activities of extracts will be determined using agar disc diffusion method. Bacteria will be cultivate from stock and after a couple of passages they will be grown until mid-log phase in Tryptic Soy Broth (TSB). Following their plating on Mueller-Hinton agar, discs that are impregnated with different concentrations of phenolic extracts will be placed on the agar. After incubation, the inhibition zones around the discs will be measured milimetrically and the results will be evaluated.

THE CHARACTERISTICS AND USAGE OF MARIGOLD (CALENDULA OFFICINALIS L.) FROM PAST TO FUTURE

IREM AYRAN¹, YÜKSEL KAN¹

ABSTRACT

Marigold (*Calendula officinalis* L.) is an annual, herbaceous plant that belongs to the Asteraceae family. It was recorded that the origin of Marigold is a plant originating in Central and Southern Europe, Western Asia and America. It has been almost every flora of Turkey. At the same time, this plant cultivated in Turkey is one of medicinal and aromatic plants. Especially in terms of medicinal, the plant contains secondary metabolites such as essential triterpene saponins, flavonoids, carotenoids and essential oils. In addition to its use as food, cosmetics, and paint, flowers of the same plant are also used in the treatment of many diseases. At the same time, the plant is widely used as a medicinal oil in traditional medicine applications in Turkey. It has been determined that studies on marigold have anti-inflammatory, antimicrobial, antiviral, antihypertensive and antilipid properties. In this study, information about the biology, chemical structure, production and evaluation of the plant will be given.

CROSS-GENERA TRANSFERABILITY OF CHLOROPLAST MICROSATELLITE MARKERS IN THE GENERA OF LAMIACEAE

EMİNE UYGUR GÖÇER¹, MEHMET KARACA¹, AYŞE GÜL İNCE¹

ABSTRACT

Microsatellites, also referred to as simple sequence repeats (SSRs) or simple tandem repeats (STRs), were first described by Litt and Luty in 1989. Microsatellites consist of tandemly repeated mono-, di-, tri-, tetra- or penta- and hexa-nucleotide motif units distributed throughout the genomes of most eukaryotic organisms. The differences in the tandemly repeating motifs are caused by DNA polymerase slippage during replication, or slipped strand mispairing. Repeat differences in microsatellite motifs are powerful DNA markers because they are highly polymorphic even between closely related lines and varieties, reproducible and co-dominant markers exhibiting multiallelic nature and inherited as simple Mendelian fashion. Microsatellites can be found in nuclear and organellar genomes, which are enclosed in chloroplast and mitochondria. These tandemly repeated DNA can be located within transcribed, un-translated and un-transcribed regions of the genomes including the regulatory regions. Microsatellites found on the transcribed and untranslated regions of genes seem to have higher level of cross-transferability within the genetically related organisms. Microsatellites located on the chloroplast genome of higher plants are usually composed of mononucleotide (usually As and Ts) repeats and occasionally di-nucleotide repeats. The utilization of chloroplast microsatellites has been reported by Taberlet et al. in 1991. Later on, several universal primers were reported for amplifying chloroplast regions in various crops. In the present study a total of 10 conserved chloroplast microsatellite primer pairs developed from chloroplast DNA sequences of *Nicotiana tabacum* were used to amplify chloroplast microsatellites of *Sideritis stricta*, *Stachys* spp., *Salvia pisidica* and *Thymus cilicicus*, members of the family Lamiaceae. Two different touch-down polymerase chain reaction profiles differing in the annealing temperatures were used in the amplification studies before high resolution of agarose gel electrophoresis separation. Amongst the 10 conserved chloroplast primer pairs (CCMP), CCMP09 did not amplify DNA templates of the genera while CCMP05 only amplified template of *Thymus cilicicus*. Rest of the CCMP primer pairs could amplify DNA templates of the genera tested. The range of amplified product varied from 80 bp to about 200 bp. Among the CCMP amplicons, CCMP01 markers contained TA dinucleotide repeats while rest of the CCMP markers consisted of A or T mononucleotide microsatellites. Successful amplification of primer pairs obtained from chloroplast of *Nicotiana tabacum* indicated that chloroplast genome sequences are highly conserved due to the low level of mutation rate among the plant species. Because chloroplast genomes are haploid and contain many copies in a cell of higher organisms and most chloroplast genomes have maternal inheritance, cross-genera transferable chloroplast microsatellite markers reported for *Sideritis stricta*, *Stachys* spp., *Salvia pisidica* and *Thymus cilicicus* could be successfully used in genetic, conservation and species identification studies. Maternal inheritance of these markers could be used in determination of hybrid identification of the genera tested.

APPLICATION OF SINGLE PRIMER AMPLIFICATION REACTION (SPAR) MARKERS IN FINGERPRINTING STUDIES OF AROMATIC PLANTS

EMİNE UYGUR GÖÇER¹, MEHMET KARACA¹, AYŞE GÜL İNCE¹

ABSTRACT

The theoretical advantages of using genetic markers, the potential value of genetic marker linkage maps and direct selection in plant breeding were first reported about eighty years ago. However, it was not until the advent of DNA marker technology in the 1980s, that a large enough number of environmentally insensitive genetic markers generated to adequately follow the inheritance of important agronomic traits and since then DNA marker technology has dramatically enhanced the efficiency of plant breeding. The 1980s could be considered as the birth of molecular breeding. The discovery of polymerase chain reaction (PCR) has facilitated the development of new marker systems that have a variety of applications, some of which include: (i) fingerprinting of genotypes or varieties for identification and bar-coding purposes; (ii) mapping of genes and quantitative trait loci for important traits; (iii) positional cloning of desired genes; (iv) identification of chromosome segments carrying desired loci; (v) establishing phylogenetic relationships among different genotypes or species; (vi) selection of suitable parents for hybrid breeding and gender identification; (vii) assessing the basis of somaclonal variation and epigenetic modifications; (viii) identification of pathogen races and biotypes; (ix) prediction of heterotic cross combinations; (x) gene pyramiding; and (xi) management, utilization and preservation of genetic resources. The various PCR-based marker systems are of two types depending on the primers used for in vitro DNA amplification: (i) arbitrary or semi-arbitrary primed PCR marker systems which are developed without prior genomic sequence information of the plant species under the study (AP-PCR, DAF, RAPD, AFLP, ISSR, DAMD etc.), and (ii) site-targeted PCR marker systems which are developed from known genomic DNA sequences of the plant species under the study (CAPS, SSR, SCAR, SRAP). Single primer amplification reaction (SPAR) marker system belongs to the first group; being in the semi-arbitrary primed PCR marker systems. In the present study, we investigated whether SRAP markers are useful in fingerprinting studies of the genera *Thymus* L., *Origanum* L., *Rosmarinus* L. and *Ocimum* L. represented with *Thymus serpyllum*, *Origanum majorana*, *Rosmarinus officinalis* and *Ocimum basilicum*. High genomic DNA samples of above mentioned plant species were extracted. About 60-120 ng genomic DNA templates were amplified by touchdown polymerase chain reactions (PCRs) using a single primer. Amplified products were separated by agarose gel electrophoresis and SPAR markers of the plant samples were visualized with the help of ethidium bromide staining. Analysis revealed that all the six primers could successfully amplify the genomic DNA samples of the aromatic plant species used in the study. In each SPAR marker profiles among the six single primers there were densely amplified products ranging one to three along with some other less dense products. The SPAR marker are produced using a single primer thus these densely amplified products contained primer binding sites at both terminal

Corresponding Author: EMİNE UYGUR GÖÇER, emineuygur@akdeniz.edu.tr
¹AKDENİZ ÜNİVERSİTESİ

ends while these less dense amplicons contained one primer binding sites at one terminal ends. Present study revealed that SPAR markers could be successfully used in genetic, conservation and species identification studies of genotypes and varieties in the genera *Thymus*, *Origanum*, *Rosmarinus* and *Ocimum*.

INVESTIGATION OF CHEMICAL CONTENT OF EREMURUS SPECTABILIS BIEB. EXTRACT USING SUBCRITICAL WATER EXTRACTION

İBRAHİM TEGIN¹, BETÜL SADIK¹, MEHMET FİDAN¹, ERDAL YABALAK², A. MURAT GIZİR²

ABSTRACT

Nowadays, food and pharmaceutical industry pay great attention to Subcritical water extraction method (SWE) attributed to being powerful technique for the extraction of various valuable solid samples [1, 2]. In addition, it has been used in environmental applications to extract hazardous components from various matrixes [3]. Subcritical water is known as water in the temperature range of 100-374 °C and pressurized enough to maintain its liquid form [4]. Solvent power can be adjusted by altering the temperature. Thus, SWE can be used as a non-polar solvent at high temperature [5-8]. Subcritical water extraction is a distingue method when comparing traditional methods due to being time-saving, rapid, green, and selective method [3, 9]. Thus, subcritical water extraction method was performed to determine chemical components of Eremurus Spectabilis Bieb. in this study. A large number of plants have been discovered by mankind since centuries. People use these plants for different purposes. This plant is used in medicinal and glue purposes in food grown in the region [7]. Samples of Eremurus Spectabilis Bieb were dried and crushed for extraction using the experimental set-up as shown in our previous work [2]. Extracts were collected after extraction time under 105 °C and 40 bar. Samples were analyzed by GC-MS according to Wiley7Nist05.L, NIST05a.L, and W9N11.L, to determine extracted compounds. Some of these compounds are as follows: Glycidyl alcohol, Acetic acid, 1,2-Propanediol, 3-Furanmethanol, 1,2,3-Propanetriol, Dimethyl phthalate, D-Erythro-Pentose, Hexadecanoic acid, 9-Octadecenoic acid.

RESOLUTIONS OF MINISATELLITE (DAMD-PCR) AND MICROSATELLITE (SSR) MARKERS IN SALVIA L.

MEHMET KARACA¹, AYŞE GÜL İNCE¹, ADNAN AYDIN¹

ABSTRACT

Sage (*Salvia L.*) is one of the largest genera in the family Lamiaceae. The genus consisted of about 1000 species and many of which are used in spices, drug and fragrance industries. DNA markers have opened a new era in plant breeding, conservation, management and utilization. However, application of DNA markers in many *Salvia* species lags behind many other plant species including the family Lamiaceae. DNA markers are very useful in those studies involving in the determination of genetic mapping, gene identification, parentage selection, identification of cultivars, marker assisted breeding and selection. Single nucleotide polymorphisms (SNPs) and microsatellites (SSRs) are the two most widely used and most powerful molecular markers. However, utilization of these markers in *Salvia L.* has not reached the optimal level. This study was undertaken to compare resolutions power of minisatellites in terms of direct amplification of minisatellite DNA (DAMD-PCR) and microsatellite in terms of simple sequence repeats (SSRs) within and between some *Salvia* species naturally occurring in Antalya. A minisatellite is a tract of tandemly repetitive DNA motifs repeated many times, ranging in length from 10–60 base pairs. They are usually 0.2–20 kb long and are usually prominent in the heterochromatin regions being the most occurring in the centromeres and telomeres of chromosomes. Minisatellite markers or minisatellite enriched markers can be detected using direct amplification of minisatellite DNA (DAMD-PCR). Amplification of DAMD-PCR markers is obtained when flanking regions of minisatellites have inverted DNA sequences to which minisatellite core primers bind during PCRs. Although they have high level of polymorphism and do not require sequence information for development, DAMD-PCR markers have lower level of reproducibility in comparison to microsatellite markers which are also known as simple sequence repeats (SSRs). Microsatellite is the “DNA marker of choice” and dominated plant molecular research during the last decade of the past century and the first decade of the present century. Microsatellites are tandem repeating mono-, di-, tri-, tetra- or penta- and hexa-nucleotide motif units distributed throughout the genomes of every eukaryotic organism sequenced so far. Microsatellites are highly polymorphic and usually co-dominant DNA markers. Development of microsatellite markers requires low amount of DNA, and can be easily automated for high throughput screening, transferable between laboratories. Polymorphisms in microsatellites and minisatellites of genetically related organisms are due to recombination (i.e. unequal crossing-over) and replication (DNA polymerase slippage) errors. In the present study 3 *Salvia* species (European sage, meadow sage and balsamic sage) and 12 genotypes four of which representing each species were studied. DNA markers obtained using 8 SSR primer pairs and 8 DAMD-PCR primers were separated in 3% (for SSRs) and 2% (for DAMD-PCR) high resolution agarose gel electrophoresis after touch-down polymerase chain reactions. Results clearly indicated that the level of polymorphisms were greater in SSR markers than that of the DAMD-PCR markers. The DAMD-PCR provided a moderate level of polymorphism between the species studied.

Corresponding Author: MEHMET KARACA, mkaraca@akdeniz.edu.tr

¹AKDENİZ ÜNİVERSİTESİ

However, the levels of polymorphic DAMD-PCR markers were low within the species. The levels of transferability of DAMD-PCR markers between the species were higher than SSR markers. In conclusion the present study indicated SSR markers provide greater resolution for intra-species while the DAMD-PCR markers are more suitable for inter-species genetic studies.

THE DETERMINATION OF MINERAL AND HEAVY METAL CONTENTS OF ECHINACEA SPECIES CULTIVATED IN TURKEY

SADIYE AYŞE ÇELİK¹, YÜKSEL KAN¹

ABSTRACT

This study was carried out in five different echinacea species in the Medicinal and Aromatic Plants Application Farm of the Faculty of Agriculture of Selçuk University in 2013 and 2014 in the ecological conditions of Konya. B, Ca, K, Na, P and S minerals and Al, Cd, Co, Cr, Cu, Fe, Mn, Pb, Mo, Ni and Zn heavy metals were investigated in the herb and root samples taken during the full flowering period of five different echinacea species (*Echinacea purpurea* var. *purpurea*, *Echinacea pallida* var. *pallida*, *Echinacea paradoxa* var. *paradoxa*, *Echinacea purpurea* var. *baby white swan* ve *Echinacea purpurea* var. *double decker* species). NMKL 161 method and ICP-AES instrument were used for determining mineral substances. The highest B, Ca, K, Na, P and S contents of the herbs of *Echinacea* species were respectively, *Echinacea purpurea* var. *double decker* 135,029 ppm, *Echinacea purpurea* var. *double decker* 31185,018 ppm, *Echinacea purpurea* var. *baby white swan* 21968,858 ppm, *Echinacea pallida* var. *pallida* 104,742 ppm, *Echinacea purpurea* var. *purpurea* 2490,672 ppm and *Echinacea paradoxa* var. *paradoxa* 1754,594 ppm. The highest Al, Cd, Co, Cr, Cu, Fe, Mn, Pb, Mo, Ni and Zn contents of the herbs of *Echinacea* species were respectively, *Echinacea purpurea* var. *baby white swan* 432.195 ppm, *Echinacea purpurea* var. *purpurea* 0.111 ppm, *Echinacea paradoxa* var. *paradoxa* 0,395 ppm, *Echinacea paradoxa* var. *paradoxa* 2,615 ppm, *Echinacea purpurea* var. *purpurea* 22,535 ppm, *Echinacea purpurea* var. *baby white swan* 451.350 ppm, *Echinacea paradoxa* var. *paradoxa* 46.217 ppm, *Echinacea paradoxa* var. *paradoxa* 21.366 ppm, *Echinacea purpurea* var. *purpurea* 3.364 ppm, *Echinacea paradoxa* var. *paradoxa* 2.936 ppm ve *Echinacea paradoxa* var. *paradoxa* 22.218 ppm. The highest B, Ca, K, Na, P and S contents of the roots of *Echinacea* species were respectively, *Echinacea purpurea* var. *double decker* 102,620 ppm, *Echinacea purpurea* var. *purpurea* 38805,7 ppm, *Echinacea paradoxa* var. *paradoxa* 20656,313 ppm, *Echinacea pallida* var. *pallida* 2062,226 ppm, *Echinacea paradoxa* var. *paradoxa* 2262,165 ppm and *Echinacea paradoxa* var. *paradoxa* 2181,838 ppm.

THE DETERMINATION OF MEDICAL PLANTS USED IN THE TREATMENT OF DISEASES IN ERZURUM

SERAP BUZTEPE¹, AKAR KARAKOÇ¹, EYYUP TELCİ², AYHAN BUZTEPE³, FATMA GÜR¹

ABSTRACT

In daily life, medicinal and aromatic plants are used as a traditional method for the protection and improvement of health, and for the treatment of diseases in Turkey. It is known by people living in the city of Erzurum located in Eastern Anatolia region of Turkey that, in here, the use of plants for the health field is widespread. The aim of our study is to determine which medicinal plants are used for which illness by the people living in Erzurum city. The research was carried out on 73 volunteers, were selected randomly, living in Erzurum. The data were collected through a questionnaire, also including open-ended questions, prepared by the researchers. Descriptive statistics, chi-square and Fisher's exact tests were used for the analysis of data. The mean age of the participants was 41.34 ± 15.23 (mean \pm standard deviation). 46.6% of the participants were women and 53.4% were men; 30% are high school graduates and 42.5% are university graduates. It was seen that participants had obtained knowledges about the use of plants from family (28.8%), friends (20.5%), relatives (17.8%) and health workers (15.1%). 51 plants used by the participants for the treatment of diseases were identified in this study. The most commonly used plants were linden (*Tilia Cordata*) (19.2%), ginger (*Zingiber officinale*) (11%) and sage (*Salvia Officinalis*) (8.2%). Linden was used for respiratory diseases (85.71%) and lumber hernia (7.14%), and in order to strengthen the immune system (7.14%), whereas ginger was used in the treatment of respiratory tract diseases. Sage-using participants consumed this plant for the treatment of respiratory (66.6%) and gastrointestinal diseases (16.6%), and as a sedative during menopause. The number of plants used by participants was compared with the economic situation, sex, occupation and social security, and a difference was found between the economic situation and the number of plants ($p=0.023$). Participants with moderate economic status used 1-3 plants. Participants' preferences were asked about plants and medicines in order to use in the treatment of diseases. All of the participants who did not have social security preferred to use the plant. In addition, there was no significant difference between the number of plants and the preference, but it was found that the people preferring to use plants used 4-10 plants. It was found that the medicinal plants were widely used in the treatment of respiratory tract diseases by people participating in the research, which may be due to the high prevalence of respiratory illnesses in cold climatic conditions of Erzurum city. The use of medical plants by the peoples is of great importance for reducing acute and chronic health problems and improving the quality of life.

LUPINUS ALBUS' FUNCTIONAL CHARACTERISTICS AND EFFECTS ON HEALTH

TAHA GÖKMEN ÜLGER¹, FUNDA PINAR ÇAKIROĞLU²

ABSTRACT

Lupinus albus, a plant belonging to the family Fabaceae, is a herbaceous plant whose leaves are split, cluster-like flowers and can grow up to 120 centimeters in length. There are about 200 kinds of lupinus albus that grow wild in Europe, the Balkans and the Aegean and Mediterranean Regions in our country. Lupinus albus, lupinus anatolicus and lupinus angustifolius are the species that grow in our country and are also called "delicebakla", "kurt baklası", "termiye", "yahudi baklası" and "gavur baklası". The lupinus albus that matures in the autumn months is widely consumed especially in the Mediterranean Region and Konya. Due to the alkaloids in its composition, the taste of the pellets is bitter and its bitterness is eliminated with traditional methods (water retention and boiling) before consumption. The lupinus albus that is consumed as a snack (tirmis) in winter usually has more protein content than milled grains. Its content is high with regard to zinc, calcium, iron, potassium and manganese which are considered micronutrient items. Although studies on the functional effects of lupinus albus, which have very beneficial effects on health, have been limited, it has been reported that it lowers blood glucose of diabetic rats in some clinical studies. The famous physician of the 11th century, Ibn Sina, tried to treat diabetic patients with curcuma, lupinus albus and fenugreek. In diabetic rats, it was observed that the lupinus albus added to their feeds decreased the malondialdehyde (MDA) levels and increased the antioxidant enzyme levels. In hypercholesterolemic subjects, it has been reported that the daily diet supplemented with lupinus albus reduced LDL cholesterol levels. There are also data showing that it lowers blood pressure of hypertensive individuals. More clinical studies are needed to address the functional effects of lupinus albus, which have a protective role in certain types of cancer and kidney diseases, particularly colon cancer. Preventative health policies are important in obesity and type 2 whose prevalence is rapidly increasing in the world and our country and which takes role in the etiology of many diseases, and these policies may include functional foods such as lupinus albus. Considering the emergence of policies for the development of healthy eating behaviors in health policies to prevent obesity and the prevalence of type 2 diabetes, it may be helpful that individuals having interchangeable risk factors for type 2 diabetes (overweight and obesity, sedentary lifestyle, impaired fasting glucose and impaired glucose tolerance, hypertension, low HDL cholesterol level, increased triglyceride level) consume foods such as lupinus albus. Although some studies in the literature have shown that lupinus albus have hypolipidemic and hypoglycemic effects, more studies are needed to determine the level of reliable intake and other possible functional effects on health.

DEVELOPMENT OF MICROSATELLITE MARKERS FOR THE WORLD'S MOST EXPENSIVE SPICE SAFFRON

MEHMET KARACA¹, AYŞE GÜL İNCE¹, EMİNE UYGUR GÖÇER¹

ABSTRACT

Saffron, *Crocus sativus* Linn in the family Iridaceae, is a fall flowering perennial domestic plant and its closed relative *C. cartwrightianus*, which originated in Crete, or in Central Asia. Saffron is a sterile triploid plant and its stigmas are mainly used as a colorant for foodstuffs. Found in the stigmas are apocarotenoid compounds responsible for the production of the yellow-orange color in food. Stigmas also contain picrocrocin and safranal which produce a bitter taste and a hay-like fragrance. These traits make saffron a much-sought ingredient in many foods worldwide. Saffron is traditionally used against cancer, depressive mood, menstruation disorders, liver disease and pain. The taxonomy of *Crocus sativus* is extremely complicated due to the lack of clear distinctive characters, the wide range of habitats and the heterogeneity of the morphological traits and cytological data. Although differences in the size and the number of the flowers produced by corms have been reported previous studies utilizing a large number of markers obtained using 140 primers of random amplified polymorphic DNA (RAPD), 91 primers of inter-simple sequence repeats (ISSRs) and 47 primer pairs of simple sequence repeats (SSRs) could not differentiate among the forty three *C. sativus* from eleven different countries including two from Turkey. Saffron, as a sterile plant, fails to produce viable seeds and is thus dependent on vegetative reproduction. The existence of differences at the phenotypic level such as size of the flowers, the shape of the tepals (combined sepals and petals), differences of color and intensity in the tepals of saffron belonging to different regions of world may indicate genetic differences. However artificial selection in the past may drastically reduce the genetic diversity. Expressed sequence tag (EST) sequences are valuable resources for development of microsatellite markers. The use microsatellite markers found transcribed and un-translated regions of the nuclear and chloroplast genome of *Crocus sativus* could differentiate saffron varieties. These markers could be also used in marker assisted selection studies for saffron breeding. In this study, a total of 6750 EST sequences of *Crocus sativus* derived from publicly available databases of National Center for Biotechnology Information (NCBI) were mined to obtain ESTs with microsatellites using Tandem Repeats Analyzer 1.5 (TRA 1.5) program. Microsatellites in the present study were considered to contain motifs that were between two and six nucleotides in length. The minimum motif length criteria were defined as being 9 repeats for di-nucleotides, 7 repeats for tri-nucleotides, 6 repeats for tetra-nucleotides and 5 repeats for penta-nucleotides and 4 repeats for hexa-nucleotides. Microsatellite primer pairs flanking the microsatellite domains were designed using PRIMER3 software. Microsatellite primer pairs were designed with several criteria such minimum/maximum as length of expected product, GC content, melting temperature etc. A total of 30 EST-SSR primer pairs were designed. Annealing temperatures of the primer pairs are set to 55 C (T_m 59 C) and expected to amplify markers ranging from 209 bp to 334 bp in size. Thirty EST primers consisted of 5 di-nucleotides, 7 tri-nucleotides, 6 tetra-nucleotides, 4 penta-nucleotides and 8 hexa-nucleotides. These

Corresponding Author: MEHMET KARACA, mkaraca@akdeniz.edu.tr

microsatellite primer pairs along with the conserved chloroplast microsatellite primer pairs could be useful in genetic characterization and breeding studies of saffron.

THE ROLE OF BIOTECHNOLOGY IN AMARILLADIACECA FAMILY

ÜMRAN ŞENEL¹, M. ERCAN ÖZZAMBAK²

ABSTRACT

The Amaryllidaceae family comprises more than 75 genera and 1100 species of herbaceous, perennial and bulbous flowering plants. In this family there are important ornamental plants such as Leucojum, Pancratium, Narcissus, Sternbergia and Galanthus. Some plants in this family also have pharmacological value due to the important alkaloids they contain. Today, the use of biotechnological tools is important for the sustainable production of these alkaloids. The need for these alkaloids used in the treatment of some important diseases is increasing day by day and access to plant resources is limited. For this reason, in vitro studies are considered as an alternative approach for alkaloids production. In this study, in vitro studies on pharmacologically valuable plants in Amaryllidaceae family were investigated.

POISONOUS BOTANICALS OF VAN PROVINCE (TURKEY)

ABDULLAH DALAR¹, MUZAFFER MÜKEMRE¹, SEMA SEZGIN¹

ABSTRACT

Plants have been used as ethnobotanically by human for their medicinal, food, ornamental, fuel, recreational and also poisonous properties since ancient times. The most ancient poisons also come from plants such as *Atropa* sp., *Nerium* sp., *Datura* sp., *Aconitum* sp. and *Hyoscyamus* sp. Many members of the plant kingdom have toxic compounds that can be highly poisonous, even lethal, if ingested. At present, despite the enormous development of toxicology surveillance systems, poisoning by plant samples continues to be one reason of morbidity and mortality. Within this presentation poisonous plant samples grown in Van province including *Anthriscus* sp., *Ferula* sp., *Vincetoxicum* sp., *Euphorbia* sp., *Papaver* sp., *Aconitum* sp., with their ethnobotanical data will be presented.

ANTIOXIDANT ACTIVITY OF ANTHEMIS AUSTRIACA JACQ. AND A. PSEUDOCOTULA BOISS. EXTRACTS AND THEIR TOTAL PHENOLIC AND FLAVONOID CONTENTS

ZEKIYE CEREN ARITULUK¹, NEZIHA YAđMUR KUMSER DİKER², İFFET İREM TATLI ÇANKAYA³

ABSTRACT

The genus *Anthemis* L. (Asteraceae) is represented by 81 taxa belonging to 51 species in the Flora of Turkey^{1,2}. Several species of *Anthemis* genus have been used as folk medicine in the treatment of various health problems such as cold, fever, cough, bronchitis, stomachache, menstrual problem and gastrointestinal disorders³⁻⁶. In this study, *Anthemis austriaca* Jacq. and *A. pseudocotula* Boiss. used as folk medicines were investigated for their potential antioxidant activity. For this purpose, methanol and aqueous extracts of the aerial parts of these plants were tested with three complementary methods, namely 2,2-diphenyl-1-picrylhydrazyl (DPPH) radical scavenging capacity, 2,2'-azinobis (3-ethylbenzothiazolin-6-sulphonic acid) (ABTS) radical cation scavenging capacity and cupric ion reducing antioxidant capacity (CUPRAC). Moreover, total phenolic contents of plant extracts were determined by Folin-Ciocalteu's reagent and their flavonoid contents were determined by aluminum chloride colorimetric method. The results of present study revealed that, all plant extracts exhibited antioxidant activity with various potencies. In the DPPH assay, both methanol and aqueous extracts of *A. pseudocotula* (IC₅₀=140.44 and 120.14 µg/mL, respectively) showed higher scavenging activity than methanol and aqueous extracts of *A. austriaca* (IC₅₀=119.72 and 116.73 µg/mL, respectively). Contrary to DPPH assay, both methanol and aqueous extracts of *A. austriaca* showed higher scavenging activity against ABTS radical cation (153.53 and 181.09 mg Trolox equivalents/g extract, respectively) compared with *A. pseudocotula* extracts (128.77 and 117.76 mg Trolox equivalents/g extract, respectively). In the CUPRAC assay, the aqueous extracts of *A. austriaca* and *A. pseudocotula* exhibited higher antioxidant activity (100.50 and 67.00 gallic acid equivalents/g extract, respectively) than methanol extracts. In addition, the highest phenolic content was detected in *A. austriaca* aqueous extract as 138.40 mg gallic acid equivalents/g extract, while the highest flavonoid content was detected in *A. pseudocotula* methanol extract as 31.17 mg quercetin equivalents/g extract. PRODUCTION AND FOREIGN TRADE OF POPPY SEED IN TURKEY

FIKRIYE YAZAR¹, ZOZAN KAYA¹, GIZEM YENER¹, ARZU SEÇER¹

ABSTRACT

PRODUCTION and FOREIGN TRADE OF HAŞHAŞ in TURKEY A poppy is the source of the crude drug opium which contains powerful medicinal alkaloids such as morphine and has been used since ancient times as an analgesic and narcotic medicinal and recreational drugs. The sugared, milled mature seeds are eaten with pasta, or they are boiled with milk and used as filling or topping on various kinds of sweet pastry. The planting of opium poppy is supervised by the UN all over the world. The UN designated Turkey, India, Australia, France, Spain, Hungary, Czech Republic and China as the legal producers of opium poppy. Turkey and India are regarded as the traditional opium poppy producer countries by the UN. Cultivation, production and trade of opium were free until 1933 in Turkey. In 1933, controlled poppy cultivation and production was launched and late on, in 1938 with the (ne demek) establishment of the Turkish Grain Board (TGB) and monopoly authority of narcotic drugs was given to TGB. It was established as an Economic State Enterprise in order to stabilize the grain market and operate the monopoly of opium and narcotic substances in Turkey. For this purpose, being organized throughout the country and within the framework of the relating legislation as it has been defined TGB as traditional poppy producer. So, it has been responsible for the cultivation, processing and marketing of poppy to be used for medical and scientific purposes in order to meet the need both domestic and foreign market. The city of Afyonkarahisar in Turkey (afyon "poppy, opium", kara "black", hisar "fortress") was a traditional center of poppy cultivation . Afyonkarahisar is produce about 31 % Turkey production of poppy seeds in 2016 .World production of poppy seeds is around 102.331 t and major producers are Turkey and Czechia Republic. These two countries meet rough 52 % of the World demand. Turkey currently only produces about 26 % of the world total. According to ten years ago poppy production was increased in Turkey and World. Approximately 95 % of our products are exported. This study aims at searching the production and foreign trade and manifesting the marketing structure and studying the role of TGB in the market structure of the poppy seeds.. Keywords: Poppy seed, foreign trade, TGB, production

COMPOSITIONS OF AMINO ACIDS IN DIFFERENT VARIETIES OF SALEP TUBERS.

**MEHMET FATİH CENGİZ¹, CEVDET GÜMÜŞ², TIMUR TONGUR¹, TANER ERKAYMAZ¹, ONUR BASANÇELEBİ¹,
AYŞE KEVSER BILGIN¹**

ABSTRACT

Salep is not cultivated on a commercial scale and is obtained by collecting tubers of the Orchidaceae plants from the wild. Amino acid contents of this plant can be important in the area of medicinal and healthcare sectors. In the study, amino acid compositions of six different varieties of salep tubers (*Himantoglossum robertianum*, *Orchis italica*, *Ophrys ferrum-equinum*, *Serapias vomeracea*, *Orchissancta*, *Anacamptis pyramidalis*), which were collected from different regions of Turkey, were determined. Salep tubers were collected from their natural habitat. The tubers were boiled in hot water, dried in sunlight and grinded by a laboratory type mill. Individual amino acids (arginine, aspartic acid, cysteine, glutamic acid, histidine, isoleucine, leucine, lysine, methionine, phenylalanine, proline, serine, threonine, tyrosine and valine) were analyzed by liquid chromatography tandem mass spectrometry (LC MSMS) without derivatization. The method was found to be selective, linear ($r^2 > 0.99$) and precise for all of interested amino acids. The limits of the quantifications (LOQ) were found to be in the range from 0.53 to 1.20 mg/kg. The content of 15 amino acids quantified by LC MSMS ranged between $>LOQ$ -14419.91 mg/kg. The total amino acid was found to be 10129.29 mg/kg, 20029.61 mg/kg, 10483.00 mg/kg, 9510.92 mg/kg, 10921.48 mg/kg and 9825.68 mg/kg for *Orchissancta*, *Serapias vomeracea*, *Ophrys ferrum-equinum*, *Orchis italica*, *Himantoglossum robertianum* and *Anacamptis pyramidalis*, respectively. None of the analyzed samples was contained cysteine. Lysine (2036.58 mg/kg), arginine (14419.91 mg/kg), histidine (458.41 mg/kg), serine (551.25 mg/kg), proline (144.24 mg/kg), valine (261.07 mg/kg), methionine (26.37 mg/kg), tyrosine (425.50 mg/kg) and phenylalanine (537.21 mg/kg) amino acids were detected in *Serapias vomeracea* samples. The highest concentration of aspartic acid and glutamic acid, *Ophrys ferrum-equinum*. The content of leucine + isoleucine (168.40 mg/kg) was the highest in *Orchis italica*. In conclusion, *Serapias vomeracea* has the most valuable salep variety in tested samples due to its high content of amino acids. Therefore, it can be preferred in medicinal and healthcare treatment which amino acid compositions is accepted as important.

ANTIOXIDANT ACTIVITY, TOTAL PHENOLIC AND FLAVONOID CONTENTS OF TWO ENDEMIC SIDERITIS L. TAXA FROM TURKEY

NEZIHA YAđMUR KUMSER DİKER¹, ZEKIYE CEREN ARITULUK¹, İFFET İREM TATLI ÇANKAYA¹

ABSTRACT

The genus *Sideritis* L. belonging to Lamiaceae family comprises more than 150 species worldwide, most of which are mainly found in the Mediterranean area. In Turkey, *Sideritis* genus is represented by 53 taxa and 39 of those are endemic¹. Several species of *Sideritis* genus have been used as tea because of their pleasant aroma and special taste as well as their healing effects. The members of this genus are rich in essential oil, flavonoids and diterpenes which are responsible for their biological activities such as antiinflammatory, antimicrobial, antiulcerogenic, antioxidant, analgesic etc.² In this study, methanol and aqueous extracts of the aerial parts of *Sideritis libanotica* Labill. ssp. *linearis* (Benth.) Bornm. and *S. phrygia* Bornm. were investigated for their potential antioxidant activity by three complementary methods, namely 2,2-diphenyl-1-picrylhydrazyl (DPPH) radical scavenging capacity, 2,2'-azino-bis (3-ethylbenzothiazolin-6-sulphonic acid) (ABTS) radical cation scavenging capacity and cupric ion reducing antioxidant capacity (CUPRAC). Moreover, total phenolic contents of plant extracts were determined by Folin-Ciocalteu's reagent and their flavonoid contents were determined by aluminum chloride colorimetric method. The results of present study revealed that, all plant extracts exhibited antioxidant activity with various potencies. The methanol extracts of *S. libanotica* ssp. *linearis* and *S. phrygia* showed higher scavenging activity against DPPH radical (IC₅₀=149.23 µg/mL and 131.78 µg/mL, respectively) and against ABTS radical cation (185.91 and 149.84 mg Trolox equivalents/g extract, respectively) while the aqueous extracts showed higher activity on CUPRAC assay (58.71 and 57.28 gallic acid equivalents/g extract, respectively). Total phenolic contents of extracts were in range between 92.47 and 138.09 mg gallic acid equivalents/g extract and the total flavonoid contents were in range between 17.60 and 29.50 mg quercetin equivalents/g extract. NATURAL PLANTS USED AS MEDICINAL IN KOZLUCA (ACIGÖL / NEVŞEHİR) VILLAGE

DENİZ ULUKUŞ¹, OSMAN TUGAY²

ABSTRACT

This study was carried out to determine the natural plants used as medicines in Kozluca Village (Acıgöl / Nevşehir). Field visits were organized between March and August months in 2015-2016. A total of 28 plant samples were taken from interviews with 20 source people in the field surveys conducted and information on how these plants were used as medicines were noted. In the field studies conducted, pictures of the plants in the field were taken. According to the common herbarium techniques, plants were pressed and dried. To determine the scientific names of plants were used Flora of Turkey as main source. In addition, local names are written by using the local people. As a result of evaluation of plant samples collected from Kozluca Village, it was determined that total 28 natural plants belonging to 13 families and 25 genera were used as medicines. Some of these plants; *Capsella bursa-pastoris* (L.) Medik., *Gundelia tournefortii* L., *Lactuca sativa* L., *Malva neglecta* Wallr., *Scorzonera cinerea* Boiss., *Tragopogon dubius* Scop., *Tribulus terrestris* L., *Papaver rhoeas* L., *Plantago major* L., *Urtica dioica* L., *Portulaca oleracea* L.

THE DETERMINATION OF SOME PHYTOCHEMICAL CONTENTS AND ANTIOXIDANT ACTIVITIES OF ECHINACEA PURPUREA VARIETIES CULTIVATED IN TURKEY

SADIYE AYŞE ÇELİK¹, YÜKSEL KAN¹

ABSTRACT

In this study, three different Echinacea purpurea varieties were cultivated and carried out in the Ecological Conditions of Konya in 2013 and 2014 in Selçuk University Faculty of Agriculture Agricultural and Aromatic Herb Farms. These varieties are Echinacea purpurea var. purpurea, Echinacea purpurea var. baby white swan and Echinacea purpurea var. double decker. These varieties are named according to flower arrangements as Echinacea purpurea var. purpurea pink coneflower, Echinacea purpurea var. baby white swan white coneflower and Echinacea purpurea var. double decker double coneflower. These varieties are harvested in 2013 and 2014 after the start of flowering period, full flowering period and seed binding period, then they are separated in to leaves, stemmed flowers, herbs and roots and dried to a certain moisture content. At the same time, samples were taken from the roots during the period of root harvest (October-November) except for other three period. The contents of ash, caffeic acid derivatives (caftaric and chicoric acid), antioxidant activity (DPPH method), total phenol content, total flavonoid content were determined in the all plant parts of each varieties taken at three different harvesting periods. In addition, volatile oil content and volatile oil components were also detected in herbs taken during the full flowering period. The highest essential oil is obtained from Echinacea purpurea var. baby white swan (0.3%). When looked at the essential oil components of three different Echinacea varieties, the components found in all of them are caryophyllene oxide and germacrene D. The highest ratio of Germacrene D was determined in Echinacea purpurea var. purpurea herb (% 21.563). According to the average of all values the highest amount of caffeic acid was obtained from E. purpurea var. purpurea (% 0.995) and leaf (% 0.696). The highest amount of chicoric acid was obtained from E. purpurea var. purpurea root (% 2.589). According to different harvesting times, Echinacea species should be harvested in full flowering period for the highest amount of chicoric acid. Total flavonoid content was determined highest in leaves (at the leaves of Echinacea purpurea var. double decker 25,0844 mg/g extract in 2014 leaf samples). The total phenol content was determined highest in leaves (at the leaves of Echinacea purpurea var. double decker 29,4378 mg/g extract in 2013 leaf samples). Antioxidant activity values were found to be in all varieties.

MEDICINAL HERBS PREVENTING OXIDATION OF BUTTER*

UĞUR KARDİL¹, MURAT KÜÇÜK², SEMRA ALKAN TÜRKUÇAR², HACER DOĞAN³, AYÇA AKTAŞ KARAÇELİK⁴

ABSTRACT

In terms of food technology, probability of the fats and the products rich in fat to be oxidized is very high. Characteristic features such as flavor, color, tissue, odor and nutritional value of these oxidized products deteriorate. Antioxidants are known to prevent these deteriorations which occur as a result of oxidative rancidity and oxipolymerization. The chemicals used in foods as antioxidant have many harmful effects to health. The use of natural antioxidants will be more meaningful in both preventing these harmful effects and oxidations. For this purpose, some plants were obtained and their aqueous and water-saturated ethyl acetate extracts were prepared. The selected plant extracts were added to the butter at 200 ppm concentration. In addition, the reference samples were prepared by adding BHT and Trolox standards to butter samples at 200 ppm concentration. In order to follow the oxidation in the butter samples prepared, TBA (thiobarbituric acid assay), PV (peroxide value) and FFA (free fatty acid) analyses were applied. The results obtained by the TBA test is shown in figure 1. All the plant extracts and standards successfully prevented oxidation in butter when compared to the control. Especially performance of UKS18 and UKE20 coded samples in protection against oxidation of butter is pretty good compared to the synthetic antioxidants. The results of the analyses of the three methods revealed that many of the plant extracts and especially UKS18 and UKE20 can be used as a natural antioxidant in order to prevent oxidation of butter. *This study is supported by 2210-C Priority Areas Domestic Master Scholarship Programme of TUBITAK-BİDEB.

DETERMINATION OF FIXED FAT COMPONENTS OF THE NATURALLY GROWING COCKLEBUR (*XANTHIUM SP. L.*) PLANT IN KAHRAMANMARAŞ

ALI RAHMI KAYA¹, OSMAN GEDİK¹, ÖMER SÜHA USLU¹, ADEM EROL¹, TAMER ERYİĞİT², CÜNEYT CESUR³,
AHMET KILINÇ⁴

ABSTRACT

Xanthium L. is a plant belonging to the Asteracea family and it is grown almost in every region of the world. It is found mostly in tropical and subtropical regions (Weaver and Lechowich 1982). It is common in America, Canada, Mexico, Malaysia, Indonesia and India (Alam et al., 2011). To date, many taxonomic studies have been carried out on this plant. Caius (1986) reported 25 species of *Xanthium* genus, and Weaver and Lechowich (1982) reported 20 species (Alam et al., 2011). It is represented in Turkey by 6 taxa including 3 species and 3 subspecies (Güner et al., 2012, Cesur and Şenkal, 2015). According to Cesur and Şenkal (2015), *Xanthium sp.* plants are accepted as weeds in Turkey today. Again, according to the same researchers, the plant is a plant that grows in anhydrous areas, with approximately 25% crude oil in its seed, which represents an important potential for exploring the possibility of obtaining oil. In this research, a number of studies have been done within the scope of the mentioned evaluations above. First, seed samples belonging to cocklebur plant (*Xanthium sp.*) were collected from around Kahramanmaraş Menzelet Dam Lake. Then fixed fatty acid components were examined in collected seed samples. It has been determined that there are totally twenty two different fixed fatty acid components in cocklebur. The main fixed fatty acid components and ratios are; Linoleic acid (75.23%), oleic acid (13.59%), palmitic acid (5.93%), stearic acid (3.57%), behenic acid (0.68%) and myristic acid (0.02%).

WATER-SATURATED ETHYL ACETATE EXTRACTS OF SOME HERBS PROMOTE BUTTER OXIDATION*

UđUR KARDIL¹, HACER DOđAN², MURAT KÜÇÜK³, SEMRA ALKAN TÜRKÜÇAR³, AYÇA AKTAŞ KARAÇELİK⁵

ABSTRACT

Lipid oxidation of fats and fat containing foods deteriorate their characteristic properties such as flavor, color, texture, odor and nutritional value during manufacturing and storage. Therefore, various synthetic antioxidants are used for a long time as food additives to increase the oxidation stability of fats. Reliability of synthetic antioxidants has created a dispute. Therefore consumers, owing to their positive effects on health such as high antioxidant activity, desire the use of natural additives in the food industry instead of synthetic ones. Recently, many plant extracts have been investigated in terms of antioxidant and antimicrobial activity and the results have been compared to controls and standard antioxidants. In this study, plant extracts obtained with ethyl acetate saturated with water having high antioxidant activity were investigated to determine their suppressive effect on oxidation of butter. Concentrations of the selected plant extracts added to the butter were 200 ppm. Control sample (containing no antioxidants) was also used. In order to monitor the oxidation of the sample determination of peroxide value (PV) was utilized during a 180 days storage at 25 °C (Figure). In contrary to our expectation, the extracts promoted the oxidation of butter leading to higher peroxide values as compared to that of control. The results provide an important fact about the food preparations of fatty nature that the plants to be used in such preparations should be closely monitored for their possible oxidation promoting properties besides the beneficial ones. *This study is supported by 2210-C Priority Areas Domestic Master Scholarship Programme of TUBITAK-BİDEB.

ANTIOXIDANT AND ANTIMICROBIOLOGICAL ACTIVITY OF HIBISCUS SABDARIFFA

ELIF ÇELİK¹, ÖZLEM TURGAY¹

ABSTRACT

ANTIOXIDANT AND ANTIMICROBIOLOGICAL ACTIVITY OF Hibiscus sabdariffa Elif ÇELİK, Özlem TURGAY University of Kahramanmaraş Sütçü İmam, Faculty of Engineering and Architecture Department of Food Engineering ozlem@ksu.edu.tr Hibiscus sabdariffa, Malvaceae, commonly known as roselle, red sorrel or karkade, is an annual herbaceous. These calyces are a good source of natural food colorants because of their high pigment content and the dried calyces are consumed worldwide in hot infusions and in cold drinks. In this study, total phenolic content, gallo-catechin content and antibacterial activity of the water extracts of Hibiscus sabdariffa were researched. Total phenolic content of water extracts of dry calyces was determined by the Folin-Ciocalteu method. The absorbance was measured at 1, 2, 5, 10, 20, 30, 60, 90 min and performed extraction kinetics. Gallo-catechin content was detected by HPLC-DAD. Antimicrobial activity of volatile fatty acid of Hibiscus sabdariffa was determined by agar gel diffusion method against Escherichia coli and Staphylococcus aureus. The total phenolic contents were ranged between 771-2056 mg gallic acid equivalents (GAE)/100 ml hibiscus tea and gallo catechin contents were ranged between 0- 4.6 ppm. Tobramycin(10 µg), cefuroxime(30 µg), tetracycline (30 µg), cephazolin (30 µg), bacitracin (0,04 unit), nalidixic acid (30 µg), nitrofurantoin (300 µg) were used as positive control. Water extracts of Hibiscus sabdariffa showed 7 mm inhibition zone against Escherichia coli and 10 mm inhibition zone against Staphylococcus aureus.

DETERMINATION OF BIOLOGICAL ACTIVITY OF SOME EXTRACT'S AUBRIETA DELTOİDEA

NAHİDE DENİZ¹, ZEKİ ARICI, RAMAZAN MAMMADOV¹

ABSTRACT

Since ages, literature has revealed plants to be the most important source of medicines for human health . According to the findings of the World Health Organization, up to 80% of the world's population relies on plants for their primary health care.. The Brassicaceae family is used as a landscape plant of the genus Aubrieta. There are a few taxonomic, morphological, anatomical and ecological studies carried out with species belonging to the genus Aubrieta in our country.The majority of the work done is in the economic and landscape areas. In the study, Aubrieta deltoidea belonging to genus Aubrieta which is distributed in Denizli belonging to Brassicaceae family was used. Diagnosis of the plant was made according to Davis (1978). Plant samples were collected in July 2015, dried and ready for analysis. Plant samples were stored at +4°C until analysis runs. In this study, some biological activities of ethanol and acetone solvent extracts of Aubrieta deltoidea, which are naturally distributed in our country, have been investigated. Biological activity of species; B-carotene-linoleic acid method and the DPPH method. The highest antioxidant activity (83.33%) was seen in ethanol extract of A. deltoidea strain. The highest free radical scavenging activity (81.24%) was seen in the A. deltoidea strain extract prepared with the acetone solvent. The results obtained in this study have shown that plants can be used as a readily available natural antioxidant source. A more detailed and versatile survey of these plants will be of great benefit to my country in terms of public health.

COMPOSITION OF HELICHRYSUM ITALICUM (ROTH) G. DON ESSENTIAL OIL FROM CYPRUS

BETÜL DEMİRCİ¹, GÜLSÜM YILDIZ¹, MEHMET KOYUNCU², CÜNEYT K. BUHARALIOĞLU², KEMAL HÜSNÜ CAN BAŞER³

ABSTRACT

The genus *Helichrysum* Mill. (Asteraceae) comprises nearly 185 genera and 1240 species worldwide (Europe, Asia, Africa and Madagascar) (Bayer et al., 2007). It is represented by 24 species and 30 taxa of which 17 are endemic in the flora of Turkey (Guner et al., 2012). *Helichrysum* species are commonly known as ‘ölmez çiçek’, ‘altınotu’, ‘yayla çiçeđi’ and are generally used as herbal tea in Turkey (Baytop, 1997). *Helichrysum* species are used in folk medicine for removing kidney stones (Suzgec et al., 2005). Essential oil of *Helichrysum italicum* has antibacterial and anti-fungal activity (Mastelic et al., 2005). The study material was collected from Cyprus in May 2015. Aerial parts of *Helichrysum italicum* were subjected to hydrodistillation for 3 hours using a Clevenger apparatus. Chemical composition of the oil was investigated with GC-FID and GC/MS techniques. In total, 75 compounds (88.4%) were identified. The main components were β -caryophyllene (12.1%), tetradecanoic acid (10.9%), hexadecanoic acid (10.1%), α -humulene (7.9%), pentacosane (7.0%), dodecanoic acid (4.5%), rosofoliol (3.3%) and heptacosane (3.2%). Key words: *Helichrysum italicum*, essential oil, GC/MS, GC-FID.

PRODUCING DISEASE-FREE GINGER IN GREENHOUSE CULTURE IN ANTALYA

AYŞE GÜL İNCE¹, MEHMET KARACA¹

ABSTRACT

Culinary ginger (*Zingiber officinale* Rosco) belongs to the family Zingiberaceae. Rhizomes of ginger are valuable not only as a spice but also as herbal medicine in the world. The production of culinary ginger is constrained due to: (i) it has a low proliferation rate; (ii) it is easily infected by soil-borne pathogens such as bacterial wilt, soft rot and nematodes, which cause heavy losses in yield in open-field production; (iii) it has poor flowering and seed sets. Culinary ginger is a tropical plant and needs plenty of heat and humidity. Climate of Antalya is not suitable for culinary ginger. In this study, fresh culinary ginger rhizomes purchased from a grocery store in Antalya were used as starting plant material to investigate the possibility of producing disease-free ginger in greenhouse culture in Antalya. In the second year, a total of 12 rhizomes were used as planting materials. Rhizomes (the seed-pieces) had 2-4 well developed growth buds ("eyes"). Rhizomes were surface-sterilized in a 10% solution of household bleach (1 part bleach in 9 parts water) for 10 minutes, washed with ddH₂O and then cured in a clean, disease-free area for three days before planting. Rhizomes were planted just below the soil surface in 12 pots filled with 1/4 peatmoss, 1/4 vermiculite, 1/4 perlite and 1/4 garden soil. Pots were watered sparingly until top growth developed. Once established, seedlings were watered heavily, fertilized monthly, and kept in a partially shaded location in a greenhouse. Harvesting of the rhizomes was performed when the greenhouse temperature started to drop below 10°C. Provided with adequate space, ginger plants could reach a height of 60-120 cm in the pots. Rhizome yield per pot ranged from 400 g to 1200 g with a mean of about 600 g. Extension of growth period would increase the yield since during the harvesting time most of the ginger plants were in green. Our yield values were obtained in 8 months started in late March and ended in early November. Greenhouse production of ginger provided a secured and protected environment from weather throughout the growing season, reducing the potential for accidental introduction of diseases. Ginger production was "unitized," in each pot, allowing for quick removal from the area of a plant suspected of being contaminated. Grow-bags instead of pots could also be used for ginger production which could reduce the cost. Production in the pots filled with light-weight medium as the plants grow to simulate the hilling cultivation done in the field, eliminating the potential for root injury as an entry point for diseases. We noted that watering, fertilization and hilling of ginger production are very important. Use of pots provides for easy watering, fertilization and hilling, harvesting, and cleaning. In some hot days the temperature of the greenhouse exceeds 50°C and in these days plenty of water was supplied to the floor of the greenhouse to reduce the heat stress. Pots were placed on benches which were clean and at least 40 cm off the ground. Each pot was watered at least one time a day but in very hot days watering times increased. Triple superphosphate, gypsum (CaSO₄.2H₂O), NPK fertilizer and minor elements were provided. Based on 3 year-experiments the following conclusions were drawn: (i) ginger seed-pieces should be planted during March and harvested as late as possible for best production; (ii) rhizomes with at least three eyes should be planted about 5 cm deep in each bag or pot

Corresponding Author: AYŞE GÜL İNCE, aince@akdeniz.edu.tr
¹AKDENİZ ÜNİVERSİTESİ

containing about 30 L of growing medium; (iii) hilling should be performed at least 4 times per growing seasons; (iv) irrigation emitters should be placed on top of the growing medium and around the planted seed-piece; (v) as the ginger plant grows, more medium should be added (hilling), and the irrigation emitters should be moved to the top of the growing medium. We also noted that hilling was an important process in ginger production to ensure development of rhizome size and mass. In the main text further information and discussions are provided for producing disease-free ginger in greenhouse culture in Antalya.

TRANSFER OF MICROSATELLITES TO CARNATION USING INTER-GENERA EST CONTIGS APPROACH

AYŞE GÜL İNCE¹, MEHMET KARACA¹

ABSTRACT

Dianthus L. is one of the highly valued plant genera in the family Caryophyllaceae. The genus contains both annual and perennial plant species most of which are valued for their ornamental, volatile, aromatic, and medicinal properties. Compared with other ornamental, medicinal and aromatic plant species, application of DNA-based molecular marker system is limited in carnation (*Dianthus caryophyllus* L.). Amongst DNA markers, microsatellites; also known simple sequence repeats (SSRs) or simple tandem repeats (STRs), are markers of the choice in many plant species. Microsatellites are important for research in both basic and applied sciences. The development of microsatellite markers require: (i) microsatellite library construction from genomic DNA of target species; (ii) identification of unique microsatellite loci screening with single or mixed simple sequence oligonucleotide probes; (iii) identifying a suitable DNA sequences flanking the microsatellite regions for primer design by sequencing studies; (iv) identification of PCR products representing desired microsatellite alleles; (v) evaluation and interpretation of microsatellite patterns, removing redundant and/or chimeric sequences, and (vi) assessing PCR products for polymorphism. Alternatively expressed sequence tags (EST) sequences are used in microsatellite markers development. However some species do not have enough EST resources including *Dianthus* L. At the time of EST mining of the present study there were just 630 ESTs for *Dianthus* L in NCBI databases. These are very low numbers of ESTs for mining microsatellites. Thus this study used a new approach, called inter-genera EST contigs approach to use the ESTs of related genera for microsatellite markers development. In this study, a total of 4618 EST sequences, 630 of which were for *Dianthus caryophyllus* L., 139 of which were *Gypsophylla arrostii* Guss., and 3849 of which were *Sileneae latifolia* Poir. derived from publicly available databases of National Center for Biotechnology Information (NCBI) were mined to obtain ESTs with microsatellites using TRA 1.5 software program. Microsatellites in the present study were considered to contain motifs that were between two and six nucleotides in length. The minimum motif length criteria were defined as being 9 repeats for di-nucleotides, 7 repeats for tri-nucleotides, 6 repeats for tetra-nucleotides and 5 repeats for penta-nucleotides and 4 repeats for hexa-nucleotides. In order to obtain inter-genera contigs, ESTs containing microsatellites were assembled into contiguous sequences (contigs) using the Sequencher software. Contigs assembly parameters were set to a minimum overlap of 50 bases, 95% identity match, and the large gap option was implemented. A total of 14 contigs consisting of microsatellite-ESTs from *D. caryophyllus*, *G. arrostii*, *S. latifolia* and 25 singletons (those ESTs that were not found in any contigs) were further analyzed to design microsatellite primer pairs using the Primer 3 program. A total of 39 primer pairs were identified and commercially synthesized. Genomic DNA samples of several commercial carnation cultivars were extracted and amplified using the developed primer pairs. Results indicated that majority of the primer pairs could be successfully used in production of microsatellite markers in carnation genetic studies.

MEDICINAL PLANTS ARE USED BY MOTHERS TO COPE WITH THE COMMON SYMPTOMS IN CHILDHOOD

SEVİNÇ POLAT¹, AYŞE GÜROL², AYŞE ŞENER TAPLAK¹

ABSTRACT

Introduction: In recent years, there has been an increasing interest in the use of complementary and alternative medicine all over the world. It is reported that about 40% of the health services is composed of traditional medicine in China and 71% of the population in Chile and 40% of the population in Colombia use similar medicine methods. Today, the interest towards the herbal methods has gradually increased due to the increase of resistant strains of microorganisms against drugs, the adverse effects of drugs, and their high cost. However, failure to know exactly the side effects of the plants consumed unconsciously has also brought the concerns about the harms of these methods. The use of herbal methods widely by the parents in symptom management in their children with the opinion that it is less harmful than drugs is an extremely sensitive situation in terms of the fact that it can cause serious conditions that may result in death. This descriptive study was conducted to determine the medicinal plants are used by mothers to cope with some problems frequently encountered in their children. **Material and Method:** The sample of the study consisted of 202 mothers who applied to Family Health Centers located in a city center in Central Anatolia between January and March 2017 and agreed to participate in the study. A questionnaire prepared by the researchers in accordance with the literature was used to collect the data. The obtained data were evaluated by using descriptive statistical methods in IBM SPSS Statistics 21 packaged software in the computer environment. **Results:** It was determined that average age of the mothers participating in the study was 38.40±10.03, 35.1% of them were high school graduate and 64.9% of them were housewives. It was determined that 41.5% of the mothers used herbal methods for sore throat induced by influenza and cold, 37.1% for nausea-vomiting, 28.2% for gas pain and indigestion, 26.7% for constipation, 17.8% for cough, 12.3% for coping with sleeping problems and calming the child down. It was found that almost all mothers preferred mint and lemon tea for coping with the sore throat induced by influenza and cold in children, the mostly used herbal method to relieve the gas pain in children was the fennel tea, half of mothers used linden and ginger tea and majority of the mothers preferred fennel tea for their children with constipation problems. 43.0% of the mothers were determined to obtain the herbal teas from sellers of medicinal herbs. 70.3% of the mothers considered that using herbal methods in symptom management in children is useful and 62.4% also recommended the method they used to the others. **Conclusion:** It was determined in the study that herbal teas were randomly used by the mothers for their children without medical advice, more than half of the mothers preferred herbal methods in symptom management and one third of the mothers recommended these methods to others. In accordance with the results obtained from the study, it is recommended to raise awareness of mothers about this matter by healthcare professionals and inform them about the appropriate dose and usage of

A NEW CONCEPT: NUTRACEUTICALS AND THEIR CONTENT

NAZAN AKTAŞ¹, GÜLPERİ HAKLI¹, ESMA AYBATTI¹, BİLİNÇ ALTUN²

ABSTRACT

Throughout life, people aim to maintain a healthy and high quality life. For maintaining a healthy lifestyle, feeding with quality foods is essential. The purpose of this study is to examine the nutraceutical conception that emerged as a result of combining of the words: nutrition and pharmaceutical. In this review study, the secondary data from the primary researches in the same subject were used, these data were obtained as a result of scanning in electronic scientific databases as well as written sources. Nutraceutical term, which provides a protective or physiological benefit to a chronic disease as an extract or food was used for the first time in 1989 by Dr. Stephen De Felice. While nutraceutical concept express any food extract support that enhances quality of life, maintains and improves physiological well-being by protecting health, protective against chronic diseases, does not develop toxic effects, functional foods refer to nutrients that reduce disease risk and have a beneficial effect on health. Nutraceuticals and functional food terms are used to describe food or food compounds that provide health benefits on the basic nutrition. While nutraceutical refers to both traditional and diverse (tablet, capsule, etc.) food and food compounds, functional food refers to traditional food forms. Functional food is called nutraceutical, when it helps the prevention and/or treatment of other diseases and/or disorders except anemia. For daily life and health, nutrition; for treatment of diseases, drugs; and for preventing diseases, nutraceuticals are required. Commonly used nutraceuticals include carotenoids, antioxidant vitamins, phenolic compounds, terpenoids, steroids, indoles, glycomine, controitin and fibers. Products that are used as nutraceuticals may be present in different dosage forms such as tablets, capsules, soft gels, and are not considered drugs. It is expected that the nutraceutical products that constitute a new field of interest in the science of pharmacognosy will make frequent use, contribute to food and health care.

THE EFFECTS OF LYCOPENE APPLICATION ON SODIUM FLUORIDE (NaF) APPLIED RENAL CELL LINE

SEDAT ÇETİN¹, FATMAGÜL YUR², MEHMET TAŞPINAR³, SEMİHA DEDE¹, VEYSEL YÜKSEK⁴

ABSTRACT

The present study was planned to investigate the potential protective effect of lycopene, an antioxidant carotenoid, on NaF applied renal cell line. NRK-52 cells were cultured under standard in vitro conditions with regular passages. 10.000 cells were planted in each culture platelet well for NRK-52E cells. Cells were incubated for 24 hours at 37°C in an incubator that contained CO₂. After the incubation, the medium on the cells was removed and the prepared NaF and lycopene solutions were added. At least 4 wells were used for each dose. Culture vessels were incubated at 37°C in a CO₂ incubator for 6, 12, and 24 hours so that MTT stain could transform non-soluble formazan crystals and MTT assay was conducted. Findings: In conclusion, it was found that low lycopene doses reduced the toxic effect of NaF by 10-20%, whereas in the high dose lycopene treated groups, lycopene increased the toxic effect of NaF synergistically. As a result, it was concluded that administration of lycopene on NaF applied renal cell line exhibited different effects based on the dose and time. Keywords: NaF, Lycopene, Cell Culture, MTT, Kidney.

SOME PROPERTIES OF ESSENTIAL OIL ADDED TURKISH TRADITIONAL BEVERAGE BOZA

ELİF ÇAKIR¹, HATİCE EBRAR KIRTIL¹, YRD. DOÇ. DR M.ZEKİ DURAK¹, PROF. DR. MUHAMMET ARICI¹

ABSTRACT

Aromatic essential oils are used as a natural preservative due to their antibacterial properties, taste, flavor as well as increasing their awareness on health benefits. For this purpose, we aim to bring new flavors and functional properties to boza without changing the original appearance of this traditional beverage. Raw boza was produced by using 1: 1 ratio of bulgur and rice. Boza was fermented by adding 2% traditionally fermented boza purchased from a local producer. At the end of the first fermentation period, ginger (*Zingiber officinale*), sage (*Salvia officinalis* L.), fennel (*Foeniculum vulgare*) essential oils obtained by hydrodistillation method from Clavenger were added. Ginger essential oil is used 500 ppm due to its sharp smell, fennel sage essential oils are used 600 ppm based on initial sensory tests. Physicochemical, microbiological and sensory characteristics of the study were investigated. Boza samples were stored 4 C for 5 days. The pH values during store of standard (control) boza was found to be 3.64- 3.50; boza with sage essential oil was 3.55-3.48; boza with fennel essential oil was 3.53-3.49; boza with ginger essential oil was 3.54-3.48. Standard (control) boza has been seen greatest decrease. Titratable acidity (TTA) were at standard boza 0.3%-0.47%; boza with sage essential oil 0.3%-0.37% ; boza with fennel essential oil 0.32%-0.38% while boza with ginger essential oil was found between 0.34%-0.39%. Alcohol content was found to be in standard boza (0.7% -0.9%); boza with sage essential oil (0.62% -0.66%); boza with fennel essential oil (0.66% -0.70%) and boza with ginger essential oil (0.63% -0.67%), respectively. The highest alcohol content was found in standard boza. Brix values in bozas (14.8% -13.7%) were not significantly different. At the same time, there was no significant difference between the color of standard boza and boza with essential oils in color parameters. According to microbiological analysis, total number of mesophyllaerob bacteria (MAB) were found in standard boza (7,84-8,74 log CFU/g), boza with fennel essential oil (7,91-8,08 log CFU/g), boza with sage essential oil (7,82-7,9 log CFU/g) and boza with ginger essential oil (7,77-7,72 log CFU/g), a higher number of bacteria were found in standard (control) boza and boza with fennel essential oil. During storage (5 days), number of lactic acid bacteria were reduced in all samples and the highest rate was found in boza with ginger essential oil (7,81-7,55 log CFU/ g). Total yeast was only increased in standard boza (6,5-6,6 log CFU/g), but was reduced in boza with fennel essential oil (5,9-5,67 log CFU/g), boza with sage essential oil (6,4-6,02 log CFU/g) and boza with ginger essential oil. In addition, antimicrobial activities of these essential oils added boza samples were determined on 8 pathogenic bacteria and 2 yeasts. The antibacterial effects (inhibition zone diameter) of sage essential oil, fennel essential oil, ginger essential oil were fixed on *Candida albicans* ATCC 10251 (15,5 mm) and *Escherichia coli* ATCC 25922 (17,8 mm); *Staphylococcus aureus* ATCC 25923 (11,3 mm) and *Listeria monocytogenes* ATCC 13932 (11,8 mm); *Listeria monocytogenes* ATCC 13932 (12,3 mm) and *Bacillus subtilis* (14,5 mm), respectively. Total antioxidant capacities of bozas with essential oils were similar to each other. Only the sage essential

¹YILDIZ TEKNİK ÜNİVERSİTESİ GIDA MÜHENDİSLİĞİ

oil added boza was found to be higher(37.58%) than the others. As for sensory analysis, there was no difference on appearance and consistency among boza samples. Interms of taste, standard boza and boza with ginger essential oil were the best. As a result, boza with ginger essential oil is considered as an alternative and healthier option for boza.

UTILIZATION OF EST RESOURCES OF PERILLA FRUTESCENS L. FOR SSR MARKERS DEVELOPMENT

AYŞE GÜL İNCE¹, MEHMET KARACA¹, ADNAN AYDIN¹

ABSTRACT

Perilla also known as beefsteak mint (*Perilla frutescens* (L.)) is a self-compatible annual herb in the family Lamiaceae. The beefsteak mint plant has a long history of use in traditional folk medicine and is an economical crop in the medicinal herb plant. Perilla has several important pharmaceutical, anti-allergic, and antioxidant functions. Perilla leaf composes of a number of chemical variants of the volatile essential oils such as perillaldehyde, elsholtziaketone, perilla ketone, perillene, phenylpropanoids, and piperitenone. Its seeds can be processed into foods and nutritional edible oils. The use of DNA markers in perilla breeding for development of promising cultivar and conservation studies is very limited. DNA markers are the best method for the selection of plants with desirable characteristics. DNA markers have been extensively used in plant improvement studies. Polymerase chain reaction (PCR) based genotyping of molecular markers such as random amplified polymorphic DNA (RAPD) markers, amplified fragment length polymorphisms (AFLPs), and simple sequence repeats (SSRs, also known as microsatellites) have provided useful information regarding genetic diversity and genetic relationships in many crops. SSRs are considered the marker of choice in many applications because; (i) they are easy to develop since they are based on polymerase chain reaction (PCR); (ii) development of SSR markers does not require a high amount and high quality of genomic DNA; (iii) SSR markers can differentiate homozygote samples from heterozygote ones since they are co-dominant markers, and (iv) SSRs are highly polymorphic since they are often multiallelic and hypervariable. However, there is no report on the use of SSR markers for perilla due to a scarcity of primer pair. Expressed sequence tags (ESTs) are fragments of expressed genes occurring from single-pass sequencing of cDNA libraries. ESTs have been utilized for many purposes including the development of SSR markers. In the study, a total of 5349 *Perilla frutescens* (L.) expressed sequence tags (ESTs) from National Center for Biotechnology Information (NCBI) were downloaded and EST-SSRs were identified using the Tandem Repeats Analyzer 1.5 (TRA 1.5) program. SSRs were searched using the following criteria: 9 repeats for di-nucleotides, 7 repeats for tri-nucleotides, 6 repeats for tetra-nucleotides and 5 repeats for penta-nucleotides and 4 repeats for hexa-nucleotides. Mining analyses indicated that the most common SSRs were di-nucleotide repeats (6.65%) followed with tri-nucleotide repeats (3.01%). Among the tetra- (0.2%), penta- (0.3%) and hexa-nucleotide (1.2%) repeats, di-nucleotide repeats were abundant in SSRs of perilla. EST-SSR primer pairs flanking the microsatellite domains were designed using PRIMER3 software. SSR primer pairs were designed with several criteria such minimum/maximum as length of expected product, GC content, melting temperature etc. Although results revealed that a total of 500 EST-SSR primer pairs could be designed, for the preliminary studies 17 EST-SSR primer pairs were designed. Annealing temperatures of the primer pairs are set to 55-56 C (T_m 59-60 C) and expected to amplify markers ranging from 211

AN INSIGHT INTO MICROPROPAGATION OF WATER HYSSOP (BACOPA MONNIERI L.)-AN IMPORTANT MEDICINAL AQUATIC PLANT

FATMA NUR DOĐANAY¹, BURAK KAHVECİ¹, ECE NUR KORKMAZ¹, MERT ÇELİKEL¹, MUHAMMAD AASİM¹,
MEHMET KARATAŞ¹

ABSTRACT

Bacopa monnieri L. (Water hyssop or brahmi) is one of the important medicinal aquatic/semi-aquatic plant of traditional Indian medicinal system. It contains important bio-active compounds like Bacosides that are used as commercial memory enhancer tonic. Number of Brahmi based registered drugs available are used for curing chronic diseases and disorders like cancer, asthma, mental illness, Alzheimer's disease, anxiety, respiratory ailments, and stomach ulcers. Due to its high demand, it is collected from wild which make this plant threatened to extinction. Propagation through seed is limited due to low seed viability and availability. Propagation through tissue culture techniques provides alternative way of production and conservation of this important aquatic plant. In recent years, large number of studies has been conducted to develop efficient and reproduce-able in vitro regeneration with objective to conserve and produce plants for continuous availability of secondary metabolites it contain. This study present an overview of in vitro regeneration of water hyssop through axillary or adventitious shoot proliferation using different explants, plant growth regulators and culture conditions like light followed by rooting and adaptation techniques.

THE IMPORTANCE OF OLIVE AND OLIVE INDUSTRY BY-PRODUCTS IN ANIMAL FEEDING

HÜSEYİN ÇAYAN¹, AHMET ŞAHİN¹, GÜRAY ERENER²

ABSTRACT

In recent years, the importance of natural products and the trend towards nature and the importance of medical and aromatic plants are increasing day by day. Our country, which has rich flora due to its geographical location, is also diversified in terms of medical and aromatic plants. Olive tree (*Olea europaea*) leaves have been widely used in traditional remedies in European and Mediterranean countries. Olive leaves, branches, olive cake and waste water are main olive by-products during the progress of harvesting to olive oil production. The use of agricultural by-products in animal nutrition is as old as the domestication of animals. Among the main advantages of using by-products in animal feeding are the reduced dependence of animals on cereals consumed by humans and the reduction of administration costs of waste products. Olive and olive by-product contain many potentially bioactive compounds that may have antioxidant, antimicrobial, antihypertensive, antiatherogenic, anti-inflammatory, hypoglycemic, and hypocholesterolemic properties. The most important of these bioactive compounds are oleuropein and hydroxytyrosol. In this review, it will be addressed to the possibilities of using by-products from olive and olive oil production in animal feeding as an alternative and to the results of several related studies.

ABSTRACT

Pistacia genus which is a member of Anacardiaceae has a shelled edible fruit. This fruit is called as "Şam fıstığı" in some regions. Pistacia genus could be raised easily such places like barren and limed land where other plants can not be cultivated. This genus is widely distributed from the Middle Asia to Anatolia. Iran, Turkey and U.S.A. shared first 3 position in the production of Pistacia. According to some anonymous data %33 of the production is made in Urfa. Pistacia consist more than %50 of oil and more than %20 of protein. Omega-3, omega-6 and highly unsaturated fatty acids are the major components of pistachio oil along with B-3, B-12, vitamine-A, provitamine-B5 (Panthenol) and B-1 (thio-vitamine) (1). In this study fatty acids of 14 pistacia vera from the different locations in Urfa were analyzed by GC-MS. In consideration of the fatty acid concentrations Principle Component Analysis (PCA) and Hierarchical Clustering Analysis (HCA) were applied using Minitab software. Relations between the samples according to their locations and other properties were revealed. Referanslar (1) Satil, F.; Azcan, N.; Baser, K. H. C. DIETARY USAGE OF FERULA ELEAOCHYTRIS POWDER IN ANIMAL NUTRITION

GÖKHAN FİLİK¹, HAYRETTİN ÇAYIROĞLU², AYŞE GÜL FİLİK¹, HÜSEYİN ÇAYAN¹, İSA COŞKUN¹, AHMET ŞAHİN¹

ABSTRACT

Ferula is a genus of about 170 species of flowering plants in the family Apiaceae, native to the Mediterranean region to East to Central Asia, mostly growing in arid climates. They are herbaceous perennial plants and present dominantly Keldağ of Yağlıdağı District of Hatay Province, as called "Çakşır" in Turkey. Animals, especially pastured goats, consume its leaves, enhancing reproductive performance in those animals, as known in folk literature. The root powder of this plant was used in small ruminant and poultry experiments. According to findings obtained from those studies the following outcomes; (1) having no harmful effect on animal health, (2) showing hypoglycemic and hypocholesteromic effects in layer hens (3) improving carcass parameters in broiler chicks, (4) changing secondarily sex characteristics in broiler chicks and quails, (5) and having estrogenic effect in small ruminants. To conclude, ferula root powder has been needed be studied in detailed manner to produce new feed additives in animal nutrition.

A HEALING PLANT "MENENGIC"

MEHMET KÖTEN¹, HALİL EKİCİ¹, MUSTAFA SATOUF¹

ABSTRACT

Terebinth tree (*Pistacia terebinthus*) is a member of Anacardiaceae family, native to Mediterranean, evergreen and grows ecologically without plantation in the mountainous and rural areas of Mediterranean, South East and Central Anatolian regions of Turkey. It is also known as çitlembik, çıtlık, çitemik and bıtım; named differently in different regions. Terebinth fruit is consumed as fresh or dried, as a coffee and used in traditional bread making in South East and southern regions of Turkey. In the same regions, terebinth paste is mixed with different spices and seasonings in order to prepare the mixture known as (kahvaltılık zahter) "breakfast zahter". Due to rich tannin and resin content of terebinth; it is considered as a medicinal plant since ancient times. Ripe terebinth fruit is rich in protein, oil, dietary fiber, unsaturated fatty acid and mineral content. Terebinth's fatty acid composition determined with gas chromatography is %52.3 oleic acid, %21.3 palmitic acid ve %19.7 linoleic acid. Sodium and phsophorus content is higher than the olive and banana fruits. Also it has been determined that terebinth has a higher potassium, phosphorus, calcium and iron content than potato. Due to high protein, oleic acid and linoleic acid content, terebinth is a healthy dietary element. In this study, Terebinth plant which has a strong potential as a functional food in terms of it's components has been examined in the context of it's all features.

ANTIOXIDANT ACTIVITY OF POLYSACCAHARIDE EXTRACTS OF TRICHOLOMA ANATOLICUM

ERHAN KAPLANER¹, MEHMET HÜSEYİN SİNĞEÇ¹, MEHMET ÖZTÜRK¹

ABSTRACT

Because having important nutrients (high protein content, rich fatty acid constituents) along with phenolics, terpenes, steroids and polysaccharides of medicinal mushrooms have been studied very frequently. Polysaccharide containing mushrooms show anti-inflammatory, cytotoxic and anti-viral properties and immunomodulatory activities¹. *Tricholoma anatolicum* which is naturally growing in Fethiye-Muđla. It is the commercial importance because of the similarity to that of *Tricholoma matsutake*, and was selected for this study. Mushroom samples collected from Fethiye-Mugla and brought to laboratory. All samples were air-dried under shadow. After grinding the dried mushrooms organic solvent extraction were applied with the increasing polarity (petroleum ether, acetone, methanol, successively). After taking the methanol extract the residue was used for hot water extraction. Ethanol was added to supernatant part (1:3 v/v) to precipitate the polysaccharides², this part was coded HWEP and the remaining part was coded HWES. Antioxidant activities of these extracts were determined according to DPPH, ABTS+, β -carotene-linoleic acid, metal chelating and CUPRAC assays. HWES showed 81.9% lipid-peroxidation inhibitory activity at a concentration of 0.8 mg/mL while HWEP showed 78.0%. Both extracts were inactive against DPPH radical but HWES showed 82.8% ABTS+ radical scavenging activity. HWES had more ability for metal-chelating activity when compared with that of HWEP. However, in CUPRAC assay HWEP exhibited better activity Acknowledgements: This study is supported by TUBITAK-SBAG with the Project number of 113R012. HEALING EFFECTS OF BALNEOTHERAPY ON CLINICAL SYMPTOMS IN DIFFERENT PATIENTS: SURVEY-BASED STUDY

AHMET CELIKKAYA¹, BULENT ELTOK², İSMAIL ASLAN³, BEKİR ÇAKICI⁴, OZGUL M. ELITOK⁵

ABSTRACT

Aims. The aim of this survey-based study was investigated in the clinically healing effects of traditional balneotherapy methods in human (in future also in animals) suffered from different diseases in thermal areas Afyonkarahisar and Gazlıgol-Yaylabagi. **Materials and Methods.** The people had always flocked to the sources of natural mineral spring water for healing (balneotherapy). In the present study, people with different diseases had received balneo- therapy as mud bath, hot water bath, drinking and bathing especially by themselves and according to their own knowledge. **Results.** The results obtained from this study show that balne therapy (drinking and bathing) was provided some clinical healing in most patient, but some unwilling effects of therapy had occurred due to their unciously use the therapy. **Discussion.** Although some unwilling effects of traditional balneotherapy use were seen in some patient, the results of study shown that received balneotherapy methods (drinking and bathing especially) were effective on clinical healing of some diseases in human beings. In future, our other aim will be using in animal diseases.

DETERMINATION OF THE ANTIOXIDANT ACTIVITY OF HAPLOPHYLLUM BUXBAUMII PLANT IN DIFFERENT SOLVENTS

İSMAIL KOYUNCU¹, ADEM NECİP¹, İBRAHİM BEKTAŞ¹, MESUT İŞİK¹, ABDURRAHMAN AKDAĞ¹, ÖMER GÖÇ¹

ABSTRACT

Most of the potential damage from oxygen is occurred by the formation of reactive oxygen species (ROS). Uncontrolled produced ROS and unbalanced antioxidant mechanisms is the cause of many diseases [1]. Natural antioxidants are very important in the regulation of unbalanced antioxidant mechanism. The antioxidant effect of the phenolic compounds contained in the plants protects the cells from potential damage [2]. This study was designed to determine the phenolic and flavonoid species and the antioxidant activity of methanol, butanol, hexane, dichloromethane and water extracts in haplophyllum buxbaumii plant. The total phenolic and flavonoid compounds in the plant were determined using Folin-Ciocalteu reactivity. The antioxidant activity of plant extracts was determined using the DPPH and ABTS which method of free radical scavenging activity test and the FRAP and CUPRAC which metal reduction capacity tests. BTH, Trolox, Ascorbic acid and Gallic acid were used as standard for antioxidant activity comparison. In this study, antioxidant activity of butanol extract was found to be more effective than the other extracts in FRAP and CUPRAC methods. It was observed that all extracts showed free radical scavenging activity in similar proportions in the DPPH test, the butanol extract in the ABTS test showed more activity than the other extracts and standards.

A SYSTEMATIC REVIEW OF FIBER FOODS USED FOR CONSTIPATION REMOVAL

FILIZ HISAR (DOÇ. DR.)¹, KEMAL MACİT HISAR (YRD. DOÇ. DR.)²

ABSTRACT

Introduction: Constipation is a health problem affecting 20% of the world population. This condition is discomfort that affects the quality of life of the individual, causes colon cancer, and increases in severity with time. Constipation is an important preventable health problem that is common in women, children and the elderly. There are some risk factors for constipation, such as physical inactivity, gender, age, low level of education, socio-economic status, sexual abuse, presence of depressive symptoms, nonsteroidal antiinflammatory drugs, some diseases. According to the studies done, in women, in children, there is more frequent constipation in the elderly. There are many different treatment methods in constipation. As first-line treatment, lifestyle changes, fluid intake or exercise are recommended. However, the efficacy of these applications is limited. Laxatives are commonly used in constipation therapy. However, the use of these drugs often causes some adverse effects. Fibrous nutrients are recommended for the prevention and treatment of constipation. Taking fibrous foods in the diet is a positive approach to healthy eating. Increased dietary fiber intake in children and adults is recommended for the prevention and treatment of insomnia. It is stated that Ayaz and Hisar (2014), "Efficiency in the elimination of constipation of education and counseling services given to women", prevented the constipation with the intake of fiber foods in the diet. Studies in the form of a systematic review of the relationship between intake of fibrous nutrients and constipation in diets are not sufficient. For this reason this work is planned. Purpose of the study: This study aims to examine the systematic compilation of plant materials applied to eliminate constipation in the world and in our country. Method: The survey was conducted between 15-20 March 2017. Using electronic search engines, we obtained 360 articles and reached 49 articles by using the fibrous nutritional statement in Wiley-blackwell, Web of Science, Scopus, Science Direct Journals, Pubmed, Medline, and Cinahl plus full text databases. In the Constitution statement, 87 articles were reached, 64 articles have been reached with the expression and 2 articles have been reached with systematic compilation statement. In addition, 2 articles have been reached with the expression of herbal applications. The other side also scanned the google search engine (45 English, 8 Turkish articles reached). A total of 249 articles have been reached. It has been suggested to use fibrous nutrients applied to remove constipation in 11 articles. Conclusions: It has been found that 92% of the studies investigating the use of fibrous nutrients for removal of constipation are inadequate for fibrous nutrient uptake. It is stated that the number of feces and the amount of fiber increases with the consumption of fiber foods.

GINSENG AND ITS HEALTH DEVELOPER FUNCTIONS

SERAY AKALIN¹, MERVE ÖZDEMİR¹, FERAY GENÇER²

ABSTRACT

Ginseng is one of the plants used for treatment of many diseases for many years. Its use has spread all over the world from East Asian countries like China, Korea and Japan. Ginseng has been shown in many studies to have positive effects in many cases such as neurological diseases, immun system disorders, diabetes, cancer, cardiovascular diseases. Panax ginseng is the most valuable and important among the ginseng species. It has been used in East Asian medicine for centuries. The habit of using plants for medical purposes and healthy nutrition in Asia has also been adopted by western societies in recent years. Thus, P.ginseng has become available all over the world. Ginsenosides are main bioactive compounds of P.ginseng. More than 50 ginsenosides have been isolated from P. Ginseng. Ginsenosides are a class of saponins with dammarane triterpenoid structure. Many human and animal studies have been conducted to investigate the effects of ginseng on health. Based on the results of these studies, it has been shown that ginsenosides and its different fractions have positive effects on the regulation of the immune response. It is also concluded that ginsenosides have important roles in tumor cell cytotoxicity against cancer development, differentiation of tumor cells, development of inflammation suppressor cells, prevention of metastasis, prevention of angiogenesis. Positive effects of ginsenosides on regulation of blood glucose level and treatment of diabetes as well as immune response and anticarcinogenic effects have been observed. It affects energy homeostasis by regulating insulin secretion and glucose transport as well as affecting peroxisome proliferator-activated receptor (PPAR- γ) and AMPK function, these are two important proteins that are effective in adipocyte differentiation. One of the known effects of ginseng is the positive effects on the central nervous system. The neurotrophic effect on memory and learning is protective against neuronal damage. Ginseng has recently been a highly studied plant and different effects of ginsenosides on health are being explored further.

THYMOL ATTENUATES INDOMETHACIN-INDUCED MACROMOLECULAR DAMAGES IN SMALL INTESTINE

FATIME GEYIKOĞLU¹, NİHAL SİMSEK ÖZEK², FERHUNDE AYSIN², KUBRA KOC¹, SALİM CERİG¹

ABSTRACT

THYMOL ATTENUATES INDOMETHACIN-INDUCED MACROMOLECULAR DAMAGES IN SMALL INTESTINE Fatime Geyikoglu¹, Nihal Simsek Ozek^{1,2}, Ferhunde Aysin^{1,2}, Kubra Koc¹, Salim Cerig¹ *Corresponding author: Nihal Simsek Ozek, e-mail: nihal.ozek@atauni.edu.tr phone number: + 90 0 442 231 1649 ¹Department of Biology, Faculty of Science, Ataturk University, Erzurum, TURKEY ²East Anatolian High Technology Research and Application Center (DAYTAM), Atatürk University, Erzurum, TURKEY Indometacin, a nonsteroidal anti-inflammatory drug (NSAID), is commonly and efficiently used to reduce fever, pain and swelling from inflammation. In spite of its therapeutic potentials, it has adverse effects on the gastrointestinal system and the occurrence of these effects are associated with oxidative stress. It has been known that this stress causes macromolecular damages in biological systems and these effects can be decreased by the use of bioactive components of plants such as thymol etc. Although, the healing roles of several plant based products such as curcumin in the indomethacin induced damages of small intestine have been indicated, the attenuating role of thymol in these damages in terms of the structure and function of intestine macromolecules has not been demonstrated yet. The current study was established to elucidate these effects by Attenuated Total Reflectance Fourier Transform Infrared (ATR-FTIR) Spectroscopy together with chemometric analysis approach. Rats received distilled water (control), indomethacin (25 mg/kg), indomethacin+ rantidine (50 mg/kg ran) and indomethacin+thymol combinations (100, 250 and 500 mg/kg Thymol) orally by intragastric gavage. Firstly, the spectra of small intestine samples were collected and then detailed spectral analyses including frequency, band area and bandwidth of spectral bands were performed to determine the structural and functional alterations in the tissue macromolecules. To discriminate the studied groups based on these alterations, hierarchical cluster (HCA) and principal component analysis (PCA) were applied to their spectra. The spectral results demonstrated that indomethacin caused significant damages in the unsaturated, saturated lipid, protein, nucleic acid amounts and also membrane fluidity with respect to the control and these damages may be related with the indomethacin-induced oxidative stress. On the other hand, especially 250 mg/kg dose of thymol administration ameliorated these damages with regards to the indomethacin group. The chemometric analysis indicated that the thymol treated groups were successfully discriminated from indomethacin group. The results of the current study suggest that thymol has the curative potential of the adverse effects of indomethacin in small intestine. Keywords: Indomethacin, Small intestine injury, Thymol, FTIR spectroscopy, Chemometric analysis.

EFFECTS OF INFRARED RADIATION DRYING PROCESS ON ASCORBIC ACID CONTENT AND ANTIOXIDANT ACTIVITY OF DILL LEAVES

FILİZ İÇİER¹, MUTLU ÇEVİK², DAMLA BAYANA³, DENİZ DÖNER³, ÖMER FARUK ÇOKGEZME³

ABSTRACT

Dill (*Anethum graveolens* L.), is a biennial or annual herb of the parsley family (Apiaceae or Umbelliferae). Because of its rich antioxidant activity, ascorbic acid and total carotenoid content, dill is utilized as pharmaceutic plant. However, storage of fresh dill is very problematic due to its high moisture content, thus drying of it is one of the common preservation methods. In case of conventional air circulation drying systems heat is transferred to product from air by convection, therefore drying process takes long times and results in undesired changes in the product. In recent years, novel drying methods shortening process time have been studied. Infrared drying, which is one of these novel methods, is suitable for drying of the materials having high surface area and drying in the form of thin layer. In infrared drying, drying time is shortened and loss of the desired components is reduced due to its high heat transfer rate. In present study, dill leaves in the form of thin layer were dried in infrared drier at two different radiation power (85 and 102 W) from initial moisture content of 82±2 % to the final moisture content of %8±1 moisture content. Changes of drying times, antioxidant activity and ascorbic acid values depending on infrared power were determined. Drying times for low and high power levels were determined as 840 s and 620 s, respectively. It was determined that antioxidant activity values increased as the radiation power increased. The loss in ascorbic acid contents of dried samples were determined as 12% and 75% for low and high power, respectively. It was concluded that the loss of ascorbic acid content during infrared drying was more affected from radiation power than drying time. It was determined that as the radiation power increased by 20% for infrared drying of dill leaves having medical and aromatic value, its drying time was shortened by 27% and its antioxidant capacity increased while the degradation of ascorbic acid content increased. It was recommended that the optimum process parameters for infrared radiation drying of dill leaves should be determined by optimization studies taking into account of changes in quality attributes in addition to drying times and performance characteristics.

EVALUATION OF CYTOTOXIC EFFECTS OF RHEUM RIBES (ROOT AND STEM) EXTRACTS ON HCT 116 COLORECTAL CANCER CELLS

İLKNUR ÇINAR¹, SÜMEYRA ÇETİNKAYA¹, HATİCE GÜL DURSUN¹, İPEK SÜNTAR²

ABSTRACT

Colorectal cancer (CRC) is one of the most frequent type of cancer that has rapidly increasing incidence, and shorter duration of survival. Due to serious side effects and chemo resistance of most chemotherapeutic drugs used in the treatment of CRC, it becomes necessary to develop new cytotoxic agents. It is thought that, secure extracts of edible plants which contain structurally different molecules may prevent the development of multi-factorial diseases as CRC; new efficient strategies are comprehensively being investigated, including the development of phytopharmaceuticals. Our aim in this study is to evaluate the cytotoxic effects of n-hexane, ethyl acetate, methanol extracts from stem and root of *Rheum ribes*, by applying them to the HCT 116 colorectal cancer cells. The samples of the stem and root of *Rheum ribes* were dried and powdered, and then extracted with n-hexane, ethyl acetate and methanol solvents respectively. A total of 6 fractions of this plant were obtained. The cytotoxic effects of *Rheum ribes* extracts on HCT-116 cells were assessed using the XTT test. In order to determine the IC₅₀ dose, plant extracts were applied to the cells at time (24 h, 48 h, 72 h) and dose-dependent at 50-2000 µM. According to the results obtained, the best cytotoxic effect in all fractions was observed at 48th hour. The IC₅₀ doses according to the fractions were determined as follows: root n-hexane: 672 µM, root ethylacetate: 96.32 µM, root methanol: 29.65 µM, stem n-hexane: 298.9 µM, stem ethylacetate: 226.6 µM, stem methanol: 182.9 µM. Among all extracts, root methanol was found to be the most effective fraction on cytotoxicity.

EFFECTS OF TIMOKINONE APPLICATION IN THE RENAL CELL LINE

VEYSEL YÜKSEK¹, SEMİHA DEDE¹

ABSTRACT

EFFECTS OF TIMOKINONE APPLICATION IN THE RENAL CELL LINE This study was planned to investigate the cytotoxic effects of thymokinon (TQ) which is a major component of *Nigella sativa* plant, which is widely used in various forms and reasons, in NRK-52E rat kidney cell line at various doses and durations. NRK-52E rat kidney cells were grown by regular passages in vitro conditions. TQ solutions prepared at different doses were added per well and MTT viability test was performed at 6, 12 and 24 hours. As a result, it was revealed that TQ administration NRK-52E is dependent on different dosages and duration; Low doses have permanently increased cell proliferation and cytotoxic activity has been consistently elevated as TQ doses are increased. Based on these results, it was concluded that the reliability of TQ administration in relation to dose and time on the kidneys should be evaluated in further studies.

AMELIORATIVE EFFECTS OF CARVACROL ON EXPERIMENTAL ACUTE PANCREATITIS

NIHAL SIMSEK OZEK¹, FATİME GEYİKOGLU², MİRKHALİL HOŞSEİNİGOUZDAGANI², KUBRA KOC², SALİM CERİG², GÜLSAH YILDIZ DENİZ³

ABSTRACT

AMELIORATIVE EFFECTS OF CARVACROL ON EXPERIMENTAL ACUTE PANCREATITIS Nihal Simsek Ozek^{1,2} Fatime Geyikoglu¹, Mirkhalil Hosseinigouzdagani¹, Kubra Koc¹, Salim Cerig¹, Gülsah Yıldız Deniz³ 1 Department of Biology, Faculty of Science, Ataturk University, Erzurum, TURKEY 2 East Anatolian High Technology Research and Application Center (DAYTAM), Atatürk University, Erzurum, TURKEY 3 Health Services, Vocational High School, Ataturk University, Erzurum, TURKEY Carvacrol, the main compound of thyme, possess antibacterial, antifungal, antiviral, antitumor anti-oxidant, and anti-inflammatory properties. The aim of this study was to investigate the curative efficacy of carvacrol on acute pancreatitis-induced kidney injury. With this aim, rats were randomized into control, acute pancreatitis and acute pancreatitis + carvacrol groups. The animals were given 50, 100 and 200 mg/kg Carvacrol by intraperitoneally injections after 50 µg/kg cerulein injection. After experimental procedures, renal tissues were removed for histological and biochemical investigations. Kidney weight, malondialdehyde (MDA) level, total antioxidant status (TAS), the blood urea nitrogen (BUN), uric acid (UA) and creatinine (CRE) levels were measured. Histology of kidney was examined by using three different staining methods: Periodic acid Schiff, Masson trichrome and Amyloid. According to obtained results, the cerulein treatment caused significant alterations in the weights of kidneys. However, a significant decrease in the kidney weights with carvacrol treatment was obtained with respect to the acute pancreatitis group. Moreover, TAS level was found to be higher in the acute pancreatitis+carvacrol compared to the acute pancreatitis group. Depending on the increased dose of the carvacrol, the significant decrease in MDA level was obtained. Also, the BUN, CRE and UA levels of acute pancreatitis and carvacrol groups were significantly from each other. The marked amelioration of the renal histopathology induced by carvacrol treatment was observed. Taken together these data showed that 200 mg/kg carvacrol is an effective therapy against acute pancreatitis-induced renal damages and dysfunction. As conclusion, the ameliorative effect of carvacrol was associated with its antioxidant properties. Thus, carvacrol was suggested as natural pharmaceutical agent against pancreatitis-induced multiple organ damages.

SEPARATION OF ODOR COMPONENTS FROM HYACINTH (HYACINTHUS ORIENTALIS) IN DIFFERENT COLORS FOR USE IN PERFUME CONSTRUCTION AND COMPATIBILITY WITH SYNTHETIC HYACINTH

SEDEF AŞIK¹, NAZAN DEMİR¹

ABSTRACT

In this study, it is aimed to look at some bioactivity of *Hyacinthus orientalis* species attracted to people naturally grown in Muđla and its surroundings in February and April, as well as to obtain the essential oil of the flower and to combine it with the essential oil of other flowers based on the notion concept. And new perfume combinations were selected as the target. The right combination is considered to be the next step when it becomes a commercial product after patent and trademark work. Hyacinth is a flower that embellishes nature with its pleasant smell, appearance and colors which are common in Anatolia. It is known that about 30 subspecies of the hyacinth, an endemic flower species. Uncultivated onions, local species are still found in Anatolia and are a very popular flower as a part of our culture. Perfume is a generic name for cosmetic products, derived from fragrant oils, aromatic mixtures and various chemical substances, which are used to impart fragrance to the human body, various objects and environments. Briefly a perfume; It is an intuitive and artistic combination that Chemistry Science has developed from the way of good smell. The white, purple and pink hyacinths used in this study were selected from the Muđla villages and uncastrated local species. They were diagnosed and worked the day they were collected. The remaining parts were kept at -80 ° C for other work. Content analysis by HPLC was performed and the enzyme activities were examined to investigate the availability of phenolic compounds as well as other cosmetic products in flowers. The hyacinth flowers are subjected to different processes in order to obtain the essential oils separately. Extraction with organic solvents, water vapor distillation methods are used in this frame. IR spectra of different hyacinth flowers were compared with the hyacinth essences on the market and different perfume combinations were studied. The efforts to optimize the successes of different perfume combinations have been continuing. As a result, the contents of some of the enzyme activities, essential oil components and phenolic components of hyacinth flowers were determined in this frame. Cinnamic alcohol, Ethyl 2-methoxybenzoate, 3,7-dimethyl-1, (E) -5 (E) -octatriene-7, (E) -cinnamic alcohol and ethyl 2-methoxybenzoate. This study also increased the recognition of hyacinth flowers and provided them as a prestige product. SHERBET AS A FUNCTIONAL TRADITIONAL DRINK

GAMZE TOYDEMİR¹, TUĐBA ÖZDAL², PERİHAN YOLCI ÖMEROĐLU³, SÜMEYYE BETÜL KAYA²

ABSTRACT

Sherbet is a traditional drink in Turkey which is made from a mixture of a variety of fruits (tamarind, date, pomegranate, cranberry, red grape, rosehip, locust bean, etc.), spices (black cumin, cinnamon, ginger, cardamom, clove, etc.), and flowers (rose leaves, carnation, etc.), and further sweetened with the addition of honey or sugar. Before the appearance of its modern alternatives, sherbet was a popular drink in the past with its refreshing taste; and it was also used as a curing agent in medicine due to its health benefits. The main ingredients of sherbet, specifically fruits and spices, are well-known to be rich sources of antioxidant components that may provide protection against oxidative damage, and thereby prevent the incidence of several degenerative diseases, such as cancer. Therefore, sherbet could certainly be considered as a promising functional drink which could regain its popularity among health-conscious consumers. In this study, we aimed to determine the antioxidant potentials of three different sherbets, including tamarind, grape, and cranberry sherbets as among the most preferred sherbet drinks in Turkey. Total phenolic contents (TPC) and total antioxidant capacities (TAC) of sherbet samples were measured, in triplicates, using the methods of Folin Ciocalteu and Cupric Reducing Antioxidant Capacity (CUPRAC), respectively. Grape sherbet was found to have the highest TPC (53 mg gallic acid equivalents (GAE)/ 100 g fresh weight) and TAC (184 mg trolox equivalent (TE)/ 100 g fresh weight) values among the tested sherbet samples, which was followed by cranberry sherbet -that had TPC and TAC values of 34 mg GAE/ 100 g fresh weight and 130 mg TE/ 100 g fresh weight, respectively- and tamarind sherbet – that had TPC and TAC values of 24 mg GAE/ 100 g fresh weight and 58 mg TE/ 100 g fresh weight, respectively. Current study indicate black grape, cranberry, and tamarind, which are the main fruit components of the namesake sherbet drinks, as potent fruit ingredients that could improve the functional properties of these traditional beverages with their substantial antioxidant potentials. This study is still on progress to reveal the bioactive properties of other sherbet types by characterizing their major phenolic compounds as well, which will enable us to highlight the health-related importance of sherbet consumption.

VİTİS VINİFERA L. AND AROMATHERAPY

NESRİN KARACA SANYÜREK¹, M. İLHAN ODABAŞIOĞLU², ATILLA ÇAKIR³

ABSTRACT

Aromatherapy is a natural treatment way based on the use of the oils obtained from plants. The concentrated vegetable energy in these essential oils obtained from plants is used in massage, steam, or bath. Aromatic oils are the ones, which are healable and curable. These oils are obtained from flowers, roots, trees, fruit, seeds, crust, and leaves, and have all of the properties that refresh and odorize plants. Humanity explored the benefit of these oils considered as the heart of plants thousands years ago. Aromatherapy based on the fact that essential oils obtained from plants influence the organism with olfactory receptors has a six-thousand-year-old history. Stress experienced intensively today is known to have a negative effect on every part of human body. The studies on the after-treatment ways against several psychological and physiological illnesses go on. Grape seeds as waste produced by the different uses of grapes need to be made usable. Especially the rich content of grape seeds has started to be used as an alternative in the cosmetic industry, the food industry, and the health sector. Grape seeds, which include carbohydrate, oil, and protein, have the rich vitamin, mineral, antioxidant, and phenolic compound content. The amount of the oil in the seeds is between %10 and % 27. This potential, which has a light and absorbable property, should be evaluated. It has been found out by the studies made that grape seeds have such effects as decreasing the level of cholesterol, protecting against the harmful influences of medicine and chemicals, reducing the impact of UV lights on the skin, having antimicrobial, anti-carcinogenic, antioxidant, and cardiovascular influences, improving eyesight, protecting against oedema after the operations, and renewing cells. Grape seed oil is used as essential oil and for treatment purposes because it is fluid, rich in fatty acids (omega 3, omega 6, omega 9), and has a high amount of vitamin E which can penetrate into the human skin easily and moisturizes. It is also used as bath and massage oil. The areas and amount of usage of grape seed oil in aromatherapy should be increased.

IMPORTANT TO HUMAN HEALTH, SOME BUSH FRUITS' INVESTMENT POTENTIALS IN TUNCELI

NESRİN KARACA SANYÜREK¹, M. İLHAN ODABAŞIOĞLU², ATILLA ÇAKIR³

ABSTRACT

With the growing population on earth, the current resources are gradually decreasing and the destruction of nature is consequently increasing. However, our bush fruits, so valuable in terms of health, together with the endemic species are among the most affected ones from this destruction. Our country is quite fertile for the potential species with regard to bush fruits. There are many bush fruits, some of which have been unexplored or ignored though they have been used for some specific purposes. These fruits, particularly important to human health, are facing the danger of extinction because of the decrease in number, not being taken under protection, or the inadequate growth. Restoring of already extinct species is too difficult or even impossible. Tunceli, a city in the east of Turkey, is quite rich in bush fruits. Rich in nutrition, important to human health, these fruits are quite suitable for the processing industry. Bush fruits, easily grown in the infertile lands and under harsh climate conditions, have been known for having protective effects against many diseases and have been traditionally used against illnesses for years. Bush fruits and its rich potential in Tunceli wait to be explored. The richness of the district, the conditions of which are adaptable to the farming of Bullace (kara mamuk), rosehip (kuş burnu), blackberry (böğürtlen), raspberry (ahududu) highbush cranberry (gilaburu), thorn apple (alıç), should be realized and taken into consideration.

HEALING TREE: COMMON WITCH HAZEL (HAMAMELIS VIRGINIANA)

İMGE İHSANE ÖZCAN¹, ŞÜHEDA BASİRE AKÇA¹

ABSTRACT

HEALING TREE: COMMON WITCH HAZEL (*Hamamelis virginiana*) There are approximately 100 species of *Hamamelis* in the world. Due to fallen leaves in the autumn and it started to bloom in the winter, they are called "Witch hazel," "Magic nut", "Magic walnut" and "Magic bush". Generally their species are grown in North America (*H. mexicana*, *H. ovalis*, *H. virginiana* and *H. vernalis*), Japan (*H. japonica*) and China (*H. mollis*). Of these, only as healing *Hamamelis virginiana* is used for medical purposes. One of the American species, the common witch hazel (*Hamamelis virginiana*) plant has been spread from South Florida to eastern Texas, western Nova Scotia to Minnesota. This plant is a tree that grows in forestland endemic to North America. It is also grown in Europe and semi-tropical forests. This plant, which is English Witch Hazel is also known as Bitter Hazel and Pigeon Tree in Turkey. The leaves and shells of *Hamamelis* is used for making tea, bandages, suppository, tincture and natural medicines. The most important effect of *Hamamelis* has a natural astringent namely firming feature. This is one of the most preferred plants in the cosmetic industry with this feature. In this study, have been given general characteristics of the common witch hazel, their usage areas, information obtained from various references about the studies.

HONEY PLANTS OF ORUMCEK FOREST : EVALUATING MEDICINAL AND AROMATIC PLANTS FOR CULTIVATION

GÜLŞAH YILMAZ¹, GÜLSÜM YALDIZ²

ABSTRACT

Flora has a significant effect on characterization of honey in beekeeping. Örümcek Forest or Spider Forest is known possess highly rich plant diversity that including many medicinal and aromatic honey plants. Nearly 620 plants taxa were identified totally over 38 thousand hectares which of 263 hectares are protected in the Forest. In recent years, some regional projects are being implemented the medicinal and aromatic plants and to develop beekeeping by the local people and increasing employment in the Black Sea Region. Some medicinal and aromatic plants which are grown in the Örümcek Forest have been cultivated as part of a project and they have been growing in the Kürtün district of Gümüşhane Province since 2012. In this study, information is provided about the medicinal and aromatic plants that can be cultivated as a honey plant by flora trips in the Örümcek Forest.

IMPORTANTANCE OF GINGER (ZINGIBER OFFICINALE ROSCOE) FOR HEALTH

HÜLYA VATANSEVER¹, DUYGU ERCAN ORUÇ¹, ABDULLAH ÇAĞLAR¹

ABSTRACT

Ginger (*Zingiber officinale* Roscoe), a member of the family Zingiberaceae, has been used as a spice and medicinal plant in many parts of the world for centuries. Many civilizations have been used ginger in various forms in the treatment of respiratory and urinary tract infections, stomach and intestinal disorders, nervous disorders, diabetes, infertility, headache, toothache and rheumatism. Carbohydrates, amino acids, vitamins (A, B3, B6) and minerals (Ca, Fe, Mg, Mn, P, K, Na, Zn) constitute the nutrient content of ginger. In addition, ginger has shogaol and gingerol polyphenolic substances with high antioxidant properties. Researches have shown that ginger has numerous therapeutic properties including antioxidant, anti-inflammatory, antiplatelet, antimicrobial, antiemetic, radioprotective, gastrokinetic, cologne effects. It has been determined that ginger is effective against various gastrointestinal cancers such as stomach, liver, pancreas and colonic carcinoma and cholangiocarcinoma. Modern clinical trials have shown that ginger helps to relieve nausea and vomiting to reduce muscle pain and discomfort and respiratory tract infections, and protects the digestive system and brain health. It also reduces LDL cholesterol and increases HDL cholesterol, regulating insulin levels. The results obtained from scientific data reveal that ginger supports most of the purposes of uses for various reasons among the people. The fact that ginger has a rich nutritional content and too many health benefits to mention increases the importance of spreading consumption of ginger.

THE DPPH FREE RADICAL SCAVENGING ACTIVITY AND ABTS CATION RADICAL DECOLORISATION ACTIVITIES OF ETHANOL EXTRACTS OF SEEDED RAISINS

DİLEK DEĞİRMENÇİ KARATAŞ¹, VEYSİ ÖZ¹, MEHMET AKDENİZ², IŞIL AYDIN², ABDÜSELAM ERTAŞ³

ABSTRACT

The DPPH Free Radical Scavenging Activity And ABTS Cation Radical Decolorisation Activities Of Ethanol Extracts of Grape Raisin Seeds Dilek Değirmenci KARATAŞ¹ Veyisi ÖZ¹ Mehmet AKDENİZ² Işıl AYDIN² Abdulsalam ERTAŞ³ 1 Dicle University, Faculty of Agriculture, Department of Horticulture, Diyarbakır, TURKEY 2Dicle University, Faculty of Pharmacy, Department of Analytical Chemistry, Diyarbakır, TURKEY 3Dicle University, Faculty of Pharmacy, Department of Pharmacognosy, Diyarbakır, TURKEY SUMMARY Considering the changes in nutrition recommendations and models in the world, the seeded raisins should be considered as one of the products with significant potential for foreign trade. In recent years, the demand for core black raisins, which are constantly on the agenda in terms of healthy nutrition due to their blood-building and high antioxidant content, has increased considerably. Anthocyanins are the most common phenolic compounds in red grapes and flavonols are most commonly present in white grapes. The health benefits associated with fresh grape consumption are broadly known and linked to the richness of phenolic compounds. These compounds have been demonstrated to have a wide range of biochemical and pharmacological effects, including anticarcinogenic, and antiatherogenic, antiinflammatory, antimicrobial, and antioxidant activities. In this study, seeds of variety of grape varieties of Besni, Dımışkı, Rumi, Banazı siyahı, Horoz Karası, Kerküş grapes collected from Southeastern Anatolia Region of our country were studied. The material (4-8 g) was dried and powdered, and they were macerated with ethanol (25 mL × 3) for 24 h at 25 °C. After filtration, the solvents were evaporated to obtain crude extracts. The ethanol extracts of seeds were tested for antioxidant (DPPH free radical scavenging activity and ABTS cation radical decolorization) activities in this study. Studied six extracts were found to be quite active on both antioxidant activity methods. In particular, the ethanol extract of Banazı Black (BBS) showed 86.34% inhibition in 50 µg / ml concentration and 87.79% in ABTS method in DPPH method. In both methods, it was found that the Dımışkı grape seed samples (DS) showed lower activity than the others. In our study, it was determined that antioxidant potentials of different grape varieties were quite different. We are continuing our efforts to determine the chemical components that cause this. Acknowledgements: The research was funded by grant : DUBAP from Dicle University Keywords: *Vitis vinifera* ssp. sativa, seeded raisins, seeds, DPPH, ABTS

THE BIOLOGICAL ACTIVITIES OF LAVANDULA STOECHAS L. AGAINST FOOD PATHOGENS

DUYGU BAYRAK¹, GÜLTEN ÖKMEN¹, ALİ ARSLAN¹, MUSTAFA VURKUN¹

ABSTRACT

Foodborne pathogens are microorganisms as well as a number of parasites, which are capable of infecting humans via contaminated food or water. In recent years, diseases caused by foodborne pathogens have become an important public health problem in the world, producing a significant rate of morbidity and mortality. In traditional medicine, numerous plants and their extracts have used for thousands of years to treat health disorders. Although many studies were made on natural herbs, those involving the antimicrobial, antioxidant and antimutagenic activity of the herb species are rather rare. This study researches the biological activities of ethanol and methanol extracts of *Lavandula stoechas* L., which are prevalent in Turkey. In this study, 8 food pathogens were used for antimicrobial activity studies. Antimicrobial activity studies were done by disk diffusion assay and MIC (minimum inhibitory concentration). DPPH method was used for non-enzymatic antioxidant activity. The *Lavandula* extracts were screened for their antimutagenic activity against sodium azide by Ames test in absence of rat microsomal liver enzyme (-S9). The ethanol and methanol extracts of *Lavandula stoechas* showed antibacterial activity (7 mm) against most of bacteria. The antifungal activity of *L. stoechas* was not determined against *C. albicans* RSKK02029. The lowest MIC value was determined as 3250 µg/mL. The highest radical inhibition was determined as 79 % by *Lavandula stoechas* flower methanol extract. The flower extract of *L. stoechas* (12500 µg/plate) was found to have its highest antimutagenic activity for *Salmonella Typhimurium* TA98. This inhibition value is 42 %. *L. stoechas* leaves extracts (6250 and 3125 µg/plate) showed a moderate positive inhibitory effect for *Salmonella Typhimurium* TA98, and TA100. *L. stoechas* flower extracts (12500 and 6250 µg/plate) showed a moderate positive inhibitory effect (respectively 31 and 30 %) for *Salmonella Typhimurium* TA100. The extracts of *L. stoechas* have antimicrobial, antioxidant and antimutagenic activities.

EFFECT OF INFUSION TIME AND CONCENTRATION ON ANTIMICROBIAL AND ANTIOXIDANT POTENTIAL OF LAVANDULA STOECHAS L. TEAS

SIBEL AYDIN¹, PINAR KADİROĞLU¹

ABSTRACT

Lavandula stoechas L. that belongs to Lamiaceae family is one of the medicinal and aromatic plants, especially grown in the Mediterranean Region. The antiseptic effect of this plant with emphasis on treatment of several diseases were reported. Recently, the great concern on natural products and the plants like this has increased. Studies on Lavandula stoechas L. were mostly performed on antibacterial properties of volatile oils of this plant. However, there was no study on optimization of infusion process that were related with antimicrobial and antioxidant potential of Lavandula stoechas L. teas. In this study, the effects of different infusion times and concentrations on antimicrobial and antioxidant potential of teas were investigated. For this purpose, teas were infused at 10% and 20% (w/v) concentrations for 5, 10 and 20 minutes. Antimicrobial activity test was conducted with Kirby-Bauer disc diffusion assay by using Staphylococcus aureus and Escherichia coli as test organisms and zones of inhibition of teas were determined. Antioxidant potential of teas was performed with DPPH radical scavenging activity assay. According to the results, antimicrobial activities of teas infused for 10 to 20 minutes were found to be similar and higher than infusion time of 5 minutes. When the effect of infusion concentrations were compared, antimicrobial activity teas with 20% (w/v) was higher than 10% (w/v) concentration. Antimicrobial potential of Lavandula stoechas L. teas was more effective on E. coli rather than S. aureus. Antioxidant potentials of the teas were comparable with antimicrobial activities and teas with higher infusion concentration and 10 minutes infusion time had better antioxidant potential when compared to other infusion conditions. The results revealed that optimization of infusion conditions of teas were important for remarkable inhibition against pathogens and antioxidant potential.

THE BIOLOGICAL ACTIVITIES OF SILYBUM MARIANUM L. GAERTN. AGAINST FOOD SPOILAGE MICROORGANISMS

DUYGU BAYRAK¹, GÜLTEN ÖKMEN¹, ALİ ARSLAN¹

ABSTRACT

Food safety and foodborne pathogenic microorganisms are one of the major public health problems in the globalizing world. In the world, numerous plants and their extracts are used for thousands of years to treat health disorders. This study researches the biological activities of extracts of *Silybum marianum*, which is prevalent in Turkey. In this study, 7 bacteria and 1 yeast were used for antimicrobial activity studies. Antimicrobial activities studies were done by disk diffusion assay and MIC (minimum inhibitory concentration). Antioxidant activities were studied by DPPH method. The plant extracts were screened for their antimutagenic activity against sodium azide by Ames test in absence of rat microsomal liver enzyme (-S9). The extracts of *Silybum marianum* showed strong antibacterial activity (10 mm) against *Bacillus subtilis* RSKK245 and *Staphylococcus aureus* RSKK2392. The highest antifungal activity was obtained methanol extract of *Silybum marianum* flowers against *Candida albicans* RSKK02029 (9 mm). The lowest MIC value was found as 3250 µg/mL. The highest radical inhibition was determined as 72 % by *Silybum marianum* flower methanol extract. *Silybum marianum* flower extracts (12500 and 6250 µg/plate) showed a mutagen effect for *Salmonella Typhimurium* TA98. However, these extracts showed low antimutagenic activity for *Salmonella Typhimurium* TA100. *Silybum marianum* leaves extracts (6250 and 3125 µg/plate) showed a moderate positive inhibitory effect for *Salmonella Typhimurium* TA98, and TA100 (respectively 38 and 28 %). The leaves and flowers extracts of *Silybum marianum* have antimicrobial, antioxidant and antimutagenic potential.

ESSENTIAL OIL COMPOSITION AND ANTIFUNGAL AND ANTIBACTERIAL ACTIVITY OF *ACHILLEA CAPPADOCICA*

NUSRET GENÇ¹, HÜSEYİN AKŞİT¹, MAHFUZ ELMASTAŞ¹, ZEYNEP AKŞİT², İSA KARAMAN¹, BEDRETTİN SELVİ¹

ABSTRACT

Achillea species is perennial herbs belongs to Asteraceae family and has a characteristic odor. The genus *Achillea* is represented 41 species and 7 subspecies 24 of which are endemic to Turkey according to Flora of Turkey. *Achillea cappadocica* is one of the endemic species and its essential oil compositions has not been reported previously. *Achillea* species are known as "civan perçemi" in Turkish and used as a folk medicine. A large number of *Achillea* species are on the "generally recognized as safe plants list (GRASS)" in Turkey and marketed for treatment of various diseases. This study focused on the determination of essential oil composition of *A. cappadocica*. Plant materials were collected from Refahiye, Erzincan at June 2016. Essential oils were obtained using clevenger type apparatus during 30 min and analyzed with GC-MS instrument. 27 compounds were identified representing %97.4 of total oil. The major components were found as ascaridiol (%55.5) isoascaridiol (%10.3), p-cymene (%11.17) and eucalyptol (%6,56). Ascaridiol is a naturally occurring endoperoxide monoterpene found in essential oil of *Chenopodium ambrosioides* (Mexican tea). Ascaridiol and isoascaridiol have unknown toxicity. It was reported the occurrence of ascaridiol in *Achillea millefolium* growing northern Greece as major component by % 47 [1]. When compared other *Achillea* species growing in Turkey, the being large amount of ascaridiol in *Achillea cappadocica* is remarkable. To ensure identifying ascaridiol, ¹H and ¹³C-NMR spectrums of crude essential oil were recorded in CDCl₃ due to suspicious MS library hits. Two olefinic methine (136.3 C2 and 133.0 C3), one aliphatic methine (32.1 C8), two oxygenated quaternary (79.7 C4 and 74.3 C1), three methyl (21.3 C7, 17.2 C9, 17.1 C10), two aliphatic methylene (29.5 C6, 25.6 C5) signals were observed at ¹³C-NMR spectrum with fully agreement with literature data[2]. The antifungal and antibacterial activity of crude essential oil were determined using disc diffusion method. Essential oil exhibited great activity against *P. aeruginosa*, *E. faecalis* and *S. aureus* and moderate activity against *E. coli* and *C. albicans* when compared commercially available some antibiotics such as tetracycline, gentamycin and streptomycin. 1. Chatzopoulou, P., S.T. Katsiotis, and A.B. Svendsen, An ascaridole containing essential oil of the *Achillea millefolium* L. complex growing wild in northern Greece. *Journal of Essential Oil Research*, 1992. 4(5): p. 457-459. 2. ISOLATION BIOLOGICAL COMPOUNDS FROM TRICHOLOMA FOCALE

MEHMET HÜSEYİN SİNGEÇ¹, ERHAN KAPLANER¹, MEHMET ÖZTÜRK¹

ABSTRACT

Tricholoma species are generally favorable in most of the Asian countries among the others because of their marvelous tastes. Anatolia has diversity of Tricholoma species. Tricholoma anaticum is considered as a new matsutake belonging to Anatolia peninsula. Tricholoma focale is another mushroom which is widely found in conifer forests of Anatolia. Having the diverse biological activity and being an important source of food, these mushrooms have very broad investigation field (Zaidman, Yassin, Mahajna, & Wasser, 2005). The aim of this study is to isolate biologically active compounds from Tricholoma focale. For this purpose the mushroom was extracted using methanol. Silica gel column chromatography, thin layer chromatography and Recycling prep. HPLC were employed for isolation studies. As a result, 1 new steroid along with 3 known compounds (2-4) isolated. 1 2 3 4 Acknowledgements: This study is supported by TUBITAK-SBAG with the Project number of 113R012. EFFECTS OF POLYPHENOLS ON DIGESTIBILITY OF MACRONUTRIENTS

YUSUF DURMUŞ¹, MÜNİR ANIL²

ABSTRACT

Polyphenols are dietary constituents of plants associated with health-promoting effects which are generally consumed with macronutrients in the human diet. Some polyphenols found in foods include catechins, condensed tannins, anthocyanidins and some phenolic acids such as caffeic acid, ferulic acid, phytic acid, gallic acid, etc. The effect of interactions between food macronutrients and plant phenols is a very important topic because of their bioavailability that effect on human health. Polyphenolic compounds have capacity to bind and precipitate proteins. Low-molecular-weight phenols are unable to precipitate protein, and oligomers must contain at least three flavonol subunits to effectively precipitate protein. The protein–polyphenol complexes do not affect the absorption of polyphenols but can significantly change the plasma kinetics profile. Moreover, tannins can bind and inhibit other endogenous proteins in the intestinal tract, such as digestive enzymes. This leads reduction not only to the digestibility of the protein but also to other macronutrients such as starch and lipids. Likewise, polyphenols also can form complexes with polysaccharides other than those that form the plant cell wall (i.e., starch) and also affect the glycemic and insulinemic responses. Carbohydrates can increase absorption and prolong the time required to reach the maximum polyphenol concentration. Interaction of phenolic acid with starch significantly contributes to the inhibitory effect of starch hydrolysis. Increased fermentation of oligosaccharides in the large intestine increases polyphenol bioavailability. Furthermore, the fermentation of oligosaccharides enlarges the intestinal mucosa, suppresses the bacterial degradation of the polyphenols in caecum, and also influences the mucosal blood flow by stimulating mucosal blood flow, thus contributing to polyphenol absorption in the intestine. In addition to its effect on absorption, it has been observed that carbohydrates alter the plasma kinetic profile of polyphenols. A positive correlation was observed between fat concentration and bioavailability of polyphenols after in vitro gastropancreatic digestion. Oils can change the absorption kinetics of polyphenols and increase their absorption. Hydrophobic interactions between oils and polyphenols promote the stability of polyphenols during digestion and therefore high fat content in the food have a protective effect. Bioavailability of phenolic compounds has been determined to increase after medium-chain fatty acid and long-chain fatty acid diets compared to standard diets. In addition, the degree of saturation of the oils can affect the bioavailability of the polyphenols. Furthermore, not only a food ingredient but also certain synergies between food macro nutrients have an important effect on the bioavailability and bioactivity of polyphenols.

EFFECT OF GROUNDING PROCESS ON ANTIOXIDANT AND ANTIMICROBIAL POTENTIAL OF CARDAMOM EXTRACTS

SIBEL AYDIN¹, PINAR KADİROĞLU¹

ABSTRACT

Cardamom, dried fruits of *Elettaria cardamomum* belongs to Zingiberaceae family. Cardamom is mostly harvested in southern India, Sri Lanka, Tanzania and Guatemala. It is traditionally used in various gastrointestinal, cardiovascular and neuronal disorders. The dried fruit of cardamom is used either whole or ground form as a food additive and flavouring agent. Cardamom has unique aromatic and sharp flavour. The cardamom flavour used in processed foods, is mainly provided by the cardamom essential oil. In this study, cardamom as whole and ground form was extracted with boiled water at 20% (w/v) concentration for 10 minutes. Antimicrobial activities of extracts were assessed with Kirby-Bauer disc diffusion assay by using *Staphylococcus aureus*, *Escherichia coli* and *Pseudomonas aeruginosa* as test organisms and zones of inhibition of extracts were determined. Antioxidant potential of extracts was performed with DPPH radical scavenging activity assay. According to the results, ground cardamom extracts had possessed better antioxidant potential than whole cardamom extracts. Antimicrobial activity studies revealed that all extracts had no antimicrobial potential against tested microorganisms.

THE EFFECTIVENESS OF HERBAL TEAS ON GLYCEMIC CONTROL

GÜLŞAH KANER¹, EZGİ BELLİKCI KOYU¹, HALİL KOYU²

ABSTRACT

Diabetes is a chronic disease which is related with impaired insulin secretion or utilization. Type 2 diabetes, is a serious global health problem and its prevalence is rapidly increasing. According to the Turkish Epidemiology Survey of Diabetes, Hypertension, Obesity and Endocrine Disease II (TURDEP-II) study, diabetes prevalence was reached to 13.7% in adults. Due to the chronic nature of diabetes and its effects on quality of life, people are interested in herbal medicine to reduce symptoms of disease. According to the ethnobotanical studies, approximately 200 taxa have been used to control blood glucose level in Turkey. Additionally, many plants such as cinnamon and ginger is popular among diabetes patients in Turkey although they are not native to our flora. Plants are mostly prepared by infusion or decoction methods in traditional medicine, which are commonly called as tea. Besides its therapeutic purpose, herbal teas are used as a part of daily nutrition and they increase the quality of with their polyphenolic content. Due to the high patient compliance and easy preparation and use, herbal teas can be consumed as a practical complementary therapy in daily nutrition. However, suggesting these products in clinics for glycemic control requires detailed information about their effectiveness and safety. In line with this objective, in this study, some plants commonly used for glycemic control such as *Camellia sinensis* (L) Kuntze, *Cinnamomum zeylanicum* Blume, *Matricaria chamomilla* L., *Morus alba* L., *Morus nigra* L., *Rosa canina* L, *Salvia fruticosa* Mill., *Urtica dioica* L. and *Zingiber officinalis* Roscoe are reviewed regarding the scientific literature.

TRADITIONAL USE, PHARMACOLOGY AND TOXICOLOGY OF FERULA L. SPECIES: A REVIEW

HAKIYE ASLAN¹, ELIF YILDIRIM²

ABSTRACT

Ferula L. is the third largest species of the Apiaceae family and consists of 180-185 varieties of flowering plants that grow in central and southern western Asia, the Far East, North India and the Mediterranean Basin. A total of 27 Ferula species (23 species and 4 subspecies), of which 9 are endemic, grow in the mountainous region of Eastern Anatolia, Central Anatolia, Southeast Anatolia and Eastern Mediterranean in Turkey. Some of species of genus Ferula are used as spices, while others are used in the preparation of local drugs to treatment of circulatory system disorders, strengthening nerves and muscles, muscle pain, bone erosion and infertility. Also, in recent years, it has been found that some species of Ferula genus exhibit antidiabetic, antimicrobial, anti-tumor and antiangiogenic activities according to the in vitro and in vivo studies. However, it has been found that some Ferula species, such as F.communis, have two different types of chemotypes that are toxic and non-toxic. The toxic chemotype shows anticoagulant and cytotoxic effects with sesquiterpene coumarins as main components while the main component of non-toxic chemotype is the daucane sesquiterpene esters and has an estrogenic effects. In this study, the available information about the traditional use, pharmacology and toxicology of Ferula L. species is summarized and its potential therapeutic effect, medical and economic importance has been mentioned.

EFFECTS OF VARIOUS DRIED POLLEN SAMPLES ON BIOFILM FORMATION IN *P. AERUGINOSA*

HALİME ÇEVİKBAŞ¹, BEKİR GÖKÇEN MAZİ², SEYHAN ULUSOY¹

ABSTRACT

Pseudomonas aeruginosa is an opportunistic human pathogen which forms biofilm through quorum sensing system. Repressing biofilm formation will be a treatment approach that looks promising especially for the immunocompromised patients. Hence, a variety of pollen samples that are known to be beneficial for human health and have been used for this purpose for a long time were tested. The effects of the five pollen samples that were exposed to different drying processes on biofilm formation in *P. aeruginosa* were investigated. In conclusion, it was observed that the frozen pollen sample (DP) inhibited biofilm formation by %62 with maximum rates. At the end of this research, it was showed that pollens can be a significant anti-virulent agent by suppressing biofilm formation.

ABSTRACT

Many pathological disorders such as arthrosclerosis, diabetes and cancer are associated with reactive oxygen species. Antioxidants protect the cells from harmful effects of free radicals and reactive oxygen species. Therefore, the detection of antioxidant rich plants is important for preventing and treating the oxidation of cells. The present study was conducted to determine the total phenolic/flavonoid content, antioxidant activity of methanol, buthanol, dichlorometane, water and hexane extracts prepared from *Haplophyllum ptilostylum* and *Alcea acaulis*. Antioxidant activity of the sample was comparable to commercial antioxidant standards (BHT, askorbik asit and trolox). The results showed that extracts prepared with different solvents has moderate free radical scavenging and reducing capacity.

FUNCTIONAL ACTIVITY OF ISPARTA ROSE (ROSA DAMASCENA MILL.) AND HEALTH EFFECTS

SANIYE SÖZLÜ¹, EFSUN KARABUDAK¹

ABSTRACT

It has been reported that mutations are an important cause in the pathogenesis and progression of many diseases such as atherosclerosis, heart disorders and cancer. For this reason, anti-mutagens from natural dietary sources that can resist the promutogenic and carcinogenic effects of mutagens have a great deal of precaution. Several phytochemicals have been reported to provide health protective effects through their anti-microbial, antioxidant, anti-mutagenic, anti-carcinogenic and anti-inflammatory activities. It is known that a large part of these health effects are carried out through phenolics and flavonoids in phytochemicals. The benefits derived from the use of natural products rich in bioactive substances have increased the growing interest of pharmaceutical, food and cosmetic industries. Roses are also used in perfumes, pharmaceuticals and food industries as well as being used as an ornamental plant in parks, gardens and houses, with over 150 species and more than 20,000 cultivars. The Rosa genus is composed of many species and different regions have their own endemic species. Rosa Damascena Mill. (Damask rose, Oil-bearing rose, Pink rose) is the most important species, producing a high-value aromatic oil, which is used in the pharmaceutical and fragrance industries. Turkey is one of the most important country growing Rosa damascena in the world. Several components were isolated from the flowers, leaves and seeds of R. damascena including terpenes, glycosides, flavonoids and anthocyanins. It also contains carboxylic acid, vitamin C, kaempferol and quercetin and organic acids. It has attracted attention in recent years as a medical food ingredient due to anti-inflammatory, antioxidant and cyclooxygenase inhibition activities as well as essential oil and pharmaceutical effects produced. The rose seed extract has been shown to have antioxidant and anti-microbial activities. Generally, the extent of the antioxidant and antibacterial effects of the extracts could be attributed to their phenolic compounds and essential oil contents. According to the results, the extracts obtained from fresh Rosa damascena flowers have higher antioxidant and anti-bacterial activity than the dried ones. It is reported that roses may be one of the important functional foods with the positive effects on health. For this reason, rose extracts may have potency to be used as a natural antioxidant source in healthy products for the prevention of oxidative damage and for the inhibition of the progression of certain diseases (heart diseases, cancer, diabetes). However, the food sources that currently contain roses on the market are products of high sugar content, such as Turkish delight, jam. Consumption can be supported by developing healthy foods.

EFFECTS OF CURCUMIN ON BREAST CANCER

NAZLI NUR ASLAN¹, MELDA KANGALGİL², AYŞE ÖZFER ÖZÇELİK¹

ABSTRACT

Curcumin (diferuloylmethane) is a polyphenol obtained from the *Curcuma longa* plant, commonly known as turmeric. Approximately 2.0-5.0% of curcumin is curcuminoid and it is responsible for the the yellow color of the spice and its therapeutic effects. Curcumin has various biological and pharmacological effects such as antioxidant, antiinflammatory, antiviral, antiischemic, antibacterial, antifungal, immunomodulator, antiproliferative and anticancer. Curcumin is helpful in reducing post-operative inflammation and in preventing atherosclerosis. In addition, curcumin also prevents the development of *Helicobacter pylori*, which causes gastric ulcer and is associated with gastric cancer. Curcumin can bind to heavy metals such as cadmium and lead, and thus reduce the toxicity of these heavy metals. Studies showed that curcumin does not have toxic effects on humans. Despite its strong biological and pharmacological properties, low bioavailability is the most important problem in the clinical use of curcumin. The anticancerogenic effects of curcumin are directly due to antioxidant and free radical scavenging effects. The underlying mechanism is still unclear, as it is estimated that the indirect effect is due to increased levels of glutathione due to hepatic detoxification of mutagens and carcinogens and the prevention of the formation of nitrosamine. Breast cancer is the most common type of cancer seen in women and the prevalence in developed countries accounts for about 25.0% of the types of cancer seen in women. Breast cancer in the world is the second most important cause of cancer-related deaths in women. Surgical treatment, radiation, chemotherapy, immunotherapy, hormone therapy and stem cell transplantation are used in breast cancer treatment. These treatments have a significant impact on the quality of life of the patient with the cost of having expensive and serious side effects. Breast cancer is resistant to chemotherapy and alternative therapies are needed because the side effects of treatment are high. In vivo and in vitro studies showed that curcumin inhibited proliferation of the breast cancer cell line (MCF-7), increased apoptosis and reduced reactive oxygen species and nitric oxide levels. Curcumin was also shown to inhibit tumor growth and angiogenesis, leading to antiproliferative activity, decreased tumor volume and weight. High levels of fatty acid synthase (FAS) expression were found in many tumors, including prostate, breast and over-cancer, and inhibition of FAS was shown to inhibit tumor growth. Curcumin was determined to inhibit intracellular FAS and induce apoptosis in human breast cancer. In addition to all of these, curcumin was found to reduce the toxic effects of drugs used in breast cancer treatment. As a result of the studies performed, curcumin appears to be an alternative way to prevent and treat breast cancer. However, in order to be able to use curcumin in breast cancer treatment, it is necessary to use it together with more complex technologies as well as to conduct more studies.

STUDIES ON PHYSICAL/CHEMICAL COMPATIBILITY BETWEEN HERBAL EXCIPIENTS AND CARVEDILOL USING SPECTROSCOPIC AND THERMAL TECHNIQUES

HALE SEÇİLMİŞ CANBAY¹, MAHMUT DOĞANTÜRK²

ABSTRACT

Studies of drug active compound-excipient suitability represent an important phase in the preformulation stage of the development of all dosage forms. The possible physical and chemical interactions between drugs and excipients can affect the chemical nature, the stability and bioavailability of drugs and, consequently, their therapeutic efficacy and safety [1]. Drug – excipients compatibility studies lays a foundation in careful selection of most appropriate excipients and helps in designing a chemically stable and effective dosage form [2,3]. Hypertension is one of the important threat for kidney, stroke and various cardiovascular diseases. Hypertension is treated by regulating blood pressure and electrolyte balance [4,5]. The purpose of the present investigation was to evaluate the compatibility of Carvedilol with various herbal excipients (cellulose, sucrose, mannitol, starch) to be used in the nanoparticle formulations utilizing the different spectroscopic and thermal techniques such as Differential Scanning Calorimetry (DSC), Thermo-Gravimetric/Differential Thermal Analyzer (TG/DTA) and Fourier Transform Infrared Spectroscopy (FTIR). The thermograms of the drug and excipient were obtained using DSC (PE DSC 400). All the samples were placed in a pre-weighed stainless steel pan and sealed carefully with a sealer supplied by the manufacturer. The sealed pan was weighed to obtain the sample mass. Another sealed empty stainless steel pan was used as the reference. The sample was equilibrated heated from - 20 °C to 400 °C at a rate of 10 °C/min Thermogravimetric analysis, derivative thermogravimetry and differential thermal analysis measurements were made by using simultaneous TG/DTA thermal analyzer apparatus (Seiko TG/DTA 7200). The drug and drug-excipients mixtures were carefully weighted and transferred to a platinum pan, sample mass of \square 10.0 mg. Measurements were carried out from ambient to 600 °C in dynamic nitrogen atmosphere heating rate of 10 °C/min. ZnSe-ATR equipment was used as well as KBr pellet technique. The FTIR measurements were formed on a PE Frontier spectrometer. Table 1 Peak temperature and enthalpy values of Carvedilol – herbal excipient mixtures Sample Ratio (drug-excipient) T_{peak} (°C) Enthalpy(Jg⁻¹) Carvedilol - 120.74 - 104.83 Carvedilol-Cellulose 1:1 119.31 - 52.63 Carvedilol-Sucrose 1:1 120.02 - 49.11 Carvedilol-Mannitol 1:1 119.31 - 49.50 Carvedilol-Starch 1:1 119.41 - 65.51 There was no interaction between Carvedilol-Cellulose, Carvedilol-Sucrose, Carvedilol-Mannitol and Carvedilol-Starch. THE EFFECT OF PHITOTHERAPY ON POSTPARTUM DEPRESSION

ESRA USLU¹, MENEKŞE NAZLI AKER²

ABSTRACT

Objective: Postpartum depression is a serious psychological problem that weakens the link between the mother and the baby in the postpartum period. Despite the fact that there is no clear data on the incidence of mental illness due to fear of stigmatization, it is thought that it affects 13% of mothers. For this reason, many mothers refuse psychological assistance because postpartum depression is normal or has a psychiatric history. However, many drugs are also contraindicated in the lactation process. At this point, phytotherapy may be an alternative in the management of postpartum depression. For this reason, this study aims to determine the effect of phytotherapy on postpartum depression. **Methods:** This is a review study which is studies through Pubmed, EBSCO Host, Ulakbim Medical Database, Turkish Medline databases. During the scanning, the words "postpartum depression" and "phytotherapy" and the Turkish equivalents of these words were used. A total of 25 articles were obtained (Pubmed n = 14, EBSCO Host n = 11, Ulakbim Medical Database n = 0, Turkish Medline n = 0). 18 of these articles were review studies and two of these articles were about aromatherapy treatments. So in total 20 of these articles were not examined. Since 2 articles out of 5 articles were the same studies, in total 3 articles were examined. One of the studies was carried out in the United States, one in Iran and one in Taiwan. We did not find any study related to the subject in our country. **Results:** Phytotherapy; It was the most prescribed method by nurses and midwives in North Carolina. Nurses and midwives also stated that they also use phytotherapy for postpartum depressed mothers. The results of two other experimental studies show that saffron is a safe complementary method to improve the depressive symptoms of postpartum depression, and chamomile tea is an additional approach to alleviate depression and sleep quality problems in postpartum period. **Conclusion:** The results of this review have showed the numerical insufficiency of the studies taken into consideration and a limited number of herbal products were examined. The methods used were found to be effective on postpartum depression. In this context, it is suggested that planning of descriptive studies in which the opinions of health workers and postpartum mothers on phytotherapy are determined and the current situation is also determined, randomized controlled trials evaluating the effect of different plants on postpartum depression.

INVESTIGATION OF AROMA PROFILES OF CRAB APPLE (*MALUS TRILOBATA* V *ERIOLOBUS TRILOBATUS*) AT DIFFERENT TEMPERATURES AND DRYERS

*SELMA KAYACAN*¹, *AHMET ABDULLAH US*¹, *OSMAN SAĐDIÇ*¹, *RASIM ALPER ORAL*²

ABSTRACT

The crab apple is a wild fruit which rarely grows in our country. There is a limited number of studies about crab apple in the literature. It is generally known to the region where it grows and it is used against cholesterol, shortness of breath, diabetes and blood pressure. In this study, crab apple was dried in two different temperatures, 40°C and 60°C, in the oven and vacuum dryer, and by using GC-MS, effect of temperatures and dryers on the aroma compounds of dried crab apple were compared. According to the results, carvacrol, anethole and kuminaldehyde which have antioxidant effects were found as dominant aromas in crab apple. Compared to the oven and vacuum dryer, the components were found to be lower in oven drying, and the components of 60°C were found to higher than of 40°C at oven drying. When compared 40°C vacuum drying with 40 °C oven drying, carvacrol was found to about 10 times more, anethole was found about 3 times more and kuminaldehyde was found about 4 times more in in the vacuum dryer. The highest value of the all components was obtained at 40°C in the vacuum dryer. According to results; it was determined that drying temperature and type of dryer have effect on antioxidant content of crab apple.

ESSENTIAL OIL COMPOSITION, ANTIOXIDANT ACTIVITY AND ANTI-PROLIFERATIVE EFFECT OF A NEW SPECIES: PARACARYUM BINGOELIANUM

MEHMET KADIR ERDOĐAN¹, HAKAN AŐKIN², LÜTFİ BEHÇET¹, İBRAHİM HALİL GEÇİBESLER¹

ABSTRACT

The plants have been used for a long time in the treatment of many diseases. Dietary and medicinal herbs contain many natural phytochemicals such as phenolics and flavonoids, and they have antioxidant, anti-inflammatory, anti-proliferative and apoptotic effects. There is a huge interest to uncover the valuable compounds and medicinal characteristic of herbs. The genus *Paracaryum* (DC) Boiss. belongs to Boraginaceae family. In this study, the essential oil composition, antioxidant, anti-proliferative and apoptotic effects of *Paracaryum bingoelianum* were investigated. *Paracaryum bingoelianum* was collected in 2014, in Bingöl, Turkey. The essential oil of *P. bingoelianum* was obtained by hydrodistillation method and chemical composition of plant was analyzed by HS-SPME/GC-MS. The antioxidant capacity of essential oil from *P. bingoelianum* was determined by different in vitro assays (DPPH radical scavenging activity, reducing power and ferric thiocyanate methods). BHA, BHT, vit.E and vit. C were used to compare the antioxidant assay results. Anti-proliferative activity was examined by MTT (3-[4,5-dimethylthiazol-2-yl]-2,5 diphenyl tetrazolium bromide) assay on human colorectal adenocarcinoma cell line (HT-29). Cell death detection Elisa assay was used to detect the apoptotic effect. Thirty six compounds were totally identified, which representing 93.38% of the oil. Among them 6,10,14-trimethyl-2-pentadecanone (17.2%), eucalyptol (9.53%) and trans-2-hexanal (8.94%) were the major compounds. At highest concentration the DPPH radical scavenging activity of essential oil (EO) was close to vit. C (vit. E > vit. C > EO). Essential oil showed lower reducing power than BHT and BHA. Ferric thiocyanate assays result was following order; BHT ≥ BHA > EO. Essential oil of *P. bingoelianum* reduced HT-29 cell proliferation and induced apoptosis. The inhibition of viability of HT-29 colorectal adenocarcinoma cell line treated with 600 µg/ml EO was 56.7%. IC50 value was determined as 473.2 µg/ml. When HT-29 cells treated with IC50 value of EO, apoptosis rate was higher 4.1 fold than untreated cells (p<0.05) The findings clearly indicate that *P. bingoelianum* has a lot of chemical compounds and present antioxidant, anti-proliferative and apoptotic activities in different experiment systems. Further in vivo explorations are needed to illuminate this plants medicinal usage.

EFFECT OF BRASSINOSTEROID APPLICATIONS ON SOME PLANT PARAMETERS OF JAPANESE MINT (*MENTHA ARVENSIS* L.)

YALÇIN KAYA¹, ŞENGÜL KARAMAN²

ABSTRACT

The Japanese mint (*Mentha arvensis* L.) belonging to the genus *Mentha* of the Lamiaceae family is an important medicinal and aromatic plant. *Mentha*, represented by about 18 species in the world, is spread with 7 species in our country. Menthol in the essential oil obtained from leaves of Japanese mint is economically important. It is produced to obtain menthol for commercial purposes. The aim of the study is to determine the effects of Brassinosteroids, which are defined as the new generation of plant hormones, in the Japanese mint and to obtain yielded plants in terms of desired traits. 24-Epirassinolide (EBL), the active form of brassinosteroids, was used in the study. For this purpose, 5 EBL levels (0, 10⁻⁸, 10⁻⁷, 10⁻⁶ ve 10⁻⁵ M), including the control, were exogenously applied to Japanese mint plants. The study was carried out under the unheated greenhouse condition of Directorate of Atatürk Horticultural Central Research Institute in 2016 according to the completely randomized designs with 4 replications and 10 plants in each replicate. Plant height (cm), wet-dry herb yield (gr/plant), drug leaf yield (gr/plant) and wet-dry root weights (gr / plant) were determined from the harvested plants. There was no significant effect of the applications on the fresh and dry root weights. The highest values were obtained in terms of plant height (cm) from applications of 10⁻⁶ M (59,92 cm) and 10⁻⁷ M (57,45 cm), respectively; (70,86 gr/plant), dry herb (21,79 g/plant) and drug leaf yield (12,34 g/plant) per plant were obtained from 10⁻⁶ M EBL application.

ENCAPSULATION OF BIOACTIVE COMPOUNDS

BÜŞRA ACOĞLU¹, TUĞBA ÖZDAL², PERİHAN YOLCI ÖMEROĞLU¹, CANAN ECE TAMER¹, UTKU ÇOPUR¹

ABSTRACT

Encapsulation is a process in which a substance is coated by a wall material. Even though encapsulation has been known as a recent method, its first application was reported sixty years ago in the area of biotechnology to make production more efficient. Various encapsulation techniques has been applied in food industry including spray drying, spray chilling or spray cooling, extrusion coating, fluidized bed coating, liposome entrapment, inclusion complexation, centrifugal extrusion and rotational suspension separation. Most critical part in encapsulation is the choice of coating material. These materials include proteins, carbohydrates, natural and modified starches, fats, synthetic polymers, gelatin and pectin. Encapsulation enables easy delivery of bioactive materials including antioxidants, minerals, vitamins, and phytosterols. It also increases the stability of bioactive materials during food processing and storage, prevents oxidation, increases bioactivity of bioactive compounds and controls their interactions with food. Encapsulation increases the shelf life, storage capability, nutrient value and digestion of bioactive compounds. Moreover, encapsulation enables efficient utilization of polyphenols by suppressing unpleasant taste of its free compounds and also increases the aroma quality of essential oils extracted from plant materials. This review focuses on new technologies on encapsulation, comparison of advantages and disadvantages of encapsulation methods, the benefits of encapsulation technology in bioactive compound industry and summarizes the recent research studies on encapsulation of bioactive compounds.

THE EFFECT OF GARLIC ON TREATMENT OF VAGINAL CANDIDA

MENEKŞE NAZLI AKER¹, NESLIHAN YILMAZ SEZER¹

ABSTRACT

Candida vaginosis is one of the most common infections of the female genital tract. At least 75% of women live with candida infection at least once in their life. There is a need to use broad spectrum antifungal drugs in the treatment of fungal infections. However, most of the commonly used antifungal drugs have limited use due to toxicity, dangerous drug interactions and side effects such as liver damage and heart failure. In the past decade, a rare antifungal drug resistance has emerged in the past. This situation, necessitated the use of non-drug methods. One of these methods is garlic. This review, aims to reveal the efficacy of garlic in the treatment of vaginal Candida. The results of the studies carried out in this regard, are listed below. Adejare et al. (2012), collected swab samples from patients with vaginal candidiasis. They tested Garcinia kola, garlic (*Alliums sativum*), fluconazole and miconazole on the isolates. The aqueous and alcoholic extracts' minimum inhibitory concentration for *Candida albicans*, were 200 mg/ml. They reported that the garlic used as herbal product has inhibitory effects such as antifungal agents. But this effect, has been achieved in the case of high concentration used. Elsom et al. (2003), used several commercial preparations of garlic, which included oil macerates, pastes, tablets and powders, to examine for their anticandidal activity on *Candida albicans* laboratory strain. Only the garlic tablet formulation exhibited good anticandidal activity, whereas all the other preparations possessed virtually no anticandidal properties. Iwalokun et al. (2004), selected *Candida* species recovered from vaginal swabs, urine, and blood samples for their study. They investigated the antifungal activities of an aqueous garlic extract. Minimum fungicidal concentration was found to be 14.9 at 24 hours. Study, supports the use of garlic in health products. Ekanola et al. (2014), tested eighteen antifungal drugs, crude extracts of garlic and some plants/ chemicals, for in vitro inhibitory potentials on *Candida* strains obtained from human oral, high vaginal and endocervical swabs. Garlic, were inhibitory against 33.3-54.4% of the *Candida* strains. They also reported significant in vitro inhibitory potentials of garlic on drug susceptible and resistant *Candida* species. Kordi et al. (2005), tested garlic extract vaginal douche and clotrimazol vaginal cream on symptomatic women in their randomized, controlled, clinical trial. Women were treated daily for 7 days and assessed 1-2 week after the end of treatment. They reported statistically non-significant difference between clinical results after treatment in both groups. Mycologic results of garlic extract vaginal douche, were good but there was a significant difference between groups. Watson et al. (2013), in their randomised double-blinded controlled study, used oral garlic tablets for vaginal candida during the second half of the menstrual cycle on asymptomatic women colonised with *Candida* species. They gave three garlic tablets or placebo orally, twice daily, for 14 days. As a result there was no difference between the proportion of cases in the garlic and placebo groups, in the mean colony counts in both groups. Farshbaf-Khalili et al. (2016); used garlic, *Zataria multiflora* boiss and clotrimazole vaginal cream on women with candidal vaginitis, in their randomized, double-blinded clinical trial. The patients used creams daily, for 7 days. In culture results, there were not significant differences between

Corresponding Author: **MENEKŞE NAZLI AKER**, menekseaker@gmail.com

¹ANKARA ÜNİVERSİTESİ SAĞLIK BİLİMLERİ FAKÜLTESİ

groups on days 7 and 30 after treatment. The result of the study shows that the mean scores of candidal symptoms, significantly reduced after treatment in all groups on days 7 and 30. The results of these studies show that the garlic is effective on Candida. However, it is recommended to perform randomized controlled trials in which the effect of garlic is assessed for using on patients.

BIOLOGY OF STACHYS KURDICA VAR. KURDICA

A. SELÇUK ERTEKİN¹, FATİH MEHMET KILINÇ², AHMET ONAY¹, REMZİ EKİNCİ¹, MEDET KORKUNÇ¹, ZIYA DUMLUPINAR²

ABSTRACT

Stachys L. (Deliçay) A sub-cosmopolitan broad ciner of the family Ballibagiller (Lamiaceae / Labiatae). It has about 370 species in the world. Stachys is represented in Turkey with 92 species and 116 taxa (subtype and varietal level). Of these taxa, 53 are about 46% endemic. Stachys kurdica Boiss. & Hohen. there is. Kurdica (Kara deliçay) Turkey (Hakkari and Dicle Departments) and in Iraq is a rare plant that grows. There is S. kurdica in this study. The detailed morphological characteristics of kurdica were tried to be determined, the relation between nearby taxa was discussed and the taxonomic condition was observed. Examples of the material of the workshop were collected from the Southeastern Anatolia Region, which was gathered from the land in 2013-2014. In addition, some of the Stachys examples in the G, HAL, JE, K, W, and WU virtual herbariums were exploited. There is S. kurdica. Cystic to basal and glabrous and serrate-crenate, sometimes the entire leaves and verticillas are mostly congested in a terminal head and are distinctly different from other nearby taxa, These morphological features were compared with those of other investigators and the status of the two varieties of S. kurdica grown in Turkey was preserved.

FUNCTIONAL FOOD: DANDELION (*TARAXACUM OFFICINALE L.*)

MURAT KARAAĐAÇ¹, SUZAN YALÇIN¹, S. SONGÜL YALÇIN²

ABSTRACT

Dandelion (*Taraxacum officinale L.*) is a family of Asteraceae. It can be found in many places especially in lawns and on roadsides. Dandelion is also considered to be a weed. However it can be used as a medical herb and food. Leaves, flower and root of dandelion can be used. It contains flavonoids including luteolin, apigenin, isoquercitrin, caffeic acid and chlorogenic acid. It also contains terpenoids, triterpenes and sesquiterpenes. It is a rich source of beta carotene, carotenoids, xanthophylls, chlorophyll, vitamin C, vitamin D, many of the B complex vitamins, choline, iron, magnesium, sodium, zinc, manganese, copper, phosphorus, and potassium. Roots contain torexacin, retinol, levulin and inulin. Due to having bioactive compounds dandelion has properties of antioxidant, anti-inflammatory, anticancer, hypoglycemic and hypolipidemic activities. Dandelion inulin is used as prebiotics in medicine. Dandelion reduced the extent of atherosclerosis by reducing oxidative stress and serum total cholesterol, triglycerides, low density lipoprotein cholesterol and raising serum high density lipoprotein cholesterol. It enhanced effectively delayed the lowering of glucose in the blood and prevented the increase in lactate and triglyceride concentrations. β -sitosterol and stigmasterol in dandelion sterols have been identified as good inflammatory inhibitors. Therefore dandelion (*Taraxacum officinale L.*) is considered as an important functional food due to their bioactive compounds.

ANTIMICROBIAL EFFECTS OF ESSENTIAL OILS EXTRACTED FROM AROMATIC AND MEDICINAL HERBS

ŞHRIBAN UĞUZ¹, SEVAL ANDIÇ¹

ABSTRACT

Essential oils (EOs), called ethereal or volatile oils, are complex mixtures of low molecular weight compounds extracted from plants by steam distillation and extraction with various solvents. Terpenoid hydrocarbons, oxygenated terpenes and sesquiterpenes are the major constituents that provide characteristic aroma and biological properties to EOs. These aromatic oily liquids obtained from plant flowers, buds, seeds, leaves, twigs, bark, herbs, wood, fruits and roots. Even in old times, traditional systems of medicine prescribed EOs for a variety of health problems and used them for the purpose of food preservation, all over the world. Some EOs have antimicrobial properties such as antibacterial, antifungal and antiviral. Besides these properties, EOs or their components also have antimycotic, antitoxigenic, anticancer, antimutagenic, antidiabetic, antiinflammatory, antiprotozoal, antiparasitic and insecticidal effects. These characteristics (the composition of essential oils and their antimicrobial effects) depend on the function of these compounds in plants, plant species and regional conditions. Antimicrobial activity of several spices and essential oils has demonstrated on *Staphylococcus aureus*, *Vibrio parahaemolyticus*, *Salmonella typhimurium*, *Shigella dysenteria*, *Escherichia coli*, *Escherichia coli* O157:H7, *Listeria monocytogenes*, *Bacillus cereus* at levels between 0.2 and 10 µl ml⁻¹. Gram-negative organisms are slightly less susceptible than gram-positive bacteria. Also clove, pimento, cinnamon, thyme, oregano, garlic and onion were particularly inhibitory for some food-spoilage microorganisms.

ANTIMICROBIAL ACTIVITY OF SPRAY DRIED SUMAC EXTRACT POWDER ON ESCHERICHIA COLI O157:H7 AND SALMONELLA TYPHIMURIUM

GÜLŞAH ÇALIŞKAN KOÇ¹, GÜLTEN TIRYAKI GÜNDÜZ¹, SAFIYE NUR DIRİM¹

ABSTRACT

Sumac (*Rhus coriaria* L.) is used in Mediterranean and Middle East regions as a spice, sauce, flavoring agent etc. Several studies demonstrate that sumac berries have the biological activities such as antimicrobial, antioxidant, hypoglycemic and antidiabetic activities due to their flavone, tannin, anthocyanin and organic acid contents. The aims of this study is are; to determine the antimicrobial activity of a spray dried sumac extract powders (SDSEP) on *E. coli* O157:H7 and *S. Typhimurium* in vitro conditions and to determine effect of pH and temperature on the antimicrobial activity of selected SDSEP. For this reason, a pilot scale spray dryer (Mobile Minor Miro-Atomizer, Denmark) was used for the production of the sumac extract powder. The inlet/outlet air temperatures were adjusted to 160/80, 180/90, and 200/100°C where the outlet air temperature was controlled by regulating the feed flow rate. The sumac berries were washed, drained, and ground with a blender and then mixed with water (with ratio of 1:4) for 2 h at room temperature. Then the extract was filtered with crude filter paper to obtain the sumac extract (SE). The total soluble solid content of the SE was measured to be as 3.5% and adjusted to 10, 15, 20, and 25% (w/w) with the addition of maltodextrin (MD) with a Dextrose Equivalence (DE) of 10–12. The atomization pressure and the air flow rate were kept constant as 392 kPa and 1.54 m³/min respectively. The obtained powders were analyzed for moisture content, water activity, pH, minimum bactericidal concentration (MBC), and minimum inhibitory concentration (MIC). In order to determine the effect of pH and temperature on the antimicrobial activity of SDSEP, the sumac extract powder (5%) which was produced at 160/80 °C was selected. The pH value of sumac extract powder (3.1) was adjusted to 6.5 – 6.8 with the addition of NaOH and the inoculated samples were incubated at three different temperatures (4 °C for 7 days, 22 °C for 48 hours, and 37 °C for 24 hours). Increasing the amount of MD and inlet/outlet temperatures showed a significant effect on the moisture content and water activity of the sumac extract powders ($P < 0.05$). The moisture content, water activity and pH values of SDSEP were ranged between 1.89-2.94 % (wet basis, wb), 0.157- 0.215, and 3.13–3.23, respectively. Increasing the amount of MD caused a significant increase in both MBCs and MICs of SDSEP ($P < 0.05$). The inlet/outlet temperatures were not found to be significantly important on the MBCs and MICs of SDSEP ($P > 0.05$). The MBCs and MICs of SDSEP ranged between 25.0 – 50.0 and 6.25 - 25.0 (mg/ml) against the *E. coli* O157:H7 and 12.5 – 50.0 and 3.12-12.5 (mg/ml) against the *S. Typhimurium*. *E. coli* O157:H7 was found to be more resistant compared to *S. Typhimurium*. The increase of pH value of SDSEP resulted in a significant decrease in the antimicrobial activity of SDSEP ($P < 0.05$). Results obtained in this study suggest that the addition of spray dried sumac powder have the potential to improve the safety of foods such as salads and meat products which could be a source of tested pathogens.

INFANTS OF PARENTS OF INFANTS WITH COLIC DISORDER AND THEIR OWN HERBAL PRODUCTS

DOÇ. DR. EMİNE GEÇKİL¹, ARŞ. GÖR. MURADİYE ALDEM¹

ABSTRACT

Colic during babyhood is defined to be the uneasiness and crying jags that last more than three weeks, more than three days a week and more than three hours a day. The studies indicate that the frequency of babyhood colic varies between 5%-25%. Usually, colic tends to start in the second or third weeks after birth, peak in the sixth or eighth weeks and end in the third or fourth months. The crying jags usually start in the afternoon or in the evening and last for several hours with continuous and loud crying. Sometimes babies also cry at night. The baby colic may arise from nutrition mistakes, food allergy, lactose intolerance and gastrointestinal causes including reflux. On the other hand, baby colic may arise from extra intestinal causes including neurodevelopmental or psychological factors. Whatever the cause, baby colic is a condition that causes babies to cry and creates physiological and psychological problems in babies and parents. Parents adopt various methods to silence colicky babies including holding, shaking, car riding, giving a bath, warm and hot applications to stomach, massaging, rhythmic voices or use of the vacuum cleaner voice etc. Other than these methods, parents of colicky babies use various herbal products to reduce the colic of their babies. The herbal products used to reduce the baby colic are generally consumed orally by the baby and the mother. There are also various oils applied on the stomach or perianal area by the parents. Herbal Products Given Orally to Colic Babies It is reported that the herbal teas used for babies relax the bowel smooth muscles and palliate the baby colic (Zengin, Çınar, Altınkaynak 2016). The studies made with fennel, melissa, licorice root, camomile tea and common vervain revealed that these teas were more effective than placebo (Akçam, 2004; Karabayır and Oğuz 2009; Zengin, Çınar, Altınkaynak 2016; Arıkan, Alp, Gözüm, Orbak, Karaca Çiftçi, 2008). Herbal Products Given Orally or Prohibited to the Mother of the Colic Baby Breastfeeding mothers are recommended to consume a diet without egg, hazelnut, peanut, cracked wheat, legume, cabbage, radish and spicy food (Zengin, Çınar, Altınkaynak 2016). Examples of herbal products recommended to mothers include herbs like aniseed and dill which include volatile oils and anethol. Mothers are recommended to use three to four drops three times a day from the mixture of herbal and natural oils such as fennel oil, sunflower oil, sweet almond oil, aniseed oil, sesame oil, cumin and dill. Herbal Products That Are Externally Applied to Colicky Baby Massaging to stomach area with fennel oil was found to be effective in eliminating the gas pains. Giving baby a bath with the water added with lavender or lemon essential oil and massage with catmint tincture are recommended to eliminate the colic (Akçam, 2004).

A RAPID METHOD FOR THE DETERMINATION OF CURCUMIN IN FOOD SAMPLES

MEHMET ÖZTÜRK¹, ERHAN KAPLANER¹, MEHMET HÜSEYİN SİNĞEÇ¹, ADEM TURAN²

ABSTRACT

Curcumin which has a wide area of usage, a yellow colored pigment and the major component of Turmeric plant. Beside of being a strong anticancer agent, it has been reported to possess important biological activities like anti-inflammatory.1,2. It becomes essential to find a rapid method for the determination of curcumin because it has a great importance for human health as well as for the food industry. In this study, curcumin was extracted from turmeric plant via soxhlet with extraction yield of 5.9%. Later we tried to create a metal complex of curcumin to make it easier to analyze curcumin in a food matrix. After selecting appropriate metals to give a stable complex with curcumin, UV spectrums were recorded while metal concentration was kept at 0.1 M with varying curcumin concentrations. According to results, it was observed that Zr²⁺-curcumin complex red-shifted the maximum absorption wavelength. Validation and recovery studies were also performed. The performance of the method was measured for yogurt sample and 97.9% recovery was yielded. EFFECTS OF AROMATHERAPY ON DYSMENORRHEA

NESLİHAN YILMAZ SEZER¹, MENEKŞE NAZLI AKER¹

ABSTRACT

Dysmenorrhea is excessive pain experienced during menstruation. Classically there are two types: primary dysmenorrhea and secondary dysmenorrhea. The main symptom of dysmenorrhea is pain concentrated in the lower abdomen or pelvis. It may radiate to the thighs and lower back. Symptoms often co-occurring with menstrual pain include nausea and vomiting, diarrhea or constipation, headache, disorientation, hypersensitivity to sound, light, smell and touch, fainting and fatigue. Dysmenorrhoea is the most common gynecological complaint that occurs in women and daily life activities, business efficiency. For this reason, treatment is important. Therapy on dysmenorrhea is multifaceted and depends on the severity of the pain and the response the patient gives to the pain. It is possible to use pharmacologic and nonpharmacologic methods in treatment. Non-steroidal anti-inflammatory drugs and hormonal birth control can be used in pharmacologic treatment. In nonpharmacologic methods, local hot application, good nutrition, regular exercise, regular and adequate sleep, acupuncture, acupressure, herbal therapies and aromatherapy can be used. Aromatherapy is the use of high concentrations of essential oils and odors distilled from plants to use their therapeutic properties. Aromatic essential oils are used by way of inhalation, compression, and massage. Studies have shown that aromatherapy is applied more by massage in the treatment of dysmenorrhea. At the same time, there are studies on inhalation. Massage is mostly applied to the lower abdomen and most of the lavender and rose oil are used. Apart from these, essential oils used in massage are cinnamon, clove, rose, and lavender, clary sage, marjoram, ginger, and geranium. Lavender and rose oil alone are used in base oils, while other essential oils are often used as a mixture. The most preferred base oils are sesame and almond oil. In a study with 80 primary dysmenorrhea student, Bakhtshirin et al. (2015) a significant decrease in VAS score after lavender massage was detected in comparison with placebo massage. A randomized controlled trial Shahr et. al. (2015), subjects were randomly divided into three groups: massage group with rose oil, who applied self-massage with Rose damascene; a placebo group who performed self-massage with unscented almond oil and a no treatment control group who applied just self-massage. In the second cycle, the menstrual pain was significantly lower in the rose oil group than in the other two groups after intervention. Hur et. al. (2011) investigated the alleviating effects of aromatherapy massage and acetaminophen on menstrual pain in Korean high school girls. The cases were divided into two groups: the aromatherapy massage group and the acetaminophen group. The abdomen was massaged once using clary sage, marjoram, cinnamon, ginger, and geranium in a base of almond oil. The reduction of menstrual pain was significantly higher in the aromatherapy group than in the acetaminophen group. In the use of aromatherapy by inhalation, rose oil and lavender are found. Uysal et all (2016) evaluate the effects of rose essential oil on primary dysmenorrhea. One hundred patients were randomly divided into two groups; Group D received diclofenac sodium (75 mg/im) and Group A administered diclofenac sodium with aromatherapy (2% rose essential oil). The 30th min mean VAS value in Group D was

Corresponding Author: NESLİHAN YILMAZ SEZER, ylmzneslihan@hotmail.com

¹ANKARA ÜNİVERSİTESİ SAĞLIK BİLİMLERİ FAKÜLTESİ

higher than in Group A. A randomized clinical trial Raisi Dehkordi et.al. (2014) subjects were randomized into two groups: experimental who inhaled lavender based on sesame oil, and placebo who inhaled sesame oil only. The symptoms of dysmenorrhea were significantly lowered in the lavender group compared to the placebo group. Studies have shown that aromatherapy was effective in alleviating dysmenorrhea symptoms. Aromatherapy can be provided as a nonpharmacological pain relief measure and as a part of nursing care given to girls suffering from dysmenorrhea.

PEST SPECIES DETERMINED ON ANATOLIAN SAGE, *SALVIA FRUTICOSA* MILL. (LAMIACEAE)

N. ZÜLAL ELEKÇİOĞLU¹

ABSTRACT

Among the sage species that grow in Turkey, the most commonly collected one which is used both for domestic consumption and exportation is the Anatolian sage, *Salvia fruticosa* Mill, (Lamiaceae), This study was carried out in order to determine the pest species in *S. fruticosa* cultivated in the research and application parcel of Ç.Ü. Karaisalı Vocational School (Karaisalı / Adana), Plant and Animal Production Department in 2015-2016. As a result, pest species belonging to 3 classes (Gastropoda, Insecta, Arachnida), 8 orders and 16 families were determined. It has been determined that species belonging to the family Cicadellidae (Hemiptera) are the most common species and cause staining, curling and deformation by damaging the leaves. Since this situation will lead to loss of yield, and because it is thought that they have adverse effects on the active compounds in the parts used as drugs, it was concluded that they were the important species to focus on.

DETERMINATION OF ANTIPROLIFERATIVE ACTIVITIES OF SATUREJA BOISSIERI EXTRACTS AGAINST PC3 (HUMAN PROSTATE CANCER) CELLS

MUHAMMED ALTUN¹, ALI RIZA TÜFEKÇİ¹, İBRAHİM DEMİRTAŞ¹, LÜTFİ BEHÇET²

ABSTRACT

Cancer is one of the major diseases in today's world. According to the World Health Organization, if no precautions are taken against cancer, 26 million people worldwide will have cancer until 2030. Plants synthesize many primary and secondary metabolites called organic compounds. Primary metabolites take part in important events such as photosynthesis, respiration, growth and development. Secondary metabolites are chemotaxonomically important natural products studied widely in last decades. *Satureja boissieri* Hausskn. ex Boiss. (Lamiaceae) is known as Catli/Kekik in Turkey. The aim of this study is to extract the active components from the of *Satureja boissieri* and to investigate the anticancer effects of these components against PC3 (human prostate cancer cell) cell lines.

SUPERCRTICAL CO₂ EXTRACTION OF CARDAMOM OIL AND DETERMINATION OF VOLATILE COMPOUNDS OF CARDAMOM OIL BY USING GC-MS SYSYTEM

ÜMIT ALTUNTAŞ¹, CEREN DAŞKAYA DIKMEN², EVREN DEMİRCAN¹, KADRIYE NUR KASAPOĞLU¹, BERAAT ÖZÇELİK¹

ABSTRACT

Cardamom is the dried fruit of the tall perennial herbaceous plant, *Elettaria Cardamomum* Maton and it is also known as 'Kakule' in Turkey. It is a member of the ginger family, and features a spicy, refreshing aroma that can be uplifting. The cardamom seeds have a warm, slightly pungent and highly aromatic flavor. Therefore, it is used as a spice in some meat products. In Turkey, consumption of coffee containing cardamom seed is common in southeast regions. The basic cardamom aroma produced by a combination of the major components, 1,8-cineole and α -terpinyl acetate. Cardamom is also popular because of its profound effects on the respiratory system due to its high 1, 8-cineole content, which promotes clear breathing and respiratory health. The chemical composition of cardamom varies considerably with variety, region and age of the product. Cardamom essential oil conventionally produced by steam distillation from the seeds after they have undergone a long drying process to get the best levels of chemical constituents possible. The content of volatile oil in the seeds is strongly depending on storage conditions, but may be as high as 8%. This study was carried out to extract Cardamom volatile oil and determine its volatile compounds by using GC-MS system. Cardamom seeds were extracted with supercritical carbon dioxide extraction method. Then GCMS analysis was performed for determination of volatile compounds of Cardamom oil. According to data obtained from GC-MS, the major volatile compounds of Cardamom oil were 1.8 cineole, sabinene, α -pinene and α -terpynenil-acetate. The volatile oil contains about 1.52% α -thujene, 10.27% α -pinene, 1.65% β -pinene, 18.86% sabinene, 4.22% β -myrcene, 1.11% p-cymene, 46.8% 1,8-cineole, 2.96% linalool, 0.48% terpinen-4-ol, 0.73% α -terpineol, 2.98% linalyl acetate, 7.31% α -terpinenyl acetate, 0.55% trans-sabinene hydrate and 0.63% trans-sabinene hydrate acetate.

RESEARCH ON THE POSSIBILITY OF LAVANDER CULTIVATION IN THE CITY OF DİYARBAKIR

MEDET KORKUNÇ¹, REMZİ EKİNCİ¹, FATİH MEHMET KILINÇ², AHMET ONAY³, ADEM BARDAK²

ABSTRACT

The city of Diyarbakır lies in the Southeast Anatolia region. It is divided into different subclimatic regions by its climate, topographic structure and soil structure. This situation causes differences in flora and fauna structure in the city and helps it to have a richer structure. Lavender, which can grow up within the city border in our city Diyarbakır, is a plant of perfumery, cosmetics and medicine that is cultivated around the world because of its high ratio and high quality evaporating oil. The aim of our research is to identify this endemic plant that exists or can exist in the flora and to put forth the medical and aromatic properties of different kinds of this plant that is grown up. The highly growing interest in lavender farming in recent years increased the importance of scientific research done on advanced cultivation methods of this plant and many improvements have been performed. Especially, in the species that have a problem in replication with seeding, research in micro replications with tissue cultures has gained a lot of value. If the types of dry farming plant lavender, which has adapted extremely well to Diyarbakır region's nonirrigated, arid and inclined fields, producing evaporating oil that can be marketed worldwide can be identified and after that if these identified types' seedlings could be quickly replicated and distributed to producers, lavender will be a huge gain for both Diyarbakır and Turkish economy. In Turkey, lavender cultivation has been done traditionally for 40 years in a few cities to produce evaporating oil. Research since the end of March 2017 has been performed with the aim of bringing forth new types of lavender and lavandin that possesses high flower efficiency and evaporating oil quality for the region and that have high adaptation abilities; researching possibilities of replication with steel in in vivo conditions; realizing numerous healthy seedling production by in vitro micro replication using tissue culture techniques. In the research, 'Raya', 'Munsted', 'Silver' and 'Vera' types belonging to *Lavandula Angustifolia* species are being planned as a material to be replicated with rooting in farm and greenhouse trials. We will be working towards the replication of the seeds of types that will naturally be raised in our city's flora by taking them into culture for intense production and towards the identification of medical and aromatic properties (fenolics and flavonoids), contents of evaporating and nonevaporating fatty acids and terpenoids. In this respect, trial productions of lavender cultivation will be performed. As a result of the aim of this research; since lavender farming is done economically in only a few cities, bringing forth lavender and lavandin types that have high flower efficiency and high evaporating oil quality (having high ratios of acetate and low ratios of camphor) for the region and that have high adaptation ability; identifying these types' farming and technological properties; researching the replication with in vivo steel possibilities of lavender types that has limited or sometimes no production possibility with seeding; and realizing the production of numerous healthy seedlings by in vitro micro replications from ripe lavender plants by making use of tissue culture techniques.

INVESTIGATION OF PREPARING A PROPOLIS CREAM WITH OLIVE OIL

SELAHATTIN SERİN¹, MUSTAFA KEMAL SANGÜN², GÜRAY KILINÇÇEKER¹

ABSTRACT

Propolis is a resinous material collected by honeybees from the flowers and trees [1]. Propolis is characterized by a series of biological properties, such as antibacterial, antiviral, antifungal, anti-inflammatory and antioxidant [1]. The applications are showed that propolis extracts are used to prevent and treat oral inflammations, cold syndrome and dermatological preparations [3]. The chemical composition of propolis is known to be very complex and influenced by the geographic origin [3]. In propolis active compounds are polyphenols, including phenolic acids and flavonoids [2,3]. Raw propolis cannot be used because of its useless materials, therefore it must be purified by solvent extraction to remove that unwanted materials and preserve the active polyphenolic fraction [2,3]. The extraction techniques used for the chemical analysis of raw propolis at room temperature is heat reflux extraction have been widely applied [2,4]. In this study, raw propolis is collected from the beekeeper from Pozantı plateau district. Before extraction raw propolis chunks into smaller pieces and stored in freezer for 1-2 days until it is hard. Then it is grinded to a powder. For the extraction, 5 grams of propolis powder in 100mL ethylalcohol (70%) is subjected 30min ultrasound-assisted extraction. It is filtered and evaporated under vacuum at 50°C. The extract is mixed with olive oil and some additives such as glycerin, thickening agent and emulsifier. The formulation of the cream and analysis detailed for creating a cream mark. THE ETHNOBOTANICAL FEATURES OF STRATONIKEIA ANCIENT CITY PLANTS

YASEMİN AKKAVAK¹, UYGAR SARP KAYA¹, OLCAY DÜŞEN¹

ABSTRACT

In this study, the ethnobotanical properties of plants species distributed in Stratonikeia ancient city and its vicinity (Eskihisar village in Muđla)' between 2010-2012. A total of 318 plant taxon were evaluated their ethnobotanical properties. Two taxon are belongs to Gymnospermae and 316 of them belongs to Angiospermae. 265 species of belongs to Dicotyledonopsida and 51 species of monocotyledonopsida. The ethnobotanical usages of these plants, local names, used parts, etc. were reported. In generally, we observed these plants are used for traditional medicine, food, handicrafts, fuel, beliefs.

DETERMINATION OF PHENOLIC COMPOUNDS IN CHESTNUT POLLEN AND ITS ANTIOXIDANT EFFECT ON DNA OXIDATION SYSTEM

BÜŞRA KARKAR¹, EFTAL ALP DORKEN¹, SALİHA ŞAHİN¹, M.ERTAN GÜNEŞ²

ABSTRACT

Bee-pollen has long been used as a dietary supplement and also as an additive in cosmetics, food and medicine. It is composed of nutritionally essential substances such as carbohydrates, proteins, amino acids, lipids, vitamins, mineral substances and trace elements. Also pollen has been a rich source of flavonoid glycosides, which contains beneficial antioxidant, anti-inflammatory, anti-allergen, antiulcer, antibiotic and anti-carcinogenic properties. Bee pollen is used to cure conditions such as colds, flu, ulcers, premature aging, anemia, colitis, allergic reactions and enteritis. It is also used in the field of cosmetics for its contribution of vitamins to cold creams. Pollen is known to be supportive in the treatment of cancer. Antioxidant compounds can increase product shelf life by retarding the process of lipid peroxidation, which is one of the major reasons for deterioration of foods during processing and storage. Phytochemicals, such as phenolic compounds, are considered beneficial for human health because they decrease the risk of degenerative diseases by reducing oxidative stress and inhibiting macromolecular oxidation such as DNA. They have been shown to possess free radical scavenging and metal chelating activity in addition to their anticarcinogenic properties. The aim of this study was to determine antioxidant phenolic compounds in chestnut pollen and its antioxidant effect on DNA oxidation system. The chestnut pollen was extracted with organic solvent such as ethanol. The phenolic compounds in ethanolic extract of chestnut pollen were determined by high-performance liquid chromatography diode-array detector (HPLC-DAD). Syringic acid, hyperoside, kaempferol, isorhamnetin, pinocembrin, chrysin and galangin were detected in chestnut pollen. And also the antioxidant property of pollen extract was evaluated according to Folin-Ciocalteu and a chromium reducing antioxidant capacity (CHROMAC) methods. The CHROMAC is a novel method as a spectrophotometric total antioxidant capacity assay based on the reaction of excessive Cr(VI) with phenolic compounds and formation of coloured complex with remaining Cr(VI) and diphenylcarbazide as described by our previous study. Antioxidant ability of chestnut pollen was examined to investigate the prevention of oxidation of calf thymus DNA in Fenton reaction medium. It was understood that the chestnut pollen prevented DNA oxidation damage of 10% under oxidative environment. Consequently, the extract of chestnut pollen showed a significant antioxidant activity for the examination of DNA damage prevention.

BLACK TEA WASTE NOT MUCH DIFFERENT FROM BLACK TEA

MURAT KÜÇÜK¹, OZAN EMRE EYUPOĞLU¹, AYÇA AKTAŞ KARAÇELİK², SEMRA ALKAN TÜRKUÇAR¹, UĞUR KARDİL³

ABSTRACT

The black tea is produced from the leaves of *Camelia sinensis* plant. The waste of the production process is discarded without any proper use. Black tea and black tea waste were studied in order to determine similarity or difference both in composition and antioxidant activities. Three widely used spectrophotometric antioxidant assays revealed that black tea waste retains much of the activity of black tea, with 39% of DPPH• scavenging activity, 76% of FRAP activity, and 84% of total phenolics content. On-line RP-HPLC-DAD-FRAP composition and antioxidant analyses showed that black tea waste has very similar compositional and antioxidant profile with black tea, the waste having more than 60% of the components of black tea. The chromatograms illustrate the mainly overlapping peaks in black tea and waste samples, and the FRAP chromatogram was same in the two samples. Inactive caffeine and highly active antioxidant gallic acid were the two major components in both tea and tea waste. Thus, besides its use as a source of caffeine and catechins, black tea waste can well be used for tea preparation, probably in tea bag form or as extract.

PRODUCTION OF FOOD COLORING FROM SAFFRON AND SAFFLOWER

OSMAN SAĞDIÇ¹, YÜKSEL BAYRAM²

ABSTRACT

Color materials are widely used in the food industry because they are a very important feature that determines the preference of food. In recent years, the adverse effects of some synthetic food colors on health have increased and in some countries, the prohibition of these colors has led to an increment in the tendency towards natural resources and studies on the use of the colors obtained from these sources have become increasingly important. In this study, the characteristics of saffron and safflower to be used for natural food dyeing will be emphasized. Saffron (*Crocus sativus*) is an onion culture plant of the family of Iridaceae that grows 20-30 cm in length, with purple flowers opening in the autumn. The flower harvest starts from October to the middle of November. In the world, saffron is mostly grown in Spain, France, Italy and Iran. While the production of saffron in Turkey is only done in Safranbolu province of Karabük until now, trial production has also started in Tokat, Kastamonu, Denizli and Şanlıurfa. Safflower (*Carthamus tinctorius*) is a grassy herbaceous Carthamus family from the Asteraceae family. There are types that are one or two years old. Safflower, which can reach 60 to 70 cm in length, opens yellow, red and orange flowers according to cesidium in July-September. The main land of this plant is Arabia. Safflower, which does not grow all over our country, is usually grown in Trakya, Isparta, Burdur and Eskişehir regions. Saffron traditionally has been used for many years as an alternative to traditional culinary arts because of its positive effects on the health and the kitchen, mostly as a color, aroma and flavoring spice. Therefore, many studies have been carried out on the bioactive properties of this flower. Antioxidant, antitumor, antidepressant, appetite regulator, enhances learning capacity and improves memory. Safflower is a plant with a very important place in the industry. It is preferred as dye material in food, cosmetics and textile products because of the dye giving feature of the flower petals. Safflower can be used for medicinal purposes in the treatment of certain diseases and also as tea. Saffron has important bioactive components. The main ones are; crocin, crocetin, picrocrocin and safranal. Two basic carotenoids, crocin and crocetin are responsible for the color. The dried stalk of *Crocus Sativus* is reddish yellow due to its cross and crossover. Crocin (24-27%) which is very well soluble in water and gives a color that is saffron has a bright yellow color. The taste of saffron comes from the picrocrocin, the second most commonly found ingredient, which makes up about 1% to 13% of the dry matter of the saffron. Picrocrocin is a compound that gives a bitter taste to safran. It adds flavor to food especially when used in meals. Safranal is the essential oil which is mainly responsible for the flavor of the saffron. At the same time more than 160 additional volatile components have been identified. Carotenoid derivatives of saffron, in particular crocin; due to its nutritive properties, it finds wide application in the food, cosmetic and nutraceutical industries. There are two color substances of safflower, safflower yellow (safflomin A, safflomin B) and safflower red (carthamin). The toxicity of synthetic food coloring has been a topic of

controversy in recent times, increasing the need for healthy food stains to be obtained from natural sources. Because of this, it is very important to use coloring materials which can be extracted from such flowers, which have been used as spices for many years and which have positive health effects on their content, as natural food dyes.

THE NUTRIENTS OF FORMULA MILK IN TERMS OF MEETING THE NEEDS OF AN INDIVIDUAL

KENAN SINAN DAYISOYLU¹, BETÜL DEMİR², BETÜL KAHVECİ¹, MOHAMMED ZAKİR İBRAHİM¹

ABSTRACT

Kenan Sinan DAYISOYLU, Betül DEMİR, Betül KAHVECİ, Mohammed Zakir İBRAHİM Kahramanmaraş Sütçüimam University, Faculty of Engineering and Architecture, Department of Food Engineering, Avşar Campus, 46100, Kahramanmaraş, Turkey E-mail: kesiday@ksu.edu.tr Adequate and balanced nutrition is one of the most important determinant of human health, growth and development, more especially in babies. Cow milk is not recommended for newborn infant who cannot breastfeed because it causes iron deficiency in some of the newborn babies. In this period, some standardized dairy products are recommended and preferred as an alternative to breast milk such as; baby milk, baby formula, the bottle milk, formula milk, newborn milk e.t.c. In Turkey, the specifications of these products, which are regarded as approximate formulas for mother's milk, are determined and issued to the markets with the permission of the Ministry of Food Agriculture and Livestock. In this study, the contents of breast milk and formula milk were compared and it also includes the daily energy and nutritional requirement needs of baby's between 0-6 up to 07-12 month. In this study, the contents of breast milk and formula milk were compared and it also includes the daily energy and nutritional requirement needs of baby's between 0-6 up to 07-12 month. Furthermore, vitamin and mineral contents of cow milk and soya protein isolates, which are used in single and mixed form, have also been studied as based on 100 kcal. In addition, according to the written legal limits, the use of newborn milk in feeding 0-6 and 7-12 month infants is been researched. More especially, the situation and the meeting rates of baby needs is been investigated. It has been determined that the formula milk produced according to the reference value given in the Communiqué does not adequately meet the needs of vitamin A, D, E, Niacin, Folate, Choline, Iodine, Magnesium, Copper and Selenium requirements in the 0-6 month period. It has been found that the formula milk produced according to the base reference value compared to the reference values given in the Communiqué does not adequately meet the needs of protein, vitamins A, D, E, Niacin, B6, Folate, Choline, Phosphorus, Iron, Iodine, Magnesium, Manganese and Selenium in 7-12 month period. The formula milk produced according to the ceiling reference values found in the Communiqué is found to meet all the needs in 0-6 month period and failed to meet the adequate iron needed during the 7-12 month period.

SIMULTANEOUS DETERMINATION OF GALLIC ACID AND RUTIN IN DIETARY TEA PRODUCTS USING RP-HPLC/DAD DETECTION

HALE SEÇİLMİŞ CANBAY¹, MAHMUT DOĞANTÜRK²

ABSTRACT

U.S. Food and Drug Administration (FDA) arranges dietary supplement products and dietary ingredients. In 1994, The US congress changed the Federal Food Drug and Cosmetic Act [1]. Under the Dietary Supplement Health and Education Act of 1994: Botanical products (Herbals), complementary nutritionals (amino acids, protein – rich foods, etc) and micronutrients (vitamins, microminerals) are all considered to be dietary supplements [2]. Dietary products are used up to extend our diet with needed micronutrients, herbs, protein and amino acid for ideal body function [3,4]. Different types of tea, pills and other similar products are sold to people over the internet for diet products. Diet products can be reached very easily. High Performance Liquid Chromatography (HPLC) system was applied to phenolic concentrations in ten dietary tea product samples in Turkey. The gallic acid and rutin compounds of dietary tea samples were determined using methanol extraction. The analytical HPLC system employed consisted of a Shimadzu Prominence high performance liquid chromatograph coupled with a 20A CBM (HPLC System Controller), a diode array detector (SPD-M20A, Tokyo, Japan), a SIL 20ACHT automatic sampler, a CTO-10ASVp column oven and a LC20 AT pump. The analytical data were evaluated using a LC Solution data processing system. The separation was achieved on a Agilent ZORBAX Eclipse Plus C18, 4.6 × 250 mm, 5 µm column (Milford, MA, USA) at 25°C. The mobile phase consisted of water with 3% glacial acetic acid (A) vs (B) methanol. The elution gradient applied at a flow rate of 0.8 mL/min was: 95% A/5% B for 3 min, 80%A/20%B in 15 min and isocratic for 2 min, 60%A/40%B in 10 min, 50%A/50%B in 10 min, 100%B in 10 min until the end of the run. Samples were dissolved in methanol, and 100 µL of this solution was injected into the column. The monitoring wavelength was 280 nm and 360 for the phenolic acids. The identification of each target compound was based on a combination of retention time and spectral matching [5]. Table 1. Retention time (Rt), wavelength (λnm), correlation coefficients (r²), limits of detection (LOD, s/n=3.3), average recovery (RSD, %) as determined for the gallic acid and rutin Compounds Rt (min) (HPLC-DAD) λnm r² LOD (µg/g) R % Gallic acid 7.8 280 0.999 0.010 91.43 (1.03) Rutin 45.6 360 0.999 0.050 95.21 (1.11) When applied to dietary tea products the proposed method showed good results. The calibration curves for all the species studied showed good linear correlation coefficients (r² ≥ 0.999), independent of the method used for sample preparation (Table 1). The quantitation limit ranged 0.010 to 0.050 µg/g in dietary tea products (Table 1).

DETERMINATION OF ANTIFUNGAL ACTIVITIES OF PSATHYRELLA CONDOLLEANA AND PSATHYRELLA SPADICEOGRISEA MACROFUNGUS CULTURES

HEMEN GÜL ERASLAN¹, DICLE ERDOĐDU¹, PERİHAN GÜLER¹

ABSTRACT

In this study, the antifungal potentials of the misella obtained from two Psathyrella (P.condolleana and P.spadiceogrisea) collected from Kırıkkale province were investigated. Ethanol and methanol extracts were prepared by taking samples from the liquid medium for determination of antifungal activity and were absorbed by discoid diffusion method and tested against two Fusarium (F.oxysporium and F. proliferactum) products. As a result of the study, P.spadiceogrisea-methanol extract was found to be most effective against F.oxysporium strain in the macrofungus species used.

COMPARISON OF IN VITRO ANTIOXIDANT ACTIVITIES OF DIFFERENT EXTRACTS FROM CENTAUREA VIRGATA LAM.

TOLGACAN AYDEMİR¹, ALI ŐEN¹, LEYLA BİTİŐ¹

ABSTRACT

The genus *Centaurea* belonging to the Asteraceae family comprises about 700 species predominantly found in the Asia, North Africa, America and Europe. This genus is represented by 34 sections and 226 species with an endemism rate of 66 % in Turkey. In traditional medicine, they are used for fever, menstrual disorders, vaginal candidiasis, the treatment of liver, kidney and ulcer diseases, as anti-diarrheal, stomachic, tonic, appetitive, anti-diabetic, antipyretic, also as a diuretic and expectorant. *Centaurea* species are characterized by the presence of acetylenes, lignans, flavonoids, and sesquiterpene lactones as main secondary metabolites. In this study, it is aimed to investigate antioxidant activities of hexane (CVH), chloroform (CVC), ethyl acetate (CVEA), aqueous ethanol (CVSE) fractions of ethanol extract and ethanol extract (CVE) obtained from the aerial parts of *Centaurea virgata*. The antioxidant activity of the extracts was tested by DPPH and ABTS methods and the results were expressed as IC₅₀ values (50% inhibitory concentration). The total phenolic content was determined by Folin-Ciocalteu method and the results were expressed as mg of gallic acid equivalent per g dry extract. CVEA extract had the highest DPPH radical scavenging activity with a IC₅₀ value of 138.7 µg / mL followed by CVE (200,3 µg/mL), CVC (293,2 µg/mL), CVSE (610,3 µg/mL) and CVH (824,8 µg/mL) extracts, respectively. CVEA extract had the highest ABTS radical scavenging activity with a IC₅₀ value of 72,89 µg / mL followed by CVC (234,6 µg/mL), CVE (240,5 µg/mL), CVSE (288,8 µg/mL) and CVH (487,4 µg/mL) extracts, respectively. When the total phenol contents of the extracts are compared, The highest amount of phenolic content was found in CVEA extract (51,3 mg/g). These results show that phenolic compounds may be responsible for the activity of the CVEA extract with high antioxidant activity.

MICROENCAPSULATION AND ITS APPLICATIONS IN ESSENTIAL OIL TECHNOLOGY

BANU KOÇ¹

ABSTRACT

Essential oils obtained from plants are complex mixtures of natural volatile compounds. They give plants their characteristic odors and are a common source of bioactive ingredients. Essential oils, and their components, are gaining increasing interest in the food, agriculture, pesticide, textile, cosmetic, and pharmaceutical industries because of their natural and safe status, wide acceptance by consumers, and multidimensional functional properties. Furthermore, essential oils could be considered suitable substitutions to chemical additives for use in the food industry. However, essential oils are unstable and susceptible to degradation in the presence of oxygen, light and temperature. So many attempts have been made to preserve essential oils through microencapsulation technology. Microencapsulation is an effective and important tool to prepare oil-based high-quality and health-beneficial products in various industries to enhance their chemical, oxidative, and thermal stability. The success of this technology is due to the correct choice of the wall material, the core release form and the microencapsulation method. Emulsification, spray-drying, electrospray system, freeze-drying, coacervation, and fluidized-bed-coating are the most commonly used techniques for the microencapsulation of essential oils. The choice of an appropriate microencapsulation technique and wall material depends upon the end use of the product and the processing conditions involved. In this study, some relevant microencapsulation aspects, such as the capsule, wall material, microencapsulation methods and their use in essential oil technology will be discussed.

AN EDIBLE WILD AND MEDICINAL MUSHROOM OF GİRESUN PROVINCE: POPLAR MUSHROOM (PLEUROTUS OSTREATUS)

SANEM BULAM¹

ABSTRACT

The edible wild mushrooms have been used as food and food-flavouring materials in soups and sauces for centuries, due to their unique and subtle taste and flavor. The edible mushrooms are also important sources of bioactive molecules and produce a wide range of secondary metabolites with high therapeutic agents. The climate and vegetation are suitable for edible wild mushroom growing especially in Eastern Black Sea Region of Turkey. In Şebinkarahisar district of Giresun province, *Pleurotus ostreatus* (Jacq. ex Fr.) P. Kumm. (Oyster Mushroom, locally named Poplar Mushroom) which is one of the edible wild and also internationally medicinal mushrooms naturally grows on the rotten roots of cut poplar trees. The Poplar Mushroom has a large, oyster-like head section, with an average diameter of 5 to 25 cm, with natural samples ranging in color from white to gray or tan to dark-brown. They are collected and sold in the local markets by the local people between mid September and mid December depending on the climate conditions. *Pleurotus ostreatus* species is consumed as food by frying in vegetable oil or sauteing with the tomatoes and onions when it is fresh or after freezing in the winter. In the previous studies for *Pleurotus ostreatus* moisture 85-87%; in 100 g dried mushroom proteins 17-42 g, lipids 0.5-5.0 g, carbohydrates 37-48 g, celluloses 11.6 g, hemicelluloses 27.8 g, fibers 24-31 g, ash 6.1 g, minerals 4-10 g and total essential amino acids 126.7 g (excluding arginine and histidine) have been reported. Besides, the studies have previously documented that *Pleurotus ostreatus* plays an important role in the treatment of many diseases due to its anti-inflammatory, antibiotic, antiviral, antitumor, antibacterial, antidiabetic, antihypercholesterolic, antiarthritic, antioxidant, anticancer and immunomodulatory activities. Because it has a large amount of medicinal compounds like water soluble protein or polysaccharides, β -D glucan, glycopeptides, lovastatin and lectin. In this review, *Pleurotus ostreatus* mushroom species of Giresun province and its nutritional and therapeutic characteristics will be discussed.

MEDICINAL MUSHROOMS AND THEIR PHARMACOLOGICAL EFFECTS ON HEALTH

SANEM BULAM¹

ABSTRACT

The edible wild mushrooms are consumed worldwide not only for their texture and flavor but also for their chemical and nutritional characteristics. They have higher protein, crude fiber, vitamin, mineral contents and contain less fat and energy. Furthermore, some mushrooms that are popular in Asian countries like China, Japan and South Korea may also have a medicinal value. These mushrooms are not only sources of nutrients but have also been reported as therapeutic foods which are useful in preventing diseases such as hypertension, diabetes, hypercholesterolemia and cancer. Their specific antitumor, antiviral, antithrombotic, antiallergic, immunomodulating, hypolipidemic, hypoglycemic, hypotensive and anti-inflammatory effects have previously been reported. These functional characteristics are mainly due to the presence of bioactive molecules such as dietary fiber and in particular cellulose, chitin, beta glucans, phenolic compounds, lentinan, lovastatin, ergosterol etc. The most popular medicinal species are *Agaricus blazei* (Brazilian Agaricus), *Auricularia auricula* (Wood Ear), *Cordyceps sinensis* (Caterpillar Mushroom), *Coriolus versicolor* (Turkey Tail), *Flammulina velutipes* (Enokitake), *Ganoderma lucidum* (Reishi), *Grifola frondosa* (Maitake), *Hericium erinaceus* (Lion's Mane), *Inonotus obliquus* (Chaga), *Lentinula edodes* (Shiitake), *Pleurotus ostreatus* (Oyster), *Polyporus umbellatus* (Zhu-ling), *Poria cocos* (Fu-ling), *Schizophyllum commune* (Split Gill) and *Tremella fuciformis* (White Wood Ear). The medicinal mushroom originated products are available as nutraceuticals and dietary supplements such as mushroom mycelium powder grown on grain and soybeans, powdered extracts in capsules or tablets and ethanolic extracts with or without glycerin. In the last few decades the medicinal mushrooms are increasingly started to be consumed in the Western countries among vegetarians and vegans. In this review, the most common medicinal mushrooms from Far East to Western countries and their pharmacological potential will be investigated.

INVESTIGATION OF ENZYME ACTIVITY OF GARDENIN B AND CYNARININ A.

HÜSEYİN AKŞİT¹, MAHFUZ ELMATAŞ¹, ŞEVKİ ADEM², ÇAĞLAR GÜLER², NACIYE KAYHAN³, EMRAH YERLİKAYA³

ABSTRACT

Natural products have various biological activities. The secondary metabolites isolated from natural sources are used for drug discovery. Naturally occurring terpenes and flavon derivatives has a great interest among scientist due to having broad spectrum biological activities. Many drugs act as inhibitor or activator on some specific enzymes by binding to active site of enzyme. In this study; Inhibitory effects of secondary metabolites isolated from different sources were tested on carbonic anhydrase IX and chicken liver aldose reductase enzymes. CA IX is a novel target enzyme for cancer treatment [1]. Aldose reductase inhibitors uses as drug to treatment such as neuropathy, nephropathy, retinopathy, cataract and cardiovascular diseases emerging with diabetes [2]. The inhibitory effects of Gardenin B and Cynarinin A isolated different plant sources against two selected enzymes were evaluated spectrophotometric method. Cynarinin A is a guaiane-type sesquiterpene lactone and found in Cynara family [3]. Isolation and characterization Cynarinin A from Centaurea polypodiifolia were previously reported by our group [4]. Gardenin B (5-hydroxy-6,7,8,4'-tetramethoxy flavone), a polymethoxylated flavone, was isolated from *Mentha x dumetorum* for the first time and characterized by spectroscopic techniques including NMR and MS and by comprising literature data [5]. The obtained spectroscopic data as follows: m/z [M+H]⁺ 359.1170, λ_{max} 331, 284 nm, ¹H NMR (400 MHz, CDCl₃) δ 12.60 (s, 1H, 5-OH), 7.92 (d, J = 9.0 Hz, 2H, H2' and H6'), 7.06 (d, J = 9.0 Hz, 2H, H3' and H5'), 6.63 (s, 1H, H3), 4.13 (s, 3H, -OMe), 4.00 (s, 3H, -OMe), 3.97 (s, 3H, -OMe), 3.92 (s, 3H, -OMe). ¹³C NMR (100 MHz, CDCl₃) δ 183.04 (C4), 164.09 (C2), 162.79 (C4'), 152.97 (C5), 149.53 (C9), 145.80 (C7), 136.55 (C6), 133.00 (C8), 128.11 (C2' and C6'), 123.50 (C1'), 114.63 (C3' and C5'), 107.00 (C10), 103.77 (C3), 62.15 (-OMe), 61.72 (-OMe), 61.14 (-OMe), 55.56 (-OMe) with fully agreement literature. Chicken liver aldose reductase enzyme was inhibited by Gardenin B and cynarinin A with IC₅₀ values 53 and 231 μ M, respectively. Gardenin B and cynarinin A exhibited inhibitory effect against human recombinant CA IX with IC₅₀ values 86 and 346 μ M, respectively. 1. THE MEDICINAL PLANTS SOLD IN HERBAL MARKETS IN DENİZLİ

MEHMET ÇİÇEK¹, OKAN ÇON¹

ABSTRACT

In this study, it was aimed to determine the plant species sold in herbal markets in Denizli and used by the public for medical purposes. Within the scope of the study, 8 herbal markets in the province center were visited, and information about the medicinal plants sold and the purposes they were used by the public were obtained. In negotiations with herbal markets in Denizli, it is recorded that the local names of the plants sold for medical purposes and which parts are used. Photographs of the related parts of the plants were taken. The Latin names of well-known species have been determined, and some of them have been sampled from their existing parts for later identification. Some were left at the genus level. In addition, information has been obtained about which diseases the medicinal products were used for medical purposes or for which purposes they were selected for treatment. A list has been prepared in line with the information obtained. This list includes information on Latin names, local names, used parts and what they are used for. As a result of the study, a total of 86 plant species belonging to 44 families and 80 genera were determined to be sold as the medicinal plant in the herbal markets in Denizli. Of these species, 71 naturally grow in Turkey. These species are collected from their natural habitat or cultivated. The 15 species are alien species and cultivated in Turkey. The great majority of the species belong to the families Lamiaceae (14 species), Asteraceae (11 species), Apiaceae (6 species) and Rosaceae (5 species), respectively.

THE ANALYSIS OF MEDICINAL AND AROMATIC PLANTS IN SOCIAL AND SCIENTIFIC CONTEXT

FEVZİ ŞİRİN¹, MUSTAFA KAYA², HASAN HÜSEYİN ÇİFTÇİ², TEVFIK TAYLAN ATALAY²

ABSTRACT

THE ANALYSIS OF MEDICINAL AND AROMATIC PLANTS IN SOCIAL AND SCIENTIFIC CONTEXT ABSTRACT WHO ARE WE AND WHAT OUR AIM IS The Association of Porsuk River Philosophers (APRP) was established in 2014. The aim of establishment is to contribute human to the awareness of the need for philosophic knowledge in personel and public domain. The Association has been keeping holistic researches on the base of the seven classic disciplines; Ethic, Knowledge, Science, Religion, Aesthetic, Politics, Ontology. Under the scientific discipline, with the slogan of "Returning To The Natural Life", the APRP began natural agricultural activities in the two deceres field. Primarily, in the light of natural farming principles in order to produce Vermicompost, Medicinal and Aromatic Plants. On the other hand, due to the protocol between Eskişehir Tepebaşı Municipality and APRP, some demonstrations were made in the garden of Esentepe Children's and Art Center, local seed production and distribution have been achieved. Throughout history, human beings have known to use the wild plants to heal the health issues. In our age, the methods of treatment under the name of "Alternative Medicine" has been applying by referring the science as a guide. Approximately, the 80% of the materials used in the manufacture of medicines that modern medicine requires of medicinal and aromatic plants origin. Apart their use as medicines; the medical and aromatic plants have contribution in foods, cleaning products, tooth paste and gums, herbal teas and cosmetics. With these developments, the trade of the Medicinal and Aromatic Plants all over the world have shown a great increase in the last 30 years. For many years, the herbal products that are required of trade are collected from nature, but this stituation has severely damaged on the endemics (flora and fauna). Many medicinal and aromatic plants have faced the danger of extinction. Also unconsciously harvesting plant have caused the invasion of dominant and recessive plants to each other's habitat. Briefly, these reasons above mentioned necessiated producing the Medicinal and Aromatic Plants by human, cultivation, increasing yield which were cultivated, extention of planting areas. Both Research Institutes and Universities in our country, have proper scientific researchs. It has been pleased to see that Minister of Food, Agriculture and Livestock have increased the project and support of Medicinal and Aromatic Plants in recent years. It is needed to make natural agricultural applications by volunteer organisations, such as APRP, with regard to social benefit, "for making the society conscious" when there is lack of public services. These kind of activities will be tried to reach to the cultivators who have interests. It should be the responsibility of non-governmental organisations to disseminate such activities and to transmit them to growers. In this context, APRP planted Menta (*Menthapiperata* L.) 50 m²; Sage (*Salvia officinalis*) 50 m²; (*Salvia Triloba*) 50 m²; Origano (*Origanum vulgare*) 50 m², (*Origanum onites*) 50 m², Rosemary (*Rosmarinus spicata*) 50 m² in the Sakintepe Campus, in the May of 2016. Another work has been realised in September of 2016 by buying 20 kg saffron (*Crocus sativus*) from the Geçit Kuşağı

ASPIR CULTIVATION IN DIYARBAKIR

MEDET KORKUNÇ¹, HANGÜL ÖZBEY¹, SERAP ERKUŞ², FATİH MEHMET KILINÇ³

ABSTRACT

Aspir (*Carthamus tinctorius* L.) is undoubtedly the world's most popular and sought after medicinal and aromatic plant with all its varieties and uses. While all medicinal and aromatic plants are examined, visual beauty of aspirin, calming, softening properties, nostalgic and distinctive smell and magnificent landscape image reveals. Aspir is 50-100 cm length and flowers cream, white, yellow, orange. These flowers can also be used in the art of dyeing rope and cloth for centuries in the city. The aspiration plant is a one-year long-day oil plant with a pile root system that can go up to a depth of about 2.5-3.0 m and can grow in average between 110-140 days. Oilseed plants have a strategic prescription for human and animal nutrition due to oil, protein, carbohydrates, minerals and vitamins. Adding Aspir oil to the greasy dishes, which have an important place in Diyarbakır's culinary culture, will enrich this culture even more. The most important advantage of aspir compare to wheat and barley agriculture is that wheat and barley agriculture can be used in the agriculture of all the tools and equipment used from the preparation of soil to the storage of the product. In addition, drought tolerance increases the importance of Aspir cultivation in our province. The high yield obtained in the trial result made in Çınar District of our province last year has been effective in starting this work. This will also help to develop the medical and aromatic plant-related industry, which will create alternative sources of income that will bring innovation to the region. As a result of this work, facilities to be established for the processing of medical and aromatic plants will contribute to the economy of our province and country, and also increase the income level of our farmers, especially women. Since the areas where the aspir farming will be done will become a visual feast, it will be seen that it will be a stopping place for photographers as well as eco-tourism.

ETHNOBOTANY OF THE GENUS SCUTELLARIA L. (LAMIACEAE) IN TURKEY

MEHMET ÇİÇEK¹

ABSTRACT

Scutellaria L., with about 360 species, is a subcosmopolitan genus of the family Lamiaceae. Most of its species occur in the tropics, and in Southern Hemisphere they are present mainly in the temperate mountains. The species of the genus Scutellaria are annual or perennial herbs or rarely subshrub plants. Its stems are four-angled and its leaves are opposite. The genus is most easily recognized by the shield on the calyx. As ethnobotanically, it is reported that the young leaves of *S. indica* and *S. baicalensis* from the Asian species of the genus are cooked as vegetable and the whole plant of *S. baicalensis* is used as a tea substitute (Tanaka, 1976). In addition, there is usage of *S. laterifolia* (American skullcap) against neurological disorders such as epilepsy, convulsion, hysteria, and insomnia in the New World (Millspaugh, 1974). The dried roots of *S. baicalensis* (Baikal skullcap), have been used in memory enhancing in Chinese traditional medicine (Adams et al., 2007). The genus Scutellaria consists of 39 taxa, 16 of which are endemic (41%) in Turkey. The Scutellaria species are known as “kaside” in Turkish. Little is known on the usage of Scutellaria in Turkish folk medicine. Infusion of its dried leaves is used as soothing, hemostatic and wound healing agent and also as a tonic by people in some parts of Eastern Anatolia (Özçelik, Ay and Öztürk, 1990). *S. orientalis* was reported to be used externally and internally for constipation, hemostatic, tonic, and wound healing purposes in Anatolian folk medicine (Baytop, 1999). According to the ethnobotanical studies conducted in Eastern Anatolia in the recent years, there are data about the usages as wound healing for *S. orientalis* subsp. *bicolor*, in the remedy of cancer and hemorrhoids for *S. orientalis* subsp. *pichleri* and *S. orientalis* subsp. *virens* (Mükemre et al., 2015), and as astringent for *S. orientalis* subsp. *bicolor* and *S. orientalis pichleri* (Çakılcıođlu and Türkođlu, 2010). No data found about its selling in herbal markets in Turkey.

INVESTIGATION OF IN VITRO CYTOTOXIC ACTIVITY OF LIQUIDAMBAR ORIENTALIS MILL. METHANOL AND CHLOROFORM FRACTIONS AGAINST HT-29 AND HCT-116 CELL LINES

SÜMEYRA ÇETINKAYA¹, İLKNUR ÇINAR¹, İPEK SÜNTAR², H.GÜL DURSUN¹

ABSTRACT

Liquidambar orientalis Mill. is a herbaceous plant which has medicinal and cosmetic properties in the family of Hamamelidaceae (Li vd. 1997). In the Mediterranean region, it is widely used in phytotherapy for diseases or health problems. General area of usage are burn, wounds and cuts (Fakir vd. 2009) In addition, ulcer, stomach ache, mouth diseases and antiseptic use are available (Everest ve Öztürk 2005). The goal of this work is to investigate the cytotoxic effects of Liquidambar orientalis Mill methanol and chloroform fractions in HT-29 and HCT-116 (human colon carcinoma) cell lines. The cytotoxicity of fractions was determined using XTT ((2,3-Bis-(2-Methoxy-4-Nitro-5-Sulfophenyl)-2H-Tetrazolium-5-Carboxanilide)) assay. The HT-29 and HCT-116 cells were used to determine cytotoxicity and chloroform and methanol fractions were investigated. As a result; IC50 values of the chloroform fraction ranged from 25 to 50 µg / ml in HT-29 cells and 50 to 200 µg / ml in HCT-116 cells after treatment at different doses for 24 hours, 48 hours and 72 hours, And 250 to 500 µg / ml in both HT-29 and HCT-116 cells after being treated at different doses for 24h, 48h and 72h, respectively. According to this chlorofom fraction of Liquidambar orientalis showed strongest cytotoxic effect while methanol fraction exhibited moderate cytotoxic effect. Further investigation is still needed to understand their mechanisms of action and usage as antitumour agents. ANTIMICROBIAL ACTIVITY OF *CENTAUREA URVILLEI* DC. SUBSP. *ARMATA* WAGENITZ

ALİ ŐEN¹, MAYRAM TÜYSÜZ², SEHER BIRTEKSÖZ TAN², ŐÜKRAN KÜLTÜR³, LEYLA BİTİŐ¹

ABSTRACT

In this study, we reported, for the first time to our knowledge, antimicrobial activities of hexane (CUH), chloroform (CUC), ethyl acetate (CUEA), aqueous ethanol (CUSE) fractions of ethanol extract and ethanol extract (CUE) obtained from the whole plant of *Centaurea urvillei* subsp. *armata*. Antimicrobial activity against *Staphylococcus aureus* ATCC 29213, *Staphylococcus epidermidis* ATCC 12228, *Escherichia coli* ATCC 25922, *Enterococcus faecalis* ATCC 29212, *Klebsiella pneumoniae* ATCC 4352, *Pseudomonas aeruginosa* ATCC 27853, *Proteus mirabilis* ATCC 14153, *Candida albicans* ATCC 10231, *Candida tropicalis* ATCC 750 and *Candida parapsilosis* ATCC 22019 were determined by the microbroth dilutions technique using the Clinical Laboratory Standards Institute (CLSI) recommendations. CUC, CUE and CUH extracts showed moderate antifungal activity against *Candida albicans* with MIC values of 312, 625 and 625 µg/mL, respectively. All extracts exhibited moderate antimicrobial activity against *Candida parapsilosis* (MIC: 312-625 µg/mL). CUH extract showed a strong antimicrobial effect against *Candida tropicalis* with a MIC value of 39 µg/mL, while CUE and CUC extracts had moderate activity with MIC values of 312 µg / mL. The CUC extract showed moderate antibacterial activity against *Staphylococcus aureus*, *Staphylococcus epidermidis* and *Escherichia coli* with MIC values of 625 µg / mL. The CUE extract exhibited poor antibacterial activity against *Staphylococcus aureus* with a MIC value of 1250 µg/mL. These results indicate that the extracts are particularly active against *Candida* species. Also, CUH extract which has a very strong activity against *Candida tropicalis* is good candidate for further bioactivity-guided fractionation in the search for new active antifungal compounds.

ANTIPROLIFERATIVE AND RADICAL SCAVENGING EFFECTS OF SOME NATURAL PHENOLIC COMPOUNDS

FEYZA OKE-ALTUNTAS¹, AYSE ŞAHİN YAĞLIOĞLU², İBRAHİM DEMİRTAŞ²

ABSTRACT

Phenolic compounds, commonly known as polyphenols, are present in plants and classified as simple phenolic acids (hydroxybenzoic and hydroxycinnamic acids) and flavonoids. They affect sensory properties of foods, such as flavor, astringency, aroma, and color. Research on phenolic compounds is carried out because of their biological and pharmacological properties. The aim of the study was to investigate the antiproliferative and radical scavenging effects of some plant origin phenolic compounds. The radical scavenging effects of these compounds were studied by DPPH assay. DPPH scavenging activity of the tested compounds decreased in the order of gallic acid > chlorogenic acid > apigenin-7-glucoside > hesperidin > 4-hydroxybenzoic acid. Also, in this study, 4-hydroxybenzoic acid (4-HBA), gallic acid (GA), and apigenin-7-glucoside (A-7-G) were investigated for their antiproliferative activities on human cervical adenocarcinoma (HeLa) cell line at the concentrations of 5–100 µg/mL by using BrdU ELISA assay during 24 h of incubation. GA exhibited the highest activity against HeLa cells (IC₅₀ < 5 µg/mL). The potency of inhibitions (at 100 µg/mL) against HeLa cells were found as GA > A-7-G > 4-HBA. Our results showed that gallic acid exhibited highest radical scavenging and antiproliferative effect.

ANTIOXIDANT AND ANTICHOLINESTERASE ACTIVITIES OF THE ETHANOL EXTRACTS FROM VARIOUS PARTS OF IN VIVO AND IN VITRO GROWN PISTACIA LENTISCUS L.

ENGİN TILKAT¹, HİLAL SARUHAN FİDAN², ABDULSELAM ERTAŞ², MUSTAFA ABDULLAH YILMAZ², GURBET BAĞLAMİŞ², VEYSEL SÜZERER³, FATİH MEHMET KILINÇ⁴, AHMET ONAY²

ABSTRACT

In the present study, anticholinesterase and antioxidant activities of the ethanol extracts from different parts of in vivo and in vitro raised *Pistacia lentiscus* were studied. The DPPH free radical scavenging activity and cupric reducing antioxidant capacity (CUPRAC) methods was used to determine antioxidant activity. A spectrophotometric method developed by Ellman, Courtney, Andres and Featherstone was used to determine the acetyl- and butyryl-cholinesterase inhibitory activities. In terms of DPPH free radical scavenging activity, 6 samples prepared from root, stem and leaf parts of the female and male genotypes and 3 in vitro samples were found to have a very high antioxidant potential. It has been determined that samples prepared from stem parts of both female and male genotypes have higher activities than other parts. In vivo samples were more active than in vitro samples in both male and female genotypes. The CUPRAC activities of in vivo samples were higher from the standarts BHT and α -TOC. Absorption values in 100 μ g/ml concentration for female leaf, stem, root, male leaf, stem, root, BHT and α -TOC were determined as 3.06, 3.81, 3.31, 2.65, 3.80, 3.46, 3.18 and 1.69 respectively. There is a decrease in the activity of in vitro samples in the CUPRAC activity. Also, in vivo samples of female and male genotypes were found to have a high anticholinesterase enzyme activity. Among the ethanol extracts, the extracts from the stem part of male genotype have the highest activity against both acetylcholinesterase and butyrylcholinesterase enzymes. This study indicated that the ethanol extracts of the stem parts of both lentisk genotypes may be a new potential resource of natural antioxidant and anticholinesterase compounds.

EXAMINATION OF ANTIMICROBIAL ACTIVITY OF PULICARIA DYSENTERICA (L.) BERNH

ALI ŞEN¹, MAYRAM TÜYSÜZ², SEHER BIRTEKSÖZ TAN², AHMET DOĞAN³, LEYLA BİTİŞ¹

ABSTRACT

The genus *Pulicaria* in Turkey is represented by 6 species, *P. arabica*, *P. armena*, *P. dysenterica*, *P. odora*, *P. sicula* and *P. Vulgaris*. *Pulicaria dysenterica* is known as “Çayır otu, yara otu, papatya” in Turkey. In traditional medicine, it is used for constipation, the treatment of abdominal pain, stye in eye, cold, bronchitis, inflamed wound, also as carminative, diuretic. Also the plant is used against dysentery. In this study, the antimicrobial activities of ethanol (PDE) extract and its fractions (hexane (PDH), chloroform (PDC), ethyl acetate (PDEA), and aqueous ethanol (PDSE)) of *Pulicaria dysenterica* were also evaluated. Antimicrobial activity against *Staphylococcus aureus* ATCC 29213, *Staphylococcus epidermidis* ATCC 12228, *Escherichia coli* ATCC 25922, *Enterococcus faecalis* ATCC 29212, *Klebsiella pneumoniae* ATCC 4352, *Pseudomonas aeruginosa* ATCC 27853, *Proteus mirabilis* ATCC 14153, *Candida albicans* ATCC 10231, *Candida tropicalis* ATCC 750 and *Candida parapsilosis* ATCC 22019 were determined by the microbroth dilutions technique using the Clinical Laboratory Standards Institute (CLSI) recommendations. PDE and PDH extracts showed moderate activity against *Candida tropicalis* with MIC values of 312 µg/mL. All extracts (except PDE) with MIC values of 625 µg/mL had moderate activity against *Candida albicans*. PDH, PDC, and PDEA extracts exhibited moderate antifungal activity against *Candida parapsilosis* with MIC values of 625 µg/mL. All extracts against *Staphylococcus aureus* were found to have poor antibacterial activity with MIC values of 1250 µg/mL. PDC showed moderate activity with a MIC value of 625 µg/mL, while PDH with a MIC value of 1250 µg/mL showed weak antibacterial activity against *Staphylococcus epidermidis*. This is the first study to examine the antifungal effect of *Pulicaria dysenterica* on *Candida* species and the results of this study showed that extracts are effective on *Candida* species.

DETERMINATION OF ANTIFUNGAL AKTIVITES OF PHELLINUS IGNIARIUS AND PHELLINUS LUNDELLII

DICLE ERDĞDU¹, HEMEN GÜL ERASLAN¹, PERİHAN GÜLER¹

ABSTRACT

: Fusarium species, known as plant pathogens, cause bottom rot, leaf and spike burn and rot in various cereal products. Grain such as wheat, corn oast, rye and other plant foods such as peanuts, tomatoes and potatoes and they can form toxins. In this study, antifungal aktivites of two Phellinus (Phellinus igniarius and Phellinus lundellii) species collected from Kırıkkale province were investigated. Samples were taken from solid media and ethanol and methanol ekstrakt were prepared and applied againts two Fusarium(Fusarium crookwellense and Fusarium oxysporum) by disk diffusion method. As a result of this study, it was determined that the ekstrakts of Phellinus igniarius prepared in ethanol and methanol had antifungal effect on Fusarium oxysporum and Fusarium crookwellense. It has been ebserved that the ethanol-ekstrakte ekstrakt of Phellinus lundellii can not have antifungal activity. It was observed that the ethanol and methanol ekstrakt of Phellinus lundellii could not have antifungal activity Fusarium crookwellense.

THE USE OF AROMATIC PLANTS AND SPICES IN VEGETABLE OILS: FLAVORED OILS

ENES BERBER¹, DERYA ARSLAN¹, AYŞENUR ACAR¹, HASAN HÜSEYİN KARA²

ABSTRACT

Spices have been used by many cultures since ancient times in order to enhance the flavor and aroma of foods, and generally have antioxidant and antimicrobial properties. Many aromatic plants and spices are known to increase the nutritional value and shelf life of foods. Today, synthetic antioxidants such as BHT and BHA are used as additives to increase the shelf life of oil-rich foods. Careless use of many synthetic additives has significant health risks. Many antioxidant active ingredients found in spices and herbs have been used to aromatize vegetable oils to increase the oxidative stability of the product. In addition to spicy aromas, it is preferred because of the reasons such as very low health risks, higher consumer acceptance and increased bioactive qualities of the product. This increases the interest in spices as antioxidant sources. There are examples in the world where various vegetable oils such as soy and canola are aromatized with aromatic herbs and spices, the most common application in the world and in Turkey is the aromatization of olive oils. Turkish food codex olive oil and pomace notification defines flavored olive oil as; "Olive oil which is obtained by adding different spices, plants, fruits and vegetables and in terms of other characteristics, carries the properties of the products of its category within the scope of this notification." Flavored olive oil is also expressed in terms of aromatized, aromatic, gourmet and boutique olive oil in sector jargon. Seasoning of olive oil is a process usually applied to natural extra virgin olive oils to increase nutritional value, enrich sensory properties and prolong shelf life. When the studies carried out in this matter are examined, aromatic plants and spices themselves can be added in crushing or kneading stages of olive oil production as well as plant infusions, extracts or essential oils can also be used. In addition, the incorporation rate of infusion or extracts of these different spices or plants and the time needed for infusion/maceration have also been the subject of studies. According to many studies carried out on olive oil, the seasoning of olive oil causes an increase in oxidative stability, along with studies in which the reduction in antioxidant activity and amount of phenolic components are also detected. It is reported that the combined use of aromatic plants has stronger positive effects.

CULTIVATION OF TRUFFLES AND DEVELOPMENT PLANS ECO-SYSTEM MANAGEMENT FOR THE TRUFFLE INDUSTRY

AMAL EZZANEGA¹, LAHSEN KHABAR¹

ABSTRACT

Throughout, human history. Truffles have been consumed in many countries and have been used as folk medicine and in cosmetic products. The quality and variety of truffles demanded by peoples has increased as consumers desire more and ecologically is a key of living sustainably in semi-arid and arid areas. In both ecological and socio-economic importance setting, the inoculating plants with mycorrhizal fungi considered greatly a good solution for in a degraded ecosystem where the truffles yield lost or threatened for many reasons: ecological factors influence, human activities and methods use for harvested it. The aims of this research has demonstrated that the production of mycorrhized plant by inoculation seedling of likely hosts plant with slurry of truffle spores is one inoculation technique encourage the cultivation of truffles .

ANTIOXIDANT AND VOLATILE COMPOSITION OF ESSENTIAL OIL FROM MYRTUS COMMUNIS IN TURKEY

HÜLYA DEMİR¹

ABSTRACT

The isolated essential oils from seven air-dried plant species were analyzed by gas chromatography–mass spectrometry (GC-MS). The essential oil from *Myrtus communis* was characterized by the presence of α -terpinene (34.4%), cineole (9.6%), linalool (6.2%), α -pinene, camphene, cineole, terpineol, terpinen-4-ol, thymol, caryophyllene. Antioxidant activity was evaluated as a free radical scavenging capacity (RSC), together with the effect on lipid peroxidation (LP). RSC was assessed by measuring the scavenging activity of essential oil on 2,2-diphenyl-1-picrylhydrazil (DPPH) and hydroxyl radical, together with the effect on lipid peroxidation (LP). RSC was assessed by measuring the scavenging activity of essential oil on 2,2-diphenyl-1-picrylhydrazil (DPPH) and hydroxyl radicals. Effect on LP was evaluated following the activities of essential oil in Fe²⁺/ascorbate and Fe²⁺/H₂O₂ systems of induction. Investigated essential oil reduced the DPPH radical formation (IC₅₀ = 7.05±0.26 μ g/mL).

THE EXTREMELY USE OF OILS OBTAINED BY COLD PRESS (COLD PRESS) OF SOME PLANTS

ŞEYMA AKALIN BENDERLİ¹, MEVLÜT BÜYÜKHELVACIGİL¹, BERİL KOPARAL¹

ABSTRACT

MULBERRY SEED OIL Latin: Oleum Morus alba Mulberry (Morus alba) is a tree-shaped plant from the family Moraceae. It is known that the oil obtained from the cold press method of mulberry cores is rich in especially essential fatty acids and vitamin E vitamins. It is stated that when used as a mouthwash in the treatment of oral wounds due to its antiviral and antibacterial properties, it can also be used in the treatment of throat pain, tonsillitis, improvement of mouth and teeth wounds and in the treatment of infections caused by candida species fungus known as thrush in children. It has also been reported that antiinflammatory, antipyretic and antitussive corticosteroids may be used to support the treatment of diseases such as mouth-throat infections, asthma and arthritis (joint inflammation). CHIA SEED OIL Latin: Oleum Salvia hispanica Chia (Salvia hispanica); It is a plant of Lamiaceae family like island tea. The most important feature of oil obtained by the cold press method of Chia seed, which is known to have many health benefits; The amount of herbal omega-3 ALA (Alpha Linolenic Acid) is at a high level. It is used for the treatment of Metabolic Syndrome patients with the help of treatment, support for weight loss, support to increase the endurance of athletes, anticoagulant and antihypertensive properties, cardioprotective and antiinflammatory effect, nutritional support (salat and yoghurt ease of use by joining) are reported to be able to be used as support in many diseases. The level of ORAC (Oxygen Radical Absorbance Capacity) indicated as an antioxidant capacity value is very high and it is reported that it can help the athletes to increase their stamina during competition and training. HEMP SEED OIL Latin: Oleum cannabis Cannabis oil produced by the Cold Press method contains essential polyunsaturated fatty acids and tocopherols such as omega 3 and omega 9. The ideal omega-3 / omega-6 ratio, containing hemp oil, is an ideal nutritional supplement for a healthy and balanced diet. Anticonvulsant and antiepileptic properties, antidepressant and antihypertensive properties, antioxidant and antiinflammatory properties, hypercholesterolemia, nutritional support (ease of use by adding to salatas and yoghurts) and support for many diseases for anti-amyloid and antiepileptic properties, help to reduce tremor in dystonic movement disorders, healthy and balanced nutrition can be used as. FLAX SEED OIL Latin: Oleum Lini Almost every part of flax (Linum usitatissimum) plant has commercial use, especially flaxseed is very important in terms of food and nutrient sectors. Especially strong and durable fibers found in the structure are of great importance in terms of usage areas. The oil obtained by cold press method from flax seeds is predominant due to the presence of α -linolenic acid (ALA, 18: 3n-3) and lignan in the content of flax seed oil. A number of studies have shown that atherosclerosis plays an important role in increasing secondary mortality and morbidity to cardiovascular disease (CVD). Recent studies have shown that the presence of omega-3 fatty acids in daily diets is effective on preserving the heart, that omega-3 fatty acid ingestion of 0.5-2 grams per day is effective in protecting against cardiovascular diseases and that there is no additional effect of taking them at higher doses. Support for osteoporosis

ANTIBACTERIAL EFFECT OF ESSENTIAL OIL OF ROSA DAMASCENA MILL. ON PSEUDOMONAS TOLAASII

ESİN BASIM¹, HÜSEYİN BASIM¹

ABSTRACT

Rose essential oil has been used to natural beauty treatments for thousands of years. Rose oil is a good bactericide as well as it has a strong antimicrobial, antiseptic, antiparasitic and antibacterial activity. Essential oil of *Rosa damascena* was obtained by steam distillation from petals of *R. damascena* grown in the Isparta province of Turkey. In this study, antibacterial activities of different concentrations (1,10,20,30,40,50 μ g/ml) of rose (*Rosa damascena*) oil were investigated by in vitro agar diffusion and volatility tests against *Pseudomonas tolaasii*, a causal agent of bacterial brown blotch disease on cultivated mushrooms (*Agaricus bisporus*). It was determined that the essential oil showed an effective antibacterial activity against *P. tolaasii* strains comparing with those of *Thymbra spicata* (100 μ g/ml) essential oil and Streptomycin (100 μ g/ml). The *R. damascena* essential oil has a potential to be used a natural protectant for bacterial brown blotch disease pathogen, *Pseudomonas tolaasii*. Future detailed works needs to be completed for a practical use of the essential oil to control bacterial brown blotch disease on cultivated mushrooms. This is a first report of antibacterial activities of the rose oil against *P. tolaasii*.

**PRELIMINARY SEARCH FOR CAPILLARY PERMEABILITY
EFFECTS OF SELECTED MEDICINAL PLANTS AJUGA
CHAMAEPITYS, PHLOMIS GRANDIFLORA AND BONGARDIA
CHRYSOGONUM**

CEYLAN AKA¹, UFUK KOCA ÇALIŞKAN¹, ESRA AKKOL¹

ABSTRACT

Objective / Purpose: Capillary permeability is meaning of permitting capacity of a blood vessel wall. If this capacity/ability deteriorates, vascular diseases (such as atherosclerosis and peripheral artery disease, haemorrhoid, aneurysm, peripheral venous disease and varicose veins blood clots in veins (vte), lymphedema) occur. Our aim is to determine potential antiinflammatory effect of *Ajuga chamaepitys* (L.) SCHREB. (AC), *Phlomis grandiflora* H. S. THOMPSON var. *grandiflora* H. S. THOMPSON (PG), and *Bongardia chrysogonum* (L.) SPACH. (BC) by applying acetic acid-induced vascular permeability models. Material and Methods: Shade dried plant samples were extracted with pure methanol, and the extracts were evaporated to the dryness. Previously applied method was used for the animal experiment (Whittle, 1964; Yesilada and Kupeli, 2007). According to that method, each plant extract (400 mg/kg dose) was administered orally to a group of 6 BALB/c mice, waited for 30 min then the mice were injected with 0.1 mL of 4% Evans blue at the tail, after 10 min waiting period 0.5% (v/v) AcOH was injected i.p. and waited for 20 min. The mice were killed by dislocation of the neck, and the viscera were exposed and irrigated with distilled water, which was then poured into 10 mL volumetric flasks through glass wool, 0.1 mL of 0.1N NaOH solution was added, each flask was made up to 10 mL with distilled water. The absorption of the final solution was measured at 590 nm. In control animals, instead of the extract 0.5% CMC was given orally, and they were treated in the same manner as described above. Results: According our preliminary results, % inhibition values of acetic acid induced capillary permeability were determined as *Ajuga chamaepitys*, *Phlomis grandiflora* and *Bongardia chrysogonum*) respectively. AC and PG have higher potent effect on capillary permeability. These two plants are hopeful for vascular diseases. The results will be discussed.

INVESTIGATION OF MACRO AND MICRO MINERAL CONTENT OF SOME MEDICINAL AND AROMATIC HERBS AND IT'S INFUSION

ADEM GÜNEŞ¹, ERMAN BEYZİ², BAŞAK ORUÇ¹

ABSTRACT

Some of the elements to create organic structures are found in trace amounts, but in some cases they are too large to be toxic or toxic. While the levels of the trace play an important role in the fulfillment of metabolic activities, their deficiencies or toxic amounts are also causing diseases. In this study, crop raw and packaged sage, cumin, nigella and melissa were collected which grow naturally in our country. These herbs' direct and hot water extraction are analysed to check variations of the element contents (K, Na, Ca, Mg, P, Cu, Fe, Zn, Ni, Mn, Cr, Pb). As a result of the studies done on the plants, the nutrient contents of the plants differed. This study was determined cumin is the highest element content and melissa is the lowest element content in herbs samples. As a result of the examinations, Pb content of toxic element is higher in Cemen plant, Cd content is higher in Cemetery plant. In general, the amount and diversity of macro-micro elements and heavy metals found in medical plants can vary depending on the physical, chemical and biological properties of the soil and climate factors.

EFFECIENCY OF PROPOLIS EXTRACT-DELIVERY NANOCOMPOSITE SYSTEM ON WOUND CARE

HATICE KÜBRA ARIKAN¹, HAYRIYE HALE SOLAK¹

ABSTRACT

Propolis is a strongly adhesive resinous substance collected, transformed and used by bees to seal holes in their honey combs, smoot houtthe internalwalls and protect the entrance against intruders It has a long history of being used in traditional medicine and been reported to have a broad spectrum of biological activities, such as anticancer, antioxidant, antiinflammatory, antibiotic, andantifungalactivities The biological or pharmacological activity is associated with phenolic compounds, mainly with potential antioxidantnamely "flavonoids" andaromaticacids. Flavonoids are frequently used as the main index for product evaluation of propolis. Propolis has recently become popular as a health drink and it claimed to prevent diseases such as dermatological wounds, inflammation, heart disease, diabetes, cancer, etc. Electrospinning is a unique fiber spinning technique of producing nanofibers from a large variety of bulk starting materials in a moderately easy, repeatable and simple fashion.It is a simple and inexpensive process that uses an electric field to control the formation and deposition of nanoormicro-sized polymeric nanofibers from a liquid polymer. Electrospun nanofibrous fabrics with high specific surface area, aspectratio and porosity as a result of random deposition of fibers, couldhave a greatpotential in biomedical applicationssuch as tissue engineering scaffolds, drug delivery carriers, wound dressings etc. In this study, potential of propolis extract (bee glue) solution based electrospun nanocomposite fabrics as wound dressing were investigated macroscopically in vitro experiments. PVA polymer with different concentrations were dissolved in water at 60 oC and then propolis extract was added into polymer solution. %5 PVA / %5 Propolis sol., %7 PVA / %7 Propolis sol., %9 PVA / %9 Propolis sol., nanocomposite fabrics were produced by electrospinning method over polypropilen nonwoven fabrics. SEM analyses tests were applied for the nanocomposite fabrics as wound dressing. In-vitro experiments showed that antimicrobial effectiveness of bacterial solutions with nanocamposite fabrics were better than those of not including nanocomposite fabrics bacterial solutions. According to investigations nanocomposite fabrics with propolis sol. were provided antimicrobial effect against to gram positive bacteria (S. aureus) and not provided antimicrobial effect against to gram negative bacteria (A baumannii and P. aeruginosa). The results indicated that the electrospun PVA/Propolis extract nanocomposite fabrics as wound dressing provided a good means for wound healing caused by gram positive bacteria.

THE DETERMINATION OF WILD MEDICAL PLANTS GROWING IN ERZURUM AND USE OF THEM AGAINST VARIOUS DISEASES

AKAR KARAKOÇ¹, SERAP BUZTEPE¹, EYYUP TELCİ², AYHAN BUZTEPE³, ELMAS KARAKOÇ⁴

ABSTRACT

As in whole world, in our country, plants existing in the natural flora for different purposes has been used as a part of traditional cultere from past to today. Plants are of great importance in the prevention and treatment of diseases or the maintenance of health. According to the investigations of World Health Organization, there are approximately 20.000 plants used for medical purposes. Our country also has a rich flora in terms of medicinal plants. Medical plants are widely used by the people in the city of Erzurum located in eastern Anatolia. The aim of present study is to determine which wild medicinal plants growing in Erzurum are used for which illness by the people living in this city. This study was carried out on 73 volunteers, were selected randomly, living in Erzurum. The mean age of they was 41.34 ± 15.23 (mean \pm standard deviation). 34 (46.6%) of the participants were women, 39 (53.4%) were men. The data were collected through a questionnaire, also including open-ended questions, prepared by the researchers. it was asked which wild medicinal plants growing in erzurum had been used for which illness by participants. Also, participants' preferences were asked about plants and medicines in order to use in the treatment of diseases. Descriptive statistics, chi-square and Fisher's exact tests were performed for the statistical analysis of data. In this research, 31 different medicinal plants were detected, growing in Erzurum and used against various diseases. The findings of the research showed that the most commonly consumed plants are giant fennel (*Ferula communis*) (39.7%), Rheum ribes (known as "ışkın" in East Anatolian of Turkey) (19.2%), Nettle herb (*Urtica dioica* L.) (13.7%), rosehip (*Rosa canina* L.) (11%), mallow (*Malva sylvestris*) (9.6%), rumex crispus L. (8.2%). 68.9% of the participants consumed giant fennel herb stated that this plant was used for diabetes mellitus, and 31.1% were used for the treatment of infectious and respiratory diseases, and cancer and hypertension. It was found that the Rheum ribes was used for cancer (42.8%), diabetes mellitus (28.6%), respiratory and gastrointeninal diseases. Nettle herb was used for cancer (40%), respiratory (20%), infectious (20%) and rheumatic (10%) diseases, and diabetes mellitus (10%). All participants using rosehip consumed it against respiratory diseases. The participants stated that they used mallow in the treatment of the infectious, respiratory and gastrointeninal diseases. In addition to, it was determined that rumex crispus L. was commonly used in hemorrhoids treatment (50%). Participants' preferences (plants, medicines or both of them) were asked for the treatment of diseases. The preferences was compared with social security, economic situation, sex, education levels, occupation and age groups (the youngs, adults and the olds). All of the participants who did not have social security preferred to use the plant. No significant difference found between the age groups and the preference, but most of the olds (50%) preferred plants to medicines. There was no significant

difference between women and men in terms of preferences, but it was found that most of men (53.8%) preferred using the plants. The results of this research showed that most commonly consumed wild medicinal plants by people living in Erzurum are giant fennel, rheum ribes, Nettle herb, rosehip, mallow, rumex crispus L.. The wild medicinal plants are used, especially, against diabetes, cancer, hemorrhoids, and infectious, respiratory, gastrointestinal and rheumatic diseases. Biological activity studies are needed to understand the effects of these plants on the treatment of these diseases.

INVESTIGATION OF SOME LAVENDER ESSENTIAL OILS COMPONENTS USING UV, FT-IR AND GC ANALYSIS

SEDA KÜLEN¹, FATMA EROĞLU², SEBLA DİNÇER², MERVE GÜMÜŞSOY²

ABSTRACT

ABSTRACT In recent years, the value of medical and aromatic plants has increased considerably. The flowers of *Lavandulastoechas*, which grow in maki areas of Western Anatolia, are used as analgesic and expectorants. English lavender (*L.angustifolia*) is used as essence. Lavender essential oil samples were analyzed using gas chromatography to determine the levels of camphor, linalool and linalyl acetate which is the criteria of the essential oil quality. The purpose of this study was to determine some spectroscopic and chromatographic properties of essential oils isolated from lavender (*L. angustifolia*), *Lavandula stoechas* and *lavandin* (*Lavandula x intermedia*) harvested in 2016 in Middle Anatolia. The essential oils, isolated by steam distillation, were analyzed by gas chromatography (GC), FT-IR and UV. In the FT-IR spectra OH, C=C, C=O and C-O bending and stretching peaks were determined. In the UV analyzes, characteristic absorption bands of linalool, linalylacetate and flavanoids, which are important main components of lavender, were observed in the range of 200-270 nm.

SPECTROSCOPIC INVESTIGATION OF ESSENTIAL OIL COMPONENTS IN SOME THYME SPECIES

FATMA EROĞLU¹, SEDA KÜLEN², SEBLA DİNÇER¹, MERVE GÜMÜŞSOY¹

ABSTRACT

In many industries such as medicine, food, perfume and cosmetics, essential oils obtained from plants are used as raw materials. Thyme, is an important aromatic and medicinal plant containing an essential oil used widely in medicine and food industry. By the method of water steam distillation of thyme, 2 - 8%, an aromatic oil is obtained. These volatile fats are carvacrol and thymol from monoterpene phenols. Thyme essential oil has important properties such as antispasmodic, antirheumatic, antiseptic, bactericidal, diuretic, expectorant, insecticide etc. The purpose of this study was to determine some spectroscopic and chromatographic properties of essential oils isolated from *Thymus vulgaris*, *Satureja spicigera* and *Origanum vulgare* subsp. *Gracile*, harvested in Middle Anatolia. These essential oils, isolated by water steam distillation, were analyzed by gas chromatography (GC), UV and FT-IR. In the UV analyzes, characteristic absorption bands of carvacrol and thymol, which are important main components of thyme, were observed in the range of 200-275nm. In the FT-IR spectra bending and stretching peaks of phenols are observed.

ALTERNATIVE FOR THE FUTURE: NATURAL FOOD COLORS

ŞÜKRAN ÇAKIR ARICA¹, SELDA ÖZ², AYŞE ÖZYILMAZ¹, SEVİL DEMİRCİ¹, ABDULLAH ÖKSÜZ³

ABSTRACT

Color additives are used to color many beverages, foods, and sweets in the world for many reasons. For example, food colors are used by the food and beverages industry to improve the color of the food which is lost while their processing. Many synthesized dyes were easier and less costly to produce and were superior in coloring properties when compared to naturally derived alternatives. These compounds have drawn considerable attention in recent years, not because of their coloring properties, but due to their potential healthpromoting effects. Amounts of artificial food dyes and added sugars in foods and sweets commonly consumed by children. Clinical guidance is given to help caregivers avoid artificial food dyes and reduce the amount of sugars in children's diets. Based upon many cell-line studies, animal models, and human clinical trials, it has been suggested that many natural food colorants, due to their potent antioxidant property, possess anti-inflammatory and anti-carcinogenic activity, cardiovascular disease prevention, obesity control, and diabetes alleviation properties. The food dyes market is segmented based on types which include synthetic and natural colors. Synthetic colors still hold a major share, but natural colorants are the fastest growing segment due to consumer consciousness especially in developed countries. The aim of this study is to draw attention to the value of natural food colors in terms of human health and to highlight Turkey's potential for natural food colorants.

SORPTION OF ANTHOCYANINS FROM HIBISCUS FLOWERS ONTO DIATOMITE FROM AQUEOUS SOLUTION

ÖZKAN DEMİRBAŞ¹, ERDAL TALAŞ¹

ABSTRACT

Anthocyanins are natural colorants found in various colors such as orange, pink, red, violet to blue in the flowers and fruits of the vascular plants in nature. Anthocyanins are harmless and water soluble. Another important feature of anthocyanins is antioxidant activity, which is known to play a vital role in preventing neuronal and cardiovascular diseases, cancer and diabetes. The main colorant of the hibiscus flower is cyanidin-3-sophoroside. Diatomite is a silica sedimentary rock formed in the form of an amorphous silica containing a small amount of microcrystalline material in its structure. Considering these properties, in this study, the sorption kinetics or rates of the main colorants of hibiscus flowers to the diatomite surface in aqueous solutions was investigated. The determination of sorption, adsorption or desorption kinetics or rates is very important for elucidating the mechanism of these phenomenon. For this purpose, a series of experiments were carried out in order to better explain the mechanism of the sorption of the cyanidin-3-sophoroside molecule to the diatomite surface. The constants of the pseudo first and second order kinetics equations are calculated with the experimental data. Mass and intra-particle diffusion constants are also determined. Dried hibiscus flowers and diatomite particles used in the experiments were grounded and sieved to have a particle size below 50 micrometres. UV-Vis spectra of hibiscus flowers in different masses in aqueous solutions were as follows. The maximum wavelength, λ_{max} , from the graph is 520 nm for aqueous solutions containing hibiscus flowers. A linear relationship was observed between the hibiscus mass in the solution and the absorbance values of the solution at 520 nm. Thus, quantitative analysis has also been done in this study. Experimental studies were carried out with various parameters. These are solution temperature, time, equilibrium pH of solution and the mass and particle size of the hibiscus flowers and diatomite in solution. As a result of the experimental studies, no effect of the contact time on the sorption was determined. However, increasing pH and solution temperature increase sorption rate, while particle size decreases. In addition, the particles were characterized by FTIR-ATR, SEM and BET surface area measurements and TG analyzes.

QUALITATIVE AND QUANTITATIVE ANALYSIS OF NATURAL ANTIOXIDANT SAGE(SALVIA OFFICINALIS)

AYŞE AKAN¹, FATMA EBRU KOÇ¹, ÇAĞLAR KULU¹

ABSTRACT

Sage (*Salvia Officinalis*) is a 50-100 cm high, purplish blue flowering, simple leafy, perennial and bitter plant. It grows on mountain slopes, is widely cultured. 1-2.5% contains essential oil, tannins and bitter substances. They're very rich in phenols, flavonoids and flavonols. The so-called "apple oil" or "bitter apple oil" is also produced from Anatolian sage. Sage is widely used for cold due to antiinflammatory, antimicrobial effect^{1,2} In this study, the sage plant collected from the Mediterranean region was extracted with different solvents and methods, and the yields were compared. The quantities of rosmarinic acid, carnosic acid and carnosol, which are responsible for the antioxidant capacity of the sage plant, were analyzed qualitatively and quantitatively by an HPLC device; The volatile oils in the extract were determined by GC-MS instrument and the total phenol content in terms of gallic acid in UV-VIS spectrophotometer was also examined. For this purpose, 70 mesh sieves were sieved after the sage plant was treated. Maceration were done for sages at 45 ° C with 70% ethyl alcohol in varying ratios (1: 6) and time (3; 6; 8; 10 hours); 100% methanol and 100% ethanol extractions; Soxhlet extraction efficiencies were compared. The proportions of rosmarinic acid and the amounts of carnosic acid and carnosol were analyzed in the extracted at UV detector and 280 nm wavelength by a Thermo Scientific Uimate HPLC instrument. As a result of the experiments, a maceration method with 70% ethanol with 25% extraction yield was chosen. As a result of calculations on the standard graphic of rosmarinic acid in analytical standards,; It was determined that 7.45 mg "rosmarinic acid"; 3,42 mg "carnosol + carnosic acid" in gram 70% ethanol extract of sage; Volatile components of the ethanol extract were detected on the Agilent brand GC-MS; The extract was found to contain high levels of cineol, camphor, borneol components.

KINETICS OF INTERACTION BETWEEN SILICA SURFACES AND ANTHOCYANINS FROM HIBISCUS FLOWERS

ÖZKAN DEMİRBAŞ¹, ASLIHAN RÜMEYSA TEMİZ¹

ABSTRACT

Anthocyanins occur in all tissues of higher plants, including leaves, stems, roots, flowers, and fruits. Anthocyanins are glycosides of anthocyanidins, the basic chemical structure was given in Figure 1a. Cyanidin-3-sophoroside, the main colorant of the hibiscus flower, is also an anthocyanin. Despite the great potential of applications that anthocyanins represent for food, pharmaceutical, and cosmetic industries, their use has been limited because of their relative instability and low extraction percentages. Their use in textile is negligible as they lack affinity for the fiber and cannot sustain washing. Currently, most investigators are engaged in solving the problems that are associated with isolation and stability of anthocyanins, their purification, identification and their end uses. For this purpose, in this study, the sorption kinetics of the cyanidin-3-sophoroside molecule, main colorants of hibiscus flowers, to the silica surface in aqueous solutions was investigated. Dried hibiscus flowers and silica particles used in the experiments were grounded and sieved to have a particle size below 50 micrometres. UV-Vis spectra of hibiscus flowers in different temperature in aqueous solutions were given in Fig. 1b. The maximum wavelength, λ_{max} , from the graph is 520 nm for aqueous solutions containing hibiscus flowers. Experimental studies were carried out with various parameters. These are solution temperature, time, equilibrium pH of solution and the mass and particle size of the hibiscus flowers and silica in solution. As a result of the experimental studies, no effect of the contact time on the sorption was determined. However, increasing pH and solution temperature increase sorption rate, while particle size decreases. The constants of the pseudo first and second order kinetics equations are also calculated with the experimental data. Mass and intra-particle diffusion constants are also determined. In addition, the particles were characterized by FTIR-ATR, SEM and BET surface area measurements and TG analyses.

RATIONAL USE OF MEDICAL AND AROMATIC PLANTS

ŞADUMAN KARACA¹

ABSTRACT

Throughout the history of mankind, plants are known not only for food but also for long-lasting medical use as the data gathered from many archaeological excavations suggest. "Today, more than 375,000 plants have been identified in the world, but it is registered in the literature that only about 20,000 of them have been utilized by the people. "A large proportion of the vast majority of plants make up the medical and aromatic plant group "(Ceylan, 1996). Today, medical and aromatic plants (TAB) are generally grouped as spice, cosmetics, paint, pleasure, aromatherapy and phytotherapeutic use. Within the framework of this presentation, TAB will only cover medical plants, therefore plants that are included in field of therapy (phytotherapy). The fact that most of the world's diseases can not be treated and even diseases becoming more complicated from day to day for the last 20-30 years, has been engaging health institutions and individuals not only in our country but all over the world. In parallel with advancing technology, the emphasis on human health increases day by day, and the desperation against illnesses is also worrying. While alternatives are being sought for the treatment of diseases all over the world, the past treatment methods have come to the fore as a remedy for today's health problems. Phytotherapy stands for Plant Therapy, so it is useful to emphasize the rationality of plant drugs prepared for therapeutic purposes, because if the plant drug is not salutiferous, the disease process will further progress and even new diseases will be created involuntarily rather than healing it. Thus, since the Hippocrates, the physician has acted on the rationale of "Do not harm human beings first", which is the main rule. The second important step in the rational use of medical plants is the competence of the person who is practicing this profession. Here, it is essential to have a basic medical knowledge consisting primarily of the anatomy, physiology and pathology of the human organism. With this knowledge, a physician does not yet have a qualification to treat with plants. It also requires the healing knowledge of plants, which requires a thorough education. Only by integrating the knowledge of both of them, the physician will initiate a rational, healthy and long-term treatment process by taking the subject as an individual and applying a holistic treatment of the diseases as much as possible. The planned presentation is intended to present both the ideal criteria for plant drugs to the treatment practitioners in a rational way, as well as the rules that the specialists who will be practicing with plant drugs should pay attention to in the ideal environment, especially through the case of Germany, the country where this profession is applied in the most advanced stance through legal regulations and practices.

THE İMPORTANCE OF SAFFLOWER (CARTHAMUS TINCTORIOUS L.) AS A MEDICINAL PLANT, REGARDING İT'S ACTIVE SUBSTANCES

FATİH SEYİS¹, EMİNE YURTERİ¹, AYSEL ÖZCAN¹

ABSTRACT

More than 200 components are isolated from different parts (leave, flower and seed) up to now. The most known components are: flavanoids, phenylethanoids, coumarins, fatty acids, steroids and polysaccharides. 7 serotonin derivatives were isolated from safflower oil. The main components of safflower flowers is carthamin, an important flavanoid glycosides. İts flowers contains also arthamidin, isocarthamidin, quercetin, kaempferol, 6-hydroxykaempferol and its glycosides and hydroxysafflor yellow A, safflor yellow A, safflamin C, safflamin A, safflomin-A. Also lauric, miristic, palmitic, linoleic, arachidic and flavon luteolin and luteolin 7-O-beta-D-glucopyranoside and luteolin-7-O-(6"-O-acetyl)-beta-D-glucopyranoside are presents in *Carthamus tinctorius* flowers. Nikotiflorin, are present as a natural flavanoid in in the petals of *C. tinctorius*. An seconder metabolite, alkan-1,3-diols, was isolated from dried petals of safflower. The main essential oil componens of safflower flowers were determined as Caryophyllene, p-allyltoluene, 1-acetoxytetralin and heneicosane. An new quinokalkon C-glikoside, tinctormine was determined in safflower. The potentail use of safflower in phytotherapy and developments in its use as healing agent was discussed in detail. İt was determined that safflower has antioksidant, analgezik, antidiabetic, hepatoprotektic ve antihperlipidemic activities.

CHEMICAL CONTENT AND IMPORTANCE FOR COMPLEMENTARY MEDICINE OF TEA (CAMELLIA SINENSIS L.)

AYSEL ÖZCAN¹, EMINE YURTERİ¹, YUSUF ŞAVŞATLI ŞAVŞATLI¹, FATİH SEYİS¹

ABSTRACT

Tea belongs to the genus *Camellia*, family Theaceae, division Angiospermae in the plant kingdom. There are types with bushy forms as well as the single-stem types in cultivated types of tea plant. This plant is evergreen and the most valuable and most consumed drink after the water in all over the world. Tea produced from cultivated forms of the species *Camellia sinensis* (L) O. Kuntze can be obtained from the terminal bud and fresh leaves under this terminal bud forming at the tip of the young shoots on the cultivated plant. The black tea most consumed between processed tea products is obtained by withering, curling, oxidation, drying, classification and packaging processes of these fresh and non-fibber leaves. Four tea types can be obtained from plant: green tea, white tea, oolong tea and black tea. These tea types have medicinal and therapeutic effects in terms of their chemical compositions. The widely produced and traded tea types contain protein, carbohydrates, oils, polysaccharides, vitamins and minerals, caffeine, quercetin, kaempferol, flavonoids (catechin, epicatechin, epicatechin gallate, epigallocatechin, epigallocatechin gallate), gallic acid, chlorogenic acid, tanen and amino acid (total of 19 including theanine) in their structures. It has protective effects against coronary heart diseases, stroke, cardiovascular diseases, cancer, obesity, hypertension, arthritis, viral and inflammatory diseases and effects regulating to bone density due to its high antioxidant properties and chemical content. In this review, the bioactive substances in various tea types obtained from tea plants which is medically important and the importance of complementary medicine of these substances are discussed in detail.

THE MULTIPLICATION OF ORIGANUM SPP. COLLECTED FROM RIZE HIGHLANDS WITH SEED AND PERLITE

FATİH SEYİS¹, EMİNE YURTERİ¹, KUDRET KEVSEROĐLU², AYSEL ÖZCAN¹

ABSTRACT

The aim of this study was to determine the multiplication potential using seeds and cuttings of *Origanum* spp. collected from the highlands of Rize. Cuttings were obtained from material collected from nature and cuttings were cutted from the 2nd and 3rd node and were implemented with 1000 ppm and 1500 ppm IBA for 1 min and transferred to peat containing perlite. Seed were directly transferred to peat containg soil and the results showed us that success rate was 25 % in seed multiplication and 80% in multiplication with cuttings at 1000 ppm and 40 % in multiplication with cuttings at 1500 ppm..

MEDICINAL İMPORTANCE OF WHITE TEA (CAMELLIA SINENSIS L.)

EMİNE YURTERİ¹, FATİH SEYİS¹, AYSEL ÖZCAN¹, YUSUF ŞAVŞATLI¹

ABSTRACT

It is possible to say that tea is the most consumed drink on the World after water. Specially şf Turkish tea is mentioned it has to be considered that tea takes it place at breakfast as well as in 5 o'clock service and also after meal as an irrepşlceable part of our culture. Tea is nowadays grouped according to its fermentation level as green and white (not fermented), partially poisoning (fermented) and oolong tea in three groups. The surplus or rarity of phenolic compounds in tea shows variation depending besides genotype/environment on cultivation package and on the process technology up to the last stage where tea is packaged. With the increase in number of processes in tea processing an increase in a and thearubigins and an decrease in the catechin group is given. The importance of unprocessed white tea is rising because of its high catechin content compared with other teas. Poliphenols, specially catechin derivatives are strong antioxidant agents and have explicit characteristics like oxidative stress inhibition and clenaing free radicals. İt is well known that oxidatiev damages are the reasons of diseases arising with develeptment of industry in the last years and it is also known that these damages are causing cardiovascular diseases, diabetes, neural crest damage and cancer in humans. Therefore, these antioxidants present in white tea are preventing the initiation or development o these diseases where endogenous defences are insufficient against reactive species.

DETERMINATION OF OPPORTUNITY TO USE AND HABIT OF MEDICINAL AND AROMATIC PLANTS IN ORDU PROVINCE (TURKEY)

MERYEM YEŞİL¹, EMEL KARACA ÖNER¹, MEHMET MUHARREM ÖZCAN¹, AYŞEGÜL KIRLI¹

ABSTRACT

In this research, it is aimed to show the opportunity of usage of medical plants and consumption habits which the concentration of most of the consumption in which medicinal plants of the people living in the province of Ordu. In this regard, such a comprehensive study has not been found before in the provinces and districts of Ordu. In the study, the questions to be asked in the questionnaire were carefully selected and the questionnaire survey was completed with face to face interviews with 310 people in the Ordu center and districts. It was applied to people aged 18 years and over by convenience sampling. The obtained data were analyzed with descriptive statistical methods and the habit of using medical plants by the people living in Ordu provinces, the most used medical plants, the use of medical plants in the treatment of diseases and answering questions such as if they are used, which diseases are used most frequently?. According to the results of the research, medicinal plant use which has been determined to be the most used medical and aromatic plant in the province of Ordu as mint, thyme, sage, lime and garlic and has emerged medicinal plant use has been complained as diseases such as colds, digestive system disorders, sedatives, sinusitis / migraine, blood pressure regulator. The vast majority of respondents indicated that they use medicinal plants for the treatment of diseases, and also the second place is to treat both illnesses and maintain health. Also for the question 'where do you get the medical plants from?' mostly the choice is 'pick up myself from the herbalist and nature' .

**ANTIFUNGAL EFFECTS OF THE ESSENTIAL OILS OF CUMIN,
LAUREL AND THYME AGAINST MYCOGENE PERNICIOSA, A
CAUSAL AGENT OF WET BUBBLE DISEASE ON CULTIVATED
MUSHROOM AGARICUS BISPORUS (LANGE) SING.**

ESİN BASIM¹, HÜSEYİN BASIM¹

ABSTRACT

The essential oils of cumin (*Cuminum cyminum* L.), laurel (*Laurus nobilis* L.) and thyme (*Thymbra spicata* L.), which are consumed as spices were tested in vitro for their antifungal effects against *Mycogene perniciosa*, a causal agent of wet bubble disease of the cultivated mushroom (*Agaricus bisporus* (Lange) Sing.). Antifungal effects of the different doses (1,5,10,20,30,40,50,100,200,500 µg/ml) of the essential oils of cumin, laurel and thyme were investigated in vitro for inhibition effect on mycelial growth of the *M. perniciosa*. The sterile deionized water was used as a control. The 5 mm diameter disc taken with cork-borer from colony side of the 7-days pathogen fungus was placed on Potato Dextrose Agar (PDA) medium. The different doses of the essential oils were placed the middle of the petri dish cover. The petri dishes were wrapped by parafilm as well as the petri dishes were reversed in position and incubated at 27°C. The even lower doses of Thyme oil showed 100% antifungal effect on *M. perniciosa* mycelial growth. The antifungal effects of the cumin and laurel on *M. perniciosa* were different according to the doses of the essential oils used. The cumin, laurel and thyme essential oils have potential to be used as natural agents for controlling wet bubble disease pathogen, *M. perniciosa*. A practical use of the essential oils needs to be completed future detailed works on direct cultivated mushrooms. This is a first report of antifungal activities of the cumin, laurel and thyme oils against *M. perniciosa*.

**ASSESSMENT OF α -AMYLASE, α -GLUCOSIDASE,
CHOLINESTERASE INHIBITION AND ANTIOXIDANT ACTIVITY OF
ALCEA BIENNIS, ARUM DIOSCORIDIS AND GERANIUM LUCIDUM**

HASYA NAZLI EKİN¹, DİDEM DELİORMAN ORHAN¹, İLKAY ERDOĞAN ORHAN¹, MUSTAFA ASLAN¹

ABSTRACT

Diabetes mellitus is a growing health problem worldwide causing severe and costly complications including blindness, cardiac and kidney diseases and increases the risk of cognitive impairment and dementia. The high glucose level of diabetic patients is the most important factor for the increased formation of free radicals such as superoxide which causes oxidative damage. It is considered that insulin signalling dysregulation is important contributing factors in Alzheimer's disease pathogenesis. The aim of the study is to determine antidiabetic, antioxidant and anti-alzheimer effect of *Alcea biennis*, *Arum dioscoridis* and *Geranium lucidum* α -amylase and α -glucosidase enzyme inhibition methods were used to examine antidiabetic activity of 80% ethanol extracts of the plants. Acetylcholinesterase (AChE) and Butyrylcholinesterase (BChE) inhibition methods were used to determine antialzheimer activity. DPPH and DMPD radical scavenging, metal-chelation, ferric-reducing antioxidant power (FRAP) assays were utilized for screening of antioxidant activity. Total flavonoid and phenolic content of the extracts were calculated. Among the tested extracts *G. lucidum* extract (95.05 \pm 0.77%) displayed the strongest α -glucosidase inhibitory activity. All of the extracts were inactive against AChE. All plant extracts displayed lower inhibition than 50% inhibition against AChE and BChE. *G. lucidum* extract (1.4042 \pm 0.072) showed high FRAP activity. Our findings indicated that *G. lucidum* contains potential compounds having selective α -glucosidase inhibitory activity and our work is in progress to identify their active components.

HEPATOPROTECTIVE EFFECT AND PHENOLIC PROFILE OF THE POLLEN ETHANOL EXTRACT OF PINUS BRUTIA TEN.

HASYA NAZLI EKİN¹, HİNA GUL², MUHAMMAD GULFRAZ³, NİLGÜN ÖZTÜRK⁴, İLKAY ERDOĞAN ORHAN¹

ABSTRACT

The genus *Pinus* L. belongs to the family Pinaceae. *Pinus brutia* Ten. has the widest distribution area in Turkey. The pollens from *P. brutia* are used internally to enhance body resistance in recent years. In this study, hepatoprotective activity of the ethanolic pollen extract (80 %) of *P. Brutia*, which is known to use against hepatic disorders in some parts of Turkey was administrated by gavage to CCl₄-induced Swiss albino mice at various doses (100, 200, and 300 mg/kg). The effects on triglyceride, HDL, LDL, and cholesterol levels as well as on liver marker enzymes, e.g. alanineaminotransferase (ALT), aspartateaminotransferase (AST), alkaline phosphatase (ALP), and total bilirubin, RBC, WBC as well as platelet level of mice were investigated. The extract caused a significant decrease on triglyceride, HDL and LDL cholesterol, liver enzymes, and protein level compared with the CCl₄ group ($p < 0.05$). Blood cells were improved with the extract level compared with the CCl₄ group ($p < 0.05$). These findings were further approved by histopathological observations of liver cells of mice and it was expected that restoration of these parameters might be due to presence of some bioactive compounds. Therefore, the phenolic profile of the pollen ethanol extract was determined. In conclusion, traditional use of *P. brutia* pollens against hepatic disorders has been confirmed in vivo.

USES OF MEDICAL AND AROMATIC PLANTS IN LANDSCAPE RESTORATION WORKS

HÜSEYİN ŞAHİN¹, MURAT ERTEKİN²

ABSTRACT

In the 21. century, rapidly developing technology and industrialization, as being a parallel with this development, the raw material need is increasing constantly. So, made a big production to meet this raw material is caused increasing of mining areas. The mining operation that can be made large production is the open pit operation. In this study, the effects of open pit operation to natural area is examined and explained how to apply of landscape repair for activity of finished areas. In this context, operated in order to make a production of sand + clay and after that in the landscape restoration of the sample area is explored by Sile Forest Management Directorate in the area of Saritas Ridge in Yesilvadi Village which is connect to Sile, Istanbul. The most important point of chosen this area, to be a sample application to the landscape restoration works in the future for our country in order to landscape restoration to the field, as planting the medicinal plants, aromatic plants and as well as stone pine. The datas of the measured characters of planted types are evaluated in the SPSS Statistical Program.

NEW TECHNIQUES IN PROPAGATION AND BREEDING OF BAY LAUREL (LAURUS NOBILIS L.)

MURAT ERTEKİN¹

ABSTRACT

An investigation was carried out to consider the effect of polystimulins (PS), gibberellic acid (GA3) and stratification date on the growth of laurel seedlings. A total of 1200 seed treated with PS-A6+ PS-K and GA3 at two different concentrations before stratified, and a total of 315 seedling were investigated taking account of height, collar diameter, root length and number of leaves. To conclude, it is obvious that hormone application is very effective and has contributed significantly to the metabolism of laurel seedlings. According to this study, the application of GA3 to laurel seedlings has been recommended for practical use in nursery situations.

EFFECTIVE METHODS ON DORMANCY BREAKING OF SEEDS OF AILANTHUS ALTISSIMA (MILL.) SWINGLE

ÖMER LÜTFÜ ÇORBACI¹, MURAT ERTEKİN²

ABSTRACT

This study was conducted in an attempt to break dormancy and thus enhance germination of tree of heaven (*Ailanthus altissima*) seeds. The another aim is to bring new proposals to uses for environmental design. Prior to sowing, seeds were treated as follows: (i) cold stratification of seeds at 4°C for 30 and 60 days; (ii) soaking in 500 mg/l polystimulin (PS-A6+ PS-K), gibberellic acid (GA3), or benzylaminopurine (BAP) for 24 h and stratification for 30 days; or (iii) soaking in 100 ml/l effective microorganisms (EM 1), 5000 mg/l PS-A6+ PS-K, GA3 and BAP for 72 h, followed by stratification for 45 days.

EFFECTS OF ADDITION OF TEREBINTH, SESAME AND FLAXSEED FLOUR TO BISCUIT FORMULATION ON THE QUALITY AND SHELF LIFE OF THE BISCUIT

AYŞENUR USLU¹, NILGÜN ERTAŞ¹

ABSTRACT

Shelf life is an important quality parameter in biscuits. One of the criteria that determines the shelf life is lipid oxidation. During the oxidation of the lipids in foods, the bad taste and smell that occurs as a result of the reaction. In recent years some researches asserted that oxidation products could be serious threat to health. Some of these compounds even have a carcinogenic effect. For this reason, the addition of natural antioxidant compounds to prevent lipid oxidation is mentioned by the researchers. Terebinth, flaxseed, sesame seeds are rich in antioxidants. Terebinth contain important minerals and vitamins, such as B and E vitamins, sodium, phosphorus, potassium, magnesium, iron, calcium, zinc, manganese, copper, cadmium and selenium. Sesame seeds have a strong antioxidants such as sesamol, sesamin, sterols and E vitamin. The oils obtained from of sesame seeds, show a considerable antioxidant effect according to the amount of tocopherols present in the sesame seeds. Flaxseed is an important herbal source of health beneficial compounds. The lignan in flaxseed contains has antioxidant properties. The flaxseed, rich in α -linolenic acid and good quality protein, is also a natural source of phytochemicals such as flavonoid, lignan and phenolic acids. Flaxseed is generally classified as "functional food", "bioactive food" and / or "endocrine active food". In order to increase the shelf life and improve the quality of the biscuits, terebinth, sesame and flaxseed flour added to biscuit formulations. In this study, the physical properties (Diameter thickness, spread ratio), chemical properties (moisture, ash, protein), nutritional properties (phytic acid, total amount of phenolic substance, mineral substance), and shelf life properties (PH, determination of induction times, determination of peroxide) were determined in biscuits enriched with terebinth, sesame and flaxseed flour.

BUCKWHEAT (FAGOPYRUM ESCULENTUM MOENCH) IN HEALTH IMPORTANCE AND FEATURES AS A FUNCTIONAL FOOD

EMİNE FAYDAOĐLU¹, MEHMET REFIK YÜCEL²

ABSTRACT

In this study, the relation of buckwheat to health is evaluated and its features as a functional food will be emphasized. The buckwheat plant has a significant positive effect on health with its naturally occurring components. It is also an important food product for celiac patients because it does not include gluten. Being a functional food, it can be used as raw material in many food items or it can only be consumed as cooked. The phenolic materials, antioxidants and fiber components increase the functional properties and nutritional value of the food which the buckwheat is added. In bread technology and in the production of baked goods, some problems such as low bread volume and hardness are caused. Allergen proteins have been studied which limit the use of buckwheat by enzymatic route or by fermentation.

DETERMINATION OF ANTIOXIDANT CONTENT OF TURKISH PINE (PINUS BRUTIA TEN.) PEEL EXTRACT

PELIN EROĐLU¹, GÖKTÜRK AVŞAR¹, ALI OSMAN ADIGÜZEL², RUKEN ESRA DEMIRDÖĐEN³, FATİH MEHMET EMEN⁴, TUNCAY YEŞILKAYNAK⁵, DERYA YÜKSEL¹, BARIŞ SAÇLI¹

ABSTRACT

Turkey has the highest Turkish pine tree population. Turkish pine, which is such widely spread, is used in forestry industry. Generally plant phenolics constitute natural antioxidant resources. Pine peel extract is rich in polyphenols. Antioxidants effectively fight against free radicals and prevent the damage to the cells. Moreover, Turkish pine peel extract contains a polyphenol called oligomeric proanthocyanidin (OPC) besides these compounds, which are very precious for human health. Data indicate that OPC has very important effects on our health. It is believed that processing Turkish pine peels would provide great health benefits especially for preventing cancer. Besides this Turkish pine peels, which offers a great potential as raw material for us, would also make it possible to provide added value to the pharmaceutical and cosmetic sector. In this study, determination of antioxidant and antibacterial content of the extract, which would be obtained from Turkish pine peels, was targeted. Turkish pine peels are ground. The powder thus obtained was extracted for 6 hours in a soxhlet extractor. It was determined that the ethanol extract of Turkish pine showed more than 50% inhibition in a concentration range between 1-10 mg/mL. However, it was determined that the radical scavenging effect of Turkish pine extract decreased as the concentration increases. Nevertheless, it was observed that this decrease was at a low ratio. When incubation periods are considered an inhibition above 50% was observed in 30 minutes at all concentrations. It was determined that according to this the concentration at which the radical scavenging effect would be the maximum is 1mg/mL.

HUMAN HEALTH EFFECTS OF PSEUDO-CEREAL

ELIF ÖNCEL¹, MUSTAFA KÜRŞAT DEMİR¹

ABSTRACT

HUMAN HEALTH EFFECTS OF PSEUDO-CEREAL Elif ÖNCEL, M. Kürşat DEMİR
Cereals and cereal products constitute a large part of our daily diet. However, cereal-like products are at the forefront, as common grains contain gluten protein and people with celiac disease should not consume gluten-containing foods. Pseudo-cereals in this context (quinoa, buckwheat and amaranth) are a good alternative due to gluten-free and high nutritional values. In addition to being a good source of protein, pseudo-cereals with balanced amino acid content also possess antioxidant properties. Quinoa, buckwheat and amaranth are a good source of vitamin-E and are thought to potentially have cholesterol-lowering properties with these characteristic. In recent years clinical studies have shown that amaranth as well as being an alternative to celiac disease, have also anticarcinogenic, antiallergic, antihypertensive and cholesterol-lowering properties due to anti-tumoral peptides such as lunasin and some other components. Buckwheat also has important phenolic components. Rutine in its content, which can be seen as a good cardiovascular drug for the treatment of disorder, are diglucosides flavanols. Rutine also reduces high blood pressure and prevents hemorrhagic diseases. On the other hand, polyphenols contained in quinoa have a great importance due to antioxidative and potential anticarcinogenic effect, which suggests the possibility of strengthening the immune system against cancer. In this review; the phenolic and antioxidative properties of quinoa, buckwheat and amaranth which have both balanced amino acid content and significant phenolic components have been mentioned.

PHYTOCHEMISTRY AND BIOACTIVITY OF NATURAL PRODUCTS FROM CEPHALARIA TUTELIANA

MERVE DAĐLI¹, SUHEYL KIRMIZIGÜL¹, NAZLI SARIKAHYA¹

ABSTRACT

Natural products are the source of numerous therapeutic agents. Recent progress to discover drugs from natural sources has resulted in compounds that are being developed to treat cancer, resistant bacteria, viruses and disorders [1]. *Cephalaria* genus which is belonging to Caprifoliaceae family has 94 species in Turkey. These species are widely spread out in Mediterranean Region [2]. Triterpenoid metabolites are the major class of this genus as well as iridoid, flavonoid, lignan glycosides and alkaloids. *Cephalaria* species have also many biological activities such as antioxidant, antimicrobial, antifungal and cytotoxic activities [3-7]. Considering this knowledge, our purpose is to isolate the seconder metabolic components from *Cephalaria tuteliana* which is an endemic plant collected from Istanbul-Turkey. The isolation and purification studies on n-BuOH fraction of *C. tuteliana* were performed by chromatographic (CC, TLC, VLC, MPLC) and chemical methods. Structures of the isolated natural compounds were determined with the help of different spectroscopic techniques (IR, 1D-, 2D-NMR, MS, HRMS, GC-MS). The potential biological activities of these natural compounds were also investigated. References 1. Ikan, R. Naturally occurring glycosides, Chichester, England: John Wiley & Sons, (1999). 2. SYNTHESIS OF GYPSOGENIN-CHALCONE HYBRID COMPOUNDS

SAFİYE EMİRDAĞ-ÖZTÜRK¹, N. GÖKÇE ULUSOY¹, NURAN KAHRIMAN², VILDAN SERDAROĞLU², NURETTİN YAYLI²

ABSTRACT

Gypsogenin aglycone (3-Hydroxy-23-oxoolean-12-en-28-oic acid), a natural saponin, is isolated from many plants belonging to carnations family (Caryophyllaceae). Gypsogenin with the pentacyclic triterpenic structure is a natural compound. It is well known that gypsogenin aglycone with sugar chains has shown a variety of biological properties such as antiviral, antitumor, anticarcinogenic, antioxidant and anti-cancer. However the gypsogenin aglycone that obtained from water extract of *Gypsophila arrostii* roots. Water used in making the halvah, is obtained from boiling water of *Gypsophila arrostii* plant roots. are obtained by boiling water. On the other hand, chalcones are natural aglycone compounds which display a wide range of biological activities, such as anticancer, antimutagenic, antiinflammatory, antituberculosis, antimalarial, antileishmanial, nitric oxide regulation modulatory, cardiovascular, and antihyperglycemic, activities. when a biodynamic heterocyclic system was combined with another, obtained natural products are the most challenging class of compounds for the total synthesis, due to their structural diversity and complexity as well as the interesting biological activity. Therefore, we designed and synthesized new gypsogenin-chalcone hybrid compounds in this study. Firstly, Gypso-Anhd compound was synthesized by substitution reactions involving acetylation at C-3 in gypsogenin aglycone. Nevertheless, methoxy substituted chalcones were synthesized. Then, in the third step of the study, Gypso-Anhd compound was combined with chalcone derivatives by using DCC/DMAP in DCM. Up to now, in our continuous research, we synthesized new gypsogenin-chalcone compounds (1-3). The synthesized compounds were established by IR, UV, ¹H NMR, ¹³C NMR, and LCMS analyses.

KEFİRAN FILMS

EDA ÖNDÜL KOÇ¹, MAHMUT İNAL²

ABSTRACT

Edible films are thin layers of materials used to protect and preserve many food products. The use of these protective coatings and suitable packaging by the food industry has become a topic of great interest because of their potentiality for increasing the shelf life of many food products. The largest part of materials used in packaging industries is produced from non-renewable material with the negative environmental consequence. Today, there is a big effort to extend the shelf life and enhance food quality while reducing packaging waste has encouraged the exploration of new biobased packaging materials, such as edible and biodegradable films from renewable resources. Water-soluble polysaccharides such as starch, chitosan, cellulose derivatives, alginate, carrageenan and pectin can form polysaccharide-based edible films. Kefir grains, the starter for obtaining the sour fermented milk kefir, are gelatinous irregular masses, composed of proteins and polysaccharides that contain LAB, acetic acid bacteria and yeasts involved in the fermentation. This polysaccharide component is a heteropolysaccharide containing equal amount glucose and galactose. This work focus on a review of the available literature on the properties and production of edible films based on kefiran.

KEFİRAN EXOPOLYSACCHARIDE

EDA ÖNDÜL KOÇ¹, MAHMUT İNAL²

ABSTRACT

Kefir is a fermented dairy product with viscous, whitish color, and effervescent property. Lactic acid, acetic acid, ethanol, carbon dioxide and other compounds such as acetaldehyde, diacetyl and acetoin occur as a result of fermentation in the kefir product. Kefiran, a neutral polysaccharide that constituted by glucose and galactose produced by *Lactobacillus kefirianofaciens*, a lactic acid bacterium present in kefir grains and also in fermented product such as milk and whey. Kefiran, which has GRAS (generally recognized as safe) status, has been found to improve rheological properties of fermented milk. This exopolysaccharide has also several health promoting properties including antimicrobial activity, immunomodulating activity, anti-inflammatory activity and antiproliferative activity. Kefiran can be used as a food additive for its rheological properties. It has viscoelastic properties and is able to form gel at low temperature. It can use suitable packaging in food industry because of its potentiality for increasing the shelf life of many food products. In this study, we will focus on chemical and physical characteristics and health benefits of the exopolysaccharide produced by kefir grains during milk fermentation.

EVALUATION OF ANTIHEMORRHOIDAL ACTIVITY OF CAPSELLA BURSA-PASTORIS ON EXPERIMENTAL HEMORRHOIDS IN RATS

BETÜL APAYDIN YILDIRIM¹, ŞABAN KORDALI¹, SERKAN YILDIRIM¹, FATİH YILDIRIM¹

ABSTRACT

In this study was aimed to investigate effects on the levels of plasma and rekto-anal tissue some biochemical parameters of Capsella bursa-pastoris extract on hemorrhoid rats. A total of 48 Sprague Dawley female rats, weighing 200-250 g were used in the present study. Thirty six rats were randomly assigned into 6 experimental groups (8 rats per group). They were allowed to adapt to laboratory conditions for 7 days. The study was conducted for 18 days. Rats were divided into the following groups: Group I: Control Group, Group II: Croton oil, Group III: Capsella bursa-pastoris extract, Group IV: Croton oil + Capsella bursa-pastoris extract, Group V. Capsella bursa-pastoris tea and Group V: Croton oil+ Capsella bursa-pastoris tea. After 3 days of croton oil application, rats were treated with Capsella bursa-pastoris for 15 days. Blood and recto-anal tissue samples were collected for biochemical and histopathological studies. Plasma and recto-anal tissue GSH, CAT, GPx and SOD activity were significantly decreased in compared to CO group. Despite this decrease, plasma TNF- α , IL-6 and MDA; recto-anal MDA and MPO levels increased in this group. In contrast plasma and recto-anal tissue GSH, CAT, GPx and SOD activity were significantly increased, plasma TNF- α , IL-6 and MDA; recto-anal MDA and MPO levels decreased in following treatment with CBE and CBT. In conclusion, we recommend both extract and tea can be used safely for the treatment of hemorrhoids in the large population of patients who do not want to undergo surgery and do not want to use drugs or cream due to their many side effects but C. bursa pastoris tea gave more positive results than extract form as biochemical and histopathological findings. C. bursa pastoris tea can improve the health and quality of life of people who suffer from hemorrhoid disease.

ABSTRACT

With its geographical place, climate and plant variety, agricultural potential and wide surface area Turkey is one of the leading countries in plant trade. This importance of Turkey is due to the plants, which give many of the products that constitute input to herbal medicine, plant chemicals, food and additives, cosmetics and perfume industries of developed countries, in the flora of our country. The main factor, which makes plants valuable, is the valuable chemical compounds they contain. The dirty air, which we breathe all day, harmful sun-rays, dangerous substances in the bad food, additives, unconscious eating habits and sedative lifestyle causes substances called free radicals to be produced in the body. The molecules, which minimize and block the effect of free radicals in the body, stop the chain reactions that may lead to many diseases and early aging, are called "antioxidants". Our body responds to these activities via antioxidants. Antioxidant molecules are the substances which protect our body against radicals that trigger many diseases such as cancer, inflammatory, coronary and atherosclerotic diseases. Antimicrobial substances placed in cosmetics provide protection against microbial deterioration. Therefore, plant extracts which have antimicrobial properties commonly used in cosmetics. In this study, the extracts of some plants (i.e., *Lavandula angustifolia*, *Hypericum perforatum* and *Urtica dioica*) grown in the geography of Mersin region and which have commercial value were obtained. Antibacterial and antioxidant properties of these extracts were investigated and the extracts showed significant antibacterial effect. Collected plant materials were extracted with ethanol by Soxhlet. The antimicrobial activity of *Lavandula angustifolia*, *Hypericum perforatum* and *Urtica dioica* extracts against *Staphylococcus aureus* (Gram positive) and *Escherichia coli* (Gram negative) was assessed by the agar-well diffusion method. One loop *S. aureus* and *E. coli* colonies were inoculated to 10 mL Nutrient Broth including 3 g/L meat extract and 5 g/L peptone and then incubated at 37 °C for 24 h. Population density of *S. aureus* and *E. coli* cultures was determined by McFarland standard and 100 µL bacterial suspension containing approximately 1.0 x 10⁶ CFU/mL cell was spread on to Nutrient Agar. The well was filled with 100 µL plant extract (50 mg/mL). Subsequently, the plates were incubated at 37 °C for 24 h. The diameter of the inhibition zones was measured as millimeters. The results showed that *Urtica dioica*, *Lavandula angustifolia*, *Hypericum*

perforatum extracts have inhibition effect on growth of E.coli and S. aureus. Additionally, it was determined that these plant extracts were more effective on growth of S. aureus than that of E.coli. It might be due to the differences in cell wall structure of bacteria. The results may suggest that extracts of *Lavandula angustifolia*, *Hypericum perforatum* and *Urtica dioica* which have antimicrobial properties can be used for prevention self-life of cosmetics.
