

Fluorescent Singapore

You want an energy efficient home, but you don't want to lose the mood, the drama or the designer look you like so much. Yet the only way to enjoy significant savings on the monthly utility bill requires switching to fluorescent lighting; that god awful replacement that flickers, hums and threatens to make your living space look as stylish as the cafeteria at the local elementary school.

Fluorescent light bulbs offer consumers a significant benefit when compared to regular light bulbs or incandescent light bulbs. There are many different types of fluorescent lights on the market. The most popular version is compact fluorescent lighting bulbs. This type of bulb is similar in size to a regular old fashioned light bulb but instead the light comes from a coiled or twisted tube. T12 and T8 bulbs are used in long panel mounts.

Singapore Energy Saving Light Bulbs

Fluorescent Light Singapore

Fluorescent lights cost more to purchase but less to operate. The cost savings should ultimately be calculated after taking into account that fluorescent lights last about ten times longer than incandescent lights and help cut down on the need to purchase replacement bulbs as well as on the labor to replace bulbs. Fluorescent lights also generate about 70% less heat in comparison to regular bulbs so they assist in cutting down on cooling costs too.

The cooling cost savings isn't nearly as remarkable as the electric cost savings. Fluorescent lights require $\frac{2}{3}$ less energy to operate. The savings is immense when a large space like a warehouse calculates these cost benefits.

Where To Buy Lights In Singapore
