Keywords: Pyridoxine hydrochloride, Nicotinamide, Spectrophotometry; Potassium Iodide, Potassium Iodate; Pharmaceutical Formulations

ABSTRACT: A simple, precise and reliable spectrophotometric method for the determination of pyridoxine hydrochloride (vitB₆) and nicotinamide (vitB₃) in pure form and pharmaceutical formulations has been described. The method is based on the reaction of studied vitamin with a mixture of potassium iodide and potassium iodate in aqueous medium at (25 ± 0.5°C) to form yellow colored tri iodide ions (I₃⁻). The reaction is followed spectrophotometrically by measuring the absorbance at 290, 335 and 288, 350 nm for vitB₆ and vitB₃ respectively. Beer's law was obeyed in the range of 0.5-20.0 µg mL⁻¹ for all procedures. Molar absorptivities were found to be 1.49 × 10⁴, 1.93 × 10⁴ and 0.89 × 10⁴, 1.25 × 10⁴ L mol⁻¹ cm⁻¹, for determination of vitB₆ and vitB₃ at 290, 335 and 288, 350 nm respectively. The proposed method has been applied to determine the components in commercial forms with no interference from the excipients. A comparative study between the suggested procedures and the official methods showed no significant difference between the two methods.

1. INTRODUCTION

Vitamin B₆, also known as pyridoxine HCl is 3-hydroxy-2-methylpyridine 4,5-dimethanol hydrochloride (Figure 1.a). VitB₆ is constituent of the enzyme system concerned with transamination and decarboxylation of amino acid. Its deficiency leads to neurological and neuromuscular disorders.

Vitamin B₃, also known as (nicotinamide, nicotinic acid, niacin, or PP) is 3-Pyridinecarboxamide (Figure 1.b). VitB₃ is required for cell respiration, for proper circulation and healthy skin, for the functioning of the nervous system and for the normal secretion of bile and stomach fluids

Figure 1: Chemical structures of a) Vitamin B₆, b) Vitamin B₃. [1]

Many methods have been developed for the determination of vitB₆ in pharmaceutical formulations include spectrophotometry [2-6], spectrofluorimetry [7], voltammetry [8-12], potentiometry [13,14]. vitB₃ has been determined in pharmaceutical formulations by chemical luminescence [15], spectrophotometry [16]. Several methods have been developed for the

Abstract: Cefotaxime (Cfm) is a member of the third generation of the Cephalosporin antibiotics. It used on a wide scale in prescribed antibiotic drugs as anti-infection for gram-positive microorganisms and gram-negative microorganisms. The present study aimed to develop an HPLC method of Cfm analysis enjoyed highly linearity, repeatability, robustness, ruggedness, selectivity, rapidly and economical to use. The chromatographic method uses a reversed phase column BDS column (150 mm x 4.0 mm x 5 μ m). The mobile phase was prepared by mixing Methanol: Phosphate buffer (1000 mL: 130 mL) and the pH was adjusted to 6.15 at isocratic flow rate 1.0 mL/min with PDA detector at 235nm, column oven adjusted at 30 $^{\circ}$ C and injection volume 20 μ L. The method revealed that satisfied linearity regression R^2 (0.9992) with repeatability (0.15%) with DL and QL: 35.5 ng/mL and 107.6 ng/mL, respectively. The method showed a successful application of analytical method validation for Cfm in bulk and pharmaceutical formulations.
