Mojang mentioned it was "wanting into other ways" to present Minecraft a brand new look, and that it had information on optimizing the constructive game for varied platforms "very quickly." The title won't be caught with its present look (nonetheless charming it could also be) eternally, but it might take considerably longer earlier than it catches up with modern technology. It would sound like I'm simply gushing over pretty graphics, however after spending hours in this Minecraft beta, I'm more excited than ever about how ray tracing will change the way we experience games. Whereas they will sometimes appear overused, like the way in which J.J. Given these limitations, I don't expect many video games to go all-in on ray tracing anytime soon -- certainly not in the way we've seen in Minecraft. Forget the rush to 4K -- we'll decide future games by how effectively they implement ray tracing and graphical upgrades you'll actually discover.

Partnering with Chinese web company NetEase is what's made this growth doable, the exact same NetEase that operates video games like World of Warcraft and Hearthstone in China already. NVIDIA claims an RTX 2080 Max-Q machine, like Acer's Triton 500, will hit 57 FPS in Minecraft with ray tracing and DLSS enabled. And the hit is even greater on the extra inexpensive RTX 2060, which falls to round 30 FPS in keeping with NVIDIA's benchmarks. Once I flipped that on, Minecraft jumped to round 93FPS in 1080p on my system. Ray tracing feels much like HDR in that it's a new way so as to add depth and texture, no matter if it's rendered in 1080p or 4K. I've all the time found the rush to 4K to be a bit foolhardy.
