From Wikipedia, the free encyclopedia Metenolone enanthate, or methenolone enanthate, sold under the brand names Primobolan Depot and Nibal Injection, is an androgen and anabolic steroid (AAS) medication which is used mainly in the treatment of anemia due to bone marrow failure. It is given by injection into muscle. Methenolone Enanthate injection is available in 100mg/ml ampoule and has a duration of action (due to the gradual transition of the drug from the muscles in the blood), at approximately 2 weeks. Methenolone has no estrogenic side effects, and its effects on cholesterol levels are minimal. #anatomicalart #anatomyart #cabinetofcuriosities #patchjeans #anatomyartwork

(Methenolone Enanthate) Methenolone is an anabolic androgenic steroid that was first released in 1962 by Squibb under the trade name Nibal (oral) and Nibal Depot (injectable). This was a very short-lived product on the U.S. market and by the mid-1960's the German pharmaceutical powerhouse Schering would own all rights to the Methenolone hormone. The injectable format (Methenolone Enanthate) in particular is simply Methenolone with the Enanthate ester bound to the Methenolone chemical structure. Specifically, 'Enanthate' is Enanthoic acid (also known as carboxylic acid), but once bound to Methenolone it is properly referred to in chemistry as an ester bond (or ester linkage).

These systems they are devising to inspect little girls' genitals operate based off of complaints. These bills are intended to harm trans girls, and you should absolutely care about that, but the practical effect of these policies is that they allow competitors to weaponize state-sanctioned child abuse against ANY girl who is perceived to be "too masculine". Cis girls can and will be accused of being trans, and they will be subjected to these inspections. [made my day](#)
