5 Things Athletes Should Know About Boldenone | USADA

Real Boldenone, also known as Boldenone Undecylenate, is an anabolic androgenic steroid derived from testosterone. Its unique chemical structure enables it to provide significant benefits in muscle growth, strength gains, and overall athletic performance.

Boldione is an anabolic androgenic steroid (AAS) related to boldenone, androstenedione, and testosterone bearing two double bonds in C1 and C4 positions. Boldione is rapidly transformed to the well-known AAS boldenone, being both compounds included in the list of prohibited substances and methods published yearly by the World Anti-Doping Agency .

Carbon isotope ratios of nandrolone, boldenone, and testosterone .

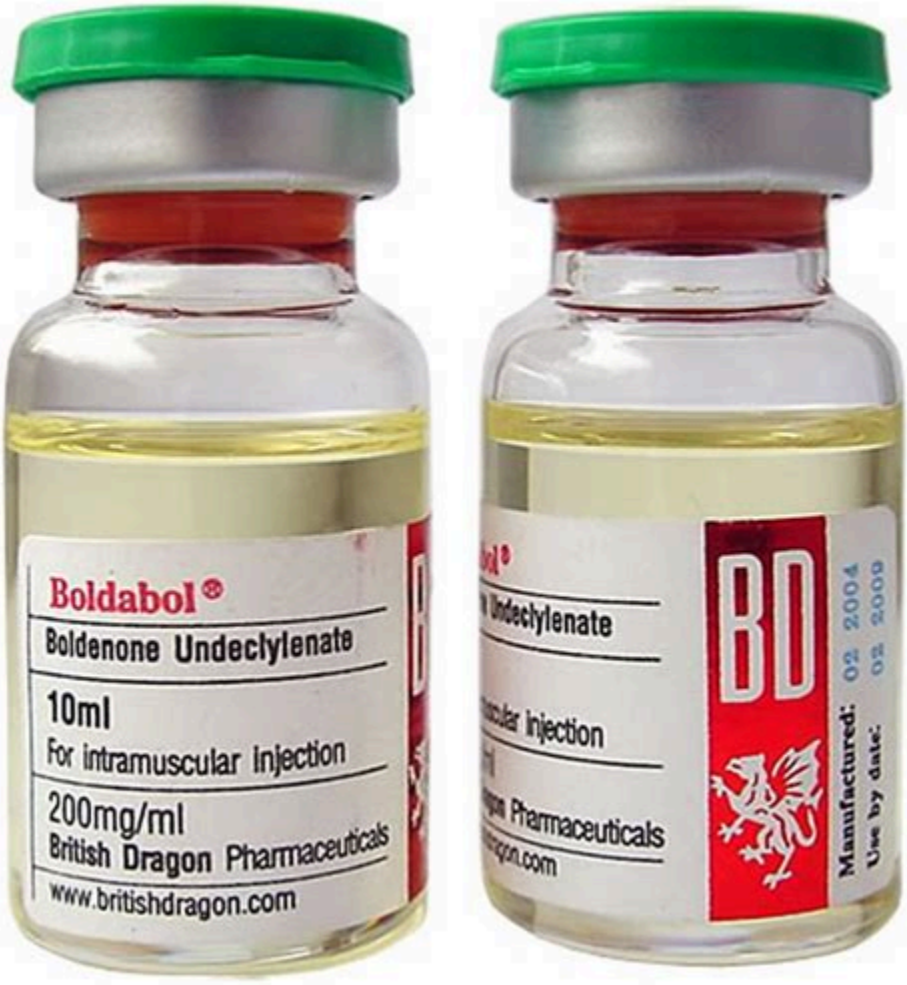

Boldenone is a derivative of testosterone that has an additional double bond between the carbons 1 and 2 of its molecule. Because of its characteristics, the rate at which it is released is noticeably more gradual than that of other steroids. Following the first peak, which will only last a few days, there will be a gradual release that will .

Boldenone vs Trenbolone: (An In-Depth Comparison)

17β-Boldenone, also called 1-dehydrotestosterone or androsta-1,4-diene-17β-ol-3-one, differs from 17β-testosterone by only one double bond at the 1-position. Since 2000, boldenone has been detected in an increased number of biological samples (mostly veal calves) in different EU Member States.

Boldenone Undecylenate: Side Effects, Benefits, and Steroid Cycle .

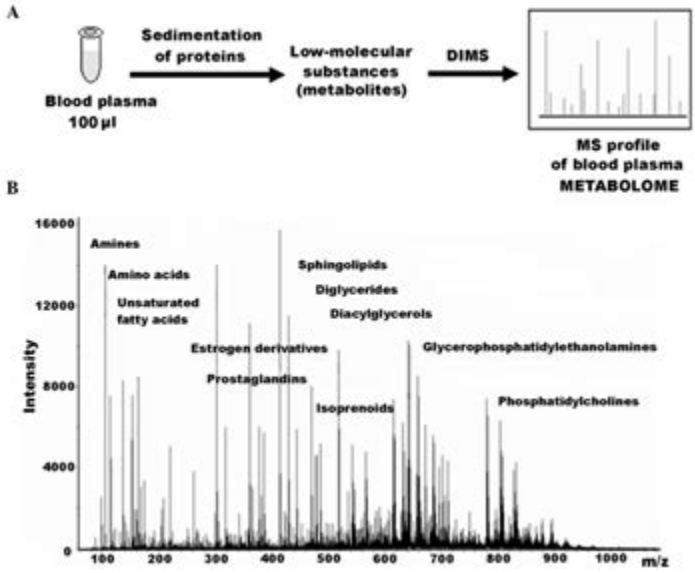

Boldenone (Equipoise) Vs DHB (Dihydroboldenone) Boldenone (Equipoise) is a derivative of Testosterone that was created by adding a double-bond between carbon atoms one and two. This bond dramatically slows aromatization and makes the steroid a poor substrate for 5-alpha reductase. While Boldenone is a substrate for 5-alpha reductase and can be .

Boldenone Undecylenate (BLD) is a synthetic derivative of testosterone and a widely used anabolic androgenic steroid. The health risk of BLD use as a pharmaceutical or dietary supplement is still underestimated and under-reported. Vitamin C (VC) has been recognized as an antioxidant with prominent hepatorenal protective effects. This study investigated the possible preventive activity of VC .

Boldenone Undecylenate (BLD) is a synthetic derivative of testosterone and a widely used anabolic androgenic steroid. The health risk of BLD use as a pharmaceutical or dietary supplement is still underestimated and under-reported. Vitamin C (VC) has been recognized as an antioxidant with prominent hepatorenal protective effects. This study investigated the possible preventive activity of VC against BLD-induced hepatorenal damage. Forty adult male Wistar rats were classified into five groups: control, vehicle control, VC (orally given 120 mg/kg b. wt./day), BLD (intramuscularly injected 5 mg/kg b. wt./week), and BLD + VC-treated groups. The experiment continued for eight weeks. Serum levels of alanine aminotransferase (ALT) and aspartate aminotransferase (AST) were measured. Serum contents of total protein (TP), albumin (ALB), globulin, total cholesterol (TC), triglycerides (TG), high-density lipoprotein-cholesterol (HDL-C), low-density lipoprotein-cholesterol (LDL-C), and very-low-density lipoprotein–cholesterol (VLDL-C) were also assayed. Urea, creatinine, and uric acid levels were determined together with sodium and potassium electrolytes measuring. Moreover, oxidative stress indicators including reduced glutathione (GSH), glutathione peroxidase (GPx), glutathione-S-transferase (GST), and glutathione reductase (GSR) as well as malondialdehyde (MDA) levels were measured in both hepatic and renal tissues. Corresponding histological examination of renal and hepatic tissues was conducted. Besides, immunohistochemical evaluations for androgen receptors protein (AR) and heat shock protein 90 (Hsp 90) expressions were performed. BLD caused significant rises in serum ALT, AST, TP, ALB, TC, TG, LDL-C, VLDL-C, urea, creatinine, uric acid, potassium, and MDA levels. Further, BLD-injected rats showed significant declines in the serum levels of HDL-C, sodium, GSH, GPx, GST, and GSR. Besides, distinct histopathological

The boldenone preparations showed δ(13) CVPDB values in the range of -32. 0 ‰ to -27. 8 ‰, and for comparison the testosterone preparations showed δ(13) CVPDB values of -31. 0 ‰ to -24. 2 ‰. The results showed that the values measured in the nandrolone and boldenone preparations were in the same range as those measured in the testosterone .
