

Identification Codes

The vehicle identification number (VIN) is a seventeen-digit combination of letters and numbers. The VIN is stamped on a metal tab riveted on the instrument panel, top upper left of the dash. The VIN number is also found on the vehicle certification (VC) label.

Item	Description
1	World Manufacturer Identifier
2	Restraint Type Code
3	Line, Series, Body Type (Passenger Car)
4	Engine Code
5	VIN Check Digit
6	Model Year Code
7	Assembly Plant Code
8	Production Sequence Number

Vehicle Identification Number

The first three vehicle identification number (VIN) positions are the world manufacturer code.

- 1LN — Ford Motor Company (Lincoln), USA, passenger car
- 1LJ — Ford Motor Company (Lincoln), USA, incomplete vehicle

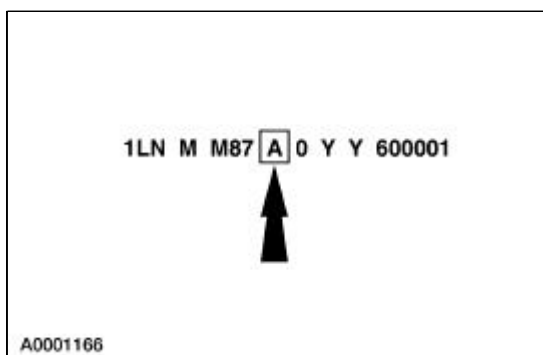

The fourth VIN position is the vehicle restraint system type code.

- M — Active safety belts — all positions, driver and front passenger air bags, driver and front passenger side impact air bags
- F — Active safety belts — all positions, second generation driver and front passenger air bags
- L — Active safety belts — all positions, driver and front passenger air bags

Positions 5 through 7 indicate vehicle line, series and body type.

- M86 — Lincoln LS (six cylinder)
- M87 — Lincoln LS (eight cylinder)

The eighth VIN position is the engine displacement and number of cylinders code.

- A — 3.9L, eight cylinder, DOHC, EFI
- S — 3.0L, six cylinder, DOHC, EFI

The ninth VIN position is the check digit code (0-9).

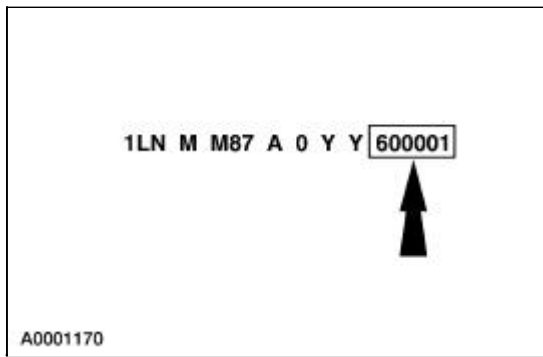

The tenth VIN position is the model year code.

- Y— 2000

The eleventh VIN position is the assembly plant code.

- S — Pilot Plant, Allen Park, Michigan (USA)
- Y — Wixom, Michigan (USA)

The last six VIN positions are the production sequence number.

- Lincoln/Mercury — 600001

Vehicle Certification (VC) Label

The upper portion of the vehicle certification (VC) label contains the manufacturer name, the month and year of manufacture, the certification statement and the VIN. It also includes gross vehicle weight ratings (GVWR). The VC label is located on the left-hand front door jamb.

Item	Description
1	Exterior Paint Color Code
2	Region Code
3	Special Order Code (DSO — Domestic Special Order FSO — Foreign Special Order, PTO — Paint, Tire Option Special Order)

4	Brake Type Code
5	Interior Trim Code
6	Tape/Paint Stripe Code
7	Radio Type Code
8	Axle Ratio Code
9	Transmission Code
10	Spring Code

Vehicle Certification (VC) Label Reference

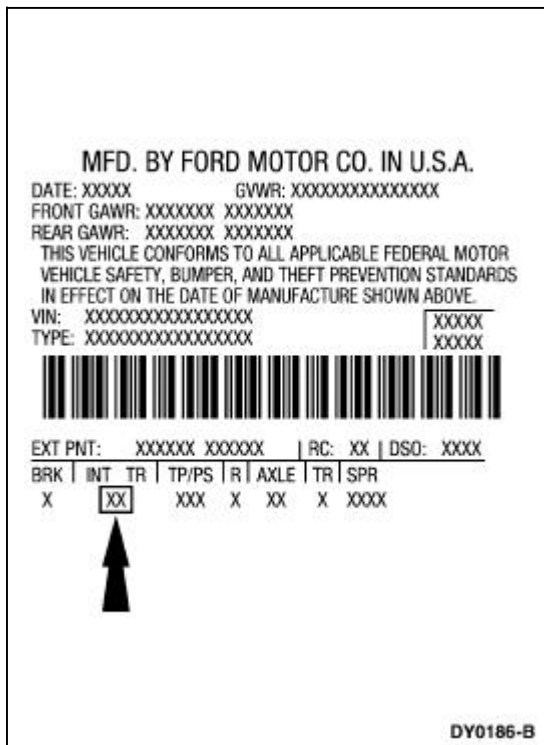

The exterior color codes are:

- BQ — Light Parchment Gold
- FZ — Cordovan
- HC — Ivory Parchment (Tri-Coat)
- KX — Graphite Blue
- LL — Deep Wedgewood Blue
- FU — Dark Satin Green
- ST — Estate Green
- TS — Silver Frost
- TV — Midnight Gray
- UA — Ebony
- WF — White Pearl Tri-Coat
- WT — Performance White

The brake type codes are:

- 6 — Anti-lock brakes (ABS) with Advancetrac®
- 3 — Anti-lock brakes (ABS) with Traction Control

The interior trim codes are listed below. The first letter/number is for the interior fabric. The second letter is for the interior color.

- 3 — Cloth Interior
- 4 — Leather Interior

The interior trim colors are:

- 2 — Light Graphite (not available in cloth interior)
- H — Medium Parchment
- T — Truffle
- W — Midnight Black

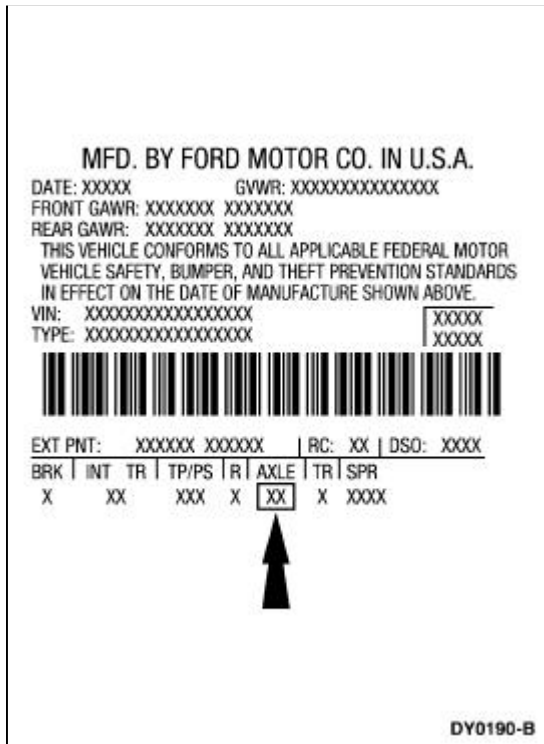

Tape and paint stripe codes do not apply.

The radio type codes are:

- 8 — Premium AM/FM stereo cassette with clock

The axle ratios are:

- Axle tag number: 554B — 3.31 conventional
- Axle tag number: 556B — 3.58 conventional

The transmission/transaxle codes are:

- 5 — 5-Speed manual (M5 221), Getrag
- A — 5-speed, automatic (5R55N), Sharonville

The spring codes are:

- FPK — 5310 — Front spring (LH)

- CSH — 5310 — Front spring (LH)
- ETR — 5310 — Front spring (RH)
- AML — 5310 — Front spring (RH)
- 5560 — Rear spring

Jacking

⚠ WARNING: Never run the engine with one wheel off the ground, such as when changing a tire. The wheel still on the ground could cause the vehicle to move.

⚠ CAUTION: The jack (17080) provided with the vehicle is intended to be used in an emergency for changing a deflated tire. To avoid damage to the vehicle, never use the jack to lift the vehicle for any other purpose. Refer to the Owner Literature when using the jack supplied with the vehicle.

⚠ CAUTION: Under no circumstances should the vehicle ever be lifted by the front control arms, suspension arm brackets, (if equipped) front I-braces, rear stabilizer or differential housing. Severe damage to the vehicle could result.

⚠ CAUTION: Do not attempt to use jack pressure on either the front bumper (17757) or the rear bumper (17906) of any vehicle. Damage to the bumper covers will occur.

Lift the vehicle using the following procedure.

Jacking Points

To lift the front or either side of the front end, position the floor jack or the hoist under the front frame lift points.

To lift the rear or either side of the rear end, position the floor jack or the hoist under the rear lift points.

Lifting

 **CAUTION:** Do not allow the lift adapters to contact the steering linkage, suspension arms, (if equipped) front I-braces, stabilizer bar, or to compress the lower suspension arm stabilizer bar insulator (5493). Damage to the suspension, exhaust and steering linkage components may occur if care is not exercised when positioning the lift adapters prior to lifting the vehicle.

 **CAUTION:** Never use the differential housing as a lift point. Damage to the differential housing and cover may occur.

 **CAUTION:** Do not lift the vehicle on the rocker panel pinch flange except at the designated lift points or body damage may occur.

Lift the vehicle using the following procedure.

Lifting Points—Drive-On Hoist

 **CAUTION:** To prevent possible damage to the underbody, do not drive the vehicle onto the drive-on hoist without first checking for possible interference.

Check for interference between the upright flanges of the hoist rails and the underbody.

If an interference exists, modify the hoist flanges or build up the approach ramps as necessary to provide clearance.

Lifting Points—Frame Contact Lift, Single-Post Lift, Two-Post Lift

⚠ CAUTION: Under no circumstances should the vehicle be lifted by the front control arms, (if equipped) front I-braces, or rear control arms. Severe damage to the vehicle could result.

⚠ CAUTION: Do not position the lift pads under the No. 3 crossmember.

NOTE: Adapters maybe necessary to clear vehicle components to lift the vehicle safely. The adapters must be placed at the four designated contact points. Position the adapters so they are centered on the adapter contact area.

Lift the vehicle at the applicable lift points.

Noise, Vibration And Harshness (NVH)

Noise is any undesirable sound, usually unpleasant in nature. Vibration is any motion, shaking or trembling, that can be felt or seen when an object moves back and forth or up and down. Harshness is a ride quality issue where the vehicle's response to the road transmits sharply to the customer. Harshness normally describes a firmer than usual response from the suspension system. Noise, vibration and harshness (NVH) is a term used to describe these conditions, which result in varying degrees of dissatisfaction. Although, a certain level of NVH caused by road and environmental conditions is normal. This section is designed to aid in the diagnosis, testing and repair of NVH concerns.

Acceptable Noise, Vibration and Harshness

All internal combustion engines and drivelines produce some noise and vibration; operating in a real world environment adds noise that is not subject to control. Vibration isolators, mufflers and dampers reduce these to acceptable levels. A driver who is unfamiliar with a vehicle can think that some sounds are abnormal when actually the sounds are normal for the vehicle type. For example, Traction-Lok® differentials produce a slight noise on slow turns after extended highway driving. This is acceptable and has no detrimental effect on the locking axle function. As a technician, it is very important to be familiar with vehicle features and know how they relate to NVH concerns and their diagnosis. For example, if the vehicle has automatic overdrive, it is important to test drive the vehicle both in and out of overdrive mode.

Diagnostic Theory

The shortest route to an accurate diagnosis results from:

- system knowledge, including comparison with a known good system.
- system history, including repair history and usage patterns.
- condition history, especially any relationship to repairs or sudden change.
- knowledge of possible sources.
- using a systematic diagnostic method that divides the system into related areas.

The diagnosis and correction of noise, vibration and harshness concerns requires:

- a road or system test to determine the exact nature of the concern.
- an analysis of the possible causes.
- testing to verify the cause.
- repairing any concerns found.
- a road test or system test to make sure the concern has been corrected or brought back to within an acceptable range.

Glossary of Terms

Acceleration-Light

An increase in speed at less than half throttle.

Acceleration-Medium

An increase in speed at half to nearly full throttle, such as 0-97 km/h (0-60 mph) in approximately 30 seconds.

Acceleration-Heavy

An increase in speed at one-half to full throttle, such as 0-97 km/h (0-60 mph) in approximately 20 seconds.

Ambient Temperature

The surrounding or prevailing temperature.

Amplitude

The quantity or amount of energy produced by a vibrating component (G force). An extreme vibration has a high amplitude. A mild vibration has a low amplitude.

Backlash

Gear teeth clearance.

Boom

Low frequency or low pitched noise often accompanied by a vibration. Also refer to Drumming.

Bound Up

An overstressed isolation (rubber) mount that transmits vibration/noise instead of absorbing it.

Brakes Applied

When the service brakes are applied with enough force to hold the vehicle against movement with the transmission in gear.

Buffet/Buffeting

Strong noise fluctuations (less than 1000 Hz) caused by gusting winds. An example would be wind gusts against the side glass.

Buzz

A low-pitched sound like (200-5000 Hz) that from a bee. Often a metallic or hard plastic humming sound. Also describes a high frequency (200-800 Hz) vibration. Vibration feels similar to an electric razor.

Camber

The angle of the wheel in relation to the true vertical as measured looking from the front of the vehicle. Camber is positive when the wheel angle is offset so that the top of the wheel is positioned away from the vehicle.

Caster

The angle of the steering knuckle in relation to the true vertical as measured looking from the side of the vehicle.

Item	Description
1	Positive caster
2	True vertical
3	Steering axis

Chatter

A pronounced series of rapidly repeating rattling or clicking sounds.

Chirp

A short-duration high-pitched noise associated with a slipping drive belt.

Chuckle

A repetitious low-pitched sound. A loud chuckle is usually described as a knock.

Click

A sharp, brief, non-resonant sound, similar to actuating a ball point pen.

Clonk

A hydraulic knocking sound. Sound occurs with air pockets in a hydraulic system. Also described as hammering.

Clunk/Driveline Clunk

A heavy or dull, short-duration, low-frequency sound. Occurs mostly on a vehicle that is accelerating or decelerating abruptly. Also described as a thunk.

Coast/Deceleration

Releasing the accelerator pedal at cruise, allowing the engine to reduce vehicle speed without applying the brakes.

Coast/Neutral Coast

Placing the transmission range selector in NEUTRAL (N) or depressing the clutch pedal while at cruise.

Constant Velocity (CV) Joint

A joint used to absorb vibrations caused by driving power being transmitted at an angle.

Controlled Rear Suspension Height

The height at which a designated vehicle element must be when driveline angle measurements are made.

Coupling Shaft

The shaft between the transfer case and the front drive axle or, in a two-piece rear driveshaft, the front section.

CPS

Cycles per second. Same as hertz (Hz).

Cracks

A mid-frequency sound, related to squeak. Sound varies with temperature conditions.

Creak

A metallic squeak.

Cruise

Constant speed on level ground; neither accelerating nor decelerating.

Cycle

The process of a vibrating component going through a complete range of motion and returning to the

starting point.

Decibel

A unit of measurement, referring to sound pressure level, abbreviated dB.

Drive Engine Run-Up (DERU) Test

The operation of the engine through the normal rpm range with the vehicle standing still, the brakes applied and the transmission engaged. This test is used for noise and vibration checks.

Driveline Angles

The differences of alignment between the transmission output shaft, the driveshaft, and the rear axle pinion centerline.

Driveshaft

The shaft that transmits power to the rear axle input shaft (pinion shaft). In a two-piece driveshaft, it is the rearmost shaft.

Drivetrain

All power transmitting components from the engine to the wheels; includes the clutch or torque converter, the transmission, the transfer case, the driveshaft, and the front or rear drive axle.

Drivetrain Damper

A weight attached to the engine, the transmission, the transfer case, or the axle. It is tuned by weight and placement to absorb vibration.

Drone

A low frequency (100-200 Hz) steady sound, like a freezer compressor. Also described as a moan.

Drumming

A cycling, low-frequency (20-100 Hz), rhythmic noise often accompanied by a sensation of pressure on the ear drums. Also described as a low rumble, boom, or rolling thunder.

Dynamic Balance

The equal distribution of weight on each side of the centerline, so that when the wheel and tire assembly spins, there is no tendency for the assembly to move from side-to-side (wobble). Dynamically unbalanced wheel and tire assemblies can cause wheel shimmy.

Engine Imbalance

A condition in which an engine's center mass is not concentric to the rotation center, causing excessive motion.

Engine Misfire

When combustion in one or more cylinders does not occur or occurs at the wrong time.

Engine Shake

An exaggerated engine movement or vibration that directly increases in frequency as the engine speed increases. It is caused by non-equal distribution of mass in the rotating or reciprocating components.

Flexible Coupling

A flexible joint.

Float

A drive mode on the dividing line between cruise and coast where the throttle setting matches the engine speed with the road speed.

Flutter

Mid to high (100-2000 Hz) intermittent sound due to air flow. Similar to a flag flapping in the wind.

Frequency

The rate at which a cycle occurs within a given time.

Gravelly Feel

A grinding or growl in a component, similar to the feel experienced when driving on gravel.

Grind

An abrasive sound, similar to using a grinding wheel, or rubbing sand paper against wood.

Hiss

Steady high frequency (200-800 Hz) noise. Vacuum leak sound.

Hoot

A steady low frequency tone (50-500 Hz), sounds like blowing over a long neck bottle.

Howl

A mid-range frequency (200-800 Hz) noise between drumming and whine. Also described as a hum.

Hum

Mid-frequency (200-800 Hz) steady sound, like a small fan motor. Also described as a howl.

Hz

Hertz; a frequency measured in cycles per second.

Imbalance

Out of balance; heavier on one side than the other. In a rotating component, imbalance often causes vibration.

Inboard

Toward the centerline of the vehicle.

Intensity

The physical quality of sound that relates to the strength of the vibration (measured in decibels). The higher the sound's amplitude, the higher the intensity and vice versa.

Isolate

To separate the influence of one component to another.

Knock

A heavy, loud, repetitious sound, like a knock on the door.

Moan

A constant, low-frequency (100-200 Hz) tone. Also described as a hum.

Neutral Engine Run-Up (NERU) Test

The operation of the engine through the normal rpm range with the vehicle standing still and the transmission disengaged. This test is used to identify engine related vibrations.

Neutralize/Normalize

To return to an unstressed position. Used to describe mounts. Refer to Bound Up.

Outboard

Away from the centerline of the vehicle.

Ping

A short duration, high-frequency sound, which has a slight echo.

Pinion Shaft

The input shaft in a driving axle that is usually a part of the smaller driving or input hypoid gear of a ring and pinion gearset.

Pitch

The physical quality of sound that relates to its frequency. Pitch increases as frequency increases and vice versa.

Pumping Feel

A slow, pulsing movement.

Radial/Lateral

Radial is in the plane of rotation; lateral is at 90 degrees to the plane of rotation.

Item	Description
1	Lateral runout
2	Radial runout

Rattle

A random and momentary or short duration noise.

Ring Gear

The large, circular, driven gear in a ring and pinion gearset.

Road Test

The operation of the vehicle under conditions intended to produce the concern under investigation.

Roughness

A medium-frequency vibration. A slightly higher frequency (20 to 50 Hz) than a shake. This type of vibration is usually related to drivetrain components.

Runout

Lateral runout means measuring the movement or "wobble" of a wheel or tire at the sidewall. Radial runout means measuring the out-of-round at the tread surface.

Rustling

Intermittent sound of varying frequency (100-2000 Hz), sounds similar to shuffling through leaves.

Shake

A low-frequency vibration (5-20 Hz), usually with visible component movement. Usually relates to tires, wheels, brake drums or brake discs if it is vehicle speed sensitive, or engine if it is engine speed sensitive. Also referred to as a shimmy or wobble.

Shimmy

An abnormal vibration or wobbling, felt as a side-to-side motion of the steering wheel in the driveshaft rotation. Also described as waddle.

Shudder

A low-frequency vibration that is felt through the steering wheel or seat during light brake application.

Slap

A resonance from flat surfaces, such as safety belt webbing or door trim panels.

Slip Yoke/Slip Spline

The driveshaft coupling that allows length changes to occur while the suspension articulates and while the driveshaft rotates.

Squeak

A high-pitched transient sound, similar to rubbing fingers against a clean window.

Squeal

A long-duration, high-pitched noise.

Static Balance

The equal distribution of weight around the wheel. Statically unbalanced wheel and tire assemblies can cause a bouncing action called wheel tramp. This condition will eventually cause uneven tire wear.

Tap

A light, rhythmic, or intermittent hammering sound, similar to tapping a pencil on a table edge.

Thump

A dull beat caused by two items striking together.

Tick

A rhythmic tap, similar to a clock noise.

Tip-In Moan

A light moaning noise heard during light vehicle acceleration, usually between 40-100 km/h (25-65 mph).

TIR

The acronym for total indicated runout is TIR.

Tire Deflection

The change in tire diameter in the area where the tire contacts the ground.

Tire Flat Spots

A condition commonly caused by letting the vehicle stand while the tires cool off. This condition can be corrected by driving the vehicle until the tires are warm. Also, irregular tire wear patterns in the tire tread resulting from wheel-locked skids.

Tire Force Vibration

A tire vibration caused by variations in the construction of the tire that is noticeable when the tire rotates against the pavement. This condition can be present on perfectly round tires because of variations in the inner tire construction. This condition can occur at wheel rotation frequency or twice rotation frequency.

Transient

A noise or vibration that is momentary, a short duration.

Two-Plane Balance

Radial and lateral balance.

Vibration

Any motion, shaking or trembling, that can be felt or seen when an object moves back and forth or up and down.

Whine

A constant, high-pitched noise. Also described as a screech.

Whistle

High-pitched noise (above 500 Hz) with a very narrow frequency band. Examples of whistle noises are a turbocharger or airflow around an antenna.

Wind Noise

Any noise caused by air movement in, out or around the vehicle.

WOT

The acronym for wide open throttle is WOT.

Tools and Techniques

Electronic Vibration Analyzer (EVA)

The EVA is a hand-held electronic diagnostic tool which will assist in locating the source of unacceptable vibrations. The vibration sensor can be remotely mounted anywhere in the vehicle for testing purposes. The unit displays the three most common vibration frequencies and their corresponding amplitudes simultaneously. A bar graph provides a visual reference of the relative signal strength (amplitude) of each vibration being displayed and its relative G force. The keypad is arranged to make the EVA simple to program and use. Some of the functions include the ability to average readings as well as record, play back and freeze readings. The EVA has a strobe balancing function that can be used to detect imbalance on rotating components such as a driveshaft or engine accessories.

Item	Description
1	EVA screen
2	Frequency mode displayed in rpm or Hz
3	Active sensor input (A or B)
4	Current active mode
5	G force indicators or the strongest frequencies in descending strength of each vibration
6	Strength of each vibration
7	Frequency in rpm/Hz of each vibration

The EVA allows for a systematic collection of information that is necessary to accurately diagnose and repair NVH problems. For the best results, carry out the test as follows:

- a. Test drive the vehicle with the vibration sensor inside the vehicle.
- b. Place the sensor in the vehicle according to feel.
 - If the condition is felt through the steering wheel, the source is most likely in the front of the vehicle.
 - A vibration that is felt in the seat or floor only will most likely be found in the driveline, drive axle or rear wheels and tires.
- c. Record the readings. Also note when the condition begins, when it reaches maximum intensity, and if it tends to diminish above/below a certain speed.
 - Frequencies should be read in the "average" mode.

- Frequencies have a range of plus or minus 2. A reading of 10 Hz can be displayed as an 8 Hz through 12 Hz.
- d. Place the vibration sensor on or near the suspect area outside the vehicle.
- e. Continue the road test, driving the vehicle at the speed the symptom occurs, and take another reading.
- f. Compare the readings.
 - A match in frequency indicates the problem component or area.
 - An unmatched test could indicate the concern is caused by the engine, torque converter, or engine accessory. Use the EVA in the rpm mode and check if concern is rpm related.
 - Example: A vibration is felt in the seat. Place the sensor on the console. Record the readings. Place the vibration sensor on the rear axle. Compare the readings. If the frequencies are the same, the axle is the problem component.

Vibrate Software®

Vibrate Software® (Rotunda tool number 215-00003) is a diagnostic aid which will assist in pinpointing the source of unacceptable vibrations. The engine's crankshaft is the point of reference for vibration diagnosis. Every rotating component will have an angular velocity that is faster, slower, or the same as the engine's crankshaft. Vibrate Software® calculates the angular velocity of each component and graphically represents these velocities on a computer screen and on a printed vibration worksheet. The following steps outline how Vibrate Software® helps diagnose a vibration concern:

- Enter the vehicle information. Vibrate will do all the calculations and display a graph showing tire, driveshaft and engine vibrations.
- Print a Vibration Worksheet graph. The printed graph is to be used during the road test.
- Road test the vehicle at the speed where the vibration is most noticeable. Record the vibration frequency (rpm) and the engine rpm on the worksheet graph. The point on the graph where the vibration frequency (rpm) reading and the engine rpm reading intersect indicates the specific component group causing the concern.
 - An EVA or equivalent tool capable of measuring vibration frequency and engine rpm will be needed.
- Provide pictures of diagnostic procedures to aid in testing components.

Combination EngineEAR/ChassisEAR

An electronic listening device used to quickly identify noise and the location under the chassis while the vehicle is being road tested. The ChassisEARs can identify the noise and location of damaged/worn wheel bearings, CV joints, brakes, springs, axle bearings or driveshaft carrier bearings.

EngineEAR Basic Unit

An electronic listening device used to detect even the faintest noises. The EngineEARs can detect the noise of damaged/worn bearings in generators, water pumps, A/C compressors and power steering pumps. They are also used to identify noisy lifters, exhaust manifold leaks, chipped gear teeth and for detecting wind noise. The EngineEAR has a sensing tip, amplifier, and headphones. The directional sensing tip is used to listen to the various components. Point the sensing tip at the suspect component and adjust the volume with the amplifier. Placing the tip in direct contact with a component will reveal structure-borne noise and vibrations, generated by or passing through, the component. Various volume levels can reveal different sounds.

Ultrasonic Leak Detector

The Ultrasonic Leak Detector is used to detect wind noises caused by leaks and gaps in areas where there is weather-stripping or other sealing material. It is also used to identify A/C leaks, vacuum leaks

and evaporative emission noises. The Ultrasonic Leak Detector includes a multi-directional transmitter (operating in the ultrasonic range) and a hand-held detector. The transmitter is placed inside the vehicle. On the outside of the vehicle, the hand-held detector is used to sweep the area of the suspected leak. As the source of the leak is approached, a beeping sound is produced which increases in both speed and frequency.

Squeak and Rattle Repair Kit

The squeak and rattle repair kit (Rotunda tool number 164-R4900) contains lubricants and self-adhesive materials that can be used to eliminate interior and exterior squeaks and rattles. The kit consists of the following materials:

- PVC (soft foam) tape
- Urethane (hard foam) tape
- Flocked (black fuzzy) tape
- UHMW (frosted) tape
- Squeak and rattle oil tube
- Squeak and rattle grease tube

Tracing Powder

Tracing powder is used to check both the uniformity of contact and the tension of a seal against its sealing surface. These tests are usually done when a suspected air leak/noise appears to originate from the seal area or during the alignment and adjustment of a component to a weatherstrip. Tracing powder can be ordered from Crest Industries as ATR Leak Trace. Carry out the tracing powder test as follows:

- a. Clean the weatherstrip.
- b. Spray the tracing powder on the mating surface only.
- c. Close the door completely. Do not slam the door.
- d. Open the door. An imprint is made where the weatherstrip contacted the mating surface seal. Gaps or a faint imprint will show where there is poor contact with the weatherstrip.

Index Card

Place an index card or a piece of paper between the weatherstrip and the sealing surface, then close the door. Slowly withdraw the index card or paper after the door is closed and check the amount of pressure on the weatherstrip. There should be a medium amount of resistance as it is withdrawn. Continue around the entire seal area. If there is little or no resistance, this indicates insufficient contact to form a good seal. At these points, the door, the glass, or the weatherstrip is out of alignment.

Noise, Vibration And Harshness (NVH)

Special Tool(s)

 ST2048-A	ChassisEAR 107-R2102 or Equivalent
 ST2311-A	Vibration Analyzer 100-F027 (014-00344) or Equivalent
 ST2312-A	EngineEAR 107-R2100 or Equivalent
 ST2314-A	Ultrasonic Leak Detector 134-R0135 or Equivalent

To assist the service advisor and the technician, a Write-up Job Aid and an NVH Diagnostic Guide are included with this material. The Write-up Job Aid serves as a place to record all important symptom information. The NVH Diagnostic Guide serves as a place to record information reported on the Write-up Job Aid as well as data from the testing to be carried out.

To begin a successful diagnosis, fill out the NVH Diagnostic Guide, record the reported findings, then proceed to each of the numbered process steps to complete the diagnosis.

NVH DIAGNOSTIC GUIDE

Dealer: _____ Date: _____

1: Customer Interview

The diagnostic process starts with the customer interview. The service advisor must obtain as much information as possible about the concern and take a test drive with the customer. There are many ways a customer will describe NVH concerns and this will help minimize confusion arising from descriptive language differences. It is important that the concern is correctly interpreted and the customer descriptions are recorded. During the interview, ask the following questions:

- When was the concern first noticed?
- Did the concern appear suddenly or gradually?

- Did any abnormal occurrence coincide with or proceed its appearance?

Use the information gained from the customer to accurately begin the diagnostic process.

2: Pre-Drive Check

It is important to do a pre-drive check before road testing the vehicle. A pre-drive check verifies that the vehicle is relatively safe to drive and eliminates any obvious faults on the vehicle.

The pre-drive check consists of a brief visual inspection. During this brief inspection, take note of anything that will compromise safety during the road test and make those repairs or adjustments before taking the vehicle on the road.

3: Preparing for the Road Test

Observe the following when preparing for the road test:

- Review the information recorded on the NVH Diagnostic Guide. It is important to know the specific concern the customer has with the vehicle.
- Do not be misled by the reported location of the noise or vibration. The cause can actually be some distance away, transferred from another part of the vehicle.
- Remember that the vibrating source component (originator) may only generate a small vibration. This small vibration can in turn cause a larger vibration or noise to emanate from another receiving component (reactor), due to contact with other components (transfer path).
- Conduct the road test on a quiet street where it is safe to duplicate the vibration/noise. The ideal testing route is an open, low-traffic area where it is possible to operate the vehicle at the speed in which the condition occurs.
- If possible, lower the radio antenna in order to minimize turbulence. Identify anything that could potentially make noise or be a source of wind noise. Inspect the vehicle for add-on items that create vibration/noise. Turn off the radio and the heating and cooling system blower.
- The engine speed is an important factor in arriving at a final conclusion. Therefore, connect an accurate tachometer to the engine, even if the vehicle has a tachometer. Use a tachometer that has clearly defined increments of less than 50 rpm. This ensures an exact engine speed reading.

4: Verify the Customer Concern

Verify the customer concern by carrying out a road test, an engine run-up test, or both.

The decision to carry out a road test, an engine run-up test, or both depends on the type of NVH concern. A road test may be necessary if the symptom relates to the suspension system or is sensitive to torque. A drive engine run-up (DERU) or a neutral engine run-up (NERU) test identifies noises and vibrations relating to engine and drivetrain rpm. Remember, a condition will not always be identifiable by carrying out these tests, however, they will eliminate many possibilities if carried out correctly.

5: Road Test

NOTE: It may be necessary to have the customer ride along or drive the vehicle to point out the concern. During the road test, take into consideration the customer's driving habits and the driving conditions. The customer's concern just may be an acceptable operating condition for that vehicle.

The following is a brief overview of each test in the order in which it appears. A review of this information helps to quickly identify the most appropriate process necessary to make a successful diagnosis. After reviewing this information, select and carry out the appropriate test(s), proceeding to the next step of this process.

- The Slow Acceleration Test is normally the first test to carry out when identifying an NVH concern, especially when a road test with the customer is not possible.
- The Heavy Acceleration Test helps to determine if the concern is torque-related.
- The Neutral Coast Down Speed Test helps to determine if the concern is vehicle speed-related.
- The Downshift Speed Test helps to determine if the concern is engine speed-related.
- The Steering Input Test helps to determine how the wheel bearings and other suspension components contribute to a vehicle speed-related concern.
- The Brake Test helps to identify vibrations or noise that are brake related.
- The Road Test Over Bumps helps isolate a noise that occurs when driving over a rough or bumpy surface.
- The Engine Run-Up Tests consist of the Neutral Run-up Test and the Engine Load Test. These tests help to determine if the concern is engine speed-related.
- The Neutral Run-up Test is used as a follow-up test to the Downshift Speed Test when the concern occurs at idle.
- The Engine Load Test helps to identify vibration/noise sensitive to engine load or torque. It also helps to reproduce engine speed-related concerns that cannot be duplicated when carrying out the Neutral Run-up Test or the Neutral Coast Down Test.
- The Engine Accessory Test helps to locate faulty belts and accessories that cause engine speed-related concerns.
- The Vehicle Cold Soak Procedure helps to identify concerns occurring during initial start-up and when an extended time lapse occurs between vehicle usage.

Slow Acceleration Test

To carry out this test, proceed as follows:

- Slowly accelerate to the speed where the reported concern occurs. Note the vehicle speed, the engine rpm and, if possible, determine the vibration frequency.
- Attempt to identify from what part of the vehicle the concern is coming.
- Attempt to identify the source of the concern.
- Proceed as necessary.

Heavy Acceleration Test

To carry out this test, proceed as follows:

- Accelerate hard from 0-64 km/h (0-40 mph).
- Decelerate in a lower gear.
- The concern is torque related if duplicated while carrying out this test.
- Proceed as necessary.

Neutral Coast Down Speed Test

To carry out this test, proceed as follows:

- Drive at a higher rate of speed than where the concern occurred when carrying out the Slow Acceleration Test.
- Place the transmission in NEUTRAL and coast down past the speed where the concern occurs.
- The concern is vehicle speed-related if duplicated while carrying out this test. This eliminates the engine and the torque converter as sources.
- If the concern was not duplicated while carrying out this test, carry out the Downshift Speed Test to verify if the concern is engine speed related.
- Proceed as necessary.

Downshift Speed Test

To carry out this test, proceed as follows:

- Shift into a lower gear than the gear used when carrying out the Slow Acceleration Test.
- Drive at the engine rpm where the concern occurs.
- The concern is engine speed related if duplicated while carrying out this test. This eliminates the tires, wheels, brakes and the suspension components as sources.
- If necessary, repeat this test using other gears and NEUTRAL to verify the results.
- Proceed as necessary.

Steering Input Test

To carry out this test, proceed as follows:

- Drive at the speed where the concern occurs, while making sweeping turns in both directions.
- If the concern goes away or gets worse, the wheel bearings, hubs, U-joints (contained in the axles of 4WD applications), and tire tread wear are all possible sources.
- Proceed as necessary.

Brake Test

To carry out this test, proceed as follows:

- Warm the brakes by slowing the vehicle a few times from 80–32 km/h (50–20 mph) using light braking applications. At highway speeds of 89–97 km/h (50–60 mph), apply the brake using a light pedal force.
- Accelerate to 89–97 km/h (55–60 mph).
- Lightly apply the brakes and slow the vehicle to 30 km/h (20 mph).
- A brake vibration noise can be felt in the steering wheel, seat or brake pedal. A brake noise can be heard upon brake application and diminish when the brake is released.

Road Test Over Bumps

To carry out this test, proceed as follows:

- Drive the vehicle over a bump or rough surface one wheel at a time to determine if the noise is coming from the front or the back and the left or the right side of the vehicle.
- Proceed as necessary.

Neutral Engine Run-up (NERU) Test

To carry out this test, proceed as follows:

- Install a tachometer.
- Increase the engine rpm up from an idle to approximately 4000 rpm while in PARK on front wheel drive vehicles with automatic transmissions, or NEUTRAL for all other vehicles. Note the engine rpm and, if possible, determine the vibration frequency.
- Attempt to identify what part of the vehicle the concern is coming from.
- Attempt to identify the source of the concern.
- Proceed as necessary.

Drive Engine Run-up (DERU) Load Test

To carry out this test, proceed as follows:

-  **WARNING: Block the front and rear wheels, and apply the parking brake and the service brake, or injury to personnel can result.**

 **CAUTION: Do not carry out the Engine Load Test for more than five seconds or damage to the transmission or transaxle can result.**

Block the front and rear wheels.

- Apply the parking brake and the service brake.
- Install a tachometer.
- Shift the transmission into DRIVE, and increase and decrease the engine rpm between an idle to approximately 2000 rpm. Note the engine rpm and, if possible, determine the vibration frequency.
- Repeat the test in REVERSE.
- If the vibration/noise is duplicated when carrying out this test, inspect the engine and transmission or transaxle mounts.
- If the concern is definitely engine speed-related, carry out the Engine Accessory Test to narrow down the source.
- Proceed as necessary.

Engine Accessory Test

To carry out this test, proceed as follows:

-  **WARNING: Block the front and rear wheels, and apply the parking brake and the service brake, or injury to personnel can result.**

 **CAUTION: Limit engine running time to one minute or less with belts removed or serious engine damage will result.**

NOTE: A serpentine drive belt decreases the usefulness of this test. In these cases, use a vibration analyzer, such as the VA, to pinpoint accessory vibrations. An electronic listening device, such as an EngineEAR, will also help to identify noises from specific accessories.

Remove the accessory drive belts.

- Increase the engine rpm to where the concern occurs.
- If the vibration/noise is duplicated when carrying out this test, the belts and accessories are not sources.
- If the vibration/noise was not duplicated when carrying out this test, install each accessory belt, one at a time, to locate the source.

Vehicle Cold Soak Procedure

To carry out this procedure, proceed as follows:

- Test preparations include matching customer conditions (if known). If not known, document the test conditions: gear selection and engine rpm. Monitor the vibration/noise duration with a watch for up to three minutes.
- Park the vehicle where testing will occur. The vehicle must remain at or below the concern temperature (if known) for 6-8 hours.
- Before starting the engine, conduct a visual inspection under the hood.
- Turn the key on, but do not start the engine. Listen for the fuel pump, anti-lock brake system (ABS) and air suspension system noises.
- Start the engine.
-  **CAUTION: Never probe moving parts.**

Isolate the vibration/noise by carefully listening. Move around the vehicle while listening to find the general location of the vibration/noise. Then, search for a more precise location by using a stethoscope or EngineEAR.

- Refer to Idle Noise/Vibration in the Symptom Chart to assist with the diagnosis.

6: Check OASIS/TSBs/Repair History

After verifying the customer concern, check for OASIS reports, TSBs and the vehicle repair history for related concerns. If information relating to a diagnosis/repair is found, carry out the procedure(s) specified in that information.

If no information is available from these sources, carry out the vehicle preliminary inspection to eliminate any obvious faults.

7: Diagnostic Procedure

Qualifying the concern by the particular sensation present can help narrow down the concern. Always use the "symptom" to "system" to "component" to "cause" diagnosis technique. This diagnostic method divides the problem into related areas to correct the customer concern.

- Verify the "symptom".
- Determine which "system(s)" can cause the "symptom".

- If a vibration concern is vehicle speed related, the tire and wheel rpm/frequency or driveshaft frequency should be calculated.
- If a vibration concern is engine speed related, the engine, engine accessory or engine firing frequencies should be calculated.
- After determining the "system", use the diagnostic tools to identify the worn or damaged "components".
- After identifying the "components", try to find the "cause" of the failure.

Once the concern is narrowed down to a symptom/condition, proceed to NVH Condition and Symptom Categories.

NVH Condition and Symptom Categories

A good diagnostic process is a logical sequence of steps that lead to the identification of a causal system. Use the condition and symptom categories as follows:

- Identify the operating condition that the vehicle is exhibiting.
- Match the operating condition to the symptom.
- Verify the symptom.
- Identify which category or system could cause the symptom.
- Refer to the diagnostic symptom chart that is referred to.

Operating Condition—Vehicle is Not Moving

1. Static operation
 - Noise occurs during component/system functioning. GO to [Symptom Chart — Squeak and Rattle](#).
2. While cranking
 1. Grinding or whine, differential ring gear or starter motor pinion noise. GO to [Symptom Chart — Engine Noise/Vibration](#).
 2. Rattle. Exhaust hanger, exhaust heat shield or A/C line noise. GO to [Symptom Chart — Squeak and Rattle](#).
 3. Vibration. Acceptable condition.
3. At idle
 - Idle noise. GO to [Symptom Chart — Idle Noise/Vibration](#).
 - Idle vibration or shake. GO to [Symptom Chart — Idle Noise/Vibration](#).
4. During Gear Selection
 1. Vehicle parked on a steep incline. Acceptable noise.
 2. Vehicle parked on a flat surface. GO to [Symptom Chart — Driveline Noise/Vibration](#).
 3. Vehicle with a manual transmission. GO to [Symptom Chart — Transmission \(Manual\) and Transfer Case Noise/Vibration](#).

Operating Condition—Vehicle is Moving

1. Depends more on how the vehicle is operated
 1. Speed related
 - Related to vehicle speed

- Pitch increases with vehicle speed. GO to [Symptom Chart — Tire Noise/Vibration](#) .
 - Noise occurs at specific vehicle speed. A high-pitched noise (whine). GO to [Symptom Chart — Driveline Noise/Vibration](#) .
 - Loudness proportional to vehicle speed. Low-frequency noise at high speeds, noise and loudness increase with speed. GO to [Symptom Chart — Driveline Noise/Vibration](#) .
 - A low-pitched noise (drumming). GO to [Symptom Chart — Engine Noise/Vibration](#) .
 - Vibration occurs at a particular speed (mph) regardless of acceleration or deceleration. GO to [Symptom Chart — Tire Noise/Vibration](#) .
 - Noise varies with wind/vehicle speed and direction. GO to [Symptom Chart — Air Leak and Wind Noise](#) .
- Related to engine speed.
 - Noise varies with engine rpm. GO to [Symptom Chart — Engine Noise/Vibration](#) .
 - Vibration occurs at a particular speed (mph) regardless of engine speed (rpm).
2. Acceleration
- Wide open throttle (WOT)
 - Engine induced contact between components. Inspect and repair as necessary.
 - Noise is continuous throughout WOT. Exhaust system or engine ground out. GO to [Symptom Chart — Engine Noise/Vibration](#) .
 - Light/moderate acceleration
 - Tip-in moan. Engine/exhaust noise. GO to [Symptom Chart — Engine Noise/Vibration](#) .
 - Knock-type noise. GO to [Symptom Chart — Engine Noise/Vibration](#) .
 - Driveline shudder. GO to [Symptom Chart — Driveline Noise/Vibration](#) .
 - Engine vibration. GO to [Symptom Chart — Engine Noise/Vibration](#) .
3. Turning noise. GO to [Symptom Chart — Steering Noise/Vibration](#) .
4. Braking
- Clicking sound is signaling ABS is active. Acceptable ABS sound.
 - A continuous grinding/squeal. GO to [Symptom Chart — Brake Noise/Vibration](#) .
 - Brake vibration/shudder. GO to [Symptom Chart — Brake Noise/Vibration](#) .
5. Clutching
- A noise occurring during clutch operation. GO to [Symptom Chart — Transmission \(Manual\) and Transfer Case Noise/Vibration](#) .
 - Vibration. GO to [Symptom Chart — Transmission \(Manual\) and Transfer Case Noise/Vibration](#) .
6. Shifting
- Noise or vibration condition related to the transmission (automatic). GO to [Symptom Chart — Transmission \(Automatic\) Noise/Vibration](#) .
 - Noise or vibration related to the transmission (manual). GO to [Symptom Chart — Transmission \(Manual\) and Transfer Case Noise/Vibration](#) .
7. Engaged in four-wheel drive. GO to [Symptom Chart — Transmission \(Manual\) and Transfer Case Noise/Vibration](#) .
8. Cruising speeds
- Accelerator pedal vibration. GO to [Symptom Chart — Engine Noise/Vibration](#) .

- Driveline vibration. GO to [Symptom Chart — Driveline Noise/Vibration](#) .
 - A shimmy or shake. GO to [Symptom Chart — Tire Noise/Vibration](#) .
9. Driving at low/medium speeds
- A wobble or shudder. GO to [Symptom Chart — Tire Noise/Vibration](#) .
2. Depends more on where the vehicle is operated
1. Bump/pothole, rough road or smooth road. GO to [Symptom Chart — Suspension Noise/Vibration](#) .
- Noise is random or intermittent occurring from road irregularities. GO to [Symptom Chart — Squeak and Rattle](#) .
 - Noise or vibration changes from one road surface to another. Normal sound changes.
 - Noise or vibration associated with a hard/firm ride. GO to [Symptom Chart — Suspension Noise/Vibration](#) .

Symptom Charts

Symptom Chart — Air Leak and Wind Noise

Condition	Possible Sources	Action
<ul style="list-style-type: none"> ● Air leak around door perimeter 	<ul style="list-style-type: none"> ● Loose fit seal. ● Seal installed incorrectly. ● Door misaligned. ● Scuff plate installed incorrectly. ● Seal or seal push pins damaged. 	<ul style="list-style-type: none"> ● PINCH the seal carrier to improve retention on the seal flange. ● REINSTALL the seal. ● REALIGN the door. CHECK door gaps and fit in the door opening and ADJUST as necessary. ● REINSTALL the scuff plate. ● INSTALL a new seal.

		as necessary.
<ul style="list-style-type: none"> ● Accelerator pedal vibration—felt through the pedal as a buzz 	<ul style="list-style-type: none"> ● Throttle cable loose or misrouted. 	<ul style="list-style-type: none"> ● INSPECT the throttle cable. REPAIR as necessary. REFER to Section 310-02.
<ul style="list-style-type: none"> ● Engine vibration—mostly at coast/neutral coast. Condition improves with vehicle accelerating 	<ul style="list-style-type: none"> ● Combustion instability. 	<ul style="list-style-type: none"> ● CHECK the ignition system. INSTALL new components as necessary.
<ul style="list-style-type: none"> ● Engine vibration or shudder—occurs with light to medium acceleration above 56 km/h (35 mph) 	<ul style="list-style-type: none"> ● Worn or damaged spark plugs. ● Plugged fuel injector. ● Damaged spark plug wire. ● Contaminated fuel. ● Worn or damaged torque converter. 	<ul style="list-style-type: none"> ● INSPECT the spark plugs for cracks, high resistance or broken insulator. INSTALL a new spark plug (s) as necessary. REFER to Section 303-04A for 3.0L engines or Section 303-04B for 3.9L engines. ● REPAIR or INSTALL a new injector as necessary. ● INSPECT the spark plug wires for damage. INSTALL a new spark plug wire(s) as necessary. ● INSPECT the fuel for contamination. DRAIN the fuel system and refill. REFER to Section 310-01. ● CHECK the torque converter. INSTALL a new torque converter as necessary. REFER to Section 307-01.

Symptom Chart—Idle Noise/Vibration

Condition	Possible Sources	Action
<ul style="list-style-type: none"> ● Idle air control (IAC) valve moan — occurs on throttle tip-out 	<ul style="list-style-type: none"> ● IAC valve is contaminated with oil. 	<ul style="list-style-type: none"> ● GO to Component Tests in this section.
<ul style="list-style-type: none"> ● Accessory drive belt chirp — occurs at idle or high idle, cold or hot. Most common occurrence is during humid weather 	<ul style="list-style-type: none"> ● Accessory drive belt worn, or pulley is misaligned or loose. 	<ul style="list-style-type: none"> ● INSPECT for loose or misaligned pulleys. CHECK the drive belt for wear or damage. INSTALL new pulley(s)/FEAD or drive belt, as necessary. REFER to Section 303-05.
<ul style="list-style-type: none"> ● Accessory drive bearing hoot — occurs at idle or high idle in cold temperatures of approximately +4°C (+40°F) or colder at first start of the day 	<ul style="list-style-type: none"> ● Accessory drive idler or tensioner pulley bearing is experiencing stick/slip between ball bearings and bearing race. 	<ul style="list-style-type: none"> ● Go To Pinpoint Test C.

<ul style="list-style-type: none"> ● Power steering moan — occurs at high idle and possibly at idle during the first cold start of the day in temperatures of approximately -18°C (0°F) or colder. Noise can even be a severe screech for less than one minute in very cold temperatures of approximately -29°C (-20°F) or colder 	<ul style="list-style-type: none"> ● High fluid viscosity, or plugged reservoir screen in power steering reservoir starves pump causing cavitation. 	<ul style="list-style-type: none"> ● Go To Pinpoint Test D .
<ul style="list-style-type: none"> ● Generator whine — during high electrical loads at idle or high idle, a high pitch whine or moan is emitted from the generator 	<ul style="list-style-type: none"> ● Generator electrical field noise. 	<ul style="list-style-type: none"> ● Using an EngineEAR, PROBE near the generator housing. LISTEN for changes in the noise level while changing electrical loads (such as rear defrost, headlamps, etc.). CARRY OUT a generator load test. REFER to Section 414-00 . If the system passes the load test, the noise is from the generator bearings, INSTALL new bearings. If the system fails the load test, INSTALL a new generator. REFER to Section 414-02 .
<ul style="list-style-type: none"> ● Engine-driven cooling fan moan — occurs during the first start of the day. It is most objectionable near idle speeds up to 2000 rpm. The noise increases with rpm 	<ul style="list-style-type: none"> ● The viscous cooling fan clutch engages until the fluid in the clutch reaches normal operating temperature, causing the fan to fully engage. 	<ul style="list-style-type: none"> ● Go To Pinpoint Test E .
<ul style="list-style-type: none"> ● Drumming noise — occurs inside the vehicle during idle or high idle, hot or cold. Very low-frequency drumming is very rpm dependent 	<ul style="list-style-type: none"> ● Exhaust system vibration excites the body resonances inducing interior noise. ● Engine vibration excites the body resonances inducing interior noise. 	<ul style="list-style-type: none"> ● Go To Pinpoint Test F .
<ul style="list-style-type: none"> ● Hissing noise — occurs during idle or high idle that is apparent with the hood open 	<ul style="list-style-type: none"> ● Vacuum leak or idle air control (IAC) valve flow noise. 	<ul style="list-style-type: none"> ● Use the Ultrasonic Leak Detector/EngineEAR to locate the source. Scan the air intake system from the inlet to each cylinder intake port. DISCARD the leaking parts, and INSTALL a new

	<ul style="list-style-type: none"> ● Vehicles with a plastic intake manifold. 	<p>component.</p> <ul style="list-style-type: none"> ● Acceptable condition. Some plastic manifolds exhibit this noise, which is the effect of the plastic manifold.
<ul style="list-style-type: none"> ● Automatic transmission buzz or hiss 	<ul style="list-style-type: none"> ● Incorrect driveline angles. ● Worn or damaged main control solenoids or valves. 	<ul style="list-style-type: none"> ● CHECK for correct driveline angles. REPAIR as necessary. REFER to Section 205-00. ● Using a transmission tester, activate the solenoids to duplicate sound. INSTALL new components as necessary. REFER to Section 307-01.
<ul style="list-style-type: none"> ● Manual Transmission Clutch throw-out bearing whine. A change in noise pitch or loudness while depressing the clutch pedal 	<ul style="list-style-type: none"> ● Worn throw-out bearing. 	<ul style="list-style-type: none"> ● INSTALL a new throw-out bearing. REFER to Section 308-01.
<ul style="list-style-type: none"> ● Heating, vacuum and air conditioning (HVAC) system chirp — most audible inside the vehicle. Listen for a change in noise pitch or loudness while changing the HVAC system blower speed 	<ul style="list-style-type: none"> ● Damaged or worn HVAC blower bearing. 	<ul style="list-style-type: none"> ● INSTALL a new blower motor. REFER to Section 412-02.
<ul style="list-style-type: none"> ● Air conditioning (A/C) clutch ticking — occurs when the compressor clutch engages 	<ul style="list-style-type: none"> ● Acceptable noise. ● Incorrect air gap. 	<ul style="list-style-type: none"> ● LISTEN to the clutch to determine if the noise occurs with clutch engagement. A small amount of noise is acceptable. If the noise is excessive, CHECK the A/C clutch air gap. INSPECT the A/C clutch for wear or damage. INSTALL a new clutch as necessary. REFER to Section 412-03.
<ul style="list-style-type: none"> ● Intermittent rattle, or scraping/rubbing noise 	<ul style="list-style-type: none"> ● Loose exhaust heat shield(s). ● Wiring, hose or other part interfering with accessory drive belt or pulley. 	<ul style="list-style-type: none"> ● INSPECT the exhaust system for loose parts using a glove or clamps to verify cause. REPAIR as necessary. REFER to Section 309-00. ● INSPECT accessory drive system closely verifying there is adequate clearance to all rotating components. REPAIR as necessary.
<ul style="list-style-type: none"> ● Engine ticking or knocking noise — occurs during idle or high idle during the first cold start of the 	<ul style="list-style-type: none"> ● Piston noise or valvetrain noise (bled down lifter/lash adjuster). 	<ul style="list-style-type: none"> ● Go To Pinpoint Test G.

day		
<ul style="list-style-type: none"> ● A continuous, speed-dependent rattle from the engine — occurs during idle or high idle during the first cold start of the day and disappears as the engine warms up 	<ul style="list-style-type: none"> ● Piston noise or valvetrain noise (bled down lifter/lash adjuster). 	<ul style="list-style-type: none"> ● Go To Pinpoint Test G.
<ul style="list-style-type: none"> ● Idle vibration—a low-frequency vibration (5-20 Hz) or mild shake that is felt through the seat/floorpan 	<ul style="list-style-type: none"> ● Cylinder misfire. ● Engine or torque converter out of balance. 	<ul style="list-style-type: none"> ● Using a scan tool, CHECK the ignition system. CARRY OUT a cylinder power test. REFER to Section 303-00. ● VERIFY the torque converter to crankshaft pilot clearance is correct, REPAIR as necessary. RE-INDEX the torque converter on the flex plate by 120° on a 3 bolt converter or 180° for a 4 bolt converter. REFER to Section 307-01. RETEST the vehicle.
<ul style="list-style-type: none"> ● Idle vibration—a high-frequency vibration (20–80 Hz) or buzz, that is felt through the steering wheel or seat 	<ul style="list-style-type: none"> ● Exhaust system mounts bound up. ● Body mounts loose. ● Power steering lines grounded out. 	<ul style="list-style-type: none"> ● VERIFY concern occurs at engine firing frequency. CHECK that the exhaust system vibrates at the same frequency as the engine. ADD 9–14 km (20–30 lb.) to the tail pipe to test. CARRY OUT Exhaust System Neutralizing in this section. ● INSPECT the body mounts. CARRY OUT a Neutral Engine Run-Up (NERU) Test. REPAIR as necessary. REFER to Section 303-01A for 3.0L engines or Section 303-01B for 3.9L engines. ● INSPECT that the power steering lines are not contacting the chassis or each other. REPAIR as necessary.

Symptom Chart—Squeak and Rattle

Condition	Possible Sources	Action
<ul style="list-style-type: none"> ● Squeak—heard inside the vehicle when closing/opening the door 	<ul style="list-style-type: none"> ● Insufficient lubrication on the door hinge or check strap. ● Internal door components loose, rubbing or misaligned. 	<ul style="list-style-type: none"> ● LUBRICATE the hinge or check strap. ● CHECK the inside of the door. TIGHTEN or ALIGN as necessary. USE the Rotunda Squeak and Rattle Kit to isolate

		any rubbing components.
<ul style="list-style-type: none"> ● Squeak—heard inside the vehicle when closing/opening the window 	<ul style="list-style-type: none"> ● Worn or damaged glass run/channel. 	<ul style="list-style-type: none"> ● REPAIR or INSTALL a new glass run/channel. REFER to Section 501-11.
<ul style="list-style-type: none"> ● Squeak—heard outside of vehicle when closing/opening the door 	<ul style="list-style-type: none"> ● Exhaust shield rubbing against the chassis or exhaust pipe. 	<ul style="list-style-type: none"> ● CHECK the exhaust system. REPAIR as necessary. REFER to Section 309-00.
<ul style="list-style-type: none"> ● Squeak—occurs with initial brake pedal application 	<ul style="list-style-type: none"> ● Disc brake pads. 	<ul style="list-style-type: none"> ● Under certain conditions, asbestos free pads can generate a squeak noise. This noise is normal and does not indicate a concern.
<ul style="list-style-type: none"> ● Squeak—a constant noise that occurs with brake pedal applications 	<ul style="list-style-type: none"> ● Damaged or worn disc brake pads. 	<ul style="list-style-type: none"> ● INSPECT the pads for oil, grease or brake fluid contamination. CHECK for glazed linings. A brake disc with hard spots will also cause a squeak type noise. REPAIR or INSTALL new pads as necessary. REFER to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
<ul style="list-style-type: none"> ● Squeak—noise occurs over bumps or when turning 	<ul style="list-style-type: none"> ● Worn control arm bushings. ● Worn or damaged shock absorber/strut. 	<ul style="list-style-type: none"> ● INSPECT the control arm bushings. Spray with lubricant and CARRY OUT a "bounce test" to determine which bushing. REPAIR as necessary. REFER to Section 204-01 for the front suspension or Section 204-02 for the rear suspension. ● INSPECT the shock absorber for damage. CARRY OUT a "bounce test" to isolate the noise. INSTALL a new shock absorber/strut as necessary. REFER to Section 204-01 for the front shock absorber/strut or Section 204-02 for the rear shock absorber/strut.
<ul style="list-style-type: none"> ● Rattle—heard when closing/opening the door or window 	<ul style="list-style-type: none"> ● Loose internal door mechanism, bracket or attachment. 	<ul style="list-style-type: none"> ● REPEAT the motion or CARRY OUT a "tap test" to duplicate the noise. INSPECT the door for loose components. TIGHTEN loose components or USE the Rotunda Squeak and Rattle Kit to isolate any rattling components.
<ul style="list-style-type: none"> ● Squeak or rattle—heard inside the vehicle over rough roads/bumps 	<ul style="list-style-type: none"> ● Misaligned glove compartment door/hinge. ● Instrument panel trim loose or misaligned. 	<ul style="list-style-type: none"> ● ALIGN the glove compartment door. ● INSPECT the instrument panel trim for missing or loose clips or screws. REPAIR as necessary.

	<ul style="list-style-type: none"> ● Loose interior component or trim. 	<ul style="list-style-type: none"> ● CARRY OUT a "touch test". ELIMINATE the noise by pressing or pulling on interior trim and components. USE the Rotunda Squeak and Rattle Kit to isolate any rattling/squeaking components.
<ul style="list-style-type: none"> ● Squeak or rattle—noise with a vibration concern 	<ul style="list-style-type: none"> ● Damaged or worn body mounts. ● Damaged or worn sub-frame mounts. 	<ul style="list-style-type: none"> ● INSPECT the upper and lower absorbers and washers for damage or wear. CHECK the body mount brackets for damage. CHECK the nuts and bolts are tightened to specifications. TIGHTEN as necessary. ● INSPECT the upper and lower absorbers for damage or wear. CHECK the sub-frame for damage. CHECK the nuts and bolts are tightened to specifications. TIGHTEN as necessary.

Symptom Chart—Steering Noise/Vibration

Condition	Possible Sources	Action
<ul style="list-style-type: none"> ● Steering grunt or shudder — occurs when turning into or out of a turn at low speeds (temperature sensitive) 	<ul style="list-style-type: none"> ● Steering gear or power steering hoses. 	<ul style="list-style-type: none"> ● GO to Steering Gear Grunt/Shudder Test component test in this section.
<ul style="list-style-type: none"> ● Steering System clonk—hydraulic knocking sound 	<ul style="list-style-type: none"> ● Air in the steering hydraulic system. 	<ul style="list-style-type: none"> ● PURGE the air from the system. REFER to Section 211-00. CHECK for leaks in the system.
<ul style="list-style-type: none"> ● Power steering pump moan — loud humming noise occurs when the steering wheel is rotated to the stop position. Produces a 120-600 Hz frequency that changes with rpm. 	<ul style="list-style-type: none"> ● Power steering hose grounded out to chassis. ● Aerated fluid. ● Steering gear isolators. ● Low fluid. 	<ul style="list-style-type: none"> ● INSPECT the power steering hoses. REPAIR as necessary. ● PURGE the air from the system. REFER to Section 211-00. CHECK for leaks in the system. ● INSPECT the isolators for wear or damage. REPAIR as necessary. ● CHECK the fluid level. REFILL as necessary.

	<ul style="list-style-type: none"> ● Power steering pump brackets loose or misaligned. 	<ul style="list-style-type: none"> ● CHECK bolts, brackets and bracket alignment. TIGHTEN bolts to specification. REPAIR or INSTALL new brackets as necessary. REFER to Section 211-02.
<ul style="list-style-type: none"> ● Steering gear clunk — occurs only while cornering over a bump (can be temperature sensitive) 	<ul style="list-style-type: none"> ● Steering gear. 	<ul style="list-style-type: none"> ● INSPECT the steering gear for loose mounting bolts. TIGHTEN as necessary. REFER to Section 211-02.
<ul style="list-style-type: none"> ● Feedback (rattle, chuckle or knocking noise in the steering gear) — a condition where roughness is felt in the steering wheel when the vehicle is driven over rough surfaces 	<ul style="list-style-type: none"> ● Column intermediate/flexible shaft joints damaged or worn. ● Loose, damaged or worn tie-rod ends. ● Steering gear insulators or mounting bolts loose or damaged. ● Steering column intermediate shaft bolts are loose. ● Steering column damaged or worn. ● Loose suspension bushings, bolts or ball joints. 	<ul style="list-style-type: none"> ● INSTALL a new intermediate/flexible shaft. REFER to Section 211-04. ● TIGHTEN the nuts to specification or INSTALL new tie-rod ends as necessary. REFER to Section 211-02. ● TIGHTEN the bolts or INSTALL new bolts as necessary. REFER to Section 211-02. ● TIGHTEN the bolts to specification. REFER to Section 211-04. ● REPAIR or INSTALL a new steering column as necessary. REFER to Section 211-04. ● INSPECT the suspension system. TIGHTEN or INSTALL new components as necessary. REFER to Section 204-01.
<ul style="list-style-type: none"> ● Feedback (nibble at the steering wheel) — a condition where slight rotational movement is felt in the steering wheel when the vehicle is driven over rough or grooved surfaces 	<ul style="list-style-type: none"> ● Lateral runout in the tire or wheel. 	<ul style="list-style-type: none"> ● Go To Pinpoint Test H.

	<ul style="list-style-type: none"> ● Yoke spring in the steering gear. 	<ul style="list-style-type: none"> ● CHECK TSBs for revised yoke spring for applicable vehicles.
<ul style="list-style-type: none"> ● Accessory drive belt squeal/chirp—when rotating the steering wheel from stop to stop 	<ul style="list-style-type: none"> ● Loose or worn accessory drive belt. 	<ul style="list-style-type: none"> ● ADJUST or INSTALL a new accessory belt as necessary. <ul style="list-style-type: none"> ● Transmission rattling/clattering noise—occurs in neutral or in gear, at idle 	<ul style="list-style-type: none"> ● Incorrect fluid level or fluid quality. 	<ul style="list-style-type: none"> ● CHECK that the transmission is filled to the correct level and with the specified fluid. REFER to Section 308-03.
<ul style="list-style-type: none"> ● Transmission rattling/clattering noise—noise at idle in neutral 	<ul style="list-style-type: none"> ● Worn or rough reverse idler gear. ● Rough running engine, cylinder misfire. ● Excessive backlash in gears ● Worn countershaft gears. 	<ul style="list-style-type: none"> ● CHECK the reverse idler gear. REPAIR as necessary. REFER to Section 308-03. ● CHECK the ignition system. CARRY OUT a cylinder power test. REFER to Section 308-03. ● CHECK the gear backlash. ADJUST as necessary. REFER to Section 308-03. ● REPAIR as necessary. REFER to Section 308-03.
<ul style="list-style-type: none"> ● Transmission whine—a mild whine at extreme speeds or high rpm 	<ul style="list-style-type: none"> ● Rotating gears/geartrain. 	<ul style="list-style-type: none"> ● Acceptable noise.
<ul style="list-style-type: none"> ● Transmission whine—a high pitched whine, also described as a squeal 	<ul style="list-style-type: none"> ● Transmission gears are worn (high mileage vehicle). ● Mismatched gear sets. ● Damaged or worn transmission bearing. 	<ul style="list-style-type: none"> ● Result of normal gear wear. REPAIR as necessary. REFER to Section 308-03. ● INSPECT the gear sets for an uneven wear pattern on the face of the gear teeth. REPAIR as necessary. REFER to Section 308-03. ● INSPECT the transmission bearings. INSTALL new bearings as necessary. REFER to Section 308-03.
<ul style="list-style-type: none"> ● Transmission growling/humming—noise occurs in the forward gears. The noise is more prominent when the 	<ul style="list-style-type: none"> ● Gear is cracked, chipped or rough. 	<ul style="list-style-type: none"> ● INSPECT the transmission gears for damage or wear. INSTALL new gears as necessary. REFER to Section 308-03.

gear is loaded. The problem gear can be located as the noise occurs in a specific gear position		
<ul style="list-style-type: none"> ● Transmission hissing—noise in neutral or in forward gears. As bearings wear or break up, the noise changes to a thumping noise 	<ul style="list-style-type: none"> ● Damaged or worn bearings. 	<ul style="list-style-type: none"> ● INSPECT the transmission bearings. INSTALL new bearings as necessary. REFER to Section 308-03.
<ul style="list-style-type: none"> ● Transmission knocking/thudding—noise at low speeds in forward gears 	<ul style="list-style-type: none"> ● Bearings with damaged balls or rollers or with pitted and spalled races. 	<ul style="list-style-type: none"> ● INSPECT the transmission bearings. INSTALL new bearings as necessary. REFER to Section 308-03.
<ul style="list-style-type: none"> ● Transmission rumble/growl—noise at higher speeds in forward gears, more pronounced in a coast/deceleration condition 	<ul style="list-style-type: none"> ● Incorrect driveline angle. ● Driveshaft out of balance or damaged. 	<ul style="list-style-type: none"> ● CHECK the driveline angle. REPAIR as necessary. REFER to Section 205-00. ● CHECK the driveshaft for damage, missing balance weights or undercoating. Using the vibration analyzer (VA). CHECK the driveshaft balance. CARRY OUT a driveline vibration test. REFER to Section 205-01. REPAIR as necessary.
<ul style="list-style-type: none"> ● Transmission rumble/growl—noise at all speeds in forward gears, more pronounced in a heavy acceleration condition 	<ul style="list-style-type: none"> ● Damaged or worn transmission bearing or gears (high mileage vehicles). 	<ul style="list-style-type: none"> ● CHECK transmission fluid for excessive metal particles. REPAIR as necessary. REFER to Section 308-03.

Symptom Chart—Transmission (Automatic) Noise/Vibration

Condition	Possible Sources	Action
<ul style="list-style-type: none"> ● Rattle—occurs at idle or at light acceleration from a stop 	<ul style="list-style-type: none"> ● Damaged engine or transmission mounts. ● A loose front exhaust pipe heat shield. ● Loose inspection plate or dust cover plate. ● Loose flexplate to converter nuts. 	<ul style="list-style-type: none"> ● CHECK the powertrain/drivetrain mounts for damage. CARRY OUT Powertrain/Drivetrain Mount Neutralizing in this section. ● REPAIR or INSTALL a new heat shield as necessary. ● CHECK for loose bolts. TIGHTEN to specifications. REFER to Section 307-01. ● CHECK for loose nuts. TIGHTEN to specifications. REFER to Section 307-01.

<ul style="list-style-type: none"> ● Whine—pitch increases with vehicle speed. Starts in first and second gear, decreases or goes away at higher gears. 	<ul style="list-style-type: none"> ● Damaged or worn low one-way clutch. ● Damaged or worn intermediate one-way clutch. ● Friction elements. ● Damaged or worn planetary or sun gear. 	<ul style="list-style-type: none"> ● INSPECT the transmission for wear or damage. REPAIR or INSTALL new components as necessary. REFER to Section 307-01.
<ul style="list-style-type: none"> ● Whine—the pitch changes with engine speed 	<ul style="list-style-type: none"> ● A worn or damaged accessory drive component. ● Incorrect fluid level. ● Partially blocked filter. ● Worn or damaged torque converter. ● Worn or damaged front pump. 	<ul style="list-style-type: none"> ● CARRY OUT the Engine Accessory Test. REPAIR or INSTALL new components as necessary. ● CHECK that the transmission is filled to the correct level. ADD fluid as necessary. REFER to Section 307-01. ● INSPECT the filter. CLEAN or INSTALL a new filter as necessary. REFER to Section 307-01. ● CARRY OUT the torque converter service and replacement check. REFER to Section 307-01. ● INSPECT the front pump. INSTALL a new front pump as necessary. REFER to Section 307-01.
<ul style="list-style-type: none"> ● Whine—pitch changes with vehicle speed 	<ul style="list-style-type: none"> ● Speedometer cable or gears. 	<ul style="list-style-type: none"> ● REPAIR or INSTALL new cables or gears as necessary. REFER to the appropriate workshop manual for the service procedures.
<ul style="list-style-type: none"> ● Whine/roan type noise—pitch increases or changes with vehicle speed 	<ul style="list-style-type: none"> ● Damaged engine or transmission mount. ● U-joints worn or damaged. ● Damaged or worn differential ring and pinion. ● Planetary gears nicked or chipped. 	<ul style="list-style-type: none"> ● CHECK the powertrain/drivetrain mounts for damage. CARRY OUT Powertrain/Drivetrain Mount Neutralizing in this section. ● INSPECT the U-joints for wear or damage. INSTALL new U-joints as necessary. REFER to Section 205-01. ● INSPECT the differential ring and pinion for damage. CARRY OUT the Checking Tooth Contact Pattern and Condition of the Ring and Pinion component test in this section. REPAIR or INSTALL a new differential ring and pinion as necessary. REFER to Section 205-02. ● CHECK the planetary gears for damage. INSTALL new components as necessary. REFER to Section 307-01.

<ul style="list-style-type: none"> ● Whistle—noise is high pitched, constant. Changes in pitch with throttle position 	<ul style="list-style-type: none"> ● Hydraulic pressure in the main control. ● Incorrect band/clutch apply pressure. ● Worn or damaged torque converter. 	<ul style="list-style-type: none"> ● INSPECT the main control. REPAIR or INSTALL new components as necessary. REFER to Section 307-01. ● CARRY OUT the line pressure tests. REPAIR or INSTALL components as necessary. REFER to Section 307-01. ● CARRY OUT the torque converter service and replacement check. REFER to Section 307-01.
<ul style="list-style-type: none"> ● Clunk—occurs when shifting from PARK to a drive or reverse position 	<ul style="list-style-type: none"> ● Damaged powertrain mounts. ● Damaged or worn pinion bearings. ● Worn or galled driveshaft slip yoke splines. ● Worn friction elements or excessive clutch pack end plate play. 	<ul style="list-style-type: none"> ● INSPECT the powertrain mounts for damage. INSTALL new mounts as necessary. REFER to Section 303-01A for 3.0L engines, Section 303-01B for 3.9L engines or Section 307-01. ● CHECK for abnormal bearing play or roughness. INSTALL new bearings as necessary. REFER to Section 205-02. ● CLEAN and INSPECT the splines of the yoke. INSTALL a new slip yoke as necessary. REFER to Section 205-01. ● INSPECT the transmission for wear. CHECK that all end play and clearances are within specification. REPAIR or INSTALL new components as necessary. REFER to Section 307-01.
<ul style="list-style-type: none"> ● Bump—occurs when shifting from PARK to a drive or reverse position. Similar to Clunk but with no sound 	<ul style="list-style-type: none"> ● Initial gear engagement. 	<ul style="list-style-type: none"> ● Acceptable condition.
<ul style="list-style-type: none"> ● Buzz or hiss 	<ul style="list-style-type: none"> ● Incorrect driveline angles. ● Worn or damaged main control solenoids or valves. 	<ul style="list-style-type: none"> ● CHECK for correct driveline angles. REPAIR as necessary. REFER to Section 205-00. ● Using a transmission tester, ACTIVATE the solenoids to duplicate sound. INSTALL new components as necessary. REFER to Section 307-01.
<ul style="list-style-type: none"> ● Vibration—a high frequency 	<ul style="list-style-type: none"> ● Transmission cooler lines grounded out. 	<ul style="list-style-type: none"> ● CHECK the transmission cooler lines. REPAIR as

<p>(20–80 Hz) that is felt through the seat or gear shifter. Changes with engine speed</p>	<ul style="list-style-type: none"> ● Flexplate to torque converter nuts loose. ● Fluid filler tube grounded out. ● Shift cable incorrectly routed, grounded out or loose. 	<p>necessary.</p> <ul style="list-style-type: none"> ● CHECK the flexplate nuts. TIGHTEN to specification. REFER to Section 307-01. ● CHECK the fluid filler tube. REPAIR as necessary. ● CHECK the shift cable. REPAIR as necessary. REFER to Section 307-05.
<ul style="list-style-type: none"> ● Shutter or chatter—occurs with light to medium acceleration from low speeds or a stop 	<ul style="list-style-type: none"> ● Electrical inputs/outputs. ● Vehicle wiring harness. ● Incorrect inputs/outputs from the powertrain control module (PCM), digital transmission range (TR) sensor, brake pedal position (BPP) sensor, throttle position (TP) sensor, transmission speed sensor (TSS), output speed shaft (OSS) sensor or the torque converter clutch (TCC). 	<ul style="list-style-type: none"> ● CARRY OUT a Torque Converter Clutch Operation Test. RUN on-board diagnostics or self-test. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the powertrain control system. CLEAR the DTCs, road test and rerun on-board diagnostics or self-test. REFER to Section 307-01.

Pinpoint Tests

The pinpoint tests are a step-by-step diagnostic process designed to determine the cause of a condition. It may not always be necessary to follow a pinpoint test to its conclusion. Carry out only the steps necessary to correct the condition. Then, test the system for normal operation. Sometimes, it is necessary to remove various vehicle components to gain access to the component requiring testing. For additional information, REFER to the appropriate Workshop Manual section for removal and installation procedures. Reinstall all components after verifying system operation is normal.

PINPOINT TEST A: BRAKE VIBRATION/SHUDDER

CONDITIONS	DETAILS/RESULTS/ACTIONS
	<p>A1 ROAD TEST THE VEHICLE—LIGHT BRAKING</p> <ol style="list-style-type: none"> 1 Check that the wheel and tires are correct for the vehicle. Inspect the tires for abnormal wear patterns. 2 Road test the vehicle. Warm the brakes by slowing the vehicle a few times from 80–32 km/h (50 to 20 mph) using light braking applications. At highway speeds of 89–97 km/h (55-60 mph), apply the brake using a light pedal force.

● **Is there a vibration/shudder felt in the steering wheel, seat or brake pedal?**

→ **Yes**
GO to [A4](#).

→ **No**
GO to [A2](#).

A2 ROAD TEST THE VEHICLE—MODERATE TO HEAVY BRAKING

1 Road test the vehicle. At highway speeds of 89–97 km/h (55-60 mph), apply the brake using a moderate to heavy pedal force.

● **Is there a vibration/shudder?**

→ **Yes**
For vehicles with ABS, GO to [A3](#).
For vehicles with standard brakes, GO to [A4](#).

→ **No**
Vehicle is OK. VERIFY condition with customer. TEST the vehicle for normal operation.

A3 NORMAL ACTUATION OF THE ABS SYSTEM DIAGNOSIS

1 During moderate to heavy braking, noise from the hydraulic control unit (HCU) and pulsation in the brake pedal can be observed. Pedal pulsation coupled with noise during heavy braking or on loose gravel, bumps, wet or snowy surfaces is acceptable and indicates correct functioning of the ABS system. Pedal pulsation or steering wheel nibble (frequency is proportioned to the vehicle speed) indicates a concern with a brake or suspension component.

● **Is the vibration/shudder vehicle speed sensitive?**

→ **Yes**
GO to [A5](#).

→ **No**
The brake system is operating correctly.

A4 APPLICATION OF THE PARKING BRAKE

1 **NOTE:** Begin at the front of the vehicle unless the vibration or shudder has been isolated to the rear.

This test is not applicable to vehicles with drum-in-hat type parking brakes. For vehicles with drum-in-hat parking brakes, proceed to the next test. For all other vehicles, apply the parking brake to identify if the problem is in the front or rear brake. At highway speeds of 89–97 km/h (55-60 mph), lightly apply the parking brake until the vehicle slows down. Release the parking brake immediately after the test.

● **Is there a vibration/shudder?**

→ **Yes**
GO to [A8](#).

→ **No**
GO to [A5](#).

A5 CHECK THE FRONT WHEEL BEARINGS

1 Check the front wheel bearings. Refer to [Wheel Bearing Check](#) in this section.

- **Are the wheel bearings OK?**

→ **Yes**
GO to [A6](#).

→ **No**
INSPECT the wheel bearings. ADJUST or REPAIR as necessary. TEST the system for normal operation.

A6 CHECK THE FRONT SUSPENSION

1 Check the front suspension for:

- Broken or loose bolts.
- Damaged springs.
- Worn or damaged upper and lower control arm bushings.
- Loose or rough front bearings.
- Uneven tire wear.

- **Are all the suspension components in satisfactory condition?**

→ **Yes**
GO to [A7](#).

→ **No**
REPAIR or INSTALL new components as necessary. TEST the system for normal operation.

A7 RESURFACE THE FRONT BRAKE DISCS

1  **CAUTION: Do not use a bench lathe to machine brake discs.**

NOTE: Follow the manufacturer's instructions to machine the brake discs. After machining, make sure the brake disc meets the thickness specification.

Resurface the front brake discs. Refer to [Brake Disc Machining](#) in this section. Road test the vehicle.

- **Is the vibration/shudder present?**

→ **Yes**
GO to [A8](#).

→ **No**
Vehicle is OK.

A8 CHECK THE REAR SUSPENSION

1 Check the rear suspension for:

- Broken or loose bolts.

	<ul style="list-style-type: none"> ● Damaged or worn springs or spring bushings. ● Worn or damaged upper and lower control arm bushings. ● Worn or damaged trailing arms. ● Loose or rough rear bearings. ● Uneven tire wear. <p>● Are all the suspension components in satisfactory condition?</p> <p>→ Yes GO to A9.</p> <p>→ No REPAIR or INSTALL new components as necessary. TEST the system for normal operation.</p>
A9 RESURFACE THE REAR BRAKE DISC OR DRUM	
	<p>1  CAUTION: Do not use a bench lathe to machine brake discs.</p> <p>NOTE: Follow the manufacturers instructions to machine the brake discs. After machining, make sure the brake disc meets the thickness specification.</p> <p>Resurface the rear brake discs or drums. Refer to Brake Disc Machining in this section. Road test the vehicle.</p> <p>● Is the vibration/shudder present?</p> <p>→ Yes CHECK the front suspension for wear or damage. RESURFACE the front brake discs. TEST the system for normal operation.</p> <p>→ No Vehicle is OK.</p>

PINPOINT TEST B: ENGINE TICKING NOISE

CONDITIONS	DETAILS/RESULTS/ACTIONS
B1 CHECK FOR TICKING NOISE AT THE FUEL RAIL	
	<p>1 Disconnect the first fuel line clip.</p> <p>● Is the ticking noise gone?</p> <p>→ Yes CHECK for TSB for applicable vehicle. REPAIR as necessary. TEST the system for normal operation.</p> <p>→ No GO to B2.</p>
B2 CHECK FOR TICKING NOISE AT THE FUEL INJECTOR	
	<p>1 Using an EngineEAR, listen at the fuel injectors by placing a probe on each injector. To isolate the faulty injector, disconnect the injector electrical connector and listen for the noise.</p>

● **Is the fuel injector the source of the ticking noise?**

- **Yes**
INSTALL a new fuel injector. REFER to [Section 303-04A](#) for 3.0L engines or [Section 303-04B](#) for 3.9L engines. TEST the system for normal operation.
- **No**
GO to [B3](#).

B3 CHECK THE BELT TENSIONER FOR TICKING NOISE

- 1** INSPECT the accessory drive. CHECK for the belt tensioner bottoming at end of travel or not at end of stroke.
- 2** Using an EngineEAR, listen at the belt tensioner.
- **Is the belt tensioner the source of the noise?**
- **Yes**
INSTALL a new belt tensioner. TEST the system for normal operation.
- **No**
GO to [B4](#).

B4 CHECK THE WATER PUMP FOR TICKING NOISE

- 1** Using an EngineEAR, listen at the water pump for ticking noise.
- **Is the water pump the source of the noise?**
- **Yes**
INSTALL a new water pump. TEST the system for normal operation.
- **No**
GO to [B5](#).

B5 CHECK FOR AN OBSTRUCTION OF THE COOLING FAN

- 1** Inspect the cooling fan for obstructions.
- 2** Check the cooling fan and shroud for wear or damage.
- **Was there an obstruction or does the cooling fan show signs of damage?**
- **Yes**
REPAIR or INSTALL a new cooling fan. REFER to [Section 303-03](#). TEST the system for normal operation.
- **No**
GO to [B6](#).

B6 CHECK THE OIL PUMP FOR TICKING NOISE

- 1** CHECK the oil pump using EngineEARs and probe at the oil filter adapter to verify the oil pump as a source.
- **Is the oil pump the source of the noise?**

	<p>→ Yes INSTALL a new oil pump. REFER to Section 303-01A for 3.0L engines or Section 303-01B for 3.9L engines. TEST the system for normal operation.</p> <p>→ No GO to B7.</p>
B7 CHECK VALVE LIFTERS OR LASH ADJUSTERS FOR CORRECT OPERATION	
	<p>1 CHECK valve lifter/lash adjuster for correct operation, using EngineEARs.</p> <ul style="list-style-type: none"> ● Are the valve lifters/lash adjusters operating correctly? <p>→ Yes VERIFY customer concern. CONDUCT a diagnosis of other suspect components.</p> <p>→ No INSTALL a new valve lifter/lash adjuster(s). TEST the system for normal operation.</p>

PINPOINT TEST C: ACCESSORY DRIVE BEARING HOOT

CONDITIONS	DETAILS/RESULTS/ACTIONS
C1 CHECK THE ACCESSORY DRIVE IDLER AND TENSIONER PULLEY BEARINGS	
<p>2</p>  <p>4</p> 	<p>1 Carry out the Vehicle Cold Soak Procedure in this section.</p> <p>3 Place an EngineEAR probe directly on the pulley center post or bolt to verify which bearing is making the noise.</p> <ul style="list-style-type: none"> ● Is either bearing making the noise? <p>→ Yes INSTALL a new pulley/idler. CARRY OUT the Vehicle Cold Soak Procedure and TEST the system for normal operation.</p> <p>→ No CONDUCT a diagnosis on other suspect accessory drive components.</p>

PINPOINT TEST D: POWER STEERING MOAN

CONDITIONS	DETAILS/RESULTS/ACTIONS
D1 CHECK THE POWER STEERING SYSTEM	

2 

3 Turn the steering wheel while the noise is occurring and listen for changes in sound pitch or loudness.

4 

- Does the sound pitch or loudness change while turning the steering wheel?

→ **Yes**
GO to [D2](#).

→ **No**
CONDUCT a diagnosis on other suspect accessory drive components.

D2 VERIFY THE SOURCE

1 

2 Place an EngineEAR probe near the power steering pump/reservoir while the noise is occurring. While an assistant turns the steering wheel, listen for changes in sound pitch or loudness.

3 

- Does the sound pitch or loudness change while turning the steering wheel?

→ **Yes**
VERIFY that the supply tube to the pump is unobstructed. CHECK the fluid condition and level. DRAIN the fluid and REFILL. REFER to [Section 211-02](#). CARRY OUT the Vehicle Cold Soak Procedure and TEST the system for normal operation.

→ **No**
Normal system operation.

PINPOINT TEST E: ENGINE DRIVEN COOLING FAN MOAN

CONDITIONS	DETAILS/RESULTS/ACTIONS
E1 CHECK THE ENGINE DRIVEN COOLING FAN AFTER A COLD SOAK	

<p>2</p> <p>5</p>	<p>1 Carry out the Vehicle Cold Soak Procedure in this section.</p> <p>3 Assess the airflow.</p> <p>4 Raise the engine speed to 1500 rpm while listening for the moan to increase in proportion to the airflow.</p> <p>● Does the moan increase in proportion to the airflow?</p> <p>→ Yes TEST the fan for normal operation. If the fan tests normal, GO to E2. Otherwise, REPAIR as necessary.</p> <p>→ No Normal system operation.</p>
-------------------	--

E2 CHECK THE ENGINE DRIVEN COOLING FAN AT NORMAL OPERATING TEMPERATURE

<p>1</p> <p>3</p>	<p>2 Run the engine to normal operating temperature while listening for the moan to stop.</p> <p>● Does the moan stop?</p> <p>→ Yes Normal clutch operation.</p> <p>→ No INSTALL a new fan clutch. TEST the system for normal operation.</p>
-------------------	---

PINPOINT TEST F: DRUMMING NOISE

CONDITIONS	DETAILS/RESULTS/ACTIONS
F1 CHECK THE EXHAUST SYSTEM	
1	

3

4

DF1766-A

5

7

2 Increase the engine rpm until the noise is the loudest. Note the engine rpm.

4 Add approximately 9 kg (20 lb) of weight to the exhaust system. First place the weight at the tail pipe and test, then at the front pipe.

6 Increase the engine rpm and listen for the drumming noise. Note the engine rpm if the noise occurs.

8 Using a vibration analyzer (VA), determine the amount of vibration that occurs with the drumming noise.

- **Is the noise/vibration reduced or eliminated, or does the noise/vibration occur at a different rpm?**

→ **Yes**
CARRY OUT [Exhaust System Neutralizing](#) in this section. TEST the system for normal operation.

→ **No**
GO to [F2](#).

F2 POWERTRAIN/DRIVETRAIN MOUNT NEUTRALIZING

1 Carry out [Powertrain/Drivetrain Mount Neutralizing](#) in this section. Test the system for normal operation.

	<ul style="list-style-type: none"> ● Is the noise reduced or eliminated? <p>→ Yes Vehicle OK. TEST the system for normal operation.</p> <p>→ No CONDUCT diagnosis of other suspect components.</p>
--	--

PINPOINT TEST G: ENGINE TICKING, KNOCKING OR CONTINUOUS RATTLE

CONDITIONS	DETAILS/RESULTS/ACTIONS
G1 CHECK FOR NOISE AT THE VALVE COVERS AND THE FRONT COVERS (OHC ENGINES)	
<p>2</p>  <p>4</p> 	<p>1 Carry out the Vehicle Cold Soak Procedure in this section.</p> <p>3 NOTE: For a short-duration ticking noise, multiple engine starts may be necessary.</p> <p>Using an EngineEAR, listen closely at the valve covers and the front covers (OHC engines) by placing the probe near the surface of the valve cover and then on the surface front cover.</p> <ul style="list-style-type: none"> ● Is the noise source apparent? <p>→ Yes REMOVE the appropriate cover and INSPECT for loose, worn/broken components. REPAIR as necessary. TEST the system for normal operation.</p> <p>→ No GO to G2.</p>
G2 CHECK FOR NOISE AT THE CYLINDER BLOCK	
<p>1</p>  <p>3</p>	<p>2 Using an EngineEAR, listen closely at the cylinder block by placing a probe on or near each freeze plug.</p>

● **Is the noise source apparent?**

- **Yes**
REPAIR or INSTALL new components as necessary.
- **No**
GO to [G3](#).

G3 CHECK FOR NOISE WHILE DISCONNECTING EACH FUEL INJECTOR ELECTRICAL CONNECTOR, ONE AT A TIME

1

- 2 Disconnect each fuel injector electrical connector, one at a time, to decrease piston force and listen for the noise.

3

● **Is the noise reduced or eliminated?**

- **Yes**
INSTALL a new fuel injector. TEST the system for normal operation.
- **No**
INSPECT accessory drive or the transmission as a possible source.

PINPOINT TEST H: FRONT SUSPENSION NOISE

CONDITIONS	DETAILS/RESULTS/ACTIONS
H1 ROAD TEST THE VEHICLE	
	<p>1 Test drive the vehicle.</p> <p>2 NOTE: An assistant will be needed for this road test.</p> <p>During the road test, drive the vehicle over a rough road. Using ChassisEARS, determine from which area/component the noise is originating.</p> <p>● Is there a squeak, creak or rattle noise?</p> <p>→ Yes GO to H2.</p> <p>→ No</p>

The suspension system is OK. CONDUCT a diagnosis on other suspect systems.

H2 INSPECT THE STEERING SYSTEM

- 1  **WARNING:** The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

Raise and support the vehicle.

- 2 Check the steering system for wear or damage. Carry out a steering linkage test. Refer to [Section 211-00](#).
- 3 Inspect the tire wear pattern. Refer to Tire Wear Patterns chart in this section.

● **Are the steering components worn or damaged?**

→ **Yes**

REPAIR the steering system. INSTALL new components as necessary. TEST the system for normal operation.

→ **No**

GO to [H3](#).

H3 FRONT SHOCK ABSORBER/STRUT CHECK

- 1 Check the front shock absorbers/strut mounts for loose bolts or nuts.
- 2 Check the front shock absorbers/struts for damage or wear. Carry out a "bounce test".

● **Are the front shock absorbers/struts loose or damaged?**

→ **Yes**

TIGHTEN to specifications if loose. INSTALL new front shock absorbers/struts if damaged. TEST the system for normal operation.

→ **No**

GO to [H4](#).

H4 CHECK THE FRONT SPRINGS

- 1 Check the front spring and front spring mounts/brackets for wear or damage.

● **Are the front springs or spring mounts/brackets worn or damaged?**

→ **Yes**

REPAIR or INSTALL new components as necessary. TEST the system for normal operation.

→ **No**

GO to [H5](#).

H5 CHECK THE CONTROL ARMS/RADIUS ARMS

- 1 Inspect the control arm bushings for wear or damage.

	<p>2 Inspect for twisted or bent control/radius arm.</p> <ul style="list-style-type: none"> ● Are the control/radius arms damaged or worn? <p>→ Yes REPAIR or INSTALL new components as necessary. TEST the system for normal operation.</p> <p>→ No GO to H6.</p>
H6 CHECK THE STABILIZER BAR/TRACK BAR	
	<p>1 Check the stabilizer bar/track bar bushings and links for damage or wear.</p> <p>2 Check the stabilizer bar/track bar for damage.</p> <p>3 Check for loose or damaged stabilizer bar isolators or brackets.</p> <ul style="list-style-type: none"> ● Are the stabilizer bar/track bar components loose, worn or damaged? <p>→ Yes REPAIR or INSTALL new components as necessary. TEST the system for normal operation.</p> <p>→ No Suspension system OK. CONDUCT diagnosis on other suspect systems.</p>

PINPOINT TEST I: REAR SUSPENSION NOISE

CONDITIONS	DETAILS/RESULTS/ACTIONS
I1 ROAD TEST THE VEHICLE	
	<p>1 Test drive the vehicle.</p> <p>2 NOTE: An assistant will be needed for this road test.</p> <p>During the road test, drive the vehicle over a rough road. Using ChassisEARS, determine from which area/component the noise is originating.</p> <ul style="list-style-type: none"> ● Is there a squeak, creak or rattle noise? <p>→ Yes GO to I2.</p> <p>→ No The suspension system is OK. CONDUCT a diagnosis on other suspect systems.</p>
I2 REAR SHOCK ABSORBER/STRUT CHECK	
	<p>1  WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during</p>

these operations.

Raise and support the vehicle.

- 2 Check the rear shock absorber/strut mounts for loose bolts or nuts.
- 3 Check the rear shock absorbers/struts for damage. Carry out a shock absorber check.

● **Are the rear shock absorbers/struts loose or damaged?**

→ **Yes**

TIGHTEN to specifications if loose. INSTALL new rear shock absorbers/struts if damaged. TEST the system for normal operation.

→ **No**

GO to [13](#).

I3 CHECK THE REAR SPRINGS

- 1 Check the rear springs and rear spring mounts/brackets for wear or damage.

● **Are the rear springs or spring mounts/brackets worn or damaged?**

→ **Yes**

REPAIR or INSTALL new components as necessary. TEST the system for normal operation.

→ **No**

GO to [14](#).

I4 CHECK THE CONTROL ARMS/TRAILING ARMS

- 1 Inspect the control arm/trailing arm bushings for wear or damage. Check for loose control arm/trailing arm bolts.

- 2 Inspect for twisted or bent control arm/trailing arms.

● **Are the control arms/trailing arms loose, damaged or worn?**

→ **Yes**

REPAIR or INSTALL new components as necessary. TEST the system for normal operation.

→ **No**

GO to [15](#).

I5 CHECK THE STABILIZER BAR/TRACK BAR

- 1 Check the stabilizer bar/track bar bushings and links for damage or wear.

- 2 Check the stabilizer bar/track bar for damage.

- 3 Check for loose or damaged stabilizer bar isolators or brackets.

● **Are the stabilizer bar/track bar components loose, worn or damaged?**

→ **Yes**

REPAIR or INSTALL new components as necessary. TEST the system for normal operation.

→ **No**
 Suspension system OK. CONDUCT diagnosis on other suspect systems.

PINPOINT TEST J: WHEEL AND TIRE

CONDITIONS	DETAILS/RESULTS/ACTIONS
J1 ROAD TEST THE VEHICLE	
	<p>1 NOTE: Wheel or tire vibrations felt in the steering wheel are most likely related to the front wheel or tire. Vibration felt through the seat are most likely related to the rear wheel or tire. This may not always be true, but it can help to isolate the problem to the front or rear of the vehicle.</p> <p>Test drive the vehicle at different speed ranges.</p> <p>2 During the road test, if the vibration can be eliminated by placing the vehicle in neutral or is affected by the speed of the engine, the cause is not the wheels or tires.</p> <p>● Is there a vibration and noise?</p> <p>→ Yes GO to J2.</p> <p>→ No The wheel and tires are OK. CONDUCT a diagnosis on other suspect systems.</p>
J2 CHECK THE FRONT WHEEL BEARINGS	
	<p>1 Check the front wheel bearings. Refer to Wheel Bearing Check in this section.</p> <p>● Are the wheel bearings OK?</p> <p>→ Yes GO to J3.</p> <p>→ No INSPECT the wheel bearings. ADJUST or REPAIR as necessary. TEST the system for normal operation.</p>
J3 INSPECT THE TIRES	
	<p>1 Check the tires for missing weights.</p> <p>2 Check the wheels for damage.</p> <p>3 Inspect the tire wear pattern. Refer to the Tire Wear Patterns chart in this section.</p>

- Do the tires have an abnormal wear pattern?

→ **Yes**
CORRECT the condition that caused the abnormal wear. INSTALL new tire(s). TEST the system for normal operation.

→ **No**
GO to [J4](#).

J4 TIRE ROTATION DIAGNOSIS

1

DF1713-A

2

DF1714-A

1 Spin the tires slowly and watch for signs of lateral runout.

2 Spin the tires slowly and watch for signs of radial runout.

- Are there signs of visual runout?

→ **Yes**
GO to [J5](#).

→ **No**
CHECK the wheel and tire balance. CORRECT as necessary. TEST the system for normal operation.

J5 RADIAL RUNOUT CHECK ON THE TIRE

1

1 Measure the radial runout of the wheel and tire assembly. A typical specification for total radial runout is 0.045 inch.

DF1715-A

- Is the radial runout within specifications?

→ **Yes**
GO to [J8](#).

→ **No**
GO to [J6](#).

J6 RADIAL RUNOUT CHECK ON THE WHEEL

1 Measure the radial runout of the wheel. A typical specification for total radial runout is 0.045 inch.

- Is the radial runout within specifications?

→ **Yes**
INSTALL a new tire. TEST the system for normal operation.

→ **No**
GO to [J7](#).

J7 CHECK THE HUB/BRAKE DISC OR DRUM PILOT RUNOUT OR BOLT CIRCLE RUNOUT

1 Measure the pilot or bolt circle runout. A typical specification for radial runout is:

- Pilot runout— less than 0.15 mm (0.006 inch).
- Bolt circle runout— less than 0.38 mm (0.015 inch).

- Is the radial runout within specifications?

→ **Yes**
INSTALL a new wheel. TEST the system for normal operation.

→ **No**
REPAIR or INSTALL new components as necessary. REFER to [Section 204-01](#) for the front wheels or [Section 204-02](#) for the

rear wheels.

J8 LATERAL RUNOUT CHECK ON THE TIRE

1

1

Measure the lateral runout of the wheel and tire assembly. A typical specification for total lateral runout is 1.14 mm (0.045 inch).

- **Is the lateral runout within specifications?**

→ **Yes**

Wheel and tires OK. CONDUCT diagnosis on other suspect systems.

→ **No**

GO to [J9](#).

J9 LATERAL RUNOUT CHECK ON THE WHEEL

1

Measure the lateral runout of the wheel. A typical specification for total radial runout is 1.14mm (0.045 inch).

- **Is the lateral runout within specifications?**

→ **Yes**

INSTALL a new tire. TEST the system for normal operation.

→ **No**

GO to [J10](#).

J10 CHECK THE FLANGE FACE LATERAL RUNOUT

1

Measure the flange face lateral runout. A typical specification for lateral runout is:

- Hub/brake disc— less than 0.13 mm (0.005 inch).
- Axle shaft— less than 0.25 mm (0.010 inch).

- **Is the lateral runout within specifications?**

→ **Yes**

INSTALL a new wheel. TEST the system for normal operation.

→ **No**
 REPAIR or INSTALL new components as necessary. REFER to [Section 204-01](#) for the front wheels or [Section 204-02](#) for the rear wheels.

PINPOINT TEST K: HIGH SPEED SHAKE OR SHIMMY

CONDITIONS	DETAILS/RESULTS/ACTIONS
K1 CHECK FOR FRONT WHEEL BEARING ROUGHNESS	
	<p>1 Check the rear wheels.</p> <p>2 Raise and support the front end of the vehicle so that the front wheel and tire assemblies can spin.</p> <p>3 Spin the front tires by hand. Refer to Wheel Bearing Check in this section.</p> <p>● Do the wheel bearings feel rough?</p> <p>→ Yes INSPECT the wheel bearings. REPAIR as necessary. TEST the system for normal operation.</p> <p>→ No GO to K2.</p>
K2 CHECK THE END PLAY OF THE FRONT WHEEL BEARINGS	
	<p>1 Check the end play of the front wheel bearings. Refer to Section 204-00.</p> <p>● Is the end play OK?</p> <p>→ Yes GO to K3.</p> <p>→ No ADJUST or REPAIR as necessary. TEST the system for normal operation.</p>
K3 MEASURE THE LATERAL RUNOUT AND THE RADIAL RUNOUT OF THE FRONT WHEELS ON THE VEHICLE	
	<p>1 Measure the lateral runout and the radial runout of the front wheels on the vehicle. Go To Pinpoint Test J.</p> <p>● Are the measurements within specifications?</p> <p>→ Yes GO to K4.</p>

	<p>→ No INSTALL new wheels as necessary and BALANCE the assembly. TEST the system for normal operation.</p>
K4 MEASURE THE LATERAL RUNOUT OF THE FRONT TIRES ON THE VEHICLE	
	<p>1 Measure the lateral runout of the front tires on the vehicle. Go To Pinpoint Test J.</p> <p>● Is the runout within specifications?</p> <p>→ Yes GO to K5.</p> <p>→ No INSTALL new tires as necessary and BALANCE the assembly. TEST the system for normal operation.</p>
K5 MEASURE THE RADIAL RUNOUT OF THE FRONT TIRES ON THE VEHICLE	
	<p>1 Measure the radial runout of the front tires on the vehicle. Go To Pinpoint Test J.</p> <p>● Is the runout within specifications?</p> <p>→ Yes BALANCE the front wheel and tire assemblies. If any tire cannot be balanced, INSTALL a new tire. TEST the system for normal operation.</p> <p>→ No GO to K6.</p>
K6 MATCH MOUNT THE TIRE AND WHEEL ASSEMBLY	
	<p>1 Mark the high runout location on the tire and also on the wheel. Break the assembly down and rotate the tire 180 degrees (halfway around) on the wheel. Inflate the tire and measure the radial runout.</p> <p>● Is the runout within specifications?</p> <p>→ Yes BALANCE the assembly. TEST the system for normal operation.</p> <p>→ No If the high spot is not within 101.6 mm (4 inches) of the first high spot on the tire, GO to K7.</p>
K7 MEASURE THE WHEEL FLANGE RUNOUT	
1	1 Dismount the tire and mount the wheel

on a wheel balancer. Measure the runout on both wheel flanges. Refer to [Section 204-04](#).

● **Is the runout within specifications?**

→ **Yes**

LOCATE and MARK the low spot on the wheel. INSTALL the tire, matching the high spot on the tire with the low spot on the wheel. BALANCE the assembly. TEST the system for normal operation. If the condition persists, GO to [K8](#).

→ **No**

INSTALL a new wheel. CHECK the runout on the new wheel. If the new wheel is within limits, LOCATE and MARK the low spot. INSTALL the tire, matching the high spot on the tire with the low spot on the wheel. BALANCE the assembly. TEST the system for normal operation. If the condition persists, GO to [K8](#).

K8 CHECK FOR VIBRATION FROM THE FRONT OF THE VEHICLE

⚠ WARNING: If only one drive wheel is allowed to rotate, speed must be limited to 55 km/h (34 mph) using the speedometer reading, since actual wheel speed will be twice that indicated on the speedometer. Exceeding a speed of 55 km/h (34 mph) or allowing the drive wheel to hang unsupported can result in tire disintegration or differential failure, which can cause serious personal injury and extensive vehicle damage.

1 Spin the front wheel and tire assemblies with a wheel balancer while the vehicle is raised on a hoist. Feel for vibration in the front fender or while seated in the vehicle.

● **Is the vibration present?**

→ **Yes**

SUBSTITUTE known good wheel and tire assemblies as necessary. TEST the system for normal operation.

→ **No**

GO to [K9](#).

K9 CHECK FOR VIBRATION FROM THE REAR OF THE VEHICLE

⚠ WARNING: If only one drive wheel is allowed to rotate, speed must be limited to 55

km/h (34 mph) using the speedometer reading, since actual wheel speed will be twice that indicated on the speedometer. Exceeding a speed of 55 km/h (34 mph) or allowing the drive wheel to hang unsupported can result in tire disintegration or differential failure, which can cause serious personal injury and extensive vehicle damage.

	<ol style="list-style-type: none"> 1 Chock the front wheels. 2 Raise and support the rear end of the vehicle so that the rear wheel and tire assemblies can spin. 3 Engage the drivetrain and carefully accelerate the drive wheels while checking for vibration. <p>● Is the vibration present?</p> <p>→ Yes GO to K10.</p> <p>→ No TEST the system for normal operation.</p>
--	--

K10 CHECK THE DRIVETRAIN

 **WARNING:** If only one drive wheel is allowed to rotate, speed must be limited to 55 km/h (34 mph) using the speedometer reading, since actual wheel speed will be twice that indicated on the speedometer. Exceeding a speed of 55 km/h (34 mph) or allowing the drive wheel to hang unsupported can result in tire disintegration or differential failure, which can cause serious personal injury and extensive vehicle damage.

	<ol style="list-style-type: none"> 1 Remove the rear wheel and tire assemblies. Refer to Section 204-04. 2 Secure the brake drums (if so equipped), by installing wheel hub bolt nuts, reversed. 3 Carefully accelerate the drivetrain while checking for vibration. <p>● Is the vibration present?</p> <p>→ Yes CHECK/TEST the drivetrain and driveline components. TEST the system for normal operation.</p> <p>→ No SUBSTITUTE known good wheel and tire assemblies as necessary. TEST the system for normal operation.</p>
--	--

PINPOINT TEST L: CLUTCH VIBRATION

CONDITIONS	DETAILS/RESULTS/ACTIONS
L1 CHECK ENGINE COMPONENTS FOR GROUNDING	
	<ol style="list-style-type: none"> 1 NOTE: Make sure the clutch is the cause of the vibration concern. The

vibration should occur during clutch operation. The clutch can also be difficult to engage or disengage. Eliminate all related systems before checking the clutch components.

NOTE: Check the driveline angles and driveshaft runout before disassembling the clutch system. Refer to [Section 205-00](#).

Check the powertrain/drivetrain mounts, exhaust manifolds or other engine components for grounding on the chassis.

● **Are any mounts or engine components grounded?**

→ **Yes**
REPAIR as necessary. TEST the system for normal operation.

→ **No**
GO to [L2](#).

L2 CHECK THE ACCESSORY DRIVE BELT

1 Remove the accessory drive belt.

● **Does the vibration stop with the accessory drive belt removed?**

→ **Yes**
DIAGNOSE the accessory drive components.

→ **No**
GO to [L3](#).

L3 CHECK FOR LOOSE CLUTCH PRESSURE PLATE BOLTS

1 Check for loose clutch pressure plate bolts. Inspect the clutch pressure plate for damage or for material between the pressure plate and flywheel.

● **Are there any loose bolts or damage?**

→ **Yes**
TIGHTEN the bolts to specifications or if damaged, INSTALL a new clutch pressure plate. REFER to [Section 308-01](#). TEST the system for normal operation.

→ **No**
GO to [L4](#).

L4 CHECK THE CLUTCH DISC SPRINGS

1 Check for worn, broken or loose clutch disc springs.

● **Are the clutch springs worn, broken or loose?**

→ **Yes**
INSTALL a new clutch disc. REFER to [Section 308-01](#). TEST the system for normal operation.

→ **No**
GO to [L5](#).

L5 CHECK THE CLUTCH DISC SPLINES

	<p>1] Inspect the clutch disc splines for damage or wear.</p> <ul style="list-style-type: none"> ● Is there damage or wear? <p>→ Yes INSTALL a new clutch disc. REFER to Section 308-01. TEST the system for normal operation.</p> <p>→ No GO to L6.</p>
L6 CHECK THE FLYWHEEL BOLTS	
	<p>1] Check for loose flywheel bolts.</p> <ul style="list-style-type: none"> ● Are the bolts loose? <p>→ Yes TIGHTEN the bolts to specifications. REFER to Section 303-01A for 3.0L engines or Section 303-01B for 3.9L engines. TEST the system for normal operation.</p> <p>→ No GO to L7.</p>
L7 CHECK THE FLYWHEEL SURFACE	
	<p>1] Inspect the flywheel surface for wear or damage. Check the flywheel runout.</p> <ul style="list-style-type: none"> ● Is there any damage or excessive wear? <p>→ Yes INSTALL a new flywheel. REFER to Section 303-01A for 3.0L engines or Section 303-01B for 3.9L engines. TEST the system for normal operation.</p> <p>→ No Clutch system normal. CONDUCT a diagnosis on other suspect systems.</p>

Component Tests

Idle Air Control (IAC) Valve

1. Open the hood.
2. **NOTE:** Key symptom is elevated idle speed while noise is occurring.

NOTE: "Snapping" the throttle can induce the noise.

Verify the condition by operating the vehicle for a short time.

3. Inspect the IAC valve. If physical evidence of contamination exists, install a new IAC valve.
4. While the noise is occurring, either place an EngineEAR probe near the IAC valve and the inlet tube, or create a 6.35 mm (0.25 in)-12.7 mm (0.50 in) air gap between the inlet tube and the clean air tube. If the IAC valve is making the noise, install a new IAC valve.
5. Test the vehicle for normal operation.

Steering Gear Grunt/Shudder Test

1. Start and run the vehicle to operating temperature.
2. Set engine idle speed to 1200 rpm.
3.  **CAUTION: Do not hold the steering wheel against the stops for more than three to five seconds at a time. Damage to the power steering pump will occur.**

Rotate the steering wheel to the RH stop, then turn the steering wheel 90° back from that position. Turn the steering wheel slowly in a 15° to 30° arc.

4. Turn the steering wheel another 90°. Turn the steering wheel slowly in a 15° to 30° arc.
5. Repeat the test with power steering fluid at different temperatures.
6. If a light grunt is heard or a low (50-200 Hz) shudder is present, this is a normal steering system condition.
7. If a loud grunt is heard, or strong shudder is felt, fill and purge the power steering system.

Checking Tooth Contact Pattern and Condition of the Ring and Pinion

There are two basic types of conditions that will produce ring and pinion noise. The first type is a howl or chuckle produced by broken, cracked, chipped, scored or forcibly damaged gear teeth and is usually quite audible over the entire speed range. The second type of ring and pinion noise pertains to the mesh pattern of the gear pattern. This gear noise can be recognized as it produces a cycling pitch or whine. Ring and pinion noise tends to peak in a narrow speed range or ranges, and will tend to remain constant in pitch.

1. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
2. Drain the axle lubricant. For additional information, refer to [Section 205-02](#).
3. Remove the carrier assembly or the axle housing cover depending on the axle type. Refer to [Section 205-02](#).
4. Inspect the gear set for scoring or damage.

5. In the following steps, the movement of the contact pattern along the length is indicated as toward the "heel" or "toe" of the differential ring gear.

Item	Description
1	Heel
2	Toe

6. Apply a marking compound to a third of the gear teeth on the differential ring gear. Rotate the differential ring gear several complete turns in both directions until a good, clear tooth pattern is obtained. Inspect the contact patterns on the ring gear teeth.
7. A good contact pattern should be centered on the tooth. It can also be slightly toward the toe. There should always be some clearance between the contact pattern and the top of the tooth.
 - Tooth contact pattern shown on the drive side of the gear teeth.

8. A high, thick contact pattern that is worn more toward the toe.

- Tooth contact pattern shown on the drive side of the gear teeth.

- The high contact pattern indicates that the drive pinion is not installed deep enough into the carrier.
- The differential ring gear backlash is correct, a thinner drive pinion shim is needed. A decrease will move the drive pinion toward the differential ring gear.

9. A high, thin contact pattern that is worn toward the toe.

- Tooth contact pattern shown on the drive side of the gear teeth.
- The drive pinion depth is correct. Increase the differential ring gear backlash.

10. A contact pattern that is worn in the center of the differential ring gear tooth toward the heel.

- Tooth contact pattern shown on the drive side of the gear teeth.
- The low contact pattern indicates that the drive pinion is installed too deep into the carrier.
- The differential ring gear backlash is correct. A thicker drive pinion shim is needed.

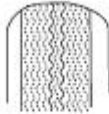

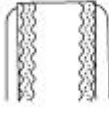

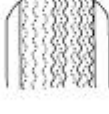

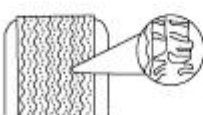

11. A contact pattern that is worn at the top of the differential ring gear tooth toward the heel.

- Tooth contact pattern shown on the drive side of the gear teeth.
- The pinion gear depth is correct. Decrease the differential ring gear backlash.

Tire Wear Patterns and frequency calculations

Tire Wear Chart

TIRE WEAR	CONDITION	POSSIBLE CAUSES
	<ul style="list-style-type: none"> • Rapid wear at both shoulders. 	<ul style="list-style-type: none"> • Tires underinflated. • Worn suspension components. • Excessive cornering speeds. • Lack of rotation.
	<ul style="list-style-type: none"> • Rapid wear at the center. 	<ul style="list-style-type: none"> • Tires overinflated. • Lack of rotation. • Excessive toe on drive wheels. • Heavy acceleration on drive wheels.
	<ul style="list-style-type: none"> • Wear at one shoulder. 	<ul style="list-style-type: none"> • Toe adjustment out of specification. • Camber out of specification. • Damaged strut. • Damaged lower control arm.
	<ul style="list-style-type: none"> • Feather edges. 	<ul style="list-style-type: none"> • Toe adjustment out of specification. • Damaged or worn tie rods. • Damaged spindle or knuckle.
	<ul style="list-style-type: none"> • Bald spots or cupping. 	<ul style="list-style-type: none"> • Unbalanced wheel. • Excessive radial runout. • Worn strut or shock absorber.
	<ul style="list-style-type: none"> • Tire scalloped. 	<ul style="list-style-type: none"> • Toe adjustment out of specification. • Camber out of specification. • Worn or damaged suspension components.
	<ul style="list-style-type: none"> • Wear pattern - FWD vehicles. 	<ul style="list-style-type: none"> • Excessive toe on non-drive wheels. • Lack of rotation.
	<ul style="list-style-type: none"> • Wear pattern - FWD vehicles. • Edge of tread blocks worn. 	<ul style="list-style-type: none"> • Excessive toe on non-drive wheels. • Lack of rotation.

DF1717-A

Wheel and tire NVH concerns are directly related to vehicle speed and are not generally affected by acceleration, coasting or decelerating. Also, out-of-balance wheel and tires can vibrate at more than one speed. A vibration that is affected by the engine rpm, or is eliminated by placing the transmission in NEUTRAL is not related to the tire and wheel. As a general rule, tire and wheel vibrations felt in the steering wheel are related to the front tire and wheel assemblies. Vibrations felt in the seat or floor are related to the rear tire and wheel assemblies. This can initially isolate a concern to the front or rear.

Careful attention must be paid to the tire and wheels. There are several symptoms that can be caused by damaged or worn tire and wheels. Carry out a careful visual inspection of the tires and wheel assemblies. Spin the tires slowly and watch for signs of lateral or radial runout. Refer to the tire wear chart to determine the tire wear conditions and actions.

For a vibration concern, use the vehicle speed to determine tire/wheel frequency and rpm. Calculate tire and wheel rpm and frequency by carrying out and following:

- Measure the diameter of the tire.
- Record the speed at which the vibration occurs.
- Obtain the corresponding tire and wheel rpm and frequency from the Tire Speed and Frequency Chart.
 - If the vehicle speed is not listed, divide the vehicle speed at which the vibration occurs by 16 km/h (10 mph). Multiply that number by 16 km/h (10 mph) tire rpm listed for that tire diameter in the chart. Then divide that number by 60. For example: a 40 mph vibration with 835 mm (33 in) tires. $40 \div 10 = 4$. Multiply 4 by 105 = 420 rpm. Divide 420 rpm by 60 seconds = 7 Hz at 40 mph.

Tire Speed and Frequency Chart

Tire Diameter	Tire RPM/Hz	Tire RPM/Hz	Tire RPM/Hz	Tire RPM/Hz
mm (inch)	@ 16 km/h (10 mph)	@ 80 km/h (50 mph)	@ 97 km/h (60 mph)	@ 113 km/h (70 mph)
483 (19)	182	910/15	1092/18	1274/21
508 (20)	173	865/14	1038/17	1211/20
533 (21)	165	825/14	990/16	1155/19

Brake Disc Machining

Special Tool(s)

 <p>ST1348-A</p>	Gauge, Clutch Housing 308-021 (T75L-4201-A)
 <p>ST1214-A</p>	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent

Material

Item	Specification
Metal Surface Cleaner F4AZ-19A536-RA or equivalent	WSE-M5B392-A
High Temperature Nickel Anti-Seize Lubricant F6AZ-9L494-AA or equivalent	ESE-M12A4-A

⚠ WARNING: The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

⚠ CAUTION: Do not install brake discs that are less than the minimum thickness specified. Do not machine a brake disc below the minimum thickness specification.

1. Check wheel bearing end-play and correct as necessary.
2. **NOTE:** Begin at the front of the vehicle unless the vibration has been isolated to the rear.
 Remove the tire and wheel assembly.
3. Remove the brake caliper and the brake caliper anchor plate. Refer to the appropriate section in Group [206](#) for the procedure.
4. Inspect the brake linings. Install new brake linings if below specification. For additional information, refer to the appropriate brake section.
5. Measure and record the brake disc thickness. Install a new brake disc if the thickness after machining will be at or below specification. The specification is molded into the brake disc.
 - Do not machine a new brake disc.

6. For vehicles with a two-piece hub and brake disc assembly:
 - Match-mark before disassembly.
 - Remove the brake disc.
 - Clean the hub and brake disc mounting surfaces with metal surface cleaner.
 - Using a die grinder with a mild abrasive (Scotch Brite® type), remove any rust or corrosion from the hub and brake disc mounting surfaces.
 - Align the match-marks and reinstall the brake disc on the hub.

7.  **CAUTION: Do not use a bench lathe to machine brake discs.**

NOTE: The depth of cut must be between 0.10 and 0.20 mm (0.004 and 0.008 inch). Lighter cuts will cause heat and wear. Heavier cuts will cause poor brake disc surface finish.

Using an on-car brake lathe, machine the brake discs. Follow the manufacturer's instructions. After machining, make sure the brake disc still meets the thickness specification.

8. Using the special tools, verify that the brake disc lateral runout is now within specification. For additional information, refer to [Section 206-00](#).
 9. Remove the special tool hub adapter.
 10. Remove any remaining metal chips from the machining operation.
 11. For vehicles with a two-piece hub and brake disc assembly:
 - Remove the brake disc from the hub.
 - Remove any remaining metal chips from hub and brake disc mounting surfaces and from the ABS sensor.
 - Apply a liberal amount of lubricant to the hub flange, pilot area and to the brake disc-to-hub mounting surface.
 - Using the match marks, mount the brake disc on the hub.
 12. Install the brake caliper anchor plate and the brake caliper.
 13. Install the tire and wheel assembly.
 14. Test the system for normal operation.
-

Powertrain/Drivetrain Mount Neutralizing

 **WARNING:** The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

1. Raise and support the vehicle.
 2. Loosen, but do not remove, the powertrain/drivetrain mount fasteners.
 3. Lower the vehicle.
 4.  **CAUTION:** Do not twist or strain the powertrain/drivetrain mounts.
Move the vehicle in forward and reverse 0.6-1.2 meters (2-4 ft).
 5. Raise and support the vehicle.
 6. Tighten the powertrain/drivetrain mount fasteners.
 7. Lower the vehicle.
 8. Test the system for normal operation.
-

Exhaust System Neutralizing

WARNING: Exhaust gases contain carbon monoxide, which is harmful to health and potentially lethal. Repair exhaust system leaks immediately. Never operate the engine in an enclosed area.

WARNING: Exhaust system components are hot.

NOTE: Neutralize the exhaust system to relieve strain on mounts which can be sufficiently bound up to transmit vibration as if grounded.

1.  **WARNING:** The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

CAUTION: Make sure the system is warmed up to normal operating temperature, as thermal expansion can be the cause of a strain problem.

Raise and support the vehicle.

2. Loosen all exhaust hanger attachments and reposition the hangers until they hang free and straight.
 3. Loosen all exhaust flange joints.
 4. Place a stand to support the muffler parallel to the vehicle frame with the muffler pipe bracket free of stress.
 5. Tighten the muffler connection.
 6. Tighten all the exhaust hanger clamps and flanges (tighten the exhaust manifold flange joint last).
 - Verify there is adequate clearance to prevent grounding at any point in the system. Make sure that the catalytic converter and heat shield do not contact the frame rails.
 - After neutralization, the rubber in the exhaust hangers should show some flexibility when movement is applied to the exhaust system.
 - With the exhaust system installed securely and cooled, the rear hanger should be angled forward.
 7. Lower the vehicle.
 8. Test the exhaust system for normal operation.
-

Wheel Bearing Check

1.  **WARNING:** The electrical power to the air suspension system must be shut off prior to hoisting, jacking or towing an air suspension vehicle. This can be accomplished by turning off the air suspension switch. Failure to do so can result in unexpected inflation or deflation of the air springs, which can result in shifting of the vehicle during these operations.

Raise the vehicle until the front tires are off the floor.

- Make sure the wheels are in a straight forward position.

2. **NOTE:** Make sure the wheel rotates freely and that the brake pads are retracted sufficiently to allow free movement of the tire and wheel assembly.

Spin the tire by hand to check the wheel bearings for roughness.

3. Grip each front tire at the top and bottom and move the wheel inward and outward while lifting the weight of the tire off the front wheel bearing.

4. If the tire and wheel (hub) is loose on the spindle, does not rotate freely, or has a rough feeling when spun, carry out one of the following:
 1. On vehicles with inner and outer bearings, inspect the bearings and cups for wear or damage. Adjust or install new bearings and cups as necessary.
 2. On vehicles with one sealed bearing, install a new wheel hub.

General Specifications

Item	LH	RH	Split
Alignment Specifications — Front			
Caster	8.10° ± 0.50°	8.10° ± 0.50°	0° ± 0.70°
Camber	-0.15° ± 0.50°	-0.15° ± 0.50°	0° ± 0.70°
Toe @ curb ride height (positive value is toe-in, negative value is toe-out)	—	—	+0.16° ± 0.25°
Alignment Specifications — Rear			
Caster	—	—	—
Camber	-1.0° ± 0.75°	-1.0° ± 0.75°	0° ± 0.75°
Toe @ curb ride height (positive value is toe-in, negative value is toe-out)	0.12° ± 0.25°	0.12° ± 0.25°	0.24° ± 0.25°

General Specifications

Item	Specification
Dogtracking — maximum (centerline of front tires compared to centerline of rear tires)	12.7 mm (0.5 in.)
Clear Vision	
Clear vision (negative value is counterclockwise)	0° ± 3°
Ride Height	
Front	60.5 mm ± 8 mm (2.4 in. ± 0.3 in.)
Rear	25.8 mm ± 8 mm (1 in. ± 0.3 in.)
Ball Joint Radial Play	
Lower ball joint — maximum	0.8 mm (1/32 in.)
Upper ball joint — maximum	0.8 mm (1/32 in.)
Vehicle Lean (Side-to-Side Height Differences)	
Front wheel opening difference — maximum	12 mm

	(0.5 in.)
Rear wheel opening difference — maximum	12 mm (0.5 in.)
Vehicle Attitude (Front-to-Rear Height Difference)	
Maximum vehicle attitude = average front - average rear	14.5 mm (0.6 in.)

Torque Specifications

Description	Nm	lb-ft
Lower front suspension arm nuts	175	129
Rear toe link lock nuts	70	52
Steering column intermediate shaft pinch bolt	35	26
Steering gear lock nuts	103	76

Wheel Alignment Angles

Camber, caster and toe are adjustable on the front suspension system. Only the toe is adjustable on the rear suspension system. Camber and caster are adjusted by means of eccentric cams on the lower control arm mounting bolts. The front toe is adjusted by use of the front wheel spindle tie rod (3280). The rear toe is adjusted by the use of toe link assemblies connecting the knuckles to the rear sub-frame.

Camber

Negative and Positive Camber

Camber is the vertical tilt of the wheel when viewed from the front. Camber can be positive or negative and has a direct effect on tire wear.

Caster

Item	Description

1	Positive caster
2	True vertical
3	Steering axis

Caster is the deviation from vertical of an imaginary line drawn through the ball joints when viewed from the side. The caster specifications in this section will give the vehicle the best directional stability characteristics when loaded and driven. The caster setting is not related to tire wear.

Toe

Positive Toe (Toe-In)

Negative Toe (Toe-Out)

The vehicle toe setting affects tire wear and directional stability.

Ride Height

Front Ride Height Measurement

Item	Description
1	Ride height = B-A
2	Measurement A
3	Measurement B

Rear Ride Height Measurement

Item	Description
1	Ride height = A-B
2	Measurement A
3	Measurement B

Wheel Track

Item	Description
1	Front track
2	Rear track

Dogtracking

Item	Description
1	Front track
2	Rear track dogtracking

Dogtracking is the condition in which the independent rear suspension (IRS) system is not square to the chassis. Heavily crowned roads can give the illusion of dogtracking.

Wander

Wander is the tendency of the vehicle to require frequent, random left and right steering wheel (3600) corrections to maintain a straight path down a level road.

Shimmy

Shimmy, as observed by the driver, is large, consistent, rotational oscillations of the steering wheel resulting from large, side-to-side (lateral) tire/wheel movements.

Shimmy is usually experienced near 64 km/h (40 mph), and can begin or be amplified when the tire

contacts pot holes or irregularities in the road surface.

Nibble

Sometimes confused with shimmy, nibble is a condition resulting from tire interaction with various road surfaces and observed by the driver as small rotational oscillations of the steering wheel.

Poor Returnability/Sticky Steering

Poor returnability and sticky steering is used to describe the poor return of the steering wheel to center after a turn or the steering correction is completed.

Drift/Pull

Pull is a tugging sensation, felt by the hands on the steering wheel, that must be overcome to keep the vehicle going straight.

Drift describes what a vehicle with this condition does with hands off the steering wheel.

- A vehicle-related drift/pull, on a flat road, will cause a consistent deviation from the straight-ahead path and require constant steering input in the opposite direction to counteract the effect.
- Drift/pull may be induced by conditions external to the vehicle (i.e., wind, road crown).

Poor Groove Feel

Poor groove feel is characterized by little or no buildup of turning effort felt in the steering wheel as the wheel is rocked slowly left and right within very small turns around center or straight-ahead (under 20 degrees of steering wheel turn). Efforts may be said to be "flat on center."

- Under 20 degrees of turn, most of the turning effort that builds up comes from the mesh of gear teeth in the steering gear (3504). In this range, the steering wheel is not yet turned enough to feel the effort from the self-aligning forces at the road wheel or tire patch.
 - In the diagnosis of a roadability problem, it is important to understand the difference between wander and poor groove feel.
-

Suspension System

Inspection and Verification

1. Road test.
 - Verify the customer's concern by performing a road test on a smooth road. If any vibrations are apparent, refer to [Section 100-04](#).
2. Inspect tires.
 - Check the tire pressure with all normal loads in the vehicle and the tires cold. For additional information, refer to the vehicle certification (VC) label.
 - Verify that all tires are sized to specification.
 - Inspect the tires for incorrect wear and damage.
3. Inspect chassis and underbody.
 - Remove any excessive accumulation of mud, dirt or road deposits from the chassis and underbody.
4. Inspect for aftermarket equipment.
 - Check for aftermarket changes to the steering, suspension, wheel and tire components (such as competition, heavy duty, etc.) The specifications shown in this manual do not apply to vehicles equipped with aftermarket equipment.

Visual Inspection Chart

Mechanical
<ul style="list-style-type: none">● Wheel bearing(s)● Loose or damaged front or rear suspension components● Loose, damaged or missing suspension fastener(s)● Incorrect spring usage● Damaged or sagging spring(s)● Damaged or leaking shock absorber(s)● Damaged or leaking strut(s)● Worn or damaged suspension bushing(s)● Loose, worn or damaged steering system components● Damaged axle components

5. If an obvious cause for an observed or reported condition is found, correct the cause (if possible) before proceeding to the next step.
6. If the fault is not visually evident, determine the symptom and proceed to the following symptom chart.

Symptom Chart

Condition	Possible Sources	Action
<ul style="list-style-type: none"> ● Dogtracking 	<ul style="list-style-type: none"> ● Incorrect rear thrust angle. ● Front or rear suspension components. ● Drive axle damaged. 	<ul style="list-style-type: none"> ● CHECK the wheel alignment. Component Tests

Ball Joint Inspection

NOTE: The front suspension is shown in the following procedures. The inspection of the rear suspension upper ball joint is similar.

1. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
2. Prior to performing any inspection of the ball joints, inspect the front wheel bearings. For

additional information, refer to [Wheel Bearing Inspection—Front and Rear](#).

3. Position a safety stand beneath the front suspension lower arm (3079) or rear suspension lower arm to be tested.

4. While an assistant pulls and pushes the top and bottom of the tire, observe the relative movement between the ball joint and the front suspension lower arm. Any movement at or exceeding the specification indicates a worn or damaged ball joint. Install a new spindle as necessary. For additional information, refer to [Section 204-01](#).

5. While an assistant pulls and pushes the top and bottom of the tire, observe the relative movement between the ball joint and the front suspension upper arm or rear suspension upper arm. Any movement at or exceeding the specification indicates a worn or damaged ball joint. Install a new front suspension upper arm or rear suspension upper arm as necessary. For additional information, refer to [Section 204-01](#) or [Section 204-02](#).
 6. Remove the safety stand.
 7. Lower the vehicle.
-

Wheel Bearing Inspection —Front and Rear

1. Raise the vehicle until the tire is off the floor. For additional information, refer to [Section 100-02](#).
2. **NOTE:** Make sure the wheel rotates freely and the brake pads are retracted sufficiently to allow movement of the tire and wheel assembly.

Grasp each tire at the top and bottom and move the wheel inward and outward while lifting the weight of the tire off the wheel bearing.

3. If the tire and wheel (hub) is loose on the wheel spindle or does not rotate freely, install a new front wheel hub (1104) or rear hub (1109) as necessary. For additional information, refer to [Section 204-01](#) or [Section 204-02](#).
-

Camber and Caster Adjustment

NOTE: If the vehicle is equipped with hex head bolts in the lower control arm, new cam bolts and lock nuts must be installed before adjusting the cast and camber.

NOTE: The camber and caster adjustment for the LH side is shown. The procedure for adjusting the RH side is similar.

Vehicles without camber and caster adjustment cam bolts

1. Remove two bolts, one pushpin and the splash shield.

2. Remove and discard the pinch bolt. Disconnect the steering shaft.

3. Remove three lock nuts and bolts. Discard the lock nuts.

4. Raise and support the front end and the No. 2 crossmember.
 - Position two 4 in. x 4 in. pieces of wood between the No. 2 crossmember and the lifting device.

5. Remove and discard the front nut and bolt.

6. Install the caster adjustment cam bolt and a new lock nut.
 - The bolt must be installed from the rear as shown.
 - Install the bolt with the cam lobe down.
 - The cam must be seated between the cam guides on the No. 1 crossmember.

7. Position the steering gear (3504) aside.
8. Remove and discard the rear nut and bolt.

9. Loosely, install the camber adjustment cam bolt, a new lock nut and the I-brace bracket (if equipped).
 - The bolt must be installed from the rear as shown.
 - Install the bolt with the cam lobe down.
 - The cam must be seated in the groove in the No. 2 crossmember.

10. Lower the front end.
11. Install the steering gear, three bolts and new lock nuts.

12. Connect the steering shaft. Install a new pinch bolt.

All vehicles

13. Measure the wheel alignment values. Follow the equipment manufacturer's instructions.

Vehicles requiring caster adjustment

14. Rotate the caster adjustment cam bolt (front) to adjust the caster.

15. Recheck the alignment settings. Follow the equipment manufacturer's instructions. Readjust as necessary.

Vehicles requiring camber adjustment

16. **NOTE:** Adjustments to the camber impact the toe settings. Therefore, the camber and toe may need to be adjusted at the same time to get the correct values.

NOTE: Both the LH and RH toe need to be adjusted when adjusting the camber.

Loosen the jam nut. Remove the clamp.

- Clean and lubricate the jam nut and front wheel spindle tie-rod threads.

17. **NOTE:** Do not allow the steering gear bellows to twist when the front wheel spindle tie-rod is rotated.

Rotate the front wheel spindle tie-rod to adjust the toe.

18. **NOTE:** To aid in accurate camber and toe measurements, support the front suspension lower arm by hand while rotating the camber adjustment cam bolt.

Rotate the camber adjustment cam bolt (rear) to adjust the camber.

19. Repeat the above camber adjustment steps until the correct camber and toe measurements are achieved.

All vehicles

20. Tighten the nut.

21. Tighten the nut.

22. Tighten the nut. Install the clamp.

23. Recheck the alignment settings. Follow the equipment manufacturer's instructions. Readjust the caster as necessary.
24. Install the splash shield, one pushpin, and two bolts.

A0000396

Toe Adjustment —Front

1. Start the engine and center the steering wheel (3600).
2. Turn the engine off, and hold the steering wheel in the "straight forward" position by attaching a rigid link from the steering wheel to the brake pedal.
3. Check the toe settings. Follow the equipment manufacturer's instructions.
4. Loosen the nuts. Remove the clamps.
 - Clean and lubricate the nuts and front wheel spindle tie-rod threads.

5. **NOTE:** Do not allow the steering gear bellows to twist when the front wheel spindle tie-rod (3280) is rotated.

Rotate the front wheel spindle tie-rods.

6. Tighten the nuts. Install the clamps.

7. Recheck the toe settings. Follow the equipment manufacturer's instructions.
-

Toe Adjustment —Rear

1. Loosen the nut.
 - Clean the nut and toe link threads.

2. Rotate the toe link to adjust the toe.

3. Tighten the nut.

4. Recheck the toe settings. Follow the equipment manufacturer's instructions.

Front Suspension

WARNING: All vehicles are equipped with gas-pressurized shock absorbers which will extend unassisted. Do not apply heat or flame to the shock absorbers during removal or component servicing. Failure to follow these instructions may result in personal injury.

CAUTION: All front suspension fasteners are important attaching parts because they can affect the performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during assembly to make sure of correct retention of these parts. Never attempt to heat, quench or straighten any front suspension part. Install a new part.

The front suspension consists of the following components:

- upper suspension arm and bushing (3082)
- lower suspension arm and bushing (3078)
- shock absorber and spring assembly
- stabilizer bar (5482)
- stabilizer bar bushings (5493)
- stabilizer bar brackets (5486)
- stabilizer bar links (5K483)
- wheel knuckle (3K185)
- wheel hub and bearing (1104)

Front Suspension

A0001090

Item	Part Number	Description
1	—	Shock absorber and spring assembly
2	3082	Upper arm and bushing
3	3K185	Wheel knuckle
4	5K483	Stabilizer bar link
5	3078	Lower arm and bushing
6	5482	Stabilizer bar
7	5493	Stabilizer bar bushing
8	5486	Stabilizer bar bracket
9	1104	Wheel hub and bearing

Front Suspension

Refer to [Section 204-00](#) .

Wheel Bearing and Hub

Removal

⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Raise the vehicle on a hoist. For additional information, refer to [Section 100-02](#).
2. Remove the wheel and tire assembly. For additional information, refer to [Section 204-04](#).
3. Remove the brake disc. For additional information, refer to [Section 206-03](#).
4. Remove the pushpins.

5. Move the inner fender skirt aside and disconnect the anti-lock brake (ABS) sensor.

6. Detach the ABS sensor wire from the retainers.

7. **⚠ CAUTION:** The wheel hub and bearing (1104) is not pressed into the wheel knuckle (3K185). Do not use a slide hammer, or strike the back of the wheel hub and bearing to remove a stuck wheel hub and bearing. Damage to the bearing or the wheel hub will occur.

NOTE: If necessary, clean any rust or corrosion from the back of the wheel hub and bearing and lubricate the wheel hub and bearing with Rust Penetrant and Inhibitor D7AZ-19A501-AA or equivalent meeting Ford specification ESR-M99C56-A.

NOTE: Do not remove the ABS sensor and wire from the hub and bearing unless a new ABS sensor and wire is being installed. If the ABS sensor is separated from the hub and bearing, make sure the O-ring is in place and is not worn or damaged. Install a new O-ring if necessary.

Remove and discard the bolts. Remove the wheel hub and bearing.

Installation

1. **⚠ CAUTION:** The knuckle bore must be clean to allow the wheel hub and bearing to be completely seated by hand. Do not press or draw the wheel hub and bearing into place.

Clean and inspect the knuckle bearing bore.

2. Lightly coat the surfaces of the bearing carrier and the wheel knuckle with Motorcraft High Temperature Nickel Anti-Seize Lubricant F6AZ-9L494-AA or equivalent meeting Ford specification ESE-M12A4-A.

3. Install the wheel hub and bearing and new bolts.

4. Route the ABS sensor wire and attach it to the retainers.

5. Move the inner fender skirt aside and connect the ABS sensor.

6. Position the inner fender skirt and install the pushpins.

7. Install the brake disc. For additional information, refer to [Section 206-03](#).
 8. Install the wheel and tire assembly. For additional information, refer to [Section 204-04](#).
 9. Lower the vehicle.
-

Wheel Studs

Special Tool(s)

Removal

⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the wheel and tire assembly. For additional information, refer to [Section 204-04](#).
2. Remove the front brake disc. For additional information, refer to [Section 206-03](#).
3. Using the special tool, press the stud from the flange.

4. Line up the stud with the hole in the knuckle and remove the stud.

Installation

1. Insert the stud through the hole in the knuckle and into the flange, making sure the serrations on the stud line up with the serrations in the flange.

2.  **CAUTION:** Do not use power tools to install a wheel stud. The serrations in the flange can be stripped.

NOTE: Do not use the wheel nuts that came with the vehicle.

Install washers and a wheel nut on the wheel stud and tighten the nut until the stud seats against the flange. Discard the nut after use.

3. Install the front brake disc. For additional information, refer to [Section 206-03](#).
 4. Install the wheel and tire assembly. For additional information, refer to [Section 204-04](#).
-

Lower Arm

Removal

⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

NOTE: New cam bolts and lock nuts must be installed whenever the lower control arm is removed.

1. Turn the ignition switch to the off, unlocked position.
2. Raise the vehicle on a hoist. For additional information, refer to [Section 100-02](#).
3. Remove the wheel and tire assembly. For additional information, refer to [Section 204-04](#).
4. Remove two bolts, one pushpin and the splash shield.

5. **NOTE:** To remove the nut, first loosen the nut, then use the hex holding feature to prevent the stabilizer bar link ball joint from turning while removing the nut.

Remove and discard the nut. Disconnect the stabilizer bar link (5K483).

6. Remove and discard the nut and bolt. Disconnect the shock absorber and spring assembly.

7. **NOTE:** To remove the nut, first loosen the nut, then use the hex holding feature to prevent the lower control arm ball joint from turning while removing the nut.

NOTE: Make sure not to lose the tapered washer on the ball joint.

Remove and discard the nut. Separate the front suspension lower arm (3078) from the wheel knuckle.

8. Remove and discard the front nut and bolt.

9. Position the power steering gear aside.
- Remove two nuts and bolts. Discard the nuts.
 - Remove the nut and bolt. Discard the nut.
 - Position the power steering gear to access the lower control arm rear bolt.

10. Remove and discard the rear nut and bolt. Remove the front suspension lower arm.

Installation

1. Position the front suspension lower arm.
2. Install a new caster adjustment cam bolt and a new nut.
 - The bolt must be installed from the rear, as shown.
 - Install the bolt with the cam lobe down.
 - The cam must be seated between the cam guides on the No. 1 crossmember.
 - The nut should only be snugged up at this time to allow for wheel alignment adjustment.

3. Install a new camber adjustment cam bolt and a new nut.
 - The bolt must be installed from the rear as shown.
 - Install the bolt with the cam lobe down.
 - The cam must be seated in the groove in the No. 2 crossmember.
 - The nut should only be snugged up at this time to allow for wheel alignment adjustment.

4. **NOTE:** Make sure the tapered washer is installed on the ball joint before connecting the lower control arm to the knuckle.

NOTE: To install the nut, first install the nut until snug using the hex holding feature. Final tighten the nut using a socket and a torque wrench. If the ball stud turns during final tighten, use a crow's foot wrench while using the hex holding feature to final tighten the nut.

Connect the lower control arm to the knuckle. Install a new nut.

5. **NOTE:** Make sure the shock absorber lower bushing end caps are in place before installing the bolt and nut.

Connect the shock absorber and spring assembly. Install a new bolt and nut.

6. **NOTE:** To install the nut, first install the nut until snug using the hex head feature. Final tighten the nut using a socket and a torque wrench.

Connect the stabilizer bar link. Install a new nut.

7. Install the splash shield, two bolts and one pushpin.

8. Attach the power steering gear.
 1. Remove the nut from the center bolt.
 2. Install two bolts and three new nuts.

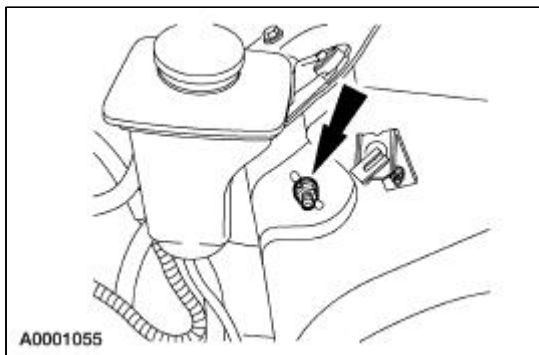

9. Install the wheel and tire assembly. For additional information, refer to [Section 204-04](#).
 10. Lower the vehicle.
 11. Check the wheel alignment. Adjust as necessary. For additional information, refer to [Section 204-00](#).
-

Upper Arm —Left Side

Removal

⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the air cleaner. For additional information, refer to [Section 303-12](#).
2. Remove and discard the nut.

3. Remove the canister purge valve. For additional information, refer to [Section 303-13](#).
4. Remove and discard the nut.

5. Remove the shock absorber and spring assembly. For additional information, refer to [Shock Absorber and Spring Assembly](#) in this section.
6. **NOTE:** Wire the top of the wheel knuckle to the body to prevent knuckle movement.

NOTE: To remove the nut, first loosen the nut, then use the hex holding feature to prevent the upper control arm ball joint from turning while removing the nut.

NOTE: Make sure not to lose the tapered washer on the ball joint.

Remove and discard the nut. Disconnect the suspension upper arm (3082) from the knuckle

(3K185).

7. Remove and discard the bolt.

8. Remove the bolt and the suspension upper arm. Discard the bolt.

Installation

1. Position the suspension upper arm and install a new bolt.

2. Install a new bolt.

3. **NOTE:** Make sure the tapered washer is installed on the ball joint before connecting the upper control arm to the knuckle.

NOTE: To install the nut, first install the nut until snug using the hex holding feature. Final tighten using a socket and a torque wrench.

NOTE: Remove the wire holding the knuckle after tightening the nut.

Connect the suspension upper arm to the knuckle. Install a new nut.

4. Install the shock absorber and spring assembly. For additional information, refer to [Shock Absorber and Spring Assembly](#) in this section.

5. **CAUTION:**  The suspension lower arm-to-body nuts must be tightened with the suspension at curb height. Make sure the vehicle is completely lowered before tightening these nuts. Failure to do so can cause bushing failure, resulting in poor ride and handling.

Install a new nut.

6. Install a new nut.

7. Install the air cleaner. For additional information, refer to [Section 303-12](#).
 8. Install the canister purge valve. For additional information, refer to [Section 303-13](#).
-

Upper Arm —Right Side

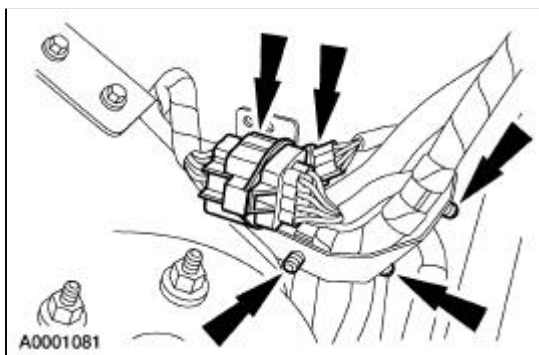

Removal

⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove and discard the nut.

2. Detach the wires and electrical connectors from the bracket.

3. Remove three bolts and the bracket.

4. Remove and discard the nut.

5. Remove the strut and spring assembly. For additional information, refer to [Shock Absorber and Spring Assembly](#) in this section.

6. **NOTE:** Wire the top of the wheel knuckle to the body to prevent knuckle movement.

NOTE: To remove the nut, first loosen the nut, then use the hex holding feature to prevent the ball joint from turning while removing the nut.

NOTE: Make sure not to lose the tapered washer on the ball joint.

Remove and discard the nut. Disconnect the suspension upper arm (3082) from the knuckle (3K185).

7. Remove and discard the bolt.

8. Remove the bolt and the suspension upper arm. Discard the bolt.

Installation

1.  **CAUTION:** The suspension upper arm nuts must be tightened with the suspension at curb height. Make sure the vehicle is completely lowered before tightening these nuts. Failure to do so can cause bushing failure, resulting in poor ride and handling.

NOTE: The suspension upper arm bolts and nuts are of a torque prevailing design. New bolts and nuts must be installed.

NOTE: Make sure the tapered washer is installed on the ball joint before connecting the upper control arm to the knuckle.

NOTE: To install the upper control arm ball joint nut, first install the nut until snug using the hex holding feature, then final tighten the nut using a socket and torque wrench.

To install, reverse the removal procedure.

Stabilizer Bar

Removal

⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the air cleaner. For additional information, refer to [Section 303-12](#).
2. Remove the bolt.

3. Raise the vehicle on a hoist. For additional information, refer to [Section 100-02](#).
4. Remove both wheel and tire assemblies. For additional information, refer to [Section 204-04](#).
5. Remove two pushpins, four bolts and both splash shields.

6. Remove the bolts and the shield.

7. **NOTE:** To remove the nut, first loosen the nut, then use the hex holding feature to prevent the stabilizer bar link ball joint from turning while removing the nut.

Remove the nut and disconnect the stabilizer bar link (5K483). Discard the nut.

8. **NOTE:** To remove the nut, first loosen the nut, then use the hex holding feature to prevent the stabilizer bar link ball joint from turning while removing the nut.

Remove the nut and stabilizer bar link. Discard the nut.

9. Remove and discard the nut and bolt. Disconnect the left shock absorber and spring assembly.

10. **NOTE:** To remove the nut, first loosen the nut, then use the hex holding feature to prevent the lower control arm ball joint from turning while removing the nut.

NOTE: Make sure not to lose the tapered washer on the ball joint.

Remove and discard the nut. Disconnect the left suspension lower arm and position the knuckle (3K185) out of the way.

11. Remove the bolts and position the heater water valve and bracket out of the way.

12. Remove the bolt and detach the A/C hose retainer. Position the A/C hose aside.

- NOTE:** To ease removal of the right front bolt, remove it first.

Remove the bolts and the stabilizer bar brackets (5486).

- Remove the stabilizer bar bushings (5493).

- NOTE:** Deflect the LH lower control arm downward to ease removal of the stabilizer bar.

Carefully remove the stabilizer bar through the left wheel well.

Installation

- NOTE:** Deflect the LH lower control arm downward to ease installation of the stabilizer bar.

Carefully install the stabilizer bar through the left wheel well.

- NOTE:** If the stabilizer bar bushings are badly worn or have no grease, install new bushings. Do not grease the bushings.

Install the stabilizer bar bushings.

- NOTE:** To ease installation of the right front bolt, install the right rear bolt first.

Install the stabilizer bar brackets and the bolts.

4. Position the A/C hose, attach the retainer, and install the bolt.

5. Position the heater water valve and bracket and install the bolts.

6. **NOTE:** Make sure the tapered washer is installed on the ball joint before connecting the lower control arm to the knuckle.

NOTE: To install the nut, first install the nut until snug using the hex holding feature. Final tighten the nut using a socket and a torque wrench. If the ball stud turns during final tighten, use a crow's foot wrench to turn the nut while using the hex holding feature to final tighten the nut.

Connect the suspension lower arm and install a new nut.

- NOTE:** Make sure the shock absorber lower bushing end caps are in place before installing the bolt and nut.

Connect the shock absorber and spring assembly and install a new nut and bolt.

- NOTE:** To install the nut, first install the nut until snug using the hex holding feature. Final tighten the nut using a socket and a torque wrench.

Position the stabilizer bar link and install a new nut.

- NOTE:** To install the nut, first install the nut until snug using the hex holding feature. Final tighten the nut using a socket and a torque wrench.

Connect the stabilizer bar link and install a new nut.

10. Install the shield and the bolts.

11. Install the shields, two pushpins and four bolts.

12. Install the wheel and tire assemblies. For additional information, refer to [Section 204-04](#).
13. Lower the vehicle.
14. Install the bolt.

15. Install the air cleaner. For additional information, refer to [Section 303-12](#).

Stabilizer Bar Link

Removal

 **CAUTION:** Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Raise the vehicle on a hoist. For additional information, refer to [Section 100-02](#).
2. **NOTE:** To remove the nut, first loosen the nut, then use the hex holding feature to prevent the stabilizer bar link ball joint from turning while removing the nut.

Remove the nut and disconnect the stabilizer bar link (5K483) from the suspension lower arm (3078).

3. **NOTE:** To remove the nut, first loosen the nut, then use the hex holding feature to prevent the stabilizer bar link ball joint from turning while removing the nut.

Remove the nut and stabilizer bar link.

Installation

1. **NOTE:** The stabilizer bar nuts are of torque prevailing design. New nuts must be installed during assembly.

NOTE: To install the nuts, first install the nuts until snug using the hex holding feature. Final

tighten the nuts using a socket and a torque wrench.

To install, reverse the removal procedure.

Stabilizer Bar Bushing

Removal

⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the air cleaner. For additional information, refer to [Section 303-12](#).
2. Remove the bolt.

3. Raise the vehicle on a hoist. For additional information, refer to [Section 100-02](#).
4. Remove both wheel and tire assemblies. For additional information, refer to [Section 204-04](#).
5. Remove two pushpins, four bolts and both splash shields.

6. Remove the bolts and the shield.

7. Remove the bolts and position the heater water valve and bracket out of the way.

8. **NOTE:** To ease removal of the right front bolt, remove it first.

Remove the bolts and the stabilizer bar brackets (5486).

9. Remove the stabilizer bar bushings (5493).

Installation

1. **NOTE:** If the stabilizer bar bushings are badly worn or have no grease, install new bushings. Do not grease the bushings.

To install, reverse the removal procedure.

Wheel Knuckle

Removal and Installation

⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the wheel bearing and hub (1104). For additional information, refer to [Wheel Bearing and Hub](#) in this section.
2. **NOTE:** The hex holding feature can be used to prevent turning of the stud while removing the nut.

Remove the nut and disconnect the tie-rod end from the wheel knuckle (3K185). Discard the nut.

3. **⚠ CAUTION:** Support the weight of the knuckle with a jack stand after disconnecting the lower control arm, or damage to the upper control arm can result.

NOTE: The hex holding feature can be used to prevent turning of the stud while removing the nut.

NOTE: Make sure not to lose the tapered washer from the ball joint.

Remove the nut and disconnect the suspension lower arm (3078) from the knuckle. Discard the nut.

4. **NOTE:** The hex holding feature can be used to prevent turning of the stud while removing the nut.

NOTE: Make sure not to lose the tapered washer from the ball joint.

Remove the nut and the knuckle. Discard the nut.

5. **CAUTION:** Support the weight of the knuckle with a jack stand while connecting the knuckle to the upper control arm or damage to the upper control arm can result.

NOTE: The upper arm-to-knuckle nut, lower arm-to-knuckle nut and the tie-rod-to-knuckle nut are of a torque prevailing design. New nuts must be installed.

NOTE: Make sure the tapered washer is installed on the ball joints before connecting the upper and lower control arms to the knuckle.

To install, reverse the removal procedure.

Shock Absorber and Spring Assembly

Removal and Installation

⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the wheel and tire assembly. For additional information, refer to [Section 204-04](#).
2. **NOTE:** The hex holding feature can be used to prevent turning of the stud while removing the nut.

Remove the nut and disconnect the stabilizer bar link (5K483). Discard the nut.

3. Remove the nut and bolt and disconnect the shock absorber and spring assembly.
 - Discard the nut and bolt.

4. Partially lower the vehicle.
5. Remove the right upper shock mount cover.

6. Remove the retainers and the left upper shock mount cover.

7.  **WARNING:** Do not remove the center nut. This nut holds the upper spring mount in place and if this nut is removed the spring tension will be released. Failure to follow these instructions may result in personal injury.

Remove and discard four nuts. Remove the shock absorber and spring assembly.

8.  **CAUTION:** Make sure the shock absorber lower bushing end caps are in place before installing the bolt and nut.

To install, reverse the removal procedure.

Shock Absorber and Spring Assembly

Disassembly

⚠ WARNING: All vehicles are equipped with gas pressurized shock absorbers which will extend unassisted. Do not apply heat or flame to the shock absorbers during removal or component servicing. Failure to follow these instructions can result in personal injury.

⚠ WARNING: The shock absorber and spring assembly is under extreme load. Do not attempt to disassemble the shock absorber and spring assembly without using a spring compressor. Failure to follow these instructions can result in personal injury.

⚠ CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the shock absorber and spring assembly. For additional information, refer to [Shock Absorber and Spring Assembly](#) in this section.

2. **⚠ CAUTION:** Over tightening the vise can damage the shock absorber tube.

Mount and mark the shock absorber and spring assembly.

1. Position the shock absorber and spring assembly in a suitable holding device.
2. Mark the upper mount, spring and shock absorber for assembly reference.

3. **NOTE:** If installing a new spring, make sure the part number is correct. Refer to the vehicle certification (VC) label for the correct spring code. Refer to [Section 100-01](#) to convert the spring code to a part number.

Compress the spring.

1. Install an appropriate spring compressor.
2. Compress the spring.

4. While holding the shock absorber rod, remove and discard the nut.

5. Remove the upper mount and dust boot as an assembly.

6. Carefully remove the spring and spring compressor.

Assembly

NOTE: If a new shock absorber, spring or upper mount is installed, the new part should be marked in the same place as the old part to make sure the assembly is correctly aligned.

1. Inspect the lower and upper spring seats for damage.
2. Inspect the spring insulator for wear or damage. Install a new upper mount if necessary.
3. **NOTE:** If installing a new spring make sure the part number is correct. Refer to the vehicle certification (VC) label for the correct spring code. Refer to [Section 100-01](#) to convert the spring code to a part number.

Inspect the spring for nicked or scratched paint. If the paint is nicked or scratched, install a new spring.

4. If removed, place the shock absorber into the vise.
5. Position the shock and spring compressor onto the strut.

6. Position the upper mount and dust boot onto the spring. Make sure the marks made during disassembly, Step 2, are lined up.

7. Install a new nut.

8. Remove the spring compressor.
9. Install the shock absorber and spring assembly. For additional information, refer to [Shock Absorber and Spring Assembly](#) in this section.

Torque Specifications

Description	Nm	lb-ft	lb-in
Subframe-to-body bolts	103	76	—
Upper arm and bushing-to-subframe pivot bolt nuts	90	66	—
Upper ball joint nut	90	66	—
Lower arm and bushing-to-subframe pivot bolt and nut	150	111	—
Lower arm and bushing-to-knuckle pivot bolt nut	150	111	—
Toe link nut (outer)	55	41	—
Toe link nut (inner)	70	52	—
Stabilizer bar link nuts	48	35	—
Stabilizer bar bracket bolts	55	41	—
Anti-lock brake sensor bolt	10	—	89
Shock absorber and spring assembly-to-lower arm and bushing bolt	133	98	—
Upper shock absorber rod-to-upper shock absorber mount nut	50	37	—
Upper shock absorber mount-to-body nuts	28	21	—
Axle shaft retaining nut	300	221	—

Rear Suspension

Rear Suspension Components

A0000316

Item	Part Number	Description
1	5500	Upper arm
2	5C488	Stabilizer bar link
3	5486	Stabilizer bar retaining bracket
4	5A772	Stabilizer bar
5	—	Lower arm
6	—	Axle shaft
7	W701904-S309M	Snap ring
8	1244	Wheel hub bearing

9	—	Knuckle
10	2C028	Rear brake disc shield
11	W701950-S100	Rivet
12	1109	Hub
13	2C026	Rear brake disc
14	4B477	Hub retainer
15	2C190	ABS sensor
16	W500014-S426	Screw

The independent rear suspension consists of the following components:

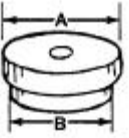

- upper arms (5500)
 - lower arms
 - shock absorber and spring assemblies
 - adjustable toe links
 - stabilizer bar (5A772)
 - rear wheel knuckles
 - hubs (1109)
 - wheel bearings (1244)
-

Rear Suspension

Refer to [Section 204-00](#) .

Hub

Special Tool(s)

 ST1690-A	Step Plate Adapter Set 205-DS011 (D80L-630-A) or Equivalent
 ST1310-A	Universal Bearing Puller 205-055 (T71P-4621-B)

Removal

⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the knuckle. For additional information, refer to [Knuckle](#) in this section.
2. **⚠ CAUTION:** Use extreme care not to damage the knuckle when drilling out the dust shield rivets.

Remove the dust shield (2C028).

1. Using a 5.5 mm (0.22 in) drill bit, drill out the dust shield rivets. If a larger drill bit is needed, it must not be larger than 6 mm (0.24 in).
2. Remove the dust shield.

3. **⚠ CAUTION:** When the wheel hub is pressed from the bearing, the bearing inner race will come out with the hub. Never try to install the race back into the bearing. Always install a new bearing.

⚠ CAUTION: Make sure to keep the knuckle level and supported during pressing operations, or damage to the knuckle can occur. Support the knuckle as close to the bearing bore as possible. Do not use knuckle extremities as supports.

Remove the hub (1109).

1. Correctly support the knuckle in a press.
2. Using the appropriate step plate adapter, press the hub from the bearing. The bearing inner race will come out with the hub.

4. Remove the snap ring.

5. **⚠ CAUTION:** Make sure to keep the knuckle level and supported during pressing operations, or damage to the knuckle can occur. Support the knuckle as close to the bearing bore as possible. Do not use knuckle extremities as supports.

Remove the bearing (1244).

1. Correctly support the knuckle in a press.
2. Using the appropriate step plate adapter, press the bearing from the knuckle.

6. If the hub is to be reused, remove the bearing inner race from the hub using the special tool.

Installation

1. Thoroughly clean and inspect the wheel knuckle to bearing mating surface before installing the bearing.
2.  **CAUTION: Make sure to keep the knuckle level and supported during pressing operations, or damage to the knuckle can occur. Support the knuckle as close to the bearing bore as possible. Do not use knuckle extremities as supports.**

Install a new bearing.

1. Correctly support the knuckle in a press.
2. Position the new bearing in the knuckle.
3. Using the appropriate step plate adapter, press the new bearing into the knuckle until the bearing clears the snap ring groove and bottoms out in the bore.

3. Install the snap ring.

4.  **CAUTION: Use only the appropriate size aluminum rivets on the rear brake disc dust shield. Galvanic corrosion will result if steel rivets are used.**

Install the rear brake dust shield.

1. Position the shield on the knuckle.
2. Install the rivets.

5.  **CAUTION: The wheel bearing inner race must be supported during hub installation. Failure to do so will damage the bearing.**

Install the hub.

1. Position the knuckle in a press, using the appropriate step plate adapter to support the wheel bearing inner race.
2. Position the hub in the bearing.
3. Using the appropriate step plate adapter, press the hub into the bearing.

6. Install the knuckle. For additional information, refer to [Knuckle](#) in this section.
-

Wheel Studs

Special Tool(s)

	C-Frame and Clamp Assembly 211-023 (T74P-3044-A1)
---	--

Removal

1. Raise the vehicle on a hoist. For additional information, refer to [Section 100-02](#).
2. Remove the wheel and tire assembly. For additional information, refer to [Section 204-04](#).
3. Remove the rear brake disc. For additional information, refer to [Section 206-04](#).
4. **NOTE:** Grind off the stud to ease removal if necessary.

Using the special tool, press the wheel stud (1107) out of the rear hub (1109) between the caliper mounting pads.

- Discard the wheel stud. Do not reuse wheel studs.

Installation

CAUTION: Never use air tools to install wheel studs. The serrations can be stripped from the stud.

1. If necessary, grind the head of a new wheel stud to a "D" shape to clear the wheel knuckle.

2. Position the new wheel stud into the hub flange, making sure the serrations on the stud are aligned with the serrations in the flange.
3. Install the wheel stud.
 1. Place four flat washers on the wheel stud.
 2. **NOTE:** Do not use the wheel nuts that came with the vehicle.

Thread a standard wheel nut (1012) onto the wheel stud with the flat side against the washers.

3. Tighten the wheel nut until the wheel stud head seats against the hub flange.

4. Remove the wheel nut and washers.
 5. Install the rear brake disc. For additional information, refer to [Section 206-04](#).
 6. Install the wheel and tire assembly. For additional information, refer to [Section 204-04](#).
 7. Lower the vehicle.
-

Arm —Upper

Removal

⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

NOTE: The suspension upper arm bushings or ball joints are not serviced separately from the upper rear suspension arm. If the bushings or ball joints require service a new suspension upper arm (5500) must be installed.

1. Remove the hub cap. Measure the distance from the center of the hub to the lip of the fender with the vehicle in a level, static ground position.

2. Raise the vehicle on a hoist. For additional information, refer to [Section 100-02](#).
3. Remove the wheel and tire assembly. For additional information, refer to [Section 204-04](#).
4. Unclip the ABS sensor wire retainer from the suspension upper arm.

5. Remove the bolt and disconnect the ABS sensor. Position the sensor aside.

6.  **CAUTION:** Use care not to damage the anti-lock brake system (ABS) sensor ring. A damaged sensor ring will result in incorrect ABS operation.

NOTE: To remove the nut, first loosen the nut, then use the hex holding feature to prevent the ball joint from turning while removing the nut.

Remove and discard the nut. Disconnect the ball joint from the knuckle.

7. Remove the suspension upper arm (5500).
1. Remove the suspension upper arm-to-subframe nuts and bolts. Discard the nuts and bolts.
 2. Remove the suspension upper arm.

Installation

 **CAUTION:** Do not tighten the suspension upper arm-to-subframe nuts until the suspension is at curb height. Failure to do so can cause severe damage to the bushings resulting in poor ride quality and handling.

1. **NOTE:** The bolts and nuts retaining the suspension upper arm are of a torque prevailing design. New bolts and nuts must be used.

Install the suspension upper arm.

1. Position the arm on the subframe.
2. Install new nuts and bolts. Do not tighten at this time.

2.  **CAUTION:** Use care not to damage the anti-lock brake system (ABS) sensor ring. A damaged sensor ring will result in incorrect ABS operation.

NOTE: To install the nut, first install the nut using the hex holding feature until snug. Final tighten the nut using a line-type crow's foot and a torque wrench.

Connect the ball joint to the knuckle and install a new nut.

3. Clip the ABS sensor wire to the suspension upper arm.

4. Position a jack stand under the suspension lower arm and raise the suspension until the distance between the center of the hub and the lip of the fender is equal to the measurement taken in Removal, Step 1.

5. Tighten the nuts.

6. Lower the suspension and remove the jack stand.
 7. Install the wheel and tire assembly. For additional information, refer to [Section 204-04](#).
 8. Lower the vehicle.
-

Arm —Lower

Removal

⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

NOTE: The suspension lower arm bushings are not serviced separately from the lower suspension arm. If the bushings require service a new lower arm must be installed.

1. With the vehicle in a static, level ground position, remove the hub cap and measure the distance from the center of the hub (1109) to the lip of the fender (curb height).

2. Raise the vehicle on a hoist. For additional information, refer to [Section 100-02](#).
3. Remove the wheel and tire assembly. For additional information, refer to [Section 204-04](#).
4. Remove the rear brake disc. For additional information, refer to [Section 206-04](#).
5. Disconnect the shock absorber and spring assembly.
 1. Remove and discard the bolt.
 2. Disconnect the shock absorber and spring assembly from the lower arm and bushing.

6. **⚠ CAUTION:** Do not use air tools to remove the nut. Damage to the boot can result.

NOTE: To remove the nut, first loosen the nut, then remove the nut using the hex holding feature to prevent the stabilizer bar link ball joint from turning.

Disconnect the stabilizer bar link (5C488) from the suspension lower arm.

1. Remove and discard the nut.
2. Disconnect the stabilizer bar link.

7. Disconnect the suspension lower arm from the knuckle.
 1. Remove and discard the nut and bolt.
 2. Disconnect the suspension lower arm.

8. Remove the suspension lower arm and bushing.
 1. Remove and discard the nuts and bolts.
 2. Remove the suspension lower arm.

Installation

⚠ CAUTION: Do not tighten the suspension lower arm-to-subframe fasteners until the suspension is at curb height. Failure to do so can cause severe damage to the bushings resulting in poor ride quality and handling.

1. Install the suspension lower arm.

1. Position the suspension lower arm onto the subframe (5R003).
2. Install new bolts and nuts. Do not tighten at this time.

2. Connect the suspension lower arm to the knuckle.
 1. Position the suspension lower arm.
 2. Install a new bolt and nut. Tighten the nut.

3.  **CAUTION: Do not use air tools to install the nut. Damage to the boot can result.**

NOTE: To install the nut, first install the nut until snug using the hex holding feature. Final tighten the nut using a socket and a torque wrench.

Connect the stabilizer bar link to the suspension lower arm.

1. Position the stabilizer bar link on the suspension lower arm.
2. Install a new nut.

4. Install the rear shock absorber and spring assembly.
 1. Position the shock absorber and spring assembly onto the suspension lower arm.
 2. Install a new bolt.

5. Position a jack stand under the suspension lower arm and raise the suspension until the measurement between the center of the hub and the lip of the fender is equal to the measurement taken in Removal, Step 1 (curb height).

6. Tighten the lower suspension arm -to-subframe rear bolt. Tighten the suspension lower arm-to-subframe front nut.

7. Lower the suspension and remove the jack stand.
 8. Install the rear brake disc. For additional information, refer to [Section 206-04](#).
 9. Install the wheel and tire assembly. For additional information, refer to [Section 204-04](#).
 10. Lower the vehicle.

Bar —Stabilizer

Special Tool(s)

Removal

⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the hub cap and measure the distance from the center of the wheel hub to the lip of the fender with the vehicle in a static, level ground position (curb height).

2. Remove both wheel and tire assemblies. For additional information, refer to [Section 204-04](#).
3. Remove the muffler and heat shield. For additional information, refer to [Section 309-00](#).
4. **⚠ CAUTION:** The driveshaft-to-pinion flange bolts, nuts and weighted nuts must be installed in the same locations from which they were removed.

Mark the pinion flange, the driveshaft flexible coupling and each of the three driveshaft-to-pinion flange bolts, nuts and weighted nuts with different color paint so that the driveshaft and differential may be realigned during installation.

5.  **CAUTION:** Do not remove the flex coupling on the driveshaft flange. Make sure to remove only the driveshaft-to-pinion flange bolts and nuts.

Remove the three driveshaft-to-pinion flange bolts and nuts.

6. Support the driveshaft at the center and rear.

7. Loosen the driveshaft yoke adjuster nut.

8. **NOTE:** There are shims between the center bearing mounting bracket and the body.

NOTE: The shims must be installed in their original locations.

Remove the bolts and the shims.

9. Position special tool 014-00765, or equivalent, under the rear subframe (5R003).
10.  **WARNING:** Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions can result in personal injury.

 **CAUTION:** Do not allow the subframe to hang from the shock absorbers. The shock absorbers can be damaged. Always keep the subframe supported on the special tool.

Lower the rear subframe.

1. **NOTE:** Paint or otherwise mark the relative position of the subframe retaining bolts to the subframe bushings for assembly reference.

Remove the four subframe bolts.

2.  **CAUTION:** To avoid damaging the fuel tank filler hose, do not lower the subframe more than specified.

Carefully lower the subframe approximately 56.25 mm (2.25 in) using the special tool.

NOTE: Components must be removed from both sides of the vehicle. Only the right side is shown.

11. Remove the cap from the stabilizer link.

12.  **CAUTION: Do not use air tools to remove the nut. Damage to the boot can occur.**

NOTE: To remove the nut, first loosen the nut, then use the hex holding feature to prevent the stabilizer bar link ball joint from turning.

Disconnect the rear stabilizer bar links (5C488) from the rear stabilizer bar (5A772).

1. Remove and discard the nuts.
2. Disconnect the links from the bar.

13. Remove the stabilizer bar brackets.
1. Remove the bolts and nuts.
 2. Remove the brackets.

14. Remove the stabilizer bar bushings.

15. Secure the knuckles to the subframe with mechanic's wire.
16. Disconnect the suspension upper arms (5500) from the subframe.
 1. Remove and discard the nuts and bolts.
 2. Disconnect the arms and rotate them out of the way.

17. **NOTE:** The stabilizer bar can be removed from either side.

Remove the stabilizer bar.

Installation

NOTE: Components on both sides of the vehicle must be installed or connected. Only the right side is shown.

1. **NOTE:** The stabilizer bar can be installed from either side.

Position the stabilizer bar in the vehicle.

2. **NOTE:** If the stabilizer bar bushings are badly worn or have no grease, install new bushings. Do not grease the bushings.

Install the stabilizer bar bushings.

3. Install the stabilizer bar brackets.
 1. Position the brackets on the bushings.
 2. Install the nuts and bolts.

4.  **CAUTION:** The suspension upper arm and bushing must be at curb height before the nuts can be tightened. Failure to do so will result in damage to the bushings resulting in poor ride quality and handling.

Connect the suspension upper arm and bushing to the subframe.

1. Position the arm on the subframe.
2. Install new bolts and nuts. Do not tighten the nuts at this time.

5. Remove the wires holding the knuckles to the subframe.

6.  **CAUTION: Do not use air tools to install the nut. Damage to the boot can occur.**

NOTE: To install the nut, first install the nut until snug using the hex holding feature. Final tighten the nut using a socket and a torque wrench.

Connect the stabilizer bar links to the stabilizer bar.

1. Connect the links to the bar.
2. Install new nuts.

7. Install the protective cap on the stabilizer bar link.

8. Secure the subframe to the body.

1. Raise the subframe using the special tool.
2. **NOTE:** Make sure the bolts are installed in the same position on the subframe bushings as they were before removal.

Install the four bolts.

9. Remove the special tool.
10. Position jack stands under the suspension lower arm and bushings and raise the suspension until the distance between the center of the hub and the lip of the fender is equal to the measurement taken during Removal, Step 1 (curb height).

11. Tighten the suspension upper arm and bushing nuts.

12. Lower the suspension and remove the jack stands.
 13. Connect the driveshaft to the rear axle housing. For additional information, refer to [Section 205-01](#).
 14. Install both wheel and tire assemblies. For additional information, refer to [Section 204-04](#).
 15. Lower the vehicle.
-

Link —Stabilizer Bar

Removal

⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Raise the vehicle on a hoist. For additional information, refer to [Section 100-02](#).
2. Remove the wheel and tire assembly. For additional information, refer to [Section 204-04](#).

3. **⚠ CAUTION:** Do not use air tools to remove the nut. Damage to the boot can occur.

NOTE: To remove the nut, first loosen the nut, then use the hex holding feature to prevent the stabilizer bar link ball joint from turning while removing the nut.

Disconnect the stabilizer bar link (5C488) from the suspension lower arm.

1. Remove and discard the nut.
2. Remove the link from the arm.

4. Remove the protective cap from the stabilizer bar link.

5. **⚠ CAUTION:** Do not use air tools to remove the nut. Damage to the boot can occur.

NOTE: To remove the nut, first loosen the nut, then use the hex holding feature to prevent the stabilizer link ball joint from turning while removing the nut.

Remove the nut and the stabilizer bar link. Discard the nut.

Installation

1. **NOTE:** The nuts retaining the stabilizer bar link are of a torque prevailing design and new nuts must be used during installation of the stabilizer bar link.

To install, reverse the removal procedure.

Link —Toe

Removal

⚠ CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

NOTE: The toe links are not serviced separately. If a toe link requires service a new assembly must be installed.

1. Raise the vehicle on a hoist. For additional information, refer to [Section 100-02](#).
2. Remove the wheel and tire assembly. For additional information, refer to [Section 204-04](#).
3. Disconnect the toe link from the knuckle.
 1. Remove and discard the nut and bolt.
 2. Disconnect the toe link.

4. Remove the toe link from the subframe.
 1. **NOTE:** To remove the nut, first loosen the nut, then use the hex holding feature to prevent the ball joint from turning while removing the nut.
Remove and discard the nut.
 2. Remove the toe link.

Installation

1. **NOTE:** The bolts and nuts retaining the toe link are of a torque prevailing design and new bolts and nuts must be used during installation of the toe link.

NOTE: To install the toe link-to-subframe nut, first install the nut until snug while using the hex holding feature. Final tighten the nut using a socket and a torque wrench.

To install, reverse the removal procedure.

2. Check wheel alignment. Adjust as necessary. For additional information, refer to [Section 204-00](#).
-

Bushing —Stabilizer Bar

Special Tool(s)

Removal

⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove both wheel and tire assemblies. For additional information, refer to [Section 204-04](#).
2. Remove the muffler and heat shield. For additional information, refer to [Section 309-00](#).
3. **⚠ CAUTION:** The driveshaft-to-pinion flange bolts, nuts and weighted nuts must be installed in the same locations from which they were removed.

Mark the pinion flange, the driveshaft flexible coupling and each of the three driveshaft-to-pinion flange bolts, nuts and weighted nuts with different color paint so that the driveshaft and differential may be realigned during installation.

4. **⚠ CAUTION:** Do not remove the flex coupling on the driveshaft flange. Make sure to remove only the driveshaft-to-pinion flange bolts and nuts.

Remove the three driveshaft-to-pinion flange bolts and nuts.

5. Support the driveshaft at the center and rear.

6. Loosen the driveshaft yoke adjuster nut.

7. **NOTE:** There are shims between the center bearing mounting bracket and the body.

NOTE: The shims must be installed in their original locations.

Remove the bolts and the shims.

8. Position the special tool 014-00765, or equivalent, under the rear subframe (5R003).

9.  **WARNING:** Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions can result in personal injury.

 **CAUTION:** Do not allow the subframe to hang from the shock absorbers. The shock absorbers can be damaged. Always keep the subframe supported on the special tool.

Lower the rear subframe.

1. **NOTE:** Paint or otherwise mark the relative position of the subframe retaining bolts to the subframe bushings for assembly reference.

Remove the four subframe bolts.

2.  **CAUTION:** To avoid damaging the fuel tank filler hose, do not lower the subframe more than specified.

Carefully lower the subframe approximately 56.25 mm (2.25 in) using the special tool 014-00765.

10. Remove the stabilizer bar bracket.
 1. Remove the bolt and nut.
 2. Remove the bracket.

11. Remove the stabilizer bar bushing.

Installation

1. **NOTE:** If the stabilizer bar bushings are badly worn or have no grease, install new bushings. Do not grease the bushings.

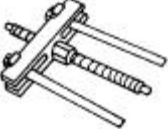

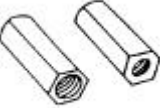

NOTE: Make sure the subframe-to-body bolts are installed in the same position on the subframe bushings as they were before removal.

To install, reverse the removal procedure.

Knuckle

Special Tool(s)

 ST1516-A	Hub Remover/Replacer 204-069 (T81P-1104-C)
 ST1517-A	Metric Hub Remover Adapter 205-237 (T86P-1104-A1)
 ST1518-A	Metric Hub Remover Adapters 204-085 (T83P-1104-BH)

Removal

 **CAUTION:** Suspension fasteners are important parts because they affect performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the rear brake disc. For additional information, refer to [Section 206-04](#).

2.  **CAUTION:** The wheel hub retainer (4B477) is a one time use item and a new retainer must be installed when removed. Failure to do so can cause the retainer to come loose during vehicle operation resulting in loss of vehicle control.

Remove and discard the wheel hub retainer.

3. Disconnect the toe link from the knuckle.
 1. Remove and discard the nut and bolt.
 2. Disconnect the toe link.

4. Remove the bolt and disconnect the ABS sensor.

5. Disconnect the suspension lower arm from the knuckle.
 1. Remove the nut and bolt. Discard the nut.
 2. Disconnect the suspension lower arm and bushing.

6.  **CAUTION: Support the axle shaft after removing it from the hub (1109). Failure to do so can damage the axle shaft.**

Using the special tools, separate the axle shaft from the hub. Support the axle shaft.

7. Remove the knuckle.
 1. **NOTE:** To remove the nut, first loosen the nut, then use the hex holding feature to remove the nut while holding the ball joint.

Remove and discard the suspension upper arm ball joint nut.

2. Remove the knuckle.

8. Remove the hub. For additional information, refer to [Hub](#) in this section.

Installation

⚠ CAUTION: Do not tighten the suspension lower arm fasteners until the suspension is at curb height. Failure to do so can cause severe damage to the bushings resulting in poor ride quality and handling.

1. Install the hub. For additional information, refer to [Hub](#) in this section.
2. **NOTE:** To install the nut, first install the nut until snug using the hex holding feature. Final tighten the nut using a torque wrench and a socket.

Position the knuckle on the suspension upper arm ball joint stud and install a new nut.

3. Install the toe link.
 1. Position the toe link onto the knuckle.
 2. Install a new bolt and nut.

4. Install the axle shaft into the hub. Make sure the splines on the shaft line up with the splines in the hub.
5. Position the knuckle onto the suspension lower arm and install a new bolt and nut. Tighten the nut.

6. Install the ABS sensor.
 1. Install the sensor.
 2. Install the bolt.

7. Install the rear brake disc. For additional information, refer to [Section 206-04](#).
8. **NOTE:** Lower the vehicle and apply the parking or service brakes before tightening the wheel hub retainer.

Install a new wheel hub retainer.

9. Install the wheel and tire. For additional information, refer to [Section 204-04](#).
-

Shock Absorber and Spring Assembly

Removal

⚠ WARNING: All vehicles are equipped with gas-pressurized rear shock absorbers which will extend unassisted. Do not apply heat or flame to the shock absorbers during removal or component service. Failure to do so may cause personal injury.

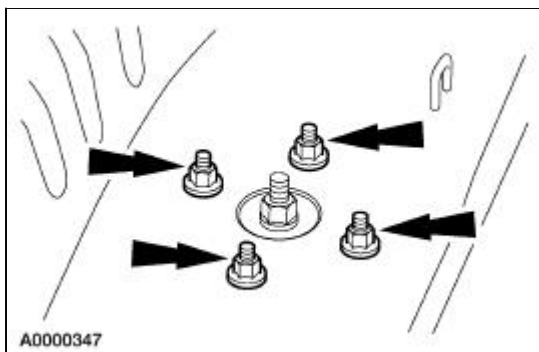

⚠ CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

NOTE: Shock absorber and spring removal is the same for both sides. The left side is shown.

1. Open the luggage compartment lid.
2. Position the trim cover aside.

3. Remove and discard the nuts.

4. Raise the vehicle on a hoist. For additional information, refer to [Section 100-02](#).
5. Remove the shock absorber and spring assembly.
 1. Remove and discard the bolt.
 2. Remove the shock absorber and spring assembly.

Installation

1. **NOTE:** The fasteners retaining the shock absorber and spring assembly are of a torque prevailing design. New fasteners must be used.

To install, reverse the removal procedure.

Shock Absorber and Spring Assembly

Disassembly

⚠ WARNING: All vehicles are equipped with gas pressurized shock absorbers which will extend unassisted. Do not apply heat or flame to the shock absorbers during removal or component servicing. Failure to follow these instructions may result in personal injury.

⚠ WARNING: The shock absorber and spring assembly is under extreme load. Do not attempt to disassemble the shock absorber and spring assembly without using a spring compressor. Failure to follow these instructions may result in personal injury.

⚠ CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the shock absorber and spring assembly. For additional information, refer to [Shock Absorber and Spring Assembly](#) in this section.
2. Mount and mark the shock absorber and spring assembly.
 1. Position the shock absorber and spring assembly in an appropriate vise.
 2. Mark the upper mount, spring and shock absorber for assembly reference.

3. Compress the spring.
 1. Install an appropriate spring compressor.
 2. Compress the spring.

4. While holding the shock absorber rod, remove the nut.

5. Remove the upper mount and dust boot as an assembly.

6. Carefully remove the spring and the spring compressor.

Assembly

NOTE: If a new shock absorber, spring or upper mount is installed, the new part should be marked in the same place the old part is marked to make sure the assembly is correctly aligned.

1. Inspect the lower and upper spring seats for damage.
2. Inspect the spring insulator for wear or damage. Install a new insulator if necessary.
3. **NOTE:** Install a new spring with the correct part number only. Refer to the vehicle certification (VC) label for the correct spring code. Refer to [Section 100-01](#) to convert the spring code to a part number.

Inspect the spring for nicked or scratched paint. If the paint is nicked or scratched, install a new spring.

4. Install the spring and the spring compressor on the shock absorber.

5. Position the upper mount and dust boot on the spring. Make sure the marks made during disassembly, Step 2, are aligned.

6. Install a new nut.

7. Remove the spring compressor.
8. Remove the shock absorber and spring assembly from the vise.
9. Install the shock absorber and spring assembly. For additional information, refer to [Shock](#)

[Absorber and Spring Assembly](#) in this section.

General Specifications

Item	Specification
Wheel stud and wheel nuts (metric)	M12x1.5-19 mm hex
Maximum tire balance weight	140 g (5.0 oz) per wheel 70 g (2.5 oz) per flange
Wheel bolt circle runout	0.65 mm (0.02 in)
Tire Inflation	
Tires	See safety certification sticker located on driver door jamb or tire inflation placard on the passenger door jamb.
Tire Tread Depth	
P215/60R16 94H	8.6 mm (0.34 in)
P215/60R16 94V	8.4 mm (0.33 in)
215/60R16 95W	8.1 mm (0.32 in)
235/50R17 95V	8.4 mm (0.33 in)
245/45R17 95W	7.6 mm (0.30 in)
Wheels	
Painted aluminum	16x7J
Bright machined aluminum	16x7J
Bright polished aluminum	16x7J
Painted aluminum	17x7.5J
Wheel offset	60 mm (2.4 in)
Wheel bolt circle runout	0.65 mm (0.02 in)

1 mm (0.04 in)	2 mm (0.08 in)

Torque Specifications

Description	Nm	lb-ft
Wheel nuts	135	100

Wheels and Tires

Part # - 1007-	Color/Style	Wheel Size	No. of Bolts	Bolt Circle Diameter	Offset	Tire Usage
-	Steel or aluminum mini-spare	16 X 4	5	107.95 mm (4.31 in)	40	T145/80R16 105
-	Silver sparkle, forged aluminum/9 spoke	16 X 7	5	107.95 mm (4.31 in)	60	P215/60R16 94H or 215/60R16 95W
-	Bright machined, forged aluminum/5 spoke	16 X 7	5	107.95 mm (4.31 in)	60	P215/60R16 V rated or 215/60R16 95W
-	Bright polished forged aluminum/5 spoke	16 X 7	5	107.95 mm (4.31 in)	60	P215/60R16 94H or P215/60R16 94V or 215/60R16 95W
-	Silver gray cast aluminum/5 spoke	17 X 7.5	5	107.95 mm (4.31 in)	60	P235/50R17 95V or 245/45R17 95W

Safety Precautions

 **WARNING:** Never run the engine with one wheel off the ground, for example, when changing a tire. The wheel(s) resting on the ground can cause the vehicle to move.

 **WARNING:** The tire and wheel must always be correctly matched. It is very important to determine the size of each component before any assembly operations commence. Failure to adhere to these instructions can result in an explosive separation and cause serious bodily injury or death.

 **WARNING:** Aftermarket aerosol tire sealants are extremely flammable. Always question the customer to make sure these products have not been used.

 **WARNING:** Aftermarket wheel assemblies may not be compatible with the vehicle. Use of incompatible wheel assemblies can result in equipment failure and possible injury. Use only approved wheel assemblies.

 **WARNING:** Use only wheels and wheel nuts that have been designed for current model year Ford vehicles. Aftermarket wheels or wheel nuts may not fit or function correctly, and can cause personal injury or damage the vehicle.

 **WARNING:** Always wear safety goggles or a face shield when performing any work with tire and wheel assemblies.

 **CAUTION:** Do not clean aluminum wheels with steel wool, abrasive-type cleaners or strong detergents. Use Custom Bright Metal Cleaner 8A-19522-A or equivalent meeting Ford specification ESR-M5B194-B.

 **CAUTION:** Reduce the air pressure as much as possible by pushing the valve core plunger in prior to removing the valve core. Avoid working in a position in which the face or body is directly over a tire in which there is pressure.

When carrying out any inspection or repair procedures on wheels (1007) and tires, follow the preceding safety precautions.

Wheels and Tires

WARNING: Do not mix different types of tires, such as radial, bias, or bias-belted, on the same vehicle except in emergencies (temporary spare usage). Vehicle handling can be seriously affected and can result in loss of control.

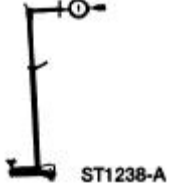

If the vehicle is equipped with uni-directional tires, mount the tires on the vehicle only in accordance with the manufacturer's instructions for direction of rotation printed on the side wall.

Original equipment uni-directional full-size spare tires can be operated with rotation counter to the directional arrow on the tire sidewall, but will perform best when rotating with the directional arrow on the sidewall.

Factory-installed tires and wheels are designed to operate satisfactorily with loads up to and including full-rated load capacity when inflated to recommended inflation pressures.

Wheels and Tires

Special Tool(s)

 <p>ST1238-A</p>	Radial Runout Gauge 418-F123 (007-0056A) or Equivalent
---	--

Inspection and Verification

WARNING: Never run the engine with one wheel off the ground, for example, when changing a tire. The wheel(s) resting on the ground can cause the vehicle to move.

WARNING: Do not balance the wheels and tires while they are mounted on the vehicle. Possible tire disintegration or differential failure can result, causing personal injury and extensive component damage. Use off-vehicle wheel and tire balancer only.

Be sure to follow the warnings when performing inspection and verification.

Road Test

Verify the customer concern by performing a road test on a smooth road. If any vibrations are apparent, go to [Section 100-04](#).

To maximize tire performance, inspect for signs of incorrect inflation and uneven wear, which can indicate a need for balancing, rotation, or front suspension alignment.

Correct tire pressure and driving techniques have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increases tire wear.

New tires must follow the recommended:

- tire sizes.
- speed rating.
- load range.
- tire construction type.

Use of any other tire size or type can seriously affect:

- ride.
- handling.

- speedometer/odometer calibration.
- vehicle ground clearance.
- tire clearance between the body and chassis.
- wheel bearing life.
- brake cooling.

New wheels need to be installed when:

- bent.
- cracked.
- dented.
- heavily corroded.
- leaking.
- they have elongated wheel hub bolt holes.
- they have excessive lateral or radial runout.

Wheel and tire assemblies are attached by five wheel nuts.

It is mandatory to use only the tire sizes recommended on the tire chart attached to the vehicle. Larger or smaller tires can damage the vehicle, affect durability, and require changing the speedometer calibration. Make sure wheel size and offsets match those recommended for the tire in use.

1. Inspect for signs of uneven wear that can indicate a need for balancing, rotation, front suspension alignment, damaged tie-rod, or steering components.
2. Check tires for:
 - cuts.
 - stone bruises.
 - abrasions
 - blisters.
 - embedded objects.
3. Tread wear indicators are molded into the bottom of the tread grooves. Install a new tire when the indicator bands become visible.

Component Tests

Tire and Wheel Runout

Excessive radial and lateral runout of a wheel and tire assembly can cause roughness, vibration, wheel tramp, tire wear, and steering wheel tremor.

Before checking runout, and to avoid false readings caused by temporary flat spots in the tires, check runout only after the vehicle has been driven far enough to warm the tires.

The extent of the runout is measured with the radial runout gauge. All measurements are made on the vehicle with the tires inflated to recommended inflation pressures and with the front wheel bearings adjusted to specifications.

Tire Runout

Measure radial and lateral tire runout at the positions shown in the illustration. Runout should not exceed specifications.

Wheel Runout

Measure radial and lateral wheel runout at the positions shown in the illustration. Runout should not exceed specifications. Note that the tire has been removed.

Wheel Leaks

WARNING: Wheel repairs that use welding or peening are not approved. An inner tube is not an acceptable repair for leaking wheels (1007) or tires.

If the air pressure in a tire mounted on an aluminum wheel is found to be low, carry out the following procedure before considering installation of a new wheel.

1. Remove the wheel and tire assembly and inspect the wheel for structural damage. If none exists, go to Step 2. If the wheel is damaged, install a new wheel.
2. With the tire mounted on the wheel, locate the air leak using a water bath or equivalent method, and mark the location. Check the complete wheel for possible additional leaks. When the leaks are marked, dismount the tire, marking valve location on the tire for correct indexing.
3. On the tire side of the wheel, thoroughly clean the leaking area with an appropriate cleaner (Metal Surface Cleaner F4AZ-19A536-RA or equivalent meeting Ford specification WSE-M5B392-A) or use sandpaper of approximately 80-grit to remove all contamination. Using the sandpaper, score the surface of the leaking area to improve adhesion of the sealer. If the valve stem is close to the area, remove it.
4. Use a clean cloth to remove all cleaner and sanding dust.
5. **NOTE:** Do not use a torch containing oxyacetylene.

Heat the prepared area with a Heat Gun or a propane torch. Apply Aluminum Wheel Repair Compound meeting Ford specification ESA-M4G280-A or equivalent over the prepared area using a liberal flow and wiping action. Repair is most effective when heat is applied to the brake side of the rim, and the sealer is melted by heat in the metal.

6. Apply only enough heat to melt the sealer, then remove the heat source. After repairing the leak, allow the wheel to cool until it can be handled safely.
7.  **CAUTION:** Use caution when mounting the tire so as not to damage the sealer.

Index and assemble the wheel and tire. Inflate the tire to the recommended pressure as indicated on the tire pressure decal.

8. Repeat Step 2 to verify repair.
 9. When the repair is completed, balance the assembly and install it on the vehicle.
-

Wheel and Tire

Removal

1.  **CAUTION: Do not use heat to loosen a seized wheel nut (1012). Heat can damage the wheel and wheel bearings.**

Loosen the wheel nuts.

1. Remove the hub cap.
2. With the weight of the vehicle on the tires, loosen the wheel nuts.

2.  **CAUTION: Never use the differential housing as a lifting point.**

Raise and support the vehicle. For additional information, refer to [Section 100-02](#).

3.  **CAUTION: Do not use heat to loosen a seized wheel because heat can damage the wheel and the wheel bearings. If the wheel cannot be removed by hand, use a wheel puller to remove the seized wheel.**

Remove the wheel and tire assembly.

1. Remove the wheel nuts.
2. Remove the wheel and tire assembly, using a side-to-side rocking motion.

Installation

1.  **WARNING: When a wheel is installed, always remove any corrosion, dirt or foreign material present on the mounting surfaces of the wheel and the surface of the wheel hub,**

brake drum or brake disc that contacts the wheel. Installing wheels without correct metal-to-metal contact at the wheel mounting surfaces can cause the wheel nuts to loosen and the wheel to come off while the vehicle is in motion, causing loss of control.

NOTE: If there is significant corrosion of the nut or stud threads, lubricate the threads with a drop of oil prior to installation.

NOTE: When the wheel nuts are used to attach the mini-spare, and are correctly installed, the cone seat of the nut body will be in contact with the cone seat of the wheel. The washer on the nut will not be in contact with the wheel and will spin freely.

Clean the wheel and the wheel hub mounting surface.

2. Install the wheel and tire assembly.
 1. Position the wheel and tire assembly.
 2. Install the wheel nuts hand-tight, then lower the vehicle.

3.  **CAUTION: Failure to tighten the wheel nuts in a star pattern can result in high brake disc runout, which will speed up the development of brake roughness, shudder and vibration.**

Tighten the wheel nuts to specification in a star-pattern sequence.

General Specifications

Item	Specification
SAE 75W-140 Synthetic Rear Axle Lubricant F1TZ-19580-B (in Canada CXY-75W140-16)	WSL-M2C192-A
Driveshaft Slip-Yoke	
Premium Long-Life Grease XG-1-C	ESA-M1C75-B

Driveshaft Angle Specifications

Transmission to Front Driveshaft	Front Driveshaft to Rear Driveshaft	Rear Driveshaft to Rear Axle Drive Pinion
(+1.0 degree) to (-0.0 degree)	(-0.4 degree) to (-1.4 degree)	(+1.0 degree) to (-0.0 degree)

Driveline System

Driveline Component Locations

A0024586

Item	Part Number	Description
1	4684	Flex coupling
2	4602	Driveshaft assembly
3	3B436	Halfshaft (RH)
4	4010	Rear axle housing
5	3B437	Halfshaft (LH)

The driveline transfers engine torque to the drive wheels. Power is transmitted through the transmission to the driveshaft (4602) and then to the axle which is connected to the halfshafts.

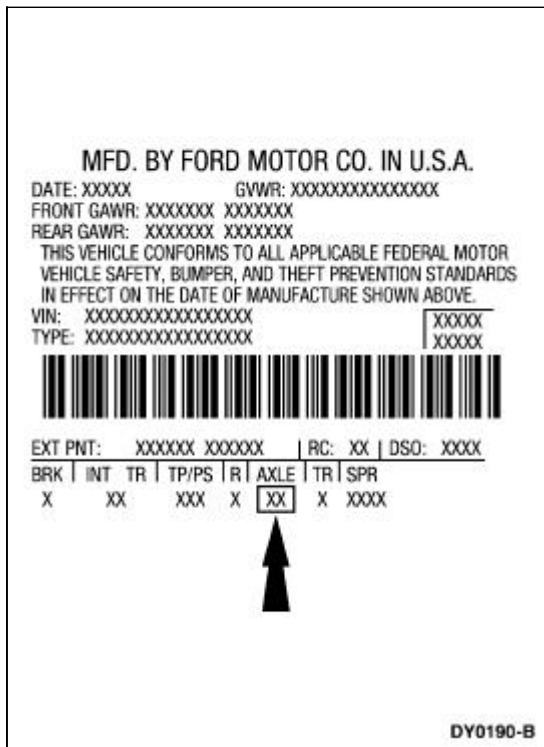

For additional information on the halfshaft, refer to [Section 205-05](#).

For additional information on the driveshaft, refer to [Section 205-01](#).

For additional information on the rear axle, refer to [Section 205-02](#).

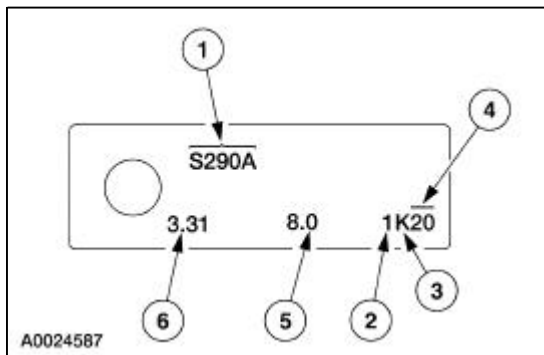

The engine angle is built into the engine mounts. If the engine angle is out of specification, the engine mounts must be inspected for damage. For additional information, refer to [Section 303-00](#).

Vehicle Certification (VC) Label Example

The vehicle certification (VC) label is located in the driver door jamb. The axle code is on the VC label. For additional information on the VC label, refer to [Section 100-01](#).

Axle Identification Tag

Item	Description
1	Plant code
2	Build year
3	Build month
4	Build day
5	Ring gear diameter (inch)
6	Axle ratio

Axle Identification Tag Denoting Interchangeability Affected Internally

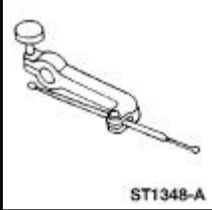

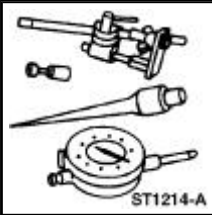

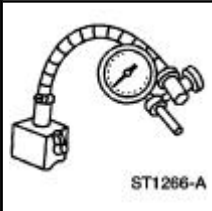

Item	Description
1	Plant code
2	Denotes interchangeability affected internally
3	Build day
4	Build month
5	Build year
6	Ring gear diameter (inch)
7	Axle ratio

⚠ CAUTION: The axle identification tag is the official identifier. Do not damage the tag. Always reinstall the tag after removing it for axle inspection/repair.

The plant code denotes a particular axle design and specific ratio. In addition, the plant code will not change as long as that particular axle assembly never undergoes an external design modification. If, however, an internal design modification takes place during the production life of the axle and that internal modification affects parts interchangeability, a dash and numerical suffix is added to the plant code. This means that, as an assembly, both axles are interchangeable; however, internally they are different. Therefore, each requires different internal parts at the time of repair.

Driveline System

Special Tool(s)

 <p>ST1348-A</p>	Gauge, Clutch Housing 308-021 (T75L-4201-A)
 <p>ST1214-A</p>	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent
 <p>ST1266-A</p>	Dial Indicator Gauge with Holding Fixture 100-D002 (D78P-4201-B) or equivalent

Inspection and Verification

Certain axle and driveline trouble symptoms are also common to the engine, transmission, wheel bearings, tires, and other parts of the vehicle. For this reason, be sure that the cause of the concern is in the axle before disassembling, adjusting or repairing the axle. For additional information, refer to [Section 100-04](#).

Certain driveshaft vibration symptoms are common to the accessory drive components, the engine, transmission or tires. Be sure the cause of the concern is the driveshaft before repairing or installing a new driveshaft. For additional information, refer to [Section 100-04](#).

Noise Acceptability

A gear-driven unit will produce a certain amount of noise. Some noise is acceptable and audible at certain speeds or under various driving conditions such as a newly paved blacktop road. Slight noise is not detrimental to the operation of the axle and is considered normal.

Flex Coupling Inspection

Check for visible reinforcing cords and signs of tearing, cracking or wear. If the flex couplings show signs of damage, inspect the rear axle mounts for cracking and tearing.

Driveshaft Center Universal Joint (U-Joint) Inspection

Place the vehicle on a frame hoist and rotate the driveshaft (4602) by hand. Check for rough operation or seized U-joint. The U-joint is not serviceable. If required, install a new complete driveshaft assembly. For additional information, refer to [Section 205-01](#).

Driveshaft Center Bearing

Rotate the driveshaft by hand. If the bearing shows signs of roughness or is noisy, install a new bearing assembly.

Analysis of Leakage

Clean up the leaking area enough to identify the exact source. An axle leak can be caused by the following:

- Axle lubricant level is too high.
- Worn or damaged axle shaft seals.
- Differential housing is cracked.
- Flange yoke seal is worn or damaged.
- Pinion flange is scored or damaged.
- Axle cover is not sealed.
- Vent is plugged.

Make sure the axle lubricant level for both nodular iron and aluminum housings is 3-5 mm (1/8-3/16 inch) below the bottom of the fill hole.

Axle Vent

NOTE: If a plugged vent cannot be cleared, install a new vent.

A plugged vent will cause excessive seal lip wear due to internal pressure buildup. If a leak occurs, check the vent. Make sure the vent hose is not kinked. Remove the hose from the vent nipple and clear the hose of any foreign material. While the hose is removed, pass a length of mechanics wire or a small diameter Allen wrench in and out of the vent to clean it. Connect the hose when done.

Flange Yoke Seal

Leaks at the axle drive pinion seal originate for the following reasons:

- Damaged seal.
- Worn seal journal surface.

Any damage to the seal bore (dings, dents, gouges, or other imperfections) will distort the seal casing and allow leakage past the outer edge of the axle drive pinion seal.

The axle drive pinion seal can be torn, cut, or gouged if it is not installed carefully. The spring that holds the axle drive pinion seal against the pinion flange may be knocked out and allow leakage past the lip.

Metal chips trapped at the sealing lip can cause oil leaks. These can cause a wear groove on the pinion flange and pinion seal wear.

A new pinion flange must be installed if any of these conditions exist.

If a seal leak occurs, install a new seal and check the vent and the vent hose to make sure they are clean and free of foreign material.

Differential Seals

Stub shaft pilot bearing housing seals are susceptible to the same kinds of damage as axle drive pinion seals if incorrectly installed. The seal bore must be clean and the lip handled carefully to avoid cutting or tearing it. The seal journal surface must be free of nicks, gouges and rough surface texture.

For additional information on differential seals, refer to [Section 205-02](#).

Analysis of Vibration

Few vibration conditions are caused by the rear axle. On a vibration concern, follow the diagnosis procedure in [Section 100-04](#) unless there is a good reason to suspect the axle.

Tires

WARNING: Do not balance the wheels and tires while they are mounted on the vehicle. Possible tire disintegration/differential/halfshaft failure can result, causing personal injury/extensive component damage. Use an off-vehicle wheel and tire balancer only.

Most vibration in the rear end is caused by tires or driveline angle.

Vibration is a concern with modern, high-mileage tires if they are not "true" both radially and laterally. They are more susceptible to vibration around the limits of radial and lateral runout of the tire and wheel assembly. They also require more accurate balancing. Wheel and tire runout checks, truing and balancing are normally done before axle inspection. For additional information, refer to [Section 204-04](#).

Driveline Angle

Driveline angularity is the angular relationship between the engine crankshaft (6303), the driveshaft and the rear axle pinion. Factors determining driveshaft center bearing height, rear axle and engine/transmission mounts.

An incorrect driveline (pinion) angle can often be detected by the driving condition in which the vibration occurs.

- A vibration during coasting from 72 to 56 km/h (45 to 35 mph) is often caused by a high axle pinion angle.
- A vibration during acceleration from 56 to 72 km/h (35 to 45 mph) may indicate a low pinion angle.

When these conditions exist, check the driveline angles.

If the tires and driveline angle are not the cause, carry out the NVH tests to determine if the concern is caused by a condition in the axle. For additional information, refer to [Section 100-04](#).

Wheel Hub Flange Bolt Circle Runout

NOTE: The brake discs must be removed to carry out all runout measurements.

1. Position the special tool perpendicular to the wheel hub bolt, as close to the hub face as possible. Zero the indicator to allow the pointer to deflect either way.

2. Rotate the hub until the next bolt is contacted. Record the measurement and continue until each bolt is checked. The difference between the maximum and minimum contact readings will be the total wheel hub bolt pattern runout. The runout must not exceed 0.38 mm (0.015 inch).

Pilot Runout

1. Position the special tools as close to the hub face as possible. Zero the indicator to allow the pointer to deflect either way.

2. Rotate the hub one full turn and note the maximum and minimum readings. The difference between the maximum and minimum readings will be the total pilot runout. Pilot runout must not exceed 0.15 mm (0.006 inch).

Wheel Hub Face Runout

1. Position the special tool on the wheel hub face, as close to the outer edge as possible. Zero the indicator to allow the pointer to deflect either way.

2. Rotate the hub one full turn and note the maximum and minimum readings. The difference between the maximum and minimum readings will be the total face runout. The runout must not exceed 0.254 mm (0.010 inch).

Drive Pinion Stem and Pinion Flange

Check the pinion flange runout when all other checks have failed to show the cause of vibration.

One cause of excessive pinion flange runout is incorrect installation of the axle drive pinion seal. Check to see if the spring on the seal lip has been dislodged before installing a new ring gear and pinion.

Halfshafts, Rear Wheel

NOTE: Install new constant velocity (CV) joints only if disassembly and inspection reveals unusual wear. For additional information, refer to [Section 205-05](#).

NOTE: While inspecting the boots, watch for indentations ("dimples") in the boot convolutions. Indentations must be removed.

- Inspect the boots for evidence of cracks, tears or splits.
- Inspect the underbody for any indication of grease splatter near the boots outboard and inboard locations. This is an indication of boot/clamp damage.

Component Tests

Driveline Vibration

Driveline vibration exhibits a higher frequency and lower amplitude than does high-speed shake. Driveline vibration is directly related to the speed of the vehicle and is usually noticed at various speed ranges. Driveline vibration can be perceived as a tremor in the floorpan or is heard as a rumble, hum or boom. Driveline vibration can exist in all drive modes, but may exhibit different symptoms depending upon whether the vehicle is accelerating, decelerating, floating or coasting. Check the driveline angles if the vibration is particularly noticeable during acceleration or deceleration, especially at lower speeds. Driveline vibration can be duplicated on a hoist. When carrying out an on-hoist test, the suspension lower arms must be supported with jack stands to make sure the halfshafts maintain the correct ride height. The brakes may need to be applied lightly in order to simulate road resistance.

Pinion Flange Runout Check

CAUTION: Pinion bearing preload must be reset if the pinion nut has been loosened or removed for pinion flange reindexing or new component installation.

1. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
2. Remove the driveshaft. For additional information, refer to [Section 205-01](#).
3. Check the pinion flange for damage.

4. Check the runout using the special tool. Rotate the pinion until the runout is obtained. If the runout is still more than 0.0762 mm (0.003 inch), install a new gearset.
 5. If excessive runout is still evident after installation of a new pinion flange, install a new ring and pinion. Repeat the above checks until the runout is within specifications.
 6. Install the driveshaft. For additional information, refer to [Section 205-01](#).

12	W704773-S301	Washer
13	4602	Shaft assembly, rear
14	4684	Flex coupling
15	W704773	Bolt

⚠ CAUTION: All driveshaft assemblies (4602) are balanced. If undercoating the vehicle, protect the driveshaft to prevent overspray of any undercoating material.

The driveshaft is a two-piece design. A single center U-joint and a slip yoke connect the front shaft

assembly (4817) and the rear shaft assembly (4602). The front and rear shaft assemblies are separable at the slip yoke. However, the slip yoke has no blind spline or index marks so it is imperative to index-mark the assemblies before separation to prevent an imbalance condition. The driveshaft uses new design flex couplings (4684) at each end of the shaft that takes the place of traditional U-joints. The driveshaft has alignment bushings (4635) at each end of the shaft. These bushings align the driveshaft with the pilot stems on the transmission flange and the axle pinion flange. Only remove the flex couplings from the driveshaft if it is necessary to install new flex couplings/alignment bushings. Always install new alignment bushings and flex couplings as a pair.

The driveshaft, has traditional balance weights attached (spot-welded) by the manufacturer. The final driveshaft balance occurs with the complete drivetrain assembly at vehicle assembly by attaching weighted color-coded nuts to the axle flex coupling bolts. For this reason, the rear flex coupling bolts are longer than the front transmission flex coupling bolts. Always install the driveshaft flex coupling bolts with the head of the bolt seated against the flange, and the nuts seated against the flex coupling.

To adjust the driveshaft angle, selective thickness spacers sit between the body and the center support-bearing bracket. Driveshaft angle specification is one degree or less. If the driveshaft angle is above one degree, damage to the alignment bushings and flex couplings will occur.

Universal Joints

The single center U-joint is:

- a lubed-for-life design that requires no periodic lubrication.
 - equipped with nylon thrust washers, located at the base of each bearing cup, which control end play, position the needle bearings and improve grease movement.
 - staked to the yoke and not removable.
-

Driveshaft

Refer to [Section 205-00](#) .

Runout and Balance

1. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
2. Remove the body brace.

3. Remove the bolts retaining the heat shield to the vehicle.

4.  **WARNING:** Personal injury can result if the heat shield contacts the driveshaft during the balancing procedure. Secure the heat shield away from the driveshaft.

Move the heat shield forward and secure it with a wire.

5. Remove the rear wheel and tire assemblies. For additional information, refer to [Section 204-04](#).
6.  **WARNING:** Tighten the wheel nuts to prevent them from coming loose during the

balancing procedure and causing personal injury.

Install and tighten the wheel nuts. For additional information, refer to [Section 204-04](#).

7. Lower the vehicle.
8. Open the hood to provide additional cooling.
9. Turn off the traction control, if so equipped.
10. Have an assistant get in the driver seat.
11. Raise the vehicle.

12.  **CAUTION: Do not exceed 70 mph.**

Have the assistant accelerate to the speed where the imbalance is most noticeable.

13.  **WARNING: Keep hands, hair, head and clothing clear of rotating parts and hot exhaust components.**

NOTE: The marker will contact the heavy side of the rotating driveshaft.

Insert a suitable marker into a 305-mm (12-inch) long piece of plastic pipe. Using the heat shield lip as a brace, move the scribe towards the driveshaft, in an area clear of the balance weld weights, until it just contacts and marks the driveshaft.

14. Have the assistant stop accelerating and shut off the engine.
15. With the driveshaft stationary, observe the mark on the driveshaft. A partial mark (less than 360 degrees) indicates the presence of an imbalance. A 360-degree mark indicates that there is no imbalance or that the pressure applied to the marker was too great. Proceed as follows if the mark indicates an imbalance. Otherwise, reinstall all components.
16. Locate the bolt in the flex coupling opposite the mark. Install a 2.75-gram weighted nut onto this bolt. This is the light side of the driveshaft. Refer to the following chart for balance nut weight and color code information.

Balance Nuts

Part Number	Color	Weight (grams)
XW4Z-4613-AA	Red	1.23
XW4Z-4613-AA	Silver	2.75
XW4Z-4613-AA	Green	5.6

17.  **WARNING: Keep hands, hair, head and clothing clear of rotating parts and hot exhaust components.**

Repeat the marking procedure Steps 12 and 13.

18. Have the assistant stop accelerating and shut off the engine.
19. With the driveshaft stationary, observe the mark on the driveshaft. If the new mark is 360-degrees, reinstall all components and road test the vehicle. If the vibration is still apparent, remove the 2.75-gram weighted nut, install a 5.6-gram weighted nut in its place, and proceed as follows.
20.  **WARNING: Keep hands, hair, head and clothing clear of rotating parts and hot exhaust components.**

Repeat the marking procedure Steps 12 and 13.

21. Have the assistant stop accelerating and shut off the engine.

22. With the driveshaft stationary, observe the mark on the driveshaft. If the new mark is 360-degrees, reinstall all components and road test the vehicle. If the vibration is still apparent, move the weighted nut to the adjacent bolts and repeat the marking procedure. If the condition does not improve, install a new driveshaft assembly. Retest using the marker and weighted nuts as necessary. When the best possible condition is met, reinstall all components and road test the vehicle.
-

Driveshaft

Special Tool(s)

Removal

 **CAUTION:** Only remove the flex couplings (4684) from the driveshaft (4602) if it is necessary to install new flex couplings/alignment bushings (4635). Install new alignment bushings and flex couplings as a pair. Balance the driveshaft with the flex couplings installed.

1. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).

2.  **WARNING:** The normal operating temperature of the exhaust system is very high. Never attempt to remove any part of the system until it has cooled. Be especially careful when working around the catalytic converters. The temperature of the converter rises to a high level after only a few minutes of engine operation. Failure to follow these instructions can result in personal injury.

 **CAUTION:** Do not allow the full weight of the exhaust to bear against the exhaust pipe manifold flanges. This will damage the flanges, and create exhaust leaks.

Remove the muffler and extension pipe assembly. For additional information, refer to [Section 309-00](#).

3. Remove the body brace.

4. Remove the 8 retainers and the heat shield.

5.  **CAUTION:** To ensure assembly in the exact same location, index-mark the bolt, nut, washer, flex coupling and pinion flange with paint or marker. Using a different color paint

or marker, index-mark the second bolt, nut and washer that retain the driveshaft and flex coupling to the pinion flange. Do not index-mark the third bolt, nut, and washer that retain the driveshaft and flex coupling to the pinion flange. These fasteners are balance weights. Always assemble them in their original positions. Failure to do so can cause driveshaft NVH.

Index-mark the components.

6.  **CAUTION:** To ensure assembly in the exact same location, index-mark the bolt, nut, washer, flex coupling and transmission flange with paint or marker. Using a different color paint or marker, index-mark the second bolt, nut and washer that retain the driveshaft and flex coupling to the transmission flange. Do not index-mark the third bolt, nut, and washer that retain the driveshaft and flex coupling to the transmission flange. These fasteners are balance weights. Always assemble them in their original positions. Failure to do so can cause driveshaft NVH.

Index-mark the components.

7.  **CAUTION:** Do not remove the bolts retaining the flex coupling to the driveshaft.

NOTE: The bolt heads are serrated. Hold the bolt and loosen the nut.

Remove the three nuts, washers and bolts.

8. Using the special tools, loosen the nut.

9.  **CAUTION:** Do not remove the bolts retaining the flex coupling to the driveshaft.

NOTE: The bolt heads are serrated. Hold the bolt and loosen the nut.

Remove the three nuts, washers and bolts.

10. Slide the front shaft assembly rearward.

- Tighten the nut to prevent separation of the front and rear shaft assemblies.

11. **⚠ CAUTION:** To ensure assembly in the exact same location, index-mark one bolt and the selective spacer(s) with paint or marker. Do not index-mark the other bolt and the selective spacer(s) on the opposite end of the mount. These parts maintain the driveshaft driveline angle. Always assemble them in their original positions. Failure to do so can cause driveshaft NVH.

Remove the bolts and spacers, and the driveshaft assembly.

Installation

1. Add one gram of grease to both alignment bushing cavities.
 - Use Premium Long-Life Grease XG-1-C or equivalent meeting Ford specification ESA-M1C75-B.
2. **⚠ CAUTION:** Align the index marks or driveshaft NVH can occur.

Align the index marks, and position the alignment bushing on the pinion flange piloting stem.

3. **⚠ CAUTION:** Install the selective spacers and bolts in their original positions.

NOTE: Do not tighten the bolts at this time.

Install the spacers and the bolts hand tight.

4. Loosen the nut and slide the front shaft assembly forward.

5.  **CAUTION:** Align the index marks or driveshaft NVH can occur.

Align the index marks, and position the alignment bushing on the transmission flange piloting stem.

6.  **CAUTION:** Install the bolts, washers and nuts in their original positions or driveshaft NVH can occur. Install the driveshaft flex coupling bolts with the head of the bolt seated against the flange, and the nuts seated against the flex coupling. Install the short bolts in the front and the long bolts in the rear.

NOTE: The bolt heads are serrated. Hold the bolt and tighten the nut.

Install the bolts, washers and nuts.

- Coat the nut and bolt threads with Threadlock 262 E2FZ-19554-B or equivalent meeting Ford specification WSK-M2G351-A6.

7.  **CAUTION:** Tighten the bolts evenly to avoid twisting the bracket.

Tighten the bolts.

8. Using the special tools, tighten the nut.

9. Install the heat shield.

10.  **CAUTION: Do not allow the full weight of the exhaust to bear against the exhaust pipe manifold flanges. This will damage the flanges, and create exhaust leaks.**

Install the muffler and extension pipe assembly. For additional information, refer to [Section 309-00](#).

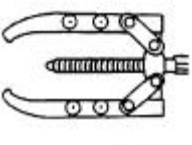

11. Install the body brace.

12. Lower the vehicle.
-

Center Bearing

Special Tool(s)

 ST1260-A	2-Jaw Puller 205-D026 (D80L-1002-L) or Equivalent
 ST1368-A	Bearing Pulling 205-D064 (D84L-1123-A) or Equivalent
 ST2454-A	Driveshaft Alignment Bushing Remover Tube 205-D073 or Equivalent

Disassembly

1. Remove the driveshaft (4602). For additional information, refer to [Driveshaft](#) in this section.
2.  **CAUTION: The slip yoke has no blind spline or index marks. Index-mark the assemblies before separation to prevent an imbalance condition.**

Loosen the nut and separate the front (4817) and rear shaft (4602) assemblies.

3.  **CAUTION: Do not clamp on the driveshaft tube as a fracture can result.**

Position and clamp the driveshaft at the weld yoke.

4. Using the special tools, remove the retaining ring and the center bearing and bracket assembly (4A499).

Assembly

1. Position the center bearing and bracket assembly and the retaining ring on the yoke.

2. Using the special tool, drive the retaining ring and bearing assembly until fully seated on the yoke.

3.  **CAUTION: Align the index marks or driveshaft imbalance can occur.**

Assemble the front and rear shaft assemblies.

- Hand-tighten the nut to prevent separation of the front and rear shaft assemblies.

4. Install the driveshaft. For additional information, refer to [Driveshaft](#) in this section.
-

Driveshaft Alignment Bushing

Special Tool(s)

 ST1144-A	Blind Hole Puller Set 303-DS005 (D80L-100A) or Equivalent
 ST2454-A	Driveshaft Alignment Bushing Remover Tube 205-D073 or Equivalent
 ST1255-A	Handle 205-153 (T80T-4000-W)
 ST1508-A	Driveshaft Alignment Bearing Installer 205-D074 or Equivalent

Disassembly

1. Remove the driveshaft (4602). For additional information, refer to [Driveshaft](#) in this section.

2.  **CAUTION: The slip yoke has no blind spline or index marks. Index-mark the assemblies before separation to prevent an imbalance condition.**

Loosen the nut and separate the front (4817) and rear shaft (4602) assemblies.

3. **NOTE:** The bolt heads are serrated. Hold the bolt and loosen the nut.

Remove the nuts and bolts and the flex coupling (4684).

- Discard the flex coupling. Retain the nuts and bolts.

4.  **CAUTION:** Do not clamp the vise on the driveshaft tube as a fracture can result.

Position the driveshaft end yoke in the vise jaws.

5. Insert the special tool inside the alignment bushing and expand the collet.

6. Install the special tools.

7. Hold the forcing screw, and tighten the forcing screw nut until removing the alignment bushing inner core.

8. Discard the alignment bushing inner core.

9. Insert the special tool and adjust it to seat behind the bushing shell.

10. Install the special tools.

11. Hold the forcing screw, and tighten the forcing screw nut until removing the alignment bushing outer shell.

12. Discard the alignment bushing outer shell.

Assembly

1. **NOTE:** Install the alignment bushing (4635) with the seal facing outward.

Using the special tools, align the bushing with the driveshaft.

2. Using the special tools, drive the alignment bushing until the tool contacts the end yoke.

3.  **CAUTION:** There are six bushings in each flex coupling. Three of the bushings protrude from one side of the flex coupling and three protrude from the other side. The arrows on the side of the flex coupling point toward the protruding end of the bushing. When installing the flex coupling, the protruding end of the bushing must seat in the driveshaft flange counterbore or damage will occur to the flex coupling during driveshaft operation.

Install the flex coupling.

1. Position the protruding end of the bushing against the driveshaft flange.
2.  **CAUTION:** The bolt heads must seat against the driveshaft flange and the nuts against the flex coupling.

Install the three bolts and nuts.

4. **NOTE:** The bolt heads are serrated. Hold the bolt and tighten the nut.

Tighten the nuts.

- Coat the bolt threads with Threadlock 262 E2FZ-19554-B or equivalent meeting Ford specification WSK-M2G351-A6.

5.  **CAUTION:** Align the index marks or driveshaft imbalance can occur.

Assemble the front and rear shaft assemblies.

- Hand-tighten the nut to prevent separation of the front and rear shaft assemblies.

6.  **CAUTION:** Add one gram of Premium Long-Life Grease XG-1-C or equivalent meeting Ford specification ESA-M1C75-B to both alignment bushing cavities before installing the driveshaft.

Install the driveshaft (4602). For additional information, refer to [Driveshaft](#) in this section.

General Specifications

Description	mm	Inches
Clearance, Tolerance and Adjustments		
Maximum runout of backface of ring gear	0.0762	0.003
Maximum differential case runout	0.076	0.003
Maximum aluminum carrier spread	0.762	0.030
Backlash between ring gear and pinion teeth	0.203-0.330	0.008-0.013
Preferred backlash	0.254	0.010
Maximum backlash variation between teeth	0.1016	0.004
Maximum radial runout of rear axle pinion flange in assembly	0.25 TIR	0.010 TIR
Available drive pinion bearing adjustment shim in steps of: 0.0254 mm (0.001 inch) 8.8-inch axle	0.254-0.965	0.010-0.038
Lubricant deflector to differential housing cover	5.08-6.35	0.200-0.250

Lubricant Capacities

Liters	Pints
1.4	3.0 ¹

¹ Use SAE 75W140 Synthetic Rear Axle Lubricant F1TZ-19580-B or equivalent meeting Ford specification WSL-M2C192-A. Fill the rear axle 3-5 mm (1/8-3/16 inch) from the bottom of filler hole.

^b With pinion flange yoke seal.

Rear Drive Axle and Differential

The rear axle assembly contains the following features:

- integral-type housing hypoid gear design has the centerline of pinion set below the centerline of ring gear.
- hypoid ring gear and pinion which consists of a 203-mm (8.0-inch) diameter ring gear and an overhung drive pinion which is supported by two opposed tapered roller bearings.
- pinion bearing preload is maintained by a drive pinion collapsible spacer on the pinion shaft and adjusted by the pinion nut.
- rear axle housing (4010) assembly which consists of a cast aluminum center section and a cast-aluminum rear differential housing cover (4033).
- differential housing cover which uses a silicone sealant rather than a gasket.
- aluminum rear axle housing that must be spread in order to remove the differential case (4204).
- differential case which is a one-piece design with two openings to allow for assembly of internal components and lubricant flow.
- differential pinion shaft (4211) which is retained by a threaded differential pinion shaft lock bolt assembled to the differential case.
- differential case which is mounted in the rear axle housing between two opposed differential bearings (4221).
- differential bearings which are retained in the rear axle housing by removable bearing caps.
- differential bearing preload and ring gear backlash are adjusted by differential bearing shims (4067) located between the differential bearing cup (4222) and the rear axle housing.
- the use of a pinion depth gauge is required for correct differential ring gear and pinion adjustment.
- the halfshafts are held in the differential case by a driveshaft bearing retainer circlip (3Z498) that is located on the inboard CV joint stub shaft pilot bearing housing (4B413). When each halfshaft is installed, the driveshaft bearing retainer circlip engages a step in the differential side gear (4236).

Rear Axle-8.0-Inch Ring Gear

Item	Part Number	Description
1	4628	Rear axle pinion bearing cup
2	4630	Pinion bearing
3	4663	Drive pinion bearing adjustment shim
4	4221	Differential bearing
5	4241	Differential pinion shaft lock bolt
6	4228	Differential side gear thrust washer
7	4236	Differential side gear
8	4211	Differential pinion shaft
9	4215	Differential pinion gear
10	4230	Differential pinion thrust washer
11	4033	Differential housing cover
12	4222	Differential bearing cup
13	4067	Differential bearing shim
14	4216	Rear axle ring gear case bolt

15	4204	Differential case
16	4209	Ring gear and pinion
17	56187-S	Bolt
18	—	Differential bearing cap (part of 4010)
19	389546-S100	Pinion nut
20	4859	Drive pinion oil seal deflector
21	4676	Rear axle drive pinion seal
22	4621	Pinion bearing
23	4616	Differential drive pinion bearing cup
24	4067	Front mount shim
25	4B424	Rear axle differential front lower insulator
26	4010	Rear axle housing (aluminum)
27	4B416	Inboard CV joint stub shaft pilot bearing housing seal
28	4B413	Inboard CV joint stub shaft pilot bearing housing
29	4010	Rear axle housing (nodular iron)
30	4B431	Rear axle differential front lower insulator cap
31	4662	Differential drive pinion collapsible spacer
32	4670	Rear axle drive pinion shaft oil slinger
33	4851	Rear axle pinion flange

The rear drive axle operates as follows:

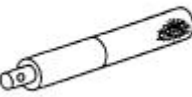

- The rear axle drive pinion receives power from the engine through the transmission and driveshaft (4602).
 - The pinion gear rotates the differential case when engaged with the ring gear, which is bolted to the differential case outer flange.
 - Inside the differential case, two differential pinion gears (4215) are mounted on a differential pinion shaft which is pinned to the differential case.
 - These differential pinion gears are engaged with the differential side gears to which the halfshafts are splined.
 - As the differential case turns, it rotates the halfshafts and rear wheels.
 - When it is necessary for one wheel and halfshaft to rotate faster than the other, the faster turning differential side gear causes the differential pinion gears to roll on the slower turning differential side gear. This allows differential action between the two halfshafts.
-

Rear Drive Axle and Differential

Refer to [Section 205-00](#) .

Stub Shaft Pilot Bearing and Seal

Special Tool(s)

 ST1200-A	Bearing Cup Remover 308-047 (T77F-1102-A)
 ST2258-A	Differential Seal Protector 205-461
 ST1676-A	Differential Seal Replacer 205-293 (T89P-4850-A)
 ST1326-A	Handle 205-153 (T80T-4000-W)
 ST1185-A	Impact Slide Hammer 100-001 (T50T-100-A)
 ST1721-A	Needle Bearing Replacer 205-288 (T89P-1244-A)

Removal

1. Remove the halfshaft assembly. For additional information, refer to [Section 205-05](#).
2. **NOTE:** If only a new inboard CV joint stub shaft pilot bearing housing seal (4B416) is to be installed, engage the bearing cup puller tangs on the inboard CV joint stub shaft pilot bearing housing seal.

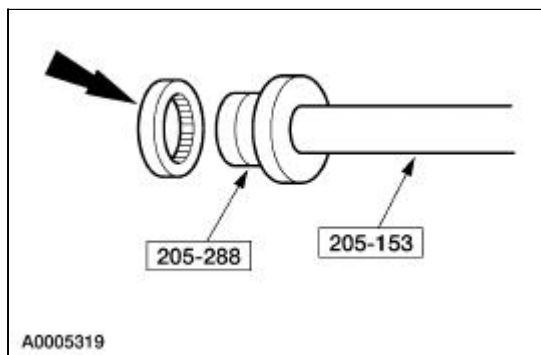

Remove the inboard CV joint stub shaft pilot bearing housing seal and inboard CV joint stub shaft pilot bearing (4B413).

1. Install the special tool with the tangs firmly engaged on the inboard CV joint stub shaft pilot bearing housing.
2. Remove the inboard CV joint stub shaft pilot bearing housing seal and inboard CV joint stub shaft pilot bearing.

Installation

1. Lubricate the new inboard CV joint stub shaft pilot bearing with SAE 75W140 Synthetic Rear Axle Lubricant F1TZ-19580-B or equivalent meeting Ford specification WSL-M2C192-A. Place the inboard CV joint stub shaft pilot bearing onto the special tools.

2. Install the inboard CV joint stub shaft pilot bearing into the rear axle housing bore.

3. Lubricate the lip of the inboard CV joint stub shaft pilot bearing housing seal with Premium Long-Life Grease XG-1-C or equivalent meeting Ford specification ESA-M1C75-B. Place the inboard CV joint stub shaft pilot bearing housing seal onto the special tools.

4. **⚠ CAUTION:** Installation of the inboard CV joint stub shaft pilot bearing housing seal or inboard CV joint stub shaft pilot bearing without the correct tool can result in an early inboard CV joint stub shaft pilot bearing housing seal or pilot bearing failure. If the inboard CV joint stub shaft pilot bearing becomes cocked in the bore during installation, remove it and install a new one.

Carefully align the inboard CV joint stub shaft pilot bearing housing seal with the housing bore and install the inboard CV joint stub shaft pilot bearing housing seal.

5. **⚠ CAUTION:** Use special tool 205-461 to avoid damaging seal with CV joint stub shaft.
- ⚠ CAUTION:** Inspect the inboard CV joint seal journal for rust or nicks/scratches prior to installing the halfshaft. Polish the seal journal with fine crocus cloth, if required.

Install the halfshaft. For additional information, refer to [Section 205-05](#).

Drive Pinion Flange

Special Tool(s)

 ST2458-A	Holding Tool, Drive Pinion Flange 205-478
 ST1734-A	Installer, Drive Pinion Flange 205-479
 ST2452-A	Remover, Output Flange 307-408

Removal

1.  **CAUTION: Do not allow the calipers to hang from the brake hoses.**

NOTE: Remove the rear wheels and the brake calipers to prevent drag during the drive pinion bearing preload adjustment.

Remove and secure the rear brake calipers aside. For additional information, refer to [Section 206-04](#).

2.  **CAUTION: Do not disconnect the driveshaft before referring to [Section 205-01](#).**

Disconnect and position the driveshaft out of the way. For additional information, refer to [Section 205-01](#).

3. Install a Nm (inch/pound) torque wrench on the pinion nut and record the torque necessary to maintain rotation of the drive pinion gear (4209) through several revolutions.

4.  **CAUTION:** After removing the pinion nut, discard it. Use a new nut for installation.

NOTE: Make sure to insert the cotter key on the special tool as shown.

Remove the pinion nut.

1. Install the special tool.
2. Install a suitable breaker bar and remove the nut.

5. Mark the pinion flange in relation to the drive pinion stem to ensure correct alignment during installation.

6. Using the special tool, remove the pinion flange.

Installation

1. Lubricate the pinion flange splines.
 - Use SAE 75W140 Synthetic Rear Axle Lubricant F1TZ-19580-B or equivalent meeting Ford specification WSL-M2C192-A.

2.  **CAUTION:** Inspect the pinion flange seal journal for rust or nicks/scratches prior to installing the pinion flange. Polish the seal journal with fine crocus cloth, if required.

NOTE: Disregard the alignment marks if installing a new pinion flange.

Align the pinion flange with the drive pinion shaft.

3. Using the special tools, install the pinion flange.

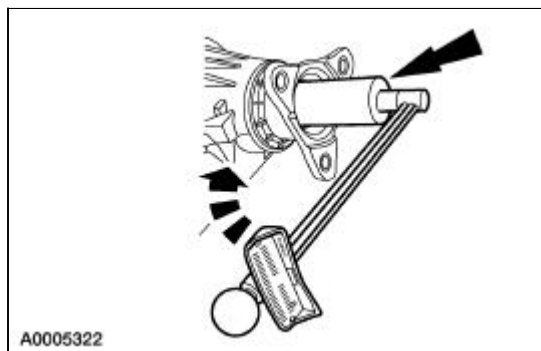

4.  **CAUTION:** Do not under any circumstance loosen the pinion nut to reduce preload. If it is necessary to reduce preload, install a new collapsible spacer and new pinion nut.

NOTE: Always install a new pinion nut.

NOTE: Make sure to insert the cotter key on the special tool as shown.

Use the special tool to hold the pinion flange while tightening the pinion nut.

- Rotate the pinion occasionally to make sure the differential pinion bearings (4630) (4621) seat correctly. Take frequent differential pinion bearing torque preload readings by rotating the pinion with a Nm (inch/pound) torque wrench.
- If the preload recorded prior to disassembly is lower than the specification for used bearings, then tighten the pinion nut to specification. If the preload recorded prior to disassembly is higher than the specification for used bearings, then tighten the pinion nut to the original reading as recorded.
- Refer to the torque specification for pinion bearings in the Specifications portion of this section.

5. Connect the driveshaft. For additional information, refer to [Section 205-01](#).
 6. Install the rear brake calipers. For additional information, refer to [Section 206-04](#).
 7. Install the rear wheel and tire assemblies. For additional information, refer to [Section 204-04](#).
-

Pinion Seal

Special Tool(s)

Removal

1. Remove the pinion flange (4851). For additional information, refer to [Drive Pinion Flange](#) in this section.
2. Force up the metal flange of the rear axle drive pinion seal (4676).

3. Strike the pliers with a hammer to remove the rear axle drive pinion seal.

Installation

1. Lubricate the lips of the new rear axle drive pinion seal.
 - Use Premium Long-Life Grease XG-1-C or equivalent meeting Ford specification ESA-M1C75-B.
2.  **CAUTION:** Installation without the correct tool can result in early seal failure.

 **CAUTION:** If the rear axle drive pinion seal becomes misaligned during installation, remove it and install a new one.

Using the special tool, install the rear axle drive pinion seal.

3. Install the pinion flange. For additional information, refer to [Drive Pinion Flange](#) in this section.
-

Axle Housing

Special Tool(s)

Removal and Installation

1. Remove the halfshafts. For additional information, refer to [Section 205-05](#).
2. Remove the heat shield underbody. For additional information, refer to [Section 309-00](#).

3.  **CAUTION: The driveshaft-to-pinion flange bolts, nuts and weighted nuts must be installed in the same locations from which they were removed.**

Mark the pinion flange, the driveshaft flexible coupling and each of the three driveshaft-to-pinion flange bolts, nuts and weighted nuts with different color paint so that the driveshaft and differential may be realigned during installation.

4.  **CAUTION: Do not remove the flex coupling on the driveshaft flange. Make sure to remove only the driveshaft-to-pinion flange bolts and nuts.**

Remove the three driveshaft-to-pinion flange bolts and nuts.

5. Support the driveshaft at the center and rear.

6. Loosen the driveshaft yoke adjuster nut.

7. **NOTE:** There are shims between the center bearing mounting bracket and the body.

NOTE: The shims must be installed in their original locations.

Remove the bolts and the shims.

8. Slide the rear driveshaft to the full forward position and tighten the adjuster nut.

9. Position a suitable jack under the axle housing.

10. **NOTE:** The front mount has a nut and shim on the top.

Remove the three mounting bolts.

11. Lower the axle housing assembly from the vehicle.

12. To install, reverse the removal procedure.

- Make sure to position the shim on the front mount before raising the axle housing into position.

Axle Housing Bushing

Special Tool(s)

 <p>ST2252-A</p>	Bushings Replacer 204-091 (T85T-5638-A2)
 <p>ST2543-A</p>	Remover/Installer, Differential Bushings 205-485

Removal

1. Remove the axle housing assembly from the vehicle. For additional information, refer to [Axle Housing](#) in this section.
2. Remove the rear axle differential front upper insulator (4B424).

3. Using the special tools, remove the front axle differential front lower insulator (4B431).

Installation

1. Insert the rear axle differential front lower insulator and make sure that the notches are aligned forward and aft.

2. Using the special tools, install the rear axle differential front lower insulator.

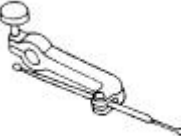

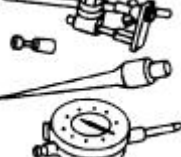

3. Install the rear axle differential front upper insulator.

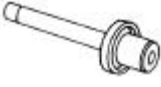

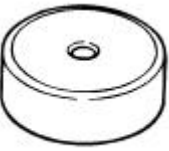

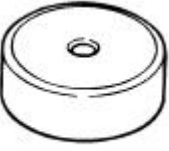

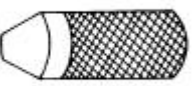

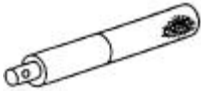

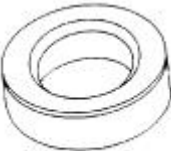

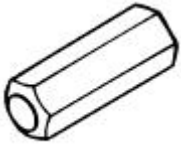

4. Install the rear axle housing. For additional information, refer to [Axle Housing](#) in this section.
-

Axle —Aluminum

Special Tool(s)

 ST2026-A	2-Jaw Puller 205-D072 (D97L-4221-A) or equivalent

Disassembly

1. Remove the differential housing cover.
2.  **CAUTION: Extreme care must be taken not to damage aluminum rear axle housing (4010) while carrying out these procedures.**

Mount the rear axle housing on the Transmission Holding Fixture.

1. Attach the special tools to the rear axle housing with four cover bolts.
2. Attach the Differential Housing (Plates) Spreader to the Transmission Holding Fixture with two 3/8 inch x 1-1/2 inch bolts.

3. Install the Differential Carrier Spreader onto the Differential Housing (Plates) Spreader Adapters with the spreader pins aligned with the holes in the Housing Spreader Adapters.

4. Assemble the special tools.
 1. Install the Dial Indicator Gauge.
 2. Attach the Clutch Housing Gauge Adapter to the Dial Indicator Gauge with the tip positioned in the spreader adapter hole.

5.  **CAUTION: Overspreading can damage the rear axle housing.**

NOTE: Tighten and loosen the housing spreader adapter screw to normalize the Differential Housing (Plates) Spreader prior to the final Dial Indicator Gauge reading.

Adjust the dial indicator to zero and tighten the housing spreader screw until the rear axle housing is spread to specification.

- Remove the Dial Indicator Gauge.

6. **NOTE:** Mark the position of the bearing caps as arrows may not be visible. The bearing caps must be installed in their identical locations and positions.

Remove the differential bearing caps.

1. Remove the bearing cap retaining bolts.
2. Remove the differential bearing caps.

7. **⚠ CAUTION: Wood blocks must be used to avoid rear axle housing damage.**

Remove the differential case (4204).

1. Position wood blocks on top and bottom of the differential (4026).
2. Pry the differential case and the differential bearing shims (4067) out of the rear axle housing.
3. Remove the special tool.

8. Remove the 10 ring gear bolts.

9.  **CAUTION:** Care should be taken not to damage the bolt hole threads.

Insert a punch in the bolt holes and drive the ring gear off.

10. Using the special tools, remove the differential bearing (4221).
● Repeat for the other side.

11. Remove the differential pinion shaft lock bolt.

12. Remove the differential pinion shaft.

13. Remove the differential gears.

14. Remove the differential side gears.

15. Install a Nm (inch/pound) torque wrench on the pinion nut and record the torque necessary to maintain rotation of the drive pinion gear (4209) through several revolutions.

16. Mark the pinion flange in relation to the drive pinion stem to make sure of correct alignment during installation.

17.  **CAUTION:** After removing the pinion nut, discard it. Use a new nut for installation.

Remove the pinion nut.

- Install the special tool.
- Install a suitable breaker bar and remove the nut.

18. Using the special tool, remove the pinion flange.

19. Install the special tool and, with a soft-faced hammer, drive the pinion out of the front bearing cone and remove it through the rear of the housing.
- Remove the rear axle drive pinion shaft oil slinger (4670), the rear axle drive pinion seal (4676) and the collapsible spacer.

20. Remove the front pinion bearing.
 1. Position the special tool under the pinion bearing.
 2. Using a press, remove the pinion bearing.

21. **NOTE:** Measure the drive pinion bearing adjustment shim (4663), which is found under the differential pinion bearing, with a micrometer and record the thickness. (Use this as a reference to compare the shim gauge reading prior to installing the differential pinion bearing.)

Remove the drive pinion bearing adjustment shim.

22. If required, remove damaged rear axle pinion bearing cup (4616) from the rear axle housing using the special tools.

23. If required, remove rear axle pinion bearing cup (4628) from the rear axle housing using the special tools.

Assembly

All vehicles

1.  **CAUTION:** Lubricate the differential side gear thrust washers with Premium Long-Life Grease XG-1-C or equivalent meeting Ford specification ESA-M1C75-B prior to installation.

Install the differential side gears in the differential case.

2.  **CAUTION:** Lubricate the differential pinion thrust washers with Premium Long-Life Grease XG-1-C or equivalent meeting Ford specification ESA-M1C75-B prior to installation.

Install the differential pinion gears with the differential pinion thrust washers in the differential case.

3. **NOTE:** If a new pinion shaft lock bolt is unavailable, coat the threads with Threadlock® and Sealer E0AZ-19554-AA or equivalent meeting Ford specifications WSK-M2G351-A5 prior to installation.

Install the differential pinion shaft and install a new differential pinion shaft lock bolt.

4. Use the special tool to install the differential bearing on the differential case. Repeat for the other side.

5. Install the differential case without the ring gear.
 - Rotate the differential case to correctly seat the differential bearings.

6. Check the differential case flange runout using the special tool.
 - If the runout is within specification, install a new ring gear and pinion. If the runout exceeds specification, the ring gear is true and the concern is due to either a damaged differential case or differential bearings.
 - Inspect the differential bearings. If the differential bearings are not damaged, install a new differential case and the differential bearings.
 - Recheck the runout with the new differential case and differential bearings.

7. Remove the differential case.
8. Press the ring gear on the differential case.
 - Start two of the ring gear bolts through the differential case and into the ring gear to make sure the ring gear bolt holes align with the differential case bolt holes correctly.

9. Install the ring gear bolts.
 - Apply Stud and Bearing Mount E0AZ-19554-BA or equivalent meeting Ford specification WSK-M2G349-A1 to the ring gear bolts.

10. With the pinion removed, place the differential case/gear subassembly with the differential bearing and the rear axle pinion bearing cups in the rear axle housing.

11. Install a differential bearing shim of the thickness shown on the LH side of the differential case.

12. Install the LH bearing cap finger-tight.

13. **NOTE:** Apply pressure toward the left side to fully seat the differential bearing cup (4222).

Install progressively larger differential bearing shims on the RH side until the largest differential bearing shim selected can be assembled with a slight drag feel.

14. Install the RH bearing cap.
 - Tighten both bearing caps to specification.

15. Rotate the differential assembly to make sure it rotates freely.

Pinion bearing cup installation with special tools 205-153, 205-480, and 205-054

16. Install a new inner rear axle pinion bearing cup in the rear axle housing.

17. Install a new outer rear axle pinion bearing cup in the rear axle housing.

Pinion bearing cup installation with special tool 205-054

18. **NOTE:** Coat the new rear axle pinion bearing cup with SAE 5W-30 Super Premium Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.

Install the pinion bearing cup.

1. Position the rear axle pinion bearing cup on the special tool.
2. Position the bearing cup replacer in the rear axle housing.
3. Tighten the special tool to fully seat the rear axle pinion bearing cup in the bore.

All vehicles

19. **NOTE:** A drive pinion bearing adjustment shim is used between the pinion bearing and the pinion head. The drive pinion bearing adjustment shim compensates for machining variations in the differential pinion and the pinion bearings. The correct drive pinion bearing adjustment shim size will locate the pinion for correct tooth contact with the ring gear. Selecting the correct drive pinion bearing adjustment shim can be done using a pinion depth gauge set.

NOTE: Apply a light film of SAE 75W-140 High Performance Rear Axle Lubricant F1TZ-19580-B or equivalent meeting Ford specification WSL-M2C192-A on the front differential pinion bearing and the rear differential pinion bearing assemblies.

Install the special tools.

A0005369

Item	Part Number	Description
1	205-109	Adapter for 205-S127 (T76P-4020-A9)
2	205-477	Gauge aligner, depth pinion
3	4630	Rear (inner) pinion bearing
4	205-476	Gauge disc, drive pinion
5	205-110	Gauge block (1.7 inch thick) (T76P-4020-A10)
6	4621	Front (outer) pinion bearing
7	205-111	Adapter for 205-S127 (T76P-4020-A11)

20. **NOTE:** This step duplicates pinion bearing preload.

Thread the Handle onto the Screw and tighten to the specification shown.

A0005370

21. **NOTE:** The special tool must be offset to obtain an accurate reading.

NOTE: Rotate the special tool several half turns to correctly seat the pinion bearings.

Position the special tool 45 degrees as shown.

22. Install the special tool.
1. Position the special tool on the differential bearing seat of the rear axle housing.
 2. Install the differential bearing caps.
 3. Install the differential bearing cap bolts and tighten to specification.

23. **NOTE:** A slight drag should be felt for the correct shim selection.

NOTE: Use a shim to determine shim thickness.

Select and check the correct shim size.

24. Remove the special tool.
25. **NOTE:** The same pinion bearings and drive pinion bearing adjustment shim used in the drive pinion shim selection procedure must be used in the final axle assembly.

Install the rear pinion bearing.

1. Position the drive pinion bearing adjustment shim on the pinion stem.
2. Position the pinion bearing on the pinion stem.
3. Position the special tool on the pinion stem.
4. Using a press, firmly seat the drive pinion bearing adjustment shim and pinion bearing on the pinion stem.

26. Install the front pinion bearing, the rear axle drive pinion shaft oil slinger and the rear axle drive pinion seal in the differential housing.
27. **NOTE:** Make sure the splines on the pinion stem are free of burrs. If burrs are evident, remove using a fine crocus cloth, working in a rotational motion.

Place a new drive pinion collapsible spacer on the pinion stem against the pinion stem shoulder.

28. Install the drive pinion and the new drive pinion collapsible spacer into the rear axle housing.

29. **⚠ CAUTION:** Take extreme care not to damage aluminum rear axle housing while carrying out these procedures.

⚠ CAUTION: Master bearings are marked LH and RH and must be installed as shown.

Remove the differential bearings and install the special tools on the differential case.

30. **NOTE:** Lubricate the rear axle pinion flange splines. Use SAE 75W-140 High Performance Rear Axle Lubricant F1TZ-19580-B or equivalent meeting Ford specification WSL-M2C192-A.

Install the rear axle pinion flange.

- **NOTE:** Disregard the scribe marks if a new rear axle pinion flange is being installed.

Align the rear axle pinion flange with the drive pinion shaft.

31. With the drive pinion in place in the rear axle housing, install the rear axle pinion flange using the special tools.

32.  **CAUTION:** Do not under any circumstance loosen the pinion nut to reduce preload. If it is necessary to reduce preload, install a new collapsible spacer (4662) and new pinion nut.

Use the special tool to hold the pinion flange while tightening the new pinion nut.

- Rotate the pinion occasionally to make sure the differential pinion bearings (4630) (4621) seat correctly. Take frequent differential pinion bearing torque preload readings by rotating the pinion with a Nm (inch/pound) torque wrench.
- Refer to the torque specification for pinion bearings in the Specifications portion of this section.

33. Place the differential case and the special tools into the rear axle housing.

34. Position the special tool on the outside mounting hole.

35. **NOTE:** Repeat this step until a consistent reading is obtained.

Measure the total end play.

1. Attach the special tool with the indicator tip positioned on the machined surface of the differential case flange.
2. Move the differential case to the left and the right (as far as possible).
3. Record the reading on the differential bearing shim selection procedure line A.

36. Remove the special tool and the differential case from the rear axle housing.

37. Draw-file the differential ring gear mounting surface to remove any nicks or burrs.

38. Install the ring gear.
1. Place the ring gear onto the differential case.
 2. Hand start three bolts to align the holes in the ring gear and the differential case.
 3. Place the differential case and ring gear onto the press bed blocks with the ring gear teeth facing down.
 4. Press the ring gear into place.

39. Install the remaining ring gear bolts and tighten to specification.

40. Place the differential case, special tools and the ring gear into the rear axle housing.

41. **NOTE:** The ring gear bolt heads inside the rear axle housing may interfere. If so, remove three to five bolts to provide clearance.

Measure the end play.

1. Attach the special tool with the indicator tip positioned on the machined surface of the differential case flange.
2. Rock the ring gear to allow full mesh with the pinion gear.
3. With the gears in full mesh, set the special tool to zero.
4. Move the differential case as far as possible to the left and note the reading.
5. Record the reading on the differential bearing shim selection procedure line B.

42. Remove the special tool and the differential case from the rear axle housing.

43. **NOTE:** The stand height of both differential bearing assemblies must be measured prior to installation.

Install the special tool.

1. Place the bearing preload gauge base in a soft-jawed vise with the bearing mounting surface above the vise jaws.

2. Position the differential bearing assembly on the bearing preload tool base.
3. Attach the bolt, spring, washers and spacer.
4. Tighten the bolt to specification shown.

44. **NOTE:** Mark the differential bearing assemblies left and right before measuring.

Measure the differential bearing stand height.

1. Invert the special tool and clamp the bolt head in a vise.
2. Position a depth micrometer flat on the differential bearing assembly.

45. Measure the stand height of both differential bearing assemblies and record on the differential bearing shim selection procedure line D.
46. Press the left and right differential bearing on the differential case.

47. Install the special tools.

48.  **CAUTION: Overspreading can damage the rear axle housing.**

NOTE: Tighten and loosen the housing spreader adapter screw to normalize the Housing Spreader Adapters prior to the final Dial Indicator reading.

Adjust the Dial Indicator Gauge to zero and tighten the Differential Carrier Spreader screw to spread the rear axle housing to specification.

- Remove the Dial Indicator Gauge.

49. **NOTE:** Apply a light coating of Premium Long-Life Grease XG-1-C or equivalent meeting Ford specification ESA-M1C75-B to the differential bearing shim to help hold in place.

NOTE: Select the correct size differential bearing shims by using the differential bearing shim selection chart.

Install the differential bearing shims.

- Place the differential bearing shims in the rear axle housing.

50. Install the differential case.
1. Position the differential bearing cups on the differential bearings.
 2. Lower the differential case in place between the differential bearing shims.

51. **NOTE:** Tighten the bearing cap bolts prior to releasing the housing spreader.

Install the bearing caps in their original positions and tighten the bolts to specification.

52. Remove the Differential Carrier Spreader and move the Dial Indicator Gauge to the 12 o'clock position.

53. **NOTE:** Measure the ring gear backlash at four places to obtain a consistent reading.

Measure the backlash.

1. Attach the special tool.
2. Position the indicator needle centrally on a drive tooth.
3. Zero the indicator.
 - Turn the ring gear without turning the pinion gear. Record the indicator reading.

54. If the backlash is not to specification, correct by increasing the thickness of one differential bearing shim and decreasing the thickness of the other differential bearing shim by the same amount. Refer to the following tables.

Differential Bearing Shim Selection Chart

8.0-inch Aluminum Axle	Example	Actual
Line A End play without ring gear	0.498	
Line B End play with ring gear (ring gear side)	-0.245	
Line C Subtract Line B from Line A, also record on Line C, below	0.253	

8.0-inch Aluminum Axle	Left Differential Bearing Height		Right Differential Bearing Height	
	Example	Actual	Example	Actual
Master bearing height	0.8695	0.8695	0.8695	0.8695

55.  **CAUTION: Make sure the machined surfaces on both the rear axle housing and the differential housing cover are clean and free of oil before installing the new silicone sealant. The inside of the rear axle (4001) must be covered when cleaning the machined surface to prevent contamination.**

If the backlash is within specification, install the differential housing cover.

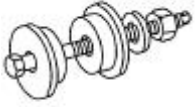

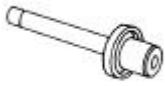

- Apply a new continuous bead of sealant to the differential housing cover. Use Silicone Rubber D6AZ-19562-AA or equivalent meeting Ford specifications ESB-M4G92-A.

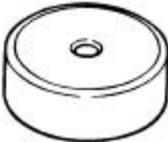

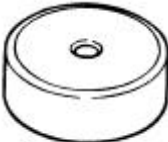

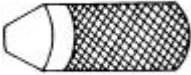

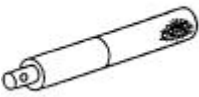

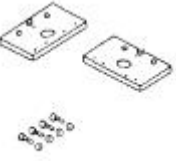

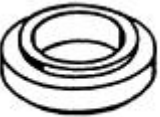

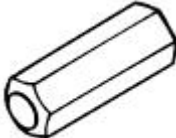

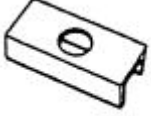

56. Install the rear axle. For additional information, refer to [Axle Housing](#) in this section.
57. Refill the rear axle (4001).
- Fill the rear axle 3-5 mm (1/8-3/16 inch) from the bottom of the filler hole with SAE 75W-140 High Performance Rear Axle Lubricant F1TZ-19580-B or equivalent meeting Ford specification WSL-M2C192-A.

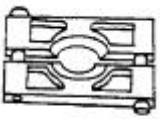

Axle —Nodular Iron

Disassembly

1. Remove the differential housing cover.
2. **NOTE:** The Differential Housing (Plate) Spreader is used here to give the rear axle housing stability. Do not spread the rear axle housing.

Mount the rear axle housing on the Transmission Holding Fixture.

1. Attach the Differential Housing (Plate) Spreader to the rear axle housing with four cover bolts.
2. Attach the Differential Housing (Plate) Spreader to the Transmission Holding Fixture with two 3/8 inch x 1-1/2 inch bolts.

3. **NOTE:** Mark the position of the bearing caps as arrows may not be visible. The bearing caps must be installed in their identical locations and positions.

Remove the differential bearing caps.

4. Remove the differential case (4204).

5. Remove the 10 ring gear bolts.

6.  **CAUTION:** Care should be taken not to damage the bolt hole threads.

Insert a punch in the bolt holes and drive the ring gear off.

7. Using the special tools, remove the differential bearing (4221).

- Repeat for the other side.

8. Remove the differential pinion shaft lock bolt.

9. Remove the differential pinion shaft.

10. Remove the differential gears.

11. Remove the differential side gears.

12. Install a Nm (inch/pound) torque wrench on the pinion nut and record the torque necessary to maintain rotation of the drive pinion gear (4209) through several revolutions.

13. Mark the pinion flange in relation to the drive pinion stem to make sure of correct alignment during installation.

14.  **CAUTION: After removing the pinion nut, discard it. Use a new nut for installation.**

Remove the pinion nut.

- Install the special tool.
- Install a suitable breaker bar and remove the nut.

15. Using the special tool, remove the pinion flange.

16. Install the special tool and, with a soft-faced hammer, drive the pinion out of the front bearing cone and remove it through the rear of the housing.
- Remove the rear axle drive pinion shaft oil slinger (4670), the rear axle drive pinion seal (4676) and the collapsible spacer.

17. Remove the front pinion bearing.
1. Position the special tool under the pinion bearing.
 2. Using a press, remove the pinion bearing.

18. **NOTE:** Measure the drive pinion bearing adjustment shim (4663), which is found under the differential pinion bearing, with a micrometer and record the thickness (use this as a reference to compare the shim gauge reading prior to installing the differential pinion bearing).

Remove the drive pinion bearing adjustment shim.

19. Remove damaged rear axle pinion bearing cup (4616) from the rear axle housing using the special tools.

20. Remove damaged rear axle pinion bearing cup (4628) from the rear axle housing using the special tools.

Assembly

All vehicles

1.  **CAUTION:** Lubricate the differential side gear thrust washers with Premium Long-Life Grease XG-1-C or equivalent meeting Ford specification ESA-M1C75-B prior to installation.

Install the differential side gears in the differential case.

2.  **CAUTION:** Lubricate the differential pinion thrust washers with Premium Long-Life Grease XG-1-C or equivalent meeting Ford specification ESA-M1C75-B prior to installation.

Install the differential pinion gears with the differential pinion thrust washers in the differential case.

3. **NOTE:** If a new pinion shaft lock bolt is unavailable, coat the threads with Threadlock® and Sealer E0AZ-19554-AA or equivalent meeting Ford specifications WSK-M2G351-A5 prior to installation.

Install the differential pinion shaft and install a new differential pinion shaft lock bolt.

4. Use the special tool to install the differential bearing on the differential case. Repeat for the other side.

5. Install the differential case without the ring gear.
 - Rotate the differential case to correctly seat the differential bearings.

6. Check the differential case flange runout using the special tool.
 - If the runout is within specification, install a new ring gear and pinion. If the runout exceeds specification, the ring gear is true and the concern is due to either a damaged differential case or differential bearings.
 - Inspect the differential bearings. If the differential bearings are not damaged, install a new differential case and the differential bearings.
 - Recheck the runout with the new differential case and differential bearings.

7. Remove the differential case.
8. Press the ring gear on the differential case.
 - Start two of the ring gear bolts through the differential case and into the ring gear to make sure the ring gear bolt holes align with the differential case bolt holes correctly.

9. Install the ring gear bolts.

- Apply Stud and Bearing Mount E0AZ-19554-BA or equivalent meeting Ford specification WSK-M2G349-A1 to the ring gear bolts.

10. **NOTE:** If the ring gear runout check (carried out before disassembly) exceeds specification, the cause may be a warped ring gear, a damaged differential case or loss of differential bearing preload.

With the pinion removed, place the differential case/gear subassembly with the differential bearing and the rear axle pinion bearing cups in the rear axle housing.

11. Install a differential bearing shim of the thickness shown on the LH side of the differential case.

12. Install the LH bearing cap finger-tight.

13. **NOTE:** Apply pressure toward the left side to fully seat the differential bearing cup (4222).

Install progressively larger differential bearing shims on the RH side until the largest differential bearing shim selected can be assembled with a slight drag feel.

14. Install the RH bearing cap.
- Tighten both bearing caps to specification.

15. Rotate the differential assembly to make sure it rotates freely.

16. Remove the differential case.

Pinion bearing cup installation with special tool 205-153, 205-480, and 205-054

17. Install a new inner rear axle pinion bearing cup in the rear axle housing.

18. Install a new outer rear axle pinion bearing cup in the rear axle housing.

Pinion bearing cup installation with special tool 205-054

19. **NOTE:** Coat the new rear axle pinion bearing cup with SAE 5W-30 Super Premium Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.

Install the pinion bearing cup.

1. Position the rear axle pinion bearing cup on the special tool.
2. Position the bearing cup replacer in the rear axle housing.
3. Tighten the special tool to fully seat the rear axle pinion bearing cup in the bore.

All vehicles

20. **NOTE:** A drive pinion bearing adjustment shim is used between the pinion bearing and the pinion head. The drive pinion bearing adjustment shim compensates for machining variations in the differential pinion and the pinion bearings. The correct drive pinion bearing adjustment shim size will locate the pinion for correct tooth contact with the ring gear. Selecting the correct drive pinion bearing adjustment shim can be done using a pinion depth gauge set.

NOTE: Apply a light film of SAE 75W-140 High Performance Rear Axle Lubricant F1TZ-19580-B or equivalent meeting Ford specification WSL-M2C192-A on the front differential pinion bearing and the rear differential pinion bearing assemblies.

Install the special tools.

Item	Part Number	Description
1	205-109	Adapter for 205-S127 (T76P-4020-A9)
2	205-477	Gauge aligner, depth pinion
3	4630	Rear (inner) pinion bearing
4	205-476	Gauge disc, drive pinion
5	205-110	Gauge block (1.7 inch thick) (T76P-4020-A10)

6	4621	Front (outer) pinion bearing
7	205-111	Adapter for 205-S127 (T76P-4020-A11)

21. **NOTE:** This step duplicates pinion bearing preload.

Thread the Handle onto the Screw and tighten to the specification shown.

22. **NOTE:** The special tool must be offset to obtain an accurate reading.

NOTE: Rotate the special tool several half turns to correctly seat the pinion bearings.

Position the special tool 45 degrees as shown.

23. Install the special tool.

1. Position the special tool on the differential bearing seat of the rear axle housing.
2. Install the differential bearing caps.
3. Install the differential bearing cap bolts and tighten to specification.

24. **NOTE:** A slight drag should be felt for the correct shim selection.

NOTE: Use a shim to determine shim thickness.

Select and check the correct shim size.

25. Remove the special tool.

26. **NOTE:** The same pinion bearings and drive pinion bearing adjustment shim used in the drive pinion shim selection procedure must be used in the final axle assembly.

Install the inner pinion bearing.

1. Position the drive pinion bearing adjustment shim on the pinion stem.
2. Position the pinion bearing on the pinion stem.
3. Position the special tool on the pinion stem.
4. Using a press, firmly seat the drive pinion bearing adjustment shim and pinion bearing on the pinion stem.

27. **NOTE:** Make sure the splines on the pinion stem are free of burrs. If burrs are evident, remove using a fine crocus cloth, working a rotational motion.

Place a new drive pinion collapsible spacer on the pinion stem against the pinion stem shoulder.

28. Install the drive pinion and drive pinion collapsible spacer into the rear axle housing.

29. Install the outer pinion bearing, the rear axle drive pinion shaft oil slinger and the rear axle drive pinion seal.
30. **NOTE:** Lubricate the rear axle pinion flange splines. Use SAE 75W-140 High Performance Rear Axle Lubricant F1TZ-19580-B or equivalent meeting Ford specification WSL-M2C192-A.

Install the rear axle pinion flange.

- **NOTE:** Disregard the scribe marks if a new rear axle pinion flange is being installed.

Align the rear axle pinion flange with the drive pinion shaft.

31. With the drive pinion in place in the rear axle housing, install the rear axle pinion flange using the special tools.

32. **CAUTION:** Do not under any circumstance loosen the pinion nut to reduce preload. If it is necessary to reduce preload, install a new collapsible spacer (4662) and pinion nut.

Use the special tool to hold the pinion flange while tightening the pinion nut.

- Rotate the pinion occasionally to make sure the differential pinion bearings (4630) (4621) seat correctly. Take frequent differential pinion bearing torque preload readings by

rotating the pinion with a Nm (inch/pound) torque wrench.

- Refer to the torque specification for new pinion bearings in the Specifications portion of this section.

33. **NOTE:** Apply a light coating of Premium Long-Life Grease XG-1-C or equivalent meeting Ford specification ESA-M1C75-B to the differential bearing shim to help hold in place.

NOTE: Select the correct size differential bearing shims by using the differential bearing shim selection chart.

Install the differential bearing shims.

- Place the differential bearing shims in the rear axle housing.

34. Install the differential case.
1. Position the differential bearing cups on the differential bearings.
 2. Lower the differential case in place between the differential bearing shims.

35. Install the bearing caps in their original positions and tighten the bolts to specification.

36. Move the Dial Indicator Gauge to the 12 o'clock position.

Measuring for backlash

37. **NOTE:** Measure the ring gear backlash at four places to obtain a consistent reading.

NOTE: Turn the ring gear without turning the pinion gear.

Measure the backlash.

- If the backlash is within specification, refer to Backlash within specification in this procedure.
- If a zero backlash condition occurs, refer to Zero backlash in this procedure.
- If the backlash is not within specification, refer to Backlash not within specification in this procedure.

Backlash Change Required		Thickness Change Required	
mm	Inch	mm	Inch
0.025	0.001	0.050	0.002

0.050	0.002	0.050	0.002
0.076	0.003	0.101	0.004
0.101	0.004	0.152	0.006
0.127	0.005	0.152	0.006
0.152	0.006	0.203	0.008
0.177	0.007	0.254	0.010
0.203	0.008	0.254	0.010
0.228	0.009	0.304	0.012
0.254	0.010	0.355	0.014
0.279	0.011	0.355	0.014
0.304	0.012	0.406	0.016
0.330	0.013	0.457	0.018
0.355	0.014	0.457	0.018
0.381	0.015	0.508	0.020

Zero backlash

38. If a zero backlash condition occurs, add 0.51 mm (0.02 in) to the RH side and subtract 0.51 mm (0.02 in) from the LH side to allow backlash indication.
- Check the backlash. Repeat Measuring ring gear backlash in this procedure.

Backlash not within specification

39. To increase or decrease the backlash, remove the bearing caps and install a thicker shim or a thinner shim as shown.
- If the backlash is not within specification, correct by increasing the thickness of one differential bearing shim and decreasing the thickness of the other differential bearing shim by the same amount.

40. Rotate the differential several times to make sure the differential bearings are correctly seated.
 - Do not turn the pinion flange in order to rotate the differential.

41. Use the special tool to recheck the backlash
 - If the backlash is within specification, refer to Backlash within specification in this procedure. If the backlash is not within specification, repeat Measuring ring gear backlash in this procedure.

Backlash within specification

42. Remove the bearing caps and bolts.
 - To establish differential bearing preload, use the special tool to increase both left and right shim sizes by the specification shown.
 - Use the special tool to make sure that the differential bearing shims are fully seated and the assembly turns freely.

43. Install the bearing caps and bolts and tighten them to specification.

44. Use the special tool to recheck the backlash.
- For further adjustments, refer to [Section 205-00](#).

45.  **CAUTION:** Make sure the machined surfaces on both the rear axle housing and the differential housing cover are clean and free of oil before installing the new silicone sealant. The inside of the rear axle (4001) must be covered when cleaning the machined surface to prevent contamination.

Install the differential housing cover.

- Apply a new continuous bead of sealant to the differential housing cover. Use Silicone Rubber D6AZ-19562-AA or equivalent meeting Ford specifications ESB-M4G92-A.

46. Install the rear axle. For additional information, refer to [Axle Housing](#) in this section.

47. Refill the rear axle (4001).

- Fill the rear axle 3-5 mm (1/8-3/16 inch) from the bottom of the filler hole with SAE 75W-140 High Performance Rear Axle Lubricant F1TZ-19580-B or equivalent meeting Ford specification WSL-M2C192-A.
-

Torque Specifications

Description	Nm	lb-ft
Rear axle wheel hub retainer	300	221

Rear Drive Halfshafts

CAUTION: An inspection of the outer and inner boots is necessary so that if damage or grease leakage is evident, installation of a new halfshaft can take place immediately. Continued operation with damage or grease leakage will result in CV joint wear and noise due to contamination and loss of the CV joint grease.

CAUTION: Vehicles with V8 engines use a larger diameter halfshaft than vehicles with V6 engines. Do not install the smaller diameter halfshafts designed for vehicles with V6 engines on vehicles with V8 engines or vice-versa.

- The RH and LH halfshafts are different lengths, with the RH halfshaft being the longer of the two.
- Inboard and outboard CV joints connect to a splined shaft. A circlip stopper holds the cross groove inboard race assembly (inboard CV joint) together.
- An axle circlip (4B422) retains the splined inboard CV joint to the differential side gear. Install a new axle circlip every time you remove the halfshaft from the vehicle.
- A rear axle wheel hub retainer secures the side shaft assembly (interconnecting shaft and outboard CV joint) to the rear hub. Install a new rear axle wheel hub retainer every time you remove the halfshaft from the vehicle.

Halfshaft Handling

CAUTION: Never pick up or hold the halfshaft only by the inboard or outboard CV joint.

Handle all halfshaft components carefully during removal and installation procedures.

- The halfshaft assemblies are not repairable. Install a new assembly if worn/damaged.
- To separate the halfshaft from the rear hub, press the outboard CV joint from the rear hub.
- To separate the halfshaft from the differential, apply a load to the back face of the inboard CV joint assembly to overcome the axle circlip.
- Do not over-angle the CV joints.
- Damage will occur to an assembled inboard CV joint if it is over-plunged outward from the joint housing.
- Never use a hammer to remove or install the halfshafts.
- Never use the halfshaft assembly as a lever to position other components. Always support the free end of the halfshaft.
- Do not allow the boots to contact sharp edges or hot exhaust components.
- Handle the halfshaft only by the interconnecting shaft to avoid pull-apart and potential damage to the CV joints.
- Do not drop assembled halfshafts. The impact will cut the boots from the inside without evidence of external damage.

Wheel and Tire Balancing, Rear

WARNING: Do not balance the rear wheels and tires while mounted on the vehicle. Possible tire disintegration, differential or halfshaft failure can result, causing personal injury or extensive component damage. Use an off-vehicle wheel and tire balancer only.

Hoisting

CAUTION: Use a frame-contact hoist only. Vehicle or component damage can result if other types of hoists are used.

Never raise the vehicle using the halfshafts as lift points.

Undercoating and Rustproofing

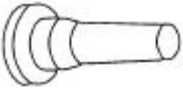

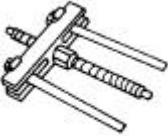

During undercoating and rustproofing procedures, protect the boots from the coating materials. Foreign materials on the rubber boots will cause extreme advanced wear.

Rear Drive Halfshafts

Refer to [Section 205-00](#) .

Halfshaft

Special Tool(s)

 ST1712-A	Differential Plug 205-294 (T89P-4850-B)
 ST2258-A	Differential Seal Protector 205-461
 ST2309-A	Halfshaft Removal Tool 205-475
 ST1516-A	Hub Remover/Replacer 204-069 (T81P-1104-C)
 ST1517-A	Metric Hub Remover Adapter 205-237 (T86P-1104-A1)
 ST1518-A	Metric Hub Remover Adapters 204-085 (T83P-1104-BH)

Removal

-  **CAUTION:** Do not begin this procedure unless:
 - a new rear axle wheel hub retainer is available.
 - a new axle circlip (4B422) is available.
 - you have read Halfshaft Handling in this section.

NOTE: This procedure applies to both the LH and RH halfshafts.

Raise and support the vehicle. For additional information, refer to [Section 100-02](#).

2. Remove the rear wheel and tire assembly. For additional information, refer to [Section 204-04](#).
3. Remove and discard the rear axle wheel hub retainer.

4. Remove the rear brake anti-lock sensor. For additional information, refer to [Section 206-09A](#).
5. Remove the brake disc. For additional information, refer to [Section 206-04](#).
6. Remove the nut and bolt.

7. Using the special tools, press the outboard CV joint until it is loose in the hub.

8.  **CAUTION: Do not over-angulate the outboard CV joint or damage the boot.**

While raising the knuckle, remove the CV joint from the hub.

9. Position the knuckle to gain clear access for the halfshaft removal.

10.  **CAUTION: The crown of the tool forks must face away from the axle housing. Position the special tool correctly between the CV joint and the axle housing so as not to damage the differential seal.**

Using the special tool, exert enough pressure to overcome the axle circlip (4B422) and separate the CV joint from the differential side gear.

11.  **CAUTION: Do not damage the differential seal.**

Carefully remove the halfshaft with both hands.

12. Install the special tool.

Installation

1.  **CAUTION: Vehicles with V8 engines use a larger diameter halfshaft than vehicles with V6 engines. Do not install the smaller diameter halfshafts designed for vehicles with V6 engines on vehicles with V8 engines or vice-versa.**

NOTE: This procedure applies to both the LH and RH halfshafts.

Install a new axle circlip.

2. Remove the special tool.

3.  **CAUTION:** Differential seal damage will occur if installing the halfshaft without the special tool installed.

Install the special tool.

4. Position the halfshaft for installation.

5. Seat the CV joint in the differential side gear.

1. Slide the CV joint into the axle housing until the shaft splines are past the differential seal.
2. Remove the special tool.
3. Align the CV joint and side gear splines, and slide the joint into the gear until it seats.
 - When seated, the axle circlip will lock the CV joint in the differential side gear.

6. Check the axle circlip engagement by attempting to pull the inboard CV joint out of the differential side gear.
 - If the circlip is not seated, push the CV joint inward until the circlip is fully engaged in the differential side gear.

7.  **CAUTION: Do not over-angulate the outboard CV joint or damage the boot.**

While raising the knuckle, install the CV joint into the hub, then position the knuckle onto the lower control arm.

8.  **CAUTION: Position the suspension at curb ride height before tightening the bolt and nut.**

Install the bolt and nut. Refer to [Section 204-02](#) for tightening specifications.

9. Install the brakes. For additional information, refer to [Section 206-04](#).
10. Install the rear brake anti-lock sensor. For additional information, refer to [Section 206-09A](#).
11. Install the rear axle wheel hub retainer.

12. Install the rear wheel and tire assembly. For additional information, refer to [Section 204-04](#).
 13. Lower the vehicle.
-

Halfshaft Joint

Disassembly

1. The halfshaft assemblies are not repairable. Install a new assembly if worn/damaged.
-

General Specifications

Item	Specification
Brake pads lining wear limit—front (above backing plate or rivets)	2 mm (0.08 in)
Brake pads lining wear limit—rear (above brake shoe or rivets)	1 mm (0.04 in)
Lubricant

Caliper bleeder screw, front	7-13	5-10	—

Brake System

Brake System, Hydraulic

This vehicle is equipped with a brake pedal-actuated hydraulic dual brake system. The system consists of the following:

- front disc brake calipers (2B120); refer to [Section 206-03](#).
- rear disc brake calipers (2553); refer to [Section 206-04](#).
- brake master cylinder (2140); refer to [Section 206-06](#).
- brake tubes and brake hoses

The ABS system will be one of the following types:

- a four wheel anti-lock control brake system (4WABS); refer to [Section 206-09A](#).
- a four wheel anti-lock control — traction control brake system; refer to [Section 206-09B](#).
- a four wheel anti-lock control — traction control and interactive vehicle dynamics (IVD); refer to [Section 206-09C](#).

The dual ABS hydraulic system is diagonally split with the LH front and RH rear making up one circuit and the RH front and LH rear making up the other circuit.

Master Cylinder, Dual

The brake master cylinder contains the following feature:

- a common plastic brake master cylinder reservoir (2K478) and low fluid level indicator combined in one assembly.

Booster, Power Brake

The power brake booster (2005) is a vacuum-operated, dual diaphragm type and is equipped with a separately serviceable power brake booster check valve (2365). Refer to [Section 206-07](#).

Brakes, Front Disc

The front disc brakes consist of the following features:

- a full-cast vented front brake disc (1125).
- hydraulically-activated pin slider-type front disc brake caliper assemblies.

Brakes, Rear Disc

The rear disc brakes consist of the following features:

- a full-cast vented rear brake disc (2C026).
- hydraulically-activated rear disc brake caliper assemblies with integral mechanically (cable) operated parking brake mechanisms.

Brake System, Parking

The parking brake system consists of the following features:

- the system is cable-actuated and controlled by a hand-operated parking brake control (2780).
- the parking brake control pulls a cable which actuates the rear disc brake calipers.
- the parking brake is self-adjusting.

Refer to [Section 206-05](#).

Brake Fluid

WARNING: Use of any other than approved DOT 4 or DOT 3 brake fluid will cause permanent damage to brake components and will render the brakes inoperative.

WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

CAUTION: Brake fluid is harmful to painted or plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

Use clean, fresh Ford High Performance DOT 3 Motor Vehicle Brake Fluid C6AZ-19542-AB or equivalent meeting Ford specification ESA-M6C25-A (United States and Canada only). If DOT 3 is not available, use Ford High Performance DOT 4 Brake Fluid or equivalent meeting Ford specification SAE-J-1704-DOT 4.

- Do not reuse brake fluid drained or bled from the system.
- Do not use brake fluid that has been stored in an open container.
- Do not use contaminated brake fluid.

Brake Tubing

WARNING: Copper tubing must not be used in a hydraulic system. When bending brake tubing to fit underbody, be careful not to kink or crack the tube.

If a section of the brake tubing becomes damaged, install a new section of tubing the same type, size, shape and length.

Brake Hose

Install a new flexible brake hose if it shows signs of softening, cracking or other damage.

Brake System

Refer to Wiring Diagrams Section [413-01](#) for schematic and connector information.

Inspection and Verification

Preliminary Checks

NOTE: Always check the fluid level in the brake master cylinder reservoir (2K478) before carrying out the test procedures. If the fluid level is not at the correct level, fill the reservoir using the specified DOT 3 or DOT 4 brake fluid.

NOTE: Prior to carrying out any diagnosis, make certain that the brake warning indicator is functional. Refer to [Section 413-01](#).

The first indication that something may be wrong in the brake system is a change in the feeling through the brake pedal (2455). The brake warning indicator in the instrument cluster and the brake fluid level in the brake master cylinder reservoir are also indicators of system concerns.

If a wheel (1007) is locked and the vehicle must be moved, open a bleeder screw at the locked wheel to let out enough fluid to relieve the pressure. Close the bleeder screw. This bleeding operation may release the brakes but will not correct the cause of trouble. If this does not relieve the locked wheel condition, repair the locked components before proceeding.

Brake Booster

Inspect all hoses and connections. All unused vacuum connectors should be capped. Hoses and their connections should be correctly secured and in good condition with no holes, soft or collapsed areas.

Road Test

Carry out a Road Test to compare actual vehicle braking performance with the performance standards expected by the driver. The ability of the test driver to make valid comparisons and detect performance deficiencies will depend on experience.

The driver should have a thorough knowledge of brake system operation and accepted general performance guidelines in order to make good comparisons and detect performance problems.

Select a road that is reasonably smooth and level. Gravel or bumpy roads are not suitable because the surface does not allow the tires to grip the road equally. Avoid crowned roads.

A key factor in evaluating brake concerns is the deceleration rate. This varies from vehicle to vehicle and with changes in operating conditions. It is evident how well the brakes are working after just a few applications.

Avoid locking the brakes. Locked brakes are not an indicator of braking efficiency.

Visual Inspection Chart

Mechanical	Electrical
● Brake master cylinder	● Parking brake switch

<ul style="list-style-type: none"> ● Brake caliper piston ● Brake disc ● Wheel bearings ● Brake pads ● Power brake booster ● Brake pedal linkage ● Booster vacuum hose ● Tires ● Foreign material 	<ul style="list-style-type: none"> ● Damaged or corroded wiring harness ● Brake master cylinder fluid level switch
--	--

For low or spongy brake pedal concerns:

- Check and, if necessary, refill the brake master cylinder reservoir.
- Bleed the brake system and retest the brake pedal feel.

For slow or incomplete brake pedal return concern:

- Inspect for binding, damage, incorrect installation or interference at the brake pedal.
- Check the power brake booster for binding, damage and incorrect installation.

Vibration When Brakes Are Applied

For vibration concerns when brakes are applied, carry out the following procedure.

Visually inspect:

- The suspension condition and tire pressure.
- Suspension bushings and ball joints.

Correct as necessary.

1. Verify and isolate the concern. Brake roughness can be felt in:

- the steering wheel.
- the seat.
- the brake pedal.

2. After verifying the concern, check for related concerns in the:

- On-Line Automotive Service Information System (OASIS).
- Technical Service Bulletins.

3. Check wheel bearing end-play and correct as necessary.

4. **NOTE:** Begin at the front of the vehicle unless the vibration has been isolated to the rear.

Remove the tire and wheel.

5. Remove the brake caliper.

6. Measure and record the brake disc thickness. If the thickness before machining is not greater than 0.6 mm (0.024 in) above the minimum thickness specification molded into the brake disc,

install a new brake disc. Do not machine a new brake disc.

7. For vehicles with a two-piece hub and brake disc assembly:

- Match-mark before disassembly.
- Remove the brake disc.
- Using a die grinder with a mild abrasive disc (Scotch Brite® type), remove any rust or corrosion from the hub and brake disc mounting surfaces.
- Align match-marks and reinstall the brake disc on the hub.

8.  **CAUTION: Do not use a bench lathe to machine brake discs.**

NOTE: The depth of cut must be between 0.10 and 0.20 mm (0.004 and 0.008 in). Lighter cuts will cause heat and wear. Heavier cuts will cause poor brake disc surface finish.

Using a hub-mount brake lathe, machine the brake discs. Follow the manufacturer's instructions. After machining, make sure the brake disc still meets the thickness specification.

9. Using a dial indicator, verify that the brake disc lateral runout is now within vehicle specification.
10. Remove metal chips.
11. Remove the brake lathe hub adapter.
12. Remove any remaining metal chips from the machining operation.
13. For vehicles with a two-piece hub and brake disc assembly:
- Remove the brake disc from the hub.
 - Remove any remaining metal chips from hub and brake disc mounting surfaces and from the ABS sensor.
 - Apply High Temperature Nickel Anti-Seize Lubricant F6AZ-9L494-AA or equivalent meeting Ford specification ESE-M12A4-A to the mounting surfaces.
 - Using the match-marks, mount the brake disc on the hub.
14. Install the caliper and check brake operation.

Pinpoint Tests

PINPOINT TEST A: THE BRAKES PULL OR DRIFT

CONDITIONS	DETAILS/RESULTS/ACTIONS
A1 CHECK THE TIRE PRESSURE	
<p>1</p>  <p>A0003832</p>	<p>1</p> <p>Check for excessive wear and measure the air pressure in all four tires.</p> <ul style="list-style-type: none"> ● Are the tires good and the tire pressure within specifications? <p>→ Yes GO to A2.</p> <p>→ No ADJUST the tire pressure. ROTATE the tires front to rear. If tires are excessively worn, INSTALL new tires.</p>

A2 INSPECT THE BRAKE PADS

1

A0003837

1 Inspect the brake pads for contamination and wear concerns.

● **Are the brake pads OK?**

→ **Yes**
GO to [A3](#).

→ **No**
INSTALL new brake pads. REFER to [Section 206-03](#) (front) or [Section 206-04](#) (rear).

A3 INSPECT THE BRAKE DISCS AND HUBS

1 Inspect the brake discs and hubs for damage.

● **Are the brake discs or hubs damaged?**

→ **Yes**
REPAIR and INSTALL new brake disc or hub as necessary.

→ **No**
GO to [A4](#).

A4 CHECK THE ALIGNMENT

1

A0003835

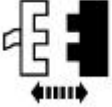

1 Check for correct camber, caster and toe-in settings. Refer to [Section 204-00](#).

● **Is the alignment set to specification?**

→ **Yes**
INSTALL a new caliper at the affected

	<p>wheel. TEST the system for normal operation.</p> <p>→ No RESET the alignment and road test vehicle.</p>
--	---

PINPOINT TEST B: THE RED BRAKE WARNING INDICATOR IS ALWAYS ON - PARKING BRAKE

CONDITIONS	DETAILS/RESULTS/ACTIONS
B1 VERIFY SYMPTOM	
	<p>1 Verify that the red brake warning indicator is never on or always on.</p> <ul style="list-style-type: none"> ● Is the indicator always on? <p>→ Yes GO to B2.</p> <p>→ No GO to B5.</p>

<p>1</p>  <p>Parking Brake Switch C306</p> <p>2</p>	

FEM Connector J1

3

A0005312

3

Measure the resistance between the parking brake connector C306, circuit 31S-RP9 (BK/GN), and ground.

- Is the resistance greater than 10,000 ohms?

→ Yes

GO to [B4](#).

→ No

REPAIR circuit 31S-RP9 (BK/GN). TEST the system for normal operation.

B4 INSTRUMENT CLUSTER DIAGNOSIS

1

1

NOTE: This pinpoint test step needs to be checked if the instrument cluster module (IC) has any DTCs and is functioning correctly, and if the telltale is OK.

Retrieve DTCs.

- Is the instrument cluster diagnosis check out OK?

→ Yes

INSTALL a new FEM. TEST the system for normal operation.

→ No

REPAIR or INSTALL a new instrument cluster and or associated circuits.

B5 RETRIEVE THE DIAGNOSTIC TROUBLE CODES (DTCs) - FEM

1

Make sure the parking brake is applied when running self-test. If the parking brake is not applied during self-test, this will cause a DTC of C1446.

2

Using recorded results from the front electronic module (FEM) self-test.

- Are any DTCs recorded?

→ **Yes**
For C1446, GO to [B6](#).

→ **No**
GO to [B11](#).

B6 CHECK CIRCUIT 31S-RP9 (BK/GN) FOR VOLTAGE

1

Parking Brake Switch C306

2

A0005310

2 Measure the voltage between parking brake switch, circuit 31S-RP9 (BK/GN) and chassis ground.

● **Is voltage greater than 10.0 volts?**

→ **Yes**
GO to [B10](#).

→ **No**
GO to [B7](#).

B7 CHECK PARKING BRAKE INDICATOR

1

3

Parking Brake Switch C306

4

2 Wait past prove out time.

4 Jumper the parking brake switch connector C306, circuit 31S-RP9 (BK/GN) to chassis ground with a fused jumper wire.

A0005311

● **Did the indicator turn on?**

→ **Yes**
 INSTALL a new parking brake switch.
 TEST the system for normal operation.

→ **No**
 GO to [B8](#).

B8 CHECK CIRCUIT 31S-RP9 (BK/GN) FOR OPENS

1

Parking Brake Switch C306

2

FEM Connector J1

3

A0005309

3 Measure the resistance between the parking brake switch, circuit 31S-RP9 (BK/GN), and FEM connector J1, pin 19, circuit 31S-RP9 (BK/GN).

● **Is resistance less than 5.0 ohms?**

→ **Yes**
 GO to [B9](#).

→ **No**
 REPAIR circuit 31S-RP9 (BK/GN). TEST the system for normal operation.

B9 INSTRUMENT CLUSTER DIAGNOSIS

1

1 **NOTE:** This pinpoint test step needs to

be checked if the instrument cluster module (IC) has any DTCs and is functioning correctly, and if the telltale is OK.

Retrieve DTCs.

- **Is the instrument cluster diagnosis check out OK?**

→ **Yes**
INSTALL a new FEM. TEST the system for normal operation.

→ **No**
REPAIR or INSTALL a new instrument cluster or associated circuits.

B10 CHECK CIRCUITS 31S-RP9 (BK/GN) FOR SHORTS TO B+

1

Parking Brake Switch C306

2

FEM Connector J1

3

A0005310

3 Measure the voltage between the parking brake switch, circuit 31S-RP9 (BK/GN), and chassis ground.

- **Is voltage greater than 10.0 volts?**

→ **Yes**
REPAIR circuit 31S-RP9 (BK/GN). TEST the system for normal operation.

→ **No**
INSTALL a new FEM. TEST the system for normal operation.

B11 INSTRUMENT CLUSTER DIAGNOSIS

1

1 **NOTE:** This pinpoint test step needs to be checked if the instrument cluster module (IC) has any DTCs and is functioning correctly, and if the telltale is

OK.

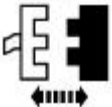

Retrieve DTCs.

- **Is the instrument cluster diagnosis check out OK?**

→ **Yes**
INSTALL a new FEM. TEST the system for normal operation.

→ **No**
REPAIR or INSTALL a new instrument cluster or associated circuits.

PINPOINT TEST C: THE RED BRAKE WARNING INDICATOR IS ALWAYS ON - LOW BRAKE FLUID LEVEL

CONDITIONS	DETAILS/RESULTS/ACTIONS
C1 VERIFY SYMPTOM	
	<p>1 Verify that the red brake warning indicator is never on or always on.</p> <ul style="list-style-type: none"> ● Is the indicator always on? <p>→ Yes GO to C2.</p> <p>→ No GO to C5.</p>
C2 CHECK FOR FAULTY LOW BRAKE FLUID LEVEL SENSOR	
<p>1</p>  <p>3</p>  <p>Low Brake Fluid Level Sensor C124</p>	<p>2 Wait past prove out time.</p> <ul style="list-style-type: none"> ● Did the indicator turn off? <p>→ Yes INSTALL a new low brake fluid level sensor. TEST the system for normal operation.</p>

→ **No**
GO to [C3](#).

C3 CHECK FOR FAULTY FEM

1

2

Low Brake Fluid Level Sensor

3

FEM Connector J3

● **Did the indicator turn off?**

→ **Yes**
GO to [C4](#).

→ **No**
GO to [C5](#).

C4 CHECK CIRCUIT 8–GC7 (WH/RD) FOR SHORTS TO GROUND

1

Low Brake Fluid Level Sensor C124

2

FEM Connector J3

3

A0003836

3 Measure the resistance between the low brake fluid level sensor connector C124, circuit 8–GC7 (WH/RD) and chassis ground.

● **Is resistance greater than 10.0 ohms?**

- **Yes**
INSTALL a new FEM. TEST the system for normal operation.
- **No**
REPAIR circuit 8–GC7 (WH/RD). TEST the system for normal operation.

C5 INSTRUMENT CLUSTER DIAGNOSIS

1

- 1 **NOTE:** This pinpoint test step needs to be checked if the instrument cluster module (IC) has any DTCs and is functioning correctly, and if the telltale is OK.

Retrieve DTCs.

- 2 Use recorded results from the front electronic module (FEM) self-test.

- **Is the instrument cluster diagnosis check out OK?**

- **Yes**
INSTALL a new FEM. TEST the system for normal operation.

- **No**
REPAIR or INSTALL a new instrument cluster or associated circuits.

C6 CHECK LOW BRAKE FLUID LEVEL SENSOR

1

3

Low Brake Fluid Level Sensor C124

4

- 2 Wait past prove out time.

- 4 Jumper low brake fluid level sensor connector C124, circuit 8–GC7 (WH/RD) to chassis ground with a fused jumper wire.

A0003839

- **Did the indicator turn on?**

→ **Yes**
GO to [C7](#).

→ **No**
GO to [C8](#).

C7 CHECK CIRCUIT 31–GC7 (BK) FOR OPENS

1

Low Brake Fluid Level Sensor C124

2

2 Measure the resistance between the low brake fluid level sensor, circuit 31–GC7 (BK) and chassis ground.

● **Is resistance less than 5.0 ohms?**

→ **Yes**
INSTALL a new low brake fluid level sensor. TEST the system for normal operation.

→ **No**
Repair circuit 31–GC7 (BK). TEST the system for normal operation.

C8 CHECK LOW BRAKE FLUID LEVEL PID

1

2

Low Brake Fluid Level Sensor C124

4

3 Access the low brake fluid level PID:
2909 Byte 1 - Bit 4.

4 View the PID while jumpering the low brake fluid level sensor connector, circuit 8–GC7 (WH/RD) to chassis ground with a fused jumper wire.

A0003839

- Did the PID read from off to on?

→ **Yes**
GO to [C10](#).

→ **No**
GO to [C9](#).

C9 CHECK CIRCUIT 8–GC7 (WH/RD) FOR OPENS

1

Low Brake Fluid Level Sensor C124

2

FEM Connector J3

3

A0005313

- 3 Measure the resistance between FEM connector J3, pin 11, circuit 8–GC7 (WH/RD) and the low brake fluid level sensor connector C124, circuit 8–GC7 (WH/RD).

- Is the resistance less than 5.0 ohms?

→ **Yes**
INSTALL a new FEM. TEST the system for normal operation.

→ **No**
REPAIR circuits 8–GC7 (WH/RD). TEST the system for normal operation.

C10 INSTRUMENT CLUSTER DIAGNOSIS

<p>1</p> 	<p>1 NOTE: This pinpoint test step needs to be checked if the instrument cluster module (IC) has any DTCs and is functioning correctly, and if the telltale—is OK.</p> <p>Retrieve DTCs.</p> <ul style="list-style-type: none"> ● Is the instrument cluster diagnosis check out OK? <p>→ Yes INSTALL a new FEM. TEST the system for normal operation.</p> <p>→ No REPAIR or INSTALL a new instrument cluster or associated circuits.</p>
--	---

PINPOINT TEST D: BRAKES LOCK UP DURING LIGHT BRAKE PEDAL FORCE

CONDITIONS	DETAILS/RESULTS/ACTIONS
D1 CHECK FOR BINDING OR STICKING BRAKE COMPONENTS	
	<p>1 Check brake components for binding, damage and incorrect installation at each wheel.</p> <ul style="list-style-type: none"> ● Do any of the components bind or stick? <p>→ Yes REPAIR or INSTALL new components as necessary. TEST the system for normal operation.</p> <p>→ No GO to D2.</p>
D2 CHECK THE PARKING BRAKE COMPONENTS	
	<p>1 Check the parking brake components for damage, seized condition, and incorrect adjustment. Refer to Section 206-05.</p> <ul style="list-style-type: none"> ● Are the parking brake components OK? <p>→ Yes GO to D3.</p> <p>→ No REPAIR or INSTALL new components as necessary. REFER to Section 206-05. TEST the system for normal operation.</p>
D3 INSPECT THE BRAKE PADS	
	<p>1 Inspect brake pads for contamination, excessive wear or damage. Refer to Section 206-03 for front disc brake inspection. Refer to Section 206-04 for rear disc brake inspection.</p>

	<ul style="list-style-type: none"> ● Are the brake pads OK? <p>→ Yes GO to D4.</p> <p>→ No INSTALL new brake pads as necessary. TEST the system for normal operation.</p>
D4 CHECK FOR LOOSE BRAKE COMPONENT MOUNTINGS	
	<p>1 Check for loose or damaged caliper mounting bolts.</p> <ul style="list-style-type: none"> ● Are the component mountings OK? <p>→ Yes CHECK the 4-wheel anti-lock control brake system (4WABS).</p> <p>→ No REPAIR as necessary. TEST the system for normal operation.</p>

PINPOINT TEST E: EXCESSIVE/ERRATIC BRAKE PEDAL TRAVEL

CONDITIONS	DETAILS/RESULTS/ACTIONS
E1 CHECK FOR SPONGY PEDAL	
<p>1</p>  <p>2</p> 	<p>3 Operate the brake pedal and note pedal feel.</p> <ul style="list-style-type: none"> ● Does the brake pedal feel spongy? <p>→ Yes BLEED the brake system. REFER to Bleeding— System in this section. TEST the system for normal operation.</p> <p>→ No GO to E2.</p>
E2 CHECK THE BRAKE PEDAL	
	<p>1 Inspect the brake pedal and bracket for binding, obstruction or damage.</p> <ul style="list-style-type: none"> ● Is the brake pedal OK? <p>→ Yes GO to E3.</p>

	<p>→ No REPAIR or INSTALL a new brake pedal as necessary. TEST the system for normal operation.</p>
E3 CHECK BRAKE COMPONENTS	
	<p>1 Inspect the calipers and brake pads for binding, damage, incorrect installation and contamination.</p> <p>● Are the calipers and brake pads OK?</p> <p>→ Yes GO to E4.</p> <p>→ No REPAIR or INSTALL new components as necessary. TEST the system for normal operation.</p>
E4 CHECK POWER BRAKE BOOSTER	
	<p>1 Carry out the brake booster component test.</p> <p>● Is the power brake booster OK?</p> <p>→ Yes INSTALL a new brake master cylinder. TEST the system for normal operation.</p> <p>→ No INSTALL a new power brake booster. TEST the system for normal operation.</p>

Component Tests

Brake Booster

1. Check the hydraulic brake system for leaks or insufficient fluid.
2. With the transmission (7003) in NEUTRAL, stop the engine (6007) and apply the parking brake control (2780). Apply the brake pedal several times to exhaust all vacuum in the system.
3. Apply the brake pedal and hold it in the applied position. Start the engine. If the vacuum system is operating, the brake pedal will tend to move downward under constant foot pressure. If no motion is felt, the power brake booster system is not functioning. Continue the test with the following steps.
4. Remove the vacuum booster hose (2A047) from the check valve connection. Manifold vacuum must be available at the check valve end of the vacuum booster hose with the engine at idle speed and the transmission in NEUTRAL. If the manifold vacuum is available to the power brake booster, connect the vacuum booster hose to the power brake booster check valve (2365) and repeat Steps 2 and 3 above.
5. Check and if no downward movement of the brake pedal is felt, install a new power brake booster.
6. Operate the engine a minimum of 10 seconds at fast idle. Stop the engine, and let the vehicle stand for 10 minutes. Then apply the brake pedal with approximately 89 N (20 lbs) of force. The brake pedal feel should be the same as that noted with the engine operating. If the brake pedal

feels hard (no power assist), install a new check valve and retest. If the brake pedal feels spongy, bleed the hydraulic system to remove air. Refer to Bleeding in this section.

Check Valve

The function of the power brake booster check valve is to allow manifold vacuum to enter the power brake booster and prevent the escape of vacuum in the event manifold vacuum is lost during sustained full throttle operation.

To test the function of the power brake booster check valve:

- Start and run the engine for at least 10 seconds.
- Operate the brake pedal to check for power assist.
- Disconnect the vacuum booster hose from the power brake booster. Do not remove the power brake booster check valve from the power brake booster.
- There should be enough vacuum retained in the power brake booster for at least one more power-assisted brake operation.

Brake Master Cylinder

Normal Conditions

The following conditions are considered normal.

Condition 1: During normal operation of the brake master cylinder, the fluid level in the brake master cylinder reservoir will rise during brake application and fall during release. The net fluid level (after brake application and release) will remain unchanged.

Condition 2: A trace of brake fluid will exist on the booster shell below the master cylinder mounting flange. This results from the normal lubricating action of the master cylinder bore and seal.

Condition 3: Fluid level will decrease with pad wear.

Abnormal Conditions

Changes in brake pedal feel or travel are indicators that something could be wrong in the brake system. Refer to the Symptom Chart for abnormal condition diagnosis.

Bypass Condition Test

1. Disconnect the brake lines at the brake master cylinder.
2. Plug the outlet ports of the brake master cylinder.
3. Apply the brakes. If brake pedal height cannot be maintained, the brake master cylinder has an internal leak and a new master cylinder must be installed.

Compensator Port Check

The purpose of the compensator ports in the brake master cylinder is to supply any additional brake fluid required by the system due to brake pad wear and to allow brake fluid returning from the brake lines to the brake master cylinder to enter the brake master cylinder reservoir.

The returning brake fluid will cause a slight turbulence in the brake master cylinder reservoir. Turbulence seen in the brake master cylinder reservoir upon release of the brake pedal is normal and shows that the compensating ports are not plugged.

Bleeding — System

Manual

⚠ WARNING: Use of any other than approved DOT 4 or DOT 3 brake fluid will cause permanent damage to brake components and will render the brakes inoperative.

⚠ WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

⚠ CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

⚠ CAUTION: Do not allow the brake master cylinder reservoir to run dry during the bleeding operation. Keep the brake master cylinder reservoir filled with the specified brake fluid. Never reuse the brake fluid that has been drained from the hydraulic system.

NOTE: When any part of the hydraulic system has been disconnected for repair or installation of new components, air can get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it has been correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

1. Connect the NGS DCL cable adapter into the vehicle data link connector (DLC) under the dash and follow the NGS instructions.
2. Clean all dirt from and remove the brake master cylinder filler cap and fill the brake master cylinder reservoir with the specified brake fluid.

3. Place a box end wrench on the RH rear bleeder screw. Attach a rubber drain tube to the RH rear bleeder screw and submerge the free end of the tube in a container partially filled with clean brake fluid.

4. Have an assistant hold firm pressure on the brake pedal.
5. Loosen the RH rear bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal, tighten the RH rear bleeder screw.
 - Repeat until clear, bubble-free fluid comes out.
 - Refill the brake master cylinder reservoir as necessary.
6. Tighten the RH rear bleeder screw.

7. Repeat Steps 3, 4, 5 and 6 for the LH rear bleeder screw.
8. Place a box end wrench on the RH front disc brake caliper bleeder screw. Attach a rubber drain tube to the RH front disc brake caliper bleeder screw, and submerge the free end of the tube in a container partially filled with clean brake fluid.

9. Have an assistant hold firm pressure on the brake pedal.
10. Loosen the RH front disc brake caliper bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal, tighten the RH front disc brake caliper bleeder screw.
 - Repeat until clear, bubble-free fluid comes out.

- Refill the brake master cylinder reservoir as necessary.

11. Tighten the RH front disc brake caliper bleeder screw. For additional information, refer to Specifications.

12. Repeat Steps 8, 9, 10 and 11 for the LH front disc brake caliper bleeder screw.

Pressure

WARNING: Use of any other than approved DOT 4 or DOT 3 brake fluid will cause permanent damage to brake components and will render the brakes inoperative.

WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

CAUTION: Do not allow the master cylinder to run dry during the bleeding operation. Keep the master cylinder reservoir filled with the specified brake fluid. Never reuse the brake fluid that has been drained from the hydraulic system.

1. Clean all dirt from and remove the brake master cylinder filler cap and fill the brake master cylinder reservoir with the specified brake fluid.

2. **NOTE:** Master cylinder pressure bleeder adapter tools are available from various manufacturers of pressure bleeding equipment. Follow the instructions of the manufacturer when installing the adapter.

Install the bleeder adapter to the brake master cylinder reservoir, and attach the bleeder tank hose to the fitting on the adapter.

3. **NOTE:** Bleed the longest line first. Make sure the bleeder tank contains enough specified brake fluid to complete the bleeding operation.

Place a box end wrench on the RH rear bleeder screw. Attach a rubber drain tube to the RH rear bleeder screw, and submerge the free end of the tube in a container partially filled with clean brake fluid.

4. Open the valve on the bleeder tank.
5. Loosen the RH rear bleeder screw. Leave open until clear, bubble-free brake fluid flows, then tighten the RH rear bleeder screw and remove the rubber hose.

6. Continue bleeding the rear of the system, going in order from the LH rear bleeder screw to the RH front disc brake caliper bleeder screw ending with the LH front disc brake caliper bleeder screw.
 7. Close the bleeder tank valve. Remove the tank hose from the adapter, and remove the adapter.
-

Hydraulic Leak Check

1. **NOTE:** Brake fluid is water soluble and it is possible that all evidence of fluid leakage has been washed off if the vehicle has been operated in the rain or snow.

Make sure the brake master cylinder reservoir (2K478) is full.

2. Apply the brakes several times and make sure the brake pedal (2455) feel is not spongy. If necessary, bleed the system. For additional information, refer to [Bleeding— System](#) in this section.
 3. Verify that the reservoir level is dropping.
 4. If the reservoir level is dropping, inspect the brake components, fittings and lines to locate the source of the leak.
-

General Specifications

Item	Specification
Brake Disc	
Minimum thickness ^a	28.00 mm (1.12 in)
Pad	
Minimum thickness above metal backing plate or rivets	2 mm (0.079 in)

Front Disc Brake

Front Disc Brake

A0003602

Item	Part Number	Description
1	2B120	Front disc brake caliper assy

Disc Brake Caliper Components

A0003354

Item	Part Number	Description
1	2B120	Disc brake caliper

2	2L126	Bleeder screw cap
3	2208	Bleeder screw
4	2196	Caliper piston
5	2B115	Piston seal
6	2207	Piston dust boot
7	2B292	Front disc brake caliper anchor plate
8	2001	Brake pads
9	2A492	Guide pin boot
10	2B296	Guide pin
11	2N386	Caliper bolt

The front disc brake caliper (2B120):

- bolts to the front disc brake caliper anchor plate (2B292), which bolts to the front wheel spindle (3105).
- is a disc brake caliper locating pin, dual piston design one piston is 38mm the other piston is 45mm.
- has a fluid inlet at the bottom of the caliper housing.

The front brake discs (1125):

- are of a ventilated full-cast design, with non-directional cooling fins.
- are serviced with the disc brake caliper and front disc brake caliper anchor plate removed.

The front brake disc shield (2K005):

- is riveted to the front wheel spindle.
- protects the front wheel bearings and inboard surface of the front brake disc.

The pads (2001):

- are housed in the front disc brake caliper anchor plate.
- are of a non-asbestos, non-metallic composition.

Brake Fluid

WARNING: Use of any other than approved DOT 4 or DOT 3 brake fluid will cause permanent damage to brake components and will render the brakes inoperative.

WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

CAUTION: Brake fluid is harmful to painted or plastic surfaces. If brake fluid is spilled

onto a painted or plastic surface, immediately wash it with water.

Use clean, fresh Ford High Performance DOT 3 Motor Vehicle Brake Fluid C6AZ-19542-AB or equivalent meeting Ford specification ESA-M6C25-A (United States and Canada only). If DOT 3 is not available, use Ford High Performance DOT 4 Brake Fluid or equivalent meeting Ford specification SAE-J-1704-DOT 4.

- Do not reuse brake fluid drained or bled from the system.
 - Do not use brake fluid that has been stored in an open container.
 - Do not use contaminated brake fluid.
-

Front Disc Brake

Refer to [Section 206-00](#) .

Pads

Removal

! WARNING: Use of any other than approved DOT 4 or DOT 3 brake fluid will cause permanent damage to brake components and will render the brakes inoperative.

! WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

! CAUTION: Brake fluid is harmful to painted or plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Remove brake master cylinder filler cap. Check brake fluid level in brake master cylinder reservoir (2K478). Remove fluid until the reservoir is half full.
2. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
3. Remove the wheel and tire assembly. For additional information, refer to [Section 204-04](#).
4. **! CAUTION:** Do not pry in caliper sight hole to retract pistons as this can damage the pistons and boots.

! CAUTION: When removing the caliper (2B120), never allow it to hang from the brake hose. Provide a suitable support.

Remove the brake caliper (2B120).

1. Remove the caliper bolts.
2. Lift the caliper off the caliper anchor plate (2B292).

5. **! CAUTION:** Install new pads if worn to or past the specified thickness above the metal backing plate or rivets. Install new pads in complete axle sets.

Inspect the pads (2100) for wear and contamination.

6. Remove the pads.

7. Measure the brake disc thickness.

- Install a new brake disc (1125) if not within specification.

8. Inspect the caliper.

- If leaks or damaged boots are found, disassembly is required. For additional information, refer to [Caliper](#) in this section.

9. Inspect the anchor plate assembly.

- Check the guide pin boots for damage.
- Check the guide pins for binding and damage.
- Install new pins if worn or damaged.

10. **NOTE:** Use a wood block or used pad to protect pistons and boots.

Compress the caliper pistons.

Installation

1. To install, reverse the removal procedure.
 - Fill the brake master cylinder reservoir with clean High Performance DOT 4 Brake Fluid or equivalent DOT 4 fluid meeting Ford specification SAE-J1704-DOT 4. If DOT 4 is not available use DOT 3 Brake Fluid (United States) C6AZ-19542-AB meeting Ford specification ESA-M6C25-A.

Caliper

Removal

⚠ WARNING: Use of any other than approved DOT 4 or DOT 3 brake fluid will cause permanent damage to brake components and will render the brakes inoperative.

⚠ WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

⚠ CAUTION: Brake fluid is harmful to painted or plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
2. Remove the wheel and tire assembly. For additional information, refer to [Section 204-04](#).
3. Remove the caliper flow bolt.
 - Discard the copper washers.

4. Remove the caliper (2B120).
 1. Remove the caliper bolts.
 2. Lift the caliper off the caliper anchor plate (2B292).

5. Inspect the caliper.

- If leaks or damaged boots are found, disassembly is required. For additional information, refer to [Caliper](#) in this section.

Installation

1. To install, reverse the removal procedure.
 - Install new copper washers.
 - Bleed the caliper. For additional information, refer to [Section 206-00](#).

Brake Caliper Anchor Plate

Removal

1. Remove the pads (2100). For additional information, refer to [Pads](#) in this section.
2. Remove the caliper anchor plate bolts.

Installation

1.  **CAUTION: Use correct type and length bolts.**

To install, reverse the removal procedure.

- Install new anchor plate bolts.

Disc

Removal

1. Remove the caliper anchor plate (2B292). For additional information, refer to [Brake Caliper Anchor Plate](#) in this section.
2. Mark the brake disc (1125) and a wheel bolt.
 - This ensures the lowest brake disc runout is maintained during reassembly.

3.  **CAUTION:** If excessive force must be used during brake disc removal, the brake disc total indicated runout (TIR) must be checked at installation. For additional information, refer to [Section 206-00](#).

NOTE: If the brake disc cannot be removed easily, apply Rust Penetrant and Inhibitor F2AZ-19A501-A or equivalent meeting Ford specification ESR-M99C56-A on brake disc to wheel hub mating surfaces.

Remove the brake disc.

Installation

1. Clean any rust or foreign material from the brake disc and wheel hub.
 - Use Brake Parts Cleaner F6AZ-2C410-AB or equivalent to clean the brake disc and hub surfaces.
2. Apply High Temperature Nickel Anti-Seize Lubricant F6AZ-9L494-AA or equivalent meeting Ford specification ESE-M12A4-A to the hub flange.

3. Align the hub and brake disc marks and position the brake disc to the wheel hub (1104).

4. Install the caliper anchor plate. For additional information, refer to [Brake Caliper Anchor Plate](#) in this section.
 5. Check total indicated runout (TIR). For additional information, refer to [Section 206-00](#).
-

Shield

Removal

1. Remove the brake disc (1125). For additional information, refer to [Disc](#) in this section.
2.  **CAUTION:** Use a 5.5 mm (0.22 in) drill **DO NOT** exceed past a 6 mm (0.24 in) drill.

Drill out the shield rivets.

Installation

1. To install, reverse the removal procedure.
-

Caliper

Disassembly

⚠ WARNING: Use of any other than approved DOT 4 or DOT 3 brake fluid will cause permanent damage to brake components and will render the brakes inoperative.

⚠ WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

⚠ CAUTION: Brake fluid is harmful to painted or plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Remove the caliper (2B120). For additional information, refer to [Caliper](#) in this section.
2. Drain the remaining brake fluid from caliper.
3. Apply low air pressure to the fluid port in the caliper.
 1. Place a block of wood between the caliper bridge and the caliper pistons (2196).
 2. Apply low air pressure to the fluid port in the caliper and force out the caliper pistons to the block of wood.

4. Remove the caliper pistons.
 1. Remove the block of wood.
 2. Remove the caliper pistons.

5. Remove and discard the piston seals (2B115) and boots (2207).

6. Remove and discard the bleed screw (2208) and cap.

Assembly

1.  **CAUTION: Do not hone the caliper bores. Caliper pistons are not available for honed caliper bores.**

Clean and inspect the caliper pistons and the caliper.

- Remove dirt and debris.
- Examine the caliper pistons for surface irregularities, scoring or wear. Install new caliper pistons if necessary.
- Clean the caliper bores with Brake Parts Cleaner F6AZ-2C410-AB. If the caliper bores are corroded or excessively scored, install a new caliper.
- Lubricate the caliper pistons and piston seals before assembly.

2.  **CAUTION: Never reuse piston seals and dust boots.**

NOTE: Never reuse brake fluid that has been drained from the hydraulic system or has been allowed to stand in an open container for an extended period of time.

Lubricate the caliper piston, piston seal and caliper bores with clean High Performance DOT 4 Brake Fluid or equivalent DOT 4 fluid meeting Ford specification SAE-J1704-DOT 4. If DOT 4 is not available use DOT 3 Brake Fluid (United States only) C6AZ-19542-AB meeting Ford specification ESA-M6C25-A.

3.  **CAUTION: Pistons are not the same diameter.**

Install the caliper piston.

1. Install the piston seal.
2. Install the piston boot on the piston.
3.  **CAUTION: Be careful not to damage or dislodge the piston seal.**

Insert the caliper piston.

4.  **CAUTION: Be careful not to cock the caliper piston.**

Press the caliper piston into the bore.

4. Install a new bleed screw and cap.
 5. Install the caliper. For additional information, refer to [Caliper](#) in this section.

Caliper bolts	33	25

Rear Disc Brake

Rear Disc Brake

Item	Part Number	Description
1	2B120	Rear disc brake caliper assy

The rear disc brake system consists of:

- solid, full-cast rear brake disc (1125).
- hydraulically activated rear disc brake caliper (2B120).

Brake Fluid

⚠ WARNING: Use of any other than approved DOT 4 or DOT 3 brake fluid will cause permanent damage to brake components and will render the brakes inoperative.

⚠ WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

⚠ CAUTION: Brake fluid is harmful to painted or plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

Use clean, fresh Ford High Performance DOT 3 Motor Vehicle Brake Fluid C6AZ-19542-AB or

equivalent meeting Ford specification ESA-M6C25-A (United States and Canada only). If DOT 3 is not available, use Ford High Performance DOT 4 Brake Fluid or equivalent meeting Ford specification SAE-J-1704-DOT 4.

- Do not reuse brake fluid drained or bled from the system.
 - Do not use brake fluid that has been stored in an open container.
 - Do not use contaminated brake fluid.
-

Rear Disc Brake

Refer to [Section 206-00](#) .

Caliper

Removal

 **WARNING:** Use of any other than approved DOT 4 or DOT 3 brake fluid will cause permanent damage to brake components and will render the brakes inoperative.

 **WARNING:** Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

 **CAUTION:** Brake fluid is harmful to painted or plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Raise the vehicle on a hoist. For additional information, refer to [Section 100-02](#).
2. Remove the wheel and tire assembly. For additional information, refer to [Section 204-04](#).
3. Disengage the parking brake cable end from the parking brake lever arm.

4. Remove the parking brake cable and conduit.

5. Remove the caliper bolts.

6. Remove the caliper flow bolt and remove the caliper (2B120).
 - Discard the copper washers.

Installation

1. To install, reverse the removal procedure.
 - Use new copper washers.
 - Bleed the brake system. For additional information, refer to [Section 206-00](#).

Pads

Special Tool(s)

Removal

1. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
2. Remove the wheel and tire assembly. For additional information, refer to [Section 204-04](#).
3. Remove the caliper bolts.

4.  **CAUTION: Do not allow the caliper to hang from the brake hose.**

Remove the caliper (2B120).

5. Remove the brake pads (2100).

6.  **CAUTION:** Use a hub-mount brake lathe if necessary to machine the brake disc.

Measure the brake disc (1125), and resurface as necessary. Install a new brake disc if beyond specification.

7. Compress the disc brake piston and adjuster into the disc brake caliper using Rear Caliper Piston Adjuster.

Installation

1. To install, reverse the removal procedure.

Disc

Removal

1. Remove the support bracket (2B511). For additional information, refer to [Brake Caliper Support Bracket](#) in this section.
2. **NOTE:** Remove and discard the pushnuts, if so equipped.

Remove the brake disc (1125).

Installation

1. To install, reverse the removal procedure.
-

Brake Caliper Support Bracket

Removal

1. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
2. Remove the tire and wheel assembly. For additional information, refer to [Section 204-04](#).

3.  **CAUTION: Do not allow the caliper to hang from the brake hose**

Remove brake pads (2100). For additional information, refer to [Pads](#) in this section.

4. Remove the support bracket bolts.

Installation

1. To install, reverse the removal procedure.

Shield

Removal

1. Remove the brake disc (1125). For additional information, refer to [Disc](#) in this section.
2.  **CAUTION:** Use a 5.5mm (0.22in) drill DO NOT exceed past a 6mm (0.24in) drill.

Drill out the shield rivets.

Installation

1. Install new rivets.

2. Install the brake disc. For additional information, refer to [Disc](#) in this section.

Caliper

Special Tool(s)

Disassembly

 **WARNING:** Use of any other than approved DOT 4 or DOT 3 brake fluid will cause permanent damage to brake components and will render the brakes inoperative.

 **WARNING:** Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

 **CAUTION:** Brake fluid is harmful to painted or plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Remove the brake caliper (2B120). For additional information, refer to [Caliper](#) in this section.
2. Drain the brake fluid from the brake caliper.
3. Secure the brake caliper in a vise.
4. Turn the brake piston counterclockwise with Rear Caliper Piston Adjuster.

5. Remove the brake piston from the caliper bore.

6. Remove and discard the piston dust boot and piston seal from the caliper bore.

Assembly

1.  **CAUTION: Do not reuse piston seals or dust boots. Install new seals and dust boots or damage to the vehicle can occur.**

NOTE: Use new brake fluid when assembling and bleeding the brake system.

To install, reverse the disassembly procedure.

Torque Specifications

Description	Nm	lb-ft
Parking brake control bolts/nuts	30	22
Parking brake control bolts/nuts	18	13
Brake hose clip mounting bolt	12	9

Parking Brake

Item	Part Number	Description
1	2780	Parking brake control
2	2552	Rear disc brake caliper

The parking brake system is cable-actuated and controlled by an independent hand-operated parking brake control. To apply parking brake, pull parking brake control upward.

The parking brake system is an AUTO-ADJUST system. The spring in the parking brake control continuously adjusts the cable tension in the system.

Brake Warning System

A brake warning indicator:

- is located in the instrument panel.
- illuminates to signal the driver the parking brake is applied.
- remains lit when a brake malfunction has occurred.

Parking Brake

Inspection and Verification

Check the operation of the parking brake system with the vehicle on a hoist and the parking brake control fully released. Check for any damaged cables and install new components as necessary. Check the rear brake adjustment or perform brake system diagnosis.

Check the parking brake by pulling up on the parking brake control. The parking brake must hold the vehicle on an incline, set by pulling up on the parking brake control before it reaches full travel. If not as specified, check the parking brake system for correct rear brake adjustment, cable operation and parking brake control operation.

Control

Removal

1. Position the right front seat into the full forward position.
2. Remove the console. For additional information, refer to [Section 501-12](#).
3. Remove the transfer duct.

4.  **WARNING:** The parking brake control will have spring tension on the tension arm and, if released inadvertently, can cause injury. Use care when working on or around the parking brake control when the tension arm is in the locked position. Failure to follow these instructions can cause personal injury.

Using a screwdriver, push down on the tension arm until it is fully depressed.

5. Move the tension arm down and release the screwdriver.

6. Remove the control retainers.
 - Disconnect the parking brake switch connector.

7. Bend the retaining tab out of the way and remove the cable anchor pin.

8. Using a 13mm line wrench, depress the conduit retaining prongs to remove the parking brake cable and conduit from the control. Remove the parking brake control.

Installation

1. To install, reverse the removal procedure.

Cable and Conduit —Front

Removal

1. Remove the console. For additional information, refer to [Section 501-12](#).
2. Pull tab slide handle up.

3. Using a screwdriver, push down on the tension arm until it is fully depressed.

4. Move the tension arm down and release the screwdriver.

5. Remove the cable anchor pin.

6. Using a 13mm box-end wrench, depress the conduit retaining prongs and remove the parking brake cable and conduit from the control.

7. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
8. Disconnect the rear parking brake cables.

9. Remove the equalizer.

10. Snap the front cable grommet out of the floor and remove the cable.

11. Tie mechanics wire to the old cable and conduit to make installation of new cable easier.

12. Using a 13mm box-end wrench, depress the conduit retaining prongs and remove the parking brake cable and conduit.

Installation

1. To install, reverse the removal procedure.
-

Cable and Conduit —Rear

Removal

NOTE: The RH rear is shown, the LH is similar.

1. Remove the console. For additional information, refer to [Section 501-12](#).
2. Pull tab slide handle up.

3. Using a screwdriver, push down on the tension arm until it is fully depressed.

4. Move the tension arm down and release the screwdriver.

5. Disconnect the rear parking brake cables from the equalizer.

6. Using a 13mm box-end wrench, depress the conduit retaining prongs and remove the parking brake rear cable and conduit.

7. Remove the parking brake rear cable and conduit routing clip bolts.

8. Disconnect the parking brake rear cable and conduit from the parking brake lever.

9. Using a 13mm box-end wrench, depress the conduit retaining prongs and remove the parking brake rear cable and conduit.

Installation

1. To install, reverse the removal procedure.

Bulb

For additional information, refer to [Section 413-01](#).

General Specifications

Item	Specification
High Performance DOT 3 Brake Fluid PM-1 (Canada CXC-31)	ESA-M6C25-A
High Performance DOT 4 Brake Fluid	FMVSS No. 116

Torque Specifications

Description	Nm	lb-ft
Brake master cylinder nuts	30	22
Brake pedal bracket nuts	30	22
Strut tower brace nuts	28	21
Master cylinder brake tubes	13	10
Brake pedal bracket bolts	25	18

Hydraulic Brake Actuation

This vehicle is equipped with a brake pedal actuated dual brake system. The system consists of the following:

- power brake booster (2005)
- brake master cylinder (2140)
- disc brake calipers (2B120)
- rear disc brake calipers (2553)
- brake tubes and hoses
- anti-lock brake system (ABS) components

The dual ABS hydraulic system is diagonally split, with the LH front and RH rear making up one circuit and the RH front and LH rear making up the other circuit.

Brake Fluid

WARNING: Use of any other than approved DOT 3 or DOT 4 brake fluid will cause permanent damage to brake components and will render the brakes inoperative.

WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

CAUTION: Brake fluid is harmful to painted or plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

Use clean, fresh Ford High Performance DOT 3 Motor Vehicle Brake Fluid PM-1 (Canada CXC-31) or equivalent meeting Ford specification ESA-M6C25-A.

If DOT 3 is not available, use Ford High Performance DOT 4 brake fluid or equivalent meeting FMVSS No. 116.

- Do not reuse brake fluid drained or bled from the system.
- Do not use brake fluid that has been stored in an open container.
- Do not use contaminated brake fluid.

Brake Master Cylinder

The brake master cylinder is a dual piston type. The brake master cylinder operates as follows:

- When the brake pedal (2455) is depressed, pressure is applied by mechanical linkage to the primary and secondary piston.

- Brake master cylinder pistons apply hydraulic pressure to the two opposed hydraulic circuits.
- Brake master cylinder cannot be overhauled, install a new master cylinder only.

The brake master cylinder consists of:

- brake master cylinder reservoir (2K478)
- brake master cylinder body

Brake Master Cylinder Reservoir

NOTE: Whenever the brake master cylinder reservoir is removed from the brake master cylinder, new grommets must be installed.

The brake master cylinder reservoir:

- is mounted to the brake master cylinder.
- holds fluid supply for each brake master cylinder hydraulic piston.
- provides visual fluid level markings.
- contains the brake master cylinder fluid level sensor.

Brake Tubes and Hoses

CAUTION: Never use copper tubing. It is subject to fatigue, cracking and corrosion, which could result in brake tube failure.

If a section of brake tube is damaged, install a new section of tube the same type, size, shape and length.

When installing hydraulic brake tubing, hoses, or connectors, tighten all connections securely. After installation, bleed the brake system. For additional information, refer to [Section 206-00](#).

Hydraulic Brake Actuation

Refer to [Section 206-00](#) .

Brake Pedal And Bracket

Removal

1. **NOTE:** LH shown, RH similar.

Disconnect the battery ground cable (14301). For additional information, refer to [Section 414-01](#).

2. Disconnect the stoplight and cruise switch electrical connectors.

3. Remove the brake pedal pin clip.

4. Remove the brake pedal pin.

5. Remove the four brake pedal bracket nuts.

6. Remove the wiring harness pushpin.

7. Remove the brake pedal bracket bolts and remove the brake pedal and bracket (2455).

Installation

1. To install, reverse the removal procedure.

Brake Master Cylinder

Removal and Installation

All vehicles

 **WARNING:** Use of any other than approved DOT 4 or DOT 3 brake fluid will cause permanent damage to brake components and will render the brakes inoperative.

 **WARNING:** Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

 **CAUTION:** Brake fluid is harmful to painted or plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Disconnect the fluid level sensor connector.

2. Remove the retainers and left upper shock mount cover.

3. Remove the vapor management valve (VMV) nuts.

4. Disconnect the (VMV) hose and position valve aside.

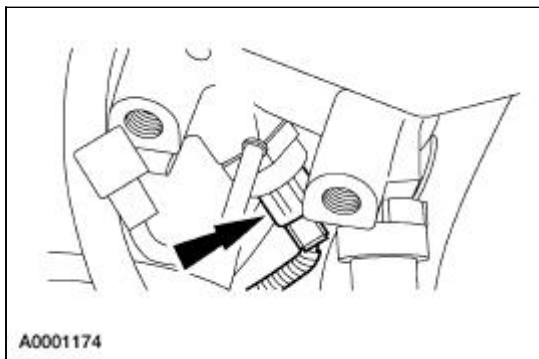

5. Disconnect the brake tubes.

6. Disconnect the brake master cylinder IVD transducer electrical connector (as applicable).

7. Disconnect the brake master cylinder IVD transducer electrical connector (as applicable).

8. Use a suitable suction device to drain the brake master cylinder reservoir.
9. Remove the reservoir bolt.

Vehicles with manual transmission

10. Remove the hose at the clutch master cylinder reservoir.

All vehicles

11. Remove the reservoir.

12. Remove the brake master cylinder nuts and remove the brake master cylinder.

13. To install, reverse the removal procedure.
 - Bleed the brake system. For additional information, refer to [Section 206-00](#).
-

Brake Fluid Reservoir

Removal and Installation

⚠ WARNING: Use of any other than approved DOT 4 or DOT 3 brake fluid will cause permanent damage to brake components and will render the brakes inoperative.

⚠ WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

⚠ CAUTION: Brake fluid is harmful to painted or plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Disconnect the brake master cylinder fluid level sensor connector.

2. Use a suitable suction device to drain the brake master cylinder reservoir (2K478).
3. Remove the reservoir screw.

4. Remove the reservoir.

5. Remove the reservoir grommets.

6. **NOTE:** Whenever installing a new brake master cylinder reservoir, install new grommets.

To install, reverse the removal procedure.

- Use clean, fresh Ford High Performance DOT 3 Motor Vehicle Brake Fluid C6AZ-19542-AB or equivalent meeting Ford specification ESA-M6C25-A (United States and Canada only). If DOT 3 is not available, use Ford High Performance DOT 4 Brake Fluid or equivalent meeting Ford specification SAE-J-1704-DOT 4.

Torque Specifications

Description	Nm	lb-ft

Power brake booster nuts	30	22
Vacuum hose bracket nut	15	11
Wiper arm nuts	35	26

Brake Booster

Power Brake Booster

Item	Part Number	Description
1	2005	Brake vacuum booster

The power brake booster (2005):

- is a dual diaphragm, vacuum assisted power brake booster.
- reduces brake pedal pressure and travel distance.
- is located on the bulkhead in the engine compartment, between the brake pedal and brake master cylinder (2140).
- is divided into separate chambers by the diaphragm.
- will not operate if vacuum is restricted or if any of the vacuum related power brake components fail.
- is installed as an assembly.

If the power assist fails, the brake system will continue to operate with increased brake pedal effort.

Hose and Check Valve

The power brake booster check valve:

- is located on the front of the power brake booster.
- is positioned between the power brake booster and the power brake booster hose.
- closes when the engine is turned off.
- in the closed position, traps engine vacuum in the power brake booster.
- retains vacuum to provide several power assisted brake applications with the engine off.

1	2005	Brake vacuum booster

Power Brake System

Refer to [Section 206-00](#) .

Brake Booster

Removal

1. Remove the wiper arm nuts and remove wiper arms.

2. Disconnect the washer hose.

3. Remove the cowl cover.
 1. Remove the cowl cover pushpins.
 2. Remove the cowl cover rubber trim.
 3. Remove the cowl cover.

4. Remove the vacuum hose bracket nut and position bracket aside.

5. Remove the cowl brace center bolts.

6. Remove the cowl brace end bolts and remove the bracket.

7. Disconnect the coolant reservoir return hose.

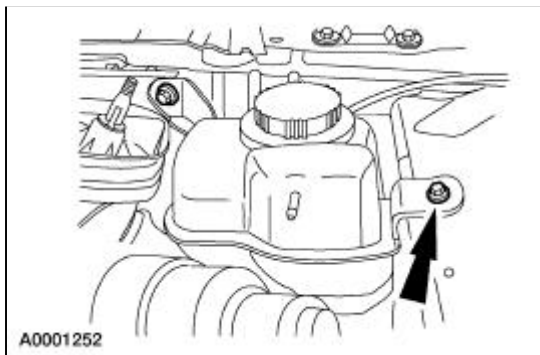

8. Remove the brake master cylinder. For additional information, refer to [Section 206-06](#)
9. Disconnect the power brake booster check valve.

10. Disconnect the power brake booster electrical connector (as applicable).

11. Remove the coolant reservoir bolts.

12. Disconnect the coolant reservoir hose.

13. Remove the coolant reservoir.

14. Remove the brake pedal pin clip.

15. Remove the brake pedal pin.

16. Remove the booster nuts.

17. Remove the power brake booster.

Installation

1. Install the power brake booster.

2. Install the booster nuts.

3. Install the brake pedal pin.

4. Install the brake pedal pin clip.

5. Install the radiator coolant recovery reservoir bolts.

6. Install the coolant reservoir hose.

7. Connect the power brake booster electrical connector (as applicable).

8. Connect the power brake booster check valve.

9. Connect the coolant reservoir return hose.

10. Install the brake master cylinder. For additional information, refer to [Section 206-06](#)

11. Install the cowl brace end bolts.

12. Install the cowl brace center bolts.

13. Install the vacuum hose bracket nut.

14. Install the cowl cover.
 1. Install the cowl cover.
 2. Install the cowl cover rubber trim.
 3. Install the cowl cover pushpins.

15. Connect the washer hose.

16. Install the wiper arm nuts.

17. Bleed brake system. For additional information, refer to [Section 206-00](#).

Anti-Lock Control

The four wheel anti-lock brake system (4WABS) consists of the following components:

- anti-lock brake module
- front anti-lock brake sensors
- front anti-lock brake sensor indicators
- hydraulic control unit (HCU)
- rear anti-lock brake sensors
- rear anti-lock brake sensor indicators
- yellow anti-lock brake warning indicator

For removal and installation of the front anti-lock brake sensor indicators, refer to [Section 204-01](#).

For removal and installation of the rear anti-lock brake sensor indicators, refer to [Section 205-05](#).

Anti-Lock Control

Refer to Wiring Diagrams Section [206-09A](#) for schematic and connector information.

Special Tool(s)

 ST1137-A	73 III Automotive Meter 105-R0057 or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent scan tool
 ST2574-A	Flex Probe Kit 105-R025B

Principles of Operation

The anti-lock-brake control module receives wheel speed readings from each anti-lock brake sensor and processes this information to determine if an ABS event is necessary. The anti-lock brake sensor electrically senses each tooth of the anti-lock brake sensor indicators as it passes through the anti-lock brake sensor magnetic field.

The anti-lock brake control module continuously monitors and compares the rotational speed of each wheel and, when it detects an impending wheel lock, modulates brake pressure to the appropriate brake caliper. This is accomplished by triggering the hydraulic control unit (HCU) to open and close the appropriate solenoid valves. Once the affected wheel returns to normal speed, the anti-lock brake control module returns the solenoid valves to their normal position, and normal (base) braking resumes.

The anti-lock brake control module is self-monitoring. When the ignition switch is turned to the RUN position, the anti-lock brake control module will do a preliminary electrical check, and at approximately 20 km/h (12 mph) the pump motor is turned on for approximately one half-second. Any malfunction of the ABS will cause the ABS to shut off and the yellow anti-lock brake warning indicator to illuminate; normal power assisted braking, however, remains.

Inspection and Verification

1. Verify the customer concern by applying the brakes under different conditions.
2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical
<ul style="list-style-type: none"> ● Anti-lock brake sensor indicator ● Base brake concerns ● HCU ● Tire pressure ● Tire size or mismatched tires 	<ul style="list-style-type: none"> ● Underhood auxiliary junction box (AJB) Maxifuses: <ul style="list-style-type: none"> ■ 114 (30A) ■ 122 (30A) ● Central junction box (CJB) Fuse: <ul style="list-style-type: none"> ■ 203 (5A) ● Anti-lock brake control module ● Anti-lock brake sensors ● Brake pedal position (BPP) switch ● Circuitry ● Connectors or connections ● EVAC and fill connector ● Wire harness routing

3. If the fault is not visually evident, connect the scan tool to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the scan tool menu. If the scan tool does not communicate with the vehicle:
 - check that the program card is correctly installed.
 - check the connections to the vehicle.
 - check the ignition switch position.
4. If the scan tool still does not communicate with the vehicle, refer to the New Generation STAR Tester manual.
5. Carry out the DATA LINK DIAGNOSTIC TEST. If the scan tool responds with:
 - CKT914, CKT915, or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to [Section 418-00](#).
 - NO RESP/NOT EQUIP for anti-lock brake control module, go to Pinpoint Test A.
 - SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out the self-test diagnostics for the anti-lock brake control module.
6. If the DTCs retrieved are related to the concern, go to Anti-Lock Brake Control Module Diagnostic Trouble Code (DTC) Index to continue diagnostics.
7. If no DTCs related to the concern are retrieved, proceed to Symptom Chart.

9	30-CF13 (RD)
---	--------------

- Are the voltages greater than 10 volts?

→ **Yes**
GO to [A2](#).

→ **No**
REPAIR the circuit in question. TEST the system for normal operation.

A2 CHECK ANTI-LOCK BRAKE MODULE GROUNDS

2 Measure the resistance between anti-lock brake control module C135 pin 8, circuit 31-CF6B (BK/YE), harness side and ground; and between anti-lock brake control module C135 pin 24, circuit 31-CF6A (BK/YE), harness side and ground.

- Are the resistances less than 5 ohms?

→ **Yes**
REFER to [Section 418-00](#).

→ **No**
REPAIR the circuit in question. TEST the system for normal operation.

PINPOINT TEST B: DTC B1485 , BRAKE PEDAL INPUT CIRCUIT BATTERY SHORT

CONDITIONS	DETAILS/RESULTS/ACTIONS

CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

B1 CHECK THE STOPLAMP OPERATION

1 Press the brake pedal.

- Do the stoplamps operate correctly?

→ **Yes**
GO to [B2](#).

→ **No**
REFER to [Section 417-01](#).

B2 CHECK CIRCUIT 29S-CF58 (OG/GN) FOR OPEN

1

2

Anti-Lock Brake Control Module C135

3

4

A0001926

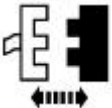

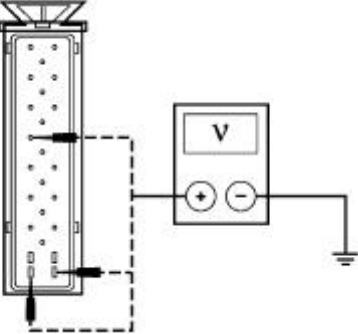

4 Measure the voltage between anti-lock brake control module pin 2 circuit 29S-CF58 (OG/GN), harness side and ground, while depressing the brake pedal.

- Is the voltage greater than 10 volts?

→ **Yes**
INSTALL a new anti-lock brake control module; REFER to [Anti-Lock Brake System \(ABS\) Module](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST C: DTC B1676, BATTERY PACK VOLTAGE OUT OF RANGE

CONDITIONS	DETAILS/RESULTS/ACTIONS								
<p> CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.</p>									
<p>C1 CHECK THE BATTERY VOLTAGE</p>									
<p>1</p> 	<p>2 Measure the voltage between positive and negative battery posts.</p> <ul style="list-style-type: none"> ● Is the voltage between 10 and 17 volts? <p>→ Yes GO to C2.</p> <p>→ No REFER to Section 414-00.</p>

Pin	Circuit								
25	30-CF6A (RD)								
20	20-CF6A (PK/YE)								
9	30-CF13 (RD)								

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

C3 CHECK THE ANTI-LOCK BRAKE CONTROL MODULE GROUNDS

1

2

2 Measure the resistance between anti-lock control module pin 24, circuit 31-CF6A (BK/YE), harness side and ground; and between anti-lock control module pin 8, circuit 31-CF6B (BK/YE), harness side and ground.

- Are the resistances less than 5 ohms?

→ **Yes**
INSTALL a new anti-lock brake control module; REFER to [Anti-Lock Brake System \(ABS\) Module](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST D: DTC C1095, HYDRAULIC PUMP MOTOR CIRCUIT FAILURE

CONDITIONS	DETAILS/RESULTS/ACTIONS
<p>CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.</p>	
<p>D1 CHECK ABS PUMP MOTOR</p>	
<p>1</p>	<ul style="list-style-type: none"> • Is the ABS pump motor running all the time? <p>→ Yes INSTALL a new anti-lock brake control</p>

module; REFER to [Anti-Lock Brake System \(ABS\) Module](#). REPEAT the self-test.

→ **No**
GO to [D2](#).

D2 CHECK PUMP MOTOR OPERATION

1

2 Trigger the anti-lock brake control module active command PMP MOTOR ON.

- **Does the ABS pump motor run for approximately three seconds?**

→ **Yes**

CLEAR the DTCs. CHECK the yellow ABS warning indicator while driving the vehicle (brakes must not be applied) above 32 km/h (20 mph). If the yellow ABS warning indicator illuminates, RETRIEVE continuous DTCs. If DTC C1095 is retrieved again, INSTALL a new anti-lock brake control module; REFER to [Anti-Lock Brake System \(ABS\) Module](#). REPEAT the self-test.

If the yellow anti-lock brake warning indicator does not illuminate, the system is OK.

→ **No**

TRIGGER the anti-lock brake control module active command PMP MOTOR OFF. GO to [D3](#).

D3 CHECK CIRCUIT 30-CF6A (RD) AND CIRCUIT 30-CF13 (RD) FOR OPEN

1

2

Anti-Lock Brake Control Module

3

4

4 Measure the voltage between anti-lock

brake control module C135 pin 25 circuit 30-CF6A (RD), harness side and ground; and between anti-lock brake control module C135 pin 9 circuit 30-CF13 (RD), harness side and ground.

- Are the voltages greater than 10 volts?

→ **Yes**
GO to [D4](#).

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

D4 CHECK CIRCUIT 31-CF6A (BK/YE) AND 31-CF6B (BK/YE) FOR AN OPEN

1 Measure the resistance between anti-lock brake control module C135 pin 24, circuit 31-CF6A (BK/YE), harness side and ground; and between anti-lock brake control module C135 pin 8, circuit 31-CF6B (BK/YE), harness side and ground.

- Are the resistances less than 5 ohms?

→ **Yes**
GO to [D5](#).

→ **No**
REPAIR circuit 31-CF6A (BK/YE) or circuit 31-CF6B (BK/YE). CLEAR the DTCs. REPEAT the self-test.

D5 CHECK THE PUMP MOTOR FOR OPERATION

Pump Motor Connector

3

GH1811-A

3

Using a heavy gauge wire, make a connection between the negative battery post and the pump motor connector brown wire (HCU side); momentarily connect a fused (30A) jumper wire between the positive battery post and the pump motor connector red wire (HCU side).

● Does the pump motor run?

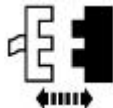

→ Yes

INSTALL a new anti-lock brake control module; REFER to [Anti-Lock Brake System \(ABS\) Module](#). CLEAR the DTCs. REPEAT the self-test.

→ No

INSTALL a new HCU; REFER to [Hydraulic Control Unit \(HCU\)](#). CLEAR the DTCs REPEAT the self-test.

PINPOINT TEST E: DTC C 1145 (RF), DTC C1155 (LF), DTC C1165 (RR), DTC C1175 (LR), ANTI-LOCK BRAKE SENSOR CIRCUIT FAILURE

CONDITIONS	DETAILS/RESULTS/ACTIONS
<p> CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.</p> <p>NOTE: Any time an anti-lock brake sensor is removed, thoroughly clean the mounting surfaces, apply High Temperature 4x4 Front Axle and Wheel Bearing Grease E8TZ-19590-A or equivalent meeting Ford specification ESA-M1C198-A.</p>	
<p>E1 CHECK FOR SHORT TO POWER</p>	
<p>NOTE: Both circuits must be checked for each DTC.</p>	
<p>1 </p> <p>2  Anti-Lock Brake Control Module C135</p> <p>3</p>	

Suspect Anti-Lock Brake Sensor

4

5

A0006088

5 Measure the voltage between anti-lock brake control module C135 pin, harness side and ground as follows:

DTC	Anti-Lock Brake Control Module C135	Circuit
C1145 (RF)	Pin 3	8-CF38 (WH/RD)
C1145 (RF)	Pin 4	7-CF38 (YE/RD)
C1155 (LF)	Pin 17	8-CF32 (WH)
C1155 (LF)	Pin 18	7-CF32 (YE)
C1165 (RR)	Pin 7	8-CF40 (WH/GN)
C1165 (RR)	Pin 6	7-CF40 (YE/GN)
C1175 (LR)	Pin 21	8-CF34 (WH/BU)
C1175 (LR)	Pin 22	7-CF34 (YE/BU)

● Is any voltage present?

→ **Yes**

If DTC C1145, REPAIR circuit 8-CF38 (WH/RD), or circuit 7-CF38 (YE/RD). CLEAR the DTCs. REPEAT the self-test.

If DTC C1155, REPAIR circuit 8-CF32 (WH), or circuit 7-CF32 (YE). CLEAR the DTCs. REPEAT the self-test.

If DTC C1165, REPAIR circuit 8-CF40 (WH/GN), or circuit 7-CF40 (YE/GN). CLEAR the DTCs. REPEAT the self-test.

If DTC C1175, REPAIR circuit 8-CF34 (WH/BU), or circuit 7-CF34 (YE/BU). CLEAR the DTCs. REPEAT the self-test.

→ **No**

GO to [E2](#).

E2 CHECK FOR SHORT TO GROUND

NOTE: Both circuits must be checked for each DTC.

1

2

2

Measure the resistance between anti-lock brake control module C135 pin, harness side and ground as follows:

DTC	Anti-Lock Brake Control Module C135	Circuit
C1145 (RF)	Pin 3	8-CF38 (WH/RD)
C1145 (RF)	Pin 4	7-CF38 (YE/RD)
C1155 (LF)	Pin 17	8-CF32 (WH)
C1155 (LF)	Pin 18	7-CF32 (YE)
C1165 (RR)	Pin 7	8-CF40 (WH/GN)
C1165 (RR)	Pin 6	7-CF40 (YE/GN)
C1175 (LR)	Pin 21	8-CF34 (WH/BU)
C1175 (LR)	Pin 22	7-CF34 (YE/BU)

● **Is the resistance greater than 10,000 ohms?**

→ **Yes**
GO to [E3](#).

→ **No**
If DTC C1145, REPAIR circuit 8-CF38 (WH/RD), or circuit 7-CF38 (YE/RD). CLEAR the DTCs. REPEAT the self-test.

If DTC C1155, REPAIR circuit 8-CF32 (WH), or circuit 7-CF32 (YE). CLEAR the DTCs. REPEAT the self-test.

If DTC C1165, REPAIR circuit 8-CF40 (WH/GN), or circuit 7-CF40 (YE/GN). CLEAR the DTCs. REPEAT the self-test.

If DTC C1175, REPAIR circuit 8-CF34 (WH/BU), or circuit 7-CF34 (YE/BU). CLEAR the DTCs. REPEAT the self-test.

E3 CHECK FOR AN OPEN

NOTE: Both circuits must be checked for each DTC.

1 Measure the resistance between anti-lock brake control module C135 pins, harness side and suspect anti-lock brake sensor connector, harness side as follows:

DTC	Anti-Lock Brake Control Module C135 Pin	Anti-Lock Brake Sensor	Circuit
C1145 (RF)	3	C160 pin 2	8-CF38 (WH/RD)
C1145 (RF)	4	C160 pin 1	7-CF38 (YE/RD)
C1155 (LF)	17	C150 pin 2	8-CF32 (WH)
C1155 (LF)	18	C150 pin 1	7-CF32 (YE)
C1165 (RR)	7	C426 pin 1	8-CF40 (WH/GN)
C1165 (RR)	6	C426 pin 2	7-CF40 (WH/GN)
C1175 (LR)	21	C440 pin 2	8-CF34 (WH/BU)
C1175 (LR)	22	C440 pin 1	7-CF34 (YE/BU)

● **Is the resistance less than 5 ohms?**

→ **Yes**
GO to [E4](#).

→ **No**
If DTC C1145, REPAIR circuit 8-CF38 (WH/RD), or circuit 7-CF38 (YE/RD). CLEAR the DTCs. REPEAT the self-test.

If DTC C1155, REPAIR circuit 8-CF32 (WH), or circuit 7-CF32 (YE). CLEAR the DTCs. REPEAT the self-test.

If DTC C1165, REPAIR circuit 8-CF40 (WH/GN), or circuit 7-CF40 (YE/GN). CLEAR the DTCs. REPEAT the self-test.

If DTC C1175, REPAIR circuit 8-CF34 (WH/BU), or circuit 7-CF34 (YE/BU). CLEAR the DTCs. REPEAT the self-test.

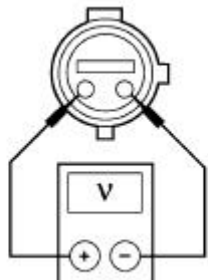

E4 CHECK THE ANTI-LOCK BRAKE CONTROL MODULE OUTPUT

1

Anti-Lock Brake Control Module C135

2 

3 

A0006087

3 Measure the voltage between suspect anti-lock brake sensor connector pins, harness side.

● Is the voltage greater than 9 volts?

→ **Yes**
 INSTALL a new anti-lock brake sensor; REFER to [Front Wheel Speed Sensor](#) , or [Rear Wheel Speed Sensor](#) . CLEAR the DTCs. TEST the system for normal operation.

→ **No**
 INSTALL a new anti-lock brake control module; REFER to [Anti-Lock Brake System \(ABS\) Module](#) . CLEAR the DTCs. TEST the system for normal operation.

PINPOINT TEST F: DTCS C1233, C1234, C1235 AND C1236 — ANTI-LOCK BRAKE SENSOR OUTPUT FAILURE

CONDITIONS	DETAILS/RESULTS/ACTIONS
<p>NOTE: Any time an anti-lock brake sensor is removed, thoroughly clean the mounting surfaces. On front anti-lock brake sensors, apply High-Temperature 4x4 Front Axle and Wheel Bearing Grease.</p>	
<p>F1 CHECK FOR DTCS</p>	
<p>1 </p> <p>2</p>	

3 Retrieve DTCs.

- Is DTC C1145, C1155, C1165 or C1175 present?

→ Yes
[Go To Pinpoint Test E](#).

→ No
GO to [F2](#).

F2 CHECK THE ANTI-LOCK BRAKE SENSOR PIDS

1

2

2 Monitor the anti-lock brake control module PIDS LF_WSPD, RF_WSPD, LR_WSPD and RR_WSP while driving the vehicle at a constant speed.

- Are the anti-lock brake sensor PIDS consistent?

→ Yes
CLEAR the DTCs. DRIVE the vehicle. RETRIEVE DTCs. If DTC C1233, C1234, C1235 or C1236 is present, INSTALL a new anti-lock brake control module. REFER to [Anti-Lock Brake System \(ABS\) Module](#). REPEAT the self-test.

→ No
GO to [F3](#).

F3 CHECK FOR ANTI-LOCK BRAKE SENSOR DAMAGE AND LOOSENESS

NOTE: Any time an anti-lock brake sensor is removed, thoroughly clean the mounting surfaces. On front anti-lock brake sensors, apply High-Temperature 4x4 Front Axle and Wheel Bearing Grease.

1

2 Raise and support the vehicle. Refer to [Section 100-02](#).

3  **CAUTION:** Examine the anti-lock brake sensor wire carefully with good light. Failure to verify damage in the anti-lock brake sensor wire can lead to the unnecessary installation of a

new component.

Inspect the anti-lock brake sensor mounting for looseness. If the anti-lock brake sensor is suspected, inspect the sensor for corrosion on the anti-lock brake sensor mounting flange. Clean as necessary.

● **Is the anti-lock brake sensor OK?**

→ **Yes**
GO to [F4](#).

→ **No**
If the anti-lock brake sensor mounting is loose or corroded, REMOVE the anti-lock brake sensor, PLUG the opening, and thoroughly CLEAN the mounting surfaces. On the front anti-lock brake sensors, APPLY High Temperature 4x4 Front Axle and Wheel Bearing Grease E8TZ-19590-A or equivalent meeting Ford Specification ESA-M1C198-A. REPEAT the self-test.

If the anti-lock brake sensor is damaged, INSTALL a new anti-lock brake sensor.

For the front anti-lock brake sensor, REFER to [Front Wheel Speed Sensor](#). CLEAR the DTCs. REPEAT the self-test.

For the rear anti-lock brake sensor, REFER to [Rear Wheel Speed Sensor](#). CLEAR the DTCs. REPEAT the self-test.

F4 CHECK FOR ANTI-LOCK BRAKE SENSOR INDICATOR DAMAGE

NOTE: Any time an anti-lock brake sensor is removed, thoroughly clean the mounting surfaces. On front anti-lock brake sensors, apply High Temperature 4x4 Front Axle and Wheel Bearing Grease.

1 Remove the anti-lock brake sensor.

2  **CAUTION: Examine the anti-lock brake sensor indicator carefully with good light. Failure to verify damage in the anti-lock brake sensor indicator can lead to the unnecessary installation of a new component.**

Inspect the anti-lock brake sensor indicator for damaged or missing teeth. Rotate the wheel to verify that no teeth are missing.

● **Is the wheel speed sensor indicator OK?**

→ **Yes**

GO to [F5](#).

→ **No**
INSTALL a new wheel speed sensor indicator.

For the front wheel speed sensor indicator, REFER to [Front Wheel Speed Sensor](#). CLEAR the DTCs. REPEAT the self-test.

For the rear wheel speed sensor indicator, REFER to [Rear Wheel Speed Sensor](#). CLEAR the DTCs. REPEAT the self-test.

F5 CHECK THE ANTI-LOCK BRAKE CONTROL MODULE OUTPUT

1

2

GH2097-A

2 Measure the voltage between the suspect anti-lock brake sensor as follows:

DTC	Suspect Anti-Lock Brake Sensor Circuit	Suspect Anti-Lock Brake Sensor Circuit
C1234 (RF)	514 (YE/RD)	516 (YE/BK)
C1233 (LF)	521 (TN/OG)	522 (TN/BK)
C1235 (RR)	523 (RD/PK)	524 (PK/BK)
C1236 (LR)	518 (LG/RD)	519 (LG/BK)

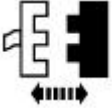

● Is the voltage greater than 9 volts?

→ **Yes**
INSTALL a new wheel speed sensor. REFER to [Front Wheel Speed Sensor](#) or [Rear Wheel Speed Sensor](#). CLEAR the DTCs. TEST the system for normal operation.

→ **No**
INSTALL a new anti-lock brake control module. REFER to [Anti-Lock Brake System \(ABS\) Module](#). TEST the system for normal operation.

PINPOINT TEST G: THE YELLOW ANTI-LOCK BRAKE WARNING

INDICATOR DOES NOT SELF-CHECK

CONDITIONS	DETAILS/RESULTS/ACTIONS
G1 CHECK THE YELLOW ANTI-LOCK BRAKE WARNING INDICATOR	
<p>1 </p> <p>2  Anti-Lock Brake Control Module C135</p> <p>3 </p>	<ul style="list-style-type: none"> ● Is the yellow anti-lock warning indicator illuminated? <p>→ Yes GO to G2.</p> <p>→ No REFER to Section 413-01.</p>

<p>1 </p> <p>2  Anti-Lock Brake Control Module C135</p> <p>3 </p>	<ul style="list-style-type: none"> ● Does the yellow anti-lock brake warning indicator prove out for three seconds and then turn off? <p>→ Yes The yellow anti-lock brake warning indicator operation is OK.</p> <p>→ No INSTALL a new anti-lock brake control module; REFER to Anti-Lock</p>

[Brake System \(ABS\) Module](#). TEST the system for normal operation.

Hydraulic Control Unit (HCU)

Removal and Installation

⚠ WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

⚠ CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Disconnect the electrical connector by lifting up on the release tab.

3. **NOTE:** Plug each open port to prevent any brake fluid from spilling.

Disconnect the brake lines from the hydraulic control unit (HCU).

4. Remove the HCU.
 1. Remove the bolts.
 2. Remove the HCU.

5.  **WARNING:** Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

 **CAUTION:** Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

 **CAUTION:** After the HCU is installed, it is necessary to bleed the hydraulic brake system. For additional information, refer to [Section 206-00](#).

NOTE: When the battery is disconnected and reconnected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 mi) or more to relearn the strategy.

To install, reverse the removal procedure.

Anti-Lock Brake System (ABS) Module

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Disconnect the anti-lock brake control module electrical connector.

3. Disconnect the anti-lock brake pump motor electrical connector.

4. Position the underhood auxiliary junction box (AJB) aside.
 1. Release the underhood AJB clips.
 2. Position the underhood AJB aside.

5. Remove the anti-lock brake control module.
 1. Remove the bolts.
 2. Remove the control module.

6.  **CAUTION:** Once the new module is installed, it is necessary to download the module configuration information from the scan tool into the module. For additional information, refer to [Section 418-01](#).

NOTE: When the battery is disconnected and reconnected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 mi) or more to relearn the strategy.

To install, reverse the removal procedure.

Front Wheel Speed Sensor

Material

Item	Specification
RTV Silicone Sealant FSTZ-19G204-AB (Canada CXC-114A)	NAVSTR Sealer

Removal and Installation

1. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
2. Position the inner splash shield aside.
 1. Remove the pin-type retainers.
 2. Position the inner splash shield aside.

3. Disconnect the anti-lock brake sensor electrical connector.

4. Remove the anti-lock brake sensor harness from the brake hose clips.

5. Remove the anti-lock brake sensor.
 1. Remove the anti-lock brake sensor clip.
 2. Remove the anti-lock brake sensor.

6. **NOTE:** Make sure the anti-lock brake sensor is fully seated before installation of the new clip.

To install, reverse the removal procedure.

- Apply a 2.5 mm (0.1 in) bead of silicone sealant to the outside diameter of the anti-lock brake sensor.
-

Rear Wheel Speed Sensor

Removal and Installation

1. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
2. Disconnect the rear anti-lock brake sensor electrical connector.

3. Remove the rear anti-lock brake sensor harness from the control arm clips.

4. **NOTE:** Clean off dirt and foreign material that may have collected around the rear anti-lock brake sensor before removal.

Remove the rear anti-lock brake sensor.

1. Remove the anti-lock brake sensor bolt.
2. Remove the anti-lock brake sensor.

5. To install, reverse the removal procedure.

Anti-Lock Control —Traction Control

The four wheel anti-lock brake system (4WABS) with traction control consists of the following components:

- anti-lock brake control module
- front anti-lock brake sensors
- front anti-lock brake sensor indicators
- hydraulic control unit (HCU)
- rear anti-lock brake sensors
- rear anti-lock brake sensor indicators
- traction control event indicator
- traction control switch
- yellow anti-lock brake warning indicator

For removal and installation of the front anti-lock brake sensor indicators, refer to [Section 204-01](#) .

For removal and installation of the rear anti-lock brake sensor indicators, refer to [Section 205-05](#) .

Anti-Lock Control —Traction Control

Special Tool(s)

 ST1217-A	New Generation STAR (NGS) Tester or equivalent 418-F048 (007-00500)
 ST1137-A	73III Automotive Meter 105-R0057

Refer to Wiring Diagrams Section 206-09B-00, Anti-Lock Brake Control—Traction Control for schematic and electrical information.

Principles of Operation

The anti-lock-brake control module receives wheel speed readings from each anti-lock brake sensor and processes this information to determine if an ABS event is necessary. The anti-lock brake sensor electrically senses each tooth of the anti-lock brake sensor indicators as it passes through the anti-lock brake sensor magnetic field.

The anti-lock brake control module continuously monitors and compares the rotational speed of each wheel and, when it detects an impending wheel lock, modulates brake pressure to the appropriate brake caliper. This is accomplished by triggering the hydraulic control unit (HCU) to open and close the appropriate solenoid valves. Once the affected wheel returns to normal speed, the anti-lock brake control module returns the solenoid valves to their normal position, and normal (base) braking resumes.

The anti-lock brake control module is self-monitoring. When the ignition switch is turned to the RUN position, the anti-lock brake control module will do a preliminary electrical check, and at approximately 20 km/h (12 mph) the pump motor is turned on for approximately one half-second. Any malfunction of the ABS will cause the ABS or anti-lock brake system/traction control (ABS/TC) to shut off and the yellow anti-lock brake warning indicator to illuminate, however the power assist braking system functions normally.

The anti-lock brake control module and traction control communicates with the powertrain control module (PCM) to assist with traction control. At speeds under 40 km/h (25 mph) the anti-lock brake control module requests the PCM to reduce engine torque, while simultaneously applying and releasing the appropriate brake to restore traction when one or both drive wheels lose traction and begin to spin. The PCM accomplishes this by minor incremental timing changes and fewer fuel injector pulses until the anti-lock brake control module ends the request (when driven wheel speed returns to normal). After the vehicle speed exceeds 40 km/h (25 mph), the traction control is accomplished only through the PCM torque control.

If the traction control system is cycled excessively, the brake portion of the system will shut down to

prevent the rear brakes from overheating. A limited traction control function using only engine torque reduction will still control the wheels from over-spinning. When the rear brakes have cooled down the system will again function normally. Anti-lock braking is not affected by this condition and will function normally during the cool down period.

The traction control system can be disabled by depressing the traction control switch. The traction control system will reset and return to normal traction assist when the ignition switch is cycled or when the traction control switch is depressed again.

Inspection and Verification

NOTE: The anti-lock brake control module must be reconfigured upon replacement; refer to [Section 418-01](#).

1. Verify the customer concern by applying the brakes under different conditions.
2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical
<ul style="list-style-type: none"> ● Anti-lock brake sensor indicator ● Base brake concerns ● HCU ● Tire pressure ● Tire size or mismatched tires 	<ul style="list-style-type: none"> ● Underhood auxiliary junction box (AJB) Maxi Fuses: <ul style="list-style-type: none"> ■ 114 (30A) ■ 122 (30A) ● Central junction box (CJB) Fuses: <ul style="list-style-type: none"> ■ 205 (5A) ■ 203 (5A) ● Anti-lock brake control module ● Anti-lock brake sensors ● Brake pedal position (BPP) switch ● Circuitry ● Connectors or connections ● EVAC and fill connector ● Traction control switch ● Wire harness routing

3. If the fault is not visually evident, connect the New Generation STAR (NGS) to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the NGS menu. If the NGS does not communicate with the vehicle:
 - check that the program card is correctly installed.
 - check the connections to the vehicle.
 - check the ignition switch position.
4. If the NGS still does not communicate with the vehicle, refer to the New Generation STAR Tester manual.
5. Carry out the DATA LINK DIAGNOSTIC TEST. If the NGS responds with:
 - CKT914, CKT915, or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to [Section 418-00](#).
 - NO RESP/NOT EQUIP for anti-lock brake control module, go to Pinpoint Test A.
 - SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out the self-test diagnostics for the anti-lock brake

control module.

6. If the DTCs retrieved are related to the concern, go to Anti-Lock Brake Control Module Diagnostic Trouble Code (DTC) Index to continue diagnostics.
7. If no DTCs related to the concern are retrieved, proceed to Symptom Chart.

Anti-Lock Brake Control Module Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1342	ECU is Defective	Anti-Lock Brake Control Module	INSTALL a new anti-lock brake control module; REFER to Module—Anti-Lock Brake Control .
B1485	Brake Pedal Input Circuit Battery Short	Anti-Lock Brake Control Module	GO to Pinpoint Test B .
B1676	Battery Pack Voltage Out of Range	Anti-Lock Brake Control Module	GO to Pinpoint Test C .
B2477	Module Configuration Failure	Anti-Lock Brake Control Module	CONFIGURE the anti-lock brake control module; REFER to Section 418-01 . CLEAR the DTCs. REPEAT the self-test. If DTC B2477 is retrieved again, INSTALL a new anti-lock brake control module; REFER to Module—Anti-Lock Brake Control . REPEAT the self-test.
C1095	Hydraulic Pump Motor Circuit Failure	Anti-Lock Brake Control Module	GO to Pinpoint Test D .
C1145	Speed Wheel Sensor RF Input Circuit Failure	Anti-Lock Brake Control Module	GO to Pinpoint Test E .
C1155	Speed Wheel Sensor LF Input Circuit Failure	Anti-Lock Brake Control Module	GO to Pinpoint Test E .

<p>1 </p> <p>2 </p>	<p>2 Measure the resistance between anti-lock brake control module C135 pin 8, circuit 31-CF6B (BK/YE), harness side and ground; and between anti-lock brake control module C135 pin 24, circuit 31-CF6A (BK/YE), harness side and ground.</p>								

A0001925

- Are the resistances less than 5 ohms?

→ **Yes**

REFER to [Section 418-00](#).

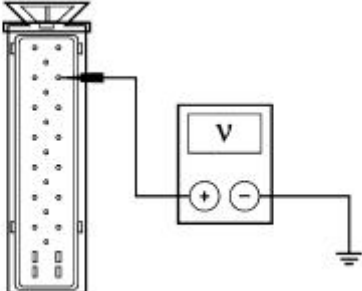

→ **No**

REPAIR the circuit in question. TEST the system for normal operation.

PINPOINT TEST B: DTC B1485 , BRAKE PEDAL INPUT CIRCUIT BATTERY SHORT

CONDITIONS	DETAILS/RESULTS/ACTIONS
B1 CHECK THE STOPLAMP OPERATION	
	<p>1 Press the brake pedal.</p> <ul style="list-style-type: none"> ● Do the stoplamps operate correctly? <p>→ Yes GO to B2.</p> <p>→ No REFER to Section 417-01.</p>
B2 CHECK CIRCUIT 29S-CF58 (OG/GN) FOR OPEN	
<p>1 </p> <p>2  Anti-Lock Brake Control Module C135</p> <p>3 </p>	

4

A0001926

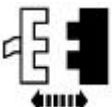

4 Measure the voltage between anti-lock brake control module pin 2 circuit 29S-CF58 (OG/GN), harness side and ground, while depressing the brake pedal.

- Is the voltage greater than 10 volts?

→ **Yes**
 INSTALL a new anti-lock brake control module; REFER to [Module—Anti-Lock Brake Control](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
 REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST C: DTC B1676, BATTERY PACK VOLTAGE OUT OF RANGE

CONDITIONS	DETAILS/RESULTS/ACTIONS
C1 CHECK THE BATTERY VOLTAGE	
<p>1</p> 	<p>2 Measure the voltage between positive and negative battery posts.</p> <ul style="list-style-type: none"> ● Is the voltage between 10 and 14 volts? <p>→ Yes GO to C2.</p> <p>→ No REFER to Section 414-00.</p>
C2 CHECK VOLTAGE TO THE ANTI-LOCK BRAKE CONTROL MODULE	
<p>1</p>  <p>Anti-Lock Brake Control Module C135</p>	

2

2

Measure the voltage between anti-lock brake control module C135 pins, and ground as follows:

Pin	Circuit
25	30-CF6A (RD)
20	20-CF6A (PK/YE)
9	30-CF13 (RD)

- Are the voltages greater than 10 volts?

→ **Yes**
GO to [C3](#).

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

C3 CHECK THE ANTI-LOCK BRAKE CONTROL MODULE GROUNDS

1

2

2

Measure the resistance between anti-lock control module pin 24, circuit 31-CF6A (BK/YE), harness side and ground; and between anti-lock control module pin 8, circuit 31-CF6B (BK/YE), harness side and ground.

- Are the resistances less than 5 ohms?

→ **Yes**
INSTALL a new anti-lock brake control module; REFER to [Module—Anti-Lock Brake Control](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST D: DTC C1095, HYDRAULIC PUMP MOTOR CIRCUIT FAILURE

CONDITIONS	DETAILS/RESULTS/ACTIONS
D1 CHECK ABS PUMP MOTOR	
<p data-bbox="204 243 228 275">1</p> 	<ul style="list-style-type: none"> <li data-bbox="855 433 1331 491">● Is the ABS pump motor running all the time? <p data-bbox="810 541 1307 659">→ Yes INSTALL a new anti-lock brake control module; REFER to Module—Anti-Lock Brake Control. REPEAT the self-test.</p> <p data-bbox="810 698 975 756">→ No GO to D2.</p>
D2 CHECK PUMP MOTOR OPERATION	
<p data-bbox="204 821 228 853">1</p> 	<p data-bbox="815 983 1326 1080">2 Trigger the anti-lock brake control module active command PMP MOTOR ON.</p> <ul style="list-style-type: none"> <li data-bbox="855 1123 1326 1181">● Does the ABS pump motor run for approximately three seconds? <p data-bbox="810 1231 1347 1565">→ Yes CLEAR the DTCs. CHECK the yellow anti-lock brake warning indicator while driving the vehicle (brakes must not be applied) above 32 km/h (20 mph). If the yellow anti-lock brake warning indicator illuminates, RETRIEVE continuous DTCs. If DTC C1095 is retrieved again, INSTALL a new anti-lock brake control module; REFER to Module—Anti-Lock Brake Control. REPEAT the self-test.</p> <p data-bbox="842 1591 1326 1677">If the yellow anti-lock brake warning indicator does not illuminate, the system is OK.</p> <p data-bbox="810 1716 1310 1834">→ No TRIGGER the anti-lock brake control module active command PMP MOTOR OFF. GO to D3.</p>
D3 CHECK CIRCUIT 30-CF6A (RD) AND CIRCUIT 30-CF13 (RD) FOR OPEN	
<p data-bbox="204 1899 228 1931">1</p> 	

2

Anti-Lock Brake Control Module

3

4

4

Measure the voltage between anti-lock brake control module C135 pin 25 circuit 30-CF6A (RD), harness side and ground; and between anti-lock brake control module C135 pin 9 circuit 30-CF13 (RD), harness side and ground.

- Are the voltages greater than 10 volts?

→ **Yes**
GO to [D4](#).

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

D4 CHECK CIRCUIT 31-CF6A (BK/YE) AND 31-CF6B (BK/YE) FOR AN OPEN

1

1

Measure the resistance between anti-lock brake control module C135 pin 24, circuit 31-CF6A (BK/YE), harness side and ground; and between anti-lock brake control module C135 pin 8, circuit 31-CF6B (BK/YE), harness side and ground.

- Are the resistances less than 5 ohms?

→ **Yes**
GO to [D5](#).

→ **No**
REPAIR circuit 31-CF6A (BK/YE) or circuit 31-CF6B (BK/YE). CLEAR the DTCs. REPEAT the self-test.

D5 CHECK THE PUMP MOTOR FOR OPERATION

1

2

Pump Motor Connector

3

GH1811-A

3

Using a heavy gauge wire, make a connection between the negative battery post and the pump motor connector brown wire (HCU side); momentarily connect a fused (30A) jumper wire between the positive battery post and the pump motor connector red wire (HCU side).

● Does the pump motor run?

→ Yes

INSTALL a new anti-lock brake control module; REFER to [Module—Anti-Lock Brake Control](#). CLEAR the DTCs. REPEAT the self-test.

→ No

INSTALL a new HCU; REFER to [Hydraulic Control Unit—\(HCU\)](#). CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST E: DTC C 1145 (RF), DTC C1155 (LF), DTC C1165 (RR), DTC C1175 (LR), ANTI-LOCK BRAKE SENSOR CIRCUIT FAILURE

CONDITIONS	DETAILS/RESULTS/ACTIONS
<p>NOTE: Any time an anti-lock brake sensor is removed, thoroughly clean the mounting surfaces, apply High Temperature 4x4 Front Axle and Wheel Bearing Grease E8TZ-19590-A or equivalent meeting Ford specification ESA-M1C198-A.</p>	
<p>E1 CHECK FOR SHORT TO POWER</p>	
<p>NOTE: Both circuits must be checked for each DTC.</p>	
<p>1</p>  <p>2</p>	

Anti-Lock Brake Control Module C135

3

Suspect Anti-Lock Brake Sensor

4

5

- 5 Measure the voltage between anti-lock brake control module C135 pin, harness side and ground as follows:

DTC	Anti-Lock Brake Control Module C135	Circuit
C1145 (RF)	Pin 3	8-CF38 (WH/RD)
C1145 (RF)	Pin 4	7-CF38 (YE/RD)
C1155 (LF)	Pin 17	8-CF32 (WH)
C1155 (LF)	Pin 18	7-CF32 (YE)
C1165 (RR)	Pin 7	8-CF40 (WH/GN)
C1165 (RR)	Pin 6	7-CF40 (YE/GN)
C1175 (LR)	Pin 21	8-CF34 (WH/BU)
C1175 (LR)	Pin 22	7-CF34 (YE/BU)

- Is any voltage present?

→ Yes

If DTC C1145, REPAIR circuit 8-CF38 (WH/RD), or circuit 7-CF38 (YE/RD). CLEAR the DTCs. REPEAT the self-test.

If DTC C1155, REPAIR circuit 8-CF32 (WH), or circuit 7-CF32 (YE). CLEAR the DTCs. REPEAT the self-test.

If DTC C1165, REPAIR circuit 8-CF40 (WH/GN), or circuit 7-CF40 (YE/GN). CLEAR the DTCs. REPEAT the self-test.

If DTC C1175, REPAIR circuit 8-CF34 (WH/BU), or circuit 7-CF34 (YE/BU). CLEAR the DTCs. REPEAT the self-test.

→ **No**
GO to [E2](#).

E2 CHECK FOR SHORT TO GROUND

NOTE: Both circuits must be checked for each DTC.

1

2

2 Measure the resistance between anti-lock brake control module C135 pin, harness side and ground as follows:

DTC	Anti-Lock Brake Control Module C135	Circuit
C1145 (RF)	Pin 3	8-CF38 (WH/RD)
C1145 (RF)	Pin 4	7-CF38 (YE/RD)
C1155 (LF)	Pin 17	8-CF32 (WH)
C1155 (LF)	Pin 18	7-CF32 (YE)
C1165 (RR)	Pin 7	8-CF40 (WH/GN)
C1165 (RR)	Pin 6	7-CF40 (YE/GN)
C1175 (LR)	Pin 21	8-CF34 (WH/BU)
C1175 (LR)	Pin 22	7-CF34 (YE/BU)

● **Is the resistance greater than 10,000 ohms?**

→ **Yes**
GO to [E3](#).

→ **No**
If DTC C1145, REPAIR circuit 8-CF38 (WH/RD), or circuit 7-CF38 (YE/RD). CLEAR the DTCs. REPEAT the self-test.

If DTC C1155, REPAIR circuit 8-CF32 (WH), or circuit 7-CF32 (YE). CLEAR the DTCs. REPEAT the self-test.

If DTC C1165, REPAIR circuit 8-CF40 (WH/GN), or circuit 7-CF40 (YE/GN).

CLEAR the DTCs. REPEAT the self-test.

If DTC C1175, REPAIR circuit 8-CF34 (WH/BU), or circuit 7-CF34 (YE/BU).
CLEAR the DTCs. REPEAT the self-test.

E3 CHECK FOR AN OPEN

NOTE: Both circuits must be checked for each DTC.

- 1 Measure the resistance between anti-lock brake control module C135 pins, harness side and suspect anti-lock brake sensor connector, harness side as follows:

DTC	Anti-Lock Brake Control Module C135 Pin	Anti-Lock Brake Sensor	Circuit
C1145 (RF)	3	C160 pin 2	8-CF38 (WH/RD)
C1145 (RF)	4	C160 pin 1	7-CF38 (YE/RD)
C1155 (LF)	17	C150 pin 2	8-CF32 (WH)
C1155 (LF)	18	C150 pin 1	7-CF32 (YE)
C1165 (RR)	7	C426 pin 1	8-CF40 (WH/GN)
C1165 (RR)	6	C426 pin 2	7-CF40 (WH/GN)
C1175 (LR)	21	C440 pin 2	8-CF34 (WH/BU)
C1175 (LR)	22	C440 pin 1	7-CF34 (YE/BU)

- Is the resistance less than 5 ohms?

→ **Yes**
GO to [E4](#).

→ **No**
If DTC C1145, REPAIR circuit 8-CF38 (WH/RD), or circuit 7-CF38 (YE/RD).
CLEAR the DTCs. REPEAT the self-test.

If DTC C1155, REPAIR circuit 8-CF32 (WH), or circuit 7-CF32 (YE). CLEAR the DTCs. REPEAT the self-test.

If DTC C1165, REPAIR circuit 8-CF40 (WH/GN), or circuit 7-CF40 (YE/GN).
CLEAR the DTCs. REPEAT the self-test.

If DTC C1175, REPAIR circuit 8-CF34 (WH/BU), or circuit 7-CF34 (YE/BU). CLEAR the DTCs. REPEAT the self-test.

E4 CHECK THE ANTI-LOCK BRAKE CONTROL MODULE OUTPUT

1

Anti-Lock Brake Control Module C135

2

3

A0006087

3

Measure the voltage between suspect anti-lock brake sensor connector pins, harness side.

● Is the voltage greater than 9 volts?

→ Yes

INSTALL a new anti-lock brake sensor; REFER to [Sensor—Front](#), or [Sensor—Rear](#). CLEAR the DTCs. TEST the system for normal operation.

→ No

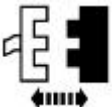

INSTALL a new anti-lock brake control module; REFER to [Module—Anti-Lock Brake Control](#). CLEAR the DTCs. TEST the system for normal operation.

PINPOINT TEST F: DTC C1233 (LF), DTC C1234 (RF), DTC C1235 (RR), DTC C1236 (LR) — ANTI-LOCK BRAKE SENSOR INPUT SIGNAL MISSING

CONDITIONS	DETAILS/RESULTS/ACTIONS
<p>NOTE: Any time an anti-lock brake sensor is removed, thoroughly clean the mounting surfaces, apply High Temperature 4x4 Front Axle and Wheel Bearing Grease E8TZ-19590-A or equivalent meeting Ford specification ESA-M1C198-A.</p>	
<p>F1 CHECK THE ANTI-LOCK BRAKE SENSOR</p>	
	<p>1 Check the suspect anti-lock brake sensor mounting. Check the suspect anti-lock brake sensor for excessive dirt buildup, metal obstructions, incorrect harness routing, and chafing.</p>

	<ul style="list-style-type: none"> ● Is the suspect anti-lock brake sensor OK? <p>→ Yes GO to F2.</p> <p>→ No REPAIR as necessary. CLEAR the DTCs. TEST the system for normal operation.</p>
F2 CHECK THE ANTI-LOCK BRAKE SENSOR INDICATOR	
	<p>1 Check the suspect anti-lock brake sensor indicator for corrosion, nicks, damaged teeth, incorrect mounting, alignment, and consistent air gap.</p> <ul style="list-style-type: none"> ● Is the suspect anti-lock brake sensor indicator OK? <p>→ Yes INSTALL a new anti-lock brake sensor; REFER to Sensor—Front, or Sensor—Rear. CLEAR the DTCs. TEST the system for normal operation.</p> <p>→ No REPAIR as necessary. CLEAR the DTCs. TEST the system for normal operation.</p>

REPAIR the circuit. TEST the system for normal operation.

Hydraulic Control Unit —(HCU)

Removal

⚠ WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

⚠ CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Disconnect the electrical connector by lifting up on the release tab.

3. **NOTE:** Plug each open port to prevent any brake fluid from spilling.

Disconnect the brake lines from the hydraulic control unit (HCU).

4. Remove the HCU.
 1. Remove the bolts.
 2. Remove the HCU.

Installation

-  **WARNING:** Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

 **CAUTION:** Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

 **CAUTION:** After the HCU is installed, it is necessary to bleed the hydraulic brake system. For additional information, refer to [Section 206-00](#).

NOTE: When the battery is disconnected and reconnected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 mi) or more to relearn the strategy.

To install, reverse the removal procedure.

Module —Anti-Lock Brake Control

Removal

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Disconnect the anti-lock brake control module electrical connector.

3. Position the underhood auxiliary junction box (AJB) aside.
 1. Release the underhood AJB clips.
 2. Position the underhood AJB aside.

4. Remove the anti-lock brake control module.
 1. Remove the bolts.
 2. Remove the control module.

Installation

1.  **CAUTION:** Once the new module is installed, it is necessary to download the module configuration information from the New Generation STAR (NGS) Tester into the module. For additional information, refer to [Section 418-01](#).

NOTE: When the battery is disconnected and reconnected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 mi) or more to relearn the strategy.

To install, reverse the removal procedure.

Sensor —Front

Removal

1. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
2. Position the inner splash shield aside.
 1. Remove the pin-type retainers.
 2. Position the inner splash shield aside.

3. Disconnect the anti-lock brake sensor electrical connector.

4. Remove the anti-lock brake sensor harness from the brake hose clips.

5. Remove the rear anti-lock brake sensor.
 1. Remove the anti-lock brake sensor clip.
 2. Remove the anti-lock brake sensor.

Installation

1. To install, reverse the removal procedure.
-

Sensor —Rear

Removal

1. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
2. Disconnect the rear anti-lock brake sensor electrical connector.

3. Remove the rear anti-lock brake sensor harness from the control arm clips.

4. **NOTE:** Clean off dirt and foreign material that may have collected around the rear anti-lock brake sensor before removal.

Remove the rear anti-lock brake sensor.

1. Remove the anti-lock brake sensor bolt.
2. Remove the anti-lock brake sensor.

Installation

1. To install, reverse the removal procedure.

Switch —Traction Control

Removal

1. Remove the console panel assembly. For additional information, refer to [Section 501-12](#).
2. Remove the traction control switch electrical connector.

3. Remove the traction control switch.
 1. Remove the traction control switch screws.
 2. Remove the traction control switch.

Installation

1. To install, reverse the removal procedure.

DESCRIPTION AND OPERATION

Anti-Lock Control — Traction Control and Stability Assist

The four wheel anti-lock brake system (4WABS) with traction control and stability assist system consists of the following components:

- active brake booster with integral solenoid
- brake booster release switch
- front anti-lock brake sensors
- front anti-lock brake sensor indicators
- hydraulic control unit (HCU)
- stability assist event indicator
- stability assist module
- lateral accelerometer
- rear anti-lock brake sensors
- rear anti-lock brake sensor indicators
- steering wheel position sensor
- two brake pressure transducers
- Advance Trac control switch
- yaw rate sensor
- yellow anti-lock brake warning indicator

For removal and installation of the brake booster release switch, refer to [Section 206-07](#).

For removal and installation of the front anti-lock brake sensor indicators, refer to [Section 204-01](#).

For removal and installation of the rear anti-lock brake sensor indicator, refer to [Section 205-05](#).

For removal and installation of the steering wheel position sensor, refer to [Section 211-04](#).

Anti-Lock Control — Traction Control and Stability Assist

Refer to Wiring Diagrams Section [206-09C](#) for schematic and connector information.

Special Tool(s)

 ST1217-A	New Generation STAR (NGS) Tester 418-F048 (007-00500) or equivalent
 ST1137-A	73III Automotive Meter 105-R0057 or equivalent

Principles of Operation

The stability assist module executes control of the anti-lock brakes, full speed traction control and stability assist functions to enhance the drivers control of the vehicle. The stability assist manages the interactions between the anti-lock, traction control, and engine control systems to optimize the vehicle traction during deceleration and acceleration. In addition, stability assist function modulates brake pressure during braking and nonbraking conditions as required to counteract excessive vehicle rotation while cornering.

The stability assist module is operational with the ignition switch in the RUN or START positions.

The stability assist module continuously monitors and compares the rotational speed of each wheel. The wheel speeds are measured by the anti-lock brake sensors which electrically sense each tooth of the anti-lock sensor indicator as they pass through the sensors magnetic field. When stability assist detects an impending wheel lock, wheel spin or vehicle motion that is inconsistent with the drivers commands, it modulates brake pressure to the appropriate brake caliper(s). This is accomplished by triggering the hydraulic control unit (HCU) to open and close the appropriate solenoid valves. Once the affected wheel returns to the desired speed, the stability assist module returns the solenoid valves to their normal position, and normal base brake operation resumes.

The stability assist module is self-monitoring. When the ignition switch is turned to the RUN position, the stability assist module will do a preliminary electrical check, and at approximately 20 km/h (12 mph) the pump motor is turned on for approximately one half-second. Any malfunction of the anti-lock brake control system will cause the ABS/TC/Stability Assist to shut off and anti-lock brake warning indicator to illuminate, however the power assist braking system will function normally.

The stability assist module communicates with the powertrain control module (PCM) to assist with traction control. At speeds under 40 km/h (25 mph) the stability assist module requests the PCM to reduce engine torque, while simultaneously applying and releasing the appropriate brake to restore traction when one or both drive wheels lose traction and begin to spin. The PCM accomplishes this by minor incremental timing changes and fewer fuel injector pulses until the stability assist module ends the request (when the driven wheel speed returns to normal). After the vehicle speed exceeds 40 km/h

(25 mph), the traction control is accomplished only through the PCM torque control.

An all new stability assist system helps maintain vehicle stability at the limits of tire adhesion. System effectiveness varies with vehicle speed, road conditions, and steering inputs.

The stability assist system constantly monitors vehicle motion relative to the driver's intended course. This is done by using added sensors to compare the steering inputs from the driver with the actual motion of the vehicle.

The driver's steering input is measured from a steering wheel rotation sensor. The motion of the vehicle is determined from a yaw rate sensor (measures rotation about the vehicle's vertical axis, caused by steering left/right), a lateral accelerometer (measures the acceleration generated from the vehicle sliding sideways), and the wheel speeds used for anti-lock brake system (ABS) and traction control function. When there is a discrepancy between the driver's inputs and the vehicle motion, the stability assist changes the force at each tire to help control the vehicle. If the vehicle is beginning to rotate excessively left or right, spin out, or slide sideways, the system will attempt to correct the excessive motion. If the vehicle is not responding to steering inputs, the system will attempt to increase the turning response of the vehicle.

The stability assist system defaults to ON when the engine is started. The system does not activate when the vehicle is traveling in reverse. In reverse, ABS and traction control will continue to function as usual. The system uses ABS and traction control (including control of the engine) as well as its more advanced controls to enhance vehicle stability. The stability assist/traction control switch (ATS) allows the driver to control use of the stability assist system. This is independent of the ABS function, which cannot be switched off by the driver. The stability assist system status is indicated by a stability assist warning light in the stability assist/traction control switch. The illuminated stability assist/traction control switch indicates stability assist system is switched off. In vehicles with a message center, the message "ADVANCETRAC OFF" is displayed.

During a stability assist event you may experience any of the following behaviors, which are normal:

- a rumble or grinding sound much like ABS or traction control
- a small deceleration or a reduction in the acceleration of the vehicle
- the stability assist indicator will flash
- if your foot is on the brake pedal, you will feel a vibration in the pedal much like ABS. As with any vehicle equipped with four-wheel anti-lock brakes, do not pump the brakes, but instead, press firmly on the pedal.
- if the event is severe and your foot is not on the brake, the brake pedal will move to apply higher brake forces. A whoosh sound may also be heard from under the instrument panel in an event this severe. All of these behaviors are normal during a stability assist event.

The stability assist system continually monitors and checks all of the sensors and actuators used to improve the stability of the vehicle. Some drivers may notice a slight movement of the brake pedal when the system checks itself. If the brake system has not been bled correctly, the brake pedal movement may become more significant. The brake pedal moves when an active test of the brake booster is run. During this test a small amount of pressure will be generated at the master cylinder, but no pressure will be generated in the calipers. This test will occur above 48 km/h (30 mph) after the vehicle has been running approximately 8 minutes. The test will only be run if the vehicle is stable, the driver is not braking and the accelerator pedal is depressed at least a small amount. If a failure is detected somewhere in the stability assist system which affects either the yaw control or traction control functions, the stability assist indicator will be illuminated. The anti-lock brake function will continue to work as designed unless the yellow anti-lock brake warning indicator is also illuminated. The normal brake function will always occur, unless the red brake warning indicator is illuminated.

Yaw Rate Sensor

The yaw rate sensor measures the rotation rate of the vehicle as it turns left and right.

Lateral Accelerometer

The lateral accelerometer measures the acceleration which corresponds to the force required to slide the vehicle sideways. This acceleration comes in two forms. The first is the centrifugal acceleration which is generated when an object travels around in a circle. The second is the acceleration due to gravity. The accelerometer only measures the acceleration along the lateral (or sideways) direction of the vehicle, so on level ground there is no contribution from this acceleration. However, if the vehicle is parked sideways on a bank or incline, the sensor will measure some lateral acceleration due to gravity even though the vehicle is stationary.

Steering Wheel Rotation Sensor

The steering wheel rotation sensor scans the steering wheel rotation sensor ring in the steering column which has holes punched in it at regular intervals. The steering wheel rotation sensor uses two signal lines to tell the stability assist module whether the steering wheel is being turned left or right and how far it is being turned. The steering wheel rotation sensor does not tell the stability assist module the position of the steering wheel relative to straight ahead. The stability assist system learns this by comparing the steering wheel position with other signals and remembering the position it has learned. The stability assist system confirms this position and modifies it as necessary during every new driving cycle of the vehicle.

Brake Booster

The brake booster is a normal brake booster which has the added function that it can be actuated electrically by the stability assist module. This is sometimes necessary in severe stability assist events, to make sure that the hydraulic control unit can generate enough brake pressure to improve vehicle stability. The help from the brake booster is especially needed in cold weather when the hydraulic control unit cannot draw the brake fluid from the reservoir when it becomes very thick and viscous at cold temperatures. Within the booster is a solenoid for electrical actuation and a release switch to indicate when the driver is stepping on the brake. The solenoid provides electrical actuation of the brake booster. Without the force of the input rod, the air valve is directly opened due to the movement of the energized solenoid. With increasing current applied to the solenoid, the air valve opens and output force is created. With decreasing current applied to the solenoid, the air valve is closed and the vacuum valve opens reducing output force.

The release switch indicates when the brake pedal has been depressed. It is integrated into the booster key that normally sits against the rear shell of the boot in its rest position and it adjoins the valve body when in its balance position. The switch itself provides indication from two positions. In its rest position, it supplies two signals, normally open (NO) and normally closed (NC). Upon application of sufficient force to initiate movement of the key away from the valve body, the brake booster switch changes state, signifying a driver application. When the stability assist module is activating the brake booster, the brake pedal is pulled forward as the valve body moves. The release switch is held in position by the input rod spring and remains against the valve body. Although the brake pedal position (BPP) switch changes state when the brake pedal drops, the release switch remains inactive until such time as it encounters an external force from the driver, whether in a stability assist event controlled by the stability assist module, or in a standard mechanical braking event.

The master cylinder attached to the booster functions the same as on vehicles not equipped with the stability assist system. It differs in that there are two pressure transducers that are installed in spare outlet ports. The values measured by each pressure transducer should be similar. The pressure transducer is a diaphragm type unit. When a pressure is seen the diaphragm is stretched, causing a voltage to be output. As the pressure increases or decreases, the voltage also increases or decreases with it. The configuration of the pressure transducers, which transducer is connected to the primary port and which is connected to the secondary port, is not known by the stability assist module. The harness connectors can be connected to either transducer, therefore, diagnosis of pressure faults requires some care to identify exactly which transducer is failed.

Modules which are normally connected to the BPP switch are connected to a signal from the stability

assist module. This signal is called driver brake application. This signal only changes state when the driver has applied the brake. If the ignition switch is in the RUN position, the brake booster is not electrically actuated, and no failure has been detected, the driver brake application signal will indicate a brake applied when either the BPP switch or the release switch built into the brake booster indicate that the driver has applied the brake pedal. If the ignition switch is in the OFF position, the driver brake application signal will indicate a brake apply only when the BPP switch indicates that the driver is applying the brake pedal. When the ignition switch is in the OFF position, failures cannot be detected. If there are failures, several layers of redundancy will try to keep the driver brake application signal accurate. If the stability assist system detects faults on the driver brake application signal line it will also attempt to maintain correct stoplamp operation by communicating on the standard corporate protocol (SCP) network. Control of the stoplamp operation is also required because the BPP switch can change states during a stability assist event when the driver is not applying the brake pedal. The switch can also change states during the system check of the brake booster. Only the stability assist system can interpret these state changes and determine which ones are actually due to the driver applying the brake. Similarly, the stability assist system can take advantage of its other sensors to detect failures in the BPP switch.

DTC C1963

This Diagnostic Trouble Code (DTC) is stored if the stability assist warning indicator has been turned ON because the system could not confirm the straight ahead position for more than 30 seconds above 18 km/h (11 mph). This condition will most likely occur if there is some other DTC. If there is another DTC logged with this DTC, the repair procedure is to follow the procedure for the other DTC. This DTC can be stored if:

- PRNDL or Reverse switch has failed (check operation of PRNDL display and back-up lights)
- Chassis modifications have been made that were not authorized by Ford.

In very rare circumstances this DTC may be stored by itself without the occurrence of any actual component failure. Two conditions can cause the DTC C1963 to set with no other DTC:

- The steering wheel has been turned while the ignition is off and then the vehicle is started, and either the vehicle is driven continuously in a circle or the vehicle is driven with continuous swerving, sliding or tire spinning.
- A new stability assist module may have been installed in the vehicle and was not calibrated.

Stability Assist Module Calibration

The stability assist module needs to be recalibrated whenever a component specific to the stability assist system is disconnected, moved, or a new component is installed; for additional information regarding the DTCs that require the recalibration procedure, refer to the stability assist Calibration List. If a DTC is logged for any component of the stability assist system, the DTC must be cleared before carrying out the recalibration procedure. The need to re-calibrate the stability assist module is also indicated by the active/fail lamp flashing. The lamp will flash after the clearing of DTC's that are indicated on the stability assist calibration list. If a DTC is retrieved after recalibration; refer to the Stability Assist Module Diagnostic Trouble Code (DTC) Index. If installing a new stability assist module, the calibration procedures as well as the configuration procedure must be carried out. For additional information regarding the module configuration procedure, refer to [Section 418-01](#).

When carrying out the lateral accelerometer or yaw rate calibration on the NGS Tester, the vehicle must be on a level surface, not moving, with ignition switch in the RUN position. When carrying out the booster learn cycle on the NGS Tester, the ignition switch must be in the RUN position with the engine running and the brake pedal must not be applied. When carrying out the steering wheel rotation sensor calibration on the NGS Tester, the ignition switch must be in the RUN position with the engine running and the steering wheel must be rotated back and forth from lock position to lock position.

Inspection and Verification

NOTE: The stability assist module must be reconfigured upon replacement; refer to [Section 418-01](#).

1. Verify the customer's concern by operating the vehicle to duplicate the condition.
2. Verify the stoplamps operate correctly by depressing and releasing the brake pedal with the ignition switch in the OFF position. If the stoplamps do not operate correctly, refer to [Section 417-01](#). If the stoplamps operate correctly, proceed to the next step.
3. Verify the PRNDL operates correctly on the instrument cluster. If the PRNDL does not operate correctly, refer to [Section 413-01](#). If the PRNDL operates correctly, proceed to the next step.
4. Inspect to determine if one of the following mechanical or electrical concerns apply:

Visual Inspection Chart

Mechanical	Electrical
<ul style="list-style-type: none"> ● Anti-lock brake sensor indicator. ● HCU. ● Incorrectly inflated tires. ● Mismatched wheels or tires on vehicle. ● Base brake concern. ● Brake booster vacuum hose. ● Ford specified steering components, suspension components and tire size. ● Steering wheel rotation ring. 	<ul style="list-style-type: none"> ● Underhood auxiliary junction box (AJB) Fuse: <ul style="list-style-type: none"> ■ 114 (30A) ■ 122 (30A) ● Battery junction box (BJB) Fuse: <ul style="list-style-type: none"> ■ 405 (10A) ● Central junction box (CJB) Fuse: <ul style="list-style-type: none"> ■ 203 (5A) ■ 205 (5A) ■ 235 (5A) ● Stability assist module. ● EVAC and fill connector. ● Anti-lock brake sensor. ● Stability assist/traction control switch. ● BPP switch. ● Steering wheel rotation sensor. ● Brake booster solenoid. ● Brake booster release switch. ● Primary/main pressure transducer. ● Secondary/redundant pressure transducer. ● Yaw rate sensor. ● Lateral accelerometer. ● Wiring harness. ● Connectors or connections. ● Circuitry.

5. If the concern remains after the inspection, connect the NGS Tester to the data link connector (DLC) located beneath the instrument panel, and select the vehicle to be tested from the NGS Tester menu. If the NGS Tester does not communicate with the vehicle:
 - Check that the program card is correctly installed.
 - Check the connection of the data link connector to the vehicle.
 - Check that the ignition switch is in the RUN position.
6. If the NGS Tester still does not communicate with the vehicle, refer to the New Generation STAR Tester manual.

7. Carry out the DATA LINK DIAGNOSTIC TEST. If NGS Tester responds with:
 - CKT914, CKT915 or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to [Section 418-00](#).
 - NO RESP/NOT EQUIP for stability assist module, go to Pinpoint Test A.
 - SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out the self-test diagnostics for the stability assist module.
8. If the DTCs retrieved are related to the concern, go to Stability Assist Module Diagnostic Trouble Code (DTC) Index to continue diagnostics.
9. If no DTCs related to the concern are retrieved, proceed to the Symptom Chart to continue diagnostics.

Stability Assist Module Diagnostic Trouble Code (DTC) Index

NOTE: The need to re-calibrate the stability assist module is indicated by the active/fail lamp flashing. There are other service actions that may require re-calibration where there is no flashing lamp. Refer to the section Stability Assist Module Calibration. The lamp will flash after the clearing of DTC's that are indicated on the stability assist calibration list.

NOTE: Stability assist may be referred to as interactive vehicle dynamics (IVD) in the NGS Tester.

Stability Assist Module Diagnostic Trouble Code (DTC) Index

NOTE: DTC C1730 (Reference Voltage Out Of Range) must be repaired before DTC C1279, C1280, C1281, C1282, C1288, C1289.

Stability Assist Calibration List

NOTE: The need to re-calibrate the stability assist module is indicated by the active/fail lamp flashing. Refer to the section Stability Assist Module Calibration for other service actions requiring re-calibration. The lamp will flash after the clearing of DTC's that are indicated on the stability assist calibration list.

Stability Assist Calibration List

DTC	Description	Stability Assist Calibration
C1277	Steering Wheel Angle 1 and 2 Circuit Failure	YES
C1278	Steering Wheel Angle 1 and 2 Signal Faulted	YES
C1279	Yaw Rate Sensor Circuit Failure	YES
C1280	Yaw Rate Sensor Signal Fault	YES
C1281	Lateral Accelerometer Circuit Failure	YES
C1282	Lateral Accelerometer Signal Fault	YES
C1283	Switch Test Signal Failure	YES
C1285	Booster Solenoid Circuit Failure	YES
C1286	Booster Mechanical Failure	YES
C1287	Booster Pedal Force Switch Circuit Failure	YES

Pinpoint Tests

PINPOINT TEST A: NO COMMUNICATION WITH THE STABILITY ASSIST MODULE

CONDITIONS	DETAILS/RESULTS/ACTIONS
A1 CHECK THE VOLTAGE TO THE STABILITY ASSIST MODULE	
1	

2

Stability Assist Module C155

3

4

4 Measure the voltage between stability assist module C155 pin 22, circuit 20-CF6A (PK/YE), harness side, and ground.

• Is the voltage greater than 10 volts?

→ Yes
GO to [A2](#).

→ No
REPAIR circuit 20-CF6A (PK/YE) or circuit 20-CF6 (PK/YE). REPEAT the self-test.

A2 CHECK THE STABILITY ASSIST MODULE GROUNDS

1

2

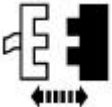

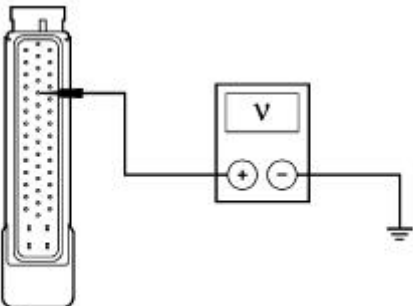

2 Measure the resistance between stability assist module C155 pin 15, circuit 31-CF6A (BK/YE), harness side, and ground; and between stability assist module C155 pin 32, circuit 31-CF6B (BK/YE), harness side, and ground.

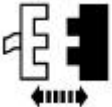

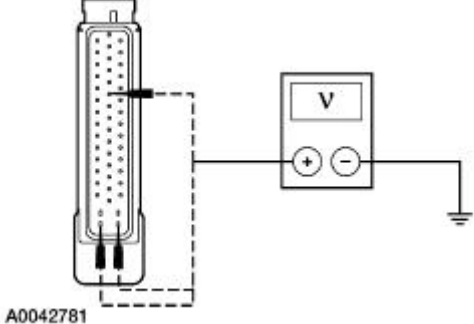

• Are the resistances less than 5

	<p>ohms?</p> <p>→ Yes Section 418-00.</p> <p>→ No REPAIR circuit 31-CF6B (BK/YE) or circuit 31-CF6A (BK/YE). REPEAT the self-test.</p>
--	--

PINPOINT TEST B: DTC B1485 — BRAKE PEDAL INPUT CIRCUIT BATTERY SHORT

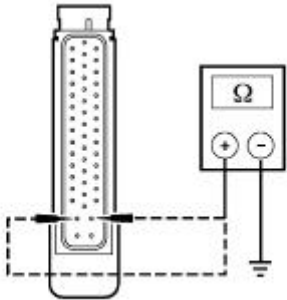

CONDITIONS	DETAILS/RESULTS/ACTIONS
B1 CHECK CIRCUIT 29S-CF1 (OG/YE) FOR AN OPEN	
<p>1</p>  <p>2</p>  <p>Stability Assist Module C155</p> <p>3</p>  <p>A0002731</p>	<p>3</p> <p>Measure the voltage between stability assist module C155 pin 21, circuit 29S-CF1 (OG/YE), harness side, and ground, while depressing and releasing the brake pedal.</p> <ul style="list-style-type: none"> ● Is the voltage greater than 10 volts with the brake pedal depressed, and zero volts with the brake pedal released? <p>→ Yes INSTALL a new stability assist module. REFER to Anti-Lock Brake System (ABS) Module—Stability Assist . REPEAT the self-test.</p> <p>→ No REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.</p>

PINPOINT TEST C: DTC B1676 — BATTERY PACK VOLTAGE OUT OF RANGE

CONDITIONS	DETAILS/RESULTS/ACTIONS
C1 CHECK THE BATTERY VOLTAGE	
	<p data-bbox="810 368 1348 498">1 Measure the battery voltage between the positive and negative battery posts with the key ON engine OFF (KOEO), and with the engine running.</p> <ul data-bbox="858 534 1310 655" style="list-style-type: none"> ● Is the battery voltage between 10 and 13 volts with KOEO, and between 11 and 17 volts with the engine running? <p data-bbox="810 698 975 763">→ Yes GO to C2.</p> <p data-bbox="810 799 1294 886">→ No REFER to Section 414-00. TEST the system for normal operation.</p>
C2 CHECK VOLTAGE TO THE STABILITY ASSIST MODULE	
<p data-bbox="201 955 233 987">1</p>  <p data-bbox="201 1116 233 1149">2</p>  <p data-bbox="355 1267 632 1300">Stability Assist Module C155</p> <p data-bbox="201 1310 233 1343">3</p>  <p data-bbox="201 1472 233 1504">4</p>  <p data-bbox="260 1817 347 1839">A0042781</p>	<p data-bbox="810 1472 1310 1688">4 Measure the voltage between stability assist module C155 pin 16, circuit 30-CF6A (RD), C155 pin 22, circuit 20-CF6A (PK/YE), harness side and ground; and between stability assist module C155 pin 33, circuit 30-CF13 (RD), harness side and ground.</p> <ul data-bbox="858 1892 1294 1957" style="list-style-type: none"> ● Are the voltages greater than 10 volts? <p data-bbox="810 2000 895 2033">→ Yes</p>

	<p>GO to C3.</p> <p>→ No REPAIR circuit 20-CF6A (PK/YE) or circuit 30-CF13 (RD). CLEAR the DTCs. REPEAT the self-test.</p>
--	---

C3 CHECK CIRCUIT 31-CF6A (BK/YE) AND CIRCUIT 31-CF6B (BK/YE)

<p>1</p>  <p>2</p>  <p>A0043709</p>	<p>2</p> <p>Measure the resistance between the stability assist module C155 pin 15, circuit 31-CF6A (BK/YE), harness side and ground; and between C155 pin 32, circuit 31-CF6B (BK/YE), harness side and ground.</p> <ul style="list-style-type: none"> • Are the resistances less than 5 ohms? <p>→ Yes INSTALL a new stability assist module. REFER to Anti-Lock Brake System (ABS) Module—Stability Assist in this section. REPEAT the self-test.</p> <p>→ No REPAIR circuit 31-CF6A (BK/YE) or circuit 31-CF6B (BK/YE). REPEAT the self-test.</p>
---	--

PINPOINT TEST D: DTC C1095 — ABS HYDRAULIC PUMP MOTOR CIRCUIT FAILURE

CONDITIONS	DETAILS/RESULTS/ACTIONS
D1 CHECK ABS PUMP MOTOR	
<p>1</p> 	<ul style="list-style-type: none"> • Is the ABS pump motor running all the time? <p>→ Yes</p>

INSTALL a new stability assist module. REFER to [Anti-Lock Brake System \(ABS\) Module—Stability Assist](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
GO to [D2](#).

D2 CHECK PUMP MOTOR OPERATION

1

2 Trigger the stability assist module active command PMP MOTOR ON.

- Does the ABS pump motor run for approximately three seconds?

→ **Yes**
CLEAR the DTC. CHECK the yellow ABS warning indicator while driving the vehicle (brakes must not be applied) above 32 km/h (20 mph). If the yellow ABS warning indicator illuminates, RETRIEVE the DTCs. If DTC C1095 is retrieved, INSTALL a new HCU. REFER to [Hydraulic Control Unit \(HCU\)](#). CLEAR the DTCs. REPEAT the self-test. If the yellow ABS warning indicator does not illuminate, system is OK.

→ **No**
TRIGGER the stability assist module active command PMP MOTOR OFF. GO to [D3](#).

D3 CHECK CIRCUIT 30-CF13 (RD) FOR AN OPEN

1

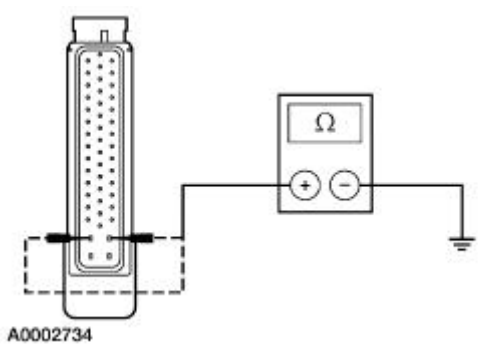

Stability Assist Module C155

2

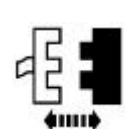

2 Measure the voltage between stability assist module C155 pin 33, circuit 30-CF13 (RD) and C155 pin 16, circuit 30-CF6A (RD), harness side, and ground.

- Is the voltage greater than 10 volts?

	<p>→ Yes GO to D4.</p> <p>→ No REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.</p>
<p>D4 CHECK CIRCUIT 31-CF6A (BK/YE) AND 31-CF6B (BK/YE) FOR AN OPEN</p>	
<p>1</p>  <p>A0002734</p>	<p>1 Measure the resistance between stability assist module C155 pin 15, circuit 31-CF6A (BK/YE), harness side, and ground; and between stability assist module C155 pin 32, circuit 31-CF6B (BK/YE), harness side, and ground.</p> <p>• Are the resistances less than 5 ohms?</p> <p>→ Yes INSTALL a new HCU. REFER to Hydraulic Control Unit (HCU). REPEAT the self-test.</p> <p>→ No REPAIR circuit 31-CF6B (BK/YE) or circuit 31-CF6A (BK/YE). CLEAR the DTCs. REPEAT the self-test.</p>

PINPOINT TEST E: DTC C1145 (RF), DTC C1155 (LF), DTC C1165 (RR), DTC C1175 (LR) — ANTI-LOCK BRAKE SENSOR INPUT CIRCUIT FAILURE

CONDITIONS	DETAILS/RESULTS/ACTIONS
<p>NOTE: Any time an anti-lock brake sensor is removed, thoroughly clean the mounting surfaces and apply High Temperature 4x4 Front Axle and Wheel Bearing Grease E8TZ-19590-A or equivalent meeting Ford specification ESA-M1C198-A.</p>	
<p>E1 CHECK FOR SHORT TO POWER</p>	
<p>NOTE: Both circuits must be checked for each DTC.</p>	
<p>1</p>  <p>2</p> 	

Stability Assist Module C155

3

Suspect Anti-lock Brake Sensor

4

5

5

Measure the voltage between stability assist module C155 pin, harness side, and ground, as follows:

DTC	Stability Assist Module C155	Circuit
C1145 (RF)	Pin 35	7-CF38 (YE/RD)
C1145 (RF)	Pin 34	8-CF38 (WH/RD)
C1155 (LF)	Pin 1	7-CF32 (YE)
C1155 (LF)	Pin 2	8-CF32 (WH)
C1165 (RR)	Pin 38	7-CF40 (YE/GN)
C1165 (RR)	Pin 37	8-CF40 (WH/GN)
C1175 (LR)	Pin 5	7-CF34 (YE/BU)
C1175 (LR)	Pin 4	8-CF34 (WH/BU)

● Is voltage present?

→ Yes

If DTC C1145, REPAIR circuit 7-CF38 (YE/RD) or circuit 8-CF38 (YE/BK). CLEAR the DTCs. REPEAT the self-test.

If DTC C1155, REPAIR circuit 7-CF32 (YE) or circuit 8-CF32 (WH). CLEAR the DTCs. REPEAT the self-test.

If DTC C1165, REPAIR circuit 7-CF40 (YE/GN) or circuit 8-CF40 (WH/GN). CLEAR the DTCs. REPEAT the self-test.

If DTC C1175, REPAIR circuit 7-CF34 (YE/BU) or circuit 8-CF34 (WH/BU). CLEAR the DTCs. REPEAT the self-test.

→ **No**
GO to [E2](#).

E2 CHECK FOR SHORT TO GROUND

NOTE: Both circuits must be checked for each DTC.

1

2

2 Measure the resistance between stability assist module C155 pin, harness side, and ground, as follows:

DTC	Stability Assist Module C155	Circuit
C1145 (RF)	Pin 35	7-CF38 (YE/RD)
C1145 (RF)	Pin 34	8-CF38 (WH/RD)
C1155 (LF)	Pin 1	7-CF32 (YE)
C1155 (LF)	Pin 2	8-CF32 (WH)
C1165 (RR)	Pin 38	7-CF40 (YE/GN)
C1165 (RR)	Pin 37	8-CF40 (WH/GN)
C1175 (LR)	Pin 5	7-CF34 (YE/BU)
C1175 (LR)	Pin 4	8-CF34 (WH/BU)

● **Are the resistances greater than 10,000 ohms?**

→ **Yes**
GO to [E3](#).

→ **No**
If DTC C1145, REPAIR circuit 7-CF38 (YE/RD) or circuit 8-CF38 (YE/BK). CLEAR the DTCs. REPEAT the self-test.

If DTC C1155, REPAIR circuit 7-CF32 (YE) or circuit 8-CF32 (WH). CLEAR the DTCs. REPEAT the self-test.

If DTC C1165, REPAIR circuit 7-CF40 (YE/GN) or circuit 8-CF40 (WH/GN). CLEAR the DTCs. REPEAT the self-test.

If DTC C1175, REPAIR circuit 7-CF34 (YE/BU) or circuit 8-CF34 (WH/BU).

CLEAR the DTCs. REPEAT the self-test.

E3 CHECK FOR AN OPEN

NOTE: Both circuits must be checked for each DTC.

- 1 Measure the resistance between stability assist module C155 pins, harness side, and suspect anti-lock brake sensor connector, harness side, as follows:

DTC	Stability Assist Module C155	Anti-lock Brake Sensor	Circuit
C1145 (RF)	Pin 35	C160 Pin 1	7-CF38 (YE/RD)
C1145 (RF)	Pin 34	C160 Pin 2	8-CF38 (YE/BK)
C1155 (LF)	Pin 1	C150 Pin 1	7-CF32 (YE)
C1155 (LF)	Pin 2	C150 Pin 2	8-CF32 (WH)
C1165 (RR)	Pin 38	C426 Pin 1	7-CF40 (YE/GN)
C1165 (RR)	Pin 37	C426 Pin 2	8-CF40 (WH/GN)
C1175 (LR)	Pin 5	C440 Pin 1	7-CF34 (YE/BU)
C1175 (LR)	Pin 4	C440 Pin 2	8-CF34 (WH/BU)

- Is the resistance less than 5 ohms?

→ **Yes**
GO to [E4](#).

→ **No**
If DTC C1145, REPAIR circuit 7-CF38 (YE/RD) or circuit 8-CF38 (YE/BK). CLEAR the DTCs. REPEAT the self-test.

If DTC C1155, REPAIR circuit 7-CF32 (YE) or circuit 8-CF32 (WH). CLEAR the DTCs. REPEAT the self-test.

If DTC C1165, REPAIR circuit 7-CF40 (YE/GN) or circuit 8-CF40 (WH/GN). CLEAR the DTCs. REPEAT the self-test.

If DTC C1175, REPAIR circuit 7-CF34 (YE/BU) or circuit 8-CF34 (WH/BU). CLEAR the DTCs. REPEAT the self-test.

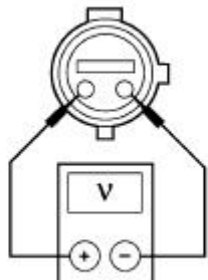

E4 CHECK THE STABILITY ASSIST MODULE OUTPUT

1

Stability Assist Module C155

2 

3 

A0006087

3 Measure the voltage between suspect anti-lock brake sensor pins, harness side.

● Is the voltage less than 9 volts?

→ **Yes**
 INSTALL a new stability assist module. REFER to [Anti-Lock Brake System \(ABS\) Module—Stability Assist](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
 INSTALL a new wheel speed sensor. REFER to [Front Wheel Speed Sensor](#) or [Rear Wheel Speed Sensor](#). CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST F: DTC C1233 (LF), DTC C1234 (RF), DTC C1235 (RR), DTC C1236 (LR) — ANTI-LOCK BRAKE SENSOR INPUT SIGNAL MISSING

CONDITIONS	DETAILS/RESULTS/ACTIONS
	<p>NOTE: Any time an anti-lock brake sensor is removed, thoroughly clean the mounting surfaces and apply High Temperature 4x4 Front Axle and Wheel Bearing Grease E8TZ-19590-A or equivalent meeting Ford specification ESA-M1C198-A.</p>
	<p>F1 CHECK THE ANTI-LOCK BRAKE SENSOR</p> <p>1 Check the suspect anti-lock brake sensor mounting. Check the suspect anti-lock brake sensor for excessive dirt buildup, metal obstructions, incorrect harness routing, and chafing.</p> <p>● Is the suspect anti-lock brake sensor OK?</p> <p>→ Yes GO to F2.</p>

	<p>→ No REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.</p>
F2 CHECK THE ANTI-LOCK BRAKE SENSOR INDICATOR	
<p>1 Check the suspect anti-lock brake sensor indicator for corrosion, nicks, damaged teeth, correct mounting, alignment, and consistent air gap.</p> <p>● Is the suspect anti-lock brake sensor indicator OK?</p>	<p>→ Yes INSTALL a new anti-lock brake sensor; REFER to Front Wheel Speed Sensor or Rear Wheel Speed Sensor. CLEAR the DTCs. REPEAT the self-test.</p> <p>→ No REPAIR as necessary. CLEAR the DTCs. REPEAT the self-test.</p>

PINPOINT TEST G: DTC C1277 — STEERING WHEEL ANGLE 1 AND 2 CIRCUIT FAILURE, DTC C1278 — STEERING WHEEL ANGLE 1 AND 2 CIRCUIT FAULTED

CONDITIONS	DETAILS/RESULTS/ACTIONS
G1 CARRY OUT THE RECALIBRATION PROCEDURE	
<p>1</p>  <p>2</p>  <p>Clear the DTC</p> <p>4</p>  <p>Retrieve DTCs</p>	<p>3 Carry out the steering wheel angle recalibration procedure using the NGS Tester.</p> <p>● Are any DTCs retrieved or does the recalibration procedure indicate a fault?</p> <p>→ Yes If DTC C1277 or C1278 is retrieved or recalibration procedure indicates a fault, GO to G2.</p>

If any other DTC, GO to the Stability Assist Module Diagnostic Trouble Code (DTC) Index.

→ **No**
The stability assist system is operating correctly.

The DTC C1278 was meant for detection of steering wheel rotation sensor harness wiring problems at vehicle assembly time. The steering wheel rotation sensor circuit is checked for swapped wires (channel A and B). This DTC should not occur during repair unless the harness wiring to the steering wheel rotation sensor was changed or the PRNDL position indicator is not operating correctly. The DTC will occur only after driving a few feet and making a turn if the wiring problem or PRNDL problem exists.

G2 CHECK THE VOLTAGE TO THE STEERING WHEEL ROTATION SENSOR

1

2

Steering Wheel Rotation Sensor C226

3

4

A0002737

4 Measure the voltage between steering wheel rotation sensor C226 pin 4, circuit 15-CC16 (GN/OG), harness side, and ground.

● **Is the voltage greater than 10 volts?**

→ **Yes**
GO to [G3](#).

→ **No**
REPAIR the circuit. CLEAR the DTCs.

RECALIBRATE the stability assist module. REPEAT the self-test.

G3 CHECK THE STEERING WHEEL ROTATION SENSOR CIRCUITRY FOR SHORT TO POWER

1

2

Stability Assist Module C155

3

4

A0002738

4 Measure the voltage between stability assist module C155 pins, harness side and ground as follows:

Stability Assist Module C155	Circuit
Pin 30	9-CC16 (BN/YE)
Pin 47	8-CC18 (WH/RD)
Pin 14	10-CC17 (GY)

• Is any voltage present?

→ **Yes**
REPAIR the circuit in question. CLEAR the DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

→ **No**
GO to [G4](#).

G4 CHECK THE STEERING WHEEL ROTATION SENSOR CIRCUITRY FOR SHORT TO GROUND

1

2

2 Measure the resistance between stability assist module C155 pins, harness side and ground as follows:

Stability Assist	

Module C155	Circuit
Pin 30	9-CC16 (BN/YE)
Pin 47	8-CC18 (WH/RD)
Pin 14	10-CC17 (GY)

- Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to [G5](#).

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

G5 CHECK THE STEERING WHEEL ROTATION SENSOR CIRCUITRY FOR AN OPEN

- 2 Measure the resistance between stability assist module C155 pins, harness side, and steering wheel rotation sensor C226 pins, harness side, as follows:

Stability Assist Module C155	Steering Wheel Rotation Sensor C226	Circuit
Pin 30	Pin 1	9-CC16 (BN/YE)
Pin 47	Pin 2	8-CC18 (WH/RD)
Pin 14	Pin 3	10-CC17 (GY)

- Is the resistance less than 5 ohms?

→ **Yes**
GO to [G6](#).

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

G6 CHECK THE STEERING WHEEL ROTATION SENSOR OUTPUT

1

Steering Wheel Rotation Sensor C226

2

A0002741

3

4

A0002742

2

Connect a fused (5A) jumper wire between stability assist module C155-30, circuit 9-CC16 (BN/YE), harness side, and ground.

4

NOTE: The WDS scan tool can also be used to monitor steering wheel rotation sensor output PIDs.

Connect 73III Automotive Meter leads between stability assist module C155-14, circuit 10-CC17 (GY), harness side, and ground; and between stability assist module C155-47, circuit 8-CC18 (WH/RD), harness side, and ground.

- While turning the steering wheel in each direction, is the voltage switching from 0 to 2 volts \pm 0.5 volt?

→ Yes

INSTALL a new stability assist module. REFER to [Anti-Lock Brake System \(ABS\) Module—Stability Assist](#) . REPEAT the self-test.

→ No

INSTALL a new steering wheel rotation sensor. REFER to [Section 211-02](#) . CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST H: DTC C1279 — YAW RATE SENSOR CIRCUIT FAILURE, DTC C1280 — YAW RATE SENSOR SIGNAL FAULT

CONDITIONS	DETAILS/RESULTS/ACTIONS
------------	-------------------------

H1 CARRY OUT THE RECALIBRATION PROCEDURE

1

2

Clear DTC

4

Retrieve DTCs

3

Carry out the yaw rate sensor recalibration procedure using the NGS Tester.

- **Are any DTCs retrieved or does the recalibration procedure indicate a fault?**

→ **Yes**

If DTC C1279 or C1280 is retrieved, or yaw rate portion of the recalibration procedure indicates failed, GO to [H2](#).

If any other DTC, GO to the Stability Assist Module Diagnostic Trouble Code (DTC) Index.

→ **No**

The stability assist system is operating correctly.

H2 CHECK THE STABILITY ASSIST MODULE PID YAWRATE

1

Monitor the stability assist module PID YAWRATE.

- **Is the stability assist module PID YAWRATE value between 479 and 545?**

→ **Yes**

CLEAR DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

→ **No**

GO to [H3](#).

H3 CHECK THE RETURN SIGNAL VOLTAGE

1

2

Stability Assist Module C155

3

A0002747

4

Stability Assist Module C155

5

6

A0002748

3

Back out the stability assist module C155 pin 27, circuit 8-CF67 (WH/RD), harness side.

6

Measure the voltage between stability assist module C155 pin 27, circuit 8-CF67 (WH/RD), harness side, and ground.

● Is the voltage approximately 2.5 volts?

→ **Yes**
RECONNECT the backed out pin. GO to [H4](#).

→ **No**
GO to [H5](#).

H4 REVERIFY THE STABILITY ASSIST MODULE PID YAWRATE

1

Monitor the stability assist module PID

YAWRATE.

- Is the stability assist module PID YAWRATE value between 479 and 545?

→ **Yes**

Check the stability assist module connector for loose or corroded pins. CLEAR the DTCs. REPEAT the self-test.

→ **No**

INSTALL a new stability assist module. REFER to [Anti-Lock Brake System \(ABS\) Module—Stability Assist](#). REPEAT the self-test.

H5 CHECK YAW RATE SENSOR CIRCUITRY FOR SHORT TO POWER

1

2

Stability Assist Module C155

3

Yaw Rate Sensor C245

4

5

5

Measure the voltage between stability assist module C155 pins, harness side, and ground as follows:

Stability Assist Module C155	Circuit
Pin 27	8-CF67 (WH/RD)
Pin 11	9-CF67 (BN/RD)
Pin 44	7-CF67 (YE/RD)

- Is any voltage present?

→ **Yes**

REPAIR the circuit in question. CLEAR the DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

→ **No**
GO to [H6](#).

H6 CHECK YAW RATE SENSOR CIRCUITRY FOR SHORT TO GROUND

1

2

2

Measure the resistance between stability assist module C155 pins, harness side, and ground as follows:

Stability Assist Module C155	Circuit
Pin 27	8-CF67 (WH/RD)
Pin 11	9-CF67 (BN/RD)
Pin 44	7-CF67 (YE/RD)

● Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to [H7](#).

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

H7 CHECK YAW RATE SENSOR CIRCUITRY FOR AN OPEN

1

1

Measure the resistance between stability assist module C155 pins, harness side, and yaw rate sensor C245 pins, harness side as follows:

Stability Assist Module C155	Yaw Rate Sensor C245	Circuit
Pin 27	Pin 1	8-CF67 (WH/RD)
Pin 11	Pin 2	9-CF67 (BN/RD)
Pin 44	Pin 3	7-CF67 (YE/RD)

● Is the resistance less than 5 ohms?

→ **Yes**
GO to [H8](#).

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

H8 CHECK THE VOLTAGE FROM THE STABILITY ASSIST MODULE

1

Stability Assist Module C155

2

3

A0002746

3 Measure the voltage between yaw rate sensor C245 pin 3, circuit 7-CF67 (YE/RD), harness side, and yaw rate sensor C245 pin 2, circuit 9-CF67 (BN/RD), harness side.

● **Is the voltage approximately 5 volts?**

→ **Yes**
INSTALL a new yaw rate sensor. REFER to [Yaw Rate Sensor](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
INSTALL a new stability assist module. REFER to [Anti-Lock Brake System \(ABS\) Module—Stability Assist](#). CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST I: DTC C1281 — LATERAL ACCELEROMETER CIRCUIT FAILURE, DTC C1282 — LATERAL ACCELEROMETER SIGNAL FAULT

CONDITIONS	DETAILS/RESULTS/ACTIONS
I1 CARRY OUT THE RECALIBRATION PROCEDURE	
1	

2

Clear DTC

4

Retrieve DTCs

3 Carry out the lateral accelerometer recalibration procedure using the NGS Tester.

- **Are any DTCs retrieved or does the recalibration procedure indicate a fault?**

→ **Yes**

If DTC C1281 or C1282 is retrieved, or lateral accelerometer portion of the recalibration procedure indicates failed, GO to [12](#).

If any other DTC, GO to the Stability Assist Module Diagnostic Trouble Code (DTC) Index.

→ **No**

The stability assist system is operating correctly.

12 CHECK THE STABILITY ASSIST MODULE PID LAT_ACC

1 Monitor the stability assist module PID LAT_ACC.

- **Is the stability assist module PID LAT_ACC value between 547 and 681?**

→ **Yes**

INSTALL a new lateral accelerometer. REFER to [Accelerometer](#). CLEAR DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

→ **No**

GO to [13](#).

13 CHECK THE RETURN SIGNAL VOLTAGE

1

2

Stability Assist Module C155

3

A0002753

4

Stability Assist Module C155

5

6

A0002748

3

Back out the stability assist module C155 pin 29, circuit 8-CF66 (WH/BU), harness side.

6

Measure the voltage between stability assist module C155 pin 29, circuit 8-CF66 (WH/BU), harness side, and ground.

● Is the voltage approximately 3 volts?

→ Yes
RECONNECT the backed out pin. GO to [14](#).

→ No
GO to [15](#).

14 REVERIFY THE STABILITY ASSIST MODULE PID LAT_ACC

1

Monitor the stability assist module PID

LAT_ACC.

- Is the stability assist module PID LAT_ACC value between 547 and 681?

→ **Yes**

Check the stability assist module connector for loose or corroded pins. CLEAR the DTCs. REPEAT the self-test.

→ **No**

INSTALL a new stability assist module. REFER to [Anti-Lock Brake System \(ABS\) Module—Stability Assist](#). REPEAT the self-test.

15 CHECK LATERAL ACCELEROMETER CIRCUITRY FOR SHORT TO POWER

1

2

Stability Assist Module C155

3

Lateral Accelerometer C244

4

5

5

Measure the voltage between stability assist module C155 pins, harness side, and ground, as follows:

Stability Assist Module C155	Circuit
Pin 13	9-CF66 (BN/BU)
Pin 29	8-CF66 (WH/BU)
Pin 46	7-CF66 (YE/BU)

- Is any voltage present?

→ **Yes**

REPAIR the circuit in question. CLEAR the DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

→ **No**
GO to [16](#).

16 CHECK LATERAL ACCELEROMETER CIRCUITRY FOR SHORT TO GROUND

1

2

2

Measure the resistance between stability assist module C155 pins, harness side, and ground as follows:

Stability Assist Module C155	Circuit
Pin 13	9-CF66 (BN/BU)
Pin 29	8-CF66 (WH/BU)
Pin 46	7-CF66 (YE/BU)

● Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to [17](#).

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

17 CHECK LATERAL ACCELEROMETER CIRCUITRY FOR AN OPEN

1

1

Measure the resistance between stability assist module C155 pins, harness side, and lateral accelerometer C244 pin, harness side as follows:

Stability Assist Module C155	Lateral Accelerometer C244	Circuit
Pin 13	Pin 1	9-CF66 (BN/BU)
Pin 29	Pin 2	8-CF66 (WH/BU)
Pin 46	Pin 3	7-CF66 (YE/BU)

● Is the resistance less than 5 ohms?

→ **Yes**
GO to [18](#).

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

18 CHECK THE VOLTAGE FROM THE STABILITY ASSIST MODULE

1

Stability Assist Module C155

2

3

A0002752

3 Measure the voltage between lateral accelerometer C244 pin 3, circuit 7-CF66 (YE/BU), harness side, and lateral accelerometer C244 pin 1, circuit 9-CF66 (BN/BU), harness side.

● **Is the voltage approximately 5 volts?**

→ **Yes**
INSTALL a new lateral accelerometer. REFER to [Accelerometer](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
INSTALL a new stability assist module. REFER to [Anti-Lock Brake System \(ABS\) Module—Stability Assist](#). CLEAR the DTCs. REPEAT the self-test.

PINPOINT TEST J: DTC C1285—BRAKE BOOSTER SOLENOID OUTPUT FAILURE

CONDITIONS	DETAILS/RESULTS/ACTIONS
J1 CARRY OUT THE RECALIBRATION PROCEDURE	
1	

2

Clear DTC

4

Retrieve DTCs

3 Carry out the brake booster recalibration procedure using the NGS Tester.

• Are any DTCs retrieved or does the recalibration procedure indicate a fault?

→ Yes

If DTC C1285 is retrieved, or brake booster portion of the recalibration procedure indicates failed, GO to [J2](#).

If any other DTC, GO to the Stability Assist Module Diagnostic Trouble Code (DTC) Index.

→ No

The stability assist system is operating correctly.

J2 CHECK THE BRAKE BOOSTER SOLENOID

1

2

Brake Booster C149

3

3 Measure the resistance between brake booster pin 3 (component side) and brake booster solenoid pin 4 (component side).

A0002754

- Is the resistance between 1 and 2 ohms?

→ **Yes**
GO to [J3](#).

→ **No**
INSTALL a new brake booster. REFER to [Section 206-07](#). CLEAR the DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

J3 CHECK THE BRAKE BOOSTER SOLENOID CIRCUITRY FOR SHORT TO POWER

1

Stability Assist Module C155

2

3

A0004059

- 3 Measure the voltage between stability assist module C155 pin 8, circuit 8-CF68 (WH/RD), harness side, and ground; and stability assist module C155 pin 24, circuit 9-CF68 (BN/RD), harness side, and ground.

- Is the any voltage present?

→ **Yes**
REPAIR the circuit in question. CLEAR the DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

→ **No**
GO to [J4](#).

J4 CHECK CIRCUIT 8-CF68 (WH/RD)

1

2

2

Measure the resistance between stability assist module C155 pin 8, circuit 8-CF68 (WH/RD), harness side, and brake booster C149 pin 4, circuit 8-CF68 (WH/RD), harness side; and stability assist module C155 pin 8, circuit 8-CF68 (WH/RD), harness side, and ground.

- Is the resistance less than 5 ohms between stability assist module and brake booster; and greater than 10,000 ohms between stability assist module and ground?

→ **Yes**
GO to [J5](#).

→ **No**
REPAIR the circuit. CLEAR the DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

J5 CHECK CIRCUIT 9-CF68 (BN/RD)

1

1

Measure the resistance between stability assist module C155 pin 24, circuit 9-CF68 (BN/RD), harness side, and brake booster C149 pin 3, circuit 9-CF68 (BN/RD), harness side; and stability assist module C155 pin 24, circuit 9-CF68 (BN/RD), harness side and ground.

- Is the resistance less than 5 ohms between stability assist module and brake booster; and greater than 10,000 ohms between stability assist module and ground?

→ **Yes**
GO to [J6](#).

→ **No**

REPAIR the circuit. CLEAR the DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

J6 CHECK THE BRAKE BOOSTER SOLENOID FOR CORRECT OPERATION

1

Brake Booster C149

2

4

3 Wait a few minutes to create engine vacuum in the brake booster and then place the ignition switch in the OFF position.

4 Connect a fused (10A) jumper wire between stability assist module pin 8, circuit 8-CF68 (WH/RD), harness side, and ground; and connect a fused (10A) jumper wire for several seconds between stability assist module pin 24, circuit 9-CF68 (WH/RD), harness side, and the positive battery post, while observing the brake pedal for movement.

● Does the brake pedal move?

→ **Yes**
INSTALL a new stability assist module. REFER to [Anti-Lock Brake System \(ABS\) Module—Stability Assist](#). REPEAT the self-test.

→ **No**
INSTALL a new brake booster. REFER to [Section 206-07](#). CLEAR the DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

PINPOINT TEST K: DTC C1286—BOOSTER MECHANICAL FAILURE

CONDITIONS	DETAILS/RESULTS/ACTIONS
K1 CARRY OUT THE RECALIBRATION PROCEDURE	
<p>1</p> 	

2

Clear DTC

4

Clear DTC

5

Retrieve DTCs

3 Carry out the brake booster recalibration procedure using the NGS Tester.

• Are any DTCs retrieved or does the recalibration procedure indicate a fault?

→ Yes

If DTC C1286 is retrieved or recalibration procedure indicate a fault, GO to [K2](#).

If any other DTC, GO to the Stability Assist Module Diagnostic Trouble Code (DTC) Index.

→ No

The stability assist system is operating correctly.

K2 CHECK THE BRAKE BOOSTER SOLENOID

1

2

Brake Booster C149

3

3 Measure the resistance between brake booster pin 3 (component side) and brake booster solenoid pin 4 (component side).

A0002754

- Is the resistance between 1 and 2 ohms?

→ **Yes**
GO to [K3](#).

→ **No**
INSTALL a new brake booster. REFER to [Section 206-07](#). CLEAR the DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

K3 CHECK THE BRAKE BOOSTER SOLENOID CIRCUITRY FOR SHORT TO POWER

1

Stability Assist Module C155

2

3

A0004059

- 3 Measure the voltage between stability assist module C155 pin 8, circuit 8-CF68 (WH/RD), harness side and ground; and stability assist module C155 pin 24, circuit 9-CF68 (BN/RD), harness side and ground.

- Is the any voltage present?

→ **Yes**
REPAIR the circuit in question. CLEAR the DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

→ **No**
GO to [K4](#).

K4 CHECK CIRCUIT 8-CF68 (WH/RD)

1

2

A0005425

2

Measure the resistance between stability assist module C155 pin 8, circuit 8-CF68 (WH/RD), harness side, and brake booster C149 pin 4, circuit 8-CF68 (WH/RD), harness side; and stability assist module C155 pin 8, circuit 8-CF68 (WH/RD), harness side, and ground.

- Is the resistance less than 5 ohms between stability assist module and brake booster; and greater than 10,000 ohms between stability assist module and ground?

→ **Yes**
GO to [K5](#).

→ **No**
REPAIR the circuit. CLEAR the DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

K5 CHECK CIRCUIT 9-CF68 (BN/RD)

1

A0005426

1

Measure the resistance between stability assist module C155 pin 24, circuit 9-CF68 (BN/RD), harness side, and brake booster C149 pin 3, circuit 9-CF68 (BN/RD), harness side; and stability assist module C155 pin 24, circuit 9-CF68 (BN/RD), harness side, and ground.

- Is the resistance less than 5 ohms between stability assist module and brake booster; and greater than 10,000 ohms between stability assist module and ground?

→ **Yes**
GO to [K6](#).

→ **No**
REPAIR the circuit. CLEAR the DTCs.

RECALIBRATE the stability assist module. REPEAT the self-test.

K6 CHECK THE BRAKE BOOSTER SOLENOID FOR CORRECT OPERATION

1

Brake Booster C149

2

4

3 Wait a few minutes to create engine vacuum in the brake booster and then place the ignition switch in the OFF position.

4 Connect a fused (10A) jumper wire between stability assist module pin 8, circuit 8-CF68 (WH/RD), harness side, and ground; and connect a fused (10A) jumper wire for several seconds between stability assist module pin 24, circuit 9-CF68 (BN/RD), harness side, and the positive battery post, while observing the brake pedal for movement.

● Does the brake pedal move?

→ **Yes**
 INSTALL a new stability assist module. REFER to [Anti-Lock Brake System \(ABS\) Module—Stability Assist](#). REPEAT the self-test.

→ **No**
 INSTALL a new brake booster. REFER to [Section 206-07](#). CLEAR the DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

PINPOINT TEST L: DTC C1287 — BOOSTER PEDAL FORCE SWITCH CIRCUIT FAILURE

CONDITIONS	DETAILS/RESULTS/ACTIONS
L1 CARRY OUT THE RECALIBRATION PROCEDURE	
<p>1</p> 	

2

Clear DTC

4

Retrieve DTCs

3

Carry out the brake booster recalibration procedure using the NGS Tester.

● Are any DTCs retrieved or does the recalibration procedure indicate a fault?

→ Yes

If DTC C1287 is retrieved or recalibration procedure indicates a fault, GO to [L2](#).

If any other DTC, GO to the Stability Assist Module Diagnostic Trouble Code (DTC) Index.

→ No

The stability assist system is operating correctly.

L2 CHECK THE NORMALLY CLOSED RELEASE SWITCH

1

2

Brake Booster C149

3

A0002759

3

Measure the resistance between brake booster pin 2 (component side) and brake booster pin 5 (component side), while depressing and releasing the brake pedal.

● Is the resistance less than 5 ohms when the brake pedal is pressed

and greater than 10,000 ohms when the brake pedal is released?

→ **Yes**
GO to [L3](#).

→ **No**
INSTALL a new brake booster. REFER to [Section 206-07](#). CLEAR the DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

L3 CHECK THE NORMALLY OPEN RELEASE SWITCH

1

A0002758

1

Measure the resistance between brake booster pin 1 (component side) and brake booster pin 5 (component side), while depressing and releasing the brake pedal.

- Is the resistance less than 5 ohms with the brake pedal depressed and greater than 10,000 ohms with the brake pedal released?

→ **Yes**
GO to [L4](#).

→ **No**
INSTALL a new brake booster. REFER to [Section 206-07](#). CLEAR the DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

L4 CHECK THE BRAKE BOOSTER CIRCUITRY FOR SHORT TO POWER

1

Stability Assist Module C155

2

3

3

Measure the voltage between stability assist module C155 pins, harness side, and ground, as follows:

Stability Assist Module C155	Circuit
------------------------------	---------

A0004060

Pin 40	9-CF51 (BN/GN)
Pin 7	10-CF51 (GY/OG)
Pin 6	8-CF51 (WH/GN)

● Is any voltage present?

- **Yes**
REPAIR the circuit in question. CLEAR the DTC. RECALIBRATE the stability assist module. REPEAT the self-test.
- **No**
GO to [L5](#).

L5 CHECK THE BRAKE BOOSTER CIRCUITRY

A0002760

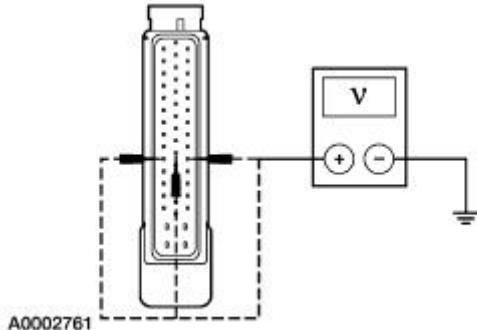

2 Measure the resistance between stability assist module C155 pins, harness side, and brake booster C149 pins, harness side, as follows:

Stability Assist Module C155	Brake Booster C149	Circuit
Pin 40	Pin 5	9-CF51 (BN/GN)
Pin 7	Pin 2	10-CF51 (GY/OG)
Pin 6	Pin 1	8-CF51 (WH/GN)

● Are the resistances less than 5 ohms?

- **Yes**
INSTALL a new stability assist module. REFER to [Anti-Lock Brake System \(ABS\) Module—Stability Assist](#). REPEAT the self-test.
- **No**
REPAIR the circuit in question. CLEAR the DTC. RECALIBRATE the stability assist module. REPEAT the self-test.

PINPOINT TEST M: DTC C1288—PRESSURE TRANSDUCER MAIN/PRIMARY INPUT CIRCUIT FAILURE

CONDITIONS	DETAILS/RESULTS/ACTIONS								
<p>NOTE: When diagnosing this DTC, the main/primary pressure transducer is the C147 pin 1, Circuit 9-CF64 (BN/YE). The pressure transducer connectors can be connected to either the main or the redundant pressure transducer and still operate correctly, therefore the wire color must be looked at before continuing diagnostics.</p>									
<p>M1 CHECK MAIN/PRIMARY PRESSURE TRANSDUCER CIRCUITRY FOR SHORT TO POWER</p>									
<p>1 </p> <p>2  Stability Assist Module C155</p> <p>3  Main/Primary Pressure Transducer C147</p> <p>4 </p> <p>5  A0002761</p>	<p>5 Measure the voltage between stability assist module C155 pins, harness side, and ground as follows:</p> <table border="1" data-bbox="890 1440 1345 1748"> <thead> <tr> <th>Stability Assist Module C155</th> <th>Circuit</th> </tr> </thead> <tbody> <tr> <td>Pin 43</td> <td>9-CF64 (BN/YE)</td> </tr> <tr> <td>Pin 26</td> <td>8-CF64 (WH/BK)</td> </tr> <tr> <td>Pin 10</td> <td>7-CF64 (YE/BK)</td> </tr> </tbody> </table> <p>• Is any voltage present?</p> <p>→ Yes REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.</p> <p>→ No</p>	Stability Assist Module C155	Circuit	Pin 43	9-CF64 (BN/YE)	Pin 26	8-CF64 (WH/BK)	Pin 10	7-CF64 (YE/BK)
Stability Assist Module C155	Circuit								
Pin 43	9-CF64 (BN/YE)								
Pin 26	8-CF64 (WH/BK)								
Pin 10	7-CF64 (YE/BK)								

GO to [M2](#).

M2 CHECK MAIN/PRIMARY PRESSURE TRANSDUCER CIRCUITRY FOR SHORT TO GROUND

1

2

2

Measure the resistance between stability assist module C155 pins, harness side, and ground, as follows:

Stability Assist Module C155	Circuit
Pin 43	9-CF64 (BN/YE)
Pin 26	8-CF64 (WH/BK)
Pin 10	7-CF64 (YE/BK)

● Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to [M3](#).

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

M3 CHECK MAIN/PRIMARY PRESSURE TRANSDUCER CIRCUITRY FOR AN OPEN

1

1

Measure the resistance between stability assist module C155 pins, harness side, and main/primary pressure transducer C147 pins, harness side, as follows:

Stability Assist Module C155	Main/Primary Pressure Transducer C147	Circuit
Pin 43	Pin 1	9-CF64 (BN/YE)
Pin 26	Pin 2	8-CF64 (WH/BK)
Pin 10	Pin 3	7-CF64 (YE/BK)

● Is the resistance less than 5 ohms?

→ **Yes**
GO to [M4](#).

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

M4 CHECK THE STABILITY ASSIST MODULE OUTPUT

1

Stability Assist Module C155

2

3

A0002764

3 Measure the voltage between main/primary pressure transducer C147 pin 3, circuit 7-CF64 (YE/BK), harness side, and main/primary pressure transducer C147 pin 1, circuit 9-CF64 (BN/YE), harness side.

- Is the voltage approximately 5 volts?

→ **Yes**
GO to [M5](#).

→ **No**
INSTALL a new stability assist module. REFER to [Anti-Lock Brake System \(ABS\) Module—Stability Assist](#). REPEAT the self-test.

M5 CHECK THE MAIN/PRIMARY PRESSURE TRANSDUCER OUTPUT

1

Main/Primary Pressure Transducer C147

2

Stability Assist Module C155

3

3 Back out the stability assist module C155 pin 26, circuit 8-CF64 (WH/BK), harness side.

A0002765

4

Stability Assist Module C155

5

6

A0002748

6 Measure the voltage between stability assist module back out pin 26, circuit 8-CF64 (WH/BK), harness side, and ground, while depressing and releasing the brake pedal.

- Is the voltage between 0.125 and 0.375 volt with the brake pedal released and between 0.125 and 5 volts with the brake pedal depressed?

→ **Yes**
INSTALL a new stability assist module. REFER to [Anti-Lock Brake System \(ABS\) Module—Stability Assist](#). REPEAT the self-test.

→ **No**
INSTALL a new main/primary pressure transducer. REFER to [Transducer—Primary](#). CLEAR the DTC. RECALIBRATE the stability assist module. REPEAT the self-test.

PINPOINT TEST N: DTC C1289—PRESSURE TRANSDUCER REDUNDANT/SECONDARY INPUT CIRCUIT FAILURE

CONDITIONS

DETAILS/RESULTS/ACTIONS

NOTE: When diagnosing this DTC, the main/primary pressure transducer is the C148 pin 1, circuit 9-CF65 (BN/WH). The pressure transducer connectors can be connected to either the main or the redundant pressure transducer and still operate correctly, therefore the wire color must be looked at before continuing diagnostics.

N1 CHECK REDUNDANT/SECONDARY PRESSURE TRANSDUCER CIRCUITRY FOR SHORT TO POWER

1

2

Stability Assist Module C155

3

Redundant/Secondary Pressure Transducer C148

4

5

5 Measure the voltage between stability assist module C155 pins, harness side, and ground, as follows:

Stability Assist Module C155	Circuit
Pin 45	9-CF65 (BN/WH)
Pin 28	8-CF65 (WH/VT)
Pin 12	7-CF65 (YE/VT)

● **Is any voltage present?**

→ **Yes**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

→ **No**
GO to [N2](#).

N2 CHECK REDUNDANT/SECONDARY PRESSURE TRANSDUCER CIRCUITRY FOR SHORT TO GROUND

1

2

2

Measure the resistance between stability assist module C155 pins, harness side, and ground, as follows:

Stability Assist Module C155	Circuit
Pin 45	9-CF65 (BN/WH)
Pin 28	8-CF65 (WH/VT)
Pin 12	7-CF65 (YE/VT)

● Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to [N3](#).

→ **No**
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

N3 CHECK REDUNDANT/SECONDARY PRESSURE TRANSDUCER CIRCUITRY FOR AN OPEN

1

1

Measure the resistance between stability assist module C155 pins, harness side and redundant/secondary pressure transducer C148 pins, harness side as follows:

Stability Assist Module C155	Redundant/Secondary-Pressure-Transducer-C148	Circuit
Pin 45	Pin 1	9-CF65 (BN/WH)
Pin 28	Pin 2	8-CF65 (WH/VT)
Pin 12	Pin 3	7-CF65 (YE/VT)

● Is the resistance less than 5 ohms?

→ **Yes**
GO to [N4](#).

→ **No**
REPAIR the circuit in question. CLEAR

the DTCs. REPEAT the self-test.

N4 CHECK THE STABILITY ASSIST MODULE OUTPUT

1

Stability Assist Module C155

2

3

A0002764

3 Measure the voltage between redundant/secondary pressure transducer C148 pin 3, circuit 7-CF65 (YE/VT), harness side, and redundant/secondary pressure transducer C148 pin 1, circuit 9-CF65 (BN/WH), harness side.

● Is the voltage approximately 5 volts?

→ Yes
GO to [N5](#).

→ No
INSTALL a new stability assist module. REFER to [Anti-Lock Brake System \(ABS\) Module—Stability Assist](#). REPEAT the self-test.

N5 CHECK THE REDUNDANT/SECONDARY PRESSURE TRANSDUCER OUTPUT

1

Redundant/Secondary Pressure Transducer C148

2

Stability Assist Module C155

3

3 Back out the stability assist module C155 pin 28, circuit 8-CF65 (WH/VT), harness side.

A0002769

4

Stability Assist Module C155

5

6

A0002748

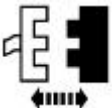

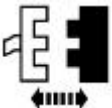

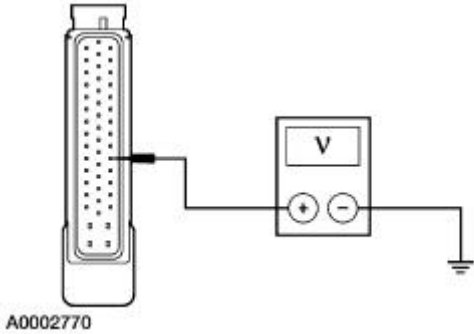

6 Measure the voltage between stability assist module back out pin 28, circuit 8-CF65 (WH/VT), harness side, and ground, while depressing and releasing the brake pedal.

- Is the voltage between 0.125 and 0.375 volt with the brake pedal released and between 0.125 and 5 volts with the brake pedal depressed?

→ **Yes**
INSTALL a new stability assist module. REFER to [Anti-Lock Brake System \(ABS\) Module—Stability Assist](#). REPEAT the self-test.

→ **No**
INSTALL a new secondary pressure transducer. REFER to [Transducer—Secondary](#). CLEAR the DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.

PINPOINT TEST O: DTC C1730 — REFERENCE VOLTAGE OUT OF RANGE (+5 V)

CONDITIONS	DETAILS/RESULTS/ACTIONS
O1 CHECK CIRCUIT 7-CF64 (YE/BK) FOR SHORT TO BATTERY	
<p>1 </p> <p>2  Stability Assist Module C155</p> <p>3  Main/Primary Pressure Transducer C147</p> <p>4 </p> <p>5  A0002770</p>	<p>5 Measure the voltage between stability assist module C155 pin 10, circuit 7-CF64 (YE/BK), harness side, and ground.</p> <p>● Is any voltage present?</p> <p>→ Yes REPAIR the circuit. CLEAR the DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.</p> <p>→ No GO to O2.</p>
O2 CHECK CIRCUIT 7-CF64 (YE/BK) FOR SHORT TO GROUND	
<p>1 </p> <p>2 </p>	<p>2 Measure the resistance between stability assist module C155 pin 10, circuit 7-CF64 (YE/BK), harness side, and ground.</p>

A0002771

- Is the resistance greater than 10,000 ohms?

- **Yes**
GO to [O3](#).
- **No**
REPAIR the circuit. CLEAR the DTC. RECALIBRATE the stability assist module. REPEAT the self-test.

O3 CHECK CIRCUIT 7-CF65 (YE/VT) FOR SHORT TO BATTERY

1

Redundant/Secondary Pressure Transducer C148

2

3

A0002772

- 3 Measure the voltage between stability assist module C155 pin 12, circuit 7-CF65 (YE/VT), harness side, and ground.

- Is any voltage present?

- **Yes**
REPAIR the circuit. CLEAR the DTC. RECALIBRATE the stability assist module. REPEAT the self-test.
- **No**
GO to [O4](#).

O4 CHECK CIRCUIT 7-CF65 (YE/VT) FOR SHORT TO GROUND

1

2

2

Measure the resistance between stability assist module C155 pin 12, circuit 7-CF65 (YE/VT), harness side, and ground.

- Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to [O5](#).

→ **No**
REPAIR the circuit. CLEAR the DTC. RECALIBRATE the stability assist module. REPEAT the self-test.

O5 CHECK CIRCUIT 7-CF66 (YE/BU) FOR SHORT TO BATTERY

1

Lateral Accelerometer C244

2

3

3

Measure the voltage between stability assist module C155 pin 46, circuit 7-CF66 (YE/BU), harness side, and ground.

- Is any voltage present?

→ **Yes**
REPAIR the circuit. CLEAR the DTC.

RECALIBRATE the stability assist module. REPEAT the self-test.

→ **No**
GO to [O6](#).

O6 CHECK CIRCUIT 7-CF66 (YE/BU) FOR SHORT TO GROUND

1

2

2 Measure the resistance between stability assist module C155 pin 46, circuit 7-CF66 (YE/BU), harness side, and ground.

● **Is the resistance greater than 10,000 ohms?**

→ **Yes**
GO to [O7](#).

→ **No**
REPAIR the circuit. CLEAR the DTC. RECALIBRATE the stability assist module. REPEAT the self-test.

O7 CHECK CIRCUIT 7-CF67 (YE/RD) FOR SHORT TO BATTERY

1

Yaw Rate Sensor C245

2

3

3 Measure the voltage between stability assist module C155 pin 44, circuit 7-CF67 (YE/RD), harness side, and ground.

● Is any voltage present?

→ **Yes**
REPAIR the circuit. CLEAR the DTC. RECALIBRATE the stability assist module. REPEAT the self-test.

→ **No**
GO to [O8](#).

O8 CHECK CIRCUIT 7-CF66 (YE/BU) FOR SHORT TO GROUND

2 Measure the resistance between stability assist module C155 pin 44, circuit 7-CF67 (YE/RD), harness side, and ground.

● Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to [O9](#).

→ **No**
REPAIR the circuit. CLEAR the DTC. RECALIBRATE the stability assist module. REPEAT the self-test.

O9 CHECK THE STABILITY ASSIST MODULE

Stability Assist Module C155

<p>2 </p> <p>3 </p> <p>Clear DTCs</p> <p>4 </p> <p>Retrieve DTCs</p>	<ul style="list-style-type: none"> ● Is DTC C1730 retrieved? <p>→ Yes INSTALL a new stability assist module. REFER to Anti-Lock Brake System (ABS) Module—Stability Assist. REPEAT the self-test.</p> <p>→ No GO to O10.</p>
---	---

O10 CHECK THE STABILITY ASSIST COMPONENTS

	<p>1 Reconnect the lateral accelerometer C244, yaw rate sensor C245, main/primary pressure transducer C147, and redundant/secondary pressure transducer C148 one at a time while clearing the DTCs and retrieving the DTCs in between each component being reconnected.</p> <ul style="list-style-type: none"> ● Is DTC C1730 retrieved? <p>→ Yes INSTALL a new component as necessary. CLEAR the DTCs. RECALIBRATE the stability assist module. REPEAT the self-test.</p> <p>→ No System is OK.</p>
--	---

PINPOINT TEST P: DTC C1960 — DRIVER BRAKE APPLY CIRCUIT FAULT

CONDITIONS	DETAILS/RESULTS/ACTIONS
P1 CHECK FOR OTHER DTCs	

<p>1 </p> <p>2  Clear DTCs</p> <p>3  Retrieve DTCs</p>	<p>● Is DTC C1960 retrieved?</p> <p>→ Yes INSTALL a new REM. REFER to Section 419-10. CLEAR the DTCs. REPEAT the self-test.</p> <p>→ No If a different DTC is retrieved, GO to the Stability Assist Module Diagnostic Trouble Code (DTC) Index.</p> <p>If no DTCs are retrieved, system is OK.</p>
---	---

PINPOINT TEST Q: THE YELLOW ABS WARNING INDICATOR DOES NOT SELF-CHECK

CONDITIONS	DETAILS/RESULTS/ACTIONS
Q1 CHECK THE YELLOW ANTI-LOCK BRAKE WARNING INDICATOR	
<p>1 </p> <p>2  Stability Assist Module C155</p> <p>3 </p>	<p>● Is the yellow anti-lock brake warning indicator illuminated?</p>

	<p>→ Yes GO to Q2.</p> <p>→ No REFER to Section 413-01.</p>
Q2 CHECK PROVE OUT	
<p>1 </p> <p>2  Stability Assist Module C162</p> <p>3 </p>	<p>● Does the yellow anti-lock brake warning indicator prove out for three seconds and then turn off?</p> <p>→ Yes The yellow anti-lock brake warning indicator is working correctly. TEST the system for normal operation.</p> <p>→ No INSTALL a new stability assist module. REFER to Anti-Lock Brake System (ABS) Module—Stability Assist. TEST the system for normal operation.</p>

PINPOINT TEST R: THE TRACTION CONTROL IS INOPERATIVE

CONDITIONS	DETAILS/RESULTS/ACTIONS
R1 CHECK FOR DTCS	
<p>1  NGS Tester</p>	<p>2 Retrieve and document continuous DTCs.</p> <p>● Are any DTCs retrieved?</p> <p>→ Yes GO to the Stability Assist Module Diagnostic Trouble Code (DTC) Index.</p>

→ **No**
GO to [R2](#).

R2 CHECK THE ABS OPERATION

- 1 Test drive the vehicle and carry out several anti-lock stops.
- **Does the ABS operate correctly?**
- **Yes**
GO to [R3](#).
- **No**
GO to the Symptom Chart.

R3 CHECK THE TRACTION CONTROL OFF INPUT TO THE STABILITY ASSIST MODULE FOR SHORT TO POWER

1

2

Stability Assist Module C155

3

4

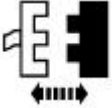

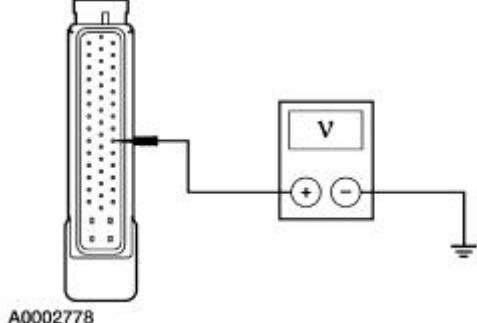

- 4 Measure the voltage between stability assist module C155 pin 9, circuit 8-CF54 (BK/GN), harness side, and ground.

- **Is any voltage present?**

→ **Yes**
GO to [R4](#).

→ **No**
INSTALL a new stability assist module. REFER to [Anti-Lock Brake System \(ABS\) Module—Stability Assist](#). TEST the system for normal operation.

R4 CHECK CIRCUIT 8-CF54 (BK/GN) FOR SHORT TO POWER

<p>1 </p> <p>2  Traction Control Switch C308</p> <p>3 </p> <p>4  A0002778</p>	<p>4 Measure the voltage between stability assist module C155 pin 9, circuit 8-CF54 (BK/GN), harness side, and ground.</p> <ul style="list-style-type: none"> • Is any voltage present? <p>→ Yes REPAIR the circuit. TEST the system for normal operation.</p> <p>→ No INSTALL a new traction control actuator. REFER to Traction Control Actuator—Advance Trac. TEST the system for normal operation.</p>
--	---

PINPOINT TEST S: THE STABILITY ASSIST/TRACTION CONTROL SWITCH INDICATOR IS NEVER/ALWAYS ON

CONDITIONS	DETAILS/RESULTS/ACTIONS
<p>S1 CHECK THE TRACTION CONTROL SWITCH</p> <p>1 </p> <p>2</p>	

Traction Control Switch C308

3

A0002337

3

Measure the resistance between traction control switch pin 1 (component side), and traction control switch pin 3 (component side).

- Is the resistance approximately 32 ohms?

→ **Yes**
GO to [S2](#).

→ **No**
INSTALL a new traction control actuator. REFER to [Traction Control Actuator—Advance Trac](#) . CLEAR the DTC. REPEAT the self-test.

S2 CHECK CIRCUIT 31S-CF45 (BK/GN) FOR SHORT TO POWER

1

Stability Assist Module 155

2

3

A0002779

3

Measure the voltage between stability assist module C155 pin 42, circuit 31S-CF45 (BK/GN), harness side, and ground.

- Is any voltage present?

→ **Yes**

REPAIR the circuit. CLEAR the DTC.
REPEAT the self-test.

→ **No**
GO to [S3](#).

S3 CHECK CIRCUIT 31S-CF45 (BK/GN)

1

2

2

Measure the resistance between stability assist module C155 pin 42, circuit 31S-CF45 (BK/GN), harness side and traction control switch C308 pin 1, circuit 31S-CF45 (BK/GN), harness side; and between stability assist module C155 pin 42, circuit 31S-CF45 (BK/GN), harness side and ground.

- **Is the resistance less than 5 ohms between the stability assist module and traction control switch; and greater than 10,000 ohms between stability assist module and ground?**

→ **Yes**
INSTALL a new stability assist module. REFER to [Anti-Lock Brake System \(ABS\) Module—Stability Assist](#). CLEAR the DTC. REPEAT the self-test.

→ **No**
REPAIR the circuit. CLEAR the DTC. REPEAT the self-test.

PINPOINT TEST T: THE STABILITY ASSIST SYSTEM CANNOT BE DISABLED

CONDITIONS	DETAILS/RESULTS/ACTIONS
T1 CHECK CIRCUIT 15-CF54 (GN/WH) FOR AN OPEN	
<p>1</p>  <p>2</p> 	

Traction Control Switch C308

3

4

A0001933

4

Measure the voltage between traction control switch C308 pin 3, circuit 15-CF54 (GN/WH), harness side, and ground.

• Is the voltage greater than 10 volts?

→ **Yes**
GO to [T2](#).

→ **No**
REPAIR circuit 15-CF54 (GN/WH) or circuit 15-DA5 (GN/OG). TEST the system for normal operation.

T2 CHECK THE TRACTION CONTROL SWITCH

1

A0001934

1

Measure the resistance between traction control switch pin 3 (component side), and traction control switch pin 4 (component side), while depressing the traction control switch.

• Is the resistance less than 5 ohms?

→ **Yes**
GO to [T3](#).

→ **No**
INSTALL a new traction control actuator. REFER to [Traction Control Actuator—Advance Trac](#). TEST the system for normal operation.

T3 CHECK CIRCUIT 8-CF54 (WH/VT) FOR AN OPEN

1

2

Stability Assist Module C155

3

A0002781

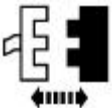

3 Measure the resistance between stability assist module pin 9, circuit 8-CF54 (WH/VT), harness side, and traction control switch C308 pin 4, circuit 8-CF54 (WH/VT), harness side.

- Is the resistance less than 5 ohms?

→ **Yes**
 INSTALL a new stability assist module. REFER to [Anti-Lock Brake System \(ABS\) Module—Stability Assist](#). TEST the system for normal operation.

→ **No**
 REPAIR the circuit. TEST the system for normal operation.

PINPOINT TEST U: THE STABILITY ASSIST INDICATOR DOES NOT SELF-CHECK

CONDITIONS	DETAILS/RESULTS/ACTIONS
U1 CHECK THE STABILITY ASSIST INDICATOR	
<p>1</p>  <p>2</p>  <p>Stability Assist Module C155</p> <p>3</p>	

● Is the stability assist indicator illuminated?

→ **Yes**
GO to [U2](#).

→ **No**
REFER to [Section 413-01](#).

U2 CHECK PROVE OUT

1

2

Stability Assist
Module C162

3

● Does the stability assist indicator prove out for three seconds and then turn off?

→ **Yes**
The stability assist indicator is working correctly. TEST the system for normal operation.

→ **No**
INSTALL a new stability assist module. REFER to [Anti-Lock Brake System \(ABS\) Module—Stability Assist](#). TEST the system for normal operation.

Hydraulic Control Unit (HCU)

Removal and Installation

⚠ WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

⚠ CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Disconnect the electrical connector by lifting up on the release tab.

3. **NOTE:** Plug each open port to prevent any brake fluid from spilling.

Disconnect the brake lines from the hydraulic control unit (HCU).

4. Remove the HCU.
 1. Remove the bolts.
 2. Remove the HCU.

5.  **WARNING:** Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately.

 **CAUTION:** Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

 **CAUTION:** After the HCU is installed, it is necessary to bleed the hydraulic brake system. For additional information, refer to [Section 206-00](#).

NOTE: When the battery is disconnected and reconnected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 mi) or more to relearn the strategy.

To install, reverse the removal procedure.

REMOVAL AND INSTALLATION

Anti-Lock Brake System (ABS) Module — Stability Assist

Removal

⚠ CAUTION: Before the module is removed, it is necessary to upload the module configuration information to the New Generation STAR (NGS) tester. For additional information, refer to [Section 418-01](#).

1. Disconnect the battery ground cable.
2. Disconnect the anti-lock brake control module electrical connector by lifting up on the release tab.

3. Position aside the underhood auxiliary junction box (AJB).
 1. Release the underhood AJB clips.
 2. Position the underhood AJB aside.

4. Remove the stability assist control module.
 1. Remove the bolts.
 2. Remove the control module.

Installation

⚠ CAUTION: Once the new module is installed, it is necessary to download the module configuration information from the New Generation STAR (NGS) Tester into the module. For additional information, refer to [Section 418-01](#).

NOTE: When the battery is disconnected and reconnected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 mi) or more to relearn the strategy.

1. To install, reverse the removal procedure.

Front Wheel Speed Sensor

Material

Item	Specification
RTV Silicone Sealant FSTZ-19G204-AB (Canada CXC-114A)	NAVSTR Sealer

Removal and Installation

1. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
2. Position the inner splash shield aside.
 1. Remove the pin-type retainers.
 2. Position the inner splash shield aside.

3. Disconnect the anti-lock brake sensor electrical connector.

4. Remove the anti-lock brake sensor harness from the brake hose clips.

5. Remove the anti-lock brake sensor.
 1. Remove the anti-lock brake sensor clip.
 2. Remove the anti-lock brake sensor.

6. **NOTE:** Make sure the anti-lock brake sensor is fully seated before installation of the new clip.

To install, reverse the removal procedure.

- Apply a 2.5 mm (0.1 in) bead of silicone sealant to the outside diameter of the anti-lock brake sensor.
-

Rear Wheel Speed Sensor

Removal and Installation

1. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
2. Disconnect the rear anti-lock brake sensor electrical connector.

3. Remove the rear anti-lock brake sensor harness from the control arm clips.

4. **NOTE:** Clean off dirt and foreign material that may have collected around the rear anti-lock brake sensor before removal.

Remove the rear anti-lock brake sensor.

1. Remove the anti-lock brake sensor bolt.
2. Remove the anti-lock brake sensor.

5. To install, reverse the removal procedure.

REMOVAL AND INSTALLATION

Yaw Rate Sensor

Removal

NOTE: The stability assist module needs to be recalibrated whenever a component is disconnected, moved, or a new component is installed. For additional information regarding the recalibration procedure and when the recalibration procedure should be carried out, refer to Principles of Operation. For additional information regarding the module configuration procedure, refer to [Section 418-01](#).

1. Remove the floor console. For additional information, refer to [Section 501-12](#).
2. Remove the center A/C duct.

3. Disconnect the yaw rate sensor electrical connector.

4. Remove the yaw rate sensor.
 1. Remove the yaw rate sensor bolts.
 2. Remove the yaw rate sensor.

Installation

NOTE: The stability assist module needs to be recalibrated whenever a component is disconnected, moved, or a new component is installed. For additional information regarding the recalibration procedure and when the recalibration procedure should be carried out, refer to Principles of Operation. For additional information regarding the module configuration procedure, refer to [Section 418-01](#).

NOTE: The yaw rate sensor is positioned with the connector pointed to the left side of the vehicle. Be sure to mount the sensor in this orientation during the installation procedure.

1. To install, reverse the removal procedure.

Traction Control Actuator — Advance Trac

Removal

1. Remove the floor console finish panel. For additional information, refer to [Section 501-12](#).
2. Disconnect the Advance Trac control switch electrical connector.

3. Remove the Advance Trac control switch.
 1. Remove the Advance Trac control switch screws.
 2. Remove the Advance Trac control switch.

Installation

1. To install, reverse the removal procedure.

Accelerometer

Removal

NOTE: The stability assist module needs to be recalibrated whenever a component is disconnected, moved, or a new component is installed. For additional information regarding the recalibration procedure and when the recalibration procedure should be carried out, refer to Principles of Operation. For additional information regarding the module configuration procedure, refer to [Section 418-01](#).

1. Remove the floor console. For additional information, refer to [Section 501-12](#).
2. Remove the console A/C duct.

3. Disconnect the lateral accelerometer electrical connector.

4. Remove the lateral accelerometer.
 1. Remove the lateral accelerometer bolts.
 2. Remove the lateral accelerometer.

Installation

NOTE: The stability assist module needs to be recalibrated whenever a component is disconnected, moved, or a new component is installed. For additional information regarding the recalibration procedure and when the recalibration procedure should be carried out, refer to Principles of Operation. For additional information regarding the module configuration procedure, refer to [Section 418-01](#).

NOTE: The accelerometer is positioned with the connector pointed to the left side of the vehicle. Be sure to mount the accelerometer in this orientation during the installation procedure.

1. To install, reverse the removal procedure.

Transducer —Primary

Removal

NOTE: The stability assist module needs to be recalibrated whenever a component is disconnected, moved, or a new component is installed. For additional information regarding the recalibration procedure and when the recalibration procedure should be carried out, refer to Principles of Operation. For additional information regarding the module configuration procedure, refer to [Section 418-01](#).

1. Position the vapor management valve aside.
 1. Remove the vapor management valve bracket bolts.
 2. Position the vapor management valve aside.

2. Disconnect the main pressure transducer electrical connector.

3. Remove the main pressure transducer.

Installation

NOTE: The stability assist module needs to be recalibrated whenever a component is disconnected, moved, or a new component is installed. For additional information regarding the recalibration procedure and when the recalibration procedure should be carried out, refer to Principles of Operation. For additional information regarding the module configuration procedure, refer to [Section 418-01](#) .

1. To install, reverse the removal procedure.
-

Transducer —Secondary

Removal

NOTE: The stability assist module needs to be recalibrated whenever a component is disconnected, moved, or a new component is installed. For additional information regarding the recalibration procedure and when the recalibration procedure should be carried out, refer to Principles of Operation. For additional information regarding the module configuration procedure, refer to [Section 418-01](#).

1. Position the vapor management valve aside.
 1. Remove the vapor management valve bracket bolts.
 2. Position the vapor management valve aside.

2. Disconnect the redundant pressure transducer electrical connector.

3. Remove the redundant pressure transducer.

Installation

NOTE: The stability assist module needs to be recalibrated whenever a component is disconnected, moved, or a new component is installed. For additional information regarding the recalibration procedure and when the recalibration procedure should be carried out, refer to Principles of Operation. For additional information regarding the module configuration procedure, refer to [Section 418-01](#) .

1. To install, reverse the removal procedure.
-

General Specifications

Item	Specification
Belt Tension ¹	
Limit mm (in)	16 (0.63)
New belt mm (in)	8-10 (0.31-0.39)
Used belt mm (in)	10-12 (0.39-0.47)
Power Steering Gear Operational Specifications	
Type	Rack and Pinion
Ratio	18:1
Static steering wheel turning effort Nm (lb-in)	3.7 (33)
Turning effort kg (lbs)	1.9 (4.1)

 <p>ST1396-A</p>	<p>Dial Thermometer 0-220°F 023-R0007 or equivalent</p>
 <p>ST1137-A</p>	<p>73 III Automotive Meter 105-R0057 or equivalent</p>

Principles of Operation

Variable Assist Power Steering (VAPS)

The VAPS system controls the level of power assistance available to the driver based on vehicle speed. Below 3.2 km/h (2 mph), full power steering assist is provided to lessen steering efforts and increase maneuverability. Between 3.2 km/h (2 mph) and 191 km/h (119 mph), steering assist will decrease gradually at a calibrated rate to raise steering efforts for increased directional stability and greater road feel. Above 191 km/h (119 mph), steering assist is constant.

The front electronic module (FEM) outputs a pulse-width-modulated (PWM) current to the control valve actuator. The control valve actuator controls the hydraulic valve that determines the amount of hydraulic assist provided to the steering gear. The amount of assistance provided varies with the control valve actuator current, which is based on vehicle speed according to a look-up table internal to the FEM. The FEM pulse-width modulates the control valve actuator current to provide the desired amount of assistance. The amount of hydraulic steering assistance provided by the VAPS subsystem is proportional to the average control valve current.

The vehicle speed is provided to the FEM through the standard corporate protocol (SCP) network from the anti-lock brake system (ABS).

The engine rpm is provided to the FEM through the SCP network from the powertrain control module (PCM). The FEM uses the engine rpm to determine if the engine is running. The FEM will only output control valve actuator current when the engine is running to minimize noise, vibration, or harshness when the engine is off. The FEM will assume the engine is running only if the engine rpm is greater than 100 rpm.

Upon engine start, the FEM will provide a 200 millisecond full-on pulse followed by a 150 millisecond full-off pulse to the control valve actuator. Normal VAPS system operation will begin after this cleaning stroke is complete. In an event that the rpm signal is invalid from the PCM (less than 100 rpm), and the vehicle speed is less than 1.6 km/h (1 mph), the VAPS system will not carry out the cleaning stroke or apply current to the control valve actuator. When the engine speed exceeds 100 rpm, the system carries out the cleaning stroke and begins applying calibrated current to the actuator.

Inspection and Verification

CAUTION: Do not hold the steering wheel (3600) at the stops for an extended amount of time. Damage to the power steering pump (3A674) can result.

NOTE: Make the following preliminary checks before repairing the steering system:

NOTE: The FEM must be reconfigured upon replacement; refer to [Section 418-01](#).

1. Verify the customer concern by operating the steering system.
2. Inspect Tires
 - Check the tire pressure. For additional information, refer to the Vehicle Certification (VC) label.
 - Verify that all tires are sized to specification. For additional information, refer to [Section 204-04](#).
 - Check the tires for damage or uneven wear. For additional information, refer to [Section 204-04](#).
3. Belt and Tensioner Check
 - Refer to [Section 303-05](#) for diagnosis and testing of the accessory drive system.
4. Fluid Level Check
 - Verify that the power steering fluid level is within the appropriate hot or cold range on the dipstick. Add MERCON® Multi-Purpose (ATF) Transmission Fluid XT-02-QDX or MERCON® equivalent.
5. Air Bleeding
 - Verify that there is no air in the power steering system. Run the engine (6007) until it reaches normal operating temperature. Turn the steering wheel to the left and right several times without hitting the stops. If any air bubbles are present, refer to Purging in this section.

External Leak Check — Typical Power Rack-and-Pinion Steering Gear

DG0592-A

6. External Leak Check

- With the ignition switch at OFF, wipe off the power steering pump, power steering pressure hose (3A719), power steering return hose (3A713), power steering fluid cooler and hose assembly and steering gear (3504).
- With the engine running, turn the steering wheel from stop-to-stop several times. Do not hold steering wheel at stops. Check for leaks. Repair as necessary if leaks are observed.

7. Turning Effort Check

- Refer to Turning Effort Test under Component Tests in this section.

8. Visually inspect for obvious signs of mechanical damage. For additional information, refer to the

following chart.

Visual Inspection Chart

Mechanical	Electrical
<ul style="list-style-type: none"> ● Loose tie-rod ends ● Loose suspension components ● Loose steering column shaft universal joints ● Loose column intermediate shaft bolts ● Steering gear ● Binding or misaligned steering column ● Power steering pump ● Bent or pinched power steering hoses 	<ul style="list-style-type: none"> ● Wiring ● Connectors

9. If an obvious cause for an observed or reported malfunction is found, correct the cause (if possible) before proceeding to the next step.
10. If the concern remains after the inspection, connect the Scan Tool to the data link connector (DLC) located beneath the instrument panel, and select the vehicle to be tested from the Scan Tool menu. If the Scan Tool does not communicate with the vehicle:
 - Check that the program card is correctly installed.
 - Check the connections to the vehicle.
 - Check the ignition switch position.
11. If the Scan Tool still does not communicate with the vehicle, refer to the tester manual.
12. Carry out the DATA LINK DIAGNOSTIC TEST. If Scan Tool responds with:
 - CKT914, CKT915 or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to [Section 418-00](#).
 - NO RESP/NOT EQUIP for FEM, refer to [Section 418-00](#).
 - SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out the self-test diagnostics for the FEM.
13. If the DTCs retrieved are related to the concern, go to Diagnostic Trouble Code (DTC) Index to continue diagnostics.
14. If no DTCs related to the concern are retrieved, proceed to Symptom Chart to continue diagnostics.
15. If the fault is not visually evident, determine the symptom and proceed to the symptom chart.

Diagnostic Trouble Code (DTC) Index

Steering System Symptom Definitions

Drift/Pull

Pull is a tugging sensation, felt by the hands on the steering wheel, that must be overcome to keep the vehicle going straight.

Drift describes what a vehicle with this condition does with hands off the steering wheel.

- A vehicle-related drift/pull, on a flat road, can cause a consistent deviation from the straight-ahead path and require constant steering input in the opposite direction to counteract the effect.
- Drift/pull can be induced by conditions external to the vehicle (i.e., wind, road camber).

Excessive Steering Wheel Play

Excessive steering wheel play is a condition in which there is too much steering wheel movement before the wheels move. A small amount of steering wheel free play is considered normal.

Feedback

Feedback is a roughness felt in the steering wheel when the vehicle is driven over rough pavement.

Hard Steering or Lack of Assist

Hard steering or lack of assist is experienced when the steering wheel effort exceeds specifications. Hard steering can remain constant through the full turn or occur near the end of a turn. It is important to know the difference between hard steering/lack of assist and binding.

Hard steering or lack of assist can result from either hydraulic or mechanical conditions. It is extremely important to know if this concern occurs during driving, during very heavy or static parking maneuvers.

Nibble

Sometimes confused with shimmy, nibble is a condition resulting from tire interaction with various road surfaces and observed by the driver as small rotational oscillations of the steering wheel.

Poor Returnability/Sticky Steering

Poor returnability and sticky steering is used to describe the poor return of the steering wheel to center after a turn or the steering correction is completed.

Shimmy

Shimmy, as observed by the driver, is large, consistent, rotational oscillations of the steering wheel resulting from large, side-to-side (lateral) tire/wheel movements.

Shimmy is usually experienced near 64 km/h (40 mph), and can begin or be amplified when the tire contacts pot holes or irregularities in the road surface.

Wander

Wander is the tendency of the vehicle to require frequent, random left and right steering wheel corrections to maintain a straight path down a level road.

PINPOINT TEST B: DTC C1925 — VAPS SOLENOID ACTUATOR RETURN CIRCUIT FAILURE

CONDITIONS	DETAILS/RESULTS/ACTIONS
B1 CHECK VAPS FOR SHORT TO POWER	
<p>1 </p> <p>2  FEM C201a</p> <p>3 </p> <p>4 </p>	<p>4 Measure the voltage between FEM C201a pin 9, circuit 8-CE9 (WH/GN), harness side and ground.</p> <p>• Is any voltage present?</p> <p>→ Yes GO to B2.</p> <p>→ No GO to B3.</p>
B2 CHECK CIRCUIT 8-CE9 (WH/GN) FOR A SHORT TO POWER	
<p>1 </p> <p>2</p>	

Control Valve Actuator C120

3

4

4 Measure the voltage between FEM C201a pin 9, circuit 8-CE9 (WH/GN), harness side and ground.

• Is any voltage present?

- **Yes**
REPAIR the circuit 8-CE9 (WH/GN).
CLEAR the DTCs. REPEAT the self-test.
- **No**
REPAIR the circuit 9-CE9 (BN/GN).
CLEAR the DTCs. REPEAT the self-test.

B3 CHECK THE VAPS SYSTEM FOR AN OPEN

1

2

2 Measure the resistance between FEM C201a pin 9, circuit 8-CE9 (WH/GN), harness side and FEM C201a pin 2, circuit 9-CE9 (BN/GN), harness side.

• Is the resistance between 4 and 85 ohms?

- **Yes**
INSTALL a new control valve actuator;
REFER to [Section 211-02](#). CLEAR the

DTCs. REPEAT the self-test. If DTC C1925 is retrieved, INSTALL a new FEM; REFER to [Section 419-10](#). TEST the system for normal operation.

→ **No**
GO to [B4](#).

B4 CHECK CIRCUIT 8-CE9 (WH/GN) FOR AN OPEN

1

1

Measure the resistance between FEM C201a pin 9, circuit 8-CE9 (WH/GN), harness side and control valve actuator C120 pin 1, circuit 8-CE9 (WH/GN), harness side.

● Is the resistance less than 5 ohms?

→ **Yes**
GO to [B5](#).

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

B5 CHECK CIRCUIT 9-CE9 (BN/GN) FOR AN OPEN

1

1

Measure the resistance between FEM C201a pin 2, circuit 9-CE9 (BN/GN), harness side and control valve actuator C120 pin 2, circuit 9-CE9 (BN/GN), harness side.

● Is the resistance less than 5 ohms?

→ **Yes**
INSTALL a new control valve actuator; REFER to [Section 211-02](#). CLEAR the DTCs. REPEAT the self-test.

→ **No**
REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

Steering Linkage

1. With the parking brake applied, carry out the following:
 1. **NOTE:** Excessive vertical or horizontal motion of the stud relative to the steering linkage ball sockets may indicate excessive wear.

Have an assistant rotate the steering wheel back and forth 360 degrees and watch for relative motion of the studs in the steering linkage ball sockets.

2. Watch for a loose steering gear attachment to the frame.
2. Another method is to raise the front tires off the ground, grasp the tire at the front and rear and watch for excessive play in the joints while trying to pivot the wheels by hand.
3. **NOTE:** Incorrect separation of the tapered stud from its seat will cause premature failure of the ball socket.

Joints can be checked for excessive wear by measuring the torque it takes to turn the stud.

1. Separate the tapered stud from its seat and thread the attaching nut back onto the stud.
2. **NOTE:** Some joint turning torques will be as little as 0.2 Nm (2 lb-in) within the first 1,000 miles and will remain there for the life of the joint.

Turn the stud with an inch-pound torque wrench and note the torque required to turn the stud.

Torque Required to Turn Stud in Socket	Nm	Lb-In
New joints	2.0-5.0	18-47
Used joints	0.2-3	2-26
Joints with excessive play	Less than 0.2	Less than 0.2

3. **NOTE:** Only install a new ball joint if the stud torque is less than 0.2 Nm (2 lb-in) and the joint has any play when moved by hand.

Install new ball joints as necessary; refer to [Section 204-01](#).

Pump Flow and Pressure Test

WARNING: Do not touch the flowmeter during the test procedure or severe burns and serious injury may occur.

1.  **CAUTION:** Make sure that the connection point will not interfere with any of the engine accessory drive components or drive belts.

Install the Power Steering Analyzer at the high pressure port of the power steering pump. Make sure the power steering analyzer gate valve is fully open.

- On some vehicles, the power steering pump high pressure port is inaccessible and the power steering analyzer should then be installed either at the steering gear or at a point in the high pressure line between the power steering pump and the steering gear.
2. Place a Dial Thermometer in the power steering pump reservoir.
 3. Check the power steering fluid level. If necessary, add power steering fluid.

- Use Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX or equivalent meeting Ford specification MERCON®.

4. Install the digital tachometer.

5.  **CAUTION: Do not hold the steering wheel against the stops for more than three to five seconds at a time. Damage to the power steering pump will occur.**

Start the engine. Place the transmission in N (neutral). Set the parking brake. Raise the power steering fluid temperature to 74-80°C (165-175°F) by rotating the steering wheel fully to the left and right several times.

6. Set the engine speed to idle. Record the flow rate and pressure readings.
- If the flow rate is below the idle flow rate specification, the power steering pump may require repair. Continue with the test procedure.
 - If the pressure reading is above the idle pressure specification, then check power steering hoses for kinks and restrictions.

7. Partially close the gate valve to obtain 5102 kPa (740 psi). Record the flow rate.
- If the flow rate is less than the specified flow rate, replace the power steering pump.

8.  **CAUTION: Do not allow the gate valve to remain closed for more than five seconds.**

Completely close and partially open the gate valve three times. Record the pressure relief valve actuation pressure reading.

- If the pressure does not meet the relief pressure specification, install a new power steering pump.

9. Set the engine speed to 1,500 rpm. Record the flow rate.
- If the flow rate varies more than 3.785 liters/minute (1 gallon/minute) from initial flow rate reading, install a new power steering pump.

10.  **CAUTION: Do not hold the steering wheel against the stops for more than three to five seconds at a time. Damage to the power steering pump will occur.**

Set the engine speed at idle. Turn (or have an assistant turn) the steering wheel to the left and right stops. Record flow rate and pressure readings at the stops.

- The pressure reading at both stops should be nearly the same as the maximum pump relief pressure.
- The flow rate should drop below 1.9 liters/minute (0.5 gallon/minute).
- If the pressure does not reach the maximum pump relief pressure or the flow rate does not drop below the specified value, excessive internal leakage is occurring. Repair or install a new steering gear as necessary; refer to [Section 211-02](#).

11. Turn (or have an assistant turn) the steering wheel slightly in both directions and release it quickly while watching the pressure gauge.
- The pressure reading should move from the normal backpressure reading and snap back as the steering wheel is released.
 - If the pressure returns slowly or sticks, the rotary valve in the steering column is binding. Check the steering column and linkage before repairing the steering gear.

Turning Effort Test

NOTE: Make sure front wheels are correctly aligned and tire pressure is correct before checking turning effort.

1. Park vehicle on dry concrete and set parking brake.
2. Idle engine for two to three minutes. Turn steering wheel to the left and right several times to warm fluid to 43-49°C (110-120°F).
3. With engine running, attach a pull scale to rim of steering wheel. Measure pull required to turn one complete revolution in each direction. Refer to Specifications for Static Steering Wheel Turning Efforts for acceptable measurements.

Steering Gear Insulator

1. With the wheel normally loaded (on the ground), check the steering gear housing for excessive lateral movement.
 - If the steering gear housing moves more than 1.5 mm (0.05 in), the steering gear insulators may have deteriorated or the steering gear mounting nuts may have loosened. Tighten the steering gear mounting nuts.
 - If the steering gear housing movement is still excessive after tightening the gear mounting nuts, install new steering gear insulators.

Steering Gear Valve

NOTE: For vehicles with a steering pull.

1. With the vehicle in motion, place the transmission in N (neutral) and turn the engine OFF.
 - If the vehicle does not pull with the engine OFF, repair or install a new steering gear; refer to [Section 211-02](#).
 - If the vehicle pull direction does not change, check the front suspension components and wheel alignment; refer to [Section 204-00](#) and [Section 204-01](#).

Tie-Rod Articulation Torque

1. **NOTE:** This check can be done with the steering gear on or off the vehicle.

Disconnect the tie-rod end from the front wheel spindle. For additional information, refer to [Section 211-02](#).

2. Move the tie-rod back and forth three times.
3. Hook the Spring Scale over the tie-rod end or the threaded portion of the tie-rod and measure the force required to move the front wheel spindle tie-rod. For additional information, refer to Tie-Rod Articulation Torque in General Specifications in this section.
4. If the force required to move the front wheel spindle tie-rod does not meet the specifications, install a new tie-rod.

Power Steering System Flushing

⚠ WARNING: Do not mix fluid types. Any mixture of an unapproved fluid could lead to seal deterioration and leaks. A leak could ultimately cause loss of fluid, which could result in a loss of power steering assist.

1. Remove the coil on plug (COP) Fuse 12 in the underhood auxiliary junction box (AJB) to disable the engine from starting.
2. Disconnect the power steering return hose.
 1. Compress and move the hose clamp.
 2. Disconnect the power steering return hose and plug the fitting to the reservoir.

3. Attach an extension hose between the power steering reservoir port and an empty container.

4. **⚠ WARNING: Do not mix fluid types. Any mixture of an unapproved fluid could lead to seal deterioration and leaks. A leak could ultimately cause loss of fluid, which could result in a loss of power steering assist.**

Fill the power steering fluid reservoir.

- Use Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX or equivalent meeting Ford specification MERCON®.

5. Raise the front wheels off the ground. For additional information, refer to [Section 100-02](#).

6.  **CAUTION: Do not operate the starter motor for more than 10 seconds at a time. Damage to the starter motor could result.**

Turn the steering wheel from stop to stop while cranking the engine until the fluid exiting the extension hose is clean.

7. Lower the vehicle.

8. Disconnect the extension hose from the power steering return hose and attach the power steering return hose to the power steering fluid reservoir.

9.  **WARNING: Do not mix fluid types. Any mixture of an unapproved fluid could lead to seal deterioration and leaks. A leak could ultimately cause loss of fluid, which could result in a loss of power steering assist.**

 **CAUTION: Do not overfill the power steering fluid reservoir.**

Fill the power steering fluid reservoir.

- Use Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX or equivalent meeting Ford specification MERCON®.

10. Install the COP fuse.

11.  **CAUTION: Do not hold the steering wheel against the stops for more than three to five seconds at a time. Damage to the power steering pump will occur.**

Start the engine and turn the steering wheel from stop to stop.

12. **NOTE:** If power steering is noisy and accompanied by evidence of aerated fluid, it will be necessary to purge the power steering system. Refer to [Power Steering System Purging](#).

Check the power steering fluid level.

Power Steering System Purging

Special Tool(s)

⚠ CAUTION: If the air is not purged from the power steering system correctly, pump failure could result. This condition can occur on pre-delivery vehicles with evidence of aerated fluid or on vehicles that had steering component repairs.

- ⚠ WARNING:** Do not mix fluid types. Any mixture of an unapproved fluid could lead to seal deterioration and leaks. A leak could ultimately cause loss of fluid, which could result in a loss of power steering assist.

⚠ CAUTION: Do not overfill the power steering fluid reservoir.

NOTE: A whine heard from the power steering pump may be caused by air in the system. The power steering purge procedure must be carried out prior to any component repair for which power steering noise complaints are accompanied by evidence of aerated fluid and after installation of any new power steering system components (gear, hose, etc.).

Remove the fluid reservoir cap and check the fluid.

- Using the special tool, tightly insert the stopper into the fluid reservoir.
- Start the vehicle.

2. Apply maximum vacuum for a minimum of three minutes at idle. Maintain maximum vacuum with the source.

3. Remove the special tool.

4. **⚠ WARNING:** Do not mix fluid types. Any mixture of an unapproved fluid could lead to

seal deterioration and leaks. A leak could ultimately cause loss of fluid, which could result in a loss of power steering assist.

Add fluid to the appropriate level.

- Use Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX or equivalent meeting Ford specification MERCON®.

5. Using the special tool, apply and maintain maximum vacuum.
6. **⚠ CAUTION: Do not hold the steering wheel against the stops for more than three to five seconds. Damage to the power steering pump will occur.**

Cycle the steering wheel from stop to stop every 30 seconds for approximately five minutes.

7. Remove the special tool and install the fluid reservoir cap.
8. **⚠ WARNING: Do not mix fluid types. Any mixture of an unapproved fluid could lead to seal deterioration and leaks. A leak could ultimately cause loss of fluid, which could result in a loss of power steering assist.**

Check the fluid level and for leaks at all connections. If the power steering still shows signs of aeration, repeat this procedure.

Power Steering System Filling

1.  **WARNING: Do not mix fluid types. Any mixture of an unapproved fluid could lead to seal deterioration and leaks. A leak could ultimately cause loss of fluid, which could result in a loss of power steering assist.**

Fill the power steering reservoir to the appropriate level.

- Use Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX or equivalent meeting Ford specification MERCON®.

2. Remove the coil on plug (COP) Fuse 12 in the underhood auxiliary junction box (AJB) to disable the engine from starting.
3. Raise the front wheels off the floor. For additional information, refer to [Section 100-02](#).

4.  **CAUTION: Do not operate the starter motor for more than 10 seconds at a time. Damage to the starter motor could result.**

Turn the steering wheel from stop to stop while cranking the engine.

5. Lower the vehicle.

6.  **CAUTION: Do not overfill the power steering fluid reservoir.**

Fill the power steering fluid reservoir to the appropriate level.

- Use Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX or equivalent meeting Ford specification MERCON®.

7. Install the COP fuse.
8. **NOTE:** If the power steering is noisy and accompanied by evidence of aerated fluid, it will be necessary to purge the power steering system. For additional information, refer to [Power Steering System Purging](#).

Clear the diagnostic trouble codes (DTCs). For additional information, refer to Section 2 in the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

- Run the vehicle and check the system for leaks.

Power Steering

System View

A0001285

Item	Part Number	Description
1	3E764	Power steering fluid reservoir
2	3A674	Power steering pump
3	3691	Power steering reservoir-to-pump hose
4	3504	Power steering gear
5	3A719	Power steering pressure hose
6	3A713	Power steering return hose
7	3D746	Power steering fluid cooler
8	—	Power steering cooler-to-reservoir hose
9	3A733	Power steering pump pulley

The power steering system consists of the following components:

- power steering pump (3A674)
- power steering fluid reservoir (3E764)
- power rack and pinion gear (3504)

- power steering fluid cooler (3D746) incorporated into an automatic transmission fluid cooler and hydraulic cooling fan fluid cooler
 - hoses connecting the various components
-

Power Steering

Refer to [Section 211-00](#) .

Reservoir

Removal

1. Remove the air cleaner. For additional information, refer to [Section 303-12](#).
2. Unclamp and disconnect the power steering reservoir-to-pump hose (3691) and drain the reservoir into a suitable container. Plug the pump inlet fitting.

3. Disconnect the reservoir (3E764).
 1. Loosen the bolts.
 2. Rotate the reservoir from the insulator.
 3. Pull the reservoir down from the insulator.

4. Unclamp and disconnect the hoses.

5. Remove the reservoir.

Installation

1. To install, reverse the removal procedure.

2. Fill and leak check the system. For additional information, refer to [Section 211-00](#).
-

Pump —3.9L

Special Tool(s)

Removal

1. Remove four pushpins and the engine cover.

2. Remove the air cleaner and the air cleaner outlet tube. For additional information, refer to [Section 303-12](#).
3. Remove the bolts.

4. Remove the accessory drive belt. For additional information, refer to [Section 303-05](#).
5. Unclamp and disconnect the power steering reservoir-to-pump hose (3691) and drain the reservoir (3E764) into a suitable container.

6. Position the power steering reservoir out of the way.
 1. Loosen the bolts.
 2. Rotate the reservoir from the insulator.
 3. Pull the reservoir down from the insulator and position the reservoir out of the way.

7. Raise the vehicle on a hoist. For additional information, refer to [Section 100-02](#).
8. Remove the wheel and tire assembly. For additional information, refer to [Section 204-04](#).
9. Remove two bolts, one pushpin and the shield.

10. Remove two pushpins and the shield.

11. Remove the bolt.

12. Disconnect the electrical connector and the wire retainer.

13. Remove four bolts and position the A/C compressor out of the way.

14. Disconnect the power steering pressure hose (3A714).

15. Remove the bolts.

16. Lower the vehicle.

17. Remove the bolts and the pump (3A674).

Installation

1. Using the appropriate special tool, install a new O-ring on the power steering pressure hose fitting.

2. **NOTE:** Do not tighten the upper bolts until the lower bolts are installed.

Position the pump and install the bolts.

3. Raise the vehicle.
4. Install the bolts.

5. Connect the power steering pressure hose.

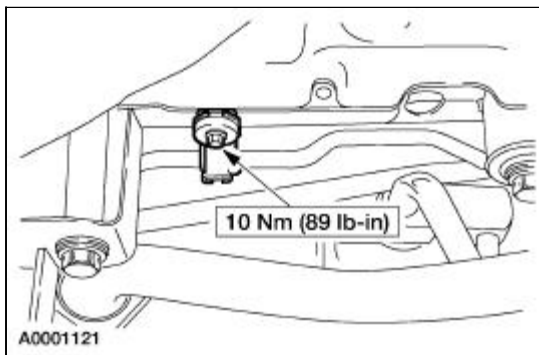

6. Position the A/C compressor and install four bolts.

7. Connect the wire retainer and the electrical connector.

8. Install the bolt.

9. Install the shield and two pushpins.

10. Install the shield, one pushpin and two bolts.

11. Install the wheel and tire assembly. For additional information, refer to [Section 204-04](#).
12. Lower the vehicle.
13. Tighten the bolts.

14. Connect the reservoir.
 1. Push the reservoir up on the insulator.
 2. Rotate the reservoir on the insulator.
 3. Tighten the bolts.

15. Connect and clamp the power steering reservoir-to-pump hose.

16. Install the accessory drive belt. For additional information, refer to [Section 303-05](#).

17. Install the bolts.

18. Install the air cleaner outlet tube and the air cleaner. For additional information, refer to [Section 303-12](#).

19. **NOTE:** Inspect the pushpins for cracks or other damage. Install new pushpins if necessary.

Install the engine cover and four pushpins.

20. Fill and leak check the system. For additional information, refer to [Section 211-00](#).

Pump —3.0L

Special Tool(s)

Removal

1. Remove four pushpins and the engine cover.

2. Remove the air cleaner and the air cleaner outlet tube. For additional information, refer to [Section 303-12](#).
3. Remove the accessory drive belt. For additional information, refer to [Section 303-05](#).
4. Unclamp and disconnect the power steering reservoir-to-pump hose (36911) and drain the reservoir into a suitable container.

5. Raise the vehicle on a hoist. For additional information, refer to [Section 100-02](#).
6. Remove the wheel and tire assembly. For additional information, refer to [Section 204-04](#).
7. Remove two bolts, one pushpin and the shield.

8. Remove two pushpins and the shield.

9. Remove the bolt.

10. Disconnect the power steering pressure hose (3A714).

11. Remove the bolt.

12. Lower the vehicle.
13. Remove the bolts and the pump (3A674).

Installation

1. Install a new O-ring on the power steering pressure hose fitting.

2. **NOTE:** Do not tighten the upper bolts until the lower bolts are installed.

Install the pump and the bolts.

3. Raise the vehicle.
4. Install the bolt.

5. Connect the power steering pressure hose.

6. Install the bolt.

7. Install the shield and two pushpins.

8. Install the shield, one pushpin and two bolts.

9. Install the wheel and tire assembly. For additional information, refer to [Section 204-04](#).
10. Lower the vehicle.
11. Tighten the bolts.

12. Install the accessory drive belt. For additional information, refer to [Section 303-05](#).
13. Install the air cleaner outlet tube and the air cleaner cover. For additional information, refer to [Section 303-12](#).
14. **NOTE:** Inspect the pushpins for cracks or other damage. Install new pushpins if necessary.
Install the engine cover and four pushpins.

15. Fill and leak check the system. For additional information, refer to [Section 211-00](#).
-

Pulley — Pump, 3.9L

Special Tool(s)

	Pump Pulley Remover 211-016 (T69L-10300-B)
	Steering Pump Pulley Replacer 211-185 (T91P-3A733-A)

Removal

1. Remove the air cleaner and the air cleaner outlet tube. For additional information, refer to [Section 303-12](#).
2. Remove the bolts.

3. Remove the accessory drive belt. For additional information, refer to [Section 303-05](#).
4. Using the special tool, remove the pulley (3A733).

Installation

1. Using the special tool, install the pulley.

2. Install the accessory drive belt. For additional information, refer to [Section 303-05](#).
3. Install the bolts.

4. Install the air cleaner outlet tube and the air cleaner. For additional information, refer to [Section 303-12](#).
-

Pulley — Pump, 3.0L

Special Tool(s)

	Pump Pulley Remover 211-016 (T69L-10300-B)
	Pump Pulley Replacer 211-185 (T91P-3A733-A)

Removal

1. Remove the air cleaner cover and the air cleaner outlet tube. For additional information, refer to [Section 303-12](#).
2. Remove the accessory drive belt. For additional information, refer to [Section 303-05](#).
3. Using the special tool, remove the pulley (3A733).

Installation

1. Using the special tool, install the pulley.

2. Install the accessory drive belt. For additional information, refer to [Section 303-05](#).
 3. Install the air cleaner outlet tube and the air cleaner cover. For additional information, refer to [Section 303-12](#).
-

Power Steering Pump to Steering Gear Pressure Line

Special Tool(s)

Removal and Installation

All vehicles

1. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
2. Remove the screw, pushpin and the air deflector.

3. Remove the screws and the air deflector.

4. Remove the bolt.

5. Remove the bolt, bracket and bushings.

6. Remove the bolt.

7. Unclip the retainer.

8. Pull the hose rearward between the oil pan and the radiator support crossmember.

3.0L engine

9. Remove the bolt and the bracket.

10. Disconnect the hose (3A719) at the pump.

3.9L engine

11. Remove the bolt and the bracket.

12. Disconnect the hose (3A719) at the pump.
 - Drain the fluid into a suitable container.

All vehicles

13. Remove the bolt.

14. Disconnect the wiring at the pressure switch (3N824).

15. Remove the pressure switch.
 - Drain the fluid into a suitable container.

16. Disconnect the hose at the steering gear.

17. Unclip the retainer and detach the hose.

18. Remove the hose.

19. To install, reverse the removal procedure.

- Install a new seal using the special tool.

20. Fill and leak check the system. For additional information, refer to [Section 211-00](#).

Cooler —Fluid

Special Tool(s)

Removal

1. Remove the A/C condenser core. For additional information, refer to [Section 412-03](#).

NOTE: There are four hoses attached to the cooler on a vehicle equipped with a manual transmission. A vehicle equipped with an automatic transmission has six hoses attached to the cooler.

2. Remove and discard the clamps.

3. **NOTE:** Position a drain pan under the vehicle to catch any fluid that may spill.

Disconnect the hoses. Plug the hoses and the cooler (3D746).

4. Remove the cooler.
 1. Remove two bolts.
 2. Lift the cooler from the retainers and remove the cooler.

Installation

1. Install the cooler.
 1. Position the cooler on the retainers.
 2. Install two bolts.

2. Position new clamps on the hoses.
3. Unplug the hoses and the cooler. Connect the hoses.
4. Using the special tool, tighten the clamps.

5. Install the A/C condenser. For additional information, refer to [Section 412-03](#).
 6. Fill and leak check the system. For additional information, refer to [Section 211-00](#).
 7. If the vehicle is equipped with an automatic transmission, check and fill the transmission. For additional information, refer to [Section 307-01](#).
 8. Fill the cooling fan reservoir. For additional information, refer to [Section 303-03](#).
-

Steering Gear

Special Tool(s)

Removal

1. Raise the vehicle on a hoist. For additional information, refer to [Section 100-02](#).
2. Remove the wheel and tire assemblies. For additional information, refer to [Section 204-04](#).
3. If equipped, remove the eight bolts and the two I-braces.
 - Discard the bolts.

4. **NOTE:** To remove the nuts, first loosen the nut, and then use the hex holding feature to prevent the tie-rod end ball joint from turning.

Remove the nuts and disconnect the tie-rod ends (3A130). Discard the nuts.

5. Disconnect the electrical connector.

6. Loosen the bolt.

7. Remove the pinch bolt and disconnect the intermediate shaft (3A525).

8. Remove the bolt and disconnect the power steering hose bracket.

9. Disconnect the power steering hoses. Plug the hose ends and the gear.

10. Remove the nuts, bolts and the power steering gear (3504). Discard the nuts.

Installation

1. Using the appropriate special tool, install new O-rings on the power steering pressure and return hose fittings.

2. Position the power steering gear and install the bolts and new nuts.

3. Remove the plugs and connect the power steering hoses.

4. Connect the power steering hose bracket and install the bolt.

5. Connect the intermediate shaft and install the bolt.

6. Tighten the bolt.

7. Connect the electrical connector.

8. **NOTE:** To install the nuts, use the hex holding feature to prevent the tie-rod end ball joint from turning. Final tighten using a socket and a torque wrench.

Connect the tie-rod ends and install new nuts.

9. If equipped, position the two I-braces and loosely install the bolts.
1. Loosely install the front bolts.
 2. Position the I-braces.
 3. Loosely install the rear bolts.

10. If equipped, make sure that the I-brace insulators are correctly positioned.

11. If equipped, install the I-brace bolts.

12. If equipped, tighten the I-brace bolts.

13. Install the wheel and tire assemblies. For additional information, refer to [Section 204-04](#).
 14. Lower the vehicle.
 15. Fill and leak check the system. For additional information, refer to [Section 211-00](#).
 16. Check wheel alignment. Adjust as necessary. For additional information, refer to [Section 204-00](#).
-

Power Steering Control Valve Actuator

Special Tool(s)

Removal

1. Raise the vehicle on a hoist. For additional information, refer to [Section 211-00](#).
2. Disconnect the electrical connector.

3. Remove the bolt and disconnect the power steering hose bracket.

4. Disconnect the power steering hoses. Plug the hose ends and the gear.

5. Remove the control valve actuator.

Installation

1. Using the appropriate special tool, install new O-rings on the power steering hose fittings.

2. Install the control valve actuator.

3. Remove the plugs and connect the power steering hoses.

4. Connect the power steering hose bracket and install the bolt.

5. Connect the electrical connector.

6. Lower the vehicle.
-

Steering Wheel Rotation Sensor

Removal

 **WARNING:** Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Do not set a live air bag module down with the trim cover facing down. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** After deployment, the air bag surface may contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

 **WARNING:** Never probe the connectors on an air bag module. Doing so can result in air bag deployment, which can result in personal injury.

 **WARNING:** Air bag modules with discolored or damaged trim covers must be replaced, not repainted.

 **WARNING:** Vehicle sensor orientation is critical for proper system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. Replace and properly position the sensor or any other damaged supplemental restraint system (SRS) components whether or not the air bag is deployed.

 **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle shop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect auxiliary batteries and power supplier (if equipped).

1. Center the steering wheel with the front wheels in the straight-ahead position.
2. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
3. Remove the driver air bag module. For additional information, refer to [Section 501-20B](#).

4. Remove the screws and pull the lower steering column opening finish panel out far enough to access the electrical connectors.

5. Disconnect the electrical connectors and remove the finish panel.

6. Remove the screws and disconnect the hood release assembly.

7. Remove the screw and the heater duct.

8. Pull the carpet away from the console tunnel and loosen the bolts.

9. Remove four screws and the steering column opening reinforcement.

10. Disconnect the steering wheel rotation sensor and the electric tilt/telescoping motor electrical connectors.

11. Disconnect the electrical connectors.

12.  **CAUTION:** The lower end of the steering column shaft must be wired in such a way that the steering column does not rotate, resulting in damage to the air bag sliding contact.

Using wire, secure the steering column shaft and the steering column to prevent damage to the air bag sliding contact.

13. Remove and discard the steering column shaft pinch bolt. Disconnect the shaft.

14. While supporting the steering column, remove the lock nuts and the steering column. Discard the nuts.

15. Remove the screws. Detach the electrical connector from the steering column and remove the sensor.

Installation

⚠ WARNING: Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

⚠ WARNING: Carry a live air bag module with the air bag trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

⚠ WARNING: Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

1. To install, reverse the removal procedure.
 - Use new lock nuts and a new pinch bolt.

Gear

Special Tool(s)

Disassembly

1. Position the power steering gear (3504) in a soft-jawed vice.
2. Mark the jam nuts and the tie-rods for installation reference.

3. Loosen the jam nuts and remove the tie-rod ends (3A130).

4. Remove the jam nuts.

5. Remove the boot clamps and the boots.

6. While holding the rack, remove the tie-rods.

Assembly

1. While holding the rack, install the tie-rods.

2. Position new inner clamps on the boots.

3. Position the boots on the gear, making sure the air tube is correctly installed in the boots and aligned between the locating marks on the gear housing.

4. Using the special tool, tighten the clamps.

5. Install the clamp.

6. Install the jam nuts to the marks made during installation.

7. Install the tie-rod ends.

Torque Specifications

Steering Column

NOTE: All fasteners are important in that they can affect the performance of vital parts and systems, and their failure can result in major repair expenses. New fasteners of the same part number must be installed if the installation of new fasteners becomes necessary. Do not install a part of lesser quality or substitute design. Torque values must be used as specified during assembly to make sure these parts function correctly.

The vehicle is equipped with a power tilt/telescopic steering column that allows the steering wheel angle and length to be adjusted to suit the driver.

Power Tilt/Telescopic Steering Column

24	3K772	Steering wheel lock actuator (manual transmission only)

The power tilt/telescopic steering column is of modular construction that features easy to service electrical switches.

The power tilt/telescopic steering columns are equipped with an electric tilt and telescopic mechanisms that allow the steering wheel angle and length to be adjusted to suit the driver. Vehicles with the memory package, the steering wheel position is stored in memory in the same way as the driver seat position and retrieved as a personality feature. The steering column is controlled by the instrument cluster module.

Before carrying out work on or around any supplemental air bag system component, observe all supplemental air bag system conditions and warnings to avoid unnecessary air bag deployment and possible injury. Refer to [Section 501-20B](#) for supplemental air bag system.

Ignition Switch

The ignition lock cylinder and switch are two components. When the lock cylinder ignition key is turned to different positions, it is aligning electrical contacts in the ignition switch. Electrical contacts are made in the ACC (Accessory), RUN and START positions. In the OFF position the switch is open and the key can be removed.

The ignition switch and lock cylinder assembly is mounted to the right of the steering column in the instrument panel. An opening in the instrument panel provides key access to the lock cylinder.

Steering Column

Refer to [Section 211-00](#) .

Steering Column —Tilt/Telescopic Motors

Refer to Wiring Diagrams Section [211-04](#) for schematic and connector information.

Special Tool(s)

 ST1137-A	77 III Automotive Meter 105-R0056 or equivalent
 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation STAR (NGS) Tester 418-F052 or equivalent scan tool

Inspection and Verification

1. Verify the customer's concern by operating the steering column switch to duplicate the condition.
2. Inspect to determine if one of the following apply:

Visual Inspection Chart

Mechanical	Electrical
<ul style="list-style-type: none"> ● Binding steering column 	<ul style="list-style-type: none"> ● Damaged fuse central power distribution box fuse 19 (15A) ● Damaged multi-function switch ● Circuitry open/shorted ● Loose/corroded electrical connectors

3. If inspection reveals obvious concern(s) that can be readily identified, repair as required.
4. If the concern remains after the inspection, connect scan tool to the data link connector (DLC) located beneath the instrument panel to carry out DATA LINK DIAGNOSTIC TEST. Refer to [Section 418-00](#). If the scan tool responds with NO RESPONSE/NOT EQUIPPED for instrument cluster module (ICM), refer to [Section 413-01](#). If the DATA LINK DIAGNOSTIC TEST is passed for the ICM, retrieve continuous diagnostic trouble codes (DTCs) and execute Self Test Diagnostics for the ICM. Refer to [Section 418-00](#).
5. If the self test is passed and no diagnostic trouble codes (DTCs) are retrieved, GO to [Symptom Chart](#) to continue diagnostics.
6. If diagnostic trouble codes (DTCs) are retrieved, go to the Instrument Cluster Module (ICM) Diagnostic Trouble Code (DTC) Index to continue diagnostics.

7. If the instrument cluster module (ICM) cannot be accessed by the scan tool, refer to [Section 413-01](#).

Instrument Cluster Module SELF-TEST

1 Disconnect and reconnect the battery.

3 Actuate the steering column to the full in position.

4 Actuate the steering column to the full out position.

● **Is DTC B2328 present?**

→ **Yes**
GO to [A3](#).

→ **No**
System was deactivated due to ICM registering an excessive number of motion faults. NOTIFY owner that concern has been corrected. REPEAT the self-test. CLEAR the DTCs.

A3 CHECK STEERING COLUMN BEARINGS

1 Remove the steering column shrouds.

2 Check the steering column bearings to make sure that they are fully seated back against the stops.

● **Are the steering column bearings correctly seated back against the stops?**

→ **Yes**
GO to [A4](#).

→ **No**
SEAT the steering column bearings back against the stops. REPEAT the self-test. CLEAR the DTCs.

A4 ISOLATE THE POTENTIOMETERS

1

Steering Column Potentiometer Assembly C222

2

2

Connect a jumper wire between the steering column potentiometer assembly C222-1, circuit 9-AL17 (PK/OG), harness side and the steering column potentiometer assembly terminal 1.

3

Connect a jumper wire between the steering column potentiometer assembly C222-4, circuit 7-AL17 (DG/WH), harness side and the steering column potentiometer assembly terminal 4.

4

Connect a jumper wire between the steering column potentiometer assembly C222-2, circuit 8-AL17 (DB/YE) and the steering column potentiometer assembly terminal 3.

5

Connect a jumper wire between the steering column potentiometer assembly C222-3, circuit 8-AL16 (PK/LB) and the steering column potentiometer assembly terminal 2.

6

Instrument Cluster Module Self-Test

● Is DTC B2332 retrieved?

→ Yes

INSTALL a new steering column potentiometer assembly. REPEAT the self-test. CLEAR the DTCs.

→ No

GO to [A5](#).

A5 CHECK CIRCUIT 8-AL16 (PK/LB) FOR A SHORT TO B+

1

Retractor Box C218

2

A0044054

2

Measure the voltage at the steering column potentiometer C222-3, circuit 8-AL16 (PK/LB), harness side.

● Is voltage present?

→ **Yes**
REPAIR circuit 8-AL16. REPEAT the self-test. CLEAR the DTCs.

→ **No**
GO to [A6](#).

A6 CHECK CIRCUIT 8-AL16 (PK/LB) FOR A SHORT TO GROUND

1

A0043712

1

Measure the resistance between the steering column potentiometer C222-3, circuit 8-AL16 (PK/LB), harness side and ground.

● Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to [A7](#).

→ **No**
REPAIR circuit 8-AL16. REPEAT the self-test. CLEAR the DTCs.

A7 CHECK CIRCUIT 8-AL16 (PK/LB) FOR AN OPEN

1

1

Measure the resistance between the steering column potentiometer assembly C222-4, circuit 8-AL16 (PK/LB), harness side and the retractor box C218-6, circuit 8-AL16 (PK/LB).

● Is the resistance less than 5 ohms?

→ **Yes**
GO to [A8](#).

→ **No**
REPAIR circuit 8-AL16. REPEAT the self-test. CLEAR the DTCs.

A8 CHECK CIRCUIT 8-AL16 (WH/BK) FOR A SHORT TO B+

1

Steering Column Potentiometer Assembly C222

2

Instrument Cluster Module C220c

3

3 Measure the voltage at instrument cluster module C220c-21, circuit 8-AL16 (WH/BK), harness side.

● Is voltage present?

→ **Yes**
REPAIR circuit 8-AL16. REPEAT the self-test. CLEAR the DTCs.

→ **No**
GO to [A9](#).

A9 CHECK CIRCUIT 8-AL16 (WH/BK) FOR A SHORT TO GROUND

1

1

Measure the resistance between the instrument cluster module C220c-21, circuit 8-AL16 (WH/BK), harness side and ground.

● **Is the resistance greater than 10,000 ohms?**

→ **Yes**
GO to [A10](#).

→ **No**
REPAIR circuit 8-AL16. REPEAT the self-test. CLEAR the DTCs.

A10 CHECK CIRCUIT 8-AL16 (WH/BK) FOR AN OPEN

1

1

Measure the resistance between the retractor box C218-6, circuit 8-AL16 (WH/BK), harness side and the instrument cluster C220c-21, circuit 8-AL16 (WH/BK), harness side.

● **Is the resistance less than 5 ohms?**

→ **Yes**
INSTALL an instrument cluster module. REFER to [Section 413-01](#). REPEAT the self-test. CLEAR the DTCs.

→ **No**
REPAIR circuit 8-AL16. REPEAT the self-test. CLEAR the DTCs.

A11 CHECK FOR STEERING COLUMN MOVEMENT

NOTE: This active command will only power motors for one second.

1

Instrument Cluster Module Active Command STEERING COLUMN CONTROL

2

Trigger TELES CP IN On, Then TELSCPOUT On

● Does the steering column telescope in and out?

→ Yes
GO to [A12](#).

→ No
GO to [A14](#).

A12 CHECK CIRCUIT 8-AL16 (PK/LB) FOR AN OPEN

1

Steering Column Potentiometer C222

2

Retractor Box C218

3

3 Measure the resistance between the steering column potentiometer assembly C222-4, circuit 8-AL16 (PK/LB), harness side and the retractor box C218-6, circuit 8-AL16 (PK/LB).

● Is the resistance less than 5 ohms?

→ Yes
GO to [A13](#).

→ No
REPAIR circuit 8-AL16. REPEAT the self-test. CLEAR the DTCs.

A13 CHECK CIRCUIT 8-AL16 (WH/BK) FOR AN OPEN

1

Steering Column Potentiometer Assembly C222

2

Instrument Cluster Module C220c

3

3

Measure the resistance between the retractor box C218-6, circuit 8-AL16 (WH/BK), harness side and the instrument cluster C220c-21, circuit 8-AL16 (WH/BK), harness side.

● Is the resistance less than 5 ohms?

→ Yes

INSTALL a new steering column potentiometer assembly. REPEAT the self-test. CLEAR the DTCs.

→ No

REPAIR circuit 8-AL16. REPEAT the self-test. CLEAR the DTCs.

A14 ISOLATE THE MOTOR

1

Steering Column Motor Connector C227

2

3

Instrument Cluster Module Active Command STEERING COLUMN CONTROL

2

Connect a voltmeter between the steering column motor C227-3, circuit 35-AL7 (VT/BK), harness side, and the steering column motor C227-4, circuit 34-AL7 (BU/BK), harness side.

4

Trigger TELESCP IN On, Then TELSCPOUT On

5

Measure the voltage during the activate commands.

• **Is voltage present for one second after each command is sent?**

→ **Yes**

INSTALL a new telescope motor.
REPEAT the self-test. CLEAR the DTCs.

→ **No**

GO to [A15](#).

A15 CHECK CIRCUIT 34-AL7 (BU/BK) FOR VOLTAGE

1

A0005893

2

Instrument Cluster Module Active Command STEERING COLUMN CONTROL

3

Trigger TELSCPOUT On

1

Connect a voltmeter between steering column motor C227-4, circuit 34-AL7 (BU/BK), harness side and ground.

4

Measure the voltage during the activate command.

• **Is voltage present for one second after command is sent?**

→ **Yes**

GO to [A17](#).

→ **No**

GO to [A16](#).

A16 CHECK CIRCUIT 34-AL7 (BU/BK) FOR AN OPEN

1

Instrument Cluster Module C220a

2

2

Measure the resistance between steering column motor C227-4, circuit 34-AL7 (BU/BK), harness side and the instrument cluster module C220a-5, circuit 34-AL7 (BU/BK), harness side.

● Is the resistance less than 5 ohms?

→ **Yes**
INSTALL a new instrument cluster module. REFER to [Section 413-01](#). REPEAT the self-test. CLEAR the DTCs.

→ **No**
REPAIR circuit 34-AL7. REPEAT the self-test. CLEAR the DTCs.

A17 CHECK CIRCUIT 35-AL7 (VT/BK) FOR AN OPEN

1

Instrument Cluster Module C220a

2

2

Measure the resistance between steering column motor C227-3, circuit 35-AL7 (VT/BK), harness side and the instrument cluster module C220a-4, circuit 35-AL7 (VT/BK), harness side.

● Is the resistance less than 5 ohms?

→ **Yes**
INSTALL a new instrument cluster module. REFER to [Section 413-01](#). REPEAT the self-test. CLEAR the DTCs.

→ **No**
REPAIR circuit 35-AL7. REPEAT the self-test. CLEAR the DTCs.

PINPOINT TEST B: DTC B2332: STEERING COLUMN TILT FEEDBACK POTENTIOMETER CIRCUIT FAILURE

CONDITIONS	DETAILS/RESULTS/ACTIONS
B1 CHECK CONTINUOUS DTCs	
<p>1</p>  <p>Instrument Cluster Module (ICM) Continuous DTCs</p>	<p>● Is DTC B2332 present?</p> <p>→ Yes GO to B2.</p> <p>→ No GO to B11.</p>
B2 CHECK FOR MOTION FAULTS	
<p>2</p>  <p>Instrument Cluster Module CLEAR DTCs</p> <p>5</p>  <p>Instrument Cluster Module SELF-TEST</p>	<p>1 Disconnect and reconnect the battery.</p> <p>3 Actuate the steering column to the full in position.</p> <p>4 Actuate the steering column to the full out position.</p> <p>● Is DTC B2328 present?</p> <p>→ Yes GO to B3.</p> <p>→ No System was deactivated due to ICM registering an excessive number of motion faults. NOTIFY owner that</p>

concern has been corrected. REPEAT the self-test. CLEAR the DTCs.

B3 CHECK STEERING COLUMN BEARINGS

- 1 Remove the steering column shrouds.
- 2 Check the steering column bearings to make sure that they are fully seated back against the stops.

- **Are the steering column bearings correctly seated back against the stops?**

→ **Yes**
GO to [B4](#).

→ **No**
SEAT the steering column bearings back against the stops. REPEAT the self-test. CLEAR the DTCs.

B4 ISOLATE THE POTENTIOMETERS

1

Steering Column Potentiometer Assembly C222

2

- 2 Connect a jumper wire between the steering column potentiometer assembly C222-1, circuit 9-AL17 (PK/OG), harness side and the steering column potentiometer assembly terminal 1.

- 3 Connect a jumper wire between the steering column potentiometer assembly C222-4, circuit 7-AL17 (DG/WH), harness side and the steering column potentiometer assembly terminal 4.

- 4 Connect a jumper wire between the steering column potentiometer assembly C222-2, circuit 8-AL17 (DB/YE) and the steering column potentiometer assembly terminal 3.

- 5 Connect a jumper wire between the steering column potentiometer assembly C222-3, circuit 8-AL16 (PK/LB) and the steering column potentiometer assembly terminal 2.

6

Instrument Cluster Module Self-Test

● Is DTC B2328 retrieved?

→ **Yes**
INSTALL a new steering column potentiometer assembly. REPEAT the self-test. CLEAR the DTCs.

→ **No**
GO to [B5](#).

B5 CHECK CIRCUIT 8-AL17 (DB/YE) FOR A SHORT TO B+

1

Retractor Box C218

2

A0006120

2

Measure the voltage at the steering column potentiometer assembly C222-2, circuit 8-AL17 (DB/YE), harness side.

● Is voltage present?

→ **Yes**
REPAIR circuit 8-AL17. REPEAT the self-test. CLEAR the DTCs.

→ **No**
GO to [B6](#).

B6 CHECK CIRCUIT 8-AL17 (DB/YE) FOR A SHORT TO GROUND

1

A0006121

1

Measure the resistance between the steering column potentiometer assembly C222-2, circuit 8-AL17 (DB/YE), harness side and ground.

- Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to [B7](#).

→ **No**
REPAIR circuit 8-AL17. REPEAT the self-test. CLEAR the DTCs.

B7 CHECK CIRCUIT 8-AL17 (DB/YE) FOR AN OPEN

1

1

Measure the resistance between the steering column potentiometer assembly C222-2, circuit 8-AL17 (DB/YE), harness side and the retractor box C218-5, circuit 8-AL17 (DB/YE).

- Is the resistance less than 5 ohms?

→ **Yes**
GO to [B8](#).

→ **No**
REPAIR circuit 8-AL17. REPEAT the self-test. CLEAR the DTCs.

B8 CHECK CIRCUIT 8-AL17 (WH/VT) FOR A SHORT TO B+

1

Instrument Cluster Module C220c

2

2

Measure the voltage at instrument cluster module C220c-20, circuit 8-AL17 (WH/VT), harness side.

- Is voltage present?

- **Yes**
REPAIR circuit 8-AL17. REPEAT the self-test. CLEAR the DTCs.
- **No**
GO to [B9](#).

B9 CHECK CIRCUIT 8-AL17 (WH/VT) FOR A SHORT TO GROUND

1

1 Measure the resistance between the instrument cluster module C220c-20, circuit 8-AL17 (WH/VT), harness side and ground.

- **Is the resistance greater than 10,000 ohms?**

- **Yes**
GO to [B10](#).
- **No**
REPAIR circuit 8-AL17. REPEAT the self-test. CLEAR the DTCs.

B10 CHECK CIRCUIT 8-AL17 (WH/VT) FOR AN OPEN

1

1 Measure the resistance between the retractor box C218-6, circuit 8-AL17 (WH/VT), harness side and the instrument cluster C220c-20, circuit 8-AL17 (WH/VT), harness side.

- **Is the resistance less than 5 ohms?**

- **Yes**
INSTALL a new instrument cluster module. REFER to [Section 413-01](#). REPEAT the self-test. CLEAR the DTCs.
- **No**
REPAIR circuit 8-AL17. REPEAT the self-test. CLEAR the DTCs.

B11 CHECK FOR STEERING COLUMN MOVEMENT

NOTE: This active command will only power motors for one second.

1

Instrument Cluster Module Active Command STEERING COLUMN CONTROL

2

Trigger TELES CP IN On, Then TELSCPOUT On

● Does the steering column telescope in and out?

→ Yes
GO to [B12](#).

→ No
GO to [B14](#).

B12 CHECK CIRCUIT 8-AL17 (DB/YE) FOR AN OPEN

1

Steering Column Potentiometer Assembly C222

2

Retractor Box C218

3

3 Measure the resistance between the steering column potentiometer assembly C222-2, circuit 8-AL17 (DB/YE), harness side and the retractor box C218-5, circuit 8-AL17 (DB/YE).

● Is the resistance less than 5 ohms?

→ Yes
GO to [B13](#).

→ No

REPAIR circuit 8-AL17. REPEAT the self-test. CLEAR the DTCs.

B13 CHECK CIRCUIT 8-AL17 (WH/VT) FOR AN OPEN

1

Steering Column Potentiometer Assembly C222

2

Instrument Cluster Module C220c

3

3 Measure the resistance between the retractor box C218-6, circuit 8-AL17 (WH/VT), harness side and the instrument cluster C220c-20, circuit 8-AL17 (WH/VT), harness side.

● Is the resistance less than 5 ohms?

→ **Yes**
INSTALL a new steering column potentiometer assembly. REPEAT the self-test. CLEAR the DTCs.

→ **No**
REPAIR circuit 8-AL17. REPEAT the self-test. CLEAR the DTCs.

B14 ISOLATE THE MOTOR

1

Steering Column Motor Connector C227

2

2 Connect a voltmeter between the steering column motor C227-2, circuit 32-AL6 (WH/BU), harness side, and the steering column motor C227-1, circuit 33-AL6 (YE/BU), harness side.

A0005886

3

Instrument Cluster Module Active Command STEERING COLUMN CONTROL

4

Trigger TELES CP IN On, Then TELES CPOUT On

5 Measure the voltage during the activate commands.

- Is voltage present for one second after each command is sent?

→ **Yes**
INSTALL a new telescope motor.
REPEAT the self-test. CLEAR the DTCs.

→ **No**
GO to [B15](#).

B15 CHECK CIRCUIT 32-AL6 (WH/BU) FOR VOLTAGE

1

A0003860

2

Instrument Cluster Module Active Command STEERING COLUMN CONTROL

3

1 Connect a voltmeter between steering column motor C227-2, circuit 32-AL6 (WH/BU), harness side and ground.

Trigger TILTDOWN On

4 Measure the voltage during the activate command.

• Is voltage present for one second after command is sent?

→ Yes
GO to [B17](#).

→ No
GO to [B16](#).

B16 CHECK CIRCUIT 32-AL6 (WH/BU) FOR AN OPEN

1

Instrument Cluster Module C220a

2

2

Measure the resistance between steering column motor C227-2, circuit 32-AL6 (WH/BU), harness side and the instrument cluster module C220a-3, circuit 32-AL6 (WH/BU), harness side.

• Is the resistance less than 5 ohms?

→ Yes
INSTALL a new instrument cluster module. REFER to [Section 413-01](#).
REPEAT the self-test. CLEAR the DTCs.

→ No
REPAIR circuit 32-AL6. REPEAT the self-test. CLEAR the DTCs.

B17 CHECK CIRCUIT 33-AL6 (YE/BU) FOR AN OPEN

1

Instrument Cluster Module C220a

2

2

Measure the resistance between

steering column motor C227-1, circuit 33-AL6 (YE/BU), harness side and the instrument cluster module C220a-2, circuit 33-AL6 (YE/BU), harness side.

- **Is the resistance less than 5 ohms?**

→ **Yes**
 INSTALL a new instrument cluster module. REFER to [Section 413-01](#).
 REPEAT the self-test. CLEAR the DTCs.

→ **No**
 REPAIR circuit 33-AL6. REPEAT the self-test. CLEAR the DTCs.

PINPOINT TEST C: DTC B2351: STEERING COLUMN SWITCH SIGNAL CIRCUIT FAILURE

CONDITIONS	DETAILS/RESULTS/ACTIONS
C1 CHECK THE PIDs	
<p>1</p>  <p>Instrument Cluster Module PID TILT and PID TELESCP</p>	<p>2</p> <p>Actuate the steering column adjust switch to the tilt up, tilt down, telescope in, telescope out and neutral positions.</p> <ul style="list-style-type: none"> ● Does the PID TILT and the PID TELESCP read OFF in the neutral position and UP, DOWN, IN and OUT in the corresponding switch position? <p>→ Yes GO to C2.</p> <p>→ No GO to C4.</p>
C2 CHECK THE PID TILT	
<p>1</p>	

Instrument Cluster Module PID TILT

2 Actuate the steering column adjust switch to the tilt up and tilt down positions while monitoring the PID TILT.

- Does the PID TILT read UP with the switch in the up position and DOWN with the switch in the down position and OFF with the switch in the neutral position?

→ Yes
GO to C3.

→ No
INSTALL a new multi-function switch. REFER to Section 211-05. REPEAT the self-test. CLEAR the DTCs.

C3 CHECK THE PID TELES CP

1

Instrument Cluster Module PID TELES CP

2 Actuate the steering column adjust switch to the telescope out and the telescope in positions while monitoring the PID TELES CP.

- Does the PID TELES CP read IN with the switch in the in position and OUT with the switch in the out position and OFF with the switch in the neutral position?

→ Yes
REPEAT the self-test. If DTC B2351 is retrieved, INSTALL a new instrument cluster module. REFER to Section 413-01. REPEAT the self-test. CLEAR the DTCs.

→ No
INSTALL a new multi-function switch. REFER to Section 211-05. REPEAT the self-test. CLEAR the DTCs.

C4 CHECK CIRCUIT 9-AL10 (YE/RD) FOR A SHORT TO BATTERY/GROUND

1

Multi-Function Switch C202

2

2 Connect the multimeter positive lead to the multi-function switch C202-11, circuit 9-AL10 (YE/RD) and the negative lead to ground.

3 Measure the voltage and resistance.

- Is the voltage greater than 11.5 volts or the resistance 5 ohms or less?

→ **Yes**
REPAIR circuit 9-AL10 (YE/RD).
REPEAT the self-test. CLEAR the DTCs.

→ **No**
GO to [C5](#).

C5 CHECK CIRCUIT 8-AL10 (BN) FOR A SHORT TO BATTERY/GROUND

1

1 Connect the multimeter positive lead to the multi-function switch C202-12, circuit 8-AL10 (BN) and the negative lead to ground.

2 Measure the voltage and resistance.

- Is the voltage greater than 11.5 volts or the resistance 5 ohms or less?

→ **Yes**
REPAIR circuit 8-AL10 (BN). REPEAT the self-test. CLEAR the DTCs.

→ **No**
GO to [C6](#).

C6 CHECK CIRCUIT 9-AL10 (YE/RD) FOR AN OPEN

1

Retractor Box C217

2

2

Measure the resistance between the multi-function switch C202-11, circuit 9-AL10 (YE/RD), harness side and the retractor box C217-7, circuit 9-AL10 (YE/RD).

● Is the resistance less than 5 ohms?

→ **Yes**
GO to [C7](#).

→ **No**
REPAIR circuit 9-AL10 (YE/RD).
REPEAT the self-test. CLEAR the DTCs.

C7 CHECK CIRCUIT 8-AL10 (BN) FOR AN OPEN

1

1

Measure the resistance between the multi-function switch C202-12, circuit 8-AL10 (BN), harness side and the retractor box C217-7, circuit 8-AL10 (BN).

● Is the resistance less than 5 ohms?

→ **Yes**
GO to [C8](#).

→ **No**
REPAIR circuit 8-AL10 (BN). REPEAT the self-test. CLEAR the DTCs.

C8 CHECK CIRCUIT 9-AL10 (BN) FOR AN OPEN

1

Multi-Function Switch C202

2

Instrument Cluster Module C220c

3

3

Measure the resistance between the retractor box C217-7, circuit 9-AL10 (BN), harness side and the instrument cluster module C220c-3, circuit 9-AL10 (BN), harness side.

● Is the resistance less than 5 ohms?

→ **Yes**
GO to [C9](#).

→ **No**
REPAIR circuit 9-AL10. REPEAT the self-test. CLEAR the DTCs.

C9 CHECK CIRCUIT 8-AL10 (WH) FOR AN OPEN

1

1

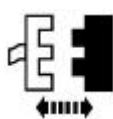

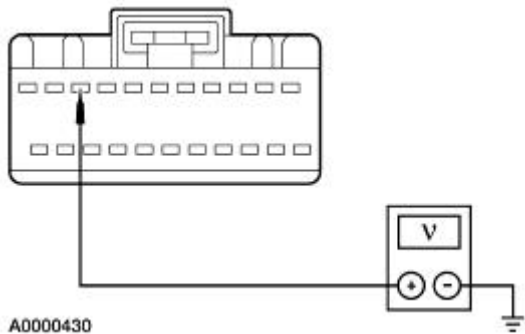

Measure the resistance between the retractor box C217-8, circuit 8-AL10 (WH), harness side and the instrument cluster module C220c-15, circuit 8-AL10 (WH), harness side.

● Is the resistance less than 5 ohms?

→ **Yes**
INSTALL a new instrument cluster module. REFER to [Section 413-01](#). REPEAT the self-test. CLEAR the DTCs.

→ **No**
REPAIR circuit 8-AL10. REPEAT the self-test. CLEAR the DTCs.

PINPOINT TEST D: THE TILT AND TELESCOPE ADJUSTMENT ARE INOPERATIVE

CONDITIONS	DETAILS/RESULTS/ACTIONS
D1 CHECK CONTINUOUS DTCs	
<p>1</p>  <p>Instrument Cluster Module (ICM) Continuous DTCs</p>	<ul style="list-style-type: none"> • Are DTCs B2328 and B2332 present? <p>→ Yes Go To Pinpoint Test A or Go To Pinpoint Test B.</p> <p>→ No GO to D2.</p>
D2 CHECK CIRCUIT 9-AL17 (BN/WH) FOR A SHORT TO B+	
<p>1</p>  <p>Instrument Cluster Module Connector C220c</p> <p>2</p>  <p>3</p>  <p>A0000430</p>	<p>3</p> <p>Measure the voltage at the instrument cluster module C220c-9, circuit 9-AL17 (BN/WH), harness side.</p> <ul style="list-style-type: none"> • Is voltage reading B+? <p>→ Yes GO to D3.</p> <p>→ No GO to D4.</p>
D3 CHECK CIRCUIT 7-AL17 (YE/VT) FOR A SHORT TO B+	
<p>1</p>	

2

Steering Column Potentiometer Assembly C222

3

4

4 Measure the voltage at the instrument cluster module C220c-19, circuit 7-AL17 (YE/VT), harness side.

• Is the voltage reading B+?

→ Yes
REPAIR circuit 7-AL17. REPEAT the self-test. CLEAR the DTCs.

→ No
REPAIR circuit 9-AL17. REPEAT the self-test. CLEAR the DTCs.

D4 CHECK CIRCUIT 9-AL17 (BN/WH) FOR AN OPEN

1

Steering Column Potentiometer Assembly C222

2

2 Measure the resistance between the instrument cluster module C220c-9, circuit 9-AL17 (BN/WH), harness side and the steering column potentiometer assembly C222-1, circuit 9-AL17 (BN/WH), harness side.

● Is the resistance less than 5 ohms?

→ **Yes**
GO to [D5](#).

→ **No**
REPAIR circuit 9-AL17. REPEAT the self-test. CLEAR the DTCs.

D5 CHECK FOR MOTOR MOTION SENSED

1

Instrument Cluster Module Active Command STEERING COLUMN CONTROL

2

Select PIDs TELEPOS and TILTPOS

3 **NOTE:** This active command will only power the motors for one second.

Trigger TILT UP, TILT DOWN, TELSCP IN and TELSCPOUT on, one at a time while monitoring the PID TELEPOS and TILTPOS.

● Do the PIDs TELEPOS and TILTPOS read **SENSED** when the corresponding motors are triggered on?

→ **Yes**
INSPECT the steering column potentiometer assembly connection and the steering column/ignition/lighting control module connectors for loose or intermittent connections. REPEAT the self-test. CLEAR the DTCs.

→ **No**
GO to [D6](#).

D6 CHECK CIRCUIT 9-AL17 (PK/OG) FOR AN OPEN

1

Steering Column Potentiometer Assembly C222

2

Retractor Box C218

3

3

Measure the resistance between the steering column potentiometer assembly C222-1, circuit 9-AL17 (PK/OG), harness side and retractor box C218-3, circuit 9-AL17 (PK/OG).

- Is the resistance less than 5 ohms?

→ **Yes**
GO to [D7](#).

→ **No**
REPAIR circuit 9-AL17. REPEAT the self-test. CLEAR the DTCs.

D7 CHECK CIRCUIT 9-AL17 (PK/OG) FOR A SHORT TO GROUND

1

1

Measure the resistance between the steering column potentiometer assembly C222-1, circuit 9-AL17 (PK/OG), harness side and ground.

- Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to [D8](#).

→ **No**
REPAIR circuit 9-AL17. REPEAT the self-test. CLEAR the DTCs.

D8 CHECK CIRCUIT 9-AL17 (BN/WH) FOR AN OPEN

1

Steering Column Potentiometer Assembly C222

2

Instrument Cluster Module C220c

3

3

Measure the resistance between the retractor box C218a-3, circuit 9-AL17 (BN/WH), harness side and the instrument cluster module C220c-9, circuit 9-AL17 (BN/WH), harness side.

- Is the resistance less than 5 ohms?

→ **Yes**
GO to [D9](#).

→ **No**
REPAIR circuit 9-AL17. REPEAT the self-test. CLEAR the DTCs.

D9 CHECK CIRCUIT 9-AL17 (BN/WH) FOR A SHORT TO GROUND

1

1

Measure the resistance between the instrument cluster module C220c-9, circuit 9-AL17 (BN/WH), harness side and ground.

- Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to [D10](#).

→ **No**
REPAIR circuit 9-AL17. REPEAT the self-test. CLEAR the DTCs.

D10 ISOLATE THE POTENTIOMETERS

1

Steering Column Potentiometer Assembly C222

2

Instrument Cluster Module Active Command STEERING COLUMN CONTROL

3

Trigger TELESOP IN On

4

A0006113

- 4 Measure the voltage at steering column potentiometer assembly C222-4, circuit 7-AL17 (DG/WH), harness side during the active command.

- Is the voltage greater than 10 volts?

→ **Yes**
INSTALL a new steering column potentiometer assembly. REPEAT the self-test. CLEAR the DTCs.

→ **No**
GO to [D11](#).

D11 CHECK CIRCUIT 7-AL17 (DG/WH) FOR A SHORT TO GROUND

1

Retractor Box C218

2

- 2 Measure the resistance between steering column potentiometer assembly C222-4, circuit 7-AL17 (DG/WH), harness side and ground.

A0006119

- Is the resistance greater than 10,000 ohms?

→ **Yes**
REPAIR circuit 7-AL17. REPEAT the self-test. CLEAR the DTCs.

→ **No**
GO to [D12](#).

D12 CHECK CIRCUIT 7-AL17 (DG/WH) FOR AN OPEN

1

A0006115

1

Measure the resistance between steering column potentiometer assembly C222-4, circuit 7-AL17 (DG/WH), harness side and retractor box C218 pin 4, circuit 7-AL17 (DG/WH).

- Is the resistance less than 5 ohms?

→ **Yes**
GO to [D13](#).

→ **No**
REPAIR circuit 7-AL17. REPEAT the self-test. CLEAR the DTCs.

D13 CHECK CIRCUIT 7-AL17 (YE/VT) FOR A SHORT TO GROUND

1

Retractor Box C218

2

2

Measure the resistance between instrument cluster module C220c-19, circuit 7-AL17 (YE/VT), harness side and ground.

A0006116

- Is the resistance greater than 10,000 ohms?

→ **Yes**
REPAIR circuit 7-AL17. REPEAT the self-test. CLEAR the DTCs.

→ **No**
GO to [D14](#).

D14 CHECK CIRCUIT 7-AL17 (YE/VT) FOR AN OPEN

1

A0006117

1

Measure the resistance between instrument cluster module C220c-19, circuit 7-AL17 (YE/VT), harness side and retractor box C218-4, circuit 7-AL17 (YE/VT), harness side.

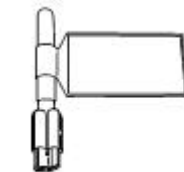

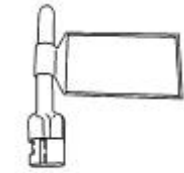

- Is the resistance less than 5 ohms?

→ **Yes**
INSTALL a new instrument cluster module. REPEAT the self-test. CLEAR the DTCs.

→ **No**
REPAIR circuit 7-AL17. REPEAT the self-test. CLEAR the DTCs.

Supplemental Restraint System (SRS) Deactivation and Reactivation

Special Tool(s)

 ST2502-A	Diagnostic Tool, Restraint System (1 Req'd) 418-F395
 ST2506-A	Diagnostic Tool, Restraint System (3 Req'd) 418-F088 (105-R0012)
 ST2507-A	Diagnostic Tool, Restraint System (2 Req'd) 418-133 (40-009)

Deactivation

 **WARNING:** Always wear safety glasses when repairing an air bag supplemental restraint system (SRS) vehicle and when handling an air bag module. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Carry a live air bag module with the air bag and trim cover pointed away from your body. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** Do not set a live air bag module down with the trim cover face down. This will reduce the risk of injury in the event of an accidental deployment.

 **WARNING:** After deployment, the air bag surface can contain deposits of sodium hydroxide, a product of the gas generant combustion that is irritating to the skin. Wash your hands with soap and water afterwards.

 **WARNING:** Never probe the connectors on the air bag module. Doing so can result in air bag deployment, which can result in personal injury.

 **WARNING:** The safety belt buckle pretensioner and safety belt retractor pretensioner are pyrotechnic devices. Never probe a pretensioner electrical connector. Doing so could result in pretensioner or air bag deployment and could result in personal injury.

WARNING: Vehicle sensor orientation is critical for proper system operation. If a vehicle equipped with an air bag supplemental restraint system (SRS) is involved in a collision, inspect the sensor mounting bracket and wiring pigtail for deformation. Replace and properly position the sensor or any other damaged supplemental restraint system (SRS) components whether or not the air bag is deployed.

WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.

NOTE: If a seat equipped with a seat mounted side air bag and/or a safety belt pretensioner (if equipped) system is being serviced, **the air bag system must be deactivated.**

NOTE: Restraint system diagnostic tools **MUST** be installed under the seats in the seat side air bag (if equipped) and safety belt pretensioner (if equipped) to floor connectors.

NOTE: Diagnostics or repairs are not to be performed on a seat equipped with a seat side air bag with the seat in the vehicle. Prior to attempting to diagnose or repair a seat concern when equipped with a seat side air bag, the seat must be removed from the vehicle and the restraint system diagnostic tools must be installed in the seat side air bag electrical connectors. **The restraint system diagnostic tools must be removed prior to operating the vehicle over the road.**

NOTE: After diagnosing or repairing an SRS, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: After diagnosing or repairing a seat system, **the restraint system diagnostic tools must be removed before operating the vehicle over the road.**

NOTE: The SRS must be fully operational and free of faults before releasing the vehicle to the customer.

- WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle workshop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, Disconnect the battery ground cable and wait at least one minute to allow for the depletion of the restraint system backup power supply. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute to allow for the depletion of the restraint system backup power supply. For additional information, refer to [Section 414-01](#).

- Remove the two screws and pull out on the lower steering column opening finish panel enough to access the electrical connectors.

3. Remove the lower steering column opening finish panel.
 1. Disconnect the electrical connectors.
 2. Remove the lower steering column opening finish panel.

4. Remove the screws. Separate the hood latch release cable and handle assembly from the steering column opening reinforcement.

5. Remove the two pin-type retainers and the RH instrument panel insulator.
 - Disconnect the courtesy lamp.

6. Remove the screw and the heater duct.

7. Loosen the two driver-side instrument panel tunnel brace bolts.
 - Position the carpet aside to gain access to the bolts.

8. Remove the screws and the steering column opening reinforcement.

9. Disconnect the clockspring electrical connector at the base of the steering column.

10. Attach the restraint system diagnostic tool to the vehicle harness side of the clockspring

electrical connector.

11. Remove the glove compartment. For additional information, refer to [Section 501-12](#).
12. Disconnect the passenger air bag module electrical connector.
 1. Reaching into the glove box opening toward the center of the instrument panel, under the cross-car beam, slide and disengage the passenger air bag module electrical connector locking clip.
 2. Push in on the two release tabs and disconnect the passenger air bag module electrical connector.

13. Attach the restraint system diagnostic tool to the vehicle harness side of the passenger air bag electrical connector.

14. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).
15. Move and tilt the front seats to their highest and most forward position.
16.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors,

instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle workshop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, Disconnect the battery ground cable and wait at least one minute to allow for the depletion of the restraint system backup power supply. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute to allow for the depletion of the restraint system backup power supply. For additional information, refer to [Section 414-01](#).

17. From under the passenger seat, release the tab on the connector bracket and remove the passenger seat side air bag electrical connector.

18. Disconnect the passenger seat side air bag electrical connector.
 1. Slide and disengage the passenger seat side air bag electrical connector locking clip.
 2. Push in to release the tab and disconnect the passenger seat side air bag electrical connector.

19. Attach the restraint system diagnostic tool to the passenger seat side air bag floor electrical connector.

20. Remove the passenger side B-pillar weatherstripping.
21. Position the safety belt D-ring to its highest point.
22. Remove the passenger side B-pillar upper trim panel.

23. Remove the passenger side front and rear door scuff plates.

24. Remove the passenger side B-pillar lower trim panel.

25. Disconnect the passenger side safety belt retractor pretensioner floor electrical connector.

26. Attach the restraint system diagnostic tool to the passenger side safety belt retractor pretensioner floor electrical connector.

27. From under the driver seat, release the tab on the connector bracket and remove the driver seat side air bag electrical connector.

28. Disconnect the driver seat side air bag electrical connector.
1. Slide and disengage the driver seat side air bag electrical connector locking clip.
 2. Push down to release the tab and disconnect the driver seat side air bag electrical connector.

29. Attach the restraint system diagnostic tool to the driver seat side air bag floor electrical connector.

30. Remove the driver side B-pillar weatherstripping.
31. Position the safety belt D-ring to its highest point.
32. Remove the driver side B-pillar upper trim panel.

33. Remove the driver side front and rear door scuff plates.

34. Remove the driver side B-pillar lower trim panel.

35. Disconnect the driver side safety belt retractor pretensioner electrical connector.

36. Attach the restraint system diagnostic tool to the driver side safety belt retractor pretensioner floor electrical connector.

37. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).
38. With the restraint system diagnostic tools installed at all deployable devices, prove out the supplemental restraint system (SRS). For additional information, refer to [Section 501-20B](#).
39. Disconnect the battery ground cable and wait at least one minute to allow for the depletion of the restraint system backup power supply. For additional information, refer to [Section 414-01](#).

Reactivation

⚠ WARNING: To reduce the risk of serious personal injury, read and follow all warnings and notes at the beginning of the deactivation procedure.

1. Remove the restraint system diagnostic tool from the driver side safety belt retractor pretensioner floor electrical connector.

2. Connect the driver side safety belt retractor pretensioner electrical connector.

3. Install the driver side B-pillar lower trim panel.

4. Install the driver side front and rear door scuff plates.

5. **NOTE:** Position the safety belt D-ring to its highest point.

Install the driver side B-pillar upper trim panel.

6. Install the driver side B-pillar weatherstripping.
7. Remove the restraint system diagnostic tool from the driver seat side air bag floor electrical connector.

8. Connect the driver seat side air bag electrical connector.
 1. Connect the driver seat side air bag electrical connector.
 2. Slide and engage the driver seat side air bag electrical connector locking clip.

9. Install the driver seat side air bag electrical connector onto the connector bracket under the driver seat.

10. Remove the restraint system diagnostic tool from the passenger side safety belt retractor pretensioner electrical connector.

11. Connect the passenger side safety belt retractor pretensioner electrical connector.

12. Install the passenger side B-pillar lower trim panel.

13. Install the passenger side front and rear door scuff plates.

14. **NOTE:** Position the safety belt D-ring to its highest point.

Install the passenger side B-pillar upper trim panel.

15. Install the passenger side B-pillar weatherstripping.

16. Remove the restraint system diagnostic tool from the passenger seat side air bag floor electrical connector.

17. Connect the passenger seat side air bag electrical connector.

1. Connect the passenger seat side air bag electrical connector.
2. Slide and engage the passenger seat side air bag electrical connector locking clip.

18. Install the passenger seat side air bag electrical connector onto the connector bracket under the passenger seat.

19. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).

20. Position the front seats rearward.

21.  **WARNING:** To avoid accidental deployment and possible personal injury, the backup power supply must be depleted before repairing or replacing any front or side air bag supplemental restraint system (SRS) components and before servicing, replacing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches.

Please refer to the appropriate vehicle workshop manual to determine location of the front air bag sensors.

The side air bag sensors are located at or near the base of the B-pillar.

To deplete the backup power supply energy, Disconnect the battery ground cable and wait at least one minute to allow for the depletion of the restraint system backup power supply. Be sure to disconnect auxiliary batteries and power supplies (if equipped).

Disconnect the battery ground cable and wait at least one minute to allow for the depletion of the restraint system backup power supply. For additional information, refer to [Section 414-01](#).

22. Remove the restraint system diagnostic tool from the vehicle harness side of the passenger air bag electrical connector.

23. Connect the passenger air bag module electrical connector.

1. Reach into the glove box opening toward the center of the instrument panel, under the cross-car beam and connect the passenger air bag module electrical connector.
2. Slide and engage the passenger air bag module electrical connector locking clip.

24. Install the glove compartment. For additional information, refer to [Section 501-12](#).
25. Remove the restraint system diagnostic tool from the vehicle harness side of the clockspring electrical connector.

26. Connect the clockspring electrical connector at the base of the steering column.

27. Position the steering column opening reinforcement and install the screws.

28. Tighten the two driver-side instrument panel tunnel brace bolts.

- Reposition the carpet.

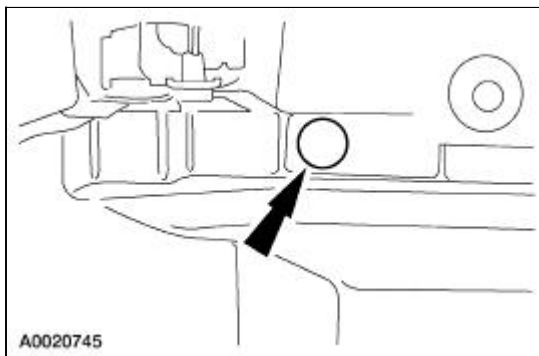

29. Position the heater duct and install the screw.

30. Install the RH instrument panel insulator and the two pin-type retainers.

- Connect the courtesy lamp.

31. Position the hood latch release cable and handle assembly to the steering column opening reinforcement and install the screws.

32. Connect the electrical connectors to the switches in the lower steering column opening finish panel.

33. Install the lower steering column opening finish panel to the instrument panel.
1. Position the lower steering column opening finish panel to the instrument panel and push in, seating the retaining clips.
 2. Install the screws.

34. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).

35.  **WARNING: The restraint system diagnostic tool is for restraint system service only. Remove from vehicle prior to road use. Failure to remove could result in injury and possible violation of vehicle safety standards.**

With all the restraint system diagnostic tools removed, prove out the supplemental restraint system (SRS). For additional information, refer to [Section 501-20B](#).

36. Check the active restraint system for correct operation. For additional information, refer to [Section 501-20A](#).
-

Ignition Switch Lock Cylinder

Removal and Installation

1. Disconnect the battery ground cable and wait at least one minute to allow for the depletion of the restraint system backup power supply. For additional information, refer to [Section 414-01](#).
2. Remove the bolts. Detach the steering column opening cover.

3. Disconnect the electrical connector. Remove the steering column opening cover.

4. Remove the bolts and the hood release handle assembly.

5. Remove the pushpins and the insulator panel.

6. Remove the bolt and the heater duct.

7. Remove the bolts and the steering column opening cover reinforcement.

8. Turn the ignition switch to the RUN position.

9. Using a small flat-blade screwdriver, depress the ignition switch lock cylinder tab. Remove the ignition switch lock cylinder.

10. To install, reverse the removal procedure.

- Verify correct operation of the ignition switch lock cylinder.
-

Steering Wheel

Special Tool(s)

Removal

1. Center the steering wheel to the straight-ahead position.
2. Disconnect the battery ground cable and wait at least one minute to allow for the depletion of the restraint system backup power supply. For additional information, refer to [Section 414-01](#).
3.  **WARNING: To avoid the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation procedure.**

Deactivate the supplemental restraint system. For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

4. Remove the horn blow switch. For additional information, refer to [Section 413-06](#).
5. Loosen the steering wheel retaining bolt.

6. Using the special tool, loosen the steering wheel.

7. Remove the steering wheel.
 1. Remove the special tool.
 2. Remove and discard the steering wheel retaining bolt.
 3. Remove the steering wheel.

Installation

1. Install the steering wheel and a new steering wheel retaining bolt.

2. Install the horn blow switch. For additional information, refer to [Section 413-06](#).
3.  **WARNING:** To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation procedure.

Reactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

Clockspring

Removal and Installation

For additional information, refer to [Section 501-20B](#).

Steering Column

Removal

All vehicles

1. Prepare the vehicle for steering column removal.
 1. Disconnect the battery ground cable for at least one minute to allow for the depletion of the restraint system backup power supply. For additional information, refer to [Section 414-01](#).
 2.  **WARNING: To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation procedure.**

Deactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

3. Remove the clockspring. For additional information, refer to [Section 501-20B](#).
2. Remove and discard the steering column shaft pinch bolt. Detach the intermediate shaft from the steering column yoke.

3. Disconnect the electronic steering sensor and steering column release motor harness electrical connectors.

Vehicles with automatic transmission

4. While supporting the steering column, remove and discard the lock nuts. Remove the steering column.

Vehicles with manual transmission

5. While supporting the steering column, remove and discard the lock nuts. Lower the steering column.

6. Disconnect the steering wheel lock actuator electrical connector.

7. Remove the steering column.

Installation

Vehicles with manual transmission

1. Connect the steering wheel lock actuator electrical connector.

All vehicles

2. Position the steering column and loosely install the bolts.

3. Connect the electronic steering sensor and the steering column release motor electrical connectors.

4. Attach the intermediate shaft to the steering column yoke and install the pinch bolt.

5. Restore the vehicle to operating condition.
 1. Install the clockspring. For additional information, refer to [Section 501-20B](#).
 2.  **WARNING:** To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the supplemental restraint system (SRS) deactivation procedure.

Reactivate the supplemental restraint system (SRS). For additional information, refer to [Supplemental Restraint System \(SRS\) Deactivation and Reactivation](#) in this section.

Tilt/Telescopic Motors

Removal and Installation

1.  **WARNING:** To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the steering column removal and installation procedure.

Remove the steering column. For additional information, refer to [Steering Column](#) in this section.

2. Place the steering column in a vise.

3. Remove the screws and the electronic steering sensor (18B015).

4. **NOTE:** Do not disconnect the steering column release motor harness electrical connectors from the steering column release motor assemblies (3D538).

Remove the screws and the steering column release motor assemblies.

5.  **WARNING:** To reduce the risk of serious personal injury, read and follow all warnings, cautions, notes and instructions in the steering column procedure.

To install, reverse the removal procedure.

Steering Column Shaft —Intermediate

Removal and Installation

1. Hold the steering wheel in the straight forward position using a suitable holding device.

2. Remove the pinch bolt and detach the intermediate shaft from the steering column yoke.
 - Discard the bolt.

3. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
4.  **CAUTION:** Do not allow the steering wheel to rotate while the steering column intermediate shaft is disconnect or damaged to the clockspring can result. If there is evidence that the wheel has rotated, the clockspring must be removed and recentered. For additional information, refer to [Section 501-20B](#).

Remove the pinch bolt and detach the coupler.

- Discard the bolt.

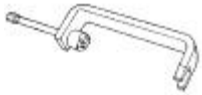

5. Remove the intermediate shaft.
6. To install, reverse the removal procedure.

Steering Column —Power Tilt/Telescopic

Special Tool(s)

 ST1692-A	Tilt Column Spring Compressor 211-201 (T97P-3D655-A)
---	---

Disassembly

All vehicles

1. Place the steering column in a vise.

Vehicles with manual transmission

2.  **CAUTION:** Use care not damage the steering wheel lock actuator (3K772) when removing the heads from the shear bolts.

Using a suitable drill and 3/8-in drill bit, remove heads of the shear bolts. Remove the steering wheel lock actuator. Using locking pliers, remove the shear bolts from the steering column upper shaft assembly.

All vehicles

3. Remove the screws and the electronic steering sensor (18B015).

4.  **CAUTION:** Do not telescope the steering column manually or by any means other than those described below. Failure to do so can result in damage to the steering column potentiometer (14A605) and the steering column actuator assembly (3F797).

 **CAUTION:** Pay close attention to the travel of power steering potentiometer while operating the steering column with the battery charger. Overtravel of the steering column can damage the steering column potentiometer and cause other electrical failures.

Disconnect the steering column release motor (telescopic) electrical connector. Using a suitable 1 amp 12 volt battery charger connected to the steering column release motor (telescopic) electrical terminals, telescope the steering column out until it reaches the stop (fully extended). Connect the steering column release motor (telescopic) electrical connector.

- If the steering column release motor (telescopic) is damaged or inoperable, a new steering column release motor (telescopic) must be installed before telescoping the steering column.

5. **NOTE:** Do not disconnect the steering column release motor harness electrical connectors from the steering column release motor assemblies (3D538).

Remove the screws and the steering column release motor assemblies.

6. **NOTE:** The upper steering column track (3B628) will fall free when the steering column outer housing (3F789) is removed.

Remove the bolts, steering column outer housing cover plate (3F790), steering column outer housing and steering column track.

7. Remove the steering column connector link (3A517).

8. Install the special tool hand tight on the steering column position spring (3D655).

9. Remove the bolts.

10. Using the special tool, release the spring tension. Remove the special tool and the steering column position spring.

11. Separate the front and rear halves of the steering column upper shaft assembly and the steering column inner housing (3F791).

12. **NOTE:** The steering column upper shaft assembly, sensor ring and coupler are serviced as an assembly.

Remove the bolts. Remove the rear half of the steering column upper shaft assembly from the steering column support assembly (3B718).

13.  **CAUTION: The curl strap on the steering column actuator assembly (telescopic) (3F797) must not be bent or altered under any circumstances.**

Remove the nuts and the steering column actuator assembly (telescopic). If the curl strap is damaged, a new steering column actuator assembly (telescopic) must be installed.

14. Remove the steering column track from the steering column support assembly.

15. Remove the screws and the steering column potentiometer assembly (14A605).

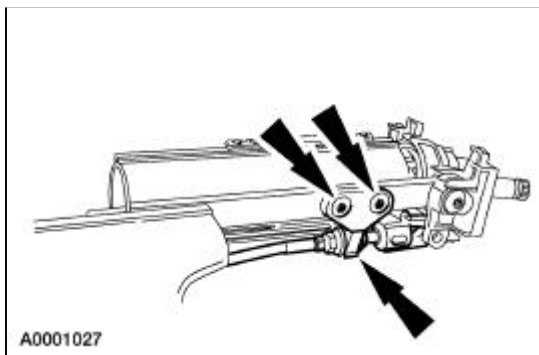

16. Remove the steering column release pin (3D545).

17. Place the steering column inner housing assembly (3F791) in a vise.

18. Remove the bolts and the steering column actuator assembly (tilt) (3F797).

19. **NOTE:** The steering column inner track bearing retainer assemblies (3F795) snap into place and will hold the steering column tracks to the steering column inner housing.

Remove the steering column inner track bearing retainer assemblies and steering column tracks.

20. Remove the bolts.

21. Remove the steering column tube flange (3511).

22. Remove the steering column upper bearing retainer (97663).

23. Remove the steering column upper bearing spring (3520).

24. Remove the steering column bearing sleeve (3518).

25. Remove the steering column upper bearing tolerance ring (3L539).
1. Using a flat-blade screwdriver, spread out the steering column upper bearing tolerance ring.
 2. Slide the steering column upper bearing tolerance ring from the steering column upper shaft assembly.

26. Remove the front half of the steering column upper shaft assembly.

27. Using a suitable brass drift, drive out the small steering column tube bearing assembly (3517).

28. Using a suitable brass drift, drive out the large steering column tube bearing assembly (3517).

Assembly

All vehicles

1. Using a suitable bearing installer tool, install the large steering column tube bearing assembly.

2. Using a suitable bearing installer tool, install the small steering column tube bearing assembly.

3. Slide the steering shaft into the tilt housing.

4. Install the steering column upper bearing tolerance ring.

5. Install the steering column bearing sleeve.

6. Install the steering column upper bearing spring.

7. Install the steering column upper bearing retainer.

8. Install the steering column tube flange.

9. Install the bolts.

10. Install the steering column actuator assembly (tilt).
1. Position the steering column actuator assembly (tilt).
 2. Install the bolts.

11. Install the steering column release pin.

12. Install the steering column potentiometer assembly and screws.
- Line up the pin on the steering column actuator assembly (tilt) with the slot on the

steering column potentiometer assembly.

13. Install the steering column actuator assembly (telescopic) and nuts. If the curl strap is damaged, a new steering column actuator assembly (telescopic) must be installed.

14. Install the steering column track on the steering column support assembly.
 - Apply Premium Long-Life Grease XG-1-C or equivalent meeting Ford specification ESA-M1C75-B to the bearing surface of the steering column track.

15.  **CAUTION: The staging of the steering column inner track bearing assemblies is very critical. The steering column inner track bearing assemblies must be installed against the rear steering column inner housing track bearing assembly retaining end. The steering column inner housing must be installed in the fully extended (out) position. Failure to correctly stage the steering column inner track bearing assemblies will result in damage to the steering column.**

Attach the steering column tracks and steering column inner track bearing assemblies on the steering column inner housing.

- Apply Premium Long-Life Grease XG-1-C or equivalent meeting Ford specification ESA-M1C75-B to the steering column track bearing assemblies and the bearing surface of the steering column tracks.

16. **NOTE:** The steering column upper shaft assembly, sensor ring and coupler are serviced as an assembly.

Install the rear half of the steering column upper shaft assembly into the steering column support assembly. Install the bolts.

17. Join the front and rear halves of the steering column upper shaft assembly and the steering column inner housing in the steering column support housing.
- Position the front half of the upper steering column upper shaft assembly with flat portion up before installing.
 - Position the rear half of the upper steering column upper shaft assembly with smooth face of the coupling up (machined side down) before installing.

18. Position the steering column spring. Using the special tool, compress the steering column position spring until the steering column actuator assembly (telescopic) bolt holes align.

19. Install the bolts.

20. Remove the special tool.

21. Install the steering column connector link.

22. Install the steering column track on the steering column outer housing.
- Apply Premium Long-Life Grease XG-1-C or equivalent meeting Ford specification ESA-M1C75-B to the bearing surface of the steering column track.

23.  **CAUTION: The staging of the steering column inner track bearing assemblies is very critical. The steering column inner track bearing assemblies must be installed against the rear steering column inner housing track bearing assembly retaining end. The steering column inner housing must be installed in the fully extended (out) position. Failure to correctly stage the steering column inner track bearing assemblies will result in damage to the steering column.**

NOTE: Make sure that the steering column inner track bearing retainer assemblies are correctly staged before the steering column outer housing and steering column outer housing cover plate are installed.

Install the steering column outer housing, steering column outer housing cover plate and bolts. Loosely hand tighten the bolts. Check that the steering column inner track bearings are correctly staged, correct as necessary.

- Apply Threadlock 262, E2FZ-19554-B or equivalent meeting Ford specification WSK-M2G351-A6 to the bolt threads.

24. Tighten the bolts.

25. Install the steering column release motor assemblies and screws.

26. **⚠ CAUTION:** Do not telescope the steering column manually or by any means other than those described below. Failure to do so can result in damage to the steering column potentiometer and the steering column actuator assembly.

⚠ CAUTION: Pay close attention to the travel of power steering potentiometer while operating the steering column with the battery charger. Overtravel of the steering column can damage the steering column potentiometer and cause other electrical failures.

Disconnect the steering column release motor (telescopic) electrical connector. Using a suitable 1 amp 12 volt battery charger connected to the steering column release motor (telescopic) electrical terminals, test the steering column for normal operation. Connect the steering column release motor (telescopic) electrical connector.

27. **⚠ CAUTION:** Pay close attention to the travel of power steering potentiometer while operating the steering column with the battery charger. Overtravel of the steering column can damage the steering column potentiometer and cause other electrical failures.

Disconnect the steering column release motor (tilt) electrical connector. Using a suitable 1 amp 12 volt battery charger connected to the steering column release motor (tilt) electrical terminals,

test the steering column for normal operation. Connect the steering column release motor (tilt) electrical connector.

28. Install the electronic steering sensor and screws.

Vehicles with manual transmission

29. Install the steering wheel lock actuator and new shear bolts.

All vehicles

30. Remove the steering column from the vise.

A0006252

Torque Specifications

Description	Nm	lb-ft	lb-in
Battery ground cable bolt	10	—	89
Steering column lock actuator screw	14	10	—

Steering Column Switches

The steering column switches system consists of the following components:

- ignition switch (11572)
- multifunction switch (13K359)
- steering column lock actuator (manual transmission only)

The ignition switch is mounted in the instrument panel to the RH side of the steering column and is activated by rotating the ignition key in the ignition switch lock cylinder.

The integrated multifunction switch is mounted to the steering column and controls the turn signals, hazard flasher, windshield wiper/washer control, and headlamp dimmer/flash-to-pass.

The steering column lock actuator will unlock when a valid ignition key is inserted into the ignition switch lock cylinder. The steering column lock actuator will only lock when the ignition key is removed, and both the vehicle messages for vehicle speed and engine rpm are not present on the standard corporate protocol (SCP) link. Power must not be enabled to the steering column lock actuator while the engine is running. While the steering column lock actuator is in the locked position, the vehicle will be inhibited from cranking.

The steering column lock actuator receives power from the REM, ground from the FEM, and exchanges security-related communication messages with the instrument cluster (IC) module over the SCP link.

Steering Column Switches

Special Tool(s)

 ST1137-A	73 III Automotive Meter or equivalent 105-R0057
 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent diagnostic tool

Refer to the Wiring Diagrams Section 700-02-00 for schematic and connector information.

Refer to the Wiring Diagrams Section 417-01-00 for schematic and connector information.

Refer to the Wiring Diagrams Section 211-00-00 for schematic and connector information.

Inspection and Verification

1. Verify the customer's concern by operating the ignition switch, the multifunction switch, and the steering column lock actuator (if equipped) (manual transmission only) on the steering column.
2. Visually inspect for obvious signs of mechanical and electrical damage; refer to the following chart:

Visual Inspection Chart

Mechanical	Electrical
<ul style="list-style-type: none"> ● Multifunction switch ● Ignition key ● Ignition switch ● Steering column ● Wiper/washer switch ● Steering column lock (SCL) actuator (if equipped) 	<ul style="list-style-type: none"> ● Circuit ● Central junction box (CJB) Fuse: <ul style="list-style-type: none"> ■ 201 (5A) ■ 202 (5A) ■ 203 (5A) ■ 204 (5A) ■ 205 (5A) ■ 213 (5A) ■ 214 (10A) ■ 216 (5A) ■ 217 (5A) ■ 226 (3A)

- 227 (10A)
- 229 (5A)
- Underhood auxiliary junction box (AJB) Fuse:
 - 102 (10A)
 - 120 (30A)
- Battery junction box (BJB) Fuse:
 - 402 (10A)
 - 406 (10A)
 - 422 (20A)
- Relay

3. If an obvious cause for an observed or reported concern is found, correct the cause before proceeding to the next step.
4. If the diagnostic tool does not power up, refer to the diagnostic tool manual.
5. **NOTE:** The SCL actuator will only allow communication with a tester after the SCL actuator has been activated. To activate the SCL actuator, open the driver door and **do not** put the key in the ignition (or alternatively, you can press one of the buttons on the key fob while there is no key in the ignition). The SCL actuator will stay activated for 30 minutes after the driver door is opened (or a key fob button is pressed).

If equipped with SCL actuator (manual transmission vehicles only), and the concern remains after inspection, connect the diagnostic tool. The diagnostic tool will receive power through the diagnostic connector. If the diagnostic tool does not communicate, refer to the diagnostic tool manual.

6. Carry out the DATA LINK DIAGNOSTIC TEST. If the diagnostic tool responds with:
 - CKT914, CKT915 or CKT70-ALL ECUS NO RESP/NOT EQUIP, refer to [Section 418-00](#).
 - NO RESP/NOT EQUIP for front electronic module (FEM), go to Pinpoint Test A.
 - NO RESP/NOT EQUIP for rear electronic module (REM), go to Pinpoint Test B.
 - NO RESP/NOT EQUIP for instrument cluster (IC), go to Pinpoint Test D.
 - NO RESP/NOT EQUIP for steering column lock module (SCLM), ignore this message and proceed to specific data link diagnostic test for the steering column lock module as follows:

NOTE: Ignition key must be kept out of the ignition switch even though the diagnostic tool may request ignition to the RUN position.

NOTE: Ignore NO RESP/NOT EQUIP messages for all modules except the steering column lock module for this test.

Turn key to OFF, remove key from ignition switch, close the driver door, open the driver door. Carry out the DATA LINK DIAGNOSTIC TEST FOR THE SCL ACTUATOR. If the diagnostic tool responds with:

- NO RESP/NOT EQUIP for steering column lock module (SCLM), go to Pinpoint Test C.
- Otherwise, retrieve and record the continuous diagnostic trouble codes (DTCs) for the SCLM, , erase the continuous DTCs, insert the key into the ignition switch, turn the ignition switch to RUN, Turn the ignition switch to OFF, remove the key from the ignition switch, close the driver door, open the driver door, record new continuous DTCs for the SCLM.

7. If the DTCs retrieved are related to the concern, go to the SCL actuator Diagnostic Trouble Code (DTC) Index.

8. If no DTCs related to the concern are retrieved, proceed to Symptom Chart to continue diagnostics.

FEM Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1319	Driver Door Ajar Circuit Failure	FEM	REFER to Section 417-02 .

Pinpoint Tests

PINPOINT TEST A: NO COMMUNICATION WITH THE FRONT ELECTRONIC MODULE

CONDITIONS	DETAILS/RESULTS/ACTIONS
A1 CHECK CIRCUITS 29-DK20 (OG/GN) AND 29S-DK22 (OG/YE) FOR VOLTAGE	
NOTE: Cycle ignition switch from OFF to RUN to enable the switched system power feature.	
<p>1</p>  <p>2</p>  <p>FEM C201c</p> <p>3</p>  <p>FEM C201f</p> <p>4</p>  <p>5</p>  <p>A0006297</p>	<p>5</p> <p>Measure the voltage between FEM C201c pin 6, circuit 29-DK20 (OG/GN), harness side and ground; and between FEM C201f pin 1, circuit 29S-DK22 (OG/YE) harness side and ground.</p> <ul style="list-style-type: none"> ● Are the voltages greater than 10 volts?

→ **Yes**
GO to [A2](#).

→ **No**
REPAIR the circuit(s) in question. TEST the system for normal operation.

A2 CHECK CIRCUITS 31-DK20 (BK/RD), 31-DK20A (BK/RD), 31-DK20B (BK/RD), 31-DK20C (BK/RD) AND 31-DK20D (BK/RD) FOR OPENS

1

2

FEM C201a

3

3 Using the following table, measure the resistance between FEM connectors, harness side and ground:

FEM	Pin	Circuit
C201c	12	31-DK20 (BK/RD)
C201a	11	31-DK20A (BK/RD)
C201a	13	31-DK20B (BK/RD)
C201a	14	31-DK20C (BK/RD)
C201a	15	31-DK20D (BK/RD)

● **Is the resistance less than 5 ohms?**

→ **Yes**
REFER to [Section 418-00](#) .

→ **No**
REPAIR the circuit(s) in question. TEST the system for normal operation.

PINPOINT TEST B: NO COMMUNICATION WITH THE REAR ELECTRONIC MODULE

CONDITIONS	DETAILS/RESULTS/ACTIONS
B1 CHECK CIRCUIT 29-DK31 (OG/BK) FOR VOLTAGE	
NOTE: Cycle ignition switch from OFF to RUN to enable the switched system power feature.	
1	

2

REM C420d

3

REM C420c

4

5

A0006299

5

Measure the voltage between REM C420d pin 3, circuit 29-DK31 (OG/BK), harness side and ground.

• Is the voltage greater than 10 volts?

→ Yes
GO to [B2](#).

→ No
REPAIR the circuit. TEST the system for normal operation.

B2 CHECK CIRCUITS 29S-DK31 (OG/BK), 31-DK30D (BK), 31-DK30E (BK), 31-DK30F (BK), 31-DK30G (BK) AND 31-DK30H (BK/OG), FOR OPENS

1

2

REM C420b

3

3

Using the following table, measure the resistance between REM connectors, harness side and ground:

REM	Pin	Circuit

C420c	13	29S-DK31 (OG/BK)
C420c	12	31-DK30E (BK)
C420c	11	31-DK30D (BK)
C420c	26	31-DK30G (BK)
C420c	25	31-DK30F (BK)
C420b	12	31-DK30H (BK/OG)

● Is the resistance less than 5 ohms?

→ **Yes**

REFER to [Section 418-00](#).

→ **No**

REPAIR the circuit(s) in question. TEST the system for normal operation.

PINPOINT TEST C: NO COMMUNICATION WITH THE STEERING COLUMN LOCK ACTUATOR

CONDITIONS	DETAILS/RESULTS/ACTIONS
<p>NOTE: The SCL actuator will only allow communication with a tester after the SCL actuator has been activated. To activate the SCL actuator, open the driver door and do not put the key in the ignition (or alternatively, you can press one of the buttons on the key fob while there is no key in the ignition). The SCL actuator will stay activated for 30 minutes after the driver door is opened (or a key fob button is pressed).</p>	
<p>C1 CHECK STEERING COLUMN LOCK ACTUATOR OPERATION</p>	
	<p>1 NOTE: The ignition key must be out of the ignition before proceeding with this test.</p> <p>Insert the ignition key into the ignition switch.</p> <p>2 Remove the ignition key from the ignition switch.</p> <p>● Does the steering column lock actuator unlock and lock?</p> <p>→ Yes REFER to Section 418-00.</p> <p>→ No GO to Pinpoint Test I.</p>

PINPOINT TEST D: NO COMMUNICATION WITH THE INSTRUMENT CLUSTER MODULE

CONDITIONS	DETAILS/RESULTS/ACTIONS
<p>D1 CHECK HOT AT ALL TIMES POWER SUPPLY CIRCUIT</p>	

1

2

Instrument Cluster C220b

3

A0002792

3

Measure the voltage between instrument cluster C220b pin 3, circuit 29-GG11 (OG/BU), harness side and ground.

• Is the voltage greater than 10 volts?

→ Yes
GO to [D2](#).

→ No
REPAIR the circuit. TEST the system for normal operation.

D2 CHECK HOT IN RUN POWER SUPPLY CIRCUITS

1

2

A0002793

2

Measure the voltage between the instrument cluster and ground as follows:

Connector Pin	Circuit
C220a pin 11	15-JA14 (GN/BK)
C220b pin 6	15-GG14 (GN/RD)
C220b pin 17	75-GG15 (YE/GN)

• Are the voltages greater than 10 volts?

→ Yes
GO to [D3](#).

→ **No**
REPAIR the circuit(s). TEST the system for normal operation.

D3 CHECK GROUND CIRCUITS

1

2

2 Measure the resistance between the instrument cluster and ground as follows:

Connector Pin	Circuit
C220a pin 6	31-AL11 (BK)
C220b pin 13	91-GG11 (BN/RD)

- Are the resistances less than 5 ohms?

→ **Yes**
REFER to [Section 418-00](#).

→ **No**
REPAIR the circuit(s). TEST the system for normal operation.

PINPOINT TEST E: THE IGNITION SWITCH IS INOPERATIVE

CONDITIONS	DETAILS/RESULTS/ACTIONS
E1 CHECK CIRCUIT 30-BB20 (RD) AND CIRCUIT 30-BB9 (RD)	
<p>1</p> <p>2</p> <p>Ignition Switch C250</p> <p>3</p>	<p>3 Measure the voltage between ignition switch C250, pin 7 circuit 30-BB20 (RD), harness side, and ground; and between ignition switch C250, pin 1 circuit 30-BB9 (RD), harness side, and ground.</p>

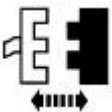

A0000315

● Is the voltage greater than 10 volts?

→ **Yes**
 INSTALL a new ignition switch; REFER to [Ignition Switch](#) .

→ **No**
 REPAIR circuit 30-BB20 (RD), Circuit 30-BB9 (RD) or Circuit 30-DA5 (RD) as necessary. TEST the system for normal operation.

PINPOINT TEST F: NO POWER IN ACC

CONDITIONS	DETAILS/RESULTS/ACTIONS
F1 CHECK IGNITION SWITCH	
	<p>1 Carry out the Ignition Switch Component Test; refer to Wiring Diagrams, Section 700-09, Component Testing.</p> <p>● Is the ignition switch OK?</p> <p>→ Yes GO to F2 .</p> <p>→ No INSTALL a new ignition switch; REFER to Ignition Switch .</p>
F2 CHECK CIRCUIT 75-DD1 (YE)	
<p>1 </p> <p>2 </p> <p>3</p>	

4

A0001613

4

Measure the voltage between the CJB C270a, pin 15 circuit 75-DD1 (YE), and ground.

● Is the voltage greater than 10 volts?

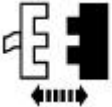

→ Yes

REFER to the appropriate Section. REPAIR the circuit in question. TEST the system for normal operation.

→ No

REPAIR the circuit. TEST the system for normal operation.

PINPOINT TEST G: NO POWER IN START

CONDITIONS	DETAILS/RESULTS/ACTIONS
G1 CHECK IGNITION SWITCH	
	<p>1 Carry out the Ignition Switch Component Test. Refer to Wiring Diagrams Section 700-09, Component Testing.</p> <p>● Is the ignition switch OK?</p> <p>→ Yes GO to G2.</p> <p>→ No INSTALL a new ignition switch; REFER to Ignition Switch. TEST the system for normal operation.</p>
G2 CHECK CIRCUIT 30-BB20 (RD) AND CIRCUIT 30-BB9 (RD)	
<p>1</p>  <p>Ignition Switch C250</p> <p>2</p>	<p>2 Measure the voltage between ignition switch C250, pin 7 circuit 30-BB20 (RD),</p>

A0000315

harness side, and ground; and between ignition switch C250, pin 1 circuit 30-BB9 (RD), harness side, and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
GO to [G3](#).

→ **No**
REPAIR circuit 30-BB20 (RD), circuit 30-BB9 (RD) or circuit 30-DA5 (RD) as necessary. TEST the system for normal operation.

G3 CHECK CIRCUIT 50-DD5 (GN/BK)

1

A0001914

1

Measure the voltage between the CJB C270a pin 3, circuit 50-DD5 (GN/BK), and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
REFER to [Section 303-06](#).

→ **No**
REPAIR the circuit. TEST the system for normal operation.

PINPOINT TEST H: THE MULTIFUNCTION SWITCH/HAZARD SWITCH DOES NOT OPERATE CORRECTLY

CONDITIONS	DETAILS/RESULTS/ACTIONS
H1 CHECK TURN SIGNAL LEVER POSITIONS	
NOTE: Prior to testing, make sure the hazard knob is pushed in fully to the OFF position.	
1	

- 2 Check the turn signal lever in the RH and LH turn positions with the steering wheel locked in the straight-ahead position. Lock the lever in position for each.
- 3 Check the lever by slightly holding it in the RH and LH turn positions. When releasing, observe that the lever springs back to normal position.
- 4 Road test the vehicle and observe the turn signals for the RH and LH turn positions while manually turning the steering wheel for each position. Verify the lever cancels when the steering returns from the desired turn position.

● **Does the turn signal lever operate correctly?**

→ **Yes**
GO to [H2](#).

→ **No**
If the lever will not cancel, CHECK the turn indicator cancel cam for damage. If the lever is worn or damaged, INSTALL a new multifunction switch. REFER to [Multifunction Switch](#). TEST the system for normal operation.

H2 CHECK HAZARD SWITCH

- 1 Fully press the hazard switch and release to turn ON the hazard lamps. Verify the switch operation.
- 2 Fully press the hazard switch and release to turn OFF the hazard lamps. Verify the switch operation.

● **Does the hazard switch operate correctly?**

→ **Yes**
GO to [H3](#).

→ **No**
If the hazard switch is worn or damaged, INSTALL a new multifunction switch. REFER to [Multifunction Switch](#). TEST the system for normal operation.

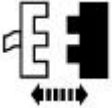

H3 CHECK HIGH BEAM AND FLASH-TO-PASS

- 1 Turn the headlamps ON.
- 2 Press the turn signal lever towards the instrument panel to the STOP position. Release the lever. Verify the high beams.
- 3 Move the lever back toward the seat. Release the lever. Verify the low beams.
- 4 Pull the lever toward the driver seat gently to the flash-to-pass position. Hold the position, and verify both the high and low beams illuminate.
- 5 Release the lever. Verify the low beams.
- 6 Turn the headlamps OFF.
- 7 Pull the lever to the flash-to-pass again and hold. Verify the high beams illuminate. Release the lever. Verify no high beams.

● **Does the high beam, low beam and flash-to-pass operate?**

	<p>→ Yes GO to H4.</p> <p>→ No If the lever is worn or damaged, INSTALL a new multifunction switch. REFER to Multifunction Switch. TEST the system for normal operation.</p>
<p>H4 CHECK WINDSHIELD WIPER AND WASH</p>	
	<p>1 Rotate the windshield wiper switch to LOW, HIGH and intermittent positions. Verify the rotation of the switch and wiper operation.</p> <p>2 Turn the switch to the OFF position. Verify the switch rotates to OFF and the wipers stop operating.</p> <p>3 Push the end of the switch in toward the center of the steering column to the WASH position. Release the wash position. Verify the wipers operate for a few cycles and return to OFF.</p> <p>4 Operate WASH in all speeds of the wiper switch. Verify the wipers return to selected speed after releasing from the WASH position.</p> <p>● Does the windshield wiper switch and WASH operate correctly?</p> <p>→ Yes Multifunction switch is OK.</p> <p>→ No If the switch or lever is worn or damaged, INSTALL a new switch; REFER to Section 501-16.</p>

PINPOINT TEST I: THE STEERING COLUMN LOCK DOES NOT OPERATE CORRECTLY

CONDITIONS	DETAILS/RESULTS/ACTIONS
<p>NOTE: This test assumes that the instrument cluster (IC) module is sending the correct engine rpm, and vehicle speed to the FEM and REM over the standard corporate protocol (SCP) communication network. Refer to Section 418-00.</p>	
<p>I1 CHECK CIRCUIT 31-GL58 (BK) AND 75-GL58 (YE/GN) FOR SHORT TO POWER</p>	
<p>1 </p> <p>2  SCL Actuator C267</p> <p>3 </p> <p>4</p>	<p>4 Measure the voltage between the SCL</p>

A0002791

actuator C267 pin 1, circuit 31-GL58 (BK), harness side, and ground; and between SCL actuator C267 pin 2, circuit 75-GL58 (YE/GN), harness side, and ground.

● Is the voltage greater than 10 volts?

→ **Yes**

If circuit 31-GL58 (BK) is greater than 10 volts, GO to [12](#). If circuit 75-GL58 (YE/GN) is greater than 10 volts, GO to [13](#).

→ **No**

GO to [14](#).

12 CHECK FEM FOR INTERNAL SHORT TO POWER

1

2

FEM C201a

3

4

A0002808

4

Measure the voltage between the SCL actuator C267 pin 1, circuit 31-GL58 (BK) and ground.

● Is the voltage greater than 10 volts?

→ **Yes**

REPAIR the circuit in question. TEST the system for normal operation.

→ **No**
INSTALL a new FEM; REFER to [Section 419-10](#). TEST the system for normal operation.

I3 CHECK REM FOR INTERNAL SHORT TO POWER

1

2

REM C420

3

4

A0002809

4 Measure the voltage between SCL actuator C267 pin 2, circuit 75-GL58 (YE/GN), harness side, and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
REPAIR the circuit in question. TEST the system for normal operation.

→ **No**
INSTALL a new REM; REFER to [Section 419-10](#). TEST the system for normal operation.

I4 CHECK FEM FOR CORRECT OPERATION

1

2

2 Measure the resistance between SCL actuator C267 pin 1, circuit 31-GL58 (BK), harness side, and ground, while triggering the FEM active command LOCK_GND ON.

A0001918

- Does the resistance change to less than 50 ohms when commanded?

→ **Yes**
GO to [15](#).

→ **No**
GO to [16](#).

15 CHECK REM FOR CORRECT OPERATION

1

2

A0002809

- 3 Measure the voltage between SCL actuator C267 pin 2, circuit 75-GL58 (YE/GN), harness side, and ground while triggering the REM active command LOCK_PWR ON.

- Is the voltage greater than 10 volts when commanded?

→ **Yes**
INSTALL a new SCL actuator; REFER to [Steering Column Lock Actuator](#) . Test the system for normal operation.

→ **No**
GO to [17](#) .

16 CHECK CIRCUIT 31-GL58 (BK) FOR OPEN

1

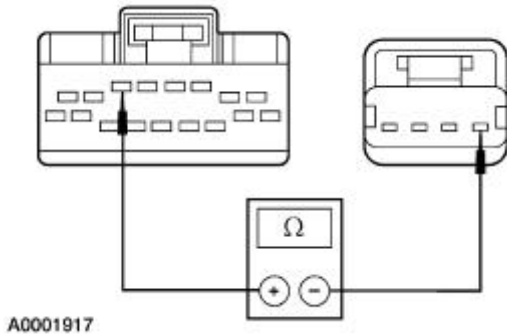

2

FEM C201a

3

3 Measure the resistance between SCL actuator C267 pin 1, circuit 31-GL58 (BK), harness side, and the FEM C201a pin 6, circuit 31-GL58 (BK), harness side.

● Is the resistance less than 5 ohms?

→ **Yes**
INSTALL a new FEM; REFER to [Section 419-10](#). TEST the system for normal operation.

→ **No**
REPAIR the circuit in question. TEST the system for normal operation.

I7 CHECK CIRCUIT 75-GL58 (YE/GN) FOR OPEN

1

2

REM C420a

3

3 Measure the resistance between SCL actuator C267 pin 2, circuit 75-GL58 (YE/GN), harness side, and the REM C420a pin 1, circuit 75-GL58 (YE/GN) harness side.

● **Is the resistance less than 5 ohms?**

→ **Yes**

INSTALL a new REM; REFER to [Section 419-10](#). TEST the system for normal operation.

→ **No**

REPAIR the circuit in question. TEST the system for normal operation.

Steering Column Lock Module Parameter Reset

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent diagnostic tool
---	---

NOTE: The SCL actuator will only allow communication with a tester after the SCL actuator has been activated. To activate the SCL actuator, open the driver door and **do not** put the key in the ignition (or alternatively, you can press one of the buttons on the key fob while there is no key in the ignition). The SCL actuator will stay activated for 30 minutes after the driver door is opened (or a key fob button has been pressed).

1. Remove the ignition key from the ignition switch.
2. Close and open the driver door (must complete steps 3-6 within 30 minutes of completing step 2).
3. Connect the diagnostic tool (use service function card).
4. Select SCLM.
5. Select ENTER SECURITY ACCESS. Wait eight minutes for security access to be granted.
6. Select PARAMETER RESET.
7. Insert key into ignition switch and place in the RUN position.
8. Select ICM.
9. Select ENTER SECURITY ACCESS. Wait 10 minutes for security access to be granted.
10. Select RESET SCLM PARAMETER.
11. Disconnect the diagnostic tool.
12. Place ignition key in the OFF position.
13. Remove ignition key from ignition switch.
14. Insert ignition key into ignition switch.
15. Place ignition key in the RUN position.
16. Remove the ignition key.

Multifunction Switch

Removal and Installation

1. Remove the steering wheel. For additional information, refer to [Section 211-04](#).
2. Remove the instrument panel cluster finish panel. For additional information, refer to [Section 501-12](#).
3. Remove the upper and lower steering column shrouds.
 1. Remove the screws.
 2. Remove the upper and lower steering column shrouds.

4.  **CAUTION:** Apply two strips of masking tape across the air bag sliding contact to prevent rotation.

Depress the three clips and position the air bag sliding contact aside.

5. Remove the multifunction switch.
 1. Disconnect the electrical connector.
 2. Remove the multifunction switch.

6. To install, reverse the removal procedure.

Ignition Switch

Removal and Installation

1. Remove the instrument panel cluster finish panel. For additional information, refer to [Section 501-12](#).
2. Remove the steering column reinforcement.
 1. Remove the two screws and position the lower instrument panel insulator aside.
 2. Remove the bolt and position the air duct aside.
 3. Remove the hood release handle from the reinforcement and position it aside.
 4. Remove the five bolts and the reinforcement.

3. Disconnect the ignition lock cylinder.
 1. Disconnect the electrical connector.
 2. Remove the two front screws.
 3. Remove the rear screw.

4. Remove the ignition lock cylinder.
 1. Remove the lock cylinder from the housing.
 2. Disconnect the electrical connector.

5. Remove the screws and position the shift lock cable aside.

6. **NOTE:** The ignition key should be in the OFF position.

Remove the ignition switch.

1. Remove the screw.
2. Remove the ignition switch.

7. To install, reverse the removal procedure.
-

Steering Column Lock Actuator

Removal

1. Remove the steering column. For additional information, refer to [Section 211-04](#).
2. Remove the steering column lock actuator.
 1. Remove the screws.
 2. Remove the steering column lock actuator.

Installation

1. To install, reverse the removal procedure.
 - After the installation is complete, carry out the steering column lock module parameter reset. Refer to [Steering Column Lock Module Parameter Reset](#).
-

General Specifications

Item	Specification
Epoxy Sealer	M3D35-A (E)
Threadlock® 262 E2FZ-19554-B	WSK-M2G351-A6
Lubricants

Gasoline Engine Oil Dye 164-R3705	ESE-M99C103-B1

Engine

NOTE: This section contains information, steps and procedures that may not be specific to your engine.

This section covers general procedures and diagnosis and testing of the engine system, except for exhaust emission control devices, which are covered in the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

The engines incorporate the following features:

- a closed positive crankcase ventilation (PCV) system. For additional information, refer to [Section 303-08](#).
- an exhaust emission control system. For additional information, refer to [Section 303-08](#).
- an evaporative emission control system. For additional information, refer to [Section 303-13](#).

The engine, fuel system, ignition system, emissions system and exhaust system all affect exhaust emission levels and must be maintained according to the maintenance schedule. For additional information, refer to the Scheduled Maintenance Guide.

Correct engine identification is necessary to order parts. Refer to the appropriate section in Group [303](#) for the procedure.

For complete vehicle and engine identification codes, refer to [Section 100-01](#).

Inspection and Verification

1. Verify the customer concern by operating the engine to duplicate the condition.
2. Visually inspect for obvious signs of mechanical damage. Refer to the following chart.

Visual Inspection Chart

Mechanical
<ul style="list-style-type: none"> ● Engine coolant leaks ● Engine oil leaks ● Fuel leaks ● Damaged or severely worn parts ● Loose mounting bolts, studs and nuts

3. If the inspection reveals obvious concerns that can be readily identified, repair as necessary.
4. If the concerns remain after the inspection, determine the symptoms and go to the Symptom Chart.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action

Component Tests

Engine Oil Leaks

NOTE: When diagnosing engine oil leaks, the source and location of the leak must be positively identified prior to repair.

Prior to carrying out this procedure, clean the cylinder block, cylinder heads, valve covers, oil pan and flywheel with a suitable solvent to remove all traces of oil.

Engine Oil Leaks—Fluorescent Oil Additive Method

Use the 12 Volt Master UV Diagnostic Inspection Kit to carry out the following procedure for oil leak diagnosis.

1. Clean the engine with a suitable solvent to remove all traces of oil.
2. Add Gasoline Engine Oil Dye 164-R3705 meeting Ford specification ESE-M99C103-B1 or equivalent. Use a minimum 14.8 ml (0.5 ounce) to a maximum 29.6 ml (1 ounce) of fluorescent additive to all engines. If the oil is not premixed, fluorescent additive must first be added to the case.
3. Run the engine for 15 minutes. Stop the engine and inspect all seal and gasket areas for leaks using the 12 Volt Master UV Diagnostic Inspection Kit. A clear bright yellow or orange area will identify the leak. For extremely small leaks, several hours may be necessary for the leak to appear.

Leakage Points—Underhood

Examine the following areas for oil leakage:

- valve cover gaskets
- cylinder head gaskets
- oil cooler, if equipped
- oil filter adapter
- engine front cover
- oil filter adapter and filter body
- oil level indicator tube connection
- oil pressure sensor

Leakage Points—Under Engine—With Vehicle on Hoist

- oil pan gaskets (6710)
- oil pan sealer
- sump sealer — 8 cyl.
- engine front cover gasket
- crankshaft front seal (6700)
- crankshaft rear oil seal (6701)
- crankshaft main bearing cap side bolts
- oil filter adapter and filter body
- oil cooler, if equipped

Leakage Points—With Transmission and Flywheel Removed

- crankshaft rear oil seal
- rear main bearing cap parting line

- rear main bearing cap and seals
- flywheel mounting bolt holes (with flywheel (6375) installed)
- camshaft rear bearing covers (6266) or pipe plugs at the end of oil passages

Oil leaks at crimped seams in sheet metal parts and cracks in cast or stamped parts can be detected when using the dye method.

Compression Test—Compression Gauge Check

1. Make sure the oil in the crankcase is of the correct viscosity and at the correct level and that the battery (10655) is correctly charged. Operate the vehicle until the engine is at normal operating temperature. Turn the ignition switch to the OFF position, then remove all the spark plugs (12405).
2. Set the throttle plates in the wide-open position.
3. Install a compression gauge such as the Compression Tester in the No. 1 cylinder.
4. Install an auxiliary starter switch in the starting circuit. With the ignition switch in the OFF position, and using the auxiliary starter switch, crank the engine a minimum of five compression strokes and record the highest reading. Note the approximate number of compression strokes necessary to obtain the highest reading.
5. Repeat the test on each cylinder, cranking the engine approximately the same number of compression strokes.

Compression Test—Test Results

The indicated compression pressures are considered within specification if the lowest reading cylinder is within 75 percent of the highest reading. For additional information, refer to the Compression Pressure Limit Chart.

Compression Pressure Limit Chart

Maximum Pressure	Minimum Pressure	Maximum Pressure	Minimum Pressure	Maximum Pressure	Minimum Pressure	Maximum Pressure	Minimum Pressure
924 kPa (134 psi)	696 kPa (101 psi)	1131 kPa (164 psi)	848 kPa (123 psi)	1338 kPa (194 psi)	1000 kPa (146 psi)	1544 kPa (224 psi)	1158 kPa (168 psi)
938 kPa (136 psi)	703 kPa (102 psi)	1145 kPa (166 psi)	855 kPa (124 psi)	1351 kPa (196 psi)	1014 kPa (147 psi)	1558 kPa (226 psi)	1165 kPa (169 psi)
952 kPa (138 psi)	717 kPa (104 psi)	1158 kPa (168 psi)	869 kPa (126 psi)	1365 kPa (198 psi)	1020 kPa (148 psi)	1572 kPa (228 psi)	1179 kPa (171 psi)

1110 kPa (161 psi)	834 kPa (121 psi)	1324 kPa (192 psi)	993 kPa (144 psi)	1631 kPa (222 psi)	1145 kPa (166 psi)	—	—

If one or more cylinders reads low, squirt approximately one tablespoon of Super Premium SAE 5W30 Motor Oil, XO-5W30-QSP meeting Ford specification WSS-M2C153-G on top of the pistons in the low-reading cylinders. Repeat the compression pressure check on these cylinders.

Compression Test—Interpreting Compression Readings

1. If compression improves considerably, piston rings are worn or damaged.
2. If compression does not improve, valves are sticking or not seating correctly.
3. If two adjacent cylinders indicate low compression pressures and squirting oil on each piston does not increase compression, the head gasket may be leaking between cylinders. Engine oil or coolant in cylinders could result from this condition.
Use the Compression Pressure Limit Chart when checking cylinder compression so that the lowest reading is within 75 percent of the highest reading.

Cylinder Leakage Detection

When a cylinder produces a low reading, use of the Engine Cylinder Leak Detection/Air Pressurization Kit will be helpful in pinpointing the exact cause.

The leakage detector is inserted in the spark plug hole, the piston is brought up to dead center on the compression stroke, and compressed air is admitted.

Once the combustion chamber is pressurized, a special gauge included in the kit will read the percentage of leakage. Leakage exceeding 20 percent is excessive.

While the air pressure is retained in the cylinder, listen for the hiss of escaping air. A leak at the intake valve (6507) will be heard in the throttle body (9E926). A leak at the exhaust valve (6505) can be heard at the tailpipe. Leakage past the piston rings will be audible at the positive crankcase ventilation (PCV) connection. If air is passing through a blown head gasket to an adjacent cylinder, the noise will be evident at the spark plug hole of the cylinder into which the air is leaking. Cracks in the cylinder block or gasket leakage into the cooling system may be detected by a stream of bubbles in the radiator (8005).

Oil Consumption Test

The following diagnostic procedure is used to determine the source of excessive internal oil consumption.

1. **NOTE:** Oil use is normally greater during the first 16,100 km (10,000 miles) of usage. As mileage increases, oil use generally decreases. Vehicles in normal usage should get at least 1,450 km per liter (900 miles per quart) after 16,100 km (10,000 miles) of service. High speed driving, towing, high ambient temperature and other factors may result in greater oil use.

Define excessive oil consumption, such as the number of miles driven per liter (quart) of oil used. Also determine customer's driving habits, such as sustained high speed operation, towing, extended idle and other considerations.

2. Verify that the engine has no external oil leak as described under Engine Oil Leaks in the Diagnosis and Testing portion of this section.
3. Verify that the engine has the correct oil level dipstick (6750).
4. Verify that the engine is not being run in an overfilled condition. Check the oil level at least five minutes after a hot shutdown with the vehicle parked on a level surface. In no case should the level be above MAX or the letter F in FULL. If significantly overfilled, carry out steps 6a through 6d.
5. Verify the spark plugs are not oil saturated. If the spark plugs are oil saturated and compression is good it can be assumed the valve seals or valve guides are at fault.
6. Carry out an oil consumption test:
 - a. Drain the engine oil, remove the oil filter (6714) and refill with one liter (quart) less than the recommended amount.
 - b. Run the engine for three minutes (10 minutes if cold), and allow the oil to drain back for at least five minutes with the vehicle on a level surface.
 - c. Remove oil level dipstick and wipe clean. (Do not wipe with anything contaminated with silicone compounds.) Reinstall the oil level dipstick, being sure to seat it firmly in the oil level indicator tube (6754). Remove the oil level dipstick and draw a mark on the back (unmarked) surface at the indicated oil level. This level should be about the same as the MIN or ADD mark on the face of the oil level dipstick.
 - d. Add one liter (quart) of oil. Restart the engine and allow to idle for at least two minutes. Shut off the engine and allow the oil to drain back for at least five minutes. Mark the oil level dipstick, using the procedure above.
 - e. Record the vehicle mileage.
 - f. Instruct the customer to drive the vehicle as usual and carry out the following:
 - Check the oil level regularly at intervals of 160 to 240 km (100-150 miles).
 - Return to the repair point when the oil level drops below the lower (MIN or ADD) mark on the oil level dipstick.
 - Add only full liters (quarts) of the same oil in an emergency. Note the mileage at which the oil is added.
 - g. Check the oil level under the same conditions and at the same location as in Steps 5c and 5d.
 - Measure the distance from the oil level to the UPPER mark on the oil level dipstick and record.
 - Measure the distance between the two scribe marks and record.
 - Divide the first measurement by the second.
 - Divide the distance driven during the oil test by the result. This quantity is the approximate oil consumption rate in kilometers per liter or in miles per quart.
 - h. If the oil consumption rate is unacceptable, go to Step 7.

7. Check the positive crankcase ventilation (PCV) system. Make sure the system is not plugged.
8. Check for plugged oil drain-back holes in the cylinder heads and cylinder block.
9. If the condition still exists after carrying out the above steps, go to Step 10.
10. Carry out a cylinder compression test or cylinder leak detection test with Engine Cylinder Leak Detection/Air Pressurization Kit. This can help determine the source of oil consumption such as valves, piston rings or other areas.
11. **NOTE:** After determining if worn parts should be replaced, make sure correct new parts are used.

Check valve guides for excessive guide clearance. Install new valve stem seals (6571) after verifying valve guide clearance.

12. Worn or damaged internal engine components can cause excessive oil consumption. Small deposits of oil on the tips of spark plugs can be a clue to internal oil consumption. If internal oil consumption still persists, proceed as follows:
 - a. Remove the engine from the vehicle and place it on an engine work stand. Remove the intake manifolds (9424), cylinder heads, oil pan (6675) and oil pump (6600).
 - b. Check piston ring clearance, ring gap and ring orientation. Repair as necessary.
 - c. Check for excessive bearing clearance. Repair as necessary.
13. Repeat the oil consumption test (Step 6) to confirm the oil consumption concern has been resolved.

Intake Manifold Vacuum Test

Bring the engine to normal operating temperature. Connect the Vacuum/Pressure Tester to the intake manifold. Run the engine at the specified idle speed.

The vacuum gauge should read between 51-74 kPa (15-22 in-Hg) depending upon the engine condition and the altitude at which the test is conducted. Subtract 4.0193 kPa (1 in-Hg) from the specified reading for every 304.8 m (1,000 feet) of elevation above sea level.

The reading should be steady. If necessary, adjust the gauge damper control (where used) if the needle is fluttering rapidly. Adjust the damper until the needle moves easily without excessive flutter.

Intake Manifold Vacuum Test—Interpreting Vacuum Gauge Readings

A careful study of the vacuum gauge reading while the engine is idling will help pinpoint trouble areas. Always conduct other appropriate tests before arriving at a final diagnostic decision. Vacuum gauge readings, although helpful, must be interpreted carefully.

Most vacuum gauges have a normal band indicated on the gauge face.

The following are potential gauge readings. Some are normal; others should be investigated further.

1. **NORMAL READING:** Needle between 51-74 kPa (15-22 in-Hg) and holding steady.
2. **NORMAL READING DURING RAPID ACCELERATION AND DECELERATION:** When the engine is rapidly accelerated (dotted needle), the needle will drop to a low reading (not to zero). When the throttle is suddenly released, the needle will snap back up to a higher than normal figure.
3. **NORMAL FOR HIGH-LIFT CAMSHAFT WITH LARGE OVERLAP:** The needle will register as low as 51 kPa (15 in-Hg) but will be relatively steady. Some oscillation is normal.
4. **WORN RINGS OR DILUTED OIL:** When the engine is accelerated (dotted needle), the needle drops to 0 kPa (0 in-Hg). Upon deceleration, the needle runs slightly above 74 kPa (22 in-Hg).
5. **STICKING VALVES:** When the needle (dotted) remains steady at a normal vacuum but occasionally flicks (sharp, fast movement) down and back about 13 kPa (4 in-Hg), one or more valves may be sticking.
6. **BURNED OR WARPED VALVES:** A regular, evenly-spaced, downscale flicking of the needle indicates one or more burned or warped valves. Insufficient valve clearance will also cause this reaction.
7. **POOR VALVE SEATING:** A small but regular downscale flicking can mean one or more valves are not seating.
8. **WORN VALVE GUIDES:** When the needle oscillates over about a 13 kPa (4 in-Hg) range at idle speed, the valve guides could be worn. As engine speed increases, the needle will become steady if guides are responsible.
9. **WEAK VALVE SPRINGS:** When the needle oscillation becomes more violent as engine rpm is increased, weak valve springs are indicated. The reading at idle could be relatively steady.
10. **LATE VALVE TIMING:** A steady but low reading could be caused by late valve timing.
11. **IGNITION TIMING RETARDING:** Retarded ignition timing will produce a steady but somewhat low reading.

12. **INSUFFICIENT SPARK PLUG GAP:** When spark plugs are gapped too close, a regular, small pulsation of the needle can occur.
13. **INTAKE LEAK:** A low, steady reading can be caused by an intake manifold or throttle body gasket leak.
14. **BLOWN HEAD GASKET:** A regular drop of fair magnitude can be caused by a blown head gasket or warped cylinder head-to-cylinder block surface.
15. **RESTRICTED EXHAUST SYSTEM:** When the engine is first started and is idled, the reading may be normal, but as the engine rpm is increased, the back pressure caused by a clogged muffler (5230), kinked tailpipe or other concerns will cause the needle to slowly drop to 0 kPa (0 in-Hg). The needle then may slowly rise. Excessive exhaust clogging will cause the needle to drop to a low point even if the engine is only idling.
16. When vacuum leaks are indicated, search out and correct the cause. Excess air leaking into the system will upset the fuel mixture and cause concerns such as rough idle, missing on acceleration or burned valves. If the leak exists in an accessory unit such as the power brake booster (2005), the unit will not function correctly. Always fix vacuum leaks.

Excessive Engine Oil Consumption

The amount of oil an engine uses will vary with the way the vehicle is driven in addition to normal engine-to-engine variation. This is especially true during the first 16,100 km (10,000 miles) when a new engine is being broken in or until certain internal engine components become conditioned. Vehicles used in heavy-duty operation may use more oil. The following are examples of heavy-duty operation:

- trailer towing applications
- severe loading applications
- sustained high speed operation

Engines need oil to lubricate the following internal components:

- cylinder block cylinder walls
- pistons and piston, pin and rings (6102)
- intake and exhaust valve stems
- intake and exhaust valve guides
- all internal engine components

When the pistons move downward, a thin film of oil is left on the cylinder walls. As the vehicle is operated, some oil is also drawn into the combustion chambers past the intake and exhaust valve stem seals and burned.

The following is a partial list of conditions that can affect oil consumption rates:

- engine duty cycle
- operator driving habits
- ambient temperature
- quality and viscosity of the oil
- oil filler cap not seated

- oil level indicator not seated

Operation under varying conditions can frequently be misleading. A vehicle that has been run for several thousand miles on short trips or in below-freezing ambient temperatures may have consumed a "normal" amount of oil. However, when checking the engine oil level, it may measure up to the FULL or MAX on the oil level dipstick due to dilution (condensation and fuel) in the engine crankcase. The vehicle might then be driven at high speeds on the highway where the condensation and fuel boil off. The next time the engine oil is checked, it may appear that a liter (quart) of oil was used in about 160 km (100 miles). This perceived 160 km (100 miles) per liter (quart) oil consumption rate causes customer concern even though the actual overall oil consumption rate is about 2400 km (1500 miles) per liter (quart).

Make sure the selected engine oil meets the current recommended API performance category with SAE viscosity grade as shown in the vehicle Owner Literature. It is also important that the engine oil is changed at the intervals specified. Refer to the Vehicle Owner Literature.

Oil Pressure Test

1. Disconnect and remove the oil pressure sensor (9278) from the engine.
2. Connect the Engine Oil Pressure Gauge to the oil pressure sender oil galley port.
3. Run the engine until normal operating temperature is reached.
4. Run the engine at the specified rpm and record the gauge reading.
5. The oil pressure should be within specifications; refer to the specification chart in the appropriate engine section.
6. If the pressure is not within specification, check the following possible sources:
 - insufficient oil
 - oil leakage
 - worn or damaged oil pump
 - oil pump screen cover and tube (6622)
 - excessive main bearing clearance
 - excessive connecting rod bearing clearance

Valve Train Analysis—Engine Off—Valve Cover Removed

Check for damaged or severely worn parts and correct assembly. Make sure correct parts are used with the static engine analysis as follows.

Valve Train Analysis—Engine Off

- Check for loose mounting bolts on camshaft caps.
- Check valve shim to camshaft gap.

Valve Train Analysis—Engine Off, Camshaft—Engines

- Check for broken or damaged parts.

Valve Train Analysis—Valve Springs

- Check for broken or damaged parts.

Valve Train Analysis—Engine Off, Valve Spring Retainer and Valve Spring Retainer Keys

- Check for correct seating of the valve spring retainer key (6518) on the valve stem and in valve spring retainer (6514).
- Check for correct seating on the valve stem.

Valve Train Analysis—Engine Off, Valves and Cylinder Head

- Check for plugged oil drain back holes.
- Check for worn or damaged valve tips.
- Check for missing or damaged valve stem seals or guide-mounted valve stem seal.
- Check valve tappet shim gap.
- Check for missing or worn valve spring seats.
- Check for plugged oil metering orifice in cylinder head oil reservoir (if equipped).

Static checks (engine off) are to be made on the engine prior to the dynamic procedure.

Valve Train Analysis—Engine Off, Camshaft Lobe Lift—OHC Engines

Check the lift of each camshaft lobe in consecutive order and make a note of the readings.

1. Remove the valve covers.
2. Remove the spark plugs.
3. Install the special tool so the rounded tip of indicator is on top of the camshaft lobe and on the same plane as the valve tappet.
4. Rotate the crankshaft using a breaker bar and socket attached to the crankshaft pulley retainer bolt. Rotate the crankshaft until the base circle of the camshaft lobe is reached.

5. Zero the dial indicator. Continue to rotate the crankshaft until the high-lift point of the camshaft lobe is in the fully-raised position (highest indicator reading).
6. To check the accuracy of the original indicator reading, continue to rotate crankshaft until the base circle is reached. The indicator reading should be zero. If zero reading is not obtained, repeat Steps 1 through 6.

7. Install the spark plugs.

8. Install the valve covers.

Valve Train Analysis—Engine Off, Valve Tappet

Valve tappet noise can be caused by any of the following:

- excessive valve tappet shim gap
- excessive valve guide wear

Excessive collapsed valve tappet shim gap can be caused by loose rocker arm seat bolts/nuts, incorrect initial adjustment or wear of valve tappet shim face.

Refer to valve train shim and gap inspection procedure in the appropriate engine section.

Sprockets

1.  **WARNING:** To avoid the possibility of personal injury or damage to the vehicle, do not operate the engine with the hood open until the fan blade has been examined for possible cracks and separation. Failure to follow these instructions may result in personal injury.

NOTE: Specifications show the expected minimum or maximum condition.

NOTE: If a component fails to meet the specifications, it is necessary to install a new component or refinish the component. If the component can be refinished, wear limits are provided as an aid to making a decision. If a component fails to meet specifications and cannot be refinished, a new component must be installed.

Inspect the timing chain/belt and the sprockets.

- Install new components as necessary. Refer to the appropriate section in Group [303](#) for the procedure.

Camshaft Journal — Diameter

1. Measure each camshaft journal diameter in two directions.
 - If it is out of specification, install a new camshaft. Refer to the appropriate section in Group [303](#) for the procedure.

A0004601

Camshaft Journal

NOTE: The camshaft journals must meet specifications before checking camshaft journal clearance.

Refer to the appropriate section in Group [303](#) for the procedure.

Camshaft —End Play, OHC Engines

Special Tool(s)

1. Use the special tool to measure camshaft end play.
2. Position the camshaft to the rear of the cylinder head.
3. Zero the indicator.
4. Move the camshaft to the front of the cylinder head. Note and record the camshaft end play. Refer to the appropriate section in Group [303](#) for the procedure.
 - If camshaft end play exceeds specifications, install new camshaft thrust bearing washers.

Camshaft —Lobe Surface

1. Inspect camshaft lobes for pitting or damage in the active area. Minor pitting is acceptable outside the active area.
 - If excessive pitting or damage is present, install a new camshaft. Refer to the appropriate section in Group [303](#) for the procedure.

Camshaft —Lobe Lift

Special Tool(s)

1. Use the special tool to measure camshaft intake/exhaust lobe lift.
 - Rotate the camshaft and subtract the lowest indicator reading from the highest indicator reading to figure the camshaft lobe lift.
 - For additional information, refer to base engine section for specification.

Camshaft —Runout

Special Tool(s)

1. **NOTE:** Camshaft journals must be within specifications before checking runout.

Use the special tool to measure the camshaft runout.

- Rotate the camshaft and subtract the lowest indicator reading from the highest indicator reading.
- For additional information, refer to the Specifications chart in the appropriate engine section.
- If it is out of specification, install a new camshaft. Refer to the appropriate section in Group [303](#) for the procedure.

Crankshaft Main Bearing Journal —Diameter

1. **NOTE:** Check part availability before engine disassembly.

Measure each of the crankshaft main bearing journal diameters in at least two directions.

- For additional information, refer to the Specifications chart in the appropriate engine section.
- If it is out of specification, install new components as necessary. Refer to the appropriate section in Group [303](#) for the procedure.

Crankshaft Main Bearing Journal —Taper

1. Measure each of the crankshaft main bearing journal diameters in at least two directions at each end of the main bearing journal.
 - For additional information, refer to the Specifications chart in the appropriate engine section.
 - If it is out of specification, install new components as necessary. Refer to the appropriate section in Group [303](#) for the procedure.

Crankshaft Main Bearing Journal — Clearance

NOTE: Crankshaft main bearing journals must be within specifications before checking journal clearance.

Refer to the appropriate section in Group [303](#) for the procedure.

Crankshaft —End Play

Special Tool(s)

1. Measure the crankshaft end play.
 - Use the special tool to measure crankshaft end play.
2. Position the crankshaft to the rear of the cylinder block.
3. Zero the indicator.
4. Move the crankshaft to the front of the cylinder block. Using the special tool, note and record the crankshaft end play.
 - If crankshaft end play exceeds specifications, install a new crankshaft thrust washer (6334) or crankshaft thrust main bearing (6337). Refer to the appropriate section in Group [303](#) for the procedure.

Crankshaft —Runout

Special Tool(s)

1. **NOTE:** Crankshaft main bearing journals must be within specifications before checking runout.

Use the special tool to measure the crankshaft runout.

- For additional information, refer to the Specifications chart in the appropriate engine section. Rotate the crankshaft and subtract the lowest dial indicator reading from the highest dial indicator reading to figure the crankshaft runout. If it is out of specification, install new components as necessary. Refer to the appropriate section in Group [303](#) for the procedure.

Crankshaft —Connecting Rod Journal Taper, Out of Round

1. Measure the crankshaft connecting rod journal diameters in two directions perpendicular to one another at each end of the connecting rod journal. The difference in the measurements from one end to the other is the taper. Verify measurement is within the wear limit.
 - For additional information, refer to the appropriate engine section Specifications chart.
 - If it is out of specification, install new components as necessary. Refer to the appropriate section in Group [303](#) for the procedure.

Cylinder Bore —Taper

1. Measure the cylinder bore at the top and bottom. Verify the cylinder bore is within the wear limit. The difference indicates the cylinder bore taper. Bore the cylinder to the next oversize.
 - For additional information, refer to the appropriate engine section Specifications chart.

Cylinder Bore —Out-of-Round

1. Measure the cylinder bore in two directions. The difference is the out-of-round. Verify the out-of-round is within the wear limit and bore the cylinder to the next oversize limit.
 - For additional information, refer to the appropriate engine section Specifications Chart.

Piston — Inspection

Special Tool(s)

 **CAUTION:** Do not use a caustic cleaning solution or a wire brush to clean the pistons or damage can occur.

1. Clean and inspect the (1) ring lands, (2) skirts, (3) pin bosses, and the (4) tops of the pistons. If wear marks, scores or glazing is found on the piston skirt, check for a bent or twisted connecting rod.

2. Use the special tool to clean the piston ring grooves.
 - Make sure the oil ring holes are clean.

Piston —Pin to Bore Diameter

1.  **WARNING:** Cover the end of the pin bore with a hand or shop rag when removing the retainer ring, since it has a tendency to spring out. Wear eye protection. Failure to follow these instructions may result in personal injury.

NOTE: Piston and piston pins are a matched set and should not be interchanged.

Measure the piston pin bore diameter in two directions on each side. Verify the diameter is within specification.

- If it is out of specification, install new components as necessary. Refer to the appropriate section in Group [303](#) for the procedure.

Piston — Diameter

1. Measure the piston dome and skirt diameter 90 degrees from the piston pin at the points indicated. For additional information, refer to the Specifications Chart in the appropriate engine section.
 - If it is out of specification, install new components as necessary. Refer to the appropriate section in Group [303](#) for the procedure.

Piston —to Cylinder Bore Clearance

1. Subtract the piston diameter from the cylinder bore diameter to find the piston-to-cylinder bore clearance.
-

Piston — Selection

NOTE: The cylinder bore must be within the specifications for taper and out-of-round before fitting a piston.

1. Select a piston size based on the cylinder bore.

2. **NOTE:** For precision fit, new pistons are divided into three categories within each size range based on their relative position within the range. A number on the new pistons indicates the position within the size range.

Choose the piston with the correct grade size.

- Refer to the appropriate section in Group [303](#) for the procedure.
-

Piston — Ring End Gap

Special Tool(s)

 **CAUTION:** Use care when fitting piston rings to avoid possible damage to the piston ring or the cylinder bore.

 **CAUTION:** Piston rings should not be transferred from one piston to another.

NOTE: Cylinder bore must be within specification for taper and out-of-round.

1. Use a piston without rings to push a piston ring in a cylinder to the bottom of ring travel.

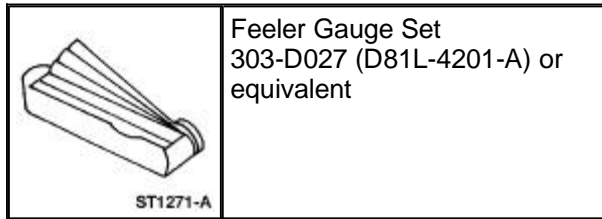

2. Use the special tool to measure the top piston ring end gap and the second piston ring end gap.
 - For additional information, refer to the appropriate engine section Specifications chart.

Piston — Ring-to-Groove Clearance

Special Tool(s)

1. Inspect for a step in the grooves.

2. Measure the piston ring-to-groove clearance.
 - For additional information, refer to the appropriate engine section Specifications chart.
 - If out of specification, install new components as necessary. Refer to the appropriate section in Group [303](#) for the procedure.

Piston —Pin Diameter

1. Measure the piston pin diameter in two directions at the points shown. Verify the diameter is within specification.
 - For additional information, refer to the appropriate engine section Specifications chart.
 - If out of specification, install new components as necessary. Refer to the appropriate section in Group [303](#) for the procedure.

Connecting Rod —Cleaning

 **CAUTION:** Do not use a caustic cleaning solution or damage to connecting rods can occur.

1. **NOTE:** If the connecting rod large end is mechanically split or cracked to produce a unique parting face, a locking joint is produced. Parts are not interchangeable.

Mark and separate the parts and clean with solvent. Clean the oil passages.

Connecting Rod —Large End Bore

1. Measure the bore in two directions. The difference is the connecting rod bore out-of-round. Verify the out-of-round is within specification.
 - For additional information, refer to the appropriate engine section Specifications chart.
 - If out of specification, install new components as necessary. Refer to the appropriate section in Group [303](#) for the procedure.

A0004629

Connecting Rod — Bushing Diameter

1. Measure the inner diameter of the connecting rod bushing, if equipped. Verify the diameter is within specification.
 - For additional information, refer to the appropriate engine section Specifications chart.
 - If out of specification, install new components as necessary. Refer to the appropriate section in Group [303](#) for the procedure.

A0004630

Connecting Rod — Bend

Special Tool(s)

1. Measure the connecting rod bend on a suitable alignment fixture. Follow the instructions of the fixture manufacturer. Verify the bend measurement is within specification.
 - For additional information, refer to the appropriate engine section Specifications chart.
 - If out of specification, install new components as necessary. Refer to the appropriate section in Group [303](#) for the procedure.

Connecting Rod —Twist

Special Tool(s)

1. Measure the connecting rod twist on a suitable alignment fixture. Follow the instructions of the fixture manufacturer. Verify the measurement is within specification.
 - For additional information, refer to the appropriate engine section Specifications chart.
 - If out of specification, install new components as necessary. Refer to the appropriate section in Group [303](#) for the procedure.

Connecting Rod —Piston Pin Side Clearance

Special Tool(s)

1. Measure the clearance between the connecting rod and the piston. Verify the measurement is within specification.
 - For additional information, refer to the appropriate engine section Specifications chart.
 - If out of specification, install new components as necessary. Refer to the appropriate section in Group [303](#) for the procedure.

Connecting Rod —Bearing Journal Clearance

Refer to the appropriate section in Group [303](#) for the procedure.

Valve — Stem Diameter

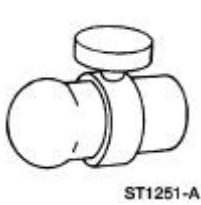

1. Measure the diameter of each intake and exhaust valve stem at the points shown. Verify the diameter is within specification.
 - Refer to the appropriate engine section Specifications chart.
 - If out of specification, install new components as necessary. Refer to the appropriate section in Group [303](#) for the procedure.

A0004640

Valve — Stem to Valve Guide Clearance

Special Tool(s)

	Dial Indicator Gauge with Holding Fixture 100-002 (TOOL-4201-C) or equivalent
	Clearance Gauge, Valve Guide 303-004 (TOOL-6505-E) or equivalent

NOTE: Valve stem diameter must be within specifications before checking valve stem to valve guide clearance.

1. **NOTE:** If necessary, use a magnetic base.

Using special tool Valve Stem Checking Tool and Dial Indicator with Bracketry, lower the valve until the Valve Stem Checking Tool contacts the upper surface of the valve guide.

2. Move the Valve Stem Checking Tool toward the indicator and zero the indicator. Move the Valve Stem Checking Tool away from the indicator and note the reading. The reading will be **DOUBLE** the valve stem-to-valve guide clearance.

Valve — Inspection

1. Inspect the following valve areas:
 1. the end of the stem for grooves or scoring
 2. the valve face and the edge for pits, grooves or scores
 3. the valve head for signs of burning, erosion, warpage and cracking
 4. the valve margin for wear

Valve —Guide Inner Diameter

1. Measure the inner diameter of the valve guides in two directions where indicated.
 - Refer to the appropriate engine section Specifications chart.

Valve — Spring Free Length

1. Measure the free length of each valve spring.
 - Refer to the Specifications chart in the appropriate engine section.
 - If out of specification, install new components as necessary. Refer to the appropriate section in Group [303](#) for the procedure.

Valve —Spring Squareness

1. Measure the out-of-square on each valve spring.
 - Turn the valve spring and observe the space between the top of the valve spring and the square. Install a new valve spring if out of square. Refer to the appropriate section in Group [303](#) for the procedure.

Valve — Spring Strength

Special Tool(s)

1. Use the special tool to check the valve spring for correct strength at the specified valve spring length.
 - Refer to the appropriate engine section Specifications chart.
 - If out of specification, install new components as necessary. Refer to the appropriate section in Group [303](#) for the procedure.

Valve — Seat Inspection

Valve and Seat Refacing Measurements

CAUTION: After grinding valves or valve seats, check valve clearance.

1. Check the valve head and seat.
 - Check valve angles.
 - Check margin width.
 - Refer to the Specifications chart in the appropriate engine section.
 - Be sure margin width is within specification.

2. Inspect for abnormalities on the valve face and seat.
-

Valve — Seat Width

1. Measure the valve seat width. Install a new cylinder head if measurements are not within specification. Refer to the appropriate section in Group [303](#) for the procedure.
 - Measure the intake valve seat width.
 - Measure the exhaust valve seat width.
 - Refer to the Specifications chart in the appropriate engine section.

A0004650

Valve — Seat Runout

1. Check valve seat runout.
 - Verify that the runout is within specification.

Cylinder Head —Distortion

Special Tool(s)

1. Use a straight edge and a feeler gauge to inspect the cylinder head for flatness. If the cylinder head is distorted, install a new cylinder head.

Cylinder Bore —Cleaning

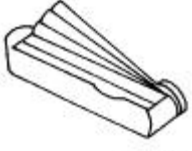

1.  **CAUTION:** If these procedures are not followed, rusting of the cylinder bores may occur.

Clean the cylinder bores with soap or detergent and water.

2. Thoroughly rinse with clean water and wipe dry with a clean, lint-free cloth.
 3. Use a clean, lint-free cloth and lubricate the cylinder bores.
 - Use engine oil meeting Ford specification.
-

Cylinder Block —Distortion

Special Tool(s)

 ST1271-A	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent
 ST1246-A	Straight Edge 303-D039 (D83L-4201-A) or equivalent

1. Use the special tools to inspect the cylinder block for flatness. If the cylinder block is distorted, install a new cylinder block. Refer to the appropriate section in Group [303](#) for the procedure.

Cylinder Block —Core Plug Replacement

Special Tool(s)

1. Use the special tool to remove the cylinder block core plug.

2. Inspect the cylinder block plug bore for any damage that would interfere with the correct sealing of the plug. If the cylinder block plug bore is damaged, bore for the next oversize plug.
3. **NOTE:** Oversize plugs are identified by the OS stamped in the flat located on the cup side of the plug.

Coat the cylinder block core plug and bore lightly with Threadlock® 262 E2FZ-19554-B or equivalent meeting Ford specification WSK-M2G351-A6 and install the cylinder block core plug.

Cup-Type

4.  **CAUTION:** Use care during this procedure so as not to disturb or distort the cup sealing surface.

 **CAUTION:** When installed, the flanged edge must be below the chamfered edge of the bore to effectively seal the bore.

Use a tooling suitable to seat the cup type cylinder block core plug.

Expansion-Type

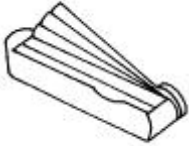

1.  **CAUTION:** Do not contact the crown when installing an expansion type cylinder block core plug. This could expand the plug before seating and result in leakage.

Use tooling suitable to seat the expansion type cylinder block core plug.

Exhaust Manifold — Inspection

Special Tool(s)

 ST1246-A	Straight Edge 303-D039 (D83L-4201-A) or equivalent
 ST1271-A	Feeler Gauge Set 303-D027 (D81L-4201-A) or equivalent

1. Use the special tools to check for warping.

Bearing — Inspection

1. Inspect bearings for the following defects. Possible causes are shown:
 1. cratering—fatigue failure
 2. spot glazing—incorrect seating
 3. scratching—dirty
 4. base exposed—poor lubrication
 5. both edges worn—journal damaged
 6. one edge worn—journal tapered or bearing not seated

General Specifications

The 3.0L (4V) (182 CID) is a 60 degree V-6 engine with dual overhead camshafts (DOHC), four valves per cylinder and sequential multiport fuel injection (SFI). The engine has:

- an aluminum upper intake manifold.
- a lower intake manifold.
- aluminum cylinder heads.
- a cast aluminum upper cylinder block.

The ignition system is electronic (distributorless) with a single ignition coil located above each spark plug. This high energy ignition system is required for fast-burn combustion.

A unique intake air system utilizes two separate plenums, one for each side of the engine. The plenums can be connected through the operation of a special intake manifold tuning valve (IMTV) to improve upper rpm power.

Identification

For quick identification refer to the safety certification decal:

- The decal is located on the LH front door lock face panel.
- An engine identification label is also attached to the engine.
- The symbol code on the identification tag identifies each engine for determining parts usage; for instance, engine displacement in liters or cubic inch displacement and model year.

Engine Code Information

The engine code information label is located on the front fender. The label contains, among other information:

- the engine calibration number
- the engine build date
- the engine plant code
- the engine code

Emission Calibration Label

NOTE: The engine codes and the calibration numbers must be used when making inquiries or ordering parts.

The emission calibration number label is located on the LH side door or LH door post pillar. It identifies:

- the engine calibration number
- the engine code number
- the revision level

These numbers are used to determine if parts are unique to specific engines.

Exhaust Emission Control System

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Induction System

The fuel needed for burning in the cylinders is provided by a returnless, sequential multiport fuel injection (SFI).

- Fuel is supplied from the vehicle fuel tank by a high-pressure electric fuel pump mounted in the fuel tank.
- The fuel is filtered and sent to the fuel injection supply manifold.
- Fuel pressure is regulated by modulating pump output based upon readings from the fuel pressure sensor, located on the fuel rail.
- Fuel is metered into the intake air stream in accordance with engine by six solenoid operated fuel injectors mounted in the lower intake manifolds.
- The six fuel injectors are mounted above the intake valves and connected in series with the fuel pressure regulator.
- These fuel induction systems are mounted on a phenolic resin intake manifold.

Crankshaft

The crankshaft is supported on the bottom of the cylinder block by four steel-backed, over-plated, aluminum crankshaft main bearings.

To provide smooth engine operation, the piston crankpins are positioned to provide a power impulse every 120 degrees of crankshaft rotation. The spacing provides smooth and quiet operation.

Two sprockets and timing chains connect the crankshaft with the camshafts and provide a 2:1 drive ratio.

Camshaft

The camshafts:

- are supported on four bearing inserts.
- thrust loads and end play are limited by a camshaft thrust plate.

Cylinder Head

The spark plug is installed in the center of the fuel/air roof-shaped combustion chamber to ignite the mixture in the combustion chamber. The central location of the spark plug causes the flame front to be evenly spread across the chamber, which also reduces spark knock.

Valve Train

Both camshafts are driven by a shared timing chain, and operate four valves per cylinder by means of an selective shim setting on the top of a tappet. One spring on each valve is used to close the valve. The adjusting shims in the valve tappets can be changed to correct the valve clearance. These are available in 44 different thicknesses. The shim thickness is ink printed on the back of the shim. Using a special procedure, the camshafts can be lifted without timing chain disassembly to change the shims. A high degree of accuracy is required during adjusting to avoid repeated changing of the shims. The camshaft cams run concentrically on the valve tappets. At engine speeds of about 3,000 rpm this causes the tappets to rotate, and they in turn transfer the rotation to the valves. This valve rotation is required because it produces an even valve seating and prevents the valves from wearing in a certain position which could cause them to leak.

Positive Crankcase Ventilation System

The engine is equipped with a positive, closed-type crankcase ventilation system which recycles the crankcase vapors to the throttle body.

Engine Lubrication System

The engine lubrication system is of the force-feed type in which oil is supplied under full pressure to the crankshaft, connecting rod bearings and timing chain tensioners. The flow of oil to the valve tappets and valve train is controlled by a restricting orifice located in the head gaskets.

Oil Pump

The lubrication system is designed to provide optimum oil flow to critical components of the engine through its entire operating range.

The heart of the system is a positive displacement internal gear oil pump. Generically this design is known as a G-rotor pump.

- The oil pump is mounted on the front face of the cylinder block.
- The inner rotor is piloted on the crankshaft post and is driven through the crankshaft.

System pressure is limited by an integral, internally vented relief valve which directs the bypassed oil back to the inlet side of the oil pump.

- Oil pump displacement has been selected to provide adequate volume so there is correct oil pressure both at hot idle and maximum speed.
- Relief valve calibration protects the system from excessive pressure during high viscosity conditions, yet is designed to provide adequate connecting rod bearing lubrication under high temperature and high speed conditions.

Engine Cooling System

The engine is liquid-cooled:

- by a centrifugal water pump driven through the front engine accessory drive by the crankshaft.

A water thermostat is used to restrict coolant flow until the engine reaches normal operating temperature.

Oil Pan

The oil pan is cast aluminum and is attached to the cylinder block and transmission.

- The oil pan acts as a reservoir holding lubricating oil that is pumped through the engine by the oil pump after start up.

Drive Belt System

Accessories mounted on the front of the engine are belt-driven by the crankshaft and an automatically tensioned serpentine drive belt is routed over the following components:

- water pump
 - A/C compressor
 - generator
 - drive belt tensioner
 - drive belt idler pulley
 - crankshaft pulley
 - power steering pump pulley
 - cooling fan pump pulley
-

Engine

Refer to [Section 303-00](#) .

Intake Manifold —Upper

Removal

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01.
2. Drain the engine cooling system. For additional information, refer to [Section 303-03](#).
3. Remove the engine appearance cover.

4. Remove the air cleaner outlet tube. For additional information, refer to [Section 303-12](#).
5. Disconnect the throttle position (TP) sensor and the idle air control (IAC) solenoid electrical connectors.

6. Disconnect the accelerator and speed control cables.

7. Remove the cable bracket.
 1. Remove the bolts.
 2. Remove the bracket.

8. Disconnect the throttle body hoses.
 1. Disconnect the coolant hoses.
 2. Disconnect the positive crankcase ventilation (PCV) hose.
 3. Disconnect the vapor purge hose.

9. Disconnect the vacuum hose.

10. Disconnect the EGR to exhaust manifold tube nut.

11. Remove the cowl vent screen. For additional information, refer to [Section 501-02](#).

12. Remove the brace.

13. Remove the vacuum hoses from the mounting bracket.

14. Remove the bracket and position the accelerator and cruise control cables aside.

15. Disconnect the differential pressure feedback EGR electrical connector.

16. Remove the stud and nut and position the differential pressure feedback EGR transducer aside.

17. Remove the fuel pressure sensor shield.
 1. Remove the nut.
 2. Remove the bolts.
 3. Remove the shield.

18. Disconnect the vacuum hose from the rear of the upper intake manifold.

19. Disconnect the intake manifold tuning valve (IMTV) electrical connector.

20. Disconnect the exhaust vacuum regulator (EVR).
 1. Disconnect the electrical connector.
 2. Disconnect the vacuum line.

21. Remove the upper intake support bolt.

22. Remove the front intake manifold support bolt.

23. Remove the bolts and the upper intake manifold.
 - Inspect the gaskets and discard as necessary.

Installation

1. Position the upper intake manifold and gaskets.

2. Install the fuel pressure sensor shield.
 1. Position the shield.
 2. Install the nut.

3. Install the upper intake manifold bolts and tighten in the sequence shown.

4. Position the differential pressure feedback EGR and install the nut and stud.

5. Install the upper intake manifold support bolt.

6. Install the upper intake support bolt.

7. Connect the exhaust vacuum regulator (EVR).
 1. Connect the electrical connector.
 2. Connect the vacuum line.

8. Connect the intake manifold tuning valve (IMTV) electrical connector.

9. Connect the vacuum hose to the rear of the upper intake manifold.

10. Position the differential pressure feedback EGR electrical connector.

11. Connect the differential pressure feedback EGR electrical connector.

12. Position the accelerator and cruise control cables and install the bracket.

13. Clip the vacuum hoses into the mounting bracket.

14. Install the brace.

15. Install the cowl vent screen. Refer to [Section 501-02](#).

16. Connect the EGR to exhaust manifold tube nut.

17. Connect the vacuum hose.

18. Connect the throttle body hoses.
 1. Connect the coolant hoses.
 2. Connect the PCV hose.
 3. Connect the vapor purge hose.

19. Install the cable bracket.
 1. Position the bracket.
 2. Install the bolts.

20. Connect the accelerator and speed control cables.

21. Connect the TP sensor and the IAC solenoid electrical connectors.

22. Install the air cleaner outlet tube. For additional information, refer to [Section 303-12](#).
23. Install the engine appearance cover.

24. Fill the engine cooling system. For additional information, refer to [Section 303-03](#).
 25. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).
-

Intake Manifold —Lower

Removal

1. Remove the upper intake manifold. Refer to [Intake Manifold—Upper](#).
2. Disconnect the fuel line. For additional information, refer to [Section 310-00](#).
3. Remove the fuel line bracket bolt.

4. Disconnect the fuel pressure sensor vacuum line.

5. Disconnect the fuel charging wiring harness connector.

6. Disconnect the crankcase ventilation tube and position out of the way.

7.  **CAUTION:** Lower intake manifold and fuel injection supply manifold must be removed as an assembly.

Remove the bolts and the lower intake manifold.

8. Remove the lower intake manifold gaskets.
- Inspect the gaskets and install new gaskets if necessary.

Installation

1. Position the lower intake manifold gaskets.

2. Position the lower intake manifold and install the bolts in the sequence shown.

3. Connect the crankcase ventilation tube.

4. Connect the fuel charging wiring harness connector.

5. Connect the fuel pressure sensor vacuum line.

6. Install the fuel line bracket bolt.

7. Connect the fuel line. For additional information, refer to [Section 310-00](#).
 8. Install the upper intake manifold. For additional information, refer to [Intake Manifold—Upper](#).
-

Valve Cover —LH

Removal

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Remove the LH ignition coils. For additional information, refer to [Section 303-07A](#).
3. Disconnect the cylinder head temperature (CHT) electrical connector.

4. Remove the CHT sensor.

5. Remove the vacuum hoses from the appearance cover support bracket.

6. Remove the nuts and the appearance cover support bracket.

7. Disconnect the positive crankcase ventilation (PCV) tube and position aside.

8. Remove the ignition coil wiring harness from the retainers.

9. Remove the studs, bolts, and the valve cover.
 - Discard the gasket.

Installation

1. **NOTE:** Apply a 5 mm (0.2 in) bead of Silicone Gasket and Sealant F7AZ-19554-EA or equivalent meeting Ford specification WSE-M4G323 to the front cover joints.

Install a new gasket.

2. Position the valve cover and install the bolts and studs in the sequence shown.

3. Install the ignition coil wiring harness onto the retainers.

4. Connect the PCV tube.

5. Install the appearance cover support bracket.

6. Install the vacuum hoses to the appearance cover support bracket.

7. Install the CHT sensor.

8. Connect the CHT electrical connector.

9. Install the LH ignition coils. For additional information, refer to [Section 303-07A](#).
-

Valve Cover —RH

Removal

1. Disconnect the positive crankcase ventilation (PCV) tube and position aside.

2. Remove the RH ignition coils. For additional information, refer to [Section 303-07A](#).
3. Remove the wiring harness retainer from the stud.

4. Remove the nuts and position the upper intake manifold support bracket aside.

5. Remove the wiring harness bracket nuts.

6. Remove the wiring harness bracket nuts and position the wiring harness aside.

7. Remove the studs, bolts, and the valve cover.
 - Discard the gasket.

Installation

1. **NOTE:** Apply a 5 mm (0.2 in) bead of Silicone Gasket and Sealant F7AZ-19554-EA or equivalent meeting Ford specification WSE-M4G323-A4 to the front cover joints.

Install a new gasket.

2. Position the valve cover and install the bolts and studs in the sequence shown.

3. Install the wiring harness bracket and nuts.

4. Install the wiring harness bracket nuts.

5. Install the upper intake manifold support bracket.

6. Install the wiring harness retainer onto the stud.

7. Install the RH ignition coils. For additional information, refer to [Section 303-07A](#).
8. Connect the PCV tube.

Crankshaft Pulley

Special Tool(s)

 ST1287-A	Crankshaft Damper Replacer 303-102 (T74P-6316-B)
 ST1184-A	Crankshaft Damper Remover 303-D121
 ST1438-A	Strap Wrench 303-D055 (D85L-6000-A)

Removal

1. Remove the accessory drive belt. For additional information, refer to [Section 303-05](#).
2. If equipped, remove the secondary air valve, bracket and tube. For additional information, refer to [Section 303-08](#).
3. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
4. Remove the front center splash panel.

5. Remove the crankshaft pulley bolt and washer.
 - Discard the bolt.

6.  **CAUTION:** The special tool must grab the inside of the damper, or damage to the damper may occur.

Using the special tool, remove the crankshaft damper.

Installation

1. **NOTE:** Seal surface must be free of dirt and oil.

Apply Silicone Gasket and Sealant F7AZ-19554-EA or equivalent meeting Ford specification WSK-M2G343-A4, to the end of the keyway slot.

2. **NOTE:** Lubricate the outside diameter sealing surface of the crankshaft pulley with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-6.

Using the special tool, install the crankshaft pulley assembly.

3. Using the special tool, install a new bolt and the washer.

- Tighten the bolt in four stages.
- Stage 1: Tighten to 120 Nm (89 lb-ft).
- Stage 2: Loosen one full turn (360 degrees).
- Stage 3: Tighten to 50 Nm (37 lb-ft).
- Stage 4: Tighten an additional 90 degrees.

4. Install the front center splash panel.

5. Lower the vehicle.

6. If equipped, install the secondary air valve, bracket and tube. For additional information, refer to [Section 303-08](#).

7. Install the accessory drive belt. For additional information, refer to [Section 303-05](#).

Crankshaft Front Oil Seal

Special Tool(s)

 ST1385-A	Seal Remover 303-409 (T92C-6700-CH)
 ST1328-A	Front Crankshaft Seal Installer 303-335

Removal

1. Remove the crankshaft pulley. For additional information, refer to [Crankshaft Pulley](#) in this section.
2. Using the special tool, remove the crankshaft front oil seal.

Installation

1. Lubricate the inside diameter of the seal with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.
2. Using the special tool, install the crankshaft front oil seal.

3. Install the crankshaft pulley. For additional information, refer to [Crankshaft Pulley](#) in this section.
-

Engine Front Cover

Removal

1. Remove the RH valve cover. For additional information, refer to [Valve Cover—RH](#) in this section.
2. Remove the LH valve cover. For additional information, refer to [Valve Cover—LH](#) in this section.
3. Remove the belt idler pulley. For additional information, refer to [Section 303-05](#).
4. Remove the water pump. For additional information, refer to [Section 303-03](#).
5. Disconnect the upper hose from the radiator.

6. Disconnect the lower hose from the radiator.

7. Remove the oil pan. For additional information, refer to [Oil Pan](#) in this section.
8. Remove the power steering pump. For additional information, refer to [Section 211-02](#).
9. Remove the hydraulic cooling fan pump. For additional information, refer to [Section 303-03](#).
10. Remove the bolt and the belt tensioner.

11. Remove the crankshaft front oil seal. For additional information, refer to [Crankshaft Front Oil Seal](#) in this section.

12. Remove the bracket.

13. Disconnect the camshaft position (CMP) sensor electrical connector.

14. Disconnect the crankshaft position (CKP) sensor electrical connector.

15. Remove the fuel supply manifold bolt.

16. Remove the bolts and the engine front cover.
 - Discard the gasket.

Installation

1. Clean the sealing surfaces on the engine and the front cover.
2. **NOTE:** Install the engine front cover within six minutes of sealer application.

Apply a 6 mm (0.24 in) diameter dot of Silicone Gasket and Sealant F7AZ-19554-EA or equivalent meeting Ford specification WSE-M4G323-A4 to the areas indicated.

- Install a new gasket.

3. Position the front cover and tighten the bolts in the sequence shown.

4. Install the fuel supply manifold bolt.

5. Connect the CKP sensor electrical connector.

6. Connect the CMP sensor electrical connector.

7. Install the bracket.

8. Install the crankshaft front oil seal. For additional information, refer to [Crankshaft Front Oil Seal](#) in this section.
9. Position the belt tensioner and install the bolt.

10. Install the hydraulic cooling fan pump. For additional information, refer to [Section 303-03](#).
11. Install the power steering pump. For additional information, refer to [Section 211-02](#).
12. Install the oil pan. For additional information, refer to [Oil Pan](#) in this section.
13. Connect the lower hose to the radiator.

14. Connect the upper hose to the radiator.

15. Install the water pump. For additional information, refer to [Section 303-03](#).
16. Install the belt idler pulley. For additional information, refer to [Section 303-05](#).
17. Install the LH valve cover. For additional information, refer to [Valve Cover—LH](#) in this section.
18. Install the RH valve cover. For additional information, refer to [Valve Cover—RH](#) in this section.
19. Fill the cooling system. For additional information, refer to [Section 303-03](#).

Timing Drive Components

Removal

1. Remove the engine front cover. For additional information, refer to [Engine Front Cover](#) in this section.
2. Remove the ignition pulse ring.

3. Reinstall the crankshaft damper bolt and washer.

4.  **CAUTION:** Rotating the crankshaft in a counterclockwise direction may cause engine damage. Crankshaft journals are directionally machined. Rotating the crankshaft counterclockwise can raise burrs on bearing surfaces, reducing engine life.

Rotate the crankshaft clockwise to position the crankshaft keyway to the nine o'clock position.

5.  **CAUTION:** If the RH timing chain tensioner arm and RH chain guide are to be reused, mark the position of each piece to make sure that they are installed on the correct side when reassembled.

Install a stiff wire or paper clip into the RH timing chain tensioner before removing the bolts.

6. Remove the bolts, the timing chain tensioner and the tensioner arm.

7. Remove the RH timing chain.
8. Remove the bolts and the RH timing chain guide.

9.  **CAUTION:** If the LH timing chain tensioner arm and the LH chain guide are to be reused, mark the position of each piece to make sure that they are installed on the correct side when reassembled.

Install a stiff wire or paper clip into the LH timing chain tensioner.

10. Remove the bolts, the timing chain tensioner and the tensioner arm.

11. Remove the bolts and LH chain guide.

12. Remove the LH timing chain.

Installation

1.  **CAUTION:** Rotating the crankshaft in a counterclockwise direction may cause engine damage. Crankshaft journals are directionally machined. Rotating the crankshaft counterclockwise can raise burrs on bearing surfaces, reducing engine life.

Verify that the crankshaft keyway is in the nine o'clock position.

2.  **CAUTION:** The crankshaft keyway must remain in the nine o'clock position until the cams are located, or damage to the valves may occur.

Rotate the LH and RH intake and exhaust camshafts to locate them in their neutral positions.

3. Position the LH chain tensioner in a soft-jawed vise.

4. Hold the chain LH tensioner ratchet lock mechanism away from the ratchet stem with a small pick.

5.  **CAUTION:** During tensioner compression, do not release the ratchet stem until the tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

Slowly compress the LH timing chain tensioner.

6. **NOTE:** The wire must remain in the timing chain tensioner until the tensioner is installed.

Retain the LH tensioner piston with a 1.5 mm (0.06 in) wire or paper clip.

7. Rotate the crankshaft clockwise to position the keyway to the 11 o'clock position and remove the crankshaft damper bolt and washer.

8. Install the LH timing chain guide.
1. Position the guide to the engine.
 2. Install the shorter (gold color) bolt into the upper hole.
 3. Install the longer bolt (black color) into the lower hole.

9. Install the LH timing chain, aligning the timing index link (gold color) with the marks on the camshaft and crankshaft sprockets.

10. **NOTE:** Be sure to position the tensioner so that the tensioner piston is fully engaged in the tensioner arm.

Install the LH tensioner arm, tensioner and bolts.

11. Remove the wire or paper clip from the tensioner.

12. Rotate the crankshaft clockwise and position the keyway between the two o'clock and three o'clock positions for RH timing chain installation.

13. Verify that the timing index links (gold color) on the LH timing chain are in alignment with the

timing index marks on the camshaft and crankshaft sprockets.

14. Position the RH chain tensioner in a soft-jawed vise.

15. Hold the RH chain tensioner ratchet lock mechanism away from the ratchet stem with a small pick.

16.  **CAUTION:** During tensioner compression, do not release the ratchet stem until the tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

Slowly compress the RH timing chain tensioner.

17. **NOTE:** The wire must remain in the timing chain tensioner until the tensioner is installed.

Retain the RH tensioner piston with a 1.5 mm (0.06 in) wire or paper clip.

18. Install the RH chain guide and bolts.

19. Install the RH timing chain, aligning the timing index links (gold color) with the marks on the camshaft and crankshaft sprockets.

20. Install the RH tensioner.
1. Position the tensioner arm.
 2. Position the tensioner.
 3. Install the bolts.

21. Remove the wire or paper clip from the RH tensioner.

22. Verify that the timing index links (gold color) on the RH timing chain are in alignment with the timing index marks on the camshaft and crankshaft sprockets.

23. Remove the bolt and washer.

24. Install the ignition pulse ring.

25. Install the engine front cover. For additional information, refer to [Engine Front Cover](#) in this section.
-

Camshaft —LH

Removal

1. Remove the timing chains. For additional information, refer to [Timing Drive Components](#) in this section.

2.  **CAUTION:** Remove the camshaft journal thrust caps prior to loosening other camshaft journal cap bolts. Damage to the camshaft journal thrust cap may occur if not removed first.

 **CAUTION:** Cylinder head camshaft journal caps and cylinder heads are numbered to be sure they are assembled in their original positions. Keep camshaft journal caps with the cylinder head from which they were removed. Do not mix with camshaft journal caps from another cylinder head.

Remove the bolts.

3. **NOTE:** The camshaft journal thrust caps have alignment dowels.

Using a soft-faced mallet, gently loosen and remove the camshaft journal thrust caps.

4. Remove the remaining camshaft journal bolts.

5. Using a soft-faced mallet, gently loosen and remove the remaining camshaft journal caps.

6. Carefully lift out the camshafts.

Installation

1. **NOTE:** Be sure camshaft bearing caps are installed in original positions.

Lubricate camshafts with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G and carefully position the camshafts into the

cylinder head.

2.  **CAUTION:** Do not install the camshaft journal thrust caps until all of the camshaft bearing caps have been installed, or damage to the thrust caps may occur.

Lubricate the bearing surfaces of the camshaft bearing caps with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G, and install the bearing caps and loosely install the bolts.

3. Lubricate the bearing surfaces of the camshaft caps with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G, and loosely install the caps and bolts.

4. Tighten the bolts in sequence shown.

5. **NOTE:** If new camshafts were installed, refer to [Valve Spring—Lash Adjustment](#) in this section.

Lubricate the tappet shims and camshaft lobes with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.

6.  **CAUTION:** Verify that the crankshaft is in the nine o'clock position before rotating the camshafts, or damage to the valve train may result.

Rotate the camshafts to be sure they are not binding. If binding occurs, check to make sure that all bearing caps are in their original positions. Loosen all bearing cap bolts in reverse order and retighten.

7. Install the timing chains. For additional information, refer to [Timing Drive Components](#) in this section.
-

Camshaft —RH

Removal

1. Remove the timing chains. For additional information, refer to [Timing Drive Components](#) in this section.

2.  **CAUTION:** Remove the camshaft journal thrust caps prior to loosening other camshaft journal cap bolts. Damage to the camshaft journal thrust cap may occur if not removed first.

 **CAUTION:** Cylinder head camshaft journal caps and cylinder heads are numbered for assembly in their original positions. Keep camshaft journal caps with the cylinder head from which they were removed. Do not mix with camshaft journal caps from another cylinder head.

Remove the bolts.

3. **NOTE:** The camshaft journal thrust caps have alignment dowels.

Using a soft-faced mallet, gently loosen and remove the camshaft journal thrust caps.

4. Remove the remaining camshaft journal cap bolts.

5. Using a soft-faced mallet, gently loosen and remove the remaining camshaft journal caps.

6. Carefully lift out the camshafts.

Installation

1. **NOTE:** Be sure camshaft bearing caps are installed in original positions.

Lubricate camshafts with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G and carefully position the camshafts into the

cylinder head.

2.  **CAUTION: Do not install the camshaft journal thrust caps until all of the camshaft bearing caps have been installed, or damage to the thrust caps may occur.**

Lubricate the bearing surfaces of the camshaft bearing caps with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G, and install the bearing caps and loosely install the bolts.

3. Lubricate the bearing surfaces of the camshaft bearing thrust caps with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G, and install the caps and loosely install the bolts.

4. Tighten the bolts in sequence shown.

5. **NOTE:** If either of the camshafts were replaced, refer to [Valve Spring—Lash Adjustment](#) in this section.

Lubricate the tappet shims and camshaft lobes with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.

6.  **CAUTION:** Verify that the crankshaft is in the nine o'clock position before rotating the camshafts, or damage to the valve train may result.

Rotate the camshafts to be make sure they are not binding. If binding occurs, check to sure that all bearing caps are in their original positions. Loosen all bearing cap bolts in reverse order and retighten.

7. Install the timing chains. For additional information, refer to [Timing Drive Components](#) in this section.
-

Exhaust Manifold — LH

Removal

1. If equipped, remove the heat shield.

2. Remove the three upper nuts on the LH exhaust manifold.

3. Remove the three-way catalytic converter (TWC). For additional information, refer to [Section 309-00](#).
4. Remove the lower splash shield.
 - Remove the bolts.
 - Remove the pin-type retainers and the shield.

5. If equipped, remove the secondary air tube from the exhaust manifold.

6. Remove the three lower nuts and the exhaust manifold.
 - Discard the gasket.

Installation

1. **NOTE:** To make sure of a seal, the manifold bolts must be tightened to the same specification two times.

Using a new gasket, install the exhaust manifold. Tighten the nuts in two stages.

- Stage 1: Tighten to 20 Nm (15 lb-ft).
- Stage 2: Tighten to 20 Nm (15 lb-ft).

2. If equipped, install the secondary air tube to the exhaust manifold.

3. Install the lower splash shield.
 - Install the shield and the pin-type retainers.
 - Install the bolts.

4. Install the TWC. For additional information, refer to [Section 309-00](#).
5. If equipped, install the heat shield.

Exhaust Manifold —RH

Removal

1. If equipped, remove the heat shield.

2. Remove the three-way catalytic converter (TWC). For additional information, refer to [Section 309-00](#).
3. Remove the lower splash shield.
 - Remove the bolts.
 - Remove the pin-type retainers and the shield.

4. **NOTE:** Left side shown; right side similar.

If equipped, remove the secondary air tube from the exhaust manifold.

5. Disconnect the EGR valve to exhaust manifold tube.

6. Remove the six nuts and the exhaust manifold.
 - Discard the gasket.

Installation

1. **NOTE:** To verify the seal, the manifold bolts must be tightened to the same specification two times.

Using a new gasket, install the exhaust manifold. Tighten the nuts in two stages:

- Stage 1: Tighten to 20 Nm (15 lb-ft).
- Stage 2: Tighten to 20 Nm (15 lb-ft).

2. Install the EGR valve-to-exhaust manifold tube.

3. **NOTE:** Left side shown; right side similar.

If equipped, install the secondary air tube to the exhaust manifold.

4. Install the lower splash shield.
- Install the shield and the pin-type retainers.
 - Install the bolts.

5. Install the TWC. For additional information, refer to [Section 309-00](#).
6. If equipped, install the heat shield.

Cylinder Head —LH

Removal

1. Remove the LH camshafts. For additional information, refer to [Camshaft—LH](#) in this section.
2. Remove the LH exhaust manifold. For additional information, refer to [Exhaust Manifold—LH](#) in this section.
3. Remove the lower intake manifold. Refer to [Intake Manifold—Lower](#).
4. Remove the ground strap.

5. Disconnect the PCV tube.

6. Remove the noise suppressor bolt.

7. Remove the bolts and the coolant outlet tube.

8. Remove the oil level indicator tube stud bolt.

9. Raise the vehicle.

10. Install the four crossmember bolts.

11. Lower the vehicle.

12. Remove the special tool.

13. Remove the bolts and the LH cylinder head.
 - Discard the gasket.

Installation

1.  **CAUTION:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tool cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.

 **CAUTION:** The cylinder head bolts must be replaced with new bolts. They are tighten-to-yield designed and cannot be reused.

NOTE: LH and RH cylinder head gaskets are not interchangeable.

Using a new cylinder head gasket and bolts, install the LH cylinder head and loosely install the bolts.

2. Tighten the bolts in six stages in the sequence shown.
 - Stage 1: Tighten to 30 Nm (22 lb-ft).
 - Stage 2: Rotate 90 degrees.
 - Stage 3: Back out a minimum of one full turn (360 degrees).
 - Stage 4: Tighten to 30 Nm (22 lb-ft).
 - Stage 5: Rotate 90 degrees.
 - Stage 6: Rotate all bolts an additional 90 degrees.

3. Install the special tool.

4. Raise the vehicle.
5. Remove the four crossmember bolts.

6. Lower the vehicle.
7. Install the oil level indicator tube stud bolt.

8. **NOTE:** Clean the sealing surfaces and inspect the O-ring seals thoroughly.

Install the coolant outlet tube and the retaining bolts.

9. Position the noise suppressor and install the bolt.

10. Connect the PCV tube.

11. Install the ground strap.

12. Install the lower intake manifold. For additional information, refer to [Intake Manifold—Lower](#) in this section.
 13. Install the LH exhaust manifold. For additional information, refer to [Exhaust Manifold—LH](#) in this section.
 14. Install the LH camshafts. For additional information, refer to [Camshaft—LH](#) in this section.
-

Cylinder Head —RH

Removal

1. Remove the RH camshafts. For additional information, refer to [Camshaft—RH](#) in this section.
2. Remove the RH exhaust manifold. For additional information, refer to [Exhaust Manifold—RH](#) in this section.
3. Remove the lower intake manifold. For additional information, refer to [Intake Manifold—Lower](#) in this section.
4. Remove the noise suppressor bolt.

5. Remove the bolts and the coolant outlet tube.

6. Raise the vehicle.
7. Install the four crossmember bolts.

8. Lower the vehicle.
9. Remove the special tool.

10. Remove the bolts and the RH cylinder head.
 - Discard the gasket.

Installation

1.  **CAUTION:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tool cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of the head gasket.

 **CAUTION:** The cylinder head bolts must be replaced with new bolts. They are tighten-to-yield designed and cannot be reused.

NOTE: LH and RH cylinder head gaskets are not interchangeable.

Using a new cylinder head gasket and bolts, install the RH cylinder head and loosely install the bolts.

2. Tighten the bolts in six stages in the sequence shown.

- Stage 1: Tighten to 30 Nm (22 lb-ft).
- Stage 2: Rotate 90 degrees.
- Stage 3: Back out a minimum of one full turn (360 degrees).
- Stage 4: Tighten to 30 Nm (22 lb-ft).
- Stage 5: Rotate 90 degrees.
- Stage 6: Rotate all bolts an additional 90 degrees.

3. Install the special tool.

4. Raise the vehicle.

5. Remove the four crossmember bolts.

6. Lower the vehicle.

7. Position the noise suppressor and install the bolt.

8. **NOTE:** Clean the sealing surfaces and inspect the O-ring seals thoroughly.

Position the coolant outlet tube and install the bolts.

9. Install the lower intake manifold. For additional information, refer to [Intake Manifold—Lower](#) in this section.
 10. Install the RH exhaust manifold. For additional information, refer to [Exhaust Manifold—RH](#) in this section.
 11. Install the RH camshafts. For additional information, refer to [Camshaft—RH](#) in this section.
-

Oil Level Indicator and Tube

Removal

1. **NOTE:** The exhaust manifold is removed for clarity.

Remove the oil level indicator and tube.

1. Remove the stud bolt.
2. Remove the oil level indicator tube.
3. Inspect the O-ring seal at the end of the oil level indicator tube and install a new O-ring seal if necessary.

Installation

1. To install, reverse the removal procedure.

Oil Filter Adapter

Removal

1. Remove the LH engine mount. For additional information, refer to [Engine Mount—LH](#) in this section.
2. Drain the engine oil.
3. Remove the oil filter.
4. If equipped, remove the oil cooler. For additional information, refer to [Oil Cooler](#) in this section.
5. Remove the bolts and the oil filter adapter.

Installation

1. **NOTE:** The oil filter adapter bolts must be tightened in two steps.

NOTE: Inspect the O-ring seal and the surfaces for contamination prior to installation.

NOTE: Non-oil cooler equipped engine shown. Engines equipped with oil cooler are similar.

Position the oil filter adapter and a new O-ring seal and install the bolts.

2. **NOTE:** Non-oil cooler equipped engine shown. Engines equipped with oil cooler are similar.

Using a new O-ring seal, lubricate with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G and install the bolt.

Tighten the oil filter adapter bolts in two stages:

- Stage 1: Tighten to 30 Nm (22 lb-ft).
- Stage 2: Tighten to 155 Nm (114 lb-ft).

3. Tighten the oil pan drain plug.

4. Install the oil filter.
 5. If equipped, install the oil cooler. For additional information, refer to [Oil Cooler](#) in this section.
 6. Fill the engine with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP meeting Ford specification WSS-M2C153-G or equivalent.
 7. Install the LH engine mount. For additional information, refer to [Engine Mount—LH](#) in this section.
 8. If drained, fill the engine cooling system. For additional information, refer to [Section 303-03](#).
-

Oil Cooler

Removal

1. Drain the engine cooling system. For additional information refer to [Section 303-03](#).
2. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
3. Remove the oil cooler hoses.

4. Remove the bolt and the oil cooler.
 - Inspect the gasket. Discard if damaged.

Installation

1. **NOTE:** Inspect gasket and surfaces for contamination prior to installation.

Position the oil cooler and gasket and install the bolt.

- Rotate the cooler clockwise until the locating pin hits the stop.

2. Install the oil cooler hoses.

3. Lower the vehicle.
 4. Fill the engine cooling system. For additional information, refer to [Section 303-03](#).
-

Oil Pressure Switch —Oil Cooler

Removal and Installation

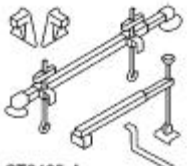

1. Remove the oil pressure switch.
 1. Disconnect the electrical connector.
 2. Remove the switch.

2. To install, reverse the removal procedure.
-

Oil Pan

Special Tool(s)

 <p>ST2425-A</p>	Three Bar Engine Support Kit 303-F072
 <p>ST1595-A</p>	Engine Lifting Brackets 303-050

Removal

1. Remove the air cleaner outlet tube. For additional information, refer to [Section 303-12](#).
2. Remove the upper radiator sight shield.

3. Install the special tool.

4. Install the special tool.

5. Using the special tool, support the engine.

6. Remove the generator. For additional information, refer to [Section 414-02](#).
7. Drain the engine oil.

8. Remove the front center splash shield.

9. Remove the RH front splash shield.

10. Remove the A/C compressor. For additional information, refer to [Section 412-03](#).
11. If equipped, remove the electronic thermactor air (ETA) bracket bolts.

12. **NOTE:** On RH drive vehicles, the power steering line attaches to the oil pan stud.

NOTE: On RH drive vehicles, the wiring harness attaches to the RH side of the oil pan.

Remove the steering gear. For additional information, refer to [Section 211-02](#).

13. Remove the LH lower control arm through bolt.

14. Remove the RH lower control arm through bolt.

15. **NOTE:** LH shown; RH similar.

Remove the LH and the RH engine mount nuts.

16. Remove the LH subframe bolts.

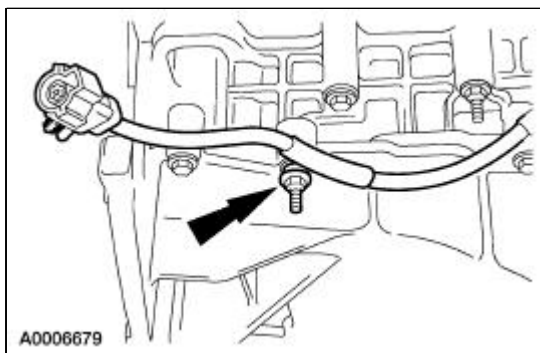

17. Remove the RH subframe bolts.

18. Remove the transmission cooler line bracket nut.

19. Remove the nut and the wiring harness from the stud.

20. Remove the transmission to oil pan bolts.

21. Remove the oil pan bolts.

22. Gently pry the subframe down and remove the oil pan.
 - Discard the gasket.

Installation

1. Clean all of the sealing surfaces.
2. Position a new gasket on the pan.
3.  **CAUTION: The oil pan must be installed and the bolts tightened within six minutes of the sealant application.**

Apply a 10 mm (0.40 in) dot of Silicone Gasket and Sealant F7AZ-19554-EA or equivalent meeting Ford specification WSE-M4G323-A4 to the oil pan gasket in the indicated position.

4. Gently pry the subframe down and install the oil pan.

5. **NOTE:** Fasteners No. 4 and No. 9 are studs.

Position the oil pan and install the studs and bolts.

- Tighten the bolts in the sequence shown.

6. Install the transmission to oil pan bolts.

7. Position the wiring harness on the stud and install the nut.

8. Install the transmission cooler line bracket nut.

9. Install the RH subframe bolts.

10. Install the LH subframe bolts.

11. **NOTE:** LH shown; RH similar.

Install the LH and the RH engine mount nuts.

12. Install the RH lower control arm through bolt.

13. Install the LH lower control arm through bolt.

14. Install the steering gear. For additional information, refer to [Section 211-02](#).

15. If equipped, install the electronic thermactor air (ETA) bracket bolts.

16. Install the A/C compressor. For additional information, refer to [Section 412-03](#).

17. Install the RH front splash shield.

18. Install the front center splash shield.

19. Tighten the oil pan drain plug.

20. Install the generator. For additional information, refer to [Section 414-02](#).
21. Remove all of the special tools.

22. Install the upper radiator sight shield.

23. Install the air cleaner outlet tube. For additional information, refer to [Section 303-12](#).
 24. Fill the engine crankcase with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.
 25. Check the vehicle alignment. For additional information, refer to [Section 204-00](#).
-

Oil Pump

Removal and Installation

1. Remove the timing chains. For additional information, refer to [Timing Drive Components](#) in this section.
2. Remove the crankshaft sprocket.
3. Remove the bolts and the oil pump screen tube.
 - Inspect the O-ring seal. Install a new seal if necessary.

4. Remove the bolts and the oil pump.

5. To install, reverse the removal procedure.

Flywheel

Removal

1. Remove the clutch. For additional information, refer to [Section 308-02](#).
2. Remove the bolts and the flywheel.

Installation

1. Position the flywheel and install the bolts.

2. Install the clutch. For additional information, refer to [Section 308-02](#).
-

Flexplate

Removal

1. Remove the transmission. For additional information, refer to [Section 307-01](#).
2. Remove the bolts and the flexplate.
 - Inspect the flexplate for cracks or other damage. Install a new flexplate if necessary.

Installation

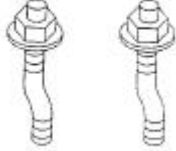

1. Position the flexplate and install the bolts.

2. Install the transmission. For additional information, refer to [Section 307-01](#).
-

Crankshaft Rear Oil Seal

Special Tool(s)

 ST1187-A	Impact Slide Hammer 307-005
 ST1382-A	Rear Crankshaft Seal Remover 303-519 (T95P-6701-EH)
 ST1333-A	Rear Crankshaft Adapter Bolts 303-384 (T91P-6701-A)
 ST1327-A	Crankshaft Seal Replacer 303-178 (T82L-6701-A)

Removal

1. Remove the flywheel or flexplate. For additional information, refer to [Flywheel](#) or [Flexplate](#) in this section.
2. Using the special tools, remove the crankshaft rear oil seal.

Installation

1. Lubricate the outer lips and the inner seal on the crankshaft rear oil seal with Super Premium 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.
2. Using the special tools, install the crankshaft rear oil seal.

3. Install the flywheel or flexplate. For additional information, refer to [Flywheel](#) or [Flexplate](#) in this section.
-

Engine Mount —LH

Removal and Installation

1. Remove the intake manifold tuning valve. For additional information, refer to [Section 303-14](#).
2. Remove the fresh air intake housing. For additional information, refer to [Section 412-01](#).
3. Remove the LH engine mount upper nut.

4. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
5. Remove the LH engine mount lower nut.

6.  **CAUTION:** The steering wheel must be in the locked position, or the lower end of the column wired in such a way that the steering column does not rotate, resulting in damage to air bag sliding contact.

Disconnect the steering coupling.

7. Raise the engine.
8. Loosen the four bolts and lower the sub-frame to remove the mount.

9. To install, reverse the removal procedure.
-

Engine Mount —RH

Removal and Installation

1. Remove the intake manifold tuning valve. For additional information, refer to [Section 303-14](#).
2. Remove the fresh air intake housing. For additional information, refer to [Section 412-01](#).
3. Remove the RH engine mount upper nut.

4. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
5. Remove the RH engine mount lower nut.

6. Raise the engine and remove the engine mount.
7. To install, reverse the removal procedure.

Valve Spring —Lash Adjustment

Special Tool(s)

 <p>ST2429-A</p>	Camshaft Lift Tools 303-659
 <p>ST1271-A</p>	Feeler Gauge Set 303-D027 (D81L-4201A)

Removal

1. Remove the RH valve cover. For additional information, refer to [Valve Cover—RH](#) in this section.
2. Remove the LH valve cover. For additional information, refer to [Valve Cover—LH](#) in this section.
3.  **CAUTION: Rotating the crankshaft in a counterclockwise direction may cause engine damage. Crankshaft journals are directionally machined. Rotating the crankshaft counterclockwise can raise burrs on bearing surfaces, reducing engine life.**

 **CAUTION: Camshaft lobes must be 180 degrees away from each valve tappet or valve lash measurements will be incorrect.**

Rotate the engine clockwise to position the camshaft lobe away from the shim surface.

4. Using the special tool, measure the clearance between the camshaft and the shim surface. Record the information.

5. Use a bright colored marker to mark the position of the timing chain in relation to the camshaft sprockets to make sure that the timing remains correct.

6.  **CAUTION:** The camshaft caps must be installed in their original positions.

Mark the camshaft cap locations.

7. Remove the camshaft thrust cap and rear camshaft cap from the camshaft that requires shim adjustment.

8. **NOTE:** The taller special tool is installed in place of the rear camshaft cap to allow the camshaft to be lifted to remove the shims.

Install the special tools.

- Hand-tighten the bolts.

9. Remove the bolts and the center camshaft caps.

10.  **CAUTION:** Do not use any means of marking the shims other than a permanent type marker. Any scratches or paint on the shims may result in incorrect lash adjustments and severe engine damage.

Use a permanent marker to mark the location of each shim.

11. Use a rubber-tipped air gun and compressed air to remove the shims that require adjustment.
 - Blow compressed air between the shim edge and bucket rail to dislodge the shim.

12. Measure and record the thickness of each shim to correspond with valve clearance.
13. Use the following formula to calculate the required shim thickness.
 - Valve clearance specification:
 - Intake: 0.175 mm — 0.225 mm (0.0069 in — 0.0089 in)
 - Exhaust: 0.325 mm — 0.375 mm (0.0128 in — 0.0148 in)
 - Original shim thickness + measured clearance - desired clearance = required shim thickness.

Installation

1. Apply a light coat of Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G to the replacement shim(s) and install the shim(s).
2. Apply Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G to the camshaft journals and bearing caps.
3. Position the center camshaft journal caps and loosely install the bolts.

4. Remove the bolts and the special tools.

5. Position the camshaft journal rear and front thrust caps and loosely install the bolts.

6. Tighten the bolts in the indicated sequence.

7. Rotate the crankshaft clockwise to rotate the camshafts two full revolutions and recheck the valve clearance.
 8. Install the LH valve cover. For additional information, refer to [Valve Cover—LH](#) in this section.
 9. Install the RH valve cover. For additional information, refer to [Valve Cover—RH](#) in this section.
-

Valve Spring —Springs, Retainers, and Stem Seals

Special Tool(s)

Removal

1. Remove the appropriate camshafts. For additional information, refer to [Camshaft—LH](#) or [Camshaft—RH](#) in this section.
2. Position the piston to the top of its stroke on the appropriate cylinder.
3. Remove the appropriate spark plug. For additional information, refer to [Section 303-07A](#).
4. Pressurize the cylinder with compressed air to hold both valves closed.

5.  **CAUTION: Do not use any means of marking the shims other than a permanent type marker. Any scratches or paint on the shims may result in incorrect lash adjustments and severe engine damage.**

 **CAUTION: The tappets and shims must be installed in their original positions to make sure of correct valve lash settings.**

Remove the tappet and shim from the valve.

- If more than one tappet and shim are removed, mark them using a permanent type marker.

6. Using the special tool, compress the valve spring and remove the retainer locks.

7. Remove the special tool.

8. Remove the valve spring.
 1. Remove the retainer.
 2. Remove the valve spring.

9. Remove the valve stem seal.

10. Repeat the procedure until all the valve stem seals have been removed.

Installation

1. Install the valve stem seal.
2. Install the valve spring.
 1. Install the spring.
 2. Install the retainer.

3. Using the special tool, compress the valve spring and install the retainer locks.

4. Release the compressed air used to hold the valves closed.
 5. Install the spark plug. For additional information, refer to [Section 303-07A](#).
 6. Repeat the procedure until all of the valve stem seals have been installed.
 7.  **CAUTION: The tappets and shims must be installed in their original positions to make sure of correct valve lash settings.**
Install the tappet and shim from the valve.
 8. Install the camshafts. For additional information, refer to [Camshaft—LH](#) or [Camshaft—RH](#) in this section.
-

Valve Tappet

Removal and Installation

1. Remove the appropriate camshafts. For additional information, refer to [Camshaft—LH](#) or [Camshaft—RH](#) in this section.

2.  **CAUTION:** Do not use any means of marking the shims other than a permanent type marker. Any scratches or paint on the shims may result in incorrect lash adjustments and severe engine damage.

 **CAUTION:** The tappets and shims must be installed in their original positions to make sure of correct valve lash settings.

NOTE: The shim sits on top of the valve tappet.

Remove the tappet and shim.

3. To install, reverse the removal procedure.
-

Engine

Special Tool(s)

Removal

All vehicles

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Remove the air cleaner outlet tube and the air cleaner. For additional information, refer to [Section 303-12](#).
3. Remove the engine appearance cover.

4. Drain the cooling system. For additional information, refer to [Section 303-03](#).
5. Evacuate the A/C system. For additional information, refer to [Section 412-00](#).
6. Remove the upper radiator sight shield.

7. **NOTE:** RH shown; LH similar.

Remove the upper radiator support brackets.

8. Disconnect the A/C pressure switch electrical connector.

9. Remove the power steering reservoir bolts and secure the power steering reservoir to the engine.

10. Disconnect the fuel tube. For additional information, refer to [Section 310-00](#).
11. Disconnect the brake booster vacuum hose.

12. Remove the vapor management valve (VMV) cover.

13. Disconnect the vacuum hose.

14. Remove the fresh air inlet duct. For additional information, refer to [Section 412-01](#).

15. Unclip the chassis vacuum tubes from the support bracket and disconnect the tubes.

16. Disconnect the main vacuum hose from the rear of the intake manifold.

17. Disconnect the accelerator and speed control cables.

18. Remove the cable brackets.
1. Remove the bolts.
2. Remove the bracket.

19. Disconnect the throttle body coolant hoses.

20. Remove the ground strap bolt.

21. Loosen the bolt and disconnect the main engine wiring harness connector.

22. Loosen the bolt and disconnect the main transmission wiring harness connector.

23. Disconnect the two fuel charging wiring harness connectors.

24. Disconnect the wiring harness retainer from the bracket.

25. Remove the bolts and secure the hydraulic cooling fan reservoir to the engine.

26. Hold the steering wheel in the straight forward position using a suitable holding device.

27. Unclip the tube from the frame.

28. Disconnect the connector located at the end of the coolant valve harness pigtail.

29. **NOTE:** The top heater hose has a green identifying mark to match the hose on the dual coolant flow valve. If the mark is not visible, identify the hoses for location. This will aid in the correct installation of the hose assemblies.

NOTE: Hose assemblies shown with components removed for clarity.

Disconnect the three quick-disconnect couplings from the coolant control valve hoses. For additional information, refer to [Section 412-00](#).

30. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
31. Drain the engine oil.

32. Remove the center, LH and RH splash shields.
33. Disconnect the A/C high pressure tube at the right frame rail.

34. Disconnect the A/C suction tube.
 1. Remove the safety clip.
 2. Disconnect the A/C tube.

35. Reposition the A/C manifold and tube assembly.
 1. Remove the bolt.
 2. Reposition the A/C manifold and tube assembly.

36. Remove the driveshaft. For additional information, refer to [Section 205-01](#).

Vehicles with automatic transmission

37. Disconnect the shift cable from the transmission.

38. Remove the bolt securing the cable bracket to the floor.

All vehicles

39. Disconnect the two heated oxygen sensors (HO2S) electrical connectors.

40. Disconnect the two catalyst monitor connectors.

41. Remove the four nuts and the three-way catalytic converter.

42. Lower the vehicle.
43. Remove the front wheels and tires. For additional information, refer to [Section 204-04](#).
44. Position the inner splash shield aside.
 1. Remove the pin-type retainers.
 2. Position the inner splash shield aside.

45. Disconnect the anti-lock brake sensor electrical connector.

46. Remove the anti-lock brake sensor harness from the brake hose clips.

47. Remove the bolts and the front brake calipers. Support the calipers out of the way.

48. Remove the nuts and disconnect the stabilizer links lower mounts.

49. Remove the nuts and disconnect the upper ball joints.

50. Remove the lower strut mount bolts.

51. Disconnect the ground strap.

52. Remove the cover.

53. Remove the nuts and position the cables aside.

54. Disconnect the B+ terminal from the generator.

55. Disconnect the power steering pressure sensor electrical connectors.

56. Remove the steering shaft clamp bolt.

Vehicles with automatic transmission

57. Remove the access cover.

58. **NOTE:** Mark one stud and the flexplate for assembly reference.

Remove the nuts.

All vehicles

59. Remove the air deflector.
 1. Remove the pin-type retainers.
 2. Remove the side-clip retainers.

60. Remove the power steering hose bracket bolt.

61. Support the rear of the vehicle with suitable safety stands.
62. Support the engine, transmission, front and center crossmembers and the cooling system with a powertrain lift and a transmission support bracket.
63. Remove the four transmission crossmember bolts.

64. Remove the LH subframe bolts.

65. Remove the RH subframe bolts.

66. Remove the four crossmember bolts.

Vehicles with manual transmission

67. Disconnect the selector rod.

- Remove the selector rod locating pin.

68. Disconnect the stabilizer rod.
- Remove the stabilizer rod locating pin.

69. Disconnect the slave cylinder supply tube.
- Remove the slave cylinder supply tube retaining clip.
 - Plug the hose to prevent loss of fluid.

All vehicles

70. Carefully lower the entire assembly from the vehicle.

71. Install the special tool to the engine.

72. Install the special tool to the engine.

73. Using an engine crane and spreader bar, support the engine and transmission in the front subframe.

74. Disconnect the two wire harness retainers and position the harness out of the way.

75. Remove the starter assembly.

76. Remove the heated oxygen sensor (HO2S) bracket.

1. Unclip the connector.
2. Remove the nut.
3. Remove the bracket.

77. Remove the engine to transmission bolt.

78. Remove the engine to transmission bolt.

79. Remove the four lower engine to transmission bolts.

80. Remove the LH engine mount nut.

81. Remove the RH engine mount nut.

82. Remove the accessory drive belt. For additional information, refer to [Section 303-05](#).

83. Remove the power steering bracket bolt and bracket.

84. Remove the bolts and secure the power steering pump and reservoir aside.

85. Disconnect the hydraulic cooling fan pump electrical connector.

86. Remove the hydraulic cooling fan tube bracket.
1. Remove the bolt.
2. Remove the bracket.

87. Remove the bolts and secure the hydraulic cooling fan pump aside.

88. Disconnect the upper radiator hose.

89. Disconnect the heater water hose from the water pump.

90. If equipped, remove the nut and transmission cooler tubes from the oil pan.

91. Remove the engine and transmission from the subframe. Rest on the floor or on a bench.

92. If equipped, remove the transmission oil cooler tubes and plug the openings.

93. If equipped, disconnect the oil cooler hoses.

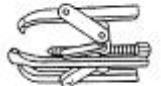

94. Remove the bolts and separate the transmission from the engine.

Engine

Special Tool(s)

 ST2115-A	Connecting Rod Guide Set 303-462 (T94P-6136-AH)
 ST1184-A	Crankshaft Damper Remover 303-D121
 ST1276-A	Cylinder Ridge Reamer 303-016 (T64L-6011-EA)

Disassembly

1. Disconnect the water pump hose from the inlet tube.

2. If equipped, remove the thermactor air control valve and bracket.
 1. Disconnect the electrical connector.
 2. Remove the bolt and nut.
 3. Remove the valve/bracket.

3. Remove the two nuts and the bracket.

4. Remove the one bolt, two stud bolts, and the water pump.

5. Disconnect the throttle position (TP) sensor and idle air control (IAC) electrical connectors.

6. Unclip the wire harness retainer.

7. Disconnect the PCV tube at the rear of the upper intake manifold.

8. Disconnect the exhaust gas recirculation (EGR) vacuum line.

9. Disconnect the differential pressure feedback EGR hoses.

10. Disconnect the differential pressure feedback EGR electrical connector.

11. Remove the nut and the accelerator cable clip.

12. Remove the nut and stud and position the differential pressure feedback EGR transducer aside.

13. Remove the fuel pressure sensor shield.
 1. Remove the nut.
 2. Remove the bolts.
 3. Remove the shield.

14. Disconnect the vacuum tubes from the EGR vacuum regulator control (EVR).

15. Disconnect the EVR electrical connector.

16. Disconnect the intake manifold tuning valve (IMTV) electrical connector.

17. Disconnect the fuel pressure sensor jumper from the main vacuum harness.

18. Remove the vacuum harness.

19. Disconnect the fuel injector wiring harness connector.

20. Disconnect the EGR tube at the EGR valve.

21. Disconnect the EGR tube at the exhaust manifold and remove the tube.

22. Remove the intake manifold bolt.

23. Remove the eight bolts and the upper intake manifold.
- Inspect the gaskets. Discard if damaged.

24. Remove the crankcase ventilation tube.

25. Remove the LH ignition coils.
1. Remove the bolts.
 2. Disconnect the electrical connectors.
 3. Remove the LH ignition coils.

26. Disconnect the cylinder head temperature (CHT) sensor connector.

27. Remove the CHT sensor.

28. Remove the RH ignition coils.

1. Remove the bolts.
2. Lift the coils and disconnect the electrical connectors.
3. Remove the RH ignition coils.

29. Disconnect the camshaft position (CMP) sensor electrical connector.

30. Disconnect the crankshaft position (CKP) sensor electrical connector.

31. Disconnect the oil pressure sensor electrical connector.

32. Detach the three wiring harness retainers from the block.

33. Detach the four wiring harness retainers.

34. Remove the nut and wiring harness from the stud.

35. Detach the two wiring harness retainers from the block.

36. Remove the nuts.

37. Unclip the wiring harness retainer.

38. Remove the two bolts and the two radio ignition interference capacitors.

39. Disconnect the valley knock sensor electrical connector.

40. Disconnect the RH engine knock sensor (KS) electrical connector.

41. Unclip the KS connector from the wiring harness.

42. Remove the four nuts and the wiring harness.

43. Remove the nut and the bracket.

44. Remove the nut and the ground strap.

45. Remove the bolt.

46. Remove the bolts and the lower intake manifold assembly.

47. Remove the lower intake manifold gaskets.

- Inspect the gaskets for damage. Discard if damaged.

48. Remove the studs and bolts and remove the RH valve cover and gasket.

- Discard the gasket.

49. Remove the nuts and position the bracket aside.

50. Remove the studs and bolts and remove the LH valve cover and gasket.
- Discard the gasket.

51. Remove the bolts and the CMP sensor.

52. Remove the bolt and the CKP sensor.

53. Remove the bolt and the idler pulley.

54. Remove the bolt and the drive belt tensioner.

55. Remove the bolt.

- Discard the bolt.

56. Using the special tool, remove the crankshaft pulley.

57. Remove the A/C compressor.

1. Disconnect the electrical connector.
2. Remove the bolts.

3. Remove the compressor.

58. Remove the generator.
 1. Disconnect the electrical connector.
 2. Remove the bolts.
 3. Remove the generator.

59. Remove the engine harness assembly.

60. Remove the bolts.

61. Remove the bolts and the engine front cover and gasket.
 - Discard the gasket.

62. Remove the ignition pulse ring.

63.  **CAUTION:** Rotating the crankshaft in a counterclockwise direction may cause possible engine damage. Crankshaft journals are directionally machined. Rotating the crankshaft counterclockwise can raise burrs on bearing surfaces, reducing engine life.

 **CAUTION:** If the RH timing chain tensioner arm and RH timing chain guide are to be reused, mark position of each to make sure of original position when reassembled.

Install a stiff wire or paper clip into the timing chain tensioner before removing the bolts.

64. Remove the bolts, the timing chain tensioner and the tensioner arm.

65. Remove the RH timing chain.
66. Remove the bolts and the RH timing chain guide.

67.  **CAUTION:** If the LH timing chain tensioner arm and the LH timing chain guide are to be reused, mark position of each to make sure of original position when reassembled.

Install a stiff wire or paper clip into the timing chain tensioner before removing the bolts.

68. Remove the bolts, the timing chain tensioner and the tensioner arm.

69. Remove the LH timing chain.
70. Remove the bolts and the LH chain guide.

71. Remove the crankshaft sprocket.

72.  **CAUTION:** Remove the camshaft journal thrust caps prior to loosening other camshaft journal cap bolts. Damage to the camshaft journal thrust cap may occur if not removed first.

 **CAUTION:** Cylinder head camshaft journal caps and cylinder heads are numbered to be sure they are assembled in their original position. Keep camshaft journal caps with the cylinder head from which they were removed. Do not mix with camshaft journal caps from another cylinder head.

NOTE: LH side shown; RH side similar.

Remove the LH and RH camshaft thrust cap bolts.

73. **NOTE:** LH side shown; RH side similar.

NOTE: The camshaft journal thrust caps have alignment dowels.

Using a soft-faced mallet, gently loosen and remove the LH and RH camshaft journal thrust caps.

74. **NOTE:** LH side shown; RH side similar.

Remove the remaining bolts.

75. **NOTE:** LH side shown; RH side similar.

Using a soft-faced mallet, gently loosen and remove the remaining camshaft journal caps.

76.  **CAUTION:** If the bucket tappets are to be reused, mark the position of the bucket tappets to make sure they are assembled in their original positions.

NOTE: LH side shown; RH side similar.

Carefully lift out the LH and RH intake and exhaust camshafts.

77. Remove the stud bolt and the oil level indicator tube.

78. Remove the bolts and the coolant bypass tube.

79. Remove the PCV tube stud.

80. If equipped, remove the bolts and the LH heat shield.

81. If equipped, remove the bolts and RH heat shield.

82. **NOTE:** RH side shown; LH side similar.

Remove the nuts and the RH and LH exhaust manifold and gasket.

- Discard the gasket.

83. Remove the bolts and the RH and LH cylinder heads.

- Discard the gaskets.

84. Remove the one stud, two bolts and the RH engine mount bracket.

85. Remove the oil pressure switch.

86. Remove the bolts and the A/C compressor mounting bracket.

87. Remove the oil filter.

88. Remove the bolts and the oil filter adapter.

89. Remove the bolts and the inlet tube.

90. Remove the bolts and the oil separator.

- Discard the gasket.

91. Remove the bolt and the top-mounted KS.

92. Remove the nut and the side-mounted KS.

93. Remove the bolts and studs and the oil pan.
● Discard the gasket.

94. Remove the bolts and the oil pick up tube.
● Inspect the O-ring seal for damage.

95. Remove the nuts and the oil pan baffle.

96. Using the special tool, remove the cylinder ridge.

97.  **CAUTION: Pistons, connecting rods, connecting rod bearings and caps should be marked to be sure they are assembled in their original locations.**

NOTE: Before removing piston or connecting rod assemblies, inspect the top of the cylinder bores. If necessary, remove any ridge or carbon deposits from each cylinder using a suitable cylinder ridge reamer. For additional information, refer to [Section 303-00](#).

Turn crankshaft until the piston to be removed is at the high point of its travel near the cylinder head deck.

98. **NOTE:** Connecting rod bearing caps are cracked and split from the connecting rods during manufacture, thereby providing an exact fit to the connecting rod when assembled. Care should be taken to prevent dirt or grease from contaminating the cap and rod mating surfaces. Identification marks on the cap and rod must remain aligned as a matched set during assembly.

Remove the connecting rod cap retaining bolts, connecting rod cap, and lower connecting rod bearing. Keep the cap and bearing together.

99. Using the special tool to protect the cylinder, push the piston, connecting rod and upper bearing assembly through the top of the cylinder bore.

100.  **CAUTION:** Care should be taken not to damage the connecting rod and cap joint face surfaces or possible engine damage may occur.

 **CAUTION:** Connecting rod bolts must be replaced with new bolts. They are torque-to-yield and cannot be reused.

Connecting rod bolts are retained in the connecting rod caps with a slight press fit. Using a hammer and punch, drive the bolts from the caps.

101. Using new connecting rod bolts, attach the connecting rod cap and lower bearing to the connecting rod and upper bearing to prevent mixing parts and damaging the connecting rod joint face surfaces.

102. If piston ring replacement, or piston and connecting rod disassembly is required, refer to Disassembly and Assembly of Subassemblies in this section.

103. Remove the bolts and the oil pump.

104.  **CAUTION: The bolts are torque-to-yield and cannot be reused. The bolts must be replaced.**

NOTE: Note the location of the stud bolts for assembly.

Remove the lower cylinder block.

1. Remove and discard the stud bolts.
2. Remove and discard the 17 bolts.
3. Remove the lower cylinder block.

105. **NOTE:** If bearings are to be reused, mark the position of the upper and lower crankshaft main bearings and crankshaft thrust bearing.

Remove the lower crankshaft main bearings and crankshaft thrust bearing from the lower cylinder block.

106. Carefully remove the crankshaft from the upper cylinder block.

107. Remove and discard the crankshaft rear oil seal.

108. Remove the upper crankshaft bearings and thrust bearing from the upper cylinder block.

109. If necessary, remove the crankshaft key from the crankshaft keyway.

110. Remove the pipe plugs, engine block heater, and dowels from the cylinder block as necessary to clean foreign material from the oil and coolant passages.

111. Inspect the crankshaft, cylinder block and cylinder heads. For additional information, refer to [Section 303-00](#).

Cylinder Head

Special Tool(s)

Disassembly

1. Using the special tool, remove the valve spring retainer key.

2. Remove the valve spring.
 - Remove the retainer.
 - Remove the spring.

3. For component tests of the valve spring retainer, refer to [Section 303-00](#).
4. Remove the valve stem seal.

5. Remove the valve.

- For component tests of the valve, refer to [Section 303-00](#).
- For component tests of the cylinder head, refer to [Section 303-00](#).

6. Repeat the procedure until all of the valves are removed.

Assembly

1. To install, reverse the removal procedure.

- Lubricate the valve stem and the valve stem seal with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.
-

Piston

Disassembly

1. **NOTE:** Use a suitable ring expander to remove piston rings to prevent damage.

Remove the top compression ring.

2. Remove the second compression ring.

3. Remove the first oil control ring.

4. Remove the second oil control ring.

5. Remove the oil control spacer ring.

6. Remove the clips.

7. Remove the piston pin and the connecting rod from the piston.

8. Clean and inspect the connecting rod and the piston; refer to [Section 303-00](#).

Assembly

1. Lubricate the piston pin and piston pin bore with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G and install the piston pin.

2. Install the clips.

3. Check piston ring end gap. For additional information, refer to [Section 303-00](#).
4. Lubricate the piston and the piston rings with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.
5. Install the oil control spacer ring.

6. Install the second oil control ring.

7. Install the first oil control ring.

8. Install the second compression ring.
 - The top of the second compression ring has a "0" on it. Position this side of the ring towards the top of the piston.

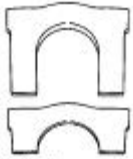

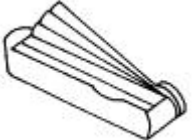

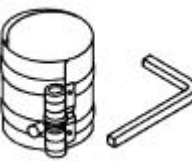

9. Install the top compression ring.
 - The top compression ring can be installed with either side up.

Engine

Special Tool(s)

 <p>ST2429-A</p>	<p>Camshaft Lift Tools 303-659</p>
 <p>ST2115-A</p>	<p>Connecting Rod Guide Set 303-462 (T94P-6136-AH)</p>
 <p>ST1327-A</p>	<p>Crankshaft Seal Replacer 303-178 (T82L-6701-A)</p>
 <p>ST1287-A</p>	<p>Crankshaft Damper Replacer 303-102 (T74P-6316-B)</p>

	<p>Piston Ring Compressor 303-D032 (D81L-6002-C)</p>
	<p>Rear Crankshaft Adapter Bolts 303-384 (T91P-6701-A)</p>

1.  **WARNING: Eye protection is required to be worn during the use of compressed air. Failure to follow these instructions may result in possible personal injury.**

NOTE: If required, deglaze the cylinder walls using a suitable spring-type tool. Clean the cylinder walls with a detergent and water solution upside-down to prevent contamination of the lower portion of the cylinder block.

Clean gasket material, dirt and foreign material from the cylinder block. Wash the cylinder block with a suitable soap and water solution, and dry with compressed air.

2. Install the cup plugs, block dowels or pipe plugs that may have been removed during disassembly. Tighten the pipe plugs as follows:
 - 3/8-18 inch to 20 Nm (15 lb-ft) + 180 degrees
 - 1/2-14 inch to 40 Nm (30 lb-ft) + 180 degrees
 - 3/4-14 inch to 10 Nm (89 lb-in) + 720 degrees or 40 Nm (30 lb-ft), whichever comes first. Do not exceed 720 degrees or 40 Nm (30 lb-ft).
3. Measure the cylinder bore diameter and compare to specification. Cylinder bore measurements should be taken within 50 mm (2 in) from the top of the bore. Mark the outside of the block with the appropriate bore grade number for the replacement piston. Replacement pistons and domes are marked with grade numbers. For additional information, refer to [Section 303-00](#).
4. If removed, install cup plugs. Apply a 2 mm (0.08 in) bead of sealant meeting Ford specification WSK-M2G349-A7 to the cup plug prior to installation.

5. If removed, install the engine block heater. For additional information, refer to [Section 303-03](#).
6. If removed, install the crankshaft key into the keyway on the crankshaft.

7. **NOTE:** This procedure is for selecting bearings using a new crankshaft.

Select the crankshaft main bearings for each crankshaft journal.

1. Read the code on the crankshaft flange.
2. Read the code on the cylinder block rear face.
 - The first two numbers after the asterisk make up the code for main No. 1 and the next two numbers for main No. 2.
 - The first two numbers after the second asterisk make up the code for main No. 3 and the last two numbers for main No. 4.

8. Look at the Select-Fit Chart and for each main, match the block and crankshaft code with its corresponding column or row, by reading across the crankshaft row and down the block column. Select the proper grade bearing for each main.
- For example: If the block code is *0609*0711* and the crankshaft code is *8480*8082*, main No. 1 should use grade 1 bearings, as determined by the intersection of the 06 block column and the 84 crankshaft row. Main Nos. 2, 3 and 4 should all be grade 2.

		BLOCK CODE																							
		98	99	00	01	02	03	04	05	06	07	08	09	10	11	12	13	14	15	16	17	18	19	20	21

A0004705

- Install the upper main bearing and upper thrust bearing into the cylinder block in the correct locations.

A0004225

- NOTE:** Lubricate the crankshaft main bearings and the crankshaft journals with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.

Carefully install the crankshaft into the cylinder block.

A0004224

- Install the lower main bearings and lower thrust bearing into the lower cylinder block in the

correct locations.

12.  **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs, or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which may make leak paths. Use a plastic scraper to remove all traces of old sealant.**

NOTE: Both sealing surfaces must be clean, dry and free of any dirt or other contamination prior to application of the sealant. Use Metal Surface Cleaner F4AZ-19A536-RA or equivalent meeting Ford specification WSE-M5B392-A. Allow to dry until there is no sign of wetness, or four minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

NOTE: The lower cylinder block and bolts, with all bolts tightened, must be assembled within four minutes of applying sealer.

Apply a 3 mm (0.12 in) bead of Silicone Gasket and Sealant F7AZ-19554-EA or equivalent meeting Ford specification WSE-M4G323-A4 to the lower cylinder block ending 6 mm (0.24 in) from the rear crankshaft seal bore on both sides.

13. Install the lower cylinder block and bolts.
- Tighten the bolts in the sequence shown in four stages.
 - Stage 1: Tighten numbers 1 through 8 to 25 Nm (18 lb-ft).
 - Stage 2: Tighten numbers 9 through 16 to 40 Nm (30 lb-ft).
 - Stage 3: Rotate numbers 1 through 16 an additional 90 degrees.
 - Stage 4: Tighten numbers 17 through 22 to 25 Nm (18 lb-ft).

14. Remove the squeezed out sealer at the engine front cover surface and the rear seal bore inner diameter.
15. Check crankshaft end play. For additional information, refer to [Section 303-00](#).
16.  **CAUTION: Rotating the crankshaft in a counterclockwise direction may cause engine damage. Crankshaft journals are directionally machined. Rotating the crankshaft counterclockwise can raise burrs on bearing surfaces, reducing engine life.**

Rotate the crankshaft clockwise to verify free rotation.

17. **NOTE:** Apply Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G to the crankshaft flange outer diameter and to the crankshaft seal bore inner diameter prior to seal installation.

Using the special tool, install the crankshaft rear oil seal.

18. Select the correct size connecting rod bearings. For additional information, refer to [Section 303-00](#).
19. **NOTE:** The connecting rod bearing tangs should align with the notch in the connecting rod and cap.

Install the connecting rod bearings into the connecting rods and connecting rod caps.

20.  **CAUTION:** Be sure not to scratch the cylinder wall or crankshaft journal with the connecting rod. Push the piston down until the connecting rod bearing seats on the crankshaft journal.

NOTE: Lubricate the pistons, piston rings, connecting rod bearings and entire cylinder bores with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G prior to installation.

NOTE: Check piston rings for correct orientation prior to installing piston into cylinder bore. For additional information, refer to [Section 303-00](#).

NOTE: Install pistons with arrows on pistons to front of engine.

NOTE: After installation of each piston and connecting rod, rotate the crankshaft to verify smooth operation.

Turn the crankshaft until the crankshaft throw is at the bottom of the stroke. Using the special tools, install the piston, connecting rod, and connecting rod bearing assemblies Nos. 1 and 4. Tighten the bolts in three stages:

- Stage 1: Tighten to 23 Nm (17 lb-ft).
- Stage 2: Tighten to 43 Nm (32 lb-ft)
- Stage 3: Tighten an additional 90 degrees.

21. Install the piston, connecting rod and connecting rod bearing assemblies Nos. 2 and 5. Tighten the bolts in three stages:
 - Stage 1: Tighten to 23 Nm (17 lb-ft).
 - Stage 2: Tighten to 43 Nm (32 lb-ft).
 - Stage 3: Tighten an additional 90 degrees.

22. Install the piston, connecting rod and connecting rod bearing assemblies Nos. 3 and 6. Tighten the bolts in three stages:
 - Stage 1: Tighten to 23 Nm (17 lb-ft).
 - Stage 2: Tighten to 43 Nm (32 lb-ft).
 - Stage 3: Tighten an additional 90 degrees.

23. Check the connecting rod side clearance for all of the connecting rods. For additional information, refer to [Section 303-00](#).

24. Rotate the crankshaft to position the keyway at the nine o'clock position.

25. Position the oil pump and install the bolts.

26. Position the oil pan baffle and install the nuts. Tighten in two stages:

- Stage 1: Tighten to 5 Nm (44 lb-in).
- Stage 2: Tighten an additional 45 degrees.

27. Position the oil pump screen cover and tube and install the bolts.

- Use a new O-ring seal if necessary.

28. Position the top-mounted KS and install the bolt.

29. Position the side-mounted KS and install the nut.

30. Using a new gasket, position the oil separator and install the bolts.

31. Using a new O-ring seal, position the coolant inlet tube and install the bolts.

32. **⚠ CAUTION:** The cylinder head gasket surfaces are ground to a precision finish. Do not rest cylinder heads on gasket surfaces. Do not use any abrasive during cleaning of the surfaces. Hairline scratches, small burrs, or dirt can provide a leak path for a cylinder head gasket to leak. If gasket material remains on the sealing surface, use only a plastic-tipped scraper to remove the material. Do not attempt to reuse the head gaskets.

⚠ CAUTION: Cylinder head bolts are torque-to-yield and cannot be reused.

NOTE: The LH and RH cylinder head gaskets are not interchangeable.

Using a new cylinder head gasket, position the RH cylinder head, and install the bolts.

- Tighten the bolts in six stages:
- Stage 1: Tighten to 30 Nm (22 lb-ft).
- Stage 2: Tighten an additional 90 degrees.

- Stage 3: Back out a minimum of one full turn (360 degrees).
- Stage 4: Tighten to 30 Nm (22 lb-ft).
- Stage 5: Tighten an additional 90 degrees.
- Stage 6: Tighten an additional 90 degrees.

33. Using a new cylinder head gasket, position the LH cylinder head, and install the bolts.
- Tighten the bolts in six stages:
 - Stage 1: Tighten to 30 Nm (22 lb-ft).
 - Stage 2: Tighten an additional 90 degrees.
 - Stage 3: Back out a minimum of one full turn (360 degrees).
 - Stage 4: Tighten to 30 Nm (22 lb-ft).
 - Stage 5: Tighten an additional 90 degrees.
 - Stage 6: Tighten an additional 90 degrees.

34.  **CAUTION: The tappets and shims must be installed in their original positions.**

 **CAUTION: The bucket tappets and bores must be absolutely clean prior to bucket tappet installation. Failure to correctly clean these components may result in a sticking valve leading to severe engine damage or failure.**

NOTE: Only lightly lubricate the tappet shim prior to installation. Excess oil on the tappet shim may cause inaccurate valve clearance measurements.

NOTE: LH side shown; RH side similar.

Lubricate all of the valve tappets, shims and bores and install them in their original positions.

- Lubricate the valve tappets and bores with Super Premium SAE 5W-30 Motor Oil XO-

5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.

- Lubricate the shims with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.

35. **NOTE:** Be sure camshaft bearing caps are installed in their original positions.

Lubricate the LH camshafts with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G and carefully position the camshaft into the LH cylinder head.

36. **⚠ CAUTION:** This is not a free-spinning engine. The crankshaft keyway must be at the nine o'clock position prior to tightening the camshaft caps or rotating the camshafts. Failure to follow these directions may result in serious engine damage.

⚠ CAUTION: Cylinder head camshaft journal caps are numbered. Keep camshaft journal caps with the cylinder head from which they were removed. Do not mix with camshaft journal caps from another cylinder head.

⚠ CAUTION: Do not install the camshaft journal thrust caps until all of the camshaft bearing journal caps have been tightened, or damage to the thrust caps may occur.

Lubricate the LH camshaft bearing journal caps with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G. Position the caps in their correct locations and loosely install the bolts.

37. Lubricate the LH camshaft thrust caps with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G and position the caps and loosely install the bolts.

38. Tighten the bolts in sequence shown.

39. Lubricate the RH camshafts with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G and carefully position the camshaft into the RH cylinder head.

40.  **CAUTION:** Cylinder head camshaft journal caps and cylinder heads are numbered to make sure they are installed in their original position. Keep camshaft journal caps with the cylinder head from which they were removed. Do not mix with camshaft journal caps from another cylinder head.

 **CAUTION:** Do not install the camshaft journal thrust caps until all of the camshaft bearing journal caps have been tightened or damage to the thrust caps may occur.

Lubricate the camshaft bearing journal caps with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G. Position the caps in their correct locations and loosely install the bolts.

41. Lubricate the RH camshaft thrust caps with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G and loosely install the caps and bolts.

42. Tighten the camshaft journal cap bolts in the sequence shown.

43.  **CAUTION:** The crankshaft keyway must remain in the nine o'clock position until the cams are located, or damage to the valves may occur.

Rotate each camshaft to make sure there is smooth rotation and to position the cams in their neutral position.

44. Install the crankshaft pulley and tighten the bolt.
45. Rotate the crankshaft clockwise to position the keyway to the 11 o'clock position.

46. Remove the bolt and the crankshaft pulley.
47. Position the LH chain tensioner in a soft-jawed vise.

48. Hold the chain LH tensioner ratchet lock mechanism away from the ratchet stem with a small pick.

49.  **CAUTION:** During tensioner compression, do not release the ratchet stem until the tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

Slowly compress the LH timing chain tensioner.

50. **NOTE:** The wire must remain in the timing chain tensioner until the tensioner is installed.

Retain the LH tensioner piston with a 1.5 mm (0.06 in) wire or paper clip.

51. Install the LH timing chain guide.
 1. Position the guide to the engine.
 2. Install the shorter (gold color) bolt into the upper hole.
 3. Install the longer bolt (black color) into the lower hole.

52. Install the LH timing chain, aligning the timing index link (gold color) with the marks on the camshaft and crankshaft sprockets.

53. **NOTE:** Be sure to position the tensioner so that the tensioner piston is fully engaged in the tensioner arm.

Install the LH tensioner arm, tensioner and tensioner bolts.

54. Remove the wire or paper clip from the tensioner.

55. Rotate the crankshaft clockwise and position the keyway between the 2 o'clock and 3 o'clock positions for RH timing chain installation.

56. Verify that the timing index links (gold color) on the LH timing chain are in alignment with the timing index marks on the camshaft and crankshaft sprockets.

57. Position the RH chain tensioner in a soft-jawed vise.

58. Hold the RH chain tensioner ratchet lock mechanism away from the ratchet stem with a small pick.

59.  **CAUTION:** During tensioner compression, do not release the ratchet stem until the tensioner piston is fully bottomed in its bore or damage to the ratchet stem will result.

Slowly compress the RH timing chain tensioner.

60. **NOTE:** The wire must remain in the timing chain tensioner until the tensioner is installed.

Retain the RH tensioner piston with a 1.5 mm (0.06 in) wire or paper clip.

61. Install the RH chain guide and bolts.

62. Install the RH timing chain, aligning the timing index links (gold color) with the marks on the camshaft and crankshaft sprockets.
63. Install the RH tensioner.
 1. Position the tensioner arm.
 2. Position the tensioner.
 3. Install the bolts.

64. Remove the wire or paper clip from the RH tensioner.

65. **⚠ CAUTION: Rotating the crankshaft in a counterclockwise direction may cause engine damage. Crankshaft journals are directionally machined. Rotating the crankshaft counterclockwise can raise burrs on bearing surfaces, reducing engine life.**

⚠ CAUTION: Camshaft lobes must be 180 degrees away from each valve tappet or valve lash measurements will be incorrect.

Rotate the engine clockwise to position the camshaft lobe away from the shim surface.

66. Using the special tool, measure the clearance between the camshaft lobe and the shim surface. Record the information.

67. Use a bright colored marker to mark the position of the timing chain in relation to the camshaft sprockets to make sure that the timing remains correct.

68.  **CAUTION: The camshaft caps must be installed in their original positions.**

Mark the camshaft caps location.

69. Remove the camshaft thrust cap and rear camshaft cap from the camshaft that requires shim adjustment.

70. **NOTE:** The taller special tool is installed in place of the rear camshaft cap to allow the camshaft to be lifted to remove the shims.

Install the special tool.

- Hand-tighten the bolts.

71. Remove the bolts and the center camshaft caps.

72.  **CAUTION: Do not use any means of marking the shims other than a permanent type marker. Any scratches or paint on the shims may result in incorrect lash adjustments and severe engine damage.**

Use a permanent marker to mark the location of each shim.

73. Use a rubber-tipped air gun and compressed air to remove the shims that require adjustment.
- Blow compressed air between the shim edge and bucket rail to dislodge the shim.

74. Measure and record the thickness of each shim to correspond with the valve clearance.
75. Use the following formula to calculate the required shim thickness.
- Valve clearance specification:
 - Intake: 0.175 mm — 0.225 mm (0.0069 in — 0.0089 in)
 - Exhaust: 0.325 mm — 0.375 mm (0.0128 in — 0.0148 in)
 - Original shim thickness + measured clearance - desired clearance = required shim thickness.
76. Apply a light coat of Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G to the replacement shim(s) and install the shim(s).
77. Apply Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G to the camshaft journals and bearing caps.
78. Position the center camshaft journal caps and install the bolts.

79. Remove the bolts and the special tools.

80. Install the camshaft caps.
1. Position the rear camshaft journal cap and install the bolts.
2. Position the camshaft journal thrust cap and install the bolts.

81. Rotate the engine clockwise to rotate the camshafts two full revolutions and recheck the valve clearance.

82. Remove the bolt and washer.

83. Install the ignition pulse ring.

84. **NOTE:** LH shown; RH similar.

Install the LH and RH spark plugs.

85. Clean the engine front cover to cylinder block and cylinder head sealing surfaces using a clean shop towel and Metal Surface Cleaner F4AZ-19A536-RA or equivalent meeting Ford specification WSE-M5B392-A to remove all residue.

86. Install new front cover seals into the front cover.

87. **NOTE:** Install the engine front cover and bolts no more than six minutes after applying sealer.

Apply a 6 mm (0.24 in) diameter dot of Silicone Gasket and Sealant F7AZ-19554-EA or equivalent meeting Ford specification WSE-M4G323-A4.

88. **NOTE:** Fastener No. 14 is a stud bolt.

Install the engine front cover and the bolts.

- Tighten the bolts in the sequence shown.

89. Rotate the engine upside down on the engine stand.
90. Clean the oil pan to cylinder block sealing surfaces on the oil pan and cylinder block with a clean shop towel and Metal Surface Cleaner F4AZ-19A536-RA or equivalent meeting Ford specification WSE-M5B392-A to remove all residues.
91. **NOTE:** Install the oil pan and bolts no more than six minutes after applying sealer.

Apply a 10 mm (0.4 in) dot of Silicone Gasket and Sealant F7AZ-19554-EA or equivalent meeting Ford specification WSE-M4G323-A4 onto the top of the new oil pan gasket at the two locations shown.

92. **NOTE:** The oil pan rear face must be installed flush to the cylinder block rear face to within +/- 0.10mm (0.0039 in). Failure to maintain this specification will require the oil pan to be removed and installed again.

Position the oil pan and a new gasket and install the bolts finger-tight.

93. Using a straightedge, align the rear face of the oil pan flush with the rear face of the cylinder block.

94. Tighten the oil pan bolts in the sequence shown.

95. **NOTE:** Non-oil cooler equipped engine shown. Engines equipped with oil cooler are similar.

Position the oil filter adapter and a new O-ring seal, and install the bolts.

96. **NOTE:** Non-oil cooler equipped engine shown. Engines equipped with oil cooler are similar.

Using a new O-ring seal, lubricate with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G and install the bolt.

Tighten the bolt in two stages:

- Stage 1: Tighten to 30 Nm (22 lb-ft).
- Stage 2: Tighten to 155 Nm (114 lb-ft).

97. On vehicles equipped with an oil cooler, position the oil cooler and gasket and install the bolt.
- Rotate the cooler clockwise until the location pin hits the stop.

98. Lubricate the oil filter sealing ring with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G and install the oil filter.
99. Position the A/C compressor mounting bracket and install the bolts.

100. Install the oil pressure switch.

101. Position the RH engine mount bracket and install the bolts.

102. Using a new gasket, position the LH exhaust manifold and install the nuts.

103. If equipped, position the LH heat shield and install the bolts.

104. Using a new gasket, position the RH exhaust manifold and install the nuts.

105. If equipped, position the RH heat shield and install the bolts.

106. Using new O-ring seals, install the coolant bypass tube.

107. Using the special tool, install the crankshaft front oil seal.

108. Apply a dot of Silicone Gasket and Sealant F7AZ-19954-EA or equivalent meeting Ford specification WSE-M4G323-A4 to the crankshaft damper keyway slot.

109. Using the special tool, install the crankshaft damper.

110. Using the special tool, install the washer and a new bolt. Tighten the bolt in four stages:

- Stage 1: Tighten to 120 Nm (89 lb-ft).
- Stage 2: Back out a minimum of one full turn (360 degrees).
- Stage 3: Tighten to 50 Nm (37 lb-ft).
- Stage 4: Tighten an additional 90 degrees.

111. Position the belt tensioner and install the bolt.

112. Position the idler pulley and install the bolt.

113. Install the engine harness assembly.

114. Install the A/C compressor.
1. Position the compressor.
 2. Install the bolts.
 3. Connect the electrical connector.

115. Install the generator.
1. Position the generator.
 2. Install the bolts.
 3. Connect the electrical connector.

116. Position the crankshaft position (CKP) sensor and install the bolt.

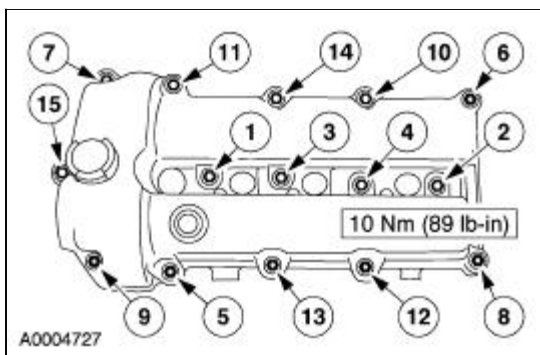

117. Position the camshaft position (CMP) sensor and install the bolt.

118. Install a new gasket in the LH valve cover.

119. Position the LH valve cover and install the bolts in the sequence shown.

120. Install the bracket.

121. Install a new gasket in the RH valve cover.

122. Position the RH valve cover and install the bolts in the sequence shown.

123. Install the oil level indicator and tube and install the stud bolt.

124. Position new lower intake manifold gaskets.

125. Position the lower intake manifold assembly and install the bolts in the sequence shown.

126. Install the bolt.

127. Position the ground strap and install the nut.

128. Install the bracket and the nut.

129. Position the wiring harness and install the four nuts.

130. Clip the KS connector to the wiring harness.

131. Connect the RH KS electrical connector.

132. Position the two radio ignition interference capacitors and install the bolts.

133. Attach the wiring harness retainer.

134. Clip the two wiring harness retainers into the brackets.

135. Position the wiring harness and install the nut.

136. Attach the four wiring harness retainers.

137. Attach the three wiring harness retainers.

138. Connect the oil pressure sensor electrical connector.

139. Connect the CMP sensor electrical connector.

140. Connect the CKP sensor electrical connector.

141. Install the RH ignition coils.
1. Install the RH ignition coils.
 2. Connect the electrical connectors.
 3. Install the bolts.

142. Install the vacuum harness.

143. Install the cylinder head temperature (CHT) sensor.

144. Connect the CHT sensor electrical connector.

145. Install the LH ignition coils.
1. Install the LH ignition coils.
 2. Connect the electrical connectors.
 3. Install the two studs and one bolt.

146. Install the crankcase ventilation tube.

147. Position the upper intake manifold and gaskets.

148. Install the fuel pressure sensor shield.
1. Position the shield.
 2. Install the nut.

149. Install the upper intake bolts in the sequence shown.

150. Position the differential pressure sensor EGR transducer and install the nut and stud.

151. Install the accelerator cable clip and the nut.

152. Install the upper intake support bracket bolt.

153. Connect the EGR tube at the exhaust manifold.

154. Loosen the EGR valve.

155. Connect the EGR tube to the EGR valve.

156. Tighten the EGR valve.

157. Connect the fuel injector wiring harness connector.

158. Connect the vacuum hose to the fuel pressure sensor.

159. Connect the intake manifold tuning valve electrical connector.

160. Connect the EGR vacuum regulator control electrical connector.

161. Connect the vacuum tubes at the EGR vacuum regulator control.

162. Connect the vacuum hose to the rear of the upper intake.

163. Connect the differential pressure feedback EGR electrical connector.

164. Connect the differential pressure feedback EGR vacuum hoses.

165. Connect the vacuum hose to the EGR valve.

166. Install the PCV valve and tube.

167. Connect the PCV tube to the throttle body.

168. Attach the wiring harness retainer to the throttle body.

169. Connect the idle air control (IAC) valve and throttle position (TP) sensor electrical connectors.

170. Position the water pump and install the one bolt and two studs.

171. Install the bracket.

172. Attach the wiring harness retainer to the stud on the water pump.

173. If equipped, install the thermactor air control valve and bracket.
1. Install the valve and bracket.
 2. Install the nut and bolt.
 3. Connect the electrical connector.

174. Connect the water pump hose.

Engine

Special Tool(s)

 <p>ST1595-A</p>	Engine Lifting Brackets 303-050
---	------------------------------------

Material

Item	Specification
Super Premium SAE 5W-20 Motor Oil XO-5W20-QSP or equivalent	WSS-M2C153- H

All vehicles

1. Install the special tool to the engine as shown.

2. Install the special tool to the engine as shown.

3. Using an engine crane, transfer the engine to the subframe.
4. Install the RH engine mount nut.

5. Install the LH engine mount nut.

6. Install the transmission to the engine and install the bolts.

7. If equipped, position the transmission oil cooler lines to the oil pan and install the nut.

8. Position the hydraulic cooling fan pump and install the bolts.

9. Connect the hydraulic cooling fan pump electrical connector.

10. Install the hydraulic cooling fan high pressure tube bracket and retaining bolt.

11. Position the power steering pump and install the bolts.

12. Install the power steering high pressure tube bracket and retaining bolt.

13. Install the four lower engine-to-transmission bolts.

14. If equipped, connect the transmission oil cooler lines.

15. Install the transmission-to-engine bolt.

16. Install the transmission-to-engine bolt.

17. Position the starter and install the studs and bolt.

18. Install the heated oxygen sensor (HO2S) bracket.
1. Position the bracket.
 2. Install the nut.
 3. Clip the connector onto the bracket.

19. Position the wiring harness and attach the two harness retainers.

20. Remove the lifting equipment.

21. Remove the special tool.

22. Remove the special tool.

23. Connect the upper radiator hose to the water pump and the water outlet tube.

24. Connect the heater hose to the water pump.

25. Position and carefully raise the entire engine, transmission, cooling and subframe assembly into the vehicle.

Vehicles with manual transmission

26. Connect the stabilizer shifter rod.

27. Connect the shifter selector rod.

28. **NOTE:** Install a new O-ring seal and clip to the supply tube.

Connect the slave cylinder supply tube.

All vehicles

29. Install the crossmember bolts.

30. Install the RH subframe bolts.

31. Install the LH subframe bolts.

32. Install the transmission support bracket.

33. Remove the powertrain lift and transmission support bracket.

34. Remove the safety stands from the rear of the vehicle.

Vehicles with automatic transmission

35. **NOTE:** Align the reference marks made during removal.

Install the nuts.

36. Install the access cover.

All vehicles

37. Install the steering shaft clamp bolt.

38. Connect the two power steering pressure electrical connectors.

39. Connect the starter wiring.

40. Install the starter wiring cover.

41. Connect the ground wire.

42. Connect the B+ terminal to the generator.

43. Install the power steering tube bracket to the LH frame rail.

44. Install the lower strut mount bolts.

45. Install the upper ball joint nut.

46. Connect the stabilizer link lower mounts and install the nuts.

47. Install the front brake calipers.

48. Connect the anti-lock brake sensor harness to the brake hose clips.

49. Connect the anti-lock brake sensor electrical connector.

50. Install the inner splash shield.
1. Position the inner splash shield in the installed position.
 2. Install the pin-type retainers.

51. Install the front wheels and tires. For additional information, refer to [Section 204-04](#).

Vehicles with automatic transmission

52. Position the cable bracket and install the bolt.

53. Connect the shift cable to the transmission. For cable adjustment, refer to [Section 307-05](#).

All vehicles

54. Install the three-way catalytic converter and the four nuts.

55. Connect the two catalyst monitor connectors.

56. Connect the two oxygen sensor electrical connectors.

57. Install the driveshaft. For additional information, refer to [Section 205-01](#).
58. Connect the A/C suction tube.
 1. Connect the A/C tube.
 2. Install the safety clip.

59. Connect the A/C high pressure tube at the right frame rail.

60. Position the A/C manifold assembly and install the bolt.

61. Install the center, LH and RH splash shields.
62. Lower the vehicle.
63. Remove the tool holding the steering wheel.

64. **NOTE:** The top heater hose has a green identifying mark to match the hose on the dual coolant flow valve. If the mark is not visible, identify the hoses for location. This will aid in the correct installation of the hose assemblies.

NOTE: Hose assemblies shown with components removed for clarity.

Connect the three quick-disconnect couplings from the coolant control valve hoses. For additional information, refer to [Section 412-00](#).

65. Connect the connector located at the end of the coolant valve harness pigtail.

66. Install the front end accessory drive belt.

67. Attach the line to the frame.

68. Position the hydraulic cooling fan reservoir and install the bolts.

69. Attach the two wiring harness retainers to the bracket.

70. Connect the two fuel charging wiring harness electrical connectors.

71. Connect the main transmission wiring harness connector and tighten the bolt.

72. Connect the main engine wiring harness connector and tighten the bolt.

73. Install the ground strap bolt.

74. Connect the throttle body coolant hoses.

75. Install the cable bracket.
1. Install the bracket.
 2. Install the bolts.

76. Connect the throttle and speed control cables.

77. Connect the main vacuum hose to the rear of the upper intake manifold.

78. Connect the chassis vacuum lines and clip into the support bracket.

79. Connect the vacuum hose.

80. Install the vapor management valve (VMV) cover.

81. Connect the brake booster vacuum hose.

82. Connect the fuel tube spring lock coupling. For additional information, refer to [Section 310-00](#).

83. Position the steering reservoir and install the bolts.

84. Connect the A/C pressure switch.

85. **NOTE:** Right side shown; left side similar.

Install the upper radiator support brackets.

86. Install the upper radiator sight shield.

87. Install the air cleaner and air cleaner outlet tube. For additional information, refer to [Section 303-12](#).

88. Install the engine appearance cover.

89. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).

90. Install the fresh air inlet duct. For additional information, refer to [Section 412-01](#).

91. Fill engine with clean engine oil.

92. Fill and bleed power steering system. For additional information, refer to [Section 211-00](#).

93. Fill and bleed hydraulic cooling fan system. For additional information, refer to [Section 303-03](#).

94. Fill the cooling system. For additional information, refer to [Section 303-03](#).

95. Evacuate and charge the A/C system. For additional information, refer to [Section 412-00](#).

96. Check front end alignment. For additional information, refer to [Section 204-00](#).

General Specifications

Item	Specification
Silicone Gasket and Sealant F7AZ-19554-EA	WSE-M4G323-A4
Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP	WSS-M2C153-G
Metal Surface Cleaner F4AZ-19A536-RA	WSE-M5B392-A
Engine oil capacity (with filter change)	5.7 liters (6.0 quarts)

Torque Specifications

Description	Nm	lb-ft	lb-in

Inlet tube support bracket bolts	11	—	97
Drive belt tensioner bolt	50	37	—

^a Refer to procedure for staged torque.

^b Install the oil filter until the seal makes contact. Tighten an additional 270 degrees.

Engine

Cylinder Head and Valve Train

A0013977

Item	Part Number	Description
1	12A409	Valve cover gaskets (4 req'd)
2	6A270	Camshaft, intake — RH
3	6A272	Camshaft, exhaust — RH
4	6049	Cylinder head — RH
5	6G004	Cylinder head temperature sensor — RH
6	6050	Cylinder head — LH
7	6051	Head gasket — RH
8	W701512	Bolt (4 req'd)

9	W704842	Washer (2 req'd)
10	6M253	Camshaft damper
11	6256	Intake camshaft sprocket (2 req'd)
12	6C258	Exhaust camshaft sprocket (2 req'd)
13	6268	Secondary timing chain (2 req'd)
14	6B209	Secondary timing chain tensioner
15	W500302	Bolt (4 req'd)
16	6A271	Camshaft, intake — LH
17	6A273	Camshaft, exhaust — LH
18	W500214	Bolt
19	6B288	Camshaft position sensor
20	6A258	Camshaft bearing cap (20 req'd)
21	W701242	Bolt (40 req'd)
22	6766	Oil filler cap
23	6765	Oil filler tube
24	W705327	Seal
25	6P053	Valve cover — LH
26	6P054	Valve cover gasket — LH
27	12A409	Valve cover gasket — LH (4 req'd)
28	6513	Valve spring (32 req'd)
29	6K514	Valve shim (32 req'd)
30	6500	Bucket (32 req'd)
31	6518	Valve keeper key (64 req'd)
32	2762	Valve keeper (32 req'd)
33	6A536	Valve seal (32 req'd)
34	6083	Head gasket — LH
35	6507	Intake valve (16 req'd)
36	W528009	Cup plug (2 req'd)
37	W701705	Dowel (4 req'd)
38	W704848	Flanged plug
39	W703346	Sealing washer
40	6397	Dowel (2 req'd)
41	6L074	Cylinder block assembly
42	6L002	Dowel (2 req'd)
43	W703302	Pipe plug
44	6505	Exhaust valve
45	W704848	Flanged plug
46	W703346	Sealing washer
47	6L033	Valley plug
48	W500310	Bolt (2 req'd)
49	12A699	Knock sensor (2 req'd)
50		

	W703346	Sealing washer
51	W704848	Flanged plug
52	6K253	Dowel (2 req'd)
53	6K260	Valve cover gasket — RH
54	6P040	Valve cover — RH
55	14B102	Jumper harness

Lower End

A0011925

Part

Item	Number	Description
1	6P044	Sleeve (2 req'd)
2	6K254	Primary timing chain tensioner (2 req'd)
3	W500302	Bolt (4 req'd)
4	W701973	Bolt (2 req'd)
5	6268	Primary timing chain (2 req'd)
6	W703346	Sealing washer
7	W704846	Flanged plug
8	6333	Upper crankshaft bearing (5 req'd)
9	6K375	Flexplate
10	W704862	Bolt (8 req'd)
11	6253	Dowel
12	6308	Thrust washer (2 req'd)
13	6331	Lower crankshaft bearing (5 req'd)
14	6701	Crankshaft rear main seal
15	6L074	Cylinder block assembly
16	6303	Crankshaft
17	W701705	Dowel (10 req'd)
18	6L074	Cylinder block assembly
19	W500203	Bolt (8 req'd)
20	6L712	Oil pan baffle
21	14W163	Heated oxygen sensor bracket (2 req'd)
22	6C315	Crankshaft position sensor
23	W500214	Bolt
24	6135	Piston pin (8 req'd)
25	6110	Piston (8 req'd)
26	6161	Spacer/expander ring (8 req'd)
27	6150	Compression ring — Upper (8 req'd)
28	6152	Compression ring — Lower (8 req'd)
29	6152	Oil control ring, (16 req'd)
30	6140	Snap ring (16 req'd)
31	6200	Connecting rod (8 req'd)
32	6211	Connecting rod bearing (16 req'd)
33	6214	Bolt (16 req'd)
34	W704749	Bolt (16 req'd)
35	W701504	Bolt (2 req'd)
36	W500305	Bolt (3 req'd)
37	6B638	Oil pan gasket
38	W701504	Bolt (17 req'd)
39	6625	Gasket
40	6617	Oil pump screen cover and tube
41		

	6840	Gasket
42	W704995	Oil drain plug
43	6695	Oil pan assembly

43	W520411	Nut (2 req'd)

Identification

For quick identification refer to the safety certification decal.

- The decal is located on the LH front door lock face panel.
- Find the engine code (letter or number) on the decal, then refer to the Engine Identification Chart to determine engine type and size. For additional information, refer to [Section 100-01](#).

- The symbol code on the identification tag identifies each engine for determining parts usage; for instance, engine displacement in liters or cubic inch displacement and model year.

Engine Code Information

The engine code information label is located on the valve cover. The label contains, among other information:

- the engine calibration number
- the engine build date
- the engine plant code
- the engine code

Emission Calibration Label

NOTE: The engine codes and the calibration numbers must be used when making inquiries or ordering parts.

The emission calibration number label is located on the LH side door or LH door post pillar. It identifies:

- the engine calibration number
- the engine code number
- the revision level

These numbers are used to determine if parts are unique to specific engines.

Exhaust Emission Control System

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Induction System

The air/fuel mixture needed for burning in the cylinders is provided by the multiport fuel injection (MFI) system. Refer to [Section 303-04B](#) for additional information.

Fuel is:

- supplied from the fuel tank by the fuel pump.
- regulated by the fuel pressure sensor.
- delivered to the injector supply manifold.

A dual damper has been added to reduce pressure fluctuations caused by the fuel injectors.

Crankshaft

The crankshaft is supported on the bottom of the cylinder block by five steel-backed, over-plated, aluminum crankshaft main bearings.

To provide smooth engine operation, the piston crankpins are positioned to provide a power impulse every 90 degrees of crankshaft rotation. The spacing provides smooth and quiet operation.

Camshafts

The camshafts:

- are arranged in pairs, one each (intake and exhaust) on each cylinder head.
- are synchronized through a secondary timing chain.
- depress the direct acting mechanical tappets to actuate the valves.

Valve Train

The valves are actuated by a direct acting mechanical bucket and shim. The direct acting mechanical tappets and shims:

- provide lash adjustment through a shim selected by thickness.
- ride on the camshaft lobes.

Positive Crankcase Ventilation System

The engine is equipped with a positive, closed-type crankcase ventilation system which recycles the crankcase vapors to the throttle body.

Engine Lubrication System

The engine lubrication system is of the force-feed type in which oil is supplied under full pressure to the:

- crankshaft main bearings
- crankshaft thrust main bearing
- connecting rod bearings

All other parts are lubricated by gravity flow or splash of the oil.

Oil Pump

The rotary spur oil pump develops the oil pressure.

- The oil pump is bolted to the front of the cylinder block.
- The oil pump is rotated by the crankshaft.
- A full flow oil filter is externally mounted on the upper sump.

If the filter element should become blocked a spring-loaded bypass valve will open and allow an uninterrupted flow of oil to the engine.

Engine Cooling System

The engine is liquid-cooled:

- by a centrifugal water pump driven by the drive belt.
- a water thermostat is used to restrict coolant flow until the engine reaches normal operating temperature.

Drive Belt System

Accessories mounted on the front of the engine are belt-driven by the crankshaft and an automatically tensioned serpentine drive belt is routed over the following components:

- water pump
 - A/C compressor
 - generator (GEN)
 - drive belt tensioner
 - drive belt idler pulley
 - crankshaft pulley
 - power steering pump
 - hydraulic cooling fan pump
-

Engine

Refer to [Section 303-00](#) .

Valve —Clearance Adjust

1. Remove the timing chains. For additional information, refer to [Timing Drive Components—Secondary](#) in this section.
2. **NOTE:** Measure each valve clearance at base circle before removing the camshafts. The shims are not repairable with the camshafts in place. Failure to measure all clearances prior to removing the camshafts will cause unnecessary repetition of the procedure.

Use a feeler gauge to measure each valve clearance and record its location.

3. Remove the camshafts. For additional information, refer to [Camshaft](#) in this section.
4. Remove the shims.

5. **NOTE:** The shims are marked for thickness; example: 2.22 mm = 222 on shim.

NOTE: The corrected shims allow the following valve clearances.

- Intake valve clearance: 0.18-0.22mm (0.00709-0.00866 in)
- Exhaust valve clearance: 0.23-0.27mm (0.00906 - 0.01063 in)

NOTE: A midrange clearance is the most desirable:

- Intake: 0.20 mm (0.00787 in)
- Exhaust: 0.25 mm (0.01 in)

NOTE: Select shims using this formula: required shim thickness = measured clearance plus the base shim thickness minus most desirable clearance.

Select shims and mark the installation location.

6. Replace the shims.

7. Install the camshaft. For additional information, refer to [Camshaft](#) in this section.

8. Measure the new valve clearances.

9. Install the timing chains. For additional information, refer to [Timing Drive Components—Secondary](#) in this section.
-

Valve —Clearance Inspection

1. Remove the valve covers. For additional information, refer to [Valve Cover—RH](#) and [Valve Cover—LH](#) in this section.
2. Remove the spark plugs.
3. **NOTE:** The engine will have to be rotated with the crankshaft pulley bolt to bring each valve to base circle.

NOTE: The valve clearance must be measured with the camshaft at base circle.

Measure and record all valve clearances.

4. If the valve clearances are out of specification, refer to [Valve —Clearance Adjust](#) in this section.
 5. To assemble, reverse the inspection procedure.
-

Intake Manifold

Removal

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Remove the air cleaner outlet tube. For additional information, refer to [Section 303-12](#).
3.  **CAUTION: The coolant drain procedure must be followed exactly or damage to the engine may occur.**

Drain the engine cooling system. For additional information, refer to [Section 303-03](#).

4. Remove the cowl vent screen. For additional information, refer to [Section 501-02](#).
5. Remove the engine compartment brace.

6. Disconnect the accelerator and speed control cables.

7. Disconnect the vacuum hoses.

8. Disconnect the vacuum line.

9. Disconnect the EGR valve to exhaust manifold tube.

10. Remove the EGR valve.
 1. Remove the two bolts.
 2. Remove the valve and discard the gasket.

11. Disconnect the camshaft position (CMP) sensor electrical connector and separate the connector from the fuel injection supply manifold.

12.  **CAUTION:** To remove normal fittings, squeeze the tabs and pull straight out or damage to the fitting may occur.

Disconnect the evaporative emission canister purge valve line.

13. Disconnect the fuel pressure sensor electrical connector.

14. Disconnect the vacuum connector from the fuel pressure sensor.

15. Disconnect the fuel line. For additional information, refer to [Section 310-00](#).

16. Remove the electrical connectors from the bracket.
 1. LH knock sensor (KS).
 2. Cylinder head temperature (CHT) sensor.

17. Remove the nut and the bracket.

18. Remove the bracket.
 1. Remove the hose.
 2. Remove the nuts and the bracket.

19. Raise the engine wiring harness and disconnect the LH fuel injector connectors.

20. Disconnect the electrical connectors.
- Idle air control (IAC) valve.
 - Throttle position (TP) sensor.

21. Disconnect the crankcase ventilation tube from the RH valve cover.

22. Disconnect the hoses (1) from the throttle body and the retaining clips (2).

23. Raise the engine wiring harness and disconnect the RH fuel injectors.

24. Remove the Delta PFE sensor.
1. Disconnect the electrical connector.
 2. Disconnect the hoses.
 3. Remove the bolts and the sensor.

25. **NOTE:** The throttle body and adapter are shown removed for clarity. It is not necessary to remove the throttle body and adapter to remove the intake manifold.

Remove the bolts and the stud (2) in the sequence shown.

26. **NOTE:** The throttle body, adapter and EGR valve are shown removed for clarity.

NOTE: Position the throttle body heater return hose out of the way before removing the throttle body.

Remove the intake manifold.

27. **⚠ CAUTION:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to clean the surfaces.

Clean the sealing surfaces.

- Inspect the gaskets and install new gaskets if necessary.

Installation

1. If removed, install the gaskets.

2. **NOTE:** Make sure that the throttle body heater return hose is positioned between the heat shield and the intake manifold.

Install the intake manifold and tighten the bolts in the sequence shown.

3. Install the Delta PFE sensor.
 1. Install the sensor and the bolts.
 2. Connect the electrical connector.
 3. Connect the hoses.

4. Connect the RH fuel injectors and position the engine wiring harness.

5. Connect the hoses (1) and install the hose in the clip (2).

6. Connect the crankcase ventilation tube.

7. Connect the IAC valve and TPS electrical connectors.

8. Connect the LH fuel injector connectors and position the engine wiring harness.

9. Install the bracket.
 1. Install the bracket and nuts.
 2. Install the hose.

10. Install the bracket and the nut.

11. Install the electrical connectors on the bracket.
 1. Install the LH KS connector.
 2. Install the CHT sensor connector.

12. Connect the fuel line. For additional information, refer to [Section 310-00](#).
13. Connect the vacuum connector to the fuel pressure sensor.

14. Connect the fuel pressure sensor electrical connector.

15. Connect the evaporative emission canister purge valve line.

16. Connect the CMP sensor electrical connector and position the connector on the fuel injection supply manifold.

17. Connect the EGR valve to exhaust manifold tube.

18. **NOTE:** EGR valve to exhaust manifold tube is removed for clarity.

Install the EGR valve.

1. Install a new gasket and the valve.

2. Install the two bolts.

19. Tighten the tube.

20. Connect the vacuum line.

21. Connect the vacuum hoses.

22. Connect the accelerator and speed control cables.

23. Install the engine compartment brace.

24. Install the cowl vent screen. For additional information, refer to [Section 501-02](#).
25. Install the air cleaner outlet tube. For additional information, refer to [Section 303-12](#).
26. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).
27.  **CAUTION: The cooling system filling and bleeding procedure must be followed exactly or damage to the engine may occur.**

Fill and bleed the engine cooling system. For additional information, refer to [Section 303-03](#).

Valve Cover —LH

Removal

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Remove the air cleaner outlet tube. For additional information, refer to [Section 303-12](#).
3. Remove the air cleaner housing.
 1. Disconnect the mass air flow (MAF) sensor electrical connector.
 2. Remove the bolt.
 3. Remove the housing.

4.  **CAUTION:** To disconnect the normal fitting, squeeze the tabs and pull straight out or damage to the fitting may occur.

Disconnect the crankcase ventilation tube.

5. Disconnect the fuel line. For additional information, refer to [Section 310-00](#).
6. Disconnect the evaporative emission canister purge valve hose.

7. Remove the vapor management valve (VMV) cover.

8. Position the VMV aside.
 1. Disconnect the vacuum hose.
 2. Disconnect the purge line.
 3. Remove the nuts and position the valve aside.

9. Position the engine vacuum regulator (EVR) solenoid aside.

10. Remove the bracket.
 1. Remove the hose.

2. Remove the bracket.

11. Position the engine wiring harness up.

12. Remove the ignition coil cover.

- Inspect the gasket and install a new gasket as necessary.

13. Disconnect the ignition coil electrical connectors.

14. Remove the four LH ignition coils.

15. Disconnect the four wiring harness retainers.

16. Remove the fuel line bracket bolt from the LH shock tower.

17. Remove the bolts and position the power steering pump reservoir aside.

18. Remove the nut and the oil level indicator tube.

19. Remove the brake line bracket from the LH frame rail.
20. Remove the LH valve cover.
 - Loosen the bolts in the sequence shown.

21.  **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of sealant.**

Clean the sealing surfaces.

22. Inspect and install new gaskets if necessary.

Installation

1. Apply two beads of Silicone Gasket and Sealant F7AZ-19554-EA or equivalent meeting Ford specification WSE-M4G323-A4.

2. Install the LH valve cover.
 - Position the valve cover and tighten the bolts in the sequence shown.

3. Install the brake line bracket.
4. **NOTE:** Lubricate the O-ring seal with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.

Install the oil level indicator tube.

- Inspect the O-ring seal and install a new O-ring seal if necessary.

5. Install the power steering pump reservoir.

6. Install the fuel line bracket bolt.

7. Connect the four wiring harness retainers.

8. Install the four LH ignition coils.

9. Connect the ignition coil electrical connectors.

10.  **CAUTION:** Make sure that the wire harness inlet seal is seated on the valve cover or damage to the harness may occur.

Install the ignition coil cover.

11. Install the engine wiring harness.

12. Install the bracket.
1. Install the bracket.
2. Install the hose.

13. Install the EVR solenoid.

14. Install the VMV.

1. Install the nuts.
2. Connect the purge line.
3. Connect the vacuum hose.

15. Install the VMV cover.

16. Connect the hose.

17. Connect the crankcase ventilation tube.

18. Connect the fuel line. For additional information, refer to [Section 310-00](#).

19. Install the air cleaner housing.
 1. Install the housing.
 2. Install the bolt.
 3. Connect the MAF sensor electrical connector.

20. Install the air cleaner outlet tube. For additional information, refer to [Section 303-12](#).
 21. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).
-

Valve Cover —RH

Removal

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Remove the air cleaner outlet tube. For additional information, refer to [Section 303-12](#).
3. Remove the bolts and position the hydraulic cooling fan reservoir aside.

4. Disconnect the crankcase ventilation hose.

5. **NOTE:** The wiring harness bracket is located on the backside of the RH strut tower.

Remove the bolts and position the wiring harness bracket aside.

6. Remove the ignition coil cover.

- Inspect the gasket and install a new gasket as necessary.

7. Disconnect the ignition coil connectors.

8. Raise the engine wiring harness and disconnect the four fuel injector connectors.

9. Disconnect the four wiring harness retainers.

10. Remove the four RH ignition coils.

11. Remove the nut and position the wiring harness aside.

12. Remove the RH valve cover.
 - Loosen the bolts in the sequence shown.

13.  **CAUTION:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of sealant.

Clean the sealing surfaces.

14. Inspect and install new gaskets as necessary.

Installation

1. Apply two beads of Silicone Gasket and Sealant F7AZ-19554-EA or equivalent meeting Ford specification WSE-M4G323-A4.

2. Install the RH valve cover.
 - Tighten the bolts in the sequence shown.

3. Install the ignition coils.

4. Position the wiring harness and install the nut.

5. Install the four wiring harness retainers.

6. Connect the four fuel injector connectors and position the engine wiring harness.

7. Connect the ignition coil connectors.

8.  **CAUTION:** Make sure that the wire harness inlet seal is seated in the valve cover or damage to the harness may occur.

Inspect the gasket and install a new gasket as necessary. Install the ignition coil cover.

9. **NOTE:** The wiring harness bracket is located on the backside of the RH strut tower.

Install the wiring harness bracket.

10. Connect the crankcase ventilation hose.

11. Install the hydraulic cooling fan reservoir.

12. Install the air cleaner outlet tube. For additional information, refer to [Section 303-12](#).

13. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).

Crankshaft Pulley

Special Tool(s)

 ST1286-A	Crankshaft Damper Remover 303-009 (T58P-6316-D)
 ST1287-A	Crankshaft Damper Replacer 303-102 (T74P-6316-B)

Removal

1. Remove the hydraulic cooling fan assembly. For additional information, refer to [Section 303-03](#).
2. Remove the drive belt. For additional information, refer to [Section 303-05](#).
3. Remove the bolt.
 - Discard the bolt.

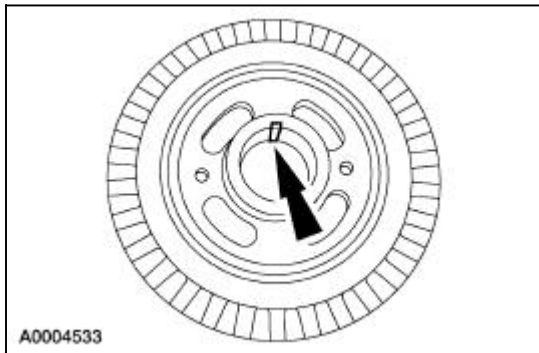

4. Using the special tool, remove the crankshaft pulley.

Installation

1. Apply a bead of Silicone Gasket and Sealant F7AZ-19554-EA or equivalent meeting Ford specification WSE-M4G323-A4 to the keyway.

2. Using the special tool, install the crankshaft pulley.

3. Install a new bolt and tighten in four stages.
 - Stage 1: Tighten to 80 Nm (59 lb-ft).
 - Stage 2: Loosen the bolt two complete turns.
 - Stage 3: Tighten to 50 Nm (37 lb-ft).
 - Stage 4: Tighten an additional 90 degrees.

4. Install the drive belt. For additional information, refer to [Section 303-05](#).
 5. Install the hydraulic cooling fan assembly. For additional information, refer to [Section 303-03](#).
-

Crankshaft Front Oil Seal

Special Tool(s)

 ST1385-A	Remover, Oil Seal 303-409 (T92C-6700-CH)
 ST2423-A	Installer, Crankshaft Front Oil Seal 303-646

Removal

1. Remove the front crankshaft pulley. For additional information, refer to [Crankshaft Pulley](#) in this section.
2. Using the special tool, remove the front crankshaft seal.
 - Discard the seal.

Installation

1. Using the special tool, install a new front crankshaft seal.

2. Install the crankshaft pulley. For additional information, refer to [Crankshaft Pulley](#) in this section.
-

Engine Front Cover

Removal

1. Drain the engine cooling system. For additional information, refer to [Section 303-03](#).
2. Remove the LH valve cover. For additional information, refer to [Valve Cover—LH](#) in this section.
3. Remove the RH valve cover. For additional information, refer to [Valve Cover—RH](#) in this section.
4. Remove the engine cooling fan assembly. For additional information, refer to [Section 303-03](#).
5. Loosen the water pump pulley bolts.
6. Remove the generator. For additional information, refer to [Section 414-02](#).
7. Remove the water pump pulley.
 - Discard the bolts.

8. Remove the bracket.
 1. Remove the nuts.
 2. Remove the bracket.

9. Remove the lower radiator hose stud bolts.

10. Disconnect the lower radiator hose from the thermostat housing.

11. Disconnect the heater hose.

12. Remove the idler pulleys.

13. Remove the crankshaft pulley. For additional information, refer to [Crankshaft Pulley](#) in this section.

14. Remove the A/C compressor. For additional information, refer to [Section 412-03](#).

15. Disconnect the power steering reservoir hose and drain the reservoir

16. **NOTE:** One bolt is blocked by the power steering pressure line and will have to be removed in stages.

Remove the bolts and position the power steering pump aside.

17. Remove the power steering pump bracket.

18. Disconnect the hydraulic cooling fan pump reservoir hose and drain the reservoir.

19. Disconnect the electrical connector.

20. Remove the hydraulic fan pump reservoir line bracket.
1. Remove the bolt.
2. Remove the bracket.

21. **NOTE:** One bolt is blocked by the hydraulic cooling fan pressure line and will have to be removed in stages.

Remove the hydraulic cooling fan pump.

22. Remove the hydraulic cooling fan pump bracket.

23. Lower the vehicle.

24. Disconnect the five wiring harness clips.

25. Remove the engine front cover.

- Remove the bolts in the sequence shown.
- Remove the engine front cover.

26.  **CAUTION:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of sealant.

Clean the sealing surfaces.

Installation

1. Install new gaskets.

2. Apply Silicone Gasket and Sealant F7AZ-19554-EA or equivalent meeting Ford specification WSE-M4G323-A4 in eight places.

3. Install the engine front cover.
 - Position the engine front cover on the cylinder block.
 - Loosely install the bolts.
 - Tighten the bolts in two stages in the sequence shown.
 - Stage 1: Tighten to 5 Nm (44 lb-in).
 - Stage 2: Tighten to 10 Nm (89 lb-in).

4. Connect the five wiring harness clips.

5. Raise the vehicle.
6. **NOTE:** The wiring harness is positioned behind the bracket.

Install the hydraulic cooling fan pump bracket.

7. **NOTE:** One bolt is blocked by the hydraulic cooling fan pressure line and will have to be installed in stages.

Install the hydraulic cooling fan pump.

8. Install the hydraulic fan pump reservoir line bracket.
 1. Install the bracket.
 2. Install the bolt.

9. Connect the electrical connector.

10. Connect the hydraulic cooling fan reservoir hose.

11. **NOTE:** The wiring harness is positioned behind the bracket.

Install the power steering pump bracket.

12. **NOTE:** One bolt is blocked by the power steering pressure line and will have to be installed in stages.

Install the power steering pump.

13. Connect the power steering reservoir hose.

14. Install the A/C compressor. For additional information, refer to [Section 412-03](#).
15. Install the crankshaft pulley. For additional information, refer to [Crankshaft Pulley](#) in this section.
16. Install the idler pulleys.

17. Connect the heater hose.

18. Connect the lower radiator hose to the thermostat housing.

19. Install the stud bolts.

20. Install the bracket.
1. Install the bracket.
2. Install the nuts.

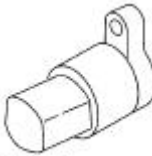

21. Position the water pump pulley and loosely install new bolts.
22. Install the generator. For additional information, refer to [Section 414-02](#).
23. Tighten the bolts in two stages.
 - Stage 1: Tighten to 10 Nm (89 lb-in).
 - Stage 2: Tighten an additional 45 degrees.

24. Install the engine cooling fan assembly. For additional information, refer to [Section 303-03](#).
 25. Install the RH valve cover. For additional information, refer to [Valve Cover—RH](#) in this section.
 26. Install the LH valve cover. For additional information, refer to [Valve Cover—LH](#) in this section.
 27. Fill and bleed the engine cooling system. For additional information, refer to [Section 303-03](#).
 28. Fill and bleed the hydraulic cooling fan. For additional information, refer to [Section 303-03](#).
 29. Fill the power steering system. For additional information, refer to [Section 211-00](#).
-

Timing Drive Components —Primary

Special Tool(s)

 ST2398-B	Camshaft Setting/Locking Tool 303-530
 ST2399-A	Timing Chain Tensioning Tool 303-532
 ST2401-A	Crankshaft Positioning Tool 303-645

Removal

1. Remove the engine front cover. For additional information, refer to [Engine Front Cover](#) in this section.
2. Raise the vehicle.
3. Remove the crankshaft position (CKP) sensor and the torque converter cover.

4. **NOTE:** There is one window on the ignition pulse wheel that is unique to accept the special tool.

Install the special tool.

- Turn the crankshaft to 45 degrees ATDC. The crankshaft keyway will be in the 6 o'clock position.
- Install the special tool.

5. Lower the vehicle.
6. Make sure the lobes of the camshaft are facing upwards. If not, repeat Step 4.

7. Install the special tool on the RH cylinder head.

8. Loosen the exhaust camshaft sprocket bolt.

9. Loosen the intake camshaft sprocket bolt and slide the camshaft sprockets forward on the bolts.

10. Remove the RH timing chain tensioner and blanking plate.

11. Remove the tensioner arm.

12. Remove the timing chain guide.

13. Remove the RH primary timing chain and crankshaft sprocket as an assembly.

14. Remove the special tool from the RH head.

15. Install the special tool on the LH head.

16. Loosen the exhaust camshaft sprocket bolt.

17. Loosen the intake sprocket bolt and slide the camshaft sprockets forward on the bolts.

18. Remove the LH timing chain tensioner and blanking plate.

19. Remove the tensioner arm.

20. Remove the timing chain guide.

21. Remove the LH primary timing chain and crankshaft sprocket as an assembly.

Installation

1. Reset the timing chain tensioners.
 - Insert a fine wire and dislodge the check ball.
 - Using finger pressure, compress the tensioner.
 - Remove the wire.

2. **NOTE:** If the timing mark on the LH timing chain crankshaft gear is facing toward the rear of the engine, install the RH timing chain crankshaft gear with the mark facing forward. If the timing mark on the LH timing chain crankshaft gear is facing toward the front of the engine, install the RH timing chain crankshaft gear with the mark facing toward the rear of the engine.

NOTE: The camshaft holding tool should still be installed on the LH cylinder head.

Position the LH timing chain and crankshaft gear.

- Position the timing chain over the LH intake camshaft sprocket.
- Position the crankshaft gear in the timing chain.
- Position the timing chain and crankshaft gear over the crankshaft as an assembly.

3. Install the LH timing chain guide.

4. Install the LH timing chain tensioner arm.

5.  **CAUTION:** The orientation of the blanking plate must be as shown or the oil galley will not seal, resulting in low oil pressure and possible engine damage.

Install the LH timing chain tensioner.

- Position the blanking plate.
- Install the LH timing chain tensioner and blanking plate.

6. Install a tie strap to take up the slack in the timing chain.

7. Using the special tool, apply tension to the LH exhaust camshaft sprocket and tighten the camshaft sprocket bolts in two stages.
 - Stage 1: Tighten to 20 Nm (15 lb-ft).
 - Stage 2: Tighten an additional 90 degrees.

8. Remove the special tool.

9. Remove the tie strap.
10. Install the special tool on the right cylinder head.

11. **NOTE:** If the timing mark on the LH timing chain crankshaft gear is facing toward the rear of the engine, install the RH timing chain crankshaft gear with the mark facing forward. If the timing mark on the LH timing chain crankshaft gear is facing toward the front of the engine, install the RH timing chain crankshaft gear with the mark facing toward the rear of the engine.

Position the RH timing chain and crankshaft gear.

- Position the timing chain over the RH intake camshaft sprocket.
- Position the crankshaft gear in the timing chain.
- Position the timing chain and crankshaft gear over the crankshaft as an assembly.

12. Install the RH timing chain guide.

13. Install the RH timing chain tensioner arm.

14.  **CAUTION:** The orientation of the blanking plate must be as shown or the oil galley will not seal, resulting in low oil pressure and possible engine damage.

Install the RH timing chain tensioner.

- Position the blanking plate.
- Install the RH timing chain tensioner and blanking plate.

15. Install a tie strap to take up the slack in the timing chain.

16. **NOTE:** The exhaust camshaft sprocket bolt must be fully tightened before tightening the intake camshaft sprocket bolt.

Using the special tool, apply tension to the RH exhaust camshaft sprocket and tighten the camshaft sprocket bolts in two stages.

- Stage 1: Tighten to 20 Nm (15 lb-ft).
- Stage 2: Tighten an additional 90 degrees.

17. Remove the special tool.

- Remove the tie strap.

18. Raise the vehicle.

19. Remove the special tool.

20. Install the CKP sensor and the torque converter cover.

21. Lower the vehicle.
 22. Install the engine front cover. For additional information, refer to [Engine Front Cover](#) in this section.
-

Timing Drive Components —Secondary

Removal

NOTE: The RH secondary timing chains are shown; the LH secondary timing chains are similar.

1. Remove the primary timing chains. For additional information, refer to [Timing Drive Components—Primary](#) in this section.
2. Remove the exhaust sprocket bolt.

3. Remove the intake sprocket bolt and remove the camshaft damper.

4. Remove the sprockets, damper, and chain as an assembly.

5. Remove the secondary timing chain tensioner bolts.

6. Remove the tensioner.

Installation

1. Collapse the tensioners.
 - Insert a thin wire into the check valve.
 - Apply hand pressure until the tensioner is fully collapsed.
 - Remove the wire.

2. Position the tensioner.

3. Install the timing chain tensioner bolts.

4. Position the intake sprocket, damper, chain and exhaust sprocket on the intake camshaft as an assembly.

5. Loosely install the intake and exhaust sprocket bolts.

6. Install the primary timing chains. For additional information, refer to [Timing Drive Components—Primary](#) in this section.

Valve —Valve Springs

Special Tool(s)

Removal

1. Remove the camshaft. For additional information, refer to [Camshaft](#) in this section.
2. Position the piston at the top of the stroke on the appropriate cylinder.
3. Remove the spark plug and apply compressed air in the cylinder to hold both valves in position.

4.  **CAUTION:** If air pressure has forced the piston to the bottom of the cylinder, any loss of air pressure will allow the valve to fall into the cylinder. If air pressure must be removed, support the valve prior to removal.

Remove the bucket tappet and shim from the valve.

5. Using the special tool, remove the retainer keys.

6. Remove the valve springs.
 1. Remove the spring retainers.
 2. Remove the valve springs.

7. Repeat the procedure until all of the valve springs are removed.

Installation

1. Position the valve springs.
 1. Position the spring retainers.
 2. Position the valve springs.

2. Using the special tool, install the retainer keys.

3. Repeat the procedure until all of the valve springs are installed.
 4. Install the camshaft. For additional information, refer to [Camshaft](#) in this section.
-

Valve —Valve Seals

Removal

1. Remove the valve springs. For additional information, refer to [Valve —Valve Springs](#) in this section.
2. Remove the valve stem seals.

Installation

1. **NOTE:** The valve stem seal must be bottomed on the valve seat.

NOTE: Make sure that the garter spring is present in the valve stem seal.

Install the valve stem seals over the valve stems.

2. Install the valve springs. For additional information, refer to [Valve —Valve Springs](#) in this section.
-

Camshaft

Special Tool(s)

 ST2398-B	Camshaft Setting/Locking Tool 303-530
---	--

Removal

1. Remove the primary timing chains. For additional information, refer to [Timing Drive Components—Primary](#) in this section.
2. Remove the secondary timing chains. For additional information, refer to [Timing Drive Components—Secondary](#) in this section.
3. Remove the special tool.

4.  **CAUTION:** Record the camshaft bearing cap locations. The camshaft bearing caps are positional and must be installed in their original locations and orientations or engine damage may occur.

 **CAUTION:** Do not use any means of marking the shims other than a permanent type marker. Any scratches or paint on the shims may result in incorrect lash adjustments and severe engine damage.

 **CAUTION:** Record the shim and bucket tappet location. The shim and bucket tappet are positional and if installed in the incorrect location, engine damage may occur.

Remove the RH camshaft bearing caps.

- Remove the bolts.
- Remove the RH camshaft bearing caps.

5. Remove the RH camshafts (6A270 intake and 6A272 exhaust).

6.  **CAUTION:** Record the camshaft bearing cap locations. The camshaft bearing caps are positional and must be installed in their original locations and orientations or engine damage may occur.

 **CAUTION:** Do not use any means of marking the shims other than a permanent type marker. Any scratches or paint on the shims may result in incorrect lash adjustments and severe engine damage.

 **CAUTION:** Record the location of the shims and bucket tappets. The bucket tappets and shims are positional and if installed in the incorrect location, engine damage may occur.

Remove the LH camshaft bearing caps.

- Remove the bolts.
- Remove the LH camshaft bearing caps.

7. Remove the LH camshafts.

Installation

1. **NOTE:** Apply Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G to the camshaft journals, the camshaft caps and the camshaft lobes prior to installing the camshafts.

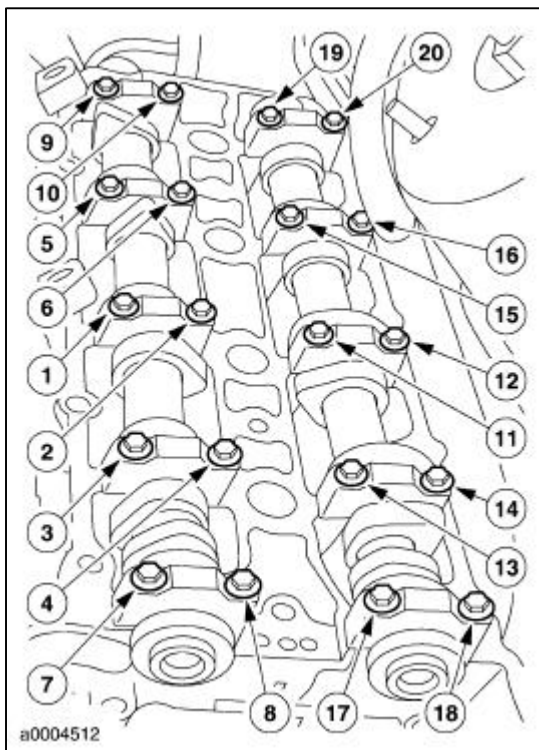

Position the LH camshafts on the camshaft journals.

2.  **CAUTION:** Install the camshaft bearing caps. The camshaft bearing caps are positional and must be installed in their original locations and orientations or engine damage may occur.

Install the LH camshaft bearing caps.

- Position the bearing caps.
- Install the bearing cap bolts. Tighten the bolts in three stages in the sequence shown.
 - Stage 1: Hand-tighten.
 - Stage 2: Tighten to 6 Nm (53 lb-in).
 - Stage 3: Tighten an additional 90 degrees.

3. **NOTE:** Apply Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G to the camshaft journals, the camshaft caps and the camshaft lobes prior to installing the camshafts.

Install the RH camshafts.

4.  **CAUTION:** Install the camshaft bearing caps. The camshaft bearing caps are positional and must be installed in their original locations and orientations or engine

damage may occur.

Install the RH camshaft bearing caps.

- Position the bearing caps.
- Install the bolts. Tighten the bolts in three stages in the sequence shown.
 - Stage 1: Hand-tighten.
 - Stage 2: Tighten to 6 Nm (53 lb-in).
 - Stage 3: Tighten an additional 90 degrees.

5.  **CAUTION:** If any of the following components are replaced, the engine must be reshimmed or engine damage may occur: The camshafts, the valves, cylinder heads, or bucket tappets .

Using feeler gages, confirm that the tappet and shim clearances are within specification.

6. Install the special tool on the LH head.

7. Install the primary and secondary timing chains. For additional information, refer to [Timing Drive Components—Primary](#) and [Timing Drive Components—Secondary](#) in this section.
-

Exhaust Manifold —LH

Removal

1. Remove the bolts and position the power steering reservoir aside.

2. Remove the nut and position the oil level indicator tube aside.

3. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
4. Disconnect the three-way catalytic (TWC) converter from the exhaust manifold. For additional information, refer to [Section 309-00](#).
5. Remove the exhaust manifold.
 - Remove the eight bolts.
 - Remove the exhaust manifold and discard the gasket.

Installation

1. To install, reverse the removal procedure.
 - Install a new gasket.
-

Exhaust Manifold —RH

Removal

1. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
2. Disconnect the three-way catalytic (TWC) converter from the exhaust manifold. For additional information, refer to [Section 309-00](#).
3. Disconnect the EGR valve to exhaust manifold tube nut at the exhaust manifold.

4. Remove the exhaust manifold.
 - Remove the eight bolts.
 - Remove the exhaust manifold and discard the gasket.

Installation

1. To install, reverse the removal procedure.
 - Install a new gasket.

Cylinder Head

Removal

1. Remove the intake manifold. For additional information, refer to [Intake Manifold](#) in this section.
2. Remove the engine sound insulator.
3. Remove the camshafts. For additional information, refer to [Camshaft](#) in this section.
4.  **CAUTION:** The shim and tappets are location-specific. Note the location so that they can be installed in their original locations or shims will have to be reselected during installation.

 **CAUTION:** Do not use any means of marking the shims other than a permanent type marker. Any scratches or paint on the shims can result in incorrect lash adjustments and severe engine damage.

If necessary, remove the tappet bucket and shims.

5. Disconnect the clamp, remove the four bolts and the water outlet pipe.

6. Disconnect the cylinder head temperature (CHT) sensor electrical connector.

7. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
8. Disconnect the three-way catalytic (TWC) converter from the exhaust manifolds.

9. Disconnect the EGR valve to exhaust manifold tube.

10. Lower the vehicle.
11. Remove the bolts from the rear of the cylinder head.

12. Remove and discard the bolts.

13. Remove the RH bolts in the sequence shown.

- Discard the bolts.

14. Remove the RH cylinder head.

- Discard the gasket.

15.  **CAUTION:** Do not use metal scrapers, wire brushes, power abrasive discs or other

abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of sealant.

Clean the sealing surfaces.

16. Remove the stud bolts from the rear of the cylinder head.

17. Remove and discard the bolts.

18. **NOTE:** The lower rear bolt cannot be fully removed. This bolt must be retained above the decking surface with a rubber band to remove the LH cylinder head.

Remove the bolts in the sequence shown.

- Discard the bolts.

19. Remove the LH cylinder head.
- Discard the gasket.

20.  **CAUTION:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of sealant.

Clean the sealing surfaces.

21. Remove the RH exhaust manifold bolts.

- Discard the gasket.

22.  **CAUTION:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of sealant.

Clean the sealing surfaces.

23. Remove the LH exhaust manifold.

- Discard the gasket.

24.  **CAUTION:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of sealant.

Clean the sealing surfaces.

Installation

1. Install the LH exhaust manifold.
 - Install a new gasket.

2. Install the RH exhaust manifold.
 - Install a new gasket.

3. **NOTE:** The lower rear bolt cannot be installed with the cylinder head in place. Secure the bolt above deck height with a rubber band prior to cylinder head installation.

Position the LH cylinder head.

- Install a new gasket.

4. **NOTE:** The cylinder head bolts are a torque-to-yield design and must not be reused. Always install new bolts.

Install and tighten the bolts in five stages in the sequence shown.

- Stage 1: Install finger-tight.
- Stage 2: Tighten to 20 Nm (15 lb-ft).
- Stage 3: Tighten to 35 Nm (26 lb-ft).
- Stage 4: Tighten to 45 Nm (33 lb-ft) and an additional 90 degrees.
- Stage 5: Tighten an additional 90 degrees.

5. Install the bolts on the rear of the cylinder head.

6. **NOTE:** The cylinder head bolts are a torque-to-yield design and must not be reused. Always install new bolts.

Install and tighten the bolts in two stages.

- Stage 1: Tighten to 20 Nm (15 lb-ft).
- Stage 2: Tighten an additional 90 degrees.

7. Position the RH cylinder head.

- Install a new gasket.

8. **NOTE:** The cylinder head bolts are a torque-to-yield design and must not be reused. Always install new bolts.

Install and tighten the bolts in five stages in the sequence shown.

- Stage 1: Install finger-tight.
- Stage 2: Tighten to 20 Nm (15 lb-ft).
- Stage 3: Tighten to 35 Nm (26 lb-ft).
- Stage 4: Tighten to 45 Nm (33 lb-ft) and an additional 90 degrees.
- Stage 5: Tighten an additional 90 degrees.

9. Install the stud bolts on the rear of the cylinder head.

10. **NOTE:** The cylinder head bolts are a torque-to-yield design and must not be reused. Always install new bolts.

Install and tighten the bolts in two stages.

- Stage 1: Tighten to 20 Nm (15 lb-ft).
- Stage 2: Tighten an additional 90 degrees.

11.  **CAUTION:** The shim and tappets are location-specific. They must be installed in their original locations or shims will have to be reselected during installation.

 **CAUTION:** Do not use any means of marking the shims other than a permanent type marker. Any scratches or paint on the shims can result in incorrect lash adjustments and severe engine damage.

 **CAUTION:** If a new cylinder head assembly is being installed, valve clearances must be adjusted or damage to the engine can occur.

Install the tappets and shims.

12. Raise the vehicle.
13. Connect the EGR valve to exhaust manifold tube.

14. Connect the TWC to the exhaust manifolds.

15. Lower the vehicle.

16. Connect the CHT sensor electrical connector.

17. **NOTE:** Make sure that the insulator is clear of the intake manifold sealing surfaces.

Install the engine sound insulator.

18. Install the water crossover and tighten the four bolts and connect the hose.

19. Install the camshafts. For additional information, refer to [Camshaft](#) in this section.
 20. Install the intake manifold. For additional information, refer to [Intake Manifold](#) in this section.
-

Oil Cooler

Removal

1. Drain the cooling system. For additional information, refer to [Section 303-03](#).
2. Raise the vehicle. For additional information, refer to [Section 100-02](#).
3. Remove the lower splash shield.
4. Drain the engine oil.
5. Remove and discard the oil filter.

6. Disconnect the oil cooler hoses.
7. Remove the oil cooler.
 - Inspect the seal and install a new seal as necessary.

Installation

1. **NOTE:** Inspect the gasket and surfaces for contamination prior to installation.

Position the oil cooler and gasket and install the bolt.

- Rotate the cooler clockwise until the locating pin hits the stop.

2. Install the oil cooler hoses.
3. Install the oil filter.
 - Install the oil filter until the seal makes contact.
 - Tighten an additional 270 degrees.

4. Install the lower splash shield.
 5. Lower the vehicle. For additional information, refer to [Section 100-02](#).
 6. Fill the engine with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.
 7. Fill and bleed the engine cooling system. For additional information, refer to [Section 303-03](#).
-

Oil Filter Adapter

Removal

1. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
2. Drain the engine oil.
3. Remove the lower splash shield.
4. Remove and discard the oil filter.

5. Remove the oil cooler assembly, if equipped. For additional information, refer to [Oil Cooler](#) in this section.
6. Disconnect the oil pressure sender.
7. Remove the oil filter adapter assembly.
 - Discard the seal.

8.  **CAUTION:** Do not use metal scrapers, wire brushes, power abrasive discs, or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool.

Clean the sealing surfaces.

Installation

1. Install a new seal and the oil filter adapter. Tighten the bolts in two stages.
 - Stage 1: Tighten to 13 Nm (10 lb-ft).
 - Stage 2: Tighten an additional 90 degrees.

2. Connect the oil pressure sender.
3. Install the oil cooler, if equipped. For additional information, refer to [Oil Cooler](#) in this section.
4. Install the oil filter.
 - Install the oil filter until the seal makes contact.
 - Tighten an additional 270 degrees.

5. Install the lower splash shield.
 6. Lower the vehicle.
 7. Fill the engine with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.
-

Oil Level Indicator and Tube

Removal

1. Remove the oil level indicator.
2. Remove the nut and the oil level indicator and tube.

Installation

1. **NOTE:** Lubricate the O-ring seal with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.

Inspect the O-ring seal and install a new O-ring seal as necessary.

- Install the oil level indicator tube.

2. Install the nut.

3. Install the oil level indicator.

Oil Pan

Removal

1. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
2. Drain the engine oil.
3. Remove the oil pan.
 - Inspect the gasket and install a new one if necessary.

Installation

NOTE: Make sure all gasket sealing surfaces are clean and dry.

1. Install the oil pan. Tighten the bolts in the sequence shown in two stages.
 - Stage 1: Tighten to 5 Nm (44 lb-in).
 - Stage 2: Tighten to 12 Nm (9 lb-ft).

2. Lower the vehicle.
3. Fill the crankcase to the specified level with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.

Oil Pump

Removal

1. Remove the primary timing chains. For additional information, refer to [Timing Drive Components—Primary](#) in this section.
2. Remove the bolts and the oil pump.
 - Discard the gasket.

3.  **CAUTION:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of sealant.

Clean the sealing surfaces.

Installation

1. Install a new gasket.

2. Install the oil pump and tighten the bolts in two stages.
 - Stage 1: Tighten to 6 Nm (53 lb-in).
 - Stage 2: Tighten an additional 90 degrees.

3. Install the primary timing chains. For additional information, refer to [Timing Drive Components—Primary](#) in this section.
-

Oil Pump Screen and Pickup Tube

Removal

1. Remove the oil pan. For additional information, refer to [Oil Pan](#) in this section.
2. Remove the bolts and the pump screen cover and tube.
 - Inspect the O-ring seal and install a new one if necessary.

Installation

1. Install the oil pump screen cover and tube.

2. Install the oil pan. For additional information, refer to [Oil Pan](#) in this section.

Flexplate

Removal

1. Remove the transmission. For additional information, refer to [Section 307-01](#).
2. Remove the flexplate.
 - Remove the bolts in the sequence shown.
 - Remove the flexplate.

Installation

NOTE: The crankshaft dowel must be positioned below the outer face of the flexplate.

1. Install the flexplate with the elongated hole over the crankshaft dowel.

2. Install the flexplate bolts and tighten in two stages in the sequence shown.
 - Stage 1: Tighten to 15 Nm (11 lb-ft).
 - Stage 2: Tighten to 110 Nm (81 lb-ft).

3. Install the transmission. For additional information, refer to [Section 307-01](#).
-

Crankshaft Rear Oil Seal

Special Tool(s)

 ST2495-B	Rear Crankshaft Seal Remover/Installer 303-647
 ST2441-A	Screw 204-208 (T95T-5310-AR2)

Removal

1. Remove the flexplate. For additional information, refer to [Flexplate](#) in this section.
2. Using the special tools, remove the crankshaft rear oil seal.
 - Discard the seal.

Installation

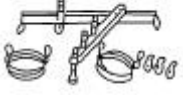

1. Lubricate the outer lips and the inner seal on the crankshaft rear oil seal with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.
2. Using the special tool, install a new crankshaft rear oil seal.

3. Install the flexplate. For additional information, refer to [Flexplate](#) in this section.
-

Engine Mount

Special Tool(s)

 <p>ST1595-A</p>	Lifting Bracket, Engine 303-050 (T70P-6000)
 <p>ST1703-A</p>	Support Bar, Engine 303-D063 (D88L-6000-A)

Removal

For LH and RH

1. Disconnect the battery ground cable (14301). For additional information, refer to [Section 414-01](#).
2. Remove the air cleaner outlet tube. For additional information, refer to [Section 303-12](#).
3. Remove the upper radiator sight shield.

4. Install the special tools and support the engine.

5. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
6. Remove the LH and the RH lower splash shield.

For RH

7. Remove the nut and disconnect the starter motor ground cable.

8. Remove the nut and disconnect the wiring harness support bracket from the engine mount bracket.

For LH and RH

9. Remove the two nuts from the top and bottom of the engine mounts.

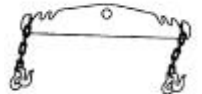

10. Remove the four bolts, the engine mounts and the brackets.

11. To install, reverse the removal procedure.
-

Engine

Special Tool(s)

 ST1595-A	Engine Lifting Brackets 303-050 (T70P-6000)
 ST1602-A	Spreader Bar 303-D089 (D93P-6001-A3)

Removal

1. Disconnect the battery ground cable (14301). For additional information, refer to [Section 414-01](#).
2. Remove the air cleaner inlet. For additional information, refer to [Section 303-12](#).

3.  **CAUTION: The coolant drain procedure must be followed exactly or damage to the engine may occur.**

Drain the engine coolant. For additional information, refer to [Section 303-03](#).

4. Remove the upper radiator sight shield.

5. Remove the two upper radiator support brackets.

6. Discharge the A/C system. For additional information, refer to [Section 412-00](#).
7. Disconnect the A/C pressure switch electrical connector.

8. Release the power steering return line from the pressure line clip.

9. Remove the power steering pump reservoir and secure the reservoir to the engine.

10. Disconnect the fuel line. For additional information, refer to [Section 310-00](#).

11. Remove the vapor management valve (VMV) cover.

12.  **CAUTION:** To disconnect the fitting, squeeze the tabs and pull straight out or damage to the fitting may occur.

Disconnect the VMV.

- Canister purge hose.
- Vacuum hose.

13. Disconnect the main vacuum supply hose.

14. Remove the cowl vent screens. For additional information, refer to [Section 501-02](#).
15. Unclip the hose and position aside.

16. Remove the bracket.

- Remove the seven bolts and one nut.
- Remove the windshield washer hose.
- Remove the bracket.

17. Disconnect the degas bottle.

18. Disconnect the accelerator cable and the speed control cable.

19. Disconnect the ground strap.

20. Remove the fresh air filter.

21. Remove the fresh air filter housing.

22. **NOTE:** The connectors are located on the backside of the RH strut tower.

Disconnect the powertrain bulkhead electrical connectors.

23. Remove the fresh air filter panel.
 1. Remove the pin-type retainer.
 2. Remove the nuts.
 3. Remove the panel.

24. Disconnect the connectors.

25. **NOTE:** Mark the position of the heater hoses for correct installation.

Disconnect the heater hoses from the water control valve.

26. Remove the hydraulic cooling fan reservoir and secure the reservoir to the engine.

27. Disconnect the water valve electrical connector, unclip from the radiator support and position the harness aside.

28. Remove the front wheels and tires. For additional information, refer to [Section 204-04](#) .
29. **NOTE:** LH shown; RH similar.

Position the LH and the RH inner splash shields aside.

1. Remove the pin-type retainers.
2. Position the shields aside.

30. **NOTE:** LH shown; RH similar.

Disconnect the LH and the RH anti-lock brake sensor electrical connectors.

31. **NOTE:** LH shown; RH similar.

Unclip the LH and the RH anti-lock brake harness from the brake hoses.

32. **NOTE:** LH shown; RH similar.

Remove the LH and the RH brake calipers and position the calipers aside.

33. **NOTE:** LH shown; RH similar.

Remove the LH and the RH sway bar lower nuts.

34. **NOTE:** LH shown; RH similar.

NOTE: Hold external hex when removing the ball joint nuts to prevent damage to the ball joints.

Remove the LH and the RH nuts and separate the ball joints from the spindles.

35. **NOTE:** LH shown; RH similar.

Remove the LH and the RH lower strut mount bolts.

36. **NOTE:** LH shown; RH similar.

Remove the LH and the RH splash shields.

37. Remove the center splash shield.

38. Remove the nut and disconnect the A/C high pressure line.

39. Disconnect the low pressure A/C line.

40. Remove the driveshaft. For additional information, refer to [Section 205-01](#).

41. Disconnect the shift cable from the shifter.

42. Unclip the shift cable from the bracket.

43. Remove the shift cable bracket.

44. Release the power steering lines from the LH frame rail.

45. Disconnect the rack and pinion steering unit electrical connectors.

46. Remove the steering shaft bolt.

47. Disconnect the steering coupling.
1. Remove the bolt.
2. Disconnect the coupling.

48. Remove the starter motor ground cable.

49. Remove the cover.

50. Disconnect the starter motor electrical connectors.

51. Disconnect the generator electrical connector.

52. Remove the six lower transmission to engine bolts.

53. Remove the cover.

54. **NOTE:** Make an identifying mark on the nut, stud, and adapter plate to allow for correct installation.

Remove the eight torque converter nuts.

55. Remove the inner air deflector.

56. Remove the engine block heater plug, if equipped.

57. Support the rear of the vehicle with suitable safety stands.

58. Support the engine, transmission, front and center crossmembers, and the cooling system with a powertrain lift and a transmission support bracket.
59. Remove the transmission crossmember bolts.

60. Remove the four front and the four center crossmember bolts.

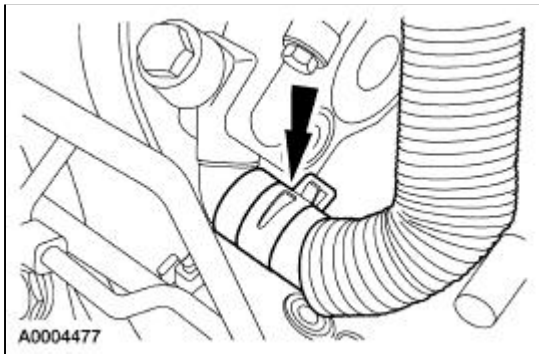

61. Carefully lower the entire assembly from the vehicle.
62. Disconnect the block heater, if equipped.

63. Disconnect the A/C manifold and tube.

64. Disconnect the power steering pump and hydraulic cooling fan pump return hoses.

65. Remove the bracket.

66. Remove the lower radiator hose.

67. Disconnect the radiator hoses.

68. Disconnect the knock sensor (KS) electrical connector.

69. Disconnect the heater hose.

70. Remove the transmission cooler line bracket.

71. Disconnect the transmission cooler lines.

72. Disconnect the power steering pressure line.

73. Remove the power steering line bracket.

74. Install the special tool.

75. Install the special tool.

76. Remove the hydraulic fan pump bracket.
1. Remove the bolt.
 2. Remove the bracket.

77. Disconnect the hydraulic fan pump line.

78. Using the special tool and an engine crane, support the engine and transmission in the front sub-frame.

79. **NOTE:** LH shown; RH similar.

Remove the LH and the RH upper engine mount nuts.

80. Using the special tool and an engine crane, move the engine and transmission from the sub-frame to rest on the floor or on a bench.

81. Remove the nuts and position the wiring harness aside.

82. Remove the bolts and separate the engine from the transmission.

83. Mount the engine on an engine stand.

84. Remove the engine lifting equipment.

Engine

Special Tool(s)

 ST1286-A	Crankshaft Damper Remover 303-009 (T58P-6316-D)
 ST2495-B	Crankshaft Rear Seal Remover/Installer 303-647
 ST2441-A	Screw 204-208 (T95T-5310-AR2)

Disassembly

1. Disconnect the vacuum harness.

2. Disconnect the vacuum line.

3. Remove the EGR valve to exhaust manifold tube.
 - Disconnect the upper fitting.
 - Disconnect the hoses.
 - Disconnect the lower fitting.

4. Disconnect the camshaft position (CMP) sensor electrical connector and separate the connector from the fuel injection supply manifold.

5. Disconnect the EGR vacuum regulator (EVR) electrical connector and the vacuum line.

6. Disconnect the air assist tube.

7. Disconnect the fuel pressure sensor electrical connector.

8. Remove the electrical connectors from the bracket.
 1. LH knock sensor (KS).
 2. Cylinder head temperature (CHT) sensor.

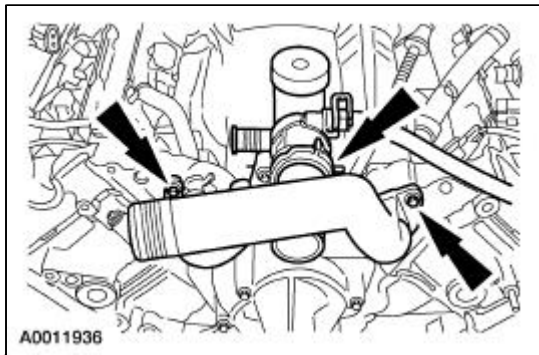

9. Remove the nut and the bracket.

10. Disconnect the RH KS and remove the electrical connector from the bracket.

11. Remove the four bolts. Disconnect the hoses and remove the coolant outlet pipe.

12. Remove the two nuts and the bracket.

13. Raise the engine wiring harness and disconnect the LH fuel injector connectors.

14. Disconnect the idle air control (IAC) valve and the throttle position sensor (TPS) electrical connectors.

15. Disconnect the PCV tube.

16. Disconnect the hoses (1) from the throttle body and the clip (2).

17. Remove the throttle body.

18. Raise the engine wiring harness and disconnect the RH fuel injectors.

19. Remove the nuts and position the wiring harness aside.

20. Remove the nine bolts and one stud (2) in the sequence shown.

21. Remove the intake manifold.

22. Remove the four bolts and the thermostat housing.

23.  **CAUTION:** To remove normal fittings, squeeze the tabs and pull straight out or damage to the fitting may occur.

Disconnect the crankcase ventilation tube.

24. Remove the nut and the oil level indicator and tube.

25. **NOTE:** LH shown; RH similar.

Remove the RH and LH coil covers.

26. **NOTE:** LH shown; RH similar.

Disconnect the RH and LH ignition coil connectors.

27. **NOTE:** LH shown; RH similar.

Remove the RH and LH ignition coils.

28. Disconnect the wiring harness retainers from the LH valve cover.

29. Remove the bolts in the sequence shown and remove the LH valve cover.

30. Remove the bracket.

31. Disconnect the four wiring harness retainers from the RH valve cover.

32. Remove the bolts in the sequence shown and remove the RH valve cover.

33. Loosen the water pump pulley bolts.

34. Remove the drive belt and tensioner. For additional information, refer to [Section 303-05](#).

35. Remove the water pump pulley.

- Remove and discard the bolts.
- Remove the pulley.

36.  **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of the gasket.**

Remove the water pump.

- Remove the bolts.
- Remove the water pump.
- Discard the gasket.
- Clean and inspect the O-ring seal. Install a new seal if necessary.

37. Remove the two idler pulleys.

38. Disconnect the electrical connector at the rear of the generator.

39. Remove the bolt.

40. Remove the generator.
1. Remove the upper bolt.
 2. Remove the lower bolt.

41. Disconnect the electrical connector.

42. Remove the hydraulic cooling fan pump.

43. Remove the hydraulic pump bracket.

44. Disconnect the A/C electrical connector and the retaining clip.

45. Remove the two power steering hose brackets.

46. Remove the A/C compressor (19703).

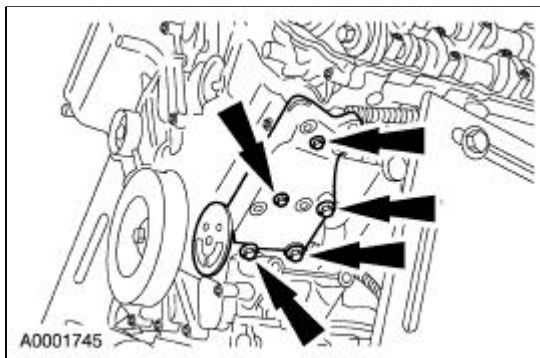

47. **NOTE:** One bolt is blocked by the power steering pressure line and will have to be removed in stages.

Remove the power steering pump.

48. Remove the power steering pump bracket.

49. Disconnect the two pin-type retainers.

50. Remove the wiring harness from the front cover.

51. Remove the wiring harness from the front cover.

52. Disconnect the crankshaft position (CKP) sensor electrical connector.

53. Remove the exhaust gas oxygen sensor (HO2S) connectors from the brackets.

54. Remove the starter motor.

55. **NOTE:** RH shown; LH similar.

Remove the RH and LH exhaust manifolds.

56. Remove the bolt and washer.
- Discard the bolt.

57. Using the special tool, remove the crankshaft damper.

58. Remove the bolts and remove the front cover.

59. Remove and discard the oil filter.

60. Remove the oil filter adapter.

- Discard the seal.

61. Turn the crankshaft to 45 degrees ATDC. The crankshaft keyway will be in the 6 o'clock position.

62. Remove the RH primary chain tensioner and the blanking plate.

63. Remove the RH lower primary chain tensioner arm.

64. Remove the RH upper primary chain tensioner guide.

65. Remove the bolt and the RH camshaft damper.

66. Remove the RH primary chain (6268) and crankshaft sprocket.

67. Remove the exhaust camshaft sprocket bolt.

68. Remove the secondary timing chain tensioner bolts.

69. Remove the RH camshaft chain, tensioner and sprockets as an assembly.

70. Remove the bolts and the LH primary chain tensioner and the blanking plate.

71. Remove the LH upper primary chain tensioner arm.

72. Remove the LH lower primary chain tensioner guide.

73. Remove the exhaust camshaft sprocket bolt.

74. Remove the secondary timing chain tensioner bolts.

75. Remove the intake sprocket bolt and the camshaft damper.

76. Remove the LH camshaft chain, tensioner sprockets, primary chain and crankshaft sprocket as an assembly.

77.  **CAUTION: Mark the camshaft caps for correct location and orientation during assembly.**

NOTE: RH shown; LH similar.

Remove the camshafts from the RH and LH cylinder heads.

- Remove the bolts.
- Remove the caps.
- Remove the camshafts.

78. **NOTE:** RH shown; LH similar.

Remove the bolts from the RH and LH cylinder heads.

79. Remove the bolts in sequence shown from both cylinder heads.

80. Remove the cylinder heads.

- Discard the gaskets.

81.  **CAUTION:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of sealant.

Clean the sealing surfaces.

82. Remove the knock sensors.

83. Remove the throttle body heater return hose.

84. Remove the four bolts and the oil pump.

- Discard the gasket.

85. Remove the bolts and the oil pan.

86. Remove the oil pump screen cover and tube and seal.

87. Remove the flexplate.

- Remove the bolts in the sequence shown.
- Remove the flexplate.

88. Using the special tool, remove the rear main seal.
- Discard the seal.

89. **⚠ CAUTION:** Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of the sealant.

Remove the bolts in the sequence shown and remove the sump body.

Cylinder Head

Special Tool(s)

Disassembly

1. Using the special tool, remove the valve spring retainer keys.

2. Remove the valve spring assemblies.
 1. Remove the valve spring retainers.
 2. Remove the valve springs.
 - For component tests for the valve spring refer to [Section 303-00](#).

3. Remove the valve stem seal.

4. Remove the valve.

- For component tests for the valve, refer to [Section 303-00](#).
- For component tests for the cylinder head, refer to [Section 303-00](#).

5. Repeat the procedure until all of the valves are removed from the cylinder head.

6. Remove the spark plugs. For additional information, refer to [Section 303-07B](#).

7. Remove the cylinder head temperature sensor (CHT) sensor.

8. Remove the camshaft position (CMP) sensor.

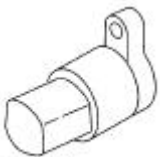

Assembly

1. To assemble, reverse the disassembly procedure.
 - Lubricate the valve stem and the valve stem seal with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.
-

Engine

Special Tool(s)

 ST2423-A	Front Crankshaft Seal Installer 303-646
 ST1287-A	Crankshaft Damper Replacer 303-102 (T74P-6316-B)
 ST2398-B	Camshaft Position Tool 303-530
 ST2399-A	Timing Chain Tensioning Tool 303-532
 ST2401-A	Crankshaft Position Tool 303-645
 ST2495-B	Crankshaft Rear Seal Remover/Installer 303-647
 ST2441-A	Screw 204-208 (T95T-5310-AR2)

1. **NOTE:** Lubricate the outer lips and the inner seal on the crankshaft rear oil seal with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-

M2C153-G.

Using the special tool, install the rear main seal.

2.  **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs, or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

NOTE: If the sump is not secured within 20 minutes of sealant application the sealant must be removed and the sealing area cleaned with Metal Surface Cleaner F4AZ-19A536-RA or equivalent meeting Ford specification WSE-M5B392-A. Allow to dry until there is no sign of wetness, or four minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

Apply three continuous beads of sealer.

- Use Silicone Gasket and Sealant F7AZ-19554-EA or equivalent meeting Ford specification WSE-M4G323-A4.

3. Install the oil sump. Using a straightedge, align the sump to the lower cylinder block. Tighten the bolts in sequence in two stages.
- Tighten the bolts to 15 Nm (11 lb-ft).

- Tighten the bolts to 25 Nm (18 lb-ft).

4. Install the flexplate and tighten the bolts in two stages in the sequence shown.
 - Stage 1: Tighten to 15 Nm (11 lb-ft).
 - Stage 2: Tighten to 110 Nm (81 lb-ft).

5. **NOTE:** There is one window on the ignition pulse wheel that is unique to accept the special tool.

Install the special tool.

- Turn the crankshaft to 45 degrees ATDC. The crankshaft keyway will be in the 6 o'clock position.
- Install the special tool.

6. **NOTE:** Inspect the seal. Install a new seal if necessary.

Install the oil pump screen cover and tube.

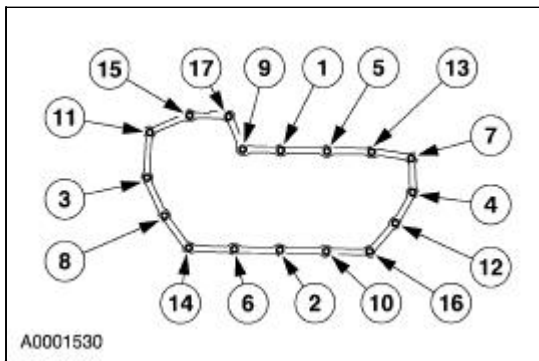

7. **NOTE:** Inspect and install a new oil pan gasket if necessary.

Install the oil pan.

8. Tighten the bolts in the sequence shown in two stages.
- Stage 1: Tighten to 5 Nm (44 lb-in).
 - Stage 2: Tighten to 12 Nm (9 lb-ft).

9. Install a new gasket, the oil pump and tighten the bolts in two stages.

- Stage 1: Tighten to 6 Nm (53 lb-in).
- Stage 2: Tighten an additional 90 degrees.

10. Install the throttle body heater return hose.

11. Install the knock sensors.

12. Position the cylinder heads.

- Install new gaskets.

13. Install and tighten the RH head bolts in six stages in the sequence shown.

- Stage 1: Tighten bolts 1–10 to 20 Nm (15 lb-ft).
- Stage 2: Tighten bolts 1–10 to 35 Nm (26 lb-ft).
- Stage 3: Tighten bolts 1-10 to 45 Nm (33 lb-ft) and an additional 90 degrees.
- Stage 4: Tighten bolts 1-10 an additional 90 degrees.
- Stage 5: Tighten bolts 11 and 12 to 20 Nm (15 lb-ft).
- Stage 6: Tighten bolts 11 and 12 an additional 90 degrees.

14. Install and tighten the bolts in two stages.
1. Tighten to 20 Nm (15 lb-ft).
2. Tighten an additional 90 degrees.

15. Install and tighten the LH head bolts in six stages in the sequence shown.
- Stage 1: Tighten bolts 1–10 to 20 Nm (15 lb-ft).
 - Stage 2: Tighten bolts 1–10 to 35 Nm (26 lb-ft).
 - Stage 3: Tighten bolts 1–10 to 45 Nm (33 lb-ft) and an additional 90 degrees.
 - Stage 4: Tighten bolts 1–10 an additional 90 degrees.
 - Stage 5: Tighten bolts 11 and 12 to 20 Nm (15 lb-ft).
 - Stage 6: Tighten bolts 11 and 12 an additional 90 degrees.

16. Install and tighten the bolts in two stages.
1. Tighten to 20 Nm (15 lb-ft).
 2. Tighten an additional 90 degrees.

17. **CAUTION:** The shim and tappets are location-specific. They must be installed in their original locations or shims will have to be reselected during installation.

CAUTION: Do not use any means of marking the shims other than a permanent type marker. Any scratches or paint on the shims may result in incorrect lash adjustments and severe engine damage.

If removed, install the tappets and shims. If new tappets and shims are to be installed or if they cannot be identified, refer to [Valve —Clearance Adjust](#) in this section.

18. **NOTE:** Apply Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G to the camshaft journals, the camshaft caps and the camshaft lobes prior to installing the camshafts.

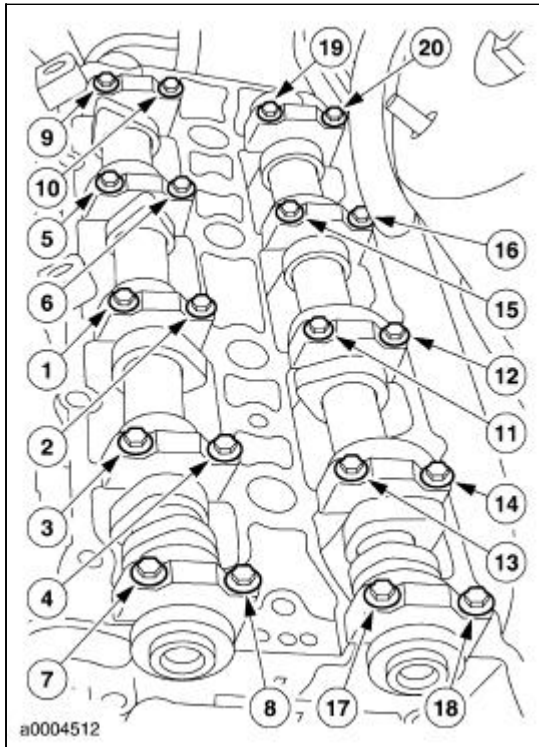

Position the LH camshafts on the camshaft journals.

19. **CAUTION:** Install the camshaft bearing cap locations. The camshaft bearing caps are positional and must be installed in their original locations and orientation or engine damage may occur.

Install the LH camshaft bearing caps.

- Position the bearing caps.
- Install the bolts. Tighten the bolts in three stages in the sequence shown.
 - Stage 1: Hand-tighten.
 - Stage 2: Tighten to 6 Nm (53 lb-in).
 - Stage 3: Tighten an additional 90 degrees.

20. **NOTE:** Apply Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G to the camshaft journals, the camshaft caps and the camshaft lobes prior to installing the camshafts.

Position the RH camshafts on the camshaft journals.

21.  **CAUTION:** Install the camshaft bearing caps in their original locations. The camshaft bearing caps are positional and must be installed in their original locations and orientations or engine damage may occur.

Install the RH camshaft bearing caps.

- Position the bearing caps.

- Install the bolts. Tighten the bolts in three stages in the sequence shown.
 - Stage 1: Hand-tighten.
 - Stage 2: Tighten to 6 Nm (53 lb-in).
 - Stage 3: Tighten an additional 90 degrees.

22. **NOTE:** The crankshaft must be at 45 degrees ATDC with crankshaft position tool installed.

Using a feeler gage, confirm that the bucket tappet and shim clearances are within specification.

23. **NOTE:** LH shown; RH similar.

Install the special tool on the LH head.

24. Collapse the tensioners.

- Insert a thin wire into the check valve.
- Apply hand pressure until the tensioner is fully collapsed.
- Remove the wire.

25. Position the tensioner.

26. Install the secondary timing chain tensioner bolts.

27. Position the intake sprocket, damper, chain and exhaust sprocket on the camshaft as an assembly.

28. Install the intake camshaft sprocket bolt.

29. Install the exhaust camshaft sprocket bolt and washer.

30. Reset the timing chain tensioner.
- Insert a fine wire and dislodge the check ball.
 - Using finger pressure, compress the tensioner.
 - Remove the wire.

31. **NOTE:** The timing mark on the LH timing chain crankshaft gear faces forward.

NOTE: The special tool should still be installed on the LH cylinder head.

Position the LH timing chain and crankshaft gear.

- Position the timing chain over the LH intake camshaft sprocket.
- Position the crankshaft gear in the timing chain.
- Position the timing chain and crankshaft gear over the crankshaft as an assembly.

32. Install the LH timing chain guide.

33. Install the LH timing chain tensioner arm.

34. Install the LH timing chain tensioner.

35. Install a tie strap to take up the slack in the timing chain.

36. Using the special tool, apply tension to the LH exhaust camshaft sprocket and tighten the camshaft sprocket bolts in two stages.
- Stage 1: Tighten to 20 Nm (15 lb-ft).
 - Stage 2: Tighten an additional 90 degrees.

37. Remove the special tool.
38. Install the special tool on the right cylinder head.

39. **NOTE:** The timing mark on the RH timing chain crankshaft gear faces forward.

Position the RH timing chain and crankshaft gear.

- Position the timing chain over the RH intake camshaft sprocket.
- Position the crankshaft gear in the timing chain.
- Position the timing chain and crankshaft gear over the crankshaft as an assembly.

40. Install the RH timing chain guide.

41. Install the RH timing chain tensioner arm .

42. Install the RH timing chain tensioner and blanking plate.

43. Install a tie strap to take up the slack in the timing chain.

44. Using the special tool, apply tension to the RH camshaft sprockets and tighten the bolts in two stages.

- Stage 1: Tighten to 20 Nm (15 lb-ft).
- Stage 2: Tighten an additional 90 degrees.

45. Remove the special tool and the two tie straps.

46. Apply Silicone Gasket and Sealant F7AZ-19554-EA or equivalent meeting Ford specification WSE-M4G323-A4 in eight places.

47. Install the engine front cover.
- Install new gaskets.
 - Position the engine front cover on the cylinder block.
 - Loosely install the bolts.
 - Tighten the bolts in two stages in the sequence shown.
 - Stage 1: Tighten to 5 Nm (44 lb-in).
 - Stage 2: Tighten to 10 Nm (89 lb-in).

48. Using the special tool, install the front crankshaft seal.

49. Apply Silicone Gasket and Sealant F7AZ-19554-EA or equivalent meeting Ford specification WSE-M4G323-A4 to the crankshaft pulley keyway.

50. Using the special tool, install the crankshaft pulley.

51. Install the washer and a new bolt and tighten in two stages.
 - Stage 1: Tighten to 80 Nm (59 lb-ft).
 - Stage 2: Tighten an additional 80 degrees.
 - Remove the flexplate holding tool.

52. Install a new seal, the oil filter adapter, and the oil cooler (if equipped).

53. Install the oil filter.
 - Install the oil filter until the seal makes contact.
 - Tighten an additional 270 degrees.

54. **NOTE:** The gaskets are marked top to aid in installation.

NOTE: LH shown; RH similar.

Install the new exhaust manifold gaskets and the exhaust manifolds.

55. Install the starter motor.

56. **NOTE:** Lubricate the water pump O-ring seal with Premium Engine Coolant E2FZ-19549-AA or equivalent meeting Ford specification ESE-M97B44-A.

Install the water pump.

- Inspect the O-ring seal and install a new O-ring seal as necessary.
- Position a new water pump gasket.
- Position the water pump.
- Install the bolts and tighten in two stages.
 - Stage 1: Tighten to 8 Nm (72 lb-in).
 - Stage 2: Tighten an additional 90 degrees.

57. **NOTE:** RH shown; LH similar.

Inspect and install new gaskets as necessary.

58. **NOTE:** RH shown; LH similar.

Apply four beads of Silicone Gasket and Sealant F7AZ-19554-EA or equivalent meeting Ford specification WSE-M4G323-A4.

59. **NOTE:** RH shown; LH similar.

Install the valve covers.

- Tighten the bolts in the sequence shown.

60. Install the eight ignition coils.

61. Install the four bolts and the thermostat housing.

62. Install the intake manifold and tighten the bolts and stud bolt (2) in the sequence shown.

- Inspect and install a new gasket if necessary.

63. Position the wiring harness and install the nuts.

64. Install the bracket.

65. Install the EGR valve to exhaust manifold tube. Finger-tighten both fittings. Tighten the upper fitting.

66. Tighten the lower fitting.

67. Connect the fuel injector connectors and position the engine wiring harness.

68. Install the bracket and the two nuts.

69. Install the water outlet pipe.
- Inspect and install a new gasket if necessary.
 - Install the four bolts.
 - Connect the hoses.

70. Connect the knock sensor connector and install onto the bracket.

71. Install the CHT sensor and KS electrical connectors on the bracket.

72. Connect the fuel pressure sensor electrical connector.

73. Connect the HO2S connectors to the brackets.

74. Remove the special tool, install the CKP sensor.

75. Connect the CKP sensor connector.

76. Connect the two pin-type retainers.

77. Install the wiring harness to the front cover on the LH side.

78. Install the wiring harness to the front cover on the RH side.

79. Install the power steering pump bracket.

80. Install the power steering pump.

81. Install the hydraulic cooling fan pump bracket.

82. Install the hydraulic cooling fan pump.

83. Connect the electrical connector.

84. Install the A/C compressor.

85. Connect the electrical connector and the retaining clip.

86.  **CAUTION:** The generator must be installed in the order shown or damage to the drive belt may occur.

Position the generator and loosely install the bolts and nut.

- Tighten the upper bolt and nut.

87. Tighten the lower expanding bushing and bolt in two stages.

- Stage 1: Tighten to 20 Nm (15 lb-ft).
- Stage 2: Tighten an additional 90 degrees.

88. Tighten the bolt.

89. Connect the electrical connector.

90. Install the two idler pulleys.

91. Position the water pump pulley and loosely install new bolts.
92. Install the drive belt tensioner. For additional information, refer to [Section 303-05](#).
93. Tighten the water pump pulley bolts in two stages.
 - Stage 1: Tighten to 10 Nm (89 lb-in).
 - Stage 2: Tighten an additional 45 degrees.

94. Install the inlet tube support bracket.

95. Install the eight wiring harness retainers.

96. Connect the fuel injector connectors and position the engine wiring harness.

97. Connect the eight ignition coil connectors.

98.  **CAUTION:** Make sure that the wiring harness inlet seals are seated in the valve covers or damage to the wiring harness may occur.

Install the ignition coil covers.

99. **NOTE:** Clean and inspect the gasket. Install a new gasket if necessary.

Install the throttle body.

100. Connect the hoses (1) and install the hose in the clip (2).

101. Connect the positive crankcase ventilation (PCV) line.

102. Connect the IAC and TPS connectors.

103. Connect the air assist valve hose.

104. Connect the EGR vacuum regulator vacuum and electrical connections.

105. Connect the CMP sensor connector and connect the connector locator.

106. Connect the EGR valve to exhaust manifold tube.

107. Connect the vacuum line.

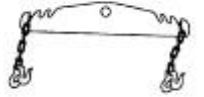

108. Connect the vacuum harness.

Engine

Special Tool(s)

 <p>ST1595-A</p>	Engine Lifting Brackets 303-050 (T70P-6000)
 <p>ST1602-A</p>	Spreader Bar 303-D089 (D93P-6001-A3)

1. Install the special tool.

2. Install the special tool.

3. Using a floor crane and a spreader bar (303-D089) to support the engine, remove the engine from the engine stand.
4. **NOTE:** Align the flexplate to converter marks made at removal.

Install the engine to the transmission and install the bolts.

5. Install the wiring harness.

6. Using a floor crane and the special tool,, install the engine onto the sub-frame.

7. **NOTE:** LH shown; RH similar.

Install the LH and the RH upper engine mounts.

8. Remove the engine lifting equipment.

9. Remove the special tool.

10. Remove the special tool.

11. Connect the hydraulic fan pump line.

12. Install the hydraulic fan pump line bracket.
1. Install the bracket.

2. Install the bolt.

13. Install the power steering line bracket.

14. Connect the power steering line.

15. Connect the transmission cooler lines.

16. Install the transmission cooler line bracket.

17. Connect heater hose.

18. Connect the KS electrical connector.

19. Connect the radiator hoses.

20. Install the lower radiator hose.

21. Install the bracket.

22. Connect the power steering pump and the hydraulic cooling fan pump return hoses.

23. Connect the A/C manifold and tube.

24. Connect the block heater, if equipped.

25. Using the powertrain lift and the transmission support bracket, carefully raise the entire assembly into the vehicle.
26. Install the four front and the four center crossmember bolts.

27. Install the transmission crossmember bolts.

28. Install the engine block heater plug, if equipped.

29. Install the inner air deflector.

30. Install the eight torque converter nuts.

31. Install the cover.

32. Install the six lower transmission to engine bolts.

33. Connect the generator electrical connector.

34. Connect the starter motor electrical connectors.

35. Install the cover.

36. Install the starter motor ground cable.

37. Connect the steering coupling.

38. Install the steering shaft bolt.

39. Connect the rack and pinion steering unit electrical connectors.

40. Install the hydraulic cooling fan lines to the RH frame rail.

41. Install the shift cable bracket.

42. Reclip the shift cable to the bracket.

43. Connect the shift cable to the shifter.

44. Install the driveshaft. For additional information, refer to [Section 205-01](#).

45. Connect the A/C low pressure line.

46. Connect the A/C high pressure line.

47. Install the center splash shield.

48. **NOTE:** LH shown; RH similar.

Install the LH and the RH splash shields.

49. **NOTE:** LH shown; RH similar.

Install the LH and the RH lower strut mount bolts.

50. **NOTE:** LH shown; RH similar.

Install the LH and the RH ball joints to the spindles and install the nuts.

51. **NOTE:** LH shown; RH similar.

Install the LH and the RH sway bar lower nuts.

52. **NOTE:** LH shown; RH similar.

Install the LH and the RH brake calipers.

53. **NOTE:** LH shown; RH similar.

Position the LH and the RH anti-lock brake sensor harness and reclip to the brake hoses.

54. **NOTE:** LH shown; RH similar.

Connect the LH and the RH anti-lock brake sensor electrical connectors.

55. **NOTE:** LH shown; RH similar.

Install the LH and the RH inner splash shields.

1. Position the shield.
2. Install the pin-type retainers.

56. Install the front wheels and tires. For additional information, refer to [Section 204-04](#).

57. Clip the harness to the radiator support and connect the water valve electrical connector.

58. Install the hydraulic cooling fan reservoir.

59. **NOTE:** Install the two hoses to the marks made during removal.

Connect the hoses to the water control valve.

60. Connect the connectors.

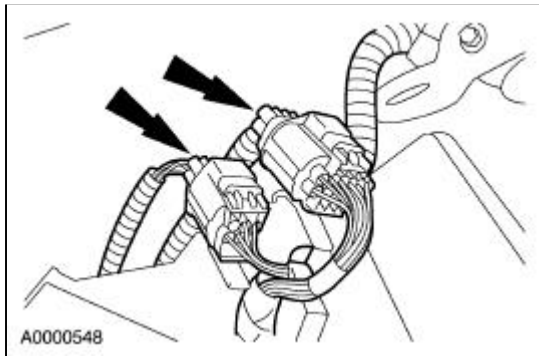

61. Install the fresh air filter panel.
1. Position the panel.

2. Install the nuts.
3. Install the pin-type retainer.

62. **NOTE:** The connectors are located on the backside of the RH strut tower.

Connect the powertrain bulkhead electrical connectors.

63. Install the fresh air filter housing.

64. Install the fresh air filter.

65. Connect the ground strap.

66. Connect the accelerator cable and the speed control cable.

67. Connect the degas bottle hose.

68. Install the bracket.
1. Install the bracket.
 2. Install the seven bolts and one nut.
 3. Install the windshield washer hose.

69. Reclip the hose.

70. Install the cowl vent screen. For additional information, refer to [Section 501-02](#).

71. Connect the main vacuum supply hose.

72. Connect the VMV.

- Vacuum hose.
- Canister purge valve.

73. Install the VMV cover.

74. Connect the fuel line. For additional information, refer to [Section 310-00](#).
75. Install the power steering pump reservoir.

76. Attach the power steering return line to the pressure line.

77. Connect the A/C pressure switch electrical connector.

78. Install the two upper radiator support brackets.

79. Install the upper radiator sight shield.

80. Fill the engine with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.
 81. Connect the battery ground cable. For additional information, refer to [Section 414-01](#).
 82. Install the air cleaner inlet. For additional information, refer to [Section 303-12](#).
 83.  **CAUTION: The cooling system filling and bleeding procedure must be followed exactly or damage to the engine may occur.**

Fill the engine cooling system. For additional information, refer to [Section 303-03](#).
 84. Fill the power steering reservoir to the correct level. For additional information, refer to [Section 211-02](#).
 85. Fill and bleed the hydraulic cooling fan. For additional information, refer to [Section 303-03](#).
 86. Charge the A/C system. For additional information, refer to [Section 412-00](#).
-

General Specifications

Item	Specification
3.9L	11.3
3.0L	10.6
Cooling fan MAX speed	2,300 ± 100 rpm
Cooling fan MAX pressure output	1,200 psi
Cooling fan operating pressure	900 psi
Cooling fan operating flow rate	4.0 ± 0.25 gpm
Coolant mixture with water	50% ^a
Pressure relief cap opening pressure kPa (psi)	110 (16)
Water thermostat start to open temperature	87-93°C (192-199°F)
Water thermostat full open temperature	104° C(219°F)
Lubrication	
Premium Cooling System Flush F1AZ-19A503-A	ESR-M14P7-A
Premium Long Life Grease XG-1-C	ESA-M1C75-B

^a Premium Engine Coolant E2FZ-19549-AA (F5FZ-19549-CC in Oregon), or equivalent meeting Ford specification ESE-M97B44-A.

Engine Cooling

The cooling system components include the:

- block heater (optional)
- cylinder head temperature sensor
- fan blade, fan motor and fan shroud assembly
- radiator
- pressure relief cap
- degas bottle
- radiator draincock
- water pump
- oil cooler (optional)
- water thermostat

The water thermostat:

- controls the engine coolant temperature.
- allows quicker engine warm-up.

The degas bottle:

- provides a location for system fill.
- contains coolant expansion and system pressurization.
- provides air separation during operation.
- replenishes the engine coolant to the system.

The fan blade draws air through the radiator to help cool the engine coolant.

The fan motor:

- operates only when the engine is running.
- will not operate when the engine is off.

The engine coolant flows:

- from the lower radiator hose to the water pump.
- from the water pump to the engine block and the cylinder heads.

A closed water thermostat returns the engine coolant to the water pump. An open water thermostat allows the engine coolant to flow to the radiator.

Unsatisfactory coolant materials:

- Alcohol-type antifreeze does not provide adequate water pump lubrication.
 - has lower boiling point
 - reduced antifreeze protection
- Alkaline brine solutions will cause serious engine cooling system damage.

The cylinder head temperature sensor provides a signal to the temperature gauge.

- will invoke failsafe cooling.

The optional block heater:

- electrical heating element is installed in the block cooling jacket.
 - uses a standard 110V (220V in Europe) electrical supply
- keeps the engine coolant warm during cold weather.

The auxiliary water pump (3.9L only):

- provides heater coolant flow boost.
- has a secondary function of providing engine-off cooling.

Coolant Flow 3.9L

A0008362

Item	Part Number	Description

Inspection and Verification

1. Verify the customer concern by operating the engine to duplicate the condition.
2. Inspect to determine if any of the following mechanical or electrical concerns apply.

Visual Inspection Chart

Mechanical	Electrical
<ul style="list-style-type: none"> ● Leaks ● Restricted airflow through the condensor/radiator ● Damaged hoses ● Loose/damaged hose clamps ● Damaged water gasket ● Damaged head gaskets ● Damaged water pump ● Damaged radiator 	<ul style="list-style-type: none"> ● Damaged cylinder head temperature sensor ● Damaged wiring ● Hydraulic cooling fan pump solenoid/solenoid wiring

<ul style="list-style-type: none"> ● Damaged degas bottle ● Damaged heater core ● Hydraulic cooling fan system <ul style="list-style-type: none"> ■ Fluid level ■ Hydraulic line or joint leaks ■ Kinked hydraulic lines 	
---	--

 **CAUTION: The cylinder head temperature sensor is not reusable after removal on 3.9L engines. For electrical concern testing refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.**

3. If the inspection reveals an obvious concern that can be readily identified, repair it as necessary.
4. If the concern remains after the inspection, determine the symptom(s) and go to the Symptom Chart.
5. Verify the cooling system is correctly filled and bled. For additional information, refer to [Cooling System Draining, Filling And Bleeding](#) in this section.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
<ul style="list-style-type: none"> ● Loss of engine coolant 	<ul style="list-style-type: none"> ● Radiator. ● Thermostat housing assembly. ● Auxiliary water pump (3.9L only). ● Heater control valve. ● Oil cooler. ● PCV heater system. ● Throttle body adapter heating (3.9L). ● Water pump seal. ● Radiator hoses. ● Heater hoses. ● Heater core. ● Engine gaskets. ● Degas bottle. 	<ul style="list-style-type: none"> ● GO to Pinpoint Test A.
<ul style="list-style-type: none"> ● The engine overheats 	<ul style="list-style-type: none"> ● Water thermostat. ● Airlock in the system. ● Water pump. ● Internal engine coolant leak. ● Radiator. ● Radiator airflow obstruction. 	<ul style="list-style-type: none"> ● GO to Pinpoint Test B.

Pinpoint Tests

PINPOINT TEST A: LOSS OF COOLANT

CONDITIONS	DETAILS/RESULTS/ACTIONS
A1 CHECK THE ENGINE COOLANT LEVEL	
NOTE: Allow the engine to cool before checking the engine coolant level.	
<p>1 </p>	<p>2 Visually check the engine coolant level at the degas bottle.</p> <ul style="list-style-type: none"> ● Is the engine coolant level within specification? <p>→ Yes GO to A2.</p> <p>→ No REFILL the engine coolant as necessary. GO to A6.</p>
A2 DEGAS BOTTLE PRESSURE RELIEF CAP	
1	<p> WARNING: Never remove the pressure relief cap under any conditions while the engine is operating. Failure to follow these instructions could result in damage to the cooling system or engine and/or personal injury. To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the pressure relief cap from a hot degas bottle. Wait until the engine has</p>

cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly one turn (counterclockwise). Step back while the pressure is released from the cooling system. When certain all the pressure has been released, remove the pressure relief cap (still with a cloth).

Allow the engine to cool.

2 Remove the pressure relief cap.

3 Inspect the pressure relief cap for foreign material between the sealing gasket and the diaphragm.

● Is the pressure relief cap OK?

→ Yes
REFER to Component Tests.

→ No
CLEAN or INSTALL a new pressure relief cap. TEST the system for normal operation. GO to [A1](#).

A3 CHECK THE ENGINE COOLANT FOR INTERNAL LEAK

1

2 Inspect the engine coolant in the degas bottle for signs of engine oil.

● Is oil evident in the coolant?

→ Yes
If engine oil is evident, GO to [Section 303-00](#).

→ No
GO to [A4](#).

A4 CHECK THE ENGINE FOR COOLANT

1 Remove the oil level indicator from the engine.

● Is coolant evident in the oil?

→ Yes
If coolant is in the engine, GO to [Section 303-00](#).

→ No
GO to [A5](#).

A5 PRESSURE TEST THE ENGINE COOLING SYSTEM

1 Pressure test the engine cooling system; refer to the Component Tests in this section.

● Does the engine cooling system leak?

→ Yes
REPAIR or INSTALL new components. TEST the system for normal operation.

	→ No The cooling system is operational. RETURN to the Symptom Chart.
A6 CHECK THE DEGAS BOTTLE	
	<p>1 NOTE: The engine must be cool when coolant is added to the degas bottle.</p> <p>Add coolant to the degas bottle until fluid is between the coolant fill level marks.</p> <ul style="list-style-type: none"> ● Does the degas bottle leak? <p>→ Yes INSTALL a new degas bottle. TEST the system for normal operation.</p> <p>→ No CARRY OUT the cooling system pressure test. REFER to the Component Tests in this section. REPAIR as necessary. TEST the system for normal operation.</p>

PINPOINT TEST B: THE ENGINE OVERHEATS

CONDITIONS	DETAILS/RESULTS/ACTIONS
B1 CHECK THE ENGINE COOLANT LEVEL	
NOTE: If the engine is hot, allow the engine to cool before proceeding.	
<p>1</p> 	<p>1  WARNING: Never remove the pressure relief cap under any conditions while the engine is operating. Failure to follow these instructions could result in damage to the cooling system or engine and/or personal injury. To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the pressure relief cap from a hot degas bottle. Wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly one turn (counterclockwise). Step back while the pressure is released from the cooling system. When certain all the pressure has been released, remove the pressure relief cap (still with a cloth).</p> <p>2 Check the engine coolant level at the degas bottle.</p> <ul style="list-style-type: none"> ● Is the engine coolant OK? <p>→ Yes GO to B2.</p> <p>→ No REFILL the engine coolant at the degas bottle. GO to Pinpoint Test A.</p>
B2 CHECK THE COOLANT CONDITION	
	<p>1 Check the coolant for contaminants such as rust, corrosion, or discoloration.</p> <ul style="list-style-type: none"> ● Is the coolant condition OK? <p>→ Yes GO to B3.</p>

→ **No**
FLUSH the engine cooling system; REFER to [Flushing—Engine and Radiator](#) in this section. TEST the system for normal operation.

B3 CHECK FOR AN AIRFLOW OBSTRUCTION

1 Inspect the A/C condenser core and radiator for obstructions such as leaves or dirt.

● **Is there an obstruction?**

→ **Yes**
REMOVE the obstruction. CLEAN the A/C condenser core and radiator. TEST the system for normal operation.

→ **No**
GO to [B4](#).

B4 CHECK THE HEATER CORE OPERATION

2

1 Install the pressure relief cap.

3 As the engine starts to heat up, feel the inlet and outlet heater water hoses. They should feel approximately the same after three or four minutes.

● **Is the outlet heater water hose approximately the same temperature as the inlet heater water hose?**

→ **Yes**
GO to [B5](#).

→ **No**
TURN the engine off. REPAIR or INSTALL a new heater core. REFER to [Section 412-00](#). TEST the system for normal operation.

B5 CHECK THE WATER THERMOSTAT OPERATION

1

1 Start the engine and allow the engine to run for 10 minutes.

2

3 Feel the upper and lower radiator hoses.

● **Are the upper and lower radiator hoses cold?**

→ **Yes**
INSTALL a new water thermostat. TEST the system for normal operation.

	→ No GO to B6 .
B6 CHECK THE COOLING FAN OPERATION	
1 	1 Carry out the cooling fan component tests; refer to the Component Tests in this section. <ul style="list-style-type: none"> ● Is the cooling fan operation OK? → Yes GO to Section 303-00 for diagnosis and testing of the engine. → No INSTALL a new fan component as necessary. TEST the system for normal operation.

PINPOINT TEST C: THE ENGINE DOES NOT REACH NORMAL OPERATING TEMPERATURE

CONDITIONS	DETAILS/RESULTS/ACTIONS
C1 CHECK THE ENGINE TEMPERATURE	
1 	1 Start the engine and allow the engine to idle for 10 minutes.
2 	2 Feel the upper and lower radiator hoses. <ul style="list-style-type: none"> ● Are the upper and lower radiator hoses cold? → Yes INSTALL a new water thermostat. TEST the system for normal operation. → No GO to Section 413-01 for diagnosis and testing of the engine coolant temperature gauge.

PINPOINT TEST D: THE BLOCK HEATER DOES NOT OPERATE CORRECTLY

CONDITIONS	DETAILS/RESULTS/ACTIONS
D1 CHECK THE POWER CABLE	
1	

2

Block Heater

3

Q4195-A

3 Check the resistance in circuits 1, 2, and 3 of the block heater.

- Are the resistances in circuits 1, 2, and 3 less than 5 ohms?

→ **Yes**
INSTALL a new block heater. TEST the system for normal operation.

→ **No**
INSTALL a new power cable. TEST the system for normal operation.

Component Tests

Pressure Test

1. Turn the engine OFF.
2. Remove the cowl vent screen. For additional information, refer to [Section 501-02](#).
3.  **WARNING:** Never remove the pressure relief cap under any conditions while the engine is operating. Failure to follow these instructions could result in damage to the cooling system or engine and/or personal injury. To avoid having scalding hot coolant or steam blow out of the cooling system, never remove the pressure relief cap from a hot degas bottle. Wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly one turn (counterclockwise). Step back while the pressure is released from the cooling system. When certain all the pressure has been released, remove the pressure relief cap (still with a cloth).

Check the engine coolant level. For additional information, refer to [Cooling System Draining, Filling And Bleeding](#) in this section.

4. Connect the Radiator/Heater Core Pressure Tester to the degas bottle nipple and overflow hose. Install a pressure test pump to the quick-connect fitting of the test adapter.
5. **NOTE:** If the plunger of the pump is depressed too fast, an erroneous pressure reading will result.

Slowly depress the plunger of the pressure test pump until the pressure gauge reading stops increasing and note the highest pressure reading obtained.

6. If the pressure relief cap does not hold pressure, remove and wash the pressure relief cap in clean water to dislodge all foreign particles from the gaskets. Check the sealing surface in the filler neck.
7. If 8-9 kPa (13 psi) cannot be reached, install a new pressure relief cap. If more than 12 kPa (18 psi) shows on the gauge, install a new pressure relief cap.
8.  **CAUTION: If the pressure drops, check for leaks at the engine to heater core hoses, engine-to-radiator hoses, water valve hose (if applicable), oil cooler return tube gasket, radiator and heater core or other system components and connections. Any leaks which are found must be corrected and the system rechecked.**

Pressurize the engine cooling system as described in Step 4 (using a pressure relief cap that operates within the specified upper and lower pressure limits). Observe the gauge reading for approximately two minutes; refer to General Specifications. Pressure should not drop during this time.

9. Release the system pressure by loosening the pressure relief cap. Check the engine coolant level and replenish, if necessary, with the correct engine coolant mixture. For additional information, refer to [Cooling System Draining, Filling And Bleeding](#) in this section.

Cap

WARNING: Never remove the pressure relief cap under any conditions while the engine is operating. Failure to follow these instructions could result in damage to the cooling system or engine and/or personal injury. To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the pressure relief cap from a hot degas bottle. Wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly one turn (counterclockwise). Step back while the pressure is released from the cooling system. When certain all the pressure has been released, remove pressure relief cap (still with a cloth).

1. Remove the pressure relief cap from the degas bottle.
2. Immerse the pressure relief cap in water and install it on the shallow filler neck of Radiator/Heater Core Pressure Tester and Radiator Cap Adapter, part of the Radiator/Heater Core Pressure Tester.
3. Immerse the filler neck seal in water and install it in the filler neck adapter.
4. Install the filler neck adapter with the filler neck seal to the Radiator Cap Adapter.
5. Connect the female quick-connect fitting of the pressure test pump to the male quick-connect fitting of the filler neck adapter.
6. **NOTE:** If the plunger of the pump is depressed too fast, an erroneous pressure reading will result.

Slowly depress the plunger of the pressure test pump until the pressure gauge reading stops increasing and note the highest pressure reading obtained.

7. Release the pressure by turning the relief screw counterclockwise. Then tighten the pressure relief screw and repeat Step 6 (at least twice) to make sure the reading is repeatable within the specifications of the pressure relief cap.
8. If the pressure test gauge readings are not within specifications, install a new pressure relief cap. If the pressure test gauge readings are within specifications, carry out the cooling system Pressure Test.

Thermostat—Water

A new water thermostat should be installed only after the following electrical and mechanical tests have been carried out.

Thermostat—Electrical Test

NOTE: The electrical thermostat test is most accurate if carried out indoors at less than 37.8°C (100°F) ambient air. This test may be carried out with or without the hood open and with the engine warm or cold.

1. Check the engine coolant level. Fill as needed.
2. With the ignition OFF, attach the Rotunda 73 Digital Multimeter. It may be used to monitor sensor voltage values between 0-5 volts.
New Generation STAR (NGS) Tester or the Service Bay Diagnostic System (SBDS) may be used to monitor the CHT on vehicles equipped with data link connector (DLC). The SBDS sequence to use for the screen is: Toolbox-Electronic Engine Control and DCL-Item.
3. **NOTE:** Running this test with the vehicle in gear or with the A/C compressor clutch engaged (running) will cause incorrect diagnosis.

Place the transmission in PARK (P) or NEUTRAL (N).

4. Start the engine and allow the engine to idle throughout this test. Allow the engine to run for two minutes, then record the CHT voltage. Record the CHT voltage every 60 seconds. When the CHT voltage trend changes direction or only changes slightly (0.03 volt or less) from the previous reading, record this as the thermostat opening voltage. Use the voltage and corresponding coolant temperature chart listed below.

Coolant Temp °C (°F)	CHT Min (Volts)	CHT Nom (Volts)	CHT Max (Volts)
0 (32)	4.7714	4.8032	4.8723
25 (77)	4.3428	4.4148	4.4727
50 (122)	3.5354	3.6495	3.7473
80 (176)	2.3049	2.4201	2.5260
110 (230)	1.3021	1.3808	1.4562
140 (284)	0.6960	0.7414	0.7857
170 (338)	0.3784	0.4024	0.4261

5. If the thermostat opening voltage is less than 2.3049 volts and less than 80°C (176°F), install a new water thermostat.

6. If the thermostat opening voltage is greater than 2.3049 volts 82°C (180°F), the water thermostat is good and a new water thermostat should not be installed. Refer to the Symptom Chart for further instructions.

Thermostat—Mechanical Test

1. Remove the water thermostat.
2. Check the water thermostat for seating. Hold the water thermostat up to a lighted background. Leakage of light around the thermostat valve at room temperature indicates a new water thermostat should be installed. Some water thermostats have a small leakage notch at one location on the perimeter of the thermostat valve, which is considered normal.
3. Immerse the water thermostat in a boiling antifreeze and water mixture.
4. See the General Specifications chart for water thermostat opening temperatures.

Radiator Leak Test, Removed From the Vehicle

CAUTION: Never leak test an aluminum radiator in the same water that copper/brass radiators are tested in. Flux and caustic cleaners may be present in the cleaning tank and they will damage aluminum radiators.

NOTE: Always install plugs in the oil cooler fittings before leak testing or cleaning any radiator.

NOTE: Clean the radiator before leak testing to avoid contamination of tank.

1. Leak test the radiator in clean water with 138 kPa (20 psi) air pressure.

Hydraulic Cooling Fan Reservoir

1. Reduce the fluid in the reservoir by half.
2. Attach the New Generation STAR (NGS) Tester to the vehicle.
3. Start the engine and command MAX fan.
4. Maintain 2,500 rpm. Fluid should be observed through the reservoir returning. The internal return also functions as a relief valve; fluid must be observed through the sides of the return. If the fluid is not returning through the sides the screen is plugged. If no or little return is observed or the fluid is returning through the pressure relief, install a new reservoir.

Hydraulic Cooling Fan Motor

1. Inspect the fan blade and shroud for any foreign materials. Clear the obstruction and continue the test procedure.
2. Rotate the fan to see if any contact between the shroud and blade exists. If contact is observed install a new fan shroud assembly.

3. Rotate the fan by hand; the fan should rotate freely (no resistance should be felt, the fan will free wheel with minimum effort). If any resistance is present install a new fan assembly.
4. Attempt to move the fan blade and shaft in and out and side to side; if any movement is detected install a new fan assembly.

Hydraulic Cooling Fan Pump

WARNING: Do not touch the flowmeter during the test procedure or severe burns and serious injury may occur.

1.  **CAUTION:** Make sure that the connection point will not interfere with any of the engine accessory drive components or drive belts.

NOTE: On some vehicles the port may not be easily accessible. The power steering analyzer should then be hooked up at the hydraulic cooling fan motor or at a point in the high pressure line between the motor and the hydraulic cooling fan pump.

Install the power steering analyzer at the high pressure port of the hydraulic cooling fan pump. Make sure the power steering analyzer gate is fully open.

2.  **CAUTION:** A noisy fan system must be bled and refilled before proceeding with any of the test procedures. For additional information, refer to [Hydraulic Cooling Fan System Filling and Bleeding](#) in this section.

Check the cooling fan hydraulic fluid level. If necessary, add fluid.

- Use MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX meeting Ford specification MERCON® or equivalent.
3. Remove the reservoir screen and place the dial thermometer in the hydraulic cooling fan reservoir.
 4. Start the engine and allow the engine to warm up until the fan turns on.
 5. Allow fluid temperature to reach 74-80°C (165-175°F).
 6. Record the flow rate and pressure readings.
 7. **NOTE:** The pressure relief valve will open at 1,050 ± 100 psi (7,240 kPa ± 689.5 kPa). If the pressure is above 1,200 psi (8,275 kPa), a new pump pressure relief valve must be installed.

Turn the A/C on MAX, and record the flow and pressure readings. The flow and pressure readings should increase.

- If the flow and pressure readings do not increase, install a new hydraulic cooling fan pump.
8. Partially close the gate valve to achieve 300 psi (2,068.5 kPa). The flow rate should be 1.65 ±.25 gpm.
 - If the flow rate is less than specified, install a new hydraulic cooling fan pump.
-

Cooling System Inspection

Special Tool(s)

 ST1720-A	Fluid Tester 014-R1060 or equivalent
---	---

-  **WARNING:** Never remove the pressure relief cap while the engine is operating or when the cooling system is hot. Failure to follow these instructions can result in damage to the cooling system or engine or personal injury. To avoid having scalding hot coolant or steam blow out of the degas bottle when removing the pressure relief cap, wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly. Step back while the pressure is released from the cooling system. When you are sure all the pressure has been released, (still with a cloth) turn and remove the pressure relief cap.

 **CAUTION:** If there is engine coolant in the engine oil, the cause must be corrected and the oil changed or engine damage may occur.

NOTE: If vehicle has not been allowed to reach normal operating temperature, check the engine coolant in the degas bottle. This will make sure sufficient engine coolant exchange has occurred.

Allow the engine to cool. Once pressure is released, remove the pressure relief cap.

- Inspect the coolant in the degas bottle for coolant color:
 - If Premium Engine Coolant E2FZ-19549-AA or equivalent meeting Ford specification ESE-M97B44-A has a clear, light green or blue color, this indicates higher water content than necessary.
 - Dark brown indicates unauthorized stop leak may have been used.
 - A light or reddish-brown color indicates rust in the cooling system. Flush the system and refill with the correct mixture of water and Premium Engine Coolant E2FZ-19549-AA (in Oregon F5FZ-19549-CC) or equivalent meeting Ford specification ESE-M97B44-A.
 - An iridescent sheen on top of the coolant indicates a trace of oil is entering the cooling system.
 - A milky brown color may indicate that engine oil is entering the cooling system.
 - Or if engine coolant is present in the engine oil, the causes of the leak might be:
 - a blown head gasket.
 - a cracked or warped cylinder head.
 - a crack in the engine oil gallery and cooling passageways.
 - an internal leak in the engine oil cooler.
- If the engine coolant appearance is good, test the engine coolant range with the Fluid Tester:

- maximum range is 60/40
- minimum range is 45/55

4. Check the engine coolant system conditions:

- If the engine cooling fluid is low, add the specified coolant mixture only.
 - If the engine coolant fluid tests weak, add straight engine coolant until the readings are within acceptable levels.
 - If the engine coolant tests strong, remove some of the engine coolant and add water until readings are within acceptable levels.
-

Cooling System Draining, Filling And Bleeding

Draining

⚠ WARNING: Never remove the pressure relief cap while the engine is operating or when the cooling system is hot. Failure to follow these instructions can result in damage to the cooling system or engine or personal injury. To avoid having scalding hot coolant or steam blow out of the degas bottle when removing the pressure relief cap, wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly. Step back while the pressure is released from the cooling system. When you are sure all the pressure has been released, (still with a cloth) turn and remove the pressure relief cap.

⚠ CAUTION: The coolant must be recovered in a suitable, clean container for reuse. If the coolant is contaminated it must be recycled or disposed of correctly.

⚠ CAUTION: Care must be taken to ensure the accessory drive belt does not become contaminated with engine coolant.

1. Release the pressure in the cooling system by slowly turning the pressure relief cap one half turn counterclockwise. When the pressure is released, remove the pressure relief cap.
2. **NOTE:** Approximately four liters will drain from the radiator.

Place a suitable container below the radiator draincock. If equipped, disconnect the coolant return hose at the oil cooler.

- Close the radiator draincock when finished.

Filling—Bleeding

On 3.9L engines

1. Remove the engine fill cap.

On 3.0L engines

2. Open the engine air bleed.

On all engines

3. Open the heater air bleed.

4. Add coolant to the degas bottle allowing the system to equalize until no more coolant can be added.

On 3.0L engines

5. Close the engine air bleed when coolant begins to escape.

On all engines

6. Replace the degas bottle cap.

On 3.9L engines

 **CAUTION:** Care must be taken to ensure the accessory drive belt does not become contaminated with engine coolant.

7. Add as much coolant as possible to the engine fill. The heater air bleed will remain open.
8. Replace the engine fill cap.

On all engines

9. **NOTE:** The heater air bleed remains open.

Start the engine and turn the heater to MAX position.

10. Close the heater air bleed when a steady stream of coolant comes from it, during engine idle.

11. Allow the engine to idle for five minutes, add coolant to the degas bottle as needed to maintain the cold fill MAX mark.
12. Reopen the heater air bleed to release any entrapped air and close again.

On 3.9L engines

13. Maintain engine speed of 2,000 rpm for 3-5 minutes or until hot air comes from the heater.
14. Return to idle and verify hot air is still coming from the heater.

On 3.0L engines

15. Maintain engine speed of 1,500 rpm for 3-5 minutes or until hot air comes from the heater.
16. Return to idle and verify hot air is still coming from the heater.

On all engines

17. Set the heater temperature setting to 24° C (75° F) and allow the vehicle to idle for two minutes.
 18. Shut the engine off and allow to cool.
 19. After the engine has cooled, add coolant to the degas bottle to bring the level to the cold fill MAX mark.
-

Hydraulic Cooling Fan System Filling and Bleeding

Special Tool(s)

NOTE: It is not uncommon to repeat this procedure three times.

1. Fill the hydraulic cooling fan reservoir to the MAX level.
 - Use Motorcraft MERCON® Multi-Purpose (ATF) Transmission Fluid XT-2-QDX meeting Ford specification MERCON® or equivalent.
2. Apply vacuum for two to three minutes.
 - Remove the vacuum pump.

3. Start the engine and turn the A/C on MAX. This will run the hydraulic fan. If a whining noise is heard, repeat the procedure.

Flushing —Engine and Radiator

Special Tool(s)

 ST1168-A	Coolant Flush Kit 164-R3658 or equivalent
 ST1167-A	Drain Kit 164-R3662 or equivalent
 ST2421-A	Coolant Flush and Fill 023-00154 or equivalent

-  **WARNING:** Never remove the pressure relief cap while the engine is operating or when the cooling system is hot. Failure to follow these instructions can result in damage to the cooling system or engine or personal injury. To avoid having scalding hot coolant or steam blow out of the degas bottle when removing the pressure relief cap, wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly. Step back while the pressure is released from the cooling system. When you are sure all the pressure has been released, (still with a cloth) turn and remove the pressure relief cap.

Once pressure is released, remove the pressure relief cap.

- Drain the cooling system. For additional information, refer to [Cooling System Draining, Filling And Bleeding](#).
- Remove the water thermostat. For additional information, refer to [Thermostat—Housing, 3.0L](#), or [Thermostat—Housing, 3.9L](#) in this section.
- Install the water hose connection without the water thermostat.
- NOTE:** Refer to the cooling system Flush-All operating instructions for specific vehicle hook-up.

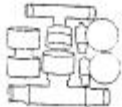

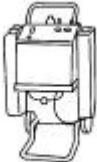

Use cooling system Flush-All, Coolant Flush Kit and Drain Kit to flush the engine and radiator. Use Premium Cooling System Flush F1AZ-19A503-A meeting Ford specification ESR-M14P7-A for vehicles filled with Premium Engine Coolant E2FZ-19549-AA or equivalent meeting Ford specification ESE-M971B44-A (green color).

- Install the water thermostat.

7. Backflush the heater core if necessary. For additional information, refer to [Backflushing—Heater Core](#).
 8. Fill the cooling system. For additional information, refer to [Cooling System Draining, Filling And Bleeding](#) in this section.
-

Backflushing —Heater Core

Special Tool(s)

 ST1168-A	Coolant Flush Kit 164-R3658 or equivalent
 ST1167-A	Drain Kit 164-R3662 or equivalent
 ST2421-A	Coolant Flush and Fill 023-00154 or equivalent

-  **WARNING:** Never remove the pressure relief cap while the engine is operating or when the cooling system is hot. Failure to follow these instructions can result in damage to the cooling system or engine or personal injury. To avoid having scalding hot coolant or steam blow out of the degas bottle when removing the pressure relief cap, wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly. Step back while the pressure is released from the cooling system. When you are sure all the pressure has been released, (still with a cloth) turn and remove the pressure relief cap.

Once pressure is released, remove the pressure relief cap.

- Partially drain the cooling system. For additional information, refer to [Cooling System Draining, Filling And Bleeding](#) in this section.
- NOTE:** Refer to the cooling system Flush-All operating instructions for particular vehicle hook-up.

Use cooling system Flush-All, Coolant Flush Kit and Drain Kit to backflush the heater core. Use Premium Cooling System Flush F1AZ-19A503-A meeting Ford specification ESR-M14P7A for vehicles filled with Premium Engine Coolant E2FZ-19549-AA or equivalent meeting Ford specification ESE-M97B44-A (green color).

- Fill the cooling system. For additional information, refer to [Cooling System Draining, Filling And Bleeding](#) in this section.

Thermostat —Housing, 3.0L

Removal

1. Drain the engine cooling system. For additional information, refer to [Cooling System Draining, Filling And Bleeding](#) in this section.
2. Remove the air cleaner outlet tube. For additional information, refer to [Section 303-12](#).
3. Disconnect the hose.

4. Disconnect the hose.

5. Disconnect the hose and remove the thermostat housing assembly.

6. Remove the bolts, separate the housing and remove the thermostat and seal.

Installation

1. **NOTE:** Clean all the sealing surfaces and inspect the O-ring seals thoroughly.

To install, reverse the removal procedure.

Thermostat —Housing, 3.9L

Removal

1. Drain the engine cooling system. For additional information, refer to [Cooling System Draining, Filling And Bleeding](#) in this section.
2. Remove the intake manifold. For additional information, refer to [Section 303-01B](#).
3. Remove the nuts and remove the bracket.

4. Remove the studbolts.

5. Disconnect the lower radiator hose from the thermostat housing.

6. Remove the bolts.

7. Remove the thermostat housing cover.

8. Remove the water thermostat.

9. Disconnect the hoses.

10. Remove the coolant outlet pipe. For additional information, refer to [Coolant Outlet Pipe—3.9L](#) in this section.
11. Remove the four bolts and the thermostat housing.

Installation

1. **NOTE:** Clean all the sealing surfaces, and inspect the O-ring seals thoroughly.

To install, reverse the removal procedure.

Coolant Outlet Pipe —3.0L

Removal

1. Remove the upper intake manifold. For additional information, refer to [Section 303-01A](#).
2. Disconnect the fuel injector electrical connector.

3. Disconnect the hose.

4. Remove the bolts and the coolant outlet pipe.

Installation

1. **NOTE:** Clean all the sealing surfaces and inspect the O-ring seals thoroughly.

To install, reverse the removal procedure.

Coolant Inlet Pipe —3.0L

Removal

1. Remove the lower intake manifold. For additional information, refer to [Section 303-01A](#).
2. Disconnect the hose.

3. Remove the bolts and the coolant inlet pipe.

Installation

1. **NOTE:** Clean all the sealing surfaces and inspect the O-ring seals thoroughly.
To install, reverse the removal procedure.

Coolant Outlet Pipe —3.9L

Removal

1. Drain the engine cooling system. For additional information, refer to [Cooling System Draining, Filling And Bleeding](#) in this section.
2. Remove the air cleaner outlet tube. For additional information, refer to [Section 303-12](#).
3. Remove the upper radiator hose.

4. Disconnect the hoses.

5. **NOTE:** Lower radiator hose not shown for illustration purposes.

Remove the four bolts.

6. Remove the coolant outlet pipe.

7. **NOTE:** Lower radiator hose not shown for illustration purposes.

Remove the O-ring seals, inspect and clean the sealing surfaces.

Installation

1. To install, reverse the removal procedure.
-

Water Pump —3.0L

Removal

1. Drain the engine cooling system. For additional information, refer to [Cooling System Draining, Filling And Bleeding](#) in this section.
2. Remove the air cleaner outlet tube. For additional information, refer to [Section 303-12](#).
3. Disconnect the engine vent hose.

4. Disconnect the upper radiator hose.

5. Disconnect the heater supply hose.

6. Disconnect the water pump hose.

7. Disconnect the lower radiator hose from the thermostat housing.

8. Remove the water crossover assembly.

9. Disconnect the water inlet hose from the coolant outlet pipe.

10. Disconnect and remove the water inlet hose from the pump.

11. Disconnect the heater water hose from the water pump.

12. Remove the belt idler pulley. For additional information, refer to [Section 303-05](#).

13. Remove the bracket.
 1. Unclip the wiring harness.
 2. Remove the two studbolts and the bolt.
 3. Remove the bracket.

14. Remove the bolt and the studs. Remove the water pump assembly.

Installation

1. To install, reverse the removal procedure.
-

Water Pump —3.9L

Removal

1. Drain the engine cooling system. For additional information, refer to [Cooling System Draining, Filling And Bleeding](#) in this section.
2. Loosen the water pump pulley bolts.

3. Remove the accessory drive belt. For additional information, refer to [Section 303-05](#).
4. Remove the water pump pulley bolts and the pulley.
5. Remove the five bolts and the water pump.

6. **NOTE:** Clean and inspect the sealing surfaces.

Remove the gasket and discard.

- Inspect the O-ring seal. Install a new O-ring seal as necessary.
- Visually inspect the rotors in the water pump.

Installation

1. **NOTE:** Lubricate the water pump O-ring using Premium Engine Coolant E2FZ-19549-AA (F5FZ-19549-CC in Oregon), or equivalent meeting Ford specification ESE-M97B44-A.

Install the water pump and tighten the bolts in two stages:

- Stage 1: Tighten to 8 Nm (71 lb-in).
 - Stage 2: Tighten an additional 90 degrees.
2. Install and tighten the water pump pulley in two stages:
 - Stage 1: Tighten to 10 Nm (89 lb-in).
 - Stage 2: Tighten an additional 45 degrees.
 3. Install the accessory drive belt. For additional information, refer to [Section 303-05](#) .
 4. Refill the engine cooling system. For additional information, refer to [Cooling System Draining, Filling And Bleeding](#) in this section.
-

Radiator —Fan Motor and Shroud

Removal

On all engines

1. Drain the engine cooling system. For additional information, refer to [Cooling System Draining, Filling And Bleeding](#) in this section.
2. Remove the upper radiator sight shield.

3. Remove the air cleaner outlet tube. For additional information, refer to [Section 303-12](#).
4. Remove the six bolts and the two radiator upper support brackets.

5. **NOTE:** 3.9L shown; 3.0L similar.

Remove the upper radiator hose.

6. Remove the bolt and position the receiver drier aside.

7. Disconnect the dual flow coolant valve electrical connector and the A/C line from the fan shroud.

On 3.0L engines

8. Disconnect the throttle position (TP) sensor and the idle air control (IAC) valve electrical connectors.

9. Remove the bracket.

1. Remove the bolts.
2. Remove the bracket.

On 3.9L engines

10. Remove the bolt and position the electric water pump aside.

On all engines

11. Disconnect the high pressure cooling fan bracket and line.
 - Inspect the seal and install a new seal if necessary. For additional information, refer to [Section 211-02](#).

12. Disconnect the return hose from the cooling fan and shroud.

13. Separate the return hose from the fan shroud and position aside.

14. Remove the two bolts and the fan shroud assembly.

15. Remove the A/C condensor. For additional information, refer to [Section 412-03](#).
16. Disconnect the lower radiator hose.

17. Remove the two bolts and position the multi-cooler assembly aside.

18. Remove the bolts and the condenser support brackets.

19. Remove the radiator.

Installation

1. To install, reverse the removal procedure.
-

Fan — Pump, 3.0L

Removal and Installation

1. Remove the accessory drive belt. For additional information, refer to [Section 303-05](#).
2. Remove the lower bolt.

3. Disconnect the hose and allow to drain.

4. Disconnect the electrical connector.

5. Remove the bolt and the high pressure line bracket.

6. Disconnect the high pressure line.

7. Remove the two upper bolts and the cooling fan pump.

8. To install, reverse the removal procedure.
-

Fan — Pump, 3.9L

Special Tool(s)

Removal and Installation

1. Remove the generator. For additional information, refer to [Section 414-02](#).
2. Disconnect the hose and allow to drain.

3. Disconnect the electrical connector.

4. Remove the bolt and the high pressure line bracket.

5. Disconnect the high pressure line.

6. Remove the bolts and the cooling fan pump.

7. To install, reverse the removal procedure.
8. Using the appropriate special tool, install a new O-ring on the hydraulic cooling fan pressure hose fitting.

9. Fill and bleed the hydraulic cooling fan system. For additional information, refer to [Section 303-](#)

Degas Bottle

Removal and Installation

1. Drain the engine cooling system. For additional information, refer to [Cooling System Draining, Filling And Bleeding](#) in this section.
2. Remove the cowl vent screen. For additional information, refer to [Section 501-02](#).

3. Disconnect the engine vent hose, and separate the air bleed hose from the degas bottle.

4. Remove the seven bolts and reposition the cross vehicle support.

5. Disconnect the degas return hose from the degas return tube.

6. Remove the two bolts.

7. Remove the degas bottle from the vehicle.

8. To install, reverse the removal procedure.

Sensor —Cylinder Head Temperature (CHT)

Removal and Installation

For additional information, refer to [Section 303-14](#) .

General Specifications

Item	Specification
Super Premium SAE 5W30 Motor Oil XO-5W30-QSP	WSS-M2C153-G

Torque Specifications

Description	Nm	lb-ft	lb-in
Fuel injection supply manifold bolts	10	—	89
Fuel pressure relief valve	7	—	62
Fuel pressure sensor shield bolt	10	—	89
Fuel pressure sensor shield nut	6	—	53
Fuel rail bolts	10	—	89
Throttle body bolts	10	—	89

Fuel Charging and Controls

The fuel charging and controls system consists of the:

- throttle body
- fuel injectors
- fuel charging wiring
- fuel supply manifold
- fuel pressure relief (Schrader) valve

The fuel charging and controls system is:

- a sequential multiport fuel injection (SFI) system.
- pulse width modulated.
- mass airflow-controlled.

The powertrain control module (PCM) controls the fuel injection system. Injector pulse-width is varied to control the amount of fuel flow. Varying fuel pump output controls fuel pressure. The PCM commands the fuel pump driver module, which directly controls the fuel pump. At low speeds, the idle air control (IAC) valve controls the bypass air around the throttle plate.

The fuel supply manifold:

- delivers fuel to the individual fuel injectors.
- receives fuel from the fuel supply line.

The throttle body:

- controls air supply to the upper intake manifold by positioning the throttle plate.
- connects the accelerator cable and the speed control actuator cable to the throttle plate.
- is not adjustable.
- must not be cleaned.
- has a different linkage ratio depending on the type of transmission (automatic or manual).

The fuel injectors:

- use new O-ring seals.
- are electrically operated by the powertrain control module (PCM).
- each have an internal solenoid that opens a needle valve to inject fuel into the lower intake manifold.
- atomize the fuel as the fuel is delivered.
- are deposit-resistant.
 - Do not clean the fuel injectors.

The fuel pressure relief valve:

- is used as a test port and to relieve fuel pressure.

The fuel charging wiring:

- connects the fuel injectors and fuel pressure sensor to the engine wiring harness and the powertrain control module.
 - Connectors on the right side fuel injectors are gray.
 - Connectors on the left side fuel injectors are black.
 - receives signals from the powertrain control module and transfers the signals to the fuel injectors.
-

Fuel Charging and Controls

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Throttle Body

Removal and Installation

⚠ WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.

⚠ CAUTION: The throttle body bore and plate area have a special coating and cannot be cleaned.

1. Remove the air cleaner outlet tube from the throttle body. For additional information, refer to [Section 303-12](#).
2. Disconnect the throttle position sensor electrical connector and the wiring harness retainer.

3. Disconnect the accelerator cable and the speed control actuator cable from the throttle body.

4. **NOTE:** The throttle body (TB) gasket is reusable.

Remove the bolts and the throttle body.

5. To install, reverse the removal procedure.
-

Fuel Injectors

Removal

⚠ WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.

⚠ CAUTION: To remove the fuel injectors the lower intake manifold assembly must be removed.

⚠ CAUTION: The fuel injectors must be removed from the fuel supply manifold in the correct sequence. Failure to follow this procedure could result in damage to the fuel supply manifold.

1. Remove the fuel supply manifold assembly. Refer to [Supply Manifold—Assembly](#).
2. Remove the fuel rail attachment bolts.

3. Turn the assembly over. Separate the two halves of the intake manifold and pull the left bank of the lower intake manifold from the supply manifold assembly and the fuel injectors.

4. Remove the supply manifold and fuel injectors from the right bank of the lower intake manifold.

5. Disconnect the electrical connector from each fuel injector. For additional information, refer to Wiring Harness in this section.
6. Remove the fuel injectors from the fuel rail.

7. Remove and discard the O-ring seals from each fuel injector.

Installation

1. **NOTE:** Install new fuel injector O-ring seals.

Lubricate the new fuel injector O-ring seals with Super Premium SAE 5W30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.

2. Install the fuel injectors into the fuel rail.

3. Connect the electrical connectors to each fuel injector.

4.  **CAUTION:** The fuel injectors must be installed into the fuel supply manifold in the correct sequence. Failure to follow the procedure could result in damage to the fuel supply manifold.

Install the supply manifold and fuel injectors into the right half of the intake manifold.

5. Turn the assembly over. Assemble the two halves of the lower intake manifold as the fuel injectors are installed into the left half of the lower intake manifold.

6. Install the fuel rail attachment bolts.

7. Install the fuel supply manifold. For additional information, refer to [Supply Manifold—Assembly](#) in this section.
-

Wiring Harness

Removal

⚠ WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.

⚠ CAUTION: To remove the wiring harness the lower intake manifold must be removed.

⚠ CAUTION: The wiring harness must be removed from the fuel supply manifold in the correct sequence. Failure to follow this procedure could result in damage to the fuel supply manifold.

1. Remove the fuel injection supply manifold assembly. Refer to [Supply Manifold—Assembly](#).
2. Remove the fuel rail attachment bolts.

3. Turn the assembly over. Separate the two halves of the intake manifold and pull the left half away from the supply manifold and the fuel injectors.

4. Remove the supply manifold and fuel injectors from the right half of the intake manifold.

5. Disconnect the fuel injector electrical connectors.

Installation

1. Connect the fuel injector electrical connectors.

2. Install the supply manifold and fuel injectors into the right half of the intake manifold.

3. Assemble the two halves of the lower intake manifold as the fuel injectors are installed into the left half of the lower intake manifold.

4. Install the fuel rail attachment bolts.

5. Install the fuel supply manifold. For additional information, refer to [Supply Manifold—Assembly](#) in this section.
-

Supply Manifold —Assembly

Removal

 **WARNING:** Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel injection components. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.

 **WARNING:** Fuel in the fuel system remains under high pressure even when the engine is not running. Use care when working on the fuel system or personal injury may occur.

 **WARNING:** Before working on or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved to prevent possible personal injury.

1. Remove the upper intake manifold. For additional information, refer to [Section 303-01A](#) .
2. Relieve the fuel system pressure. For additional information, refer to [Section 310-00](#) .
3. **NOTE:** The fuel charging wiring to engine control sensor wiring harness connector is located behind the lower intake manifold on the rear side of the wiring shield.

Disconnect the fuel charging wiring connector from the engine control sensor electrical connector.

4. Disconnect the fuel pressure sensor vacuum hose.

5. Disconnect the fuel pressure sensor electrical connector.

6.  **CAUTION:** After disconnecting, plug the fuel line to prevent leakage.

Disconnect the fuel line. Refer to [Section 310-00](#).

7.  **CAUTION:** The lower intake manifold assembly must be removed from the engine.

Remove the four bolts and the fuel supply manifold assembly.

Installation

1. Position the fuel supply manifold assembly and tighten the four bolts using the sequence shown.

2. Connect the fuel line. For additional information, refer to [Section 310-00](#).
3. Connect the fuel pressure sensor electrical connector.

4. Connect the fuel pressure sensor vacuum hose.

5. Connect the fuel charging wiring connector from the engine control sensor electrical connector.

6. Test the fuel system pressure. For additional, information, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
-

Pressure Relief Valve

Removal and Installation

⚠ WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.

⚠ WARNING: Fuel in the system remains under high pressure even when the engine is not running. Use care when working on the fuel system or personal injury may occur.

⚠ WARNING: Before working on or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved to prevent possible personal injury.

1. Relieve the fuel system pressure. For additional information, refer to [Section 310-00](#).
2. Remove the fuel pressure relief valve cap and the fuel pressure relief valve.

3. To install, reverse the removal procedure.

General Specifications

Item	Specification
Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP	WSS-M2C153-G

Torque Specifications

Description	Nm	lb-ft	lb-in
Engine appearance cover bracket nuts	6	—	53
Fuel injection supply manifold bolts	13	10	—
Throttle body bolts	12	9	—

Fuel Charging and Controls

The fuel charging and controls system consists of the:

- throttle body (9E926)
- fuel injectors (9F593)
- engine wiring harness (12B637)
- fuel injection supply manifold (9F792)
- fuel pressure relief valve (9H321)

The fuel charging and controls system is:

- a sequential multiport fuel injection (SFI) system.
- pulse width modulated.
- mass airflow controlled.

The fuel injection supply manifold:

- delivers fuel to the individual fuel injectors.
- receives fuel from the fuel supply line.

The throttle body:

- controls air supply to the intake manifold (9C633) by positioning the throttle plate.
- connects the accelerator cable (9A758) and the speed control actuator cable (9A825) to the throttle plate.
- is not adjustable.
- must not be cleaned.

The fuel injectors:

- are electrically operated by the powertrain control module (PCM) (12A650).
- have an air assist feature to aid in atomization of the fuel.
- each have an internal solenoid which opens a needle valve to inject fuel into the lower intake manifold.
- atomize the fuel as the fuel is delivered.
- are deposit-resistant.
- do not need cleaning.

The fuel pressure relief valve:

- is used to relieve fuel pressure.

The engine wiring harness:

- connects the fuel injectors and other electronic engine controls, such as the throttle position (TP) sensor (9B989), to the powertrain control module.
 - receives fuel injector signals from the powertrain control module and transfers the signals to the fuel injectors.
-

Fuel Charging and Controls

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Throttle Body

Removal

⚠ WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.

⚠ CAUTION: Throttle body bore and plate area have a special coating and cannot be cleaned.

1. Remove the air cleaner outlet tube from the throttle body. For additional information, refer to [Section 303-12](#).
2. Disconnect the throttle position (TP) sensor electrical connector.

3. Disconnect the throttle body linkages.
 1. Disconnect the speed control actuator cable.
 2. Disconnect the accelerator cable.

4. **NOTE:** Discard the throttle body (TB) gasket.

Remove the throttle body.

1. Remove the four bolts.
2. Remove the throttle body.
3. Remove the throttle body gasket.

Installation

1. **NOTE:** Use a new throttle body gasket.

To install, reverse the removal procedure.

Fuel Injectors

Removal

⚠ WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.

1. Remove the fuel injection supply manifold. For additional information, refer to [Supply Manifold—Fuel Injection](#) in this section.
2. Remove the retaining clip and the fuel injectors from the fuel injection supply manifold.

3. Remove and discard the two O-ring seals from each fuel injector.

Installation

1. **⚠ CAUTION:** Install new O-ring seals.

NOTE: Lubricate new fuel injector O-ring seals with Super Premium SAE 5W30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.

To install, reverse the removal procedure.

Supply Manifold —Fuel Injection

Removal

 **WARNING:** Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.

 **WARNING:** Fuel in the fuel system remains under high pressure even when the engine is not running. Use care when working on the fuel system or personal injury may occur.

 **WARNING:** Before working on or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved to prevent possible personal injury.

1. Remove the engine appearance cover.
2. Relieve the fuel pressure. For additional information, refer to [Section 310-00](#).
3. Remove the air cleaner outlet tube from the throttle body. For additional information, refer to [Section 303-12](#).
4. Disconnect the electrical connector from the fuel pressure sensor.

5. **NOTE:** The fuel pressure sensor vacuum hose must be disconnected at the jumper connection, not at the sensor.

Disconnect the fuel pressure sensor vacuum hose.

6. Disconnect the fuel line. For additional information, refer to [Section 310-00](#).
7. Remove the nuts and the engine appearance cover bracket.

8. **NOTE:** RH side shown; LH side similar.

Disconnect the eight fuel injector electrical connectors.

9. Remove the throttle body heater return hose from the retaining clip.

10. Disconnect the camshaft position (CMP) sensor.

11. **NOTE:** Do not use tools to remove the air assist hose fittings. Squeeze the fitting by hand to disconnect the air assist hose.

Remove the air assist hose from both sides of the intake manifold and the idle air control (IAC) valve.

12. Remove the four bolts and the fuel injection supply manifold.

13. Remove the retaining clip and the fuel injectors from the fuel injection supply manifold.

14. Remove and discard the two O-ring seals from each fuel injector.

Installation

1.  **CAUTION: Install new O-ring seals.**

NOTE: Lubricate new fuel injector O-ring seals with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G.

To install, reverse the removal procedure.

General Specifications

Item	Specification
Drive belt	Non neoprene 6K poly v belt
Press-on pulleys power steering pump and hydraulic cooling fan	Flush to end of shaft \pm 0.25 mm (0.0010 inch)

7	6316	Crankshaft vibration damper
8	19A216	Belt idler pulley—flanged
9	10A352	Generator pulley
10	8620	Drive belt

Accessory Drive

Inspection and Verification

1. Verify customer concern by running the engine.
2. Inspect the drive belt for chunking, fraying, wear, and pilling.
3. Check the drive belt for correct routing.

Drive Belt Cracking/Chunking/Wear

V Ribbed Serpentine Drive Belt With Cracks Across Ribs

The accessory drive:

- has a single serpentine drive belt.
- has an automatic drive belt tensioner.
- does not require adjustment.

V Ribbed Belt With Chunks of Rib Missing

V Ribbed Belt With Pilling

NOTE: Pilling is an excessive build up in the V grooves of the belt.

Symptom Chart

Symptom Chart

Condition	Possible Sources	Action
<ul style="list-style-type: none"> ● Drive belt noise, chirping, flutter 	<ul style="list-style-type: none"> ● Defective/worn drive belt. ● Misaligned pulley. ● Pulley runout. ● Damaged accessories. ● Fluid contamination of drive belt. ● Damaged or worn drive belt tensioner. 	<ul style="list-style-type: none"> ● REFER to Component Tests, Drive Belt, Noise/Flutter in this section. ● REFER to Component Tests, Belt Tensioner, Automatic in this section.
<ul style="list-style-type: none"> ● Premature drive belt wear 	<ul style="list-style-type: none"> ● Defective drive belt. ● Misaligned pulley. ● Pulley runout. ● Damaged accessories. ● Incorrectly installed drive belt. ● Fluid contamination. 	<ul style="list-style-type: none"> ● REFER to Component Tests, Drive Belt Noise/Flutter and Drive Belt Misalignment diagnosis in this section.

Component Tests

Drive Belt Noise/Flutter

NOTE: Tensioner is shown in free-state position against arm travel stops.

Drive Belt Tensioner/Belt Length Indicator

NOTE: The 3.0L and the 3.9L drive belt tensioners are the same.

Item	Part Number	Description
1	—	Belt tension relief point
2	—	Unacceptable belt wear range
3	—	Acceptable belt installation and wear range
4	—	Belt length indicator

Drive belt chirp occurs due to pulley misalignment or excessive pulley runout. It can be the result of a damaged pulley or an incorrectly aligned pulley.

To correct, determine the area where the noise comes from. Check each of the pulleys in that area with a straightedge to the crankshaft pulley. Look for accessory pulleys out of position in the fore/aft direction or at an angle to the straightedge.

NOTE: Do not apply any fluids or belt dressing to the belt or pulleys.

Drive belt squeal is an intermittent noise that occurs when the drive belt slips on a pulley during certain conditions, such as: engine start up, rapid engine acceleration, A/C clutch engagement, 1-2 shift and power steering loading.

Drive belt squeal can occur under certain conditions:

- if the A/C discharge pressure goes above specifications:
 - the A/C system is overcharged.
 - the A/C condenser core airflow is blocked.
- if the A/C OFF equalized pressure (the common discharged and suction pressure that occurs after several minutes) exceeds specifications.
- if any of the accessories are damaged, have a worn or damaged bearing, or internal torsional resistance above normal. All accessories should be rotatable by hand in the unloaded condition. If not, inspect the accessory.
- if fluid gets on the drive belt. This includes power steering fluid, engine coolant, engine oil or air conditioning system lubricant. If excessive fluid does get on the drive belt during repair, install a new drive belt.
- if the drive belt is too long. A drive belt that is too long will allow the drive belt tensioner arm to go all the way to the arm travel stop under certain load conditions, which will release tension to the drive belt. If the drive belt tensioner indicator is outside the normal installation wear range window, install a new drive belt.
- **NOTE:** The drive belt tensioner arm should rotate freely without binding.

Install a new drive belt tensioner if the drive belt tensioner is worn or damaged.

Belt Tension

NOTE: Drive belt tension is not adjustable.

The drive belt tensioner automatically adjusts drive belt tension.

Belt Tensioner, Automatic

Check the automatic drive belt tensioner:

1. With the engine off, check for correct drive belt routing. For additional information, refer to [Belt—3.0L](#) or [Belt—3.9L](#) in this section. Repair as necessary.
2. Rotate the drive belt tensioner and check for a binding or frozen condition. Install new components as necessary.

Drive Belt Misalignment

CAUTION: Incorrect drive belt installation will cause excessive drive belt wear and may cause the drive belt to come off the drive pulleys.

Non-standard drive belts may track differently or incorrectly. If a drive belt tracks incorrectly, install a new drive belt to avoid performance failure or loss of the drive belt.

With the engine running, check drive belt tracking. If the edge of the drive belt rides beyond the edge of the pulleys, noise and premature wear may occur. Make sure the drive belt rides correctly on the pulley. If a drive belt tracking condition exists, proceed with the following:

- Visually check the drive belt tensioner for damage, especially the mounting pad surface. If the drive belt tensioner is not installed correctly, the mounting surface pad will be out of position. This will result in chirp and squeal noises.
 - With the engine running, visually observe the grooves in the pulleys (not the pulley flanges or the pulley forward faces) for excessive wobble. Install new components as necessary.
 - Check all accessories, mounting brackets and the drive belt tensioner for any interference that would prevent the component from mounting correctly. Correct any interference condition and recheck the drive belt tracking.
 - Tighten all accessories, mounting brackets, and drive belt tensioner retaining hardware to specification. Recheck the drive belt tracking.
-

Belt —3.0L

Removal

1. Remove the air cleaner outlet tube. For additional information, refer to [Section 303-12](#).
2. Rotate the tensioner counterclockwise and remove the drive belt.

Installation

1.  **CAUTION: Incorrect drive belt installation will cause premature drive belt failure.**

NOTE: Make sure the drive belt (8620) is correctly installed on each pulley.

To install, reverse the removal procedure.

- Refer to component locations —3.0L for correct drive belt routing.
-

Belt —3.9L

Removal

1. Remove the air cleaner outlet tube. For additional information, refer to [Section 303-12](#).
2. Rotate the tensioner counterclockwise and remove the drive belt from the pulley.

3. Remove the belt tensioner. For additional information, refer to [Belt Tensioner](#) in this section.

Installation

1.  **CAUTION: Incorrect drive belt installation will cause premature drive belt failure.**

NOTE: Make sure the drive belt (8620) is correctly installed on each pulley.

To install, reverse the removal procedure.

- Refer to component locations —3.9L for correct drive belt routing.
-

Belt Tensioner

Removal

1. Position the drive belt out of the way. For additional information, refer to [Belt—3.0L](#) or [Belt—3.9L](#) in this section.
2. **NOTE:** The 3.9L is shown, and the 3.0L is similar.

Remove the bolt and the drive belt tensioner.

Installation

1. **NOTE:** Make sure locating pins are aligned with the holes in the front cover, and the belt is installed around the belt tensioner pulley.

To install, reverse the removal procedure.

Belt Idler Pulley

Removal

1. Position the drive belt out of the way. For additional information, refer to [Belt—3.0L](#) or [Belt—3.9L](#) in this section.
2. **NOTE:** The 3.0L belt idler pulley is shown, and the 3.9L is similar.

Remove the bolt and the belt idler pulley.

Installation

1. To install, reverse the removal procedure.
-

General Specifications

Item	Specification
Starter motor normal load current draw (amperes)	130-220
Starting circuit maximum voltage drop (volts)	0.5

Torque Specifications

Description	Nm	lb-ft	lb-in
Starter motor bolts	25	18	—
Starter motor ground cable nut	25	18	—
Starter solenoid terminal nut (S-terminal)	6	—	53
Starter solenoid terminal nut (B-terminal)	12	9	—

Starting System

The starting system consists of the following components:

- starter motor (11002)
 - ignition switch
 - digital transmission range (TR) sensor (7F293)
 - starter relay
-

Starting System

Refer to Wiring Diagrams Section [303-06](#), Starting System for schematic and connector information.

Special Tool(s)

 ST1137-A	73III Automotive Meter 105-R0057 or equivalent
---	---

Principles of Operation

Anti-Theft Intervention

The starting system is electronically controlled by the passive anti-theft system (PATS). The PATS recognizes the correct electronically coded ignition key and signals the instrument cluster to provide a ground for the starter relay. The energized relay provides voltage to the starter solenoid, thereby allowing the starter motor to activate.

Insection and Verification

WARNING: When carrying out underhood work in the vicinity of the starter motor, be aware that the heavy gauge battery input lead at the starter solenoid is "electrically hot" at all times. A protective cap or boot is provided over the terminal of this lead and must be installed after the repair procedure is completed. Failure to follow these instructions may result in personal injury.

WARNING: When working in area of the starter motor, be careful to avoid touching hot exhaust components. Failure to follow these instructions may result in personal injury.

NOTE: When working on the starter system, make sure the anti-theft system is deactivated.

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
<ul style="list-style-type: none">● Starter motor● Brackets	<ul style="list-style-type: none">● Battery● Auxiliary junction box (AJB) fuse F121 (30A)● Battery junction box (BJB) fuse F22 (20A)

- Central junction box (CJB) fuse F201 (5A)
- Starter relay
- Loose or corroded connectors
- Damaged wiring

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the concern remains after the inspection, determine the symptom(s) and go to the Symptom Chart.

Pinpoint Tests

PINPOINT TEST A: THE ENGINE DOES NOT CRANK

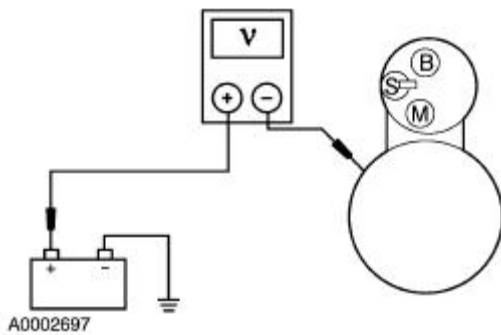

CONDITIONS	DETAILS/RESULTS/ACTIONS
A1 CHECK FOR INSTRUMENT CLUSTER DIAGNOSTIC TEST CODES	
	<p>1 NOTE: The instrument cluster PATS DTCs are the only DTCs of concern in this step. Only repair retrieved non-PATS DTCs if a customer concern is reported.</p> <p>Carry out the instrument cluster self-test. Refer to Section 413-01.</p> <ul style="list-style-type: none"> ● Were any PATS DTCs retrieved from the instrument cluster? <p>→ Yes GO to Section 419-01B to diagnose the PATS DTCs.</p> <p>→ No GO to A2.</p>
A2 CHECK THE BATTERY	
	<p>1 Check the battery condition and charge. For additional information, refer to Section 414-00.</p> <ul style="list-style-type: none"> ● Is the battery OK? <p>→ Yes GO to A3.</p> <p>→ No CHARGE or INSTALL a new battery as necessary. For additional information, refer to Section 414-00. TEST the system for normal operation.</p>
A3 CHECK THE BATTERY GROUND CABLE	
<p>1</p>  <p>A0002696</p>	<p>1 Measure the voltage between the positive battery post and the battery ground cable connection on the engine.</p> <ul style="list-style-type: none"> ● Is the voltage greater than 10 volts?

→ **Yes**
GO to [A4](#).

→ **No**
INSTALL a new battery ground cable.
REFER to [Section 414-01](#). TEST the
system for normal operation.

A4 CHECK THE STARTER MOTOR GROUND

1

1 Measure the voltage between the battery
positive post and the starter motor case.

● Is the voltage greater than 10 volts?

→ **Yes**
GO to [A5](#).

→ **No**
CLEAN the starter motor mounting flange
and make sure the starter motor is
correctly mounted. TEST the system for
normal operation.

A5 CHECK THE POWER SUPPLY TO THE STARTER MOTOR

1

1 Measure the voltage between starter
motor B-terminal and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
GO to [A6](#).

→ **No**
REPAIR circuit 30-BB10 (RD). TEST the
system for normal operation.

A6 CHECK THE STARTER MOTOR B-TERMINAL

1

A0002699

1

Connect a fused jumper wire to the B-terminal of the starter motor. Momentarily connect the other lead of the jumper wire to the starter motor S-terminal.

- **Did the starter motor engage and the engine crank?**

→ **Yes**
GO to [A7](#).

→ **No**
INSTALL a new starter motor; REFER to [Starter Motor—3.0L](#) or [Starter Motor—3.9L](#) in this section. TEST the system for normal operation.

A7 CHECK THE START INPUT TO THE STARTER MOTOR

1

Starter motor C197

2

A0002700

3

2

Measure the voltage between starter motor C197, circuit 50-BB12 (GY/BK), harness side and ground while holding the ignition switch in the START position.

- **Is the voltage greater than 10 volts in START?**

→ **Yes**
CLEAN the starter motor S-terminal and connector. CHECK the wiring and the starter motor for a loose or intermittent connection. TEST the system for normal

operation.

→ **No**
GO to [A8](#).

A8 CHECK THE START INPUT TO THE STARTER RELAY

1

Starter relay

5

A0003577

- 2 For manual transmissions, depress the clutch pedal position (CPP) switch.
- 3 Make sure the vehicle is in PARK or NEUTRAL.
- 4 Turn the ignition switch to START and hold.
- 5 Measure the voltage between starter relay pin 86, circuit 50–SBB12 (GY), harness side and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
GO to [A9](#).

→ **No**
GO to [A17](#).

A9 CHECK THE GROUND SUPPLY TO THE STARTER RELAY

- 1 For manual transmissions, depress the clutch pedal position (CPP) switch.
- 2 Make sure the vehicle is in PARK or NEUTRAL.

4

3 Turn the ignition switch to START and hold.

4 Measure the resistance between the starter relay pin 85, circuit 31-SBB12 (BK/YE), harness side and ground.

● Is the resistance less than 5 ohms?

→ **Yes**
GO to [A14](#).

→ **No**
If automatic transmission, GO to [A10](#). If manual transmission, GO to [A11](#).

A10 CHECK THE CIRCUIT 31S-BB12 FOR AN OPEN

1

Instrument cluster C220b

2

2 Measure the resistance between the starter relay pin 85, circuit 31S-BB12 (BK/YE), harness side and the instrument cluster C220B pin 18, circuit 31S-BB12, harness side.

● Is the resistance less than 5 ohms?

- **Yes**
INSTALL a new instrument cluster;
REFER to [Section 413-01](#) .
- **No**
REPAIR the circuit. TEST the system for
normal operation.

A11 CHECK THE GROUND SUPPLY TO THE CLUTCH PEDAL POSITION (CPP) SWITCH

1

CPP switch C257

3

A0002086

- 2 Turn the ignition switch to START and hold.
- 3 Measure the resistance between clutch pedal position (CPP) switch C257 pin 2, circuit 31S-BB6 (BK/YE), harness side and ground.

● Is the resistance less than 5 ohms?

→ **Yes**
GO to [A12](#).

→ **No**
GO to [A13](#).

A12 CHECK CIRCUIT 31S-BB12 FOR AN OPEN

1

1

Measure the resistance between clutch pedal position (CPP) switch C257 pin 1, circuit 31S-BB12 (BK/YE), harness side and the starter relay pin 85, circuit 31S-BB12 (BK/YE), harness side.

● **Is the resistance less than 5 ohms?**

→ **Yes**
INSTALL a new clutch pedal position switch (CPP); REFER to [Section 303-14](#).

→ **No**
REPAIR the circuit. TEST the system for normal operation.

A13 CHECK CIRCUIT(S) 31S-BB12 AND 31S-BB6 FOR AN OPEN

1

1

Measure the resistance between instrument cluster C220b pin 18, circuit 31S-BB12 (BK/YE), harness side and clutch pedal position (CPP) switch C257 pin 2, circuit 31S-BB6 (BK/YE), harness side.

● **Is the resistance less than 5 ohms?**

- **Yes**
INSTALL a new instrument cluster;
REFER to [Section 413-01](#). TEST the
system for normal operation.
- **No**
REPAIR the circuit(s). TEST the system
for normal operation.

A14 CHECK THE BATTERY SUPPLY TO THE STARTER RELAY

1

- 1 Measure the voltage between the starter relay pin 30, circuit 30-BB13 (RD), harness side and ground.

● Is the voltage greater than 10 volts?

- **Yes**
GO to [A15](#).
- **No**
REPAIR the circuit. TEST the system for normal operation.

A15 CHECK CIRCUIT 50-BB10 AND 50-BB12 FOR AN OPEN

2

- 1 Disconnect the eyelet from the starter S-terminal.
- 2 Measure the resistance between the starter relay pin 87, circuit 50-BB10 (GY/BK), harness side and the S-terminal eyelet C197, circuit 50-BB12 (GY/BK), harness side.

A0000706

● Is the resistance less than 5 ohms?

→ **Yes**

GO to [A16](#).

→ **No**

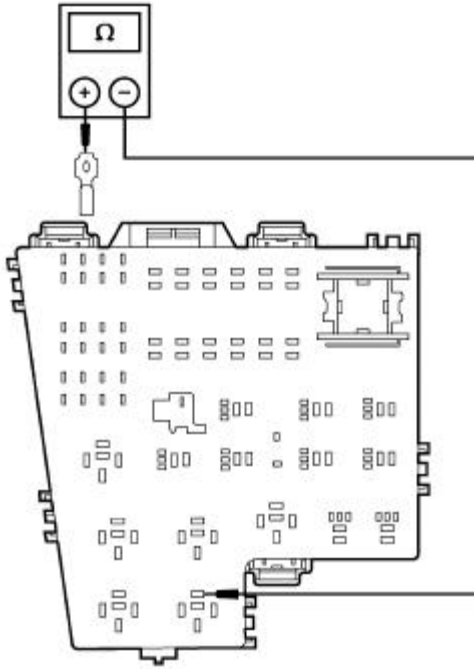

REPAIR the circuit(s). TEST the system for normal operation.

A16 CHECK CIRCUIT 50-BB10 AND 50-BB12 FOR A SHORT TO GROUND

1

1

Measure the resistance between the starter relay pin 87, circuit 50-BB10 (GY/BK), harness side and the S-terminal eyelet C197, circuit 50-BB12 (GY/BK), harness side.

A0000706

- Is the resistance greater than 10,000 ohms?

- **Yes**
INSTALL a new starter relay. TEST the system for normal operation.
- **No**
REPAIR the circuit. TEST the system for normal operation.

A17 CHECK FUSE 1 (5A)

1

CJB Fuse F201 (5A)

- Is CJB fuse F201 (5A) open?

- **Yes**
GO to [A24](#).
- **No**
GO to [A18](#).

A18 CHECK THE START INPUT TO FUSE 1

1

CJB Fuse F201 (5A)

3

A0000670

- 2 Turn the ignition switch to the START position and hold.
- 3 Measure the voltage between CJB fuse F201 (5A) input terminal and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
GO to [A22](#).

→ **No**
GO to [A19](#).

A19 CHECK THE BATTERY INPUT TO THE IGNITION SWITCH

1

Ignition switch C250

2

A0000685

- 2 Measure the voltage between ignition switch C250 pin 1, circuit 30-BB9 (RD), harness side and ground.

● Is the voltage greater than 10 volts?

→ **Yes**
GO to [A20](#).

→ **No**

1

A0004195

1 Measure the resistance between the ignition switch C250 pin 3, circuit 50-DD5 (GY/BK), harness side and the CJB fuse F201 (5A) input terminal, circuit 50-DD5, harness side.

● **Is the resistance less than 5 ohms?**

→ **Yes**
GO to [A21](#).

→ **No**
REPAIR the circuit. TEST the system for normal operation.

A21 CHECK CIRCUIT 50-DD5 FOR A SHORT TO GROUND

1

1 Measure the resistance between ignition switch C250 pin 3, circuit 50-DD5 (GY/BK), harness side and the CJB fuse F201 (5A) input terminal, circuit 50-DD5, harness side.

A0002692

- Is the resistance greater than 10,000 ohms?

- **Yes**
INSTALL a new ignition switch; [Section 211-05](#). TEST the system for normal operation.
- **No**
REPAIR the circuit. TEST the system for normal operation.

A22 CHECK CIRCUIT 50-BB15 FOR AN OPEN

1

CJB Fuse F201 (5A)

2

Digital TR sensor C167

4

- 3 Turn the ignition switch to the START position and hold.
- 4 Measure the voltage between digital TR sensor C167 pin 10, circuit 50-BB15 (GY/OG), harness side and ground.

A0002693

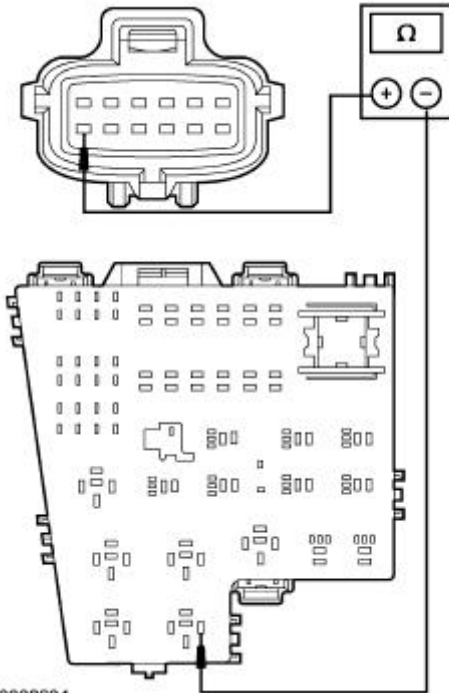

- Is the voltage greater than 10 volts?

→ **Yes**
GO to [A23](#) .

→ **No**
REPAIR the circuit. TEST the system for normal operation.

A23 CHECK CIRCUIT 50S-BB12 FOR AN OPEN

1

A0002694

1

Measure the resistance between the digital TR sensor C167 pin 12, circuit 50S-BB12 (GY), harness side and the starter relay pin 86, circuit 50S-BB12, harness side.

- Is the resistance less than 5 ohms?

→ **Yes**
ADJUST the digital TR sensor. For additional information, REFER to [Section 307-05](#) .

→ **No**
REPAIR the circuit. TEST the system for normal operation.

A24 CHECK CIRCUIT 50-BB15 FOR A SHORT TO GROUND

1

A0009036

1

Measure the resistance between digital TR sensor C167 pin 10, circuit 50S-BB15 (GY/OR), harness side and CJB fuse F201 (5A) output terminal C270b pin 3, circuit 50S-BB15 (GY/OR), harness side.

- Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to [A25](#).

→ **No**
REPAIR the circuit. TEST the system for normal operation.

A25 CHECK CIRCUIT 50S-BB12 FOR A SHORT TO GROUND

1

1

Measure the resistance between the digital TR sensor switch C167 pin 12, circuit 50S-BB12 (GY), harness side and the starter relay pin 86, circuit 50S-BB12 (GY), harness side.

- Is the resistance greater than 10,000 ohms?

→ **Yes**
GO to [A26](#).

→ **No**
REPAIR the circuit. TEST the system for normal operation.

A26 INSTALL A NEW FUSE 1 (5A)

1

Digital TR sensor switch C167

2 Install a new CJB fuse F201 (5A). Retest the system.

- Does the fuse open?

→ **Yes**
ADJUST the digital TR sensor. For additional information, REFER to [Section 307-05](#).

→ **No**
RETEST for normal operation. VERIFY the symptom.

PINPOINT TEST B: UNUSUAL STARTER NOISE

CONDITIONS	DETAILS/RESULTS/ACTIONS
B1 CHECK THE STARTER MOUNTING	
	<p>1 Inspect the starter motor mounting bolts and brackets for looseness.</p> <ul style="list-style-type: none"> ● Is the starter motor mounted correctly? <p>→ Yes GO to B2.</p> <p>→ No INSTALL the starter motor correctly. For additional information, REFER to Starter Motor—3.0L or Starter Motor—3.9L in this section. TEST the system for normal operation.</p>
B2 CHECK FOR ENGINE NOISE	
	<p>1 Turn the ignition switch to the OFF position.</p> <p>2 Connect a fused jumper wire from the B-terminal to the S-terminal of the starter motor. Engage the starter motor and verify the noise is due to the starter operation.</p> <ul style="list-style-type: none"> ● Is the noise due to the starter motor engagement? <p>→ Yes GO to B3.</p> <p>→ No REFER to Section 303-01A or Section 303-01B to continue the diagnosis.</p>
B3 CHECK FOR UNUSUAL WEAR	
	<p>1 Remove the starter motor. For additional information, refer to Starter Motor—3.0L or Starter Motor—3.9L in this section.</p> <p>2 Inspect the ring gear for damaged or worn teeth.</p> <ul style="list-style-type: none"> ● Is the noise due to flywheel ring gear tooth damage? <p>→ Yes INSTALL a new flywheel ring gear. EXAMINE the starter pinion teeth. If damaged, INSTALL a new starter motor. For additional information, REFER to Starter Motor—3.0L or Starter Motor—3.9L in this section. TEST the system for normal operation.</p> <p>→ No INSTALL a new starter motor. For additional information, REFER to Starter Motor—3.0L or Starter Motor—3.9L in this section. TEST the system for normal operation.</p>

Component Tests

WARNING: When repairing the starter motor or carrying out other underhood work in the vicinity of the starter motor, be aware that the heavy gauge battery input lead at the starter solenoid is "electrically hot" at all times. Failure to follow these instructions may result in personal injury.

CAUTION: A protective cap or boot is provided over the battery input terminal on all vehicle lines and must be installed after repairing. Be sure to disconnect the battery ground cable before repairing the starter motor.

Connect the 73III Automotive Meter at the component terminal rather than at the wiring end connector. Making a connection at the wiring end connector could result in false readings because the meter will not pick up a high resistance between the wiring connector and the component.

Starter Motor—Motor Feed Circuit

1. Make sure the battery is fully charged. Carry out a battery load test. For additional information, refer to [Section 414-00](#).
2. Disconnect the inertia fuel shutoff (IFS) switch (9341).
3. Connect a remote starter switch between the starter solenoid S-terminal and the battery positive (+) terminal.
4. Connect the 73III Automotive Meter positive lead to the battery positive (+) post. Connect negative lead to the M-terminal.

5. Engage the remote starter switch. Read and record the voltage. The voltage reading should be 0.8 volt or less.
6. If the voltage reading is 0.8 volt or less, go to the Starter Motor-Ground Circuit Component Test.
7. If the voltage reading is greater than 0.8 volt, this is an indication of excessive resistance in the connections, the positive battery cable or in the starter solenoid. Move the 73III Automotive Meter negative lead to the starter solenoid B-terminal and repeat the test. If the voltage reading at the B-terminal is lower than 0.8 volt, the concern is either in the connections at the starter solenoid or in the solenoid contacts.
8. Remove the cables from solenoid B-, S- and M-terminals. Clean the cables and connections and reinstall the cables to the correct terminals. Repeat Steps 3 through 6. If the voltage drop reading is still greater than 0.8 volt when checked at the M-terminal or less than 0.8 volt when checked at the B-terminal, the concern is in the solenoid contacts. Install a new starter motor.
9. If the voltage reading taken at the solenoid B-terminal is still greater than 0.8 volt after cleaning the cables and the connections at the solenoid, the concern is either in the positive (+) battery cable connection or in the positive battery cable itself. Clean the positive (+) battery cable connection. If this does not solve the problem, install a new positive battery cable. Refer to [Section 414-01](#).

Starter Motor—Ground Circuit

A slow cranking condition can be caused by resistance in the ground or return portion of the cranking circuit. Check the voltage drop in the ground circuit as follows:

1. Connect the 73III Automotive Meter positive lead to the starter motor housing (the connection must be clean and free of rust or grease). Connect the negative lead to the negative (-) battery terminal.

2. Engage the remote starter switch and crank the engine. Read and record the voltage reading. The reading should be 0.5 volt or less.
 3. If the voltage is more than 0.5 volt, clean the negative cable connections at the battery, the body ground connections, and the starter ground connections. Retest.
 4. If the voltage is more than 0.5 volt, install a new cable. If the voltage reading is less than 0.5 volt and the engine still cranks slowly, install a new starter motor.
-

Starter Drive and Flywheel Ring Gear Inspection

1. Remove the starter motor (11002). For additional information, refer to [Starter Motor—3.0L](#) and [Starter Motor—3.9L](#) in this section.
2. Check the wear patterns on the (1) starter drive gear and the (2) flywheel ring gear. If the wear pattern is normal, install the starter motor. For additional information, refer to [Starter Motor—3.0L](#) and [Starter Motor—3.9L](#) in this section.

3. If the (1) starter drive gear and the (2) flywheel ring gear are not fully meshing or the gears are milled or damaged, install a new starter motor and, if necessary, a new flywheel gear. For additional information, refer to [Starter Motor—3.0L](#) and [Starter Motor—3.9L](#) in this section or [Section 303-01A](#).

Starter Motor —3.0L

Removal

1. Disconnect the battery ground cable (14301). For additional information, refer to [Section 414-01](#).
2. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
3. Disconnect the ground strap.

4. Remove the cover.

5. Remove the nuts and position the cables aside.

6. Remove the bolts, two stud bolts and the starter motor (11002).

Installation

1. To install, reverse the removal procedure.
-

Starter Motor —3.9L

Removal

1. Disconnect the battery ground cable (14301). For additional information, refer to [Section 414-01](#).
2. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
3. Disconnect the ground strap.

4. Remove the cover.

5. Remove the nuts and position the cables aside.

6. Remove the bolt, stud bolt and the starter motor (11002).

Installation

1. To install, reverse the removal procedure.
-

General Specifications

Item	Specification

Spark plug type	AGSF-32FS
Spark plug gap	1.30-1.45 mm (0.051-0.057 inch)

Torque Specifications

Description	Nm	lb-ft	lb-in
Spark plugs	15	11	—
Ignition coil bolts	6	—	53

Engine Ignition

The electronic ignition (EI) system is a coil-on-plug (COP) ignition system. The COP ignition system consists of the following components:

- crankshaft position (CKP) sensor
- camshaft position (CMP) sensor
- ignition coils
- spark plugs

The crankshaft position sensor:

- is a variable reluctance sensor.
- is mounted on the engine front cover.
- is triggered by a 36-minus-1 tooth trigger wheel mounted on the crankshaft.
- provides base timing and crankshaft speed (rpm) to the powertrain control module (PCM).

Refer to [Section 303-14](#) for removal and installation of the crankshaft position sensor.

The camshaft position sensor:

- sends the powertrain control module (PCM) a signal indicating camshaft position used for fuel synchronization.

Refer to [Section 303-14](#) for removal and installation of the camshaft position sensor.

The six separate ignition coils:

- convert low voltage signals from the powertrain control module to high voltage pulses.
- produce the high voltage pulses for the spark plugs.
- are connected directly to each spark plug.

The spark plugs:

- convert a high voltage pulse into a spark which ignites the fuel and air mixture.
 - originally installed on the vehicle have a platinum-enhanced active electrode for long life.
-

Engine Ignition

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Ignition Coil

Removal

1. Remove the engine appearance cover.
2. To access the RH bank ignition coils, remove the upper intake manifold. For additional information, refer to [Section 303-01A](#).
3. Disconnect the electrical connector from the ignition coils.
4. Remove the bolts.

5. Remove the ignition coils.

Installation

1. **NOTE:** Verify the ignition coils are seated and the boots are not damaged. If the boots are damaged, install a new ignition coil.

To install, reverse the removal procedure.

Spark Plug

Removal

1. Remove the ignition coil. For additional information, refer to [Ignition Coil](#) in this section.
2. **NOTE:** Use compressed air to remove any foreign material from the spark plug well before removing the spark plugs.

Remove the spark plugs.

3. Inspect for a bridged gap.
 - Check for deposit build-up closing the gap between electrodes. Deposits are caused by oil or carbon fouling.
 - Clean the spark plug.

4. Inspect for oil fouling, identified by wet, black deposits on the insulator shell bore electrodes. This is caused by excessive oil entering the combustion chamber through worn rings and pistons, excessive valve-to-guide clearance or worn or loose bearings.
 - Correct the oil leak concern.
 - Install a new spark plug.

5. Inspect for carbon fouling, identified by black, dry, fluffy carbon deposits on the insulator tips, exposed shell surfaces and electrodes. This is caused by a spark plug with an incorrect heat range, dirty air cleaner, too rich a fuel mixture or excessive idling.

- Clean the spark plug.

6. Inspect for normal burning.

- Check for light tan or gray deposits on the firing tip.

7. Inspect for pre-ignition, identified by melted electrodes and possibly a damaged insulator. Metallic deposits on the insulator indicate engine damage. Pre-ignition may be caused by incorrect ignition timing, wrong type of fuel or the installation of a heli-coil insert in place of the spark plug threads.

- Install a new spark plug.

8. Inspect for overheating, identified by a white or light gray insulator with small black or gray-brown spots with bluish-burnt appearance of electrodes. This is caused by engine overheating, wrong type of fuel, loose spark plugs, spark plugs with an incorrect heat range, low fuel pump pressure or incorrect ignition timing.

- Install a new spark plug.

9. Inspect for fused spot deposits, identified by melted or spotty deposits resembling bubbles or blisters. This is caused by sudden acceleration.

- Clean the spark plug.

10. Adjust the spark plug gap as necessary.

Installation

1. To install, reverse the removal procedure.
-

General Specifications

Item	Specification

Torque Specifications

Description	Nm	lb-ft	lb-in
Ignition coil cover bolts	5	—	44
Spark plugs	26	19	—
Ignition coil bolts	5	—	44

Engine Ignition

The electronic ignition (EI) system is a coil-on-plug (COP) ignition system. The COP ignition system consists of the following components:

- crankshaft position (CKP) sensor
- camshaft position (CMP) sensor
- ignition coils
- spark plugs

The crankshaft position sensor:

- is a variable reluctance sensor.
- is mounted on the sump body under the engine.
- is triggered by the flywheel.
- provides base timing and crankshaft speed (rpm) to the powertrain control module (PCM).

Refer to [Section 303-14](#) for removal and installation of the crankshaft position sensor.

The camshaft position sensor:

- sends the powertrain control module (PCM) a signal indicating camshaft position used for fuel synchronization.
- indicates top dead center.

Refer to [Section 303-14](#) for removal and installation of the camshaft position sensor.

The eight separate ignition coils:

- convert low voltage signals from the powertrain control module to high voltage pulses.
- produce the high voltage pulses for the spark plugs.
- are connected directly to each spark plug.

The spark plugs:

- convert the high voltage pulse into a spark which ignites the fuel and air mixture.
 - originally installed on the vehicle have a platinum-enhanced active electrode for long life.
-

Engine Ignition

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Ignition Coil

Material

Item	Specification
Silicone Brake Caliper Grease and Dielectric Compound D7AZ-19A331-A	ESE-M1C171-A

Removal and Installation

Right side ignition coils

1. Remove the air cleaner outlet tube. For additional information, refer to [Section 303-12](#).

Left side ignition coils

2. Remove the evaporative emission canister purge valve cover.

3. Remove the evaporative emission canister purge valve bracket nuts and position aside.

Left and right side ignition coils

4. **NOTE:** Left side shown, right side similar.

Remove the bolts and the ignition coil cover.

5. Disconnect the electrical connector from each ignition coil.

6. Remove the ignition coils.
 1. Remove the bolts.
 2. Remove the ignition coils.

7. **NOTE:** Apply silicone brake caliper grease and dielectric compound to the inside of ignition coil boots.

To install, reverse the removal procedure.

Spark Plug

Removal

1. Remove the ignition coil. For additional information, refer to [Ignition Coil](#) in this section.
2. **NOTE:** Use compressed air to remove any foreign material from the spark plug well before removing the spark plugs.

Remove the spark plugs.

3. Inspect for a bridged gap.
 - Check for deposit build-up closing the gap between electrodes. Deposits are caused by oil or carbon fouling.
 - Clean the spark plug.

4. Inspect for oil fouling, identified by wet, black deposits on the insulator shell bore electrodes. This is caused by excessive oil entering the combustion chamber through worn rings and pistons, excessive valve-to-guide clearance or worn or loose bearings.
 - Correct the oil leak concern.
 - Install a new spark plug.

5. Inspect for carbon fouling, identified by black, dry, fluffy carbon deposits on the insulator tips, exposed shell surfaces and electrodes. This is caused by a spark plug with an incorrect heat range, dirty air cleaner, too rich a fuel mixture or excessive idling

- Clean the spark plug.

6. Inspect for normal burning.

- Check for light tan or gray deposits on the firing tip.

7. Inspect for pre-ignition, identified by melted electrodes and possibly a damaged insulator. Metallic deposits on the insulator indicate engine damage. Pre-ignition may be caused by incorrect ignition timing, wrong type of fuel or the installation of a heli-coil insert in place of the spark plug threads.

- Install a new spark plug.

8. Inspect for overheating, identified by a white or light gray insulator with small black or gray-brown spots with bluish-burnt appearance of electrodes. This is caused by engine overheating, wrong type of fuel, loose spark plugs, spark plugs with an incorrect heat range, low fuel pump pressure or incorrect ignition timing.

- Install a new spark plug.

9. Inspect for fused spot deposits, identified by melted or spotty deposits resembling bubbles or blisters. This is caused by sudden acceleration.

- Clean the spark plug.

10. Inspect to make sure the platinum tip is present.

11. Adjust the spark plug gap as necessary.

Installation

1. To install, reverse the removal procedure.
-

^a Refer to the procedure in this section.

Engine Emission Control

⚠ CAUTION: Do not remove any part of the engine emission control system. Operating the engine without the engine emission control system will reduce fuel economy and engine ventilation. This will weaken engine performance and shorten engine life.

The engine emission control consists of the:

- positive crankcase ventilation (PCV) system.
- exhaust gas recirculation (EGR) system.
- secondary air system (3.0L only).

The Vehicle Emission Control Information (VECI) decal shows:

- the components of the emission control system.
- the correct vacuum hose routing.

For additional information, refer to [Section 100-01](#).

The PCV system uses intake manifold vacuum to ventilate the crankcase and return the fumes to the intake manifold for combustion.

The PCV valve (3.0L only):

- controls the amount of ventilating air and blow-by gases going to the intake manifold.
- prevents a backfire from reaching the crankcase.

EGR System Components

Item	Part Number	Description
1	12A650	Powertrain control module
2	9J459	EGR vacuum regulator solenoid
3	9D475	EGR valve
4	9J433	Differential pressure feedback EGR
5	—	Metering orifice (part of 9D477)

The EGR system returns a portion of the exhaust gas to the intake manifold to reduce the combustion temperature. This results in lower nitrous oxide formation.

The EGR vacuum regulator solenoid (9J459) uses input from the PCM to change the EGR valve operation.

The EGR valve-to-exhaust manifold tube:

- connects the exhaust manifold (9430) to the EGR valve.
- has two tubes connecting to the differential pressure feedback EGR for EGR flow monitoring.

The differential pressure feedback EGR:

- monitors the EGR flow rate through the EGR valve-to-exhaust manifold tube.
- sends an EGR flow rate signal to the PCM.

The powertrain control module (PCM) (12A650) controls the EGR vacuum regulator solenoid. The EGR vacuum regulator solenoid controls the vacuum to the EGR valve. When the EGR valve opens, exhaust gas flows to the intake manifold. The differential pressure feedback EGR (9J433) measures the flow through the EGR valve from the exhaust manifold tube (9D477) and sends a signal to the PCM. A metering orifice in the EGR valve-to-exhaust manifold tube restricts the flow rate when the EGR valve (9D475) is open.

The secondary air system is used to reduce hydrocarbons (HC) by introducing oxygen into the exhaust gas stream. It operates at startup for the first 90 seconds.

Engine Emission Control

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

EGR Valve

Removal and Installation

NOTE: The 3.9L is shown, the 3.0L is similar.

1. Disconnect the vacuum hose.

2. Disconnect the exhaust gas recirculation (EGR) tube from the EGR valve.

3. Remove the EGR valve.
 1. Remove the bolts.
 2. Remove the EGR valve.
 3. Remove and discard the gasket and clean the sealing surfaces.

4. To install, reverse the removal procedure.
 - Install a new gasket.

EGR Valve Tube —3.0L

Removal

1. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
2. Disconnect the EGR tube from the exhaust manifold.

3. Lower the vehicle.
4. Disconnect the differential pressure feedback EGR hoses.

5. Disconnect the EGR tube from the EGR valve.
 - Remove the tube from the vehicle.

Installation

1. Loosen the two EGR valve bolts.

2. Hand-tighten the EGR valve tube to the EGR valve.

3. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
4. Tighten the EGR valve tube to the exhaust manifold in two stages:
 - Stage 1: Hand-tighten the EGR valve tube to the exhaust manifold.
 - Stage 2: Tighten the EGR valve tube to 40 Nm (30 lb-ft).

5. Lower the vehicle.
6. Tighten the two EGR valve bolts.

7. Tighten the EGR valve tube to the EGR valve.

8. Connect the differential pressure feedback EGR hoses.

EGR Valve Tube —3.9L

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Remove the cabin air filter. For additional information, refer to [Section 412-01](#).
3. Disconnect the exhaust gas recirculation (EGR) tube from the exhaust manifold.
 - Loosen the compression nut.

4. Disconnect the differential pressure feedback EGR (DPFE) hoses.

5. Disconnect the DPFE electrical connector.

6. Disconnect the EGR tube from the EGR valve.

- Loosen the compression nut.

7. Disconnect the accelerator and speed control cables.

8. Position the wire harness bracket aside.

- Remove the nuts.

9. Position the bracket aside.

- Remove the bolts.

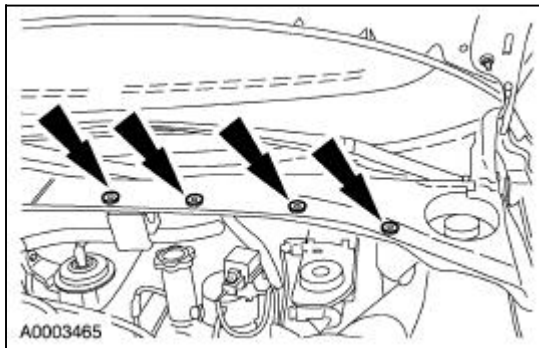

10. Remove the EGR tube from the vehicle.
 11. To install, reverse the removal procedure.
-

Differential Pressure Feedback EGR —3.0L

Removal and Installation

1. Remove the cowl vent screen. For additional information, refer to [Section 501-02](#).

2. Remove the seven bolts and position the cross vehicle support out of the way.

3. Remove the nut and the throttle cable bracket.

4. Remove the differential pressure feedback EGR.
 1. Disconnect the electrical connector.
 2. Disconnect the hoses.
 3. Remove the bolts and the differential pressure feedback EGR.

5. To install, reverse the removal procedure.
-

Differential Pressure Feedback EGR —3.9L

Removal and Installation

1. Remove the differential pressure feedback EGR.
 1. Disconnect the electrical connector.
 2. Disconnect the hoses.
 3. Remove the bolts and the differential pressure feedback EGR.

2. To install, reverse the removal procedure.
-

Solenoid —Electric Vacuum Regulator, 3.0L

Removal and Installation

1. Remove the cabin air filter plenum. For additional information, refer to [Section 412-01](#).
2. Disconnect the EGR vacuum regulator (EVR).
 - Disconnect the electrical connector.
 - Disconnect the vacuum hoses.

3. Remove the EVR.
 - Remove the bolts.

4. To install, reverse the removal procedure.

Solenoid —Electric Vacuum Regulator, 3.9L

Removal and Installation

1. Remove the EGR vacuum regulator (EVR).
 1. Disconnect the electrical connector.
 2. Disconnect the vacuum hoses.
 3. Remove the bolts and EVR.

2. To install, reverse the removal procedure.
-

PCV Valve —3.0L

Removal and Installation

1. Remove the lower intake manifold. For additional information, refer to [Section 303-01A](#).
2. Remove the positive crankcase ventilation (PCV) valve from the oil separator.

3. To install, reverse the removal procedure.
-

PCV Ventilation Hose —3.0L

Removal and Installation

1. Disconnect and remove the PCV ventilation hose.

2. To install, reverse the removal procedure.
-

Crankcase Vent Oil Separator —3.0L

Removal and Installation

1. Remove the LH cylinder head. For additional information, refer to [Section 303-01A](#).
2. Remove the bolts and the oil separator. Discard the gasket.

3. To install, reverse the removal procedure.
 - Install a new gasket.
-

Secondary Air Pump —3.0L

Removal and Installation

1. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
2. Remove the inner fender splash shield.
3. Disconnect the electrical connectors and separate the wiring from the secondary air pump.

4. Remove the secondary air pump.
 - Disconnect and remove the pump-to-valve air tube.
 - Remove the bolt and nut, remove the secondary air pump.

5. To install, reverse the removal procedure.

Secondary Air Valve —3.0L

Removal and Installation

1. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
2. Disconnect the secondary air tube from the valve.

3. Disconnect the vacuum lines from the secondary air valve.

4. Disconnect and remove the pump-to-valve air tube.

5. Disconnect the electrical connector. Remove the nut and bolt. Remove the valve.

6. To install, reverse the removal procedure.
-

Secondary Air Valve —Tube, 3.0L

Removal and Installation

1. Remove the accessory drive belt from the generator pulley. For additional information, refer to [Section 303-05](#).
2. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
3. Disconnect the A/C line.

4. Remove the secondary air tube.

5. To install, reverse the removal procedure.

Torque Specifications

Description	Nm	lb-in
ACL outlet tube clamp screws	5	44
ACL outlet tube support nut	4	35

Intake Air Distribution and Filtering

The air intake system consists of the:

- air cleaner (ACL) (inlet and outlet) (9600)
- air cleaner (ACL) element (9601)
- mass airflow (MAF) sensor (12B579)
- intake air temperature (IAT) sensor (12A697)
- air cleaner outlet tube (9F805)

The air intake system:

- cleans intake air with a replaceable air cleaner element.
- measures airflow with the MAF sensor. For additional information, refer to [Section 303-14](#).
- measures air temperature with the IAT.

Component Locations

A0000710

Item	Part Number	Description
1	9B659	Air cleaner outlet tube—3.0L
2	12A697	Intake air temperature sensor
3	12B579	Mass airflow sensor
4	9600	Air cleaner— outlet
5	9601	Air cleaner element
6	9600	Air cleaner— inlet
7	9F805	Air cleaner outlet tube—3.9L

Intake Air Distribution and Filtering

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Air Cleaner Outlet Pipe —3.0L

Removal

1. Disconnect the intake air temperature (IAT) sensor electrical connector.

2. Disconnect the aspirator hose from the air cleaner outlet tube (9F805).

3. Disconnect the positive crankcase ventilation hose (6853).

4. Loosen the hose clamp screws and remove the air cleaner outlet tube.

Installation

⚠ CAUTION: The air cleaner outlet tube should be securely sealed to prevent unmeasured air from entering the engine.

1. To install, reverse the removal procedure.

Air Cleaner Outlet Pipe —3.9L

Removal

1. Remove the engine appearance cover (6N030).

2. Disconnect the intake air temperature (IAT) sensor electrical connector.

3. Disconnect the full load breather hose (9P903).

4. Disconnect the idle air control valve inlet tube (9K617).

5. Remove the air cleaner outlet tube support nut and washer.

6. Loosen the hose clamp screws and remove the air cleaner outlet tube (9F805).

Installation

⚠ CAUTION: The air cleaner outlet tube should be securely sealed to prevent unmetered air from entering the engine.

1. To install, reverse the removal procedure.

Air Cleaner —Outlet

Removal

1. Remove the air cleaner outlet tube (9F805). For additional information, refer to [Air Cleaner Outlet Pipe—3.0L](#) or [Air Cleaner Outlet Pipe—3.9L](#) in this section.
2. Disconnect the electrical connector from the mass airflow (MAF) sensor (12B579).

3. **NOTE:** No tools are needed to remove the air cleaner (ACL) element (9601). The following removal and installation steps should be carried out using hands only.

Open the air cleaner snaps and remove the outlet side of the air cleaner (9600).

4. If necessary, remove the MAF sensor from the outlet side of the air cleaner. For additional information, refer to [Section 303-14](#).

Installation

CAUTION: The grommet used to seal the air cleaner housing must be fully seated. Failure to do so will result in unmetered air entering the engine.

NOTE: Use the alignment notches to correctly align the inlet side and the outlet side of the air cleaner.

1. To install, reverse the removal procedure.

Air Cleaner —Inlet

Removal

1. Remove the outlet side of the air cleaner (ACL) (9600). For additional information, refer to [Air Cleaner—Outlet](#) in this section.
2. Remove the air cleaner element (9601).

3. Remove the screw and the inlet side of the ACL.

4. If necessary, remove the grommet and bracket.

Installation

1. To install, reverse the removal procedure.

Air Cleaner Element

Removal

1. Loosen the clamp on the air cleaner (ACL) outlet tube (9F805) at the mass airflow (MAF) sensor (12B579).

2. **NOTE:** No tools are needed to remove the air cleaner (ACL) element (9601). The following removal and installation steps should be carried out using hands only.

Open the air cleaner snaps and set the outlet side of the air cleaner (ACL) (9600) aside.

3. Remove the air cleaner (ACL) element (9601).

Installation

 **CAUTION:** The grommet used to seal the air cleaner housing must be fully seated. Failure

to do so will result in unmetered air entering the engine.

NOTE: Use the alignment notch to correctly align the inlet side and the outlet side of the air cleaner.

1. To install, reverse the removal procedure.

General Specifications

Item	Specification
MERPOL® O-ring Seal Lubricant	ESE-M99B144-B

Torque Specifications

Evaporative canister purge valve nuts	8	—	71
Evaporative canister purge valve bracket nuts	10	—	89
Differential bolt	114	84	—

Evaporative Emissions

Component Location

Item	Part Number	Description
1	9J280	Tube assembly —fuel supply and vapor (engine compartment)
2	9C915	EVAP canister purge valve
3	9E857	Evaporative emission (EVAP) canister with bracket assembly
4	9F945	Canister vent solenoid
5	9002	Fuel tank assembly
6	9C047	Fuel vapor control valve tube assembly

7	9S284	Tube assembly—fuel supply and vapor (underbody)
---	-------	---

The evaporative emission (EVAP) system:

- is equipped with an on-board refueling vapor recovery (ORVR) system.
- prevents hydrocarbon emissions from reaching the atmosphere.
- stores fuel vapors in the EVAP canister that are generated during vehicle refueling, vehicle operation or hot soak until they can be consumed by the engine.
- routes the stored fuel vapors to the engine during engine operation.
- is controlled by the powertrain control module (PCM) which uses various sensor inputs to calculate the desired amount of purge flow. The PCM regulates the purge flow, induced by the application of intake manifold vacuum, by varying the duty cycle applied to the EVAP canister purge valve.
- has an EVAP test port for test purposes.

The fuel vapors are routed:

- from the fuel tank through the fuel vapor control valve and fuel vapor vent valve.
- to the EVAP canister through a vapor line.
- to the engine when the EVAP canister purge valve is opened by the PCM.

The fuel tank pressure (FTP) sensor:

- monitors the pressure levels in the fuel tank.
- communicates the pressure reading to the PCM during the OBDII leak test.
- is permanently attached to the fuel vapor control valve tube assembly.

The evaporative emission canister:

- is located above the rear subframe.
- contains activated carbon.
- stores fuel vapors.

The fuel tank filler cap:

- relieves system pressure above 14 kPa (56.21 inches H₂O).
- relieves system vacuum below 3.8 kPa (15.26 inches H₂O).

The canister vent solenoid:

- is normally open.
- seals the EVAP system for the inspection and maintenance (I/M 240) test and OBDII leak and pressure tests.
- is mounted on the EVAP canister bracket assembly.
- is repaired as a separate item.

The evaporative emission (EVAP) canister purge valve:

- is normally closed.
- regulates purging of the EVAP canister.
- is controlled by the PCM.
- is located in the engine compartment near the LH strut tower.

Fuel vapor vent (FVV) valve

- in fuel tank mounted.
- prevents suspended liquid fuel from being drawn into the EVAP canister along with the fuel vapors.

Fuel vapor control valve:

- is fuel tank mounted.
- controls fuel tank refueling fill level.
- prevents suspended liquid fuel from being drawn into the EVAP canister along with the fuel vapors.
- relieves system pressure above 14 kPa (56.21 inches H₂O).

The underbody fuel supply and vapor tube assembly:

- is located under the LH rocker panel.
- includes both the fuel supply line and the EVAP canister purge outlet tube.
- supplies fuel from the fuel pump to the fuel filter.
- routes fuel vapors from the fuel vapor control valve tube assembly to the engine compartment fuel supply and vapor tube.
- is repaired as an assembly.

The engine compartment fuel supply and vapor tube assembly:

- is located on the LH side of the engine compartment.
- supplies fuel from the fuel filter to the fuel injection manifold.
- routes fuel vapors from the underbody fuel supply and vapor tube assembly to the EVAP canister purge valve.
- is repaired as an assembly.

The evaporative emission (EVAP) system monitor:

- is a self-test strategy within the PCM, which tests the integrity of the EVAP system.
- monitors the EVAP system for leaks.
- monitors electronic EVAP components for irrationally high or low voltages.
- monitors for correct EVAP system operation.
- uses negative and positive leak test methods to test and activate the EVAP system.

The evaporative emission (EVAP) test port:

- is used to connect the Evaporative Emission System Leak Tester to the EVAP system.
- is located on the EVAP canister purge valve.

The EVAP Running Loss System Leak Test:

- utilizes intake manifold vacuum to test the EVAP system and involves several stages.
-

Evaporative Emissions

Evaporative Emission System

Item	Part Number	Description
1	9030	Fuel filler cap
2	9B190	Fuel vapor control valve
3	9C052	Fuel tank pressure sensor
4	9C915	Evaporative emission canister purge valve
5	9F945	Canister vent solenoid
6	9D653	Evaporative emission canister
7	9002	Fuel tank
8	9B593	Fuel vapor vent valve
9	9189	Fuel filler pipe check valve

Principles of Operation

Fuel Filler Cap

The fuel filler cap is used to prevent fuel spill and to close the EVAP system to the atmosphere.

Fuel Vapor Control Valve

The fuel vapor control valve is normally between the EVAP canister and the fuel vapor vent valve. Its function is to prevent the flow of liquid fuel into the EVAP canister or up to the canister purge valve during refueling, and to prevent the collection of liquid fuel in the fuel vapor hoses by overfilling the fuel tank.

Fuel Tank Pressure (FTP) Sensor

The fuel tank pressure sensor is used to measure the fuel tank pressure during the Evaporative Emissions Monitor Test. It is also used to control excessive fuel tank pressures by forcing the EVAP system to purge. The fuel tank pressure sensor is mounted in the fuel vapor control valve tube assembly as it crosses over the fuel tank.

Evaporative Emission (EVAP) Canister Purge Valve

The EVAP canister purge valve is controlled by the powertrain control module (PCM). The EVAP canister purge valve controls the flow of fuel vapors from the EVAP canister to the engine intake manifold during various engine operating modes. The EVAP canister purge valve is normally closed.

Canister Vent Solenoid

During the Evaporative Emission Running Loss System Test Monitor, Evaporative Emissions Repair Verification Drive Cycle, and the Evaporative Emission System Leak Test, the canister vent solenoid is closed to allow either a vacuum to be drawn on the fuel tank or to hold a specified pressure in the system. The canister vent solenoid is normally open.

Evaporative Emission (EVAP) Canister

Fuel vapors from the fuel tank are stored in the EVAP canister. When the engine is running, the vapors are purged from the EVAP canister for combustion.

Fuel Vapor Vent Valve (FVV) Assembly

The fuel vapor vent (FVV) valve assembly is mounted on the top of the fuel tank. It is used to control the flow of fuel vapors entering the EVAP system. The assembly also has a spring float, which prevents liquid fuel from entering the vapor delivery system under severe handling or vehicle rollover conditions. In the upright position, the open bottom of the float will lift and shut off the orifice. Under severe handling conditions, the spring will push the float closed when angles allow liquid fuel to reach the orifice. In a rollover condition, the weight of the open bottom float and spring pressure will close the orifice. The FVV valve has a pressure relief feature which will vent excessive fuel tank pressure to atmosphere.

Fuel Filler Pipe Check Valve

The fuel filler pipe check valve is an integral part of the fuel filler pipe. It is intended to prevent liquid fuel from re-entering the fuel filler pipe from the fuel tank on refueling or rollover conditions.

Evaporative Emission System Monitor

When a fault occurs, the EVAP system monitor is reset to NO and a diagnostic trouble code (DTC) is set in the PCM memory. After the DTC is repaired, the vehicle drive cycle must be completed to reset the monitor in preparation for inspection and maintenance testing.

EVAP Running Loss System Leak Test

To start the testing, conditions of stable purging and vehicle speed must be satisfied. During the first stage, the canister vent solenoid is closed, while the EVAP canister purge valve remains open, applying and building vacuum in the system as indicated by the FTP sensor. This phase checks for major leaks in the EVAP system.

In the second stage, the EVAP canister purge valve closes and the system looks for minimal decay rate in the EVAP vacuum, indicating the absence of any small EVAP system leaks.

The last stage is entered only if stage two of the leak test has failed and checks whether the failed test was due to excess vapor generation. It monitors fuel vapor generation rate. Initially, the canister vent solenoid is opened to equalize EVAP system pressure to atmosphere. Then the canister vent solenoid is closed, allowing pressure to build if vapor generation is present in sufficient quantity. If the rate of generation is found to be too high, the EVAP running loss system leak test is aborted. If not, then a small leak is diagnosed.

On-Board Refueling Vapor Recovery (ORVR) Evaporative Emission (EVAP) System

The basic elements forming the ORVR system are as follows:

- The fuel filler pipe forms a seal to prevent vapors from escaping the fuel tank while liquid is entering the fuel tank. Liquid in the one inch diameter tube blocks vapors from rushing back up the fuel filler pipe.
- A fuel vapor control valve controls the flow of vapors out of the fuel tank. The valve closes when the liquid level reaches a height associated with fuel tank usable capacity. The valve accomplishes the following:
 - Limits the total amount of fuel that can be dispensed into the fuel tank.
 - Prevents liquid gasoline from exiting the fuel tank when submerged or when tipped well beyond a horizontal plane as part of the vehicle rollover protection in road accidents.
 - Minimizes vapor flow resistance during anticipated refueling conditions.
- Fuel vapor tubing connects the fuel vapor control valve to the EVAP canister. This routes the fuel tank vapors, displaced by the incoming liquid, to the EVAP canister.
- A check valve in the fuel filling system prevents liquid from rushing back up the fuel filler pipe during the liquid flow variations associated with the filler nozzle shut-off.

Between refueling events, the EVAP canister is purged with fresh air so that it may be used again to store vapors accumulated during engine soaks or subsequent refueling events. The vapors drawn off of the carbon in the EVAP canister are consumed by the engine.

Inspection and Verification

1. Verify the customer concern is with the evaporative emission (EVAP) system.
2. Visually inspect the following for obvious signs of mechanical damage.

Visual Inspection Chart

Mechanical
<ul style="list-style-type: none">● Fuel filler cap● EVAP test port

- EVAP canister or canister vent solenoid
- EVAP lines or hoses
- Vacuum lines or hoses

3. If the concern remains after the inspection, connect the scan tool to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the scan tool menu. If the scan tool does not communicate with the vehicle:
 - check that the program card is correctly installed.
 - check the connections to the vehicle.
 - check the ignition switch position.
4. If the scan tool still does not communicate with the vehicle, refer to the scan tool manual.
5. Carry out the DATA LINK DIAGNOSTICS test. If the scan tool responds with:
 - CKT914, CKT915 or CKT70 = ALL ECUS NO RESP/NOT EQUIP, refer to [Section 418-00](#).
 - NO RESP/NOT EQUIP for PCM, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
 - SYSTEM PASSED, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out the PCM KOEO self-test.
6. If the DTCs retrieved are related to the concern, go to the PCM Diagnostic Trouble Code (DTC) Index to continue diagnostics.
7. If the concern remains after the inspection, determine the symptom and proceed to the Symptom Chart.

PCM Diagnostics Trouble Code (DTC) Index

DTC	Description	Source	Action
P0442	Small leak detected in EVAP system (As small as 1.02 mm [0.040 inch])	PCM	GO to Pinpoint Test A .
P0455	Major leak or no flow detected	PCM	GO to Pinpoint Test B .
P1443	Very small or no purge flow detected	PCM	GO to Pinpoint Test B .
P1450	Excessive vacuum detected in the fuel tank	PCM	GO to Pinpoint Test C .
—	Any other PCM DTC	PCM	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Symptom Chart

SYMPTOM CHART

Condition	Possible Sources	Action
<ul style="list-style-type: none"> ● Hissing Sound When Removing Fuel Cap 	<ul style="list-style-type: none"> ● Canister vent solenoid. ● Evaporative emissions canister. ● Fuel vapor control valve 	<ul style="list-style-type: none"> ● GO to Pinpoint Test D.

● Unable to Refuel Vehicle	● Fuel filler pipe. ● Canister vent solenoid. ● Fuel vapor control valve tube assembly.	● GO to Pinpoint Test F .

Pinpoint Tests

NOTE: Reinstall or install new evaporative emission hose clamps removed or damaged during testing procedures.

PINPOINT TEST A: DTC P0442 SMALL LEAK IN EVAP SYSTEM

CONDITIONS	DETAILS/RESULTS/ACTIONS
<p>NOTE: Condition P0442 DTC set: less than 0.625 kPa (2.5 inches H₂O) bleed-up over 15 seconds at 75% fuel fill. Vapor generation limit: more than 0.625 kPa (2.5 inches H₂O) over 120 seconds.</p>	
<p>A1 VISUALLY INSPECT THE COMPONENTS FOR SMALL LEAKS</p>	
	<ol style="list-style-type: none"> 1 Check for the presence of a fuel filler cap. Do not tighten or check for correct installation at this time. 2 Verify the canister vent solenoid hose is correctly seated on the canister vent solenoid. 3 Check for cut or loose connections to fuel vapor hoses, tubes and connections in the following locations: <ul style="list-style-type: none"> ● EVAP canister to EVAP canister purge valve ● EVAP canister to fuel vapor vent valve assembly ● fuel vapor control valve tube assembly to fuel tank 4 Check the fuel filler pipe for damage. <p>● Is a concern with a hose, tube, connection or valve visually evident?</p>

- **Yes**
REPAIR or INSTALL new components as necessary. GO to [A2](#).
- **No**
GO to [A2](#).

A2 CHECK AT THE EVAP TEST PORT FOR SMALL SYSTEM LEAKS

- 1 Disconnect and plug the evaporative emission return tube at the intake manifold.
 - 2 Complete the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section.
- **Does the system pass the leak test?**
- **Yes**
GO to [A3](#).
 - **No**
GO to [A4](#).

A3 VISUALLY INSPECT THE FUEL FILLER CAP

- 1 Visually inspect the fuel filler cap for damage.
- **Is the fuel filler cap damaged?**
- **Yes**
INSTALL a new fuel filler cap. GO to [A4](#).
 - **No**
GO to [A4](#).

A4 CHECK FOR SMALL LEAKS AT THE FUEL FILLER CAP AND EVAP TEST PORT

2

- 1 Connect the Evaporative Emission System Leak Tester to the fuel filler pipe.
- 3 Close the canister vent solenoid. Refer to [Canister Vent Solenoid Closing Procedure](#) in this section.
- 4 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).
- 5 Using the ultrasonic leak detector, check the fuel filler cap and EVAP test port for leaks.

● **Is a leak detected?**

→ **Yes**
REPAIR or INSTALL new components as necessary. GO to [A5](#).

→ **No**
INSTALL the fuel filler cap. CARRY OUT the evaporative emission system leak test. REFER to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emissions repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

A5 CHECK FOR CONCERN OTHER THAN THE FUEL FILLER CAP

1 Refer to previous test results.

● **Did the system pass the evaporative emission system leak test carried out in pinpoint test Step A2?**

→ **Yes**
CARRY OUT the evaporative emission system leak test. REFER to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**
INSTALL the fuel filler cap. GO to [A6](#).

A6 CHECK FOR SMALL LEAK WITH TESTER SET AT FILL POSITION

2

1 Connect the Evaporative Emission System Leak Tester to the EVAP test port.

3 Close the canister vent solenoid. Refer to [Canister Vent Solenoid Closing Procedure](#) in this section.

4 Turn the selector on the Evaporative Emission System Leak Tester to the FILL position.

5 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

● **Does the pressure on the EVAP**

system hold between 3.43 kPa and 3.53 kPa (13.80 inches and 14.20 inches H₂O)?

→ **Yes**
GO to [A7](#).

→ **No**
DISCONTINUE pressurizing the system.
GO to [A8](#).

A7 CHECK FOR LEAKS IN THE COMPLETE EVAP SYSTEM

2

1 Connect the Evaporative Emission System Leak Tester to the EVAP test port.

3 Close the canister vent solenoid. Refer to [Canister Vent Solenoid Closing Procedure](#) in this section.

4 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

5 Using the ultrasonic leak detector, check the following EVAP system locations:

- EVAP return tube to EVAP canister purge valve
- EVAP canister purge valve to EVAP canister— canister vent solenoid assembly
- EVAP canister — canister vent solenoid assembly to fuel tank
- fuel filler cap and fuel filler tube

● **Is a leak detected at EVAP return tube, EVAP canister purge outlet tube or EVAP canister tube or associated hose?**

→ **Yes**
REPAIR or INSTALL new components as necessary. CARRY OUT the evaporative emission system leak test. REFER to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emissions repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**
DISCONTINUE pressurizing the system.
GO to [A8](#).

A8 CHECK FOR SMALL LEAK FROM THE EVAP RETURN TUBE TO THE FUEL VAPOR

CONTROL VALVE TUBE

1

1 Disconnect the fuel vapor control valve tube assembly from the under vehicle fuel supply and vapor tube assembly. Plug the open end of the under vehicle fuel supply and vapor tube assembly.

2 Connect the Evaporative Emission System Leak Tester to the EVAP test port.

3 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

4 Using the ultrasonic leak detector, check the EVAP system from the intake manifold to the plugged end of the under vehicle fuel supply and vapor tube assembly.

● **Is a leak detected?**

→ **Yes**
REPAIR or INSTALL new components as necessary. REPEAT Step A6 to verify the repair. GO to [A9](#).

→ **No**
GO to [A9](#).

A9 CHECK FOR SMALL LEAK BETWEEN EVAP CANISTER AND FUEL TANK FILLER PIPE

4

1 Connect the Evaporative Emission System Leak Tester to the fuel filler pipe.

2 Transfer the plug from the under-vehicle fuel supply and vapor tube assembly to the fuel vapor control valve tube .

3 Turn the Evaporative Emission System Leak Tester selector to the FILL position.

5 Close the canister vent solenoid. Refer to [Canister Vent Solenoid Closing Procedure](#) in this section.

6 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

7 Using the ultrasonic leak detector, check

the fuel vapor control valve tube to the fuel tank for leaks. Check the fuel tank pressure sensor, fuel vapor control valve tube and the fuel filler pipe. Check tubes from the fuel tank to the EVAP canister and the canister vent solenoid.

● **Is a leak detected?**

→ **Yes**
REPAIR or INSTALL new components as necessary.

GO to [A10](#).

→ **No**
GO to [A10](#).

A10 CHECK EVAP SYSTEM AT FUEL FILLER PIPE

1 Reconnect the fuel vapor control valve tube assembly to the under-vehicle fuel supply and vapor tube assembly.

2 Complete the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section.

● **Does the EVAP system pass the leak test?**

→ **Yes**
RESTORE the system to normal operation. CARRY OUT the evaporative emission system leak test. REFER to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emissions repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**
GO to [A6](#).

PINPOINT TEST B: DTC P0455 MAJOR LEAK OR NO FLOW DETECTED OR DTC P1443 VERY SMALL OR NO PURGE FLOW DETECTED IN SYSTEM

CONDITIONS	DETAILS/RESULTS/ACTIONS
<p>NOTE: Condition DTC P0455 set: -1.74 kPa (-7.0 inches H₂O) over 30 seconds.</p>	
<p>NOTE: Condition DTC P1443 set: -1.74 kPa (-7.0 inches H₂O) over 30 seconds with more than 0.02 lb/min vapor flow.</p>	
<p>B1 CHECK FOR DIAGNOSTIC TROUBLE CODE P0455 OR P1443</p>	

1 Use the recorded results from the PCM DTCs.

● **Is DTC P0455 present?**

→ **Yes**
GO to [B2](#).

→ **No**
GO to [B3](#).

B2 VISUALLY CHECK FOR GROSS EVAP SYSTEM LEAKS

1 Check for the presence of a fuel filler cap. Do not tighten or check for correct installation at this time.

2 Check the input port vacuum and EVAP return tube are connected to the EVAP canister purge valve.

3 Check that the canister vent solenoid hose is correctly attached to the canister vent solenoid.

4 Check for disconnected or cracked fuel vapor hoses or tubes between the intake manifold and following components:

- EVAP canister purge valve
- EVAP canister
- fuel vapor vent valve assembly
- fuel vapor control valve tube assembly

5 Check for damaged fuel tank or fuel filler pipe.

● **Is a concern with a hose, tube, connection or valve visually evident?**

→ **Yes**
REPAIR or INSTALL new EVAP components as necessary. GO to [B3](#).

→ **No**
GO to [B3](#).

B3 CHECK FOR EVAP SYSTEM LEAKS

1 Disconnect the EVAP return tube from the intake manifold and plug the EVAP return tube.

2 Connect the Evaporative Emissions System Leak Tester to the EVAP test port.

3 Carry out the evaporative emissions system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section.

● **Does the system pressure stay above 1.99 kPa (8 inches H₂O)?**

→ **Yes**
GO to [B4](#).

→ **No**
VERIFY that the fuel filler cap is installed correctly. REPAIR or INSTALL new components as necessary. CARRY OUT the evaporative emission system leak test. REFER to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair](#)

[Verification Drive Cycle](#) in this section.

B4 CHECK FOR BLOCKAGE BETWEEN THE EVAP CANISTER PURGE VALVE AND CANISTER VENT SOLENOID

1

2 Close the canister vent solenoid. Refer to [Canister Vent Solenoid Closing Procedure](#) in this section.

3 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

4 Open the canister vent solenoid.

● **Does the pressure drop immediately?**

→ **Yes**
GO to [B5](#).

→ **No**
Go to [Pinpoint Test D](#).

B5 CHECK FOR BLOCKAGE BETWEEN FUEL FILLER PIPE AND THE FUEL VAPOR CONTROL VALVE TUBE ASSEMBLY

1 Connect the Evaporative Emissions System Leak Tester to the fuel filler pipe.

2 Pressurize the EVAP system to 6.47 to 6.97 kPa (26 to 28 inches H₂O).

● **Does the pressure drop immediately?**

→ **Yes**
GO to [B6](#).

→ **No**
Go to [Pinpoint Test D](#).

B6 CHECK FOR FAILED EVAP CANISTER PURGE VALVE OR FUEL TANK PRESSURE SENSOR

1 Use the recorded results from the PCM DTCs.

● **Are DTC codes P0455 and P1443 present?**

→ **Yes**
INSTALL a new EVAP canister purge valve. REFER to [Evaporative Emission Canister Purge Valve](#) in this section. CARRY OUT the evaporative emission system leak test. REFER to [Evaporative Emission System Leak Test](#) in this section. If no leak is detected, CARRY OUT the evaporative emissions repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**
INSTALL a new fuel tank. REFER to [Section 310-01](#). CARRY OUT the evaporative emission system leak test. REFER to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY out the evaporative emission repair verification drive cycle. REFER to

PINPOINT TEST C: DTC P1450 EXCESSIVE VACUUM DETECTED IN THE FUEL TANK

CONDITIONS	DETAILS/RESULTS/ACTIONS
<p>NOTE: Condition P1450 DTC set: more than -1.79 kPa (-7.2 inches H₂O) over 30 seconds.</p>	
<p>C1 CHECK FOR VISUAL CAUSES OF EXCESSIVE FUEL TANK VACUUM</p>	
	<ol style="list-style-type: none"> 1 Check for kinks or bends in the fuel vapor hoses and tubes. 2 Visually check the canister vent solenoid inlet port for contamination or foreign material. 3 Check the canister vent solenoid for blockage or contamination. <ul style="list-style-type: none"> ● Is a concern with a hose, tube, connection or component visually evident? <p>→ Yes REMOVE any contamination or foreign material around fuel vapor hoses and tubes. REPAIR the hoses, tubes or components as necessary. After all visual concerns are repaired, GO to C2.</p> <p>→ No GO to C2.</p>
<p>C2 CHECK FOR BLOCKAGE BETWEEN EVAP TEST PORT AND CANISTER VENT SOLENOID</p>	
	<ol style="list-style-type: none"> 1 Disconnect and plug the EVAP return tube at the intake manifold. 2 Connect the Evaporative Emissions System Leak Tester to the EVAP test port. 3 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O). <ul style="list-style-type: none"> ● Does the pressure drop immediately? <p>→ Yes GO to C3.</p> <p>→ No GO to Pinpoint Test D.</p>
<p>C3 CHECK FOR BLOCKAGE BETWEEN THE FUEL FILLER PIPE AND THE FUEL VAPOR CONTROL VALVE TUBE ASSEMBLY</p>	

- 1 Connect the Evaporative Emission System Leak Tester to the fuel filler pipe.
- 2 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

- **Does the pressure drop immediately?**

→ **Yes**
GO to [C4](#).

→ **No**
GO to [Pinpoint Test D](#).

C4 CHECK FOR FUEL TANK PRESSURE SENSOR PID WITHOUT PRESSURE APPLIED

1

2

- 1 Disconnect the EVAP canister outlet tube from the fuel vapor control valve tube assembly.

- 3 Access PCM PID FTP V.

- 4 Record the reading.

- **Is PID FTP V reading between 2.40 and 2.80 volts?**

→ **Yes**
GO to [C5](#).

→ **No**
REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual to continue diagnosis.

C5 CHECK FOR STUCK OPEN EVAP CANISTER PURGE VALVE CONDITION AT IDLE

- 1 Reconnect the EVAP canister outlet tube.
- 2 Remove the plug from the EVAP return tube and reconnect the tube to the intake manifold.
- 3 Verify that the fuel filler cap is correctly installed.

4

- 5 Access PCM PIDs FTP V and EVAPPDC.
- 6 Start the engine and allow to idle.
- 7 Monitor the FTP V and EVAPPDC PIDs.

- **When PID EVAPPDC is zero, is PID FTP V reading below 2.40 volts?**

→ **Yes**

INSTALL a new EVAP canister purge valve. REFER to [Evaporative Emission Canister Purge Valve](#) in this section. CARRY OUT an EVAP system leak test. REFER to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT an evaporative emissions repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**

CARRY OUT the EVAP system leak test. REFER to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emissions repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

PINPOINT TEST D: HISS WHEN OPENING FUEL CAP OR UNABLE TO REFUEL VEHICLE

CONDITIONS	DETAILS/RESULTS/ACTIONS
D1 TEST FOR FUEL TANK PRESSURE SENSOR OPERATION	
<p>2</p> 	<ol style="list-style-type: none"> 1 Connect the Evaporative Emission System Leak Tester to the fuel filler pipe. 3 Close the canister vent solenoid. Refer to Canister Vent Solenoid Closing Procedure in this section. 4 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

- Is the FTP (FTP V) PID reading 3.11 kPa to 3.86 kPa (12.5 to 15.5 inches H₂O) (4.22 to 4.90 volts)?

→ **Yes**
GO to [D2](#).

→ **No**
GO to [D3](#).

D2 TEST FOR BLOCKAGE IN VENTING PORTION OF EVAP SYSTEM

1 Open the canister vent solenoid.

- Does the pressure drop immediately?

→ **Yes**
CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**
GO to [D5](#).

D3 TEST FOR BLOCKAGE IN FUEL FILLER PIPE

1 Connect the Evaporative Emission System Leak Tester to the fuel filler pipe.

2 Disconnect the fuel filler pipe from the fuel tank.

3 Pressurize the EVAP system to (3.48 kPa) (14 inches H₂O).

- Does the pressure drop immediately?

→ **Yes**
GO to [D4](#).

→ **No**
INSTALL a new fuel filler pipe assembly. REFER to [Section 310-01](#). CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

D4 TEST FOR PINCHED FUEL VAPOR CONTROL VALVE TUBE

- 1 Reconnect the fuel filler pipe to the fuel tank.
- 2 Lower the fuel tank about 19mm (0.75 in).
- 3 Connect the Evaporative Emission System Leak Tester to the fuel filler pipe.
- 4 Close the canister vent solenoid. Refer to [Canister Vent Solenoid Closing Procedure](#) in this section.
- 5 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

- Is the FTP (FTP V) PID reading 3.11 kPa to 3.86 kPa (12.5 to 15.5 inches H₂O)(4.22 to 4.90 volts)?

→ **Yes**

Fuel vapor control valve tube is pinched. INSTALL a new fuel tank assembly. REFER to [Section 310-01](#). CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**

Fuel vapor control valve tube or fuel tank vapor control valve is blocked. INSTALL a new fuel tank assembly. REFER to [Section 310-01](#). CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

D5 ISOLATE LOCATION OF BLOCKAGE

1

A0002143

1

Disconnect the fuel vapor control valve tube assembly from the EVAP canister purge outlet tube.

2 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

- Does the pressure drop immediately?

→ **Yes**
GO to [D6](#).

→ **No**
INSTALL a new fuel tank assembly.
REFER to [Section 310-01](#).
RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

D6 TEST FOR BLOCKAGE IN CANISTER VENT SOLENOID

3

A0004672

1 Reconnect the fuel vapor control valve tube assembly to the EVAP canister purge outlet tube.

2 Lower the differential to access the canister vent solenoid as necessary. If necessary, refer to [Section 205-02](#).

3 Disconnect the canister vent solenoid from the canister vent solenoid hose.

4 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

- Does the pressure drop immediately?

→ **Yes**
INSTALL a new canister vent solenoid.
REFER to [Evaporative Emission Canister Vent Solenoid](#) in this section.
RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair

verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**
GO to [D7](#).

D7 TEST FOR BLOCKAGE IN THE CANISTER VENT SOLENOID HOSE

4

A0004673

- 1 Reinstall the differential. If necessary, refer to [Section 205-02](#).
- 2 Lower the rear subframe out of the way to access the EVAP canister with bracket assembly. Refer to [Section 502-00](#).
- 3 Lower the EVAP canister with bracket assembly.
- 4 Disconnect the canister vent solenoid hose from the 1.0L EVAP canister.

- 5 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

- **Does the pressure drop immediately?**

→ **Yes**
INSTALL a new canister vent solenoid hose. RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**
GO to [D8](#).

D8 TEST FOR BLOCKAGE IN 1.0L EVAP CANISTER

1

- 1 Disconnect the fuel vapor storage canister inlet tube from the 1.0L EVAP canister.

A0004674

- 2 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

- Does the pressure drop immediately?

→ Yes

INSTALL a new 1.0L EVAP canister. RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ No

GO to [D9](#).

D9 TEST FOR BLOCKAGE IN FUEL VAPOR STORAGE CANISTER INLET TUBE

1

A0004675

- 1 Disconnect the fuel vapor storage canister inlet tube from the 2.0L EVAP canister.

- 2 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

- Does the pressure drop immediately?

→ Yes

INSTALL a new fuel vapor storage canister inlet tube. RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System](#)

[Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**
GO to [D10](#).

D10 TEST FOR BLOCKAGE IN 2.0L EVAP CANISTER

1

A0004676

1 Disconnect the EVAP canister purge outlet tube from the 2.0L EVAP canister.

2 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

- Does the pressure drop immediately?

→ **Yes**
INSTALL a new 2.0L EVAP canister. RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**
INSTALL a new EVAP canister purge outlet tube. RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

PINPOINT TEST E: EXCESSIVE FUEL ODOR

CONDITIONS	DETAILS/RESULTS/ACTIONS
------------	-------------------------

E1 TEST THE EVAPORATIVE EMISSION (EVAP) RUNNING LOSS SYSTEM MONITOR

1 Carry out the evaporative emission repair verification drive cycle. Refer to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

● **Are PCM DTCs retrieved?**

→ **Yes**
For DTCs P0442, P0455, P1443 and P1450 REFER to the Diagnostic Trouble Code (DTC) Index in this section. For all other DTCs, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

→ **No**
GO to [E2](#).

E2 EVAPORATIVE EMISSION SYSTEM LEAK TEST

1 Carry out the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section.

● **Does the EVAP system pass the leak test?**

→ **Yes**
GO to [E3](#).

→ **No**
GO to [E9](#).

E3 TEST FOR FUEL TANK PRESSURE SENSOR OPERATION

1 Connect the Evaporative Emission System Leak Tester to the fuel filler pipe.

2 Close the canister vent solenoid. Refer to [Canister Vent Solenoid Closing Procedure](#) in this section.

3 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

● **Is the FTP (FTP V) PID reading 3.11 kPa to 3.86 kPa (12.5 to 15.5 inches H₂O)(4.22 to 4.90 volts)?**

→ **Yes**
GO to [E4](#).

→ **No**
GO to [Pinpoint Test D](#).

E4 TEST FOR BLOCKAGE IN VENTING PORTION OF THE EVAP SYSTEM

1 Open the canister vent solenoid.

- Does the pressure drop immediately?

→ **Yes**
GO to [E5](#).

→ **No**
GO to [Pinpoint Test D](#).

E5 TEST FOR BLOCKAGE THROUGH EVAPORATIVE EMISSION TEST PORT

- 1 Connect the Evaporative Emission System Leak Tester to the evaporative emission test port.
- 2 Close the canister vent solenoid. Refer to [Canister Vent Solenoid Closing Procedure](#) in this section.
- 3 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

- Is the FTP (FTP V) PID reading 3.11 kPa to 3.86 kPa (12.5 to 15.5 inches H₂O)(4.22 to 4.90 volts)?

→ **Yes**
Evaporative emission system operating correctly. RETURN to Symptom Chart.

→ **No**
GO to [E6](#).

E6 TEST FOR BLOCKAGE IN FUEL VAPOR CONTROL VALVE TUBE ASSEMBLY

1

- 1 Disconnect the fuel vapor control valve tube assembly from the under vehicle fuel supply and vapor tube assembly.

- 2 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

- Does the pressure drop immediately?

→ **Yes**
Blockage located in the fuel vapor control valve tube. INSTALL a new fuel tank assembly. REFER to [Section 310-01](#). CARRY OUT the evaporative emission system leak test. Refer to [Evaporative](#)

[Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**
GO to [E7](#).

E7 TEST FOR BLOCKAGE IN UNDER-VEHICLE FUEL SUPPLY AND VAPOR TUBE ASSEMBLY

- 1 Disconnect the under-vehicle fuel supply and vapor tube from the engine compartment fuel supply and vapor tube.
- 2 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

● **Does the pressure drop immediately?**

→ **Yes**
INSTALL a new under-vehicle fuel supply and vapor tube assembly. REFER to [Section 310-01](#). RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**
GO to [E8](#).

E8 TEST FOR BLOCKAGE IN THE ENGINE COMPARTMENT FUEL SUPPLY AND VAPOR TUBE ASSEMBLY

1

- 1 Disconnect the engine compartment fuel supply and vapor tube assembly from the evaporative emission canister purge valve.

- 2 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

● **Does the pressure drop immediately?**

→ **Yes**

INSTALL a new engine compartment fuel supply and vapor tube assembly. RECONNECT all components. GO to [E7](#). CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**

INSTALL a new evaporative emission canister purge valve. REFER to [Evaporative Emission Canister Purge Valve](#) in this section. RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

E9 TEST TO DETERMINE GENERAL LOCATION OF LEAK

2

1 Connect the Evaporative Emission System Leak Tester to the fuel filler pipe.

2 Disconnect the fuel vapor control valve tube from the under-vehicle fuel supply and vapor tube assembly and plug both tubes.

3 Carry out the Evaporative Emission System Leak Test procedure. Refer to [Evaporative Emission System Leak Test](#) in this section.

● **Does the system pass the leak test?**

→ **Yes**

Leak is in the front portion of the EVAP system. GO to [E10](#).

→ **No**

Leak is in the rear portion of the EVAP system. GO to [E14](#).

E10 TEST TO CONFIRM LEAK IS IN THE FRONT PORTION OF THE EVAP SYSTEM

- 1 Connect the Evaporative Emission System Leak Tester to the EVAP system test port.
- 2 Plug the under-vehicle fuel supply and vapor tube assembly.
- 3 Carry out the Evaporative Emission System Leak Test. Refer to [Evaporative Emission System Leak Test](#) in this section.

● **Does the EVAP system pass the leak test?**

→ **Yes**

INSTALL new O-ring seals between the evaporative emission fuel vapor control valve tube assembly and the under-vehicle fuel supply and vapor tube assembly. RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**

GO to [E11](#).

E11 TEST FOR LEAK IN UNDER-VEHICLE FUEL SUPPLY AND VAPOR TUBE ASSEMBLY

- 1 Disconnect the under-vehicle fuel supply and vapor tube assembly from the engine compartment fuel supply and vapor tube assembly.
- 2 Plug the engine compartment fuel supply and vapor tube assembly.
- 3 Carry out the Evaporative Emission System Leak Test procedure. Refer to [Evaporative Emission System Leak Test](#) in this section.

● **Does the system pass the leak test?**

→ **Yes**

INSTALL a new under-vehicle fuel supply and vapor tube assembly. RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification

drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**
GO to [E12](#).

E12 TEST FOR LEAK IN THE ENGINE COMPARTMENT FUEL SUPPLY AND VAPOR TUBE ASSEMBLY

1

1 Disconnect the engine compartment fuel supply and vapor tube assembly from the evaporative emission canister purge valve.

2 Plug the evaporative emission canister purge valve.

3 Carry out the Evaporative Emission System Leak Test. Refer to [Evaporative Emission System Leak Test](#) in this section.

● **Does the EVAP system pass the leak test?**

→ **Yes**
INSTALL a new engine compartment fuel supply and vapor tube assembly. RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**
GO to [E13](#).

E13 TEST FOR LEAK IN EVAP CANISTER PURGE VALVE

1

1 Disconnect the evaporative emission return tube from the EVAP canister purge valve.

- 2 Plug the EVAP canister purge valve.
- 3 Carry out the Evaporative Emission System Leak Test. Refer to [Evaporative Emission System Leak Test](#) in this section.

● **Does the system pass the leak test?**

→ **Yes**
 INSTALL a new evaporative emission return tube. RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**
 INSTALL a new EVAP canister purge valve assembly. REFER to [Evaporative Emission Canister Purge Valve](#) in this section. RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

E14 TEST TO DETERMINE IF LEAK IS IN EVAP CANISTER OR FUEL TANK PORTION OF THE SYSTEM

1

- 1 Disconnect the fuel vapor control valve tube from EVAP canister purge outlet tube.

A0002143

- 2 Connect evaporative emission system leak tester to the fuel filler pipe.
- 3 Plug open end of the fuel vapor control valve tube.
- 4 Carry out the Evaporative Emission System Leak Test. Refer to [Evaporative Emission System Leak Test](#) in this section.

● **Does the EVAP system pass the leak test?**

→ **Yes**
RECONNECT all components. GO to [E15](#).

→ **No**
GO to [E20](#).

E15 TEST FOR LEAK IN CANISTER VENT SOLENOID

1

A0002143

- 1 Reconnect the fuel vapor control valve tube to the EVAP canister purge outlet tube.

3

- 2 Lower the differential to access the canister vent solenoid. If necessary, refer to [Section 205-02](#).
- 3 Disconnect the canister vent solenoid from the canister vent solenoid hose and plug the hose.

A0004672

- 4 Carry out the Evaporative Emission System Leak Test. Refer to [Evaporative Emission System Leak Test](#) in this section.

- Does the EVAP system pass the leak test?

→ **Yes**
INSTALL a new canister vent solenoid. REFER to [Evaporative Emission Canister Vent Solenoid](#) in this section. RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**
GO to [E16](#).

E16 TEST THE CANISTER VENT SOLENOID HOSE FOR LEAK

5

- 1 Reinstall the differential. If necessary, refer to [Section 205-02](#).
- 2 Lower the rear subframe out of the way. Refer to [Section 502-00](#).
- 3 Remove the EVAP canister and bracket assembly.
- 4 Connect the Evaporative Emission System Leak Tester to the EVAP canister purge outlet tube.
- 5 Disconnect the canister vent solenoid hose from the 1.0L EVAP canister and plug the EVAP canister.

A0004673

- 6 Pressurize the system to 3.48 kPa (14 inches H₂O).

● **Does the pressure hold?**

→ **Yes**
 INSTALL a new canister vent solenoid hose. RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **Yes**
 GO to [E17](#).

E17 TEST FOR LEAK IN 1.0L EVAP CANISTER

1

A0004674

- 1 Disconnect the fuel vapor storage canister inlet tube from the 1.0L EVAP canister and plug the inlet tube.

- 2 Pressurize the system to 3.48 kPa (14 inches H₂O).

● **Does the pressure hold?**

→ **Yes**
 INSTALL a new 1.0L EVAP canister. RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to

[Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**
GO to [E18](#).

E18 TEST FOR LEAK IN FUEL VAPOR STORAGE CANISTER INLET TUBE

1

A0004675

1 Disconnect the fuel vapor storage canister inlet tube from the 2.0L EVAP canister and plug the EVAP canister.

2 Pressurize the system to 3.48 kPa (14 inches H₂O).

● **Does the pressure hold?**

→ **Yes**
INSTALL a new fuel vapor storage canister inlet tube. RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**
GO to [E19](#).

E19 TEST FOR LEAK IN 2.0L EVAP CANISTER

1

A0004676

1 Disconnect the EVAP canister purge outlet tube from the 2.0L EVAP canister and plug the outlet tube.

2 Pressurize the system to 3.48 kPa (14 inches H₂O).

● **Does the pressure hold?**

→ **Yes**
INSTALL a new 2.0L EVAP canister. RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**
INSTALL a new EVAP canister purge outlet tube. RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

E20 TEST FOR LEAK IN FUEL VAPOR CONTROL VALVE TUBE AND FUEL TANK ASSEMBLY

- 1 Disconnect the fuel filler pipe hose at the fuel tank and plug the hose.
- 2 Carry out the Evaporative Emission System Leak Test. Refer to [Evaporative Emission System Leak Test](#) in this section.

● **Does the EVAP system pass the leak test?**

→ **Yes**
INSTALL a new fuel tank assembly. RECONNECT all components. REFER to [Section 310-01](#). CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**
GO to [E21](#).

E21 TEST FOR LEAK IN FUEL FILLER PIPE HOSE

- 1 Disconnect the fuel filler pipe hose from the fuel filler pipe and plug the fuel filler pipe.
- 2 Carry out the Evaporative Emission System Leak Test. Refer to [Evaporative](#)

[Emission System Leak Test](#) in this section.

- **Does the EVAP system pass the leak test?**

→ **Yes**

INSTALL a new fuel filler pipe hose. RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**

INSTALL a new fuel filler pipe assembly. REFER to [Section 310-01](#) . RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

PINPOINT TEST F: HISS WHEN OPENING FUEL CAP OR UNABLE TO REFUEL VEHICLE

CONDITIONS	DETAILS/RESULTS/ACTIONS
F1 TEST FOR FUEL TANK PRESSURE SENSOR OPERATION	
	<ol style="list-style-type: none"> 1 Connect the Evaporative Emission System Leak Tester to the fuel filler pipe. 2 Close the canister vent solenoid. Refer to Canister Vent Solenoid Closing Procedure in this section. 3 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O). <ul style="list-style-type: none"> ● Is the FTP (FTP V) PID reading 3.11 kPa to 3.86 kPa (12.5 to 15.5 inches H₂O) (4.22 to 4.90 volts)? <p>→ Yes GO to F2.</p> <p>→ No GO to F3.</p>
F2 TEST FOR BLOCKAGE IN VENTING PORTION OF EVAP SYSTEM	

1 Open the canister vent solenoid.

- Does the pressure drop immediately?

→ **Yes**

CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**

GO to [F5](#).

F3 TEST FOR BLOCKAGE IN FUEL FILLER PIPE

1 Connect the Evaporative Emission System Leak Tester to the fuel filler pipe.

2 Disconnect the fuel filler pipe from the fuel tank.

3 Pressurize the EVAP system to (3.48 kPa) (14 inches H₂O).

- Does the pressure drop immediately?

→ **Yes**

GO to [F4](#).

→ **No**

INSTALL a new fuel filler pipe assembly. REFER to [Section 310-01](#). CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

F4 TEST FOR PINCHED FUEL VAPOR CONTROL VALVE TUBE

1 Reconnect the fuel filler pipe to the fuel tank.

2 Lower the fuel tank about 19mm (0.75 in).

3 Connect the Evaporative Emission System Leak Tester to the fuel filler pipe.

4 Close the canister vent solenoid. Refer to [Canister Vent Solenoid Closing Procedure](#) in this section.

5 Pressurize the EVAP system to 3.48 kPa

(14 inches H₂O).

- **Is the FTP (FTP V) PID reading 3.11 kPa to 3.86 kPa (12.5 to 15.5 inches H₂O)(4.22 to 4.90 volts)?**

→ **Yes**

Fuel vapor control valve tube is pinched. INSTALL a new fuel tank assembly. REFER to [Section 310-01](#). CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**

Fuel vapor control valve tube or fuel tank vapor control valve is blocked. INSTALL a new fuel tank assembly. REFER to [Section 310-01](#). CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

F5 ISOLATE LOCATION OF BLOCKAGE

1

1

Disconnect the fuel vapor control valve tube assembly from the EVAP canister purge outlet tube.

2

Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

- **Does the pressure drop immediately?**

→ **Yes**

GO to [F6](#).

→ **No**

INSTALL a new fuel tank assembly. RECONNECT all components. REFER to

[Section 310-01](#). CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

F6 TEST FOR BLOCKAGE IN CANISTER VENT SOLENOID

3

- 1 Reconnect the fuel vapor control valve tube assembly to the EVAP canister purge outlet tube.
- 2 Lower the differential to access the canister vent solenoid as necessary. If necessary, refer to [Section 205-02](#).
- 3 Disconnect the canister vent solenoid from the canister vent solenoid hose.
- 4 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

- **Does the pressure drop immediately?**

→ **Yes**
INSTALL a new canister vent solenoid. RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**
GO to [F7](#).

F7 TEST FOR BLOCKAGE IN THE CANISTER VENT SOLENOID HOSE

- 1 Reinstall the differential. If necessary, refer to [Section 205-02](#).
- 2 Lower the rear subframe out of the way to access the EVAP canister with bracket assembly. Refer to [Section 502-00](#).

4

A0004673

3 Lower the EVAP canister with bracket assembly.

4 Disconnect the canister vent solenoid hose from the 1.0L EVAP canister.

5 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

● Does the pressure drop immediately?

→ Yes

INSTALL a new canister vent solenoid hose. RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ No

GO to [F8](#).

F8 TEST FOR BLOCKAGE IN 1.0L EVAP CANISTER

1

A0004674

1 Disconnect the fuel vapor storage canister inlet tube from the 1.0L EVAP canister.

2 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

● Does the pressure drop immediately?

→ Yes

INSTALL a new 1.0L EVAP canister.

RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**
GO to [F9](#).

F9 TEST FOR BLOCKAGE IN FUEL VAPOR STORAGE CANISTER INLET TUBE

1

A0004675

1 Disconnect the fuel vapor storage canister inlet tube from the 2.0L EVAP canister.

2 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

- Does the pressure drop immediately?

→ **Yes**
INSTALL a new fuel vapor storage canister inlet tube. RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**
GO to [F10](#).

F10 TEST FOR BLOCKAGE IN 2.0L EVAP CANISTER

1

1 Disconnect the EVAP canister purge outlet tube from the 2.0L EVAP canister.

A0004676

2 Pressurize the EVAP system to 3.48 kPa (14 inches H₂O).

- Does the pressure drop immediately?

→ **Yes**

INSTALL a new 2.0L EVAP canister. RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

→ **No**

INSTALL a new EVAP canister purge outlet tube. RECONNECT all components. CARRY OUT the evaporative emission system leak test. Refer to [Evaporative Emission System Leak Test](#) in this section. If the system passes the leak test, CARRY OUT the evaporative emission repair verification drive cycle. REFER to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

Evaporative Emission System Leak Test

Special Tool(s)

 <p>ST2116-A</p>	Evaporative Emission System Leak Tester 310-F007 (134-00056) or equivalent
 <p>ST2332-A</p>	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent scan tool

 **CAUTION:** The evaporative emission system must not be pressurized to more than 3.48 kPa (14 inches H₂O) or damage to the evaporative emission system may occur.

1. Connect the Evaporative Emission System Leak Tester to the evaporative emission test port.
2. Close the canister vent solenoid. For additional information, refer to [Canister Vent Solenoid Closing Procedure](#) in this section.
3. Pressurize the evaporative emission system to 3.48 kPa (14 inches/H₂O).
4. Monitor the system for two minutes. The system fails the Leak Test if the pressure falls below 2.0 kPa (8 inches/H₂O).
5. Repair any leaks as required.
6. Repeat the Leak Test until the system remains above 2.0 kPa (8 inches/H₂O) after the two-minute test period.

Canister Vent Solenoid Closing Procedure

Special Tool(s)

 <p>ST2332-A</p>	<p>Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent scan tool</p>
---	---

⚠ CAUTION: The canister vent solenoid must not be energized for more than nine minutes at one time. Once the canister vent solenoid is energized and de-energized, adequate time must be allowed for the component to cool adequately. Failure to allow the component to cool may create a false failure in the diagnostics, causing unnecessary repairs.

1. Connect the scan tool and select the output test mode.
 2. If PID monitors are not active, select PIDs.
 3. Select the fuel tank pressure (FTP) and the volts (V) parameter identification (PID) for monitoring.
 4. Select the ALL OFF mode.
 5. Close the canister vent solenoid by pushing the START button on the scan tool.
-

Evaporative Emission Repair Verification Drive Cycle

Special Tool(s)

 ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent scan tool
---	---

Drive Cycle Recommendations

NOTE: The following procedure is designed to execute and complete the evaporative emission repair verification drive cycle and to clear the Ford P1000, inspection and maintenance (I/M) readiness code. When the ambient air temperature is below 4.4°C (40°F) or above 37.8°C (100°F), or the altitude is above 2,438 meters (8,000 feet), the EVAP monitor will not run. If the P1000 must be cleared in these conditions, the powertrain control module (PCM) must detect them once (twice on some applications) before the EVAP monitor can be bypassed and the P1000 cleared. The EVAP bypassing procedure is described in the following drive cycle.

1. Most OBD II monitors will complete more readily using a steady foot driving style during cruise or acceleration modes. Operating the throttle in a smooth fashion will minimize the time necessary for monitor completion.
2. Fuel tank level should be between one-half and three-quarters full with three-quarters full being the most desirable.
3. The evaporative monitor can only operate during the first 30 minutes of engine operation. When executing the procedure for this monitor, stay in part throttle mode and drive in a smooth fashion to minimize fuel slosh.

Drive Cycle Preparation

NOTE: For best results, follow each of the following steps as accurately as possible.

4. **NOTE:** This step bypasses the engine soak timer and resets OBD II monitor status.

Install the scan tool. Turn the key ON with the engine OFF. Cycle the key off, then on. Select the appropriate vehicle and engine qualifier. Clear all diagnostic trouble codes (DTCs) and carry out a PCM reset.

5. Begin to monitor the following PIDs: ECT, EVAPDC, FLI (if available) and TP MODE. Press Diagnostic Data Link, PCM, PID/Data monitor and record, press trigger to select each PID, then start.
6. Start the engine without returning the key to the OFF position.

Preparation for Monitor Entry

WARNING: Strict observance of posted speed limits and attention to driving conditions

are mandatory when proceeding through the following drive cycle.

7. **NOTE:** This step allows engine warm-up and provides intake air temperature (IAT) input to the PCM.

Idle the vehicle for 15 seconds. Drive at 64 km/h (40 mph) until the ECT is at least 76.7°C (170° F).

8. Is IAT above 4.4°C (40°F) and below 37.8°C (100°F)? If not, continue with the following steps but note that the EVAP Monitor Bypass portion of the drive cycle (Step 13) will be required to bypass the EVAP monitor and clear the P1000.

9. **NOTE:** This step executes the heated oxygen sensor (HO2S) monitor.

Cruise at 64 km/h (40 mph) for 60 seconds.

10. **NOTE:** This executes the EVAP monitor if IAT is above 4.4°C (40°F) and below 37.8°C (100°F).

NOTE: To initiate the monitor, TP MODE should equal PT, EVAPDC must be greater than 75%, and FLI must be between 15 and 85%.

NOTE: Avoid sharp turns and hills.

Cruise at 72 to 104 km/h (45 to 65 mph) for 10 minutes.

11. **NOTE:** This step executes the ISC portion of the Secondary Air/CCM.

Bring the vehicle to a stop. Idle with the transmission in DRIVE (for automatic transmission) or NEUTRAL (for manual transmission) for two minutes.

Pending Code and EVAP Monitor Bypass Check

12. **NOTE:** This determines if a pending code is preventing the clearing of P1000.

NOTE: If the EVAP monitor is not complete and IAT was below 4.4°C (40°F) or above 37.8°C (100°F) temperature range in Step 8, or the altitude is above 2,438 meters (8,000 feet), the EVAP Monitor Bypass (Step 13) must be carried out.

Using the scan tool, check for pending codes. Conduct normal repair procedures for any pending code concerns. Rerun any incomplete monitor.

EVAP Monitor Bypass

13. **NOTE:** This allows the bypass counter to increment to two.

NOTE: Do not repeat Step 4.

Park the vehicle for a minimum of eight hours. Repeat Steps 5 through 12.

Evaporative Emission Canister

Removal and Installation

⚠ WARNING: The evaporative emission system contains fuel vapor and condensed fuel vapor. Although not present in large quantities, it still presents the danger of explosion or fire. Disconnect the battery ground cable from the battery to minimize the possibility of an electrical spark occurring, possibly causing a fire or explosion if fuel vapor or liquid fuel are present in the area. Failure to follow these instructions may result in personal injury.

⚠ WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
3. Lower the rear subframe to access the evaporative emission canister assembly. For additional information, refer to [Section 502-00](#).
4. Disconnect the connectors.

5. Disconnect the hose.

6. Disconnect the connector.

7. Remove the evaporative emission (EVAP) canister and bracket assembly (9E857).
 - Remove the four bolts.

8. Disconnect the hoses.

9. Remove the EVAP canister.

10. Remove the EVAP canister.
 - Remove the rivet.

11. **NOTE:** The evaporative emission canister assembly must be leak-tested prior to installation on the vehicle.

NOTE: Lubricate the O-ring seals with MERPOL® or equivalent meeting Ford specifications ESE-M99B144-B.

To install, reverse the removal procedure.

- Carry out a leak test. For additional information, refer to [Evaporative Emission System Leak Test](#) in this section.
 - Carry out the evaporative emission repair verification drive cycle. For additional information, refer to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.
-

Evaporative Emission Canister Purge Valve

Removal and Installation

⚠ WARNING: The evaporative emission system contains fuel vapor and condensed fuel vapor. Although not present in large quantities, it still presents the danger of explosion or fire. Disconnect the battery ground cable from the battery to minimize the possibility of an electrical spark occurring, possibly causing a fire or explosion if fuel vapor or liquid fuel are present in the area. Failure to follow these instructions may result in personal injury.

⚠ WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.

1. Disconnect battery cable. For additional information, refer to [Section 414-01](#).
2. Disconnect the connector.

3. Disconnect the vacuum line.

4. Disconnect the evaporative emission (EVAP) return tube.

5. Disconnect the EVAP canister purge outlet tube.

6. Remove the EVAP canister purge valve.

7. **NOTE:** The EVAP canister assembly must be leak-tested prior to installation on the vehicle.

NOTE: Lubricate the O-ring seals with MERPOL® or equivalent meeting Ford specifications ESE-M99B144-B.

To install, reverse the removal procedure.

- Carry out a leak test. For additional information, refer to [Evaporative Emission System Leak Test](#) in this section.
 - Carry out the evaporative emission repair verification drive cycle. For additional information, refer to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.
-

Fuel Vapor Control Tube Assembly Valve

Removal and Installation

⚠ WARNING: The evaporative emission system contains fuel vapor and condensed fuel vapor. Although not present in large quantities, it still presents the danger of explosion or fire. Disconnect the battery ground cable from the battery to minimize the possibility of an electrical spark occurring, possibly causing a fire or explosion if fuel vapor or liquid fuel are present in the area. Failure to follow these instructions may result in personal injury.

⚠ WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Remove the fuel tank. For additional information, refer to [Section 310-01](#).
3. Disconnect and remove the fuel vapor control valve tube assembly.

4. **NOTE:** Lubricate the O-ring seals with MERPOL® or equivalent meeting Ford specifications ESE-M99B144-B.

To install, reverse the removal procedure.

- Carry out a leak test. For additional information, refer to [Evaporative Emission System Leak Test](#) in this section.
- Carry out the evaporative emission repair verification drive cycle. For additional information, refer to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.

Evaporative Emission Canister Vent Solenoid

Removal and Installation

1. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
2. Position a jack stand under the differential.

3. Remove the bolt.

4. Lower the differential to access the canister vent solenoid as necessary.

5. Remove the canister vent solenoid.
 1. Disconnect the connector.
 2. Disconnect the hose.
 3. Remove the canister vent solenoid.

6. **NOTE:** Lubricate the O-ring seals with MERPOL® or equivalent meeting Ford specifications ESE-M99B144-B.

To install, reverse the removal procedure.

- Carry out a leak test. For additional information, refer to [Evaporative Emission System Leak Test](#) in this section.
 - Carry out the evaporative emission repair verification drive cycle. For additional information, refer to [Evaporative Emission Repair Verification Drive Cycle](#) in this section.
-

General Specifications

Item	Specification
High Temperature Nickel Anti-Seize Lubricant F6AZ-9L494-AA	ESE-M12A4-A

Knock sensor (KS) bolt—3.9L	20	15	—
Knock sensor (KS) nut/bolt—3.0L	25	18	—
Mass airflow (MAF) sensor plate nuts	5	—	44
Powertrain control module (PCM) bracket bolts	7	—	62
Powertrain Control module (PCM) harness connector bolts	10	—	89
Power steering pressure (PSP) switch	17	13	—
Throttle position (TP) sensor screws	3	—	27
Wiring harness bracket to cylinder head nuts	10	—	89

Electronic Engine Controls

The electronic engine controls consist of the following:

- powertrain control module (PCM)
- throttle position (TP) sensor
- idle air control (IAC) valve
- camshaft position (CMP) sensor
- crankshaft position (CKP) sensor
- mass air flow (MAF) sensor
- intake air temperature (IAT) sensor
- heated oxygen sensor (HO2S)—front
- heated oxygen sensor (HO2S)—rear
- knock sensor (KS) (12A699)
- cylinder head temperature (CHT) sensor
- power steering pressure (PSP) switch
- fuel pressure sensor
- vehicle speed sensor (VSS)

The powertrain control module needs the following inputs to calibrate the engine correctly:

- camshaft position
- engine rpm
- cylinder head temperature
- clutch pedal position
- amount of engine detonation
- mass air flow (MAF) sensor

The throttle position sensor:

- sends the powertrain control module a signal indicating the throttle plate angle.
- is the main input to the powertrain control module from the driver.

The idle air control valve:

- supplies air to the fuel rail for better atomization of fuel (3.9L only)
- controls bypass air around the throttle plate at low speeds.
- is controlled by the powertrain control module.

The camshaft position sensor:

- sends the powertrain control module a signal indicating camshaft position used for fuel synchronization.

The power steering pressure switch:

- is located on the power steering pump, generates a differential pressure, and is dependent on current input.
- controls the spool valve in the power steering pump.
- regulates the hydraulic flow and, when combined with a current controlling device, yields a variable assist power steering system.
- is controlled by the PCM to increase power steering pump flow and power steering assist at low vehicle speeds and to reduce power steering pump flow and power steering assist at high vehicle speeds.
- is controlled by the PCM to increase the power steering pump flow, thereby increasing power steering assist for evasive maneuvering at high vehicle speeds (steering wheel rotation rate greater than 22 rpm).

The crankshaft position sensor:

- sends the powertrain control module a signal indicating crankshaft position.
- is essential for calculating spark timing.

The mass air flow sensor:

- sends the powertrain control module a signal indicating mass air flow rate of air entering the engine.

The intake air temperature sensor:

- sends the powertrain control module a signal indicating the temperature of the air entering the engine.
- resistance decreases as temperature increases.

The heated oxygen sensors:

- monitor oxygen content before and after the exhaust flows through the catalytic converter.
- provide a voltage to the powertrain control module used to calculate catalytic converter integrity.

The knock sensor:

- is located in the intake valley.
- sends a signal to the powertrain control module indicating engine detonation. (If detonation is occurring, the powertrain control module then changes spark timing.)

The cylinder head temperature sensor:

- is mounted into the wall of the cylinder head and is not connected to any coolant passages.

The knock sensor:

- is located in the intake valley.
- sends a signal to the powertrain control module indicating engine detonation. (If detonation is occurring, the powertrain control module then changes spark timing.)

The fuel pressure sensor:

- sends the powertrain control module a signal indicating fuel pressure.
 - The powertrain control module uses the fuel pressure sensor signal and the fuel temperature sensor signal to maintain the fuel liquid pressure in the fuel line which reduces the fuel vapor pressure in the fuel line.
- sends a signal to the powertrain control module indicating the cylinder head temperature.
 - If the temperature exceeds approximately 121°C (250°F), the powertrain control module disables half the fuel injectors at a time. The powertrain control module will alternate which fuel injectors are disabled every 32 engine cycles. The cylinders that are not being fuel injected act as air pumps to aid in cooling the engine.
 - If the temperature exceeds approximately 166°C (330°F), the powertrain control module disables all of the fuel injectors until the engine temperature drops below approximately 154°C (310°F).
 - The coolant temperature gauge pointer will read fully hot.
 - The check gauge warning indicator will illuminate and DTCs are set.

The vehicle speed sensor:

- sends a frequency signal to the powertrain control module.
 - The powertrain control module uses the vehicle speed sensor signal to calculate vehicle speed and to determine shift scheduling and electronic pressure control.

The intake manifold tuning valve:

- connects the plenums to improve upper rpm power.
-

Electronic Engine Controls

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Intake Manifold Tuning (IMT) Valve —3.0L

Removal

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Remove the cowl vent screen. For additional information, refer to [Section 501-02](#).
3. Remove the bolts and the cross vehicle support.

4. Remove the wiring harness bracket.

5. Remove the intake manifold tuning valve (IMTV).
 1. Disconnect the electrical connector.
 2. Remove the two bolts.
 3. Remove the IMTV.

Installation

1.  **CAUTION: The IMTV must be fully seated in the intake manifold prior to installing the bolts, or damage to the IMTV may occur.**

Install the intake manifold tuning valve (IMTV).

1. Coat the IMTV with Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification WSS-M2C153-G, and install into the intake manifold.
2. Install the two bolts.
3. Connect the electrical connector.

2. Install the wiring harness bracket.

3. Position the cross vehicle support and install the bolts.

4. Install the cowl vent screen. For additional information, refer to [Section 501-02](#).

Camshaft Position (CMP) Sensor —3.0L

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Disconnect the camshaft position (CMP) sensor electrical connector.

3. Remove the CMP sensor.
 1. Remove the bolt from the CMP sensor.
 2. Remove the CMP sensor from the vehicle.

4.  **CAUTION:** Do not overtighten the screw or damage to the CMP sensor may occur.

To install, reverse the removal procedure.

Camshaft Position (CMP) Sensor —3.9L

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Remove the wiper motor. Refer to [Section 501-16](#).
3. Remove the harness bracket nut and stud from the rear of the LH cylinder head.

4. Remove the harness bracket nut and position the bracket away from the cylinder head.

5. Remove the camshaft position (CMP) sensor.
 1. Disconnect the electrical connector.
 2. Remove the bolt.
 3. Remove the CMP sensor.

6.  **CAUTION: Do not overtighten the screw or damage to the camshaft position sensor may occur.**

NOTE: When the battery is disconnected and reconnected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The vehicle may need to be driven 16 km (10 miles) or more to relearn the strategy.

To install, reverse the removal procedure.

Crankshaft Position (CKP) Sensor —3.0L

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
3. **NOTE:** Generator removed for clarity.

Disconnect the crankshaft position (CKP) sensor electrical connector.

4. Remove the CKP sensor bolt and the CKP sensor.

5. To install, reverse the removal procedure.

Crankshaft Position (CKP) Sensor —3.9L

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
3. Disconnect the crankshaft position (CKP) sensor electrical connector.

4. Remove the bolt and the CKP sensor.

5. To install, reverse the removal procedure.

Power Steering Pressure (PSP) Switch —3.0L

Removal

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
3. Disconnect the power steering pressure (PSP) switch electrical connector.

4. Remove the PSP switch.

5. To install, reverse the removal procedure.

Power Steering Pressure (PSP) Switch —3.9L

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Disconnect the power steering pressure (PSP) switch electrical connector.

3. Remove the PSP switch.

4. To install, reverse the removal procedure.

Powertrain Control Module (PCM)

Special Tool(s)

 <p>ST2332-A</p>	<p>Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent scan tool</p>
---	--

Removal

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Remove the cabin air filter and plenum. For additional information, refer to [Section 412-01](#).
3. Loosen the bolts and disconnect the powertrain control module (PCM) harness connectors.

4. Remove the instrument panel finish panel.

5. Release the assist cable from the glove compartment.

6. Lower the glove compartment.
 1. Release the tabs.
 2. Lower the glove compartment.

7. If equipped with a compact disc changer, remove the glove compartment inner panel.
 1. Remove the screw.
 2. Remove the panel.

8. Remove the glove compartment instrument panel finish panel.
 1. Remove the screws.
 2. Remove the panel.

9. Remove the PCM bracket bolts and bracket.

10. Remove the PCM.

Installation

All Vehicles

1. Install the PCM into the bracket.

2. Install the PCM into the vehicle through the glove box and install the bolts.

3. Install the glove compartment instrument panel finish panel.
 1. Position the panel.
 2. Install the screws.

4. If equipped with a compact disc changer, install the glove compartment inner panel.
 1. Position the panel.
 2. Install the screws.

5. Raise the glove compartment.
 1. Raise the glove compartment.
 2. Position the stop tabs.

6. Connect the assist cable to the glove compartment.

7. Install the instrument panel finish panel.

8. Connect the PCM harness connectors and tighten the bolts.

9. Install the cabin air filter and plenum. For additional information, refer to [Section 412-01](#).
10. Connect the battery ground cable.

Vehicles With Automatic Transmission

11. Connect the scan tool.
12. Select ICM.
13. Select ENTER SECURITY ACCESS. Wait 10 minutes for security access to be granted.
14. Select PARAMETER RESET.
15. Disconnect the scan tool.

16. Place ignition key in the OFF position.
17. Place ignition key in the RUN position.
18. Remove the ignition key.

Vehicles With Manual Transmission

19. **NOTE:** The steering column lock (SCL) actuator will only allow communication with a tester after the SCL actuator has been activated. To activate the SCL actuator, open the driver door and **do not** put the key in the ignition (or alternatively, you can press one of the buttons on the key fob while there is no key in the ignition.) The SCL actuator will stay activated for 30 minutes after the driver door is opened (or a key fob button is pressed).

Connect the scan tool.

20. Place the ignition switch in the OFF position.
 21. Select SCLM.
 22. Select ENTER SECURITY ACCESS. Wait 8 minutes for security access to be granted.
 23. Select PARAMETER RESET.
 24. Place the ignition in the RUN position.
 25. Select ICM.
 26. Select ENTER SECURITY ACCESS. Wait 10 minutes for security access to be granted.
 27. Select RESET SCLM PARAMETER.
 28. Select PARAMETER RESET.
 29. Disconnect the scan tool.
 30. Place ignition key in the OFF position.
 31. Place ignition key in the RUN position.
 32. Remove the ignition key.
-

Throttle Position (TP) Sensor —3.0L

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Disconnect the throttle position (TP) sensor electrical connector.

3. Remove the TP sensor.
 1. Remove the screws from the TP sensor.
 2. Remove the TP sensor from the vehicle.

4. **NOTE:** The TP sensor cannot be adjusted. If necessary, a new sensor must be installed.

To install, reverse the removal procedure.

- After installation, cycle the throttle lever to wide open throttle (WOT). It should return without interference.

Throttle Position (TP) Sensor —3.9L

Removal and Installation

1. Remove the idler air control (IAC) valve. Refer to [Idle Air Control \(IAC\) Valve—3.9L](#).
2. Disconnect the throttle position (TP) sensor electrical connector.

3. Remove the TP sensor.
 1. Remove the screws from the TP sensor.
 2. Remove the TP sensor from the vehicle.

4. To install, reverse the removal procedure.
 - After installation, cycle the throttle lever to wide open throttle (WOT). It should return without interference.

Idle Air Control (IAC) Valve —3.0L

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Disconnect the electrical connector from the idle air control (IAC) valve.

3. Remove the IAC valve.
 1. Remove the bolts from the IAC valve.
 2. Lift and remove the IAC valve from the vehicle and discard the gasket.

4.  **CAUTION:** Do not use Carburetor Tune-up Cleaner D9AZ-19579-BA meeting Ford specifications ESR-M14P9-A or any other type of solvent as damage to the valve internal components may result.

NOTE: The engine control sensor wiring (12A581) cannot be cleaned. If necessary, new wiring must be installed.

Clean the gasket mating surfaces.

5. To install, reverse the removal procedure.
 - Install a new gasket.

Idle Air Control (IAC) Valve —3.9L

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Remove the engine appearance cover.
 - Remove the pin-type retainers.

3. Disconnect the electrical connector from the idle air control (IAC) valve (9F715).

4.  **CAUTION:** In order to disconnect the Noma type hose fittings, squeeze the tabs and pull the hose straight back. Failure to squeeze tabs may result in fitting damage.

Disconnect the hoses.

1. Disconnect the air assist hose.
2. Disconnect the idle air bypass hose.

5. Remove the IAC valve.
 1. Remove the bolts from the IAC valve.
 2. Lift and remove the IAC valve from the vehicle and discard the gasket.

6.  **CAUTION: Do not use Carburetor Tune-up Cleaner D9AZ-19579-BA meeting Ford specification ESR-M14P9-A or any other type of solvent as damage to the valve internal components may result.**

NOTE: The engine control sensor wiring cannot be cleaned. If necessary, new wiring must be installed.

Clean the gasket mating surfaces.

7. To install, reverse the removal procedure.
 - Install a new gasket.
-

Cylinder Head Temperature (CHT) Sensor —3.0L

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Remove the engine appearance cover.
3. Disconnect the cylinder head temperature (CHT) sensor electrical connector.

4. Remove and discard the CHT sensor.

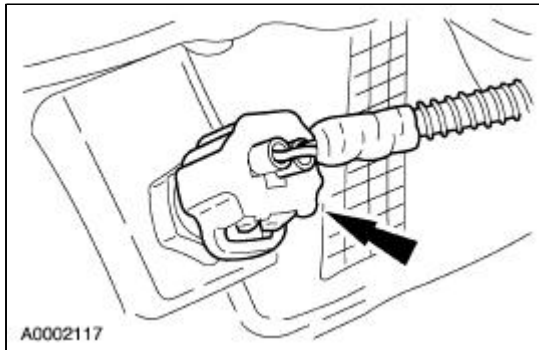

5. To install, reverse the removal procedure.

Cylinder Head Temperature (CHT) Sensor —3.9L

Removal and Installation

1. Remove the intake manifold. Refer to [Section 303-01B](#).
2. Disconnect the cylinder head temperature (CHT) sensor electrical connector.

3. Remove and discard the CHT sensor.

4.  **CAUTION:** The tip of the CHT sensor must contact the cylinder head at the bottom of the hole. When removed, it will be slightly crushed. This is a normal condition.

NOTE: 3.9L CHT sensors are not to be reused. Always install a new sensor.

To install, reverse the removal procedure.

Mass Air Flow (MAF) Sensor

Removal and Installation

⚠ CAUTION: The mass airflow sensor hot wire sensing element and housing are calibrated as a unit and must be repaired as a complete assembly. Do not damage the sensing element (internal to housing) or possible failure of the MAF sensor may occur.

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Disconnect the mass airflow (MAF) sensor electrical connector.

3. Loosen the screws on the air cleaner outlet tube clamp.

4. Remove the air cleaner housing cover.
 1. Release the cover clips.
 2. Remove the cover.

5. Remove the bolts and the MAF sensor.
 - Discard the gasket.

6. **NOTE:** A new gasket must be installed.
To install, reverse the removal procedure.
-

Intake Air Temperature (IAT) Sensor

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Remove the intake air temperature (IAT) sensor.
 1. Disconnect the IAT sensor electrical connector.
 2. Remove the IAT sensor.

3. Inspect the IAT sensor O-ring seal for damage or deterioration. Install a new O-ring seal as necessary.
 4. To install, reverse the removal procedure.
-

Heated Oxygen Sensor (HO2S) —3.0L, 3.9L, Front

Special Tool(s)

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
3. **NOTE:** RH shown, LH similar.

Remove the heated oxygen sensor (HO2S).

1. Unclip and disconnect the electrical connector.
2. Using the special tool, remove the HO2S.

4. To install, reverse the removal procedure.
 - Apply a light coat of High Temperature Nickel Anti-Seize Lubricant F6AZ-9L494-AA or equivalent meeting Ford specification ESE-M12A4-A to the threads of the heated oxygen sensors.

Heated Oxygen Sensor (HO2S) —3.0L (A/T), 3.9L, Rear

Special Tool(s)

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
3. **NOTE:** RH shown, LH similar.

Remove the heated oxygen sensor (HO2S).

1. Disconnect the electrical connector.
2. Unclip the harness.
3. Using the special tool, remove the sensor.

4. To install, reverse the removal procedure.
 - Apply a light coat of High Temperature Nickel Anti-Seize Lubricant F6AZ-9L494-AA or equivalent meeting Ford specification ESE-M12A4-A to the threads of the heated oxygen sensors.

Heated Oxygen Sensor (HO2S) —3.0L (M/T), Rear

Special Tool(s)

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Raise and support the vehicle. For additional information, refer to [Section 100-02](#).
3. **NOTE:** LH shown, RH similar.

Remove the heated oxygen sensors (HO2S).

1. Disconnect the electrical connector.
2. Using the special tool, remove the HO2S.

4. To install, reverse the removal procedure.
 - Apply a light coat of High Temperature Nickel Anti-Seize Lubricant F6AZ-9L494-AA or equivalent meeting Ford specification ESE-M12A4-A to the threads of the heated oxygen sensors.

Knock Sensor (KS) —3.0L

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. If removing the top-mounted knock sensor, remove the lower intake manifold. Refer to [Section 303-01A](#).
3. Disconnect the electrical connectors from the top-mounted and side-mounted knock sensors (KS).

4. Remove the nut and the side-mounted KS.

5. Remove the bolt and the top-mounted KS.

6. To install, reverse the removal procedure.

Knock Sensor (KS) —3.9L

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Remove the lower intake manifold. For additional information, refer to [Section 303-01B](#).
3. Disconnect the knock sensor (KS) electrical connectors.

4. Remove the bolts and the knock sensors.

5. To install, reverse the removal procedure.

Clutch Pedal Position (CPP) Switch

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Disconnect the clutch pedal position (CPP) switch electrical connector.

3. Remove the CPP switch.
 1. Lift the CPP switch retaining tag.
 2. Remove the CPP switch.

4. To install, reverse the removal procedure.

Fuel Pressure Sensor —3.0L

Removal and Installation

⚠ WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and may be ignited, resulting in possible personal injury.

⚠ WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before working on or disconnecting any of the fuel lines or fuel system components the fuel system pressure must be relieved. Failure to do so may result in personal injury.

1. Disconnect the battery ground cable. For additional information, refer to [Section 414-01](#).
2. Relieve the fuel system pressure. For additional information, refer to [Section 310-00](#).
3. Remove the cowl vent screen. For additional information, refer to [Section 501-02](#).
4. Remove the differential pressure feedback EGR (DPFE) nuts.

5. Remove the fuel pressure sensor shield.
 1. Remove the nut.
 2. Remove the two bolts.
 3. Remove the shield.

6. Disconnect the fuel pressure sensor electrical connector.

7. Remove the fuel pressure sensor.
 1. Disconnect the fuel pressure sensor vacuum hose.
 2. Remove the bolts.
 3. Remove the fuel pressure sensor.

8.  **WARNING:** Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and may be ignited, resulting in possible personal injury.

NOTE: Lubricate the new seal and O-ring seals with clean Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification ESE-M2C153-G.

To install, reverse the removal procedure.

Fuel Pressure Sensor —3.9L

Removal and Installation

⚠ WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and may be ignited, resulting in possible personal injury.

⚠ WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before working on or disconnecting any of the fuel lines or fuel system components the fuel system pressure must be relieved. Failure to do so may result in personal injury.

1. **NOTE:** When the battery is disconnected and reconnected, some abnormal drive symptoms may occur while the vehicle relearns its adaptive strategy. The vehicle may need to be driven to relearn the strategy.

Disconnect the battery ground cable. For additional information, refer [Section 414-01](#).

2. Relieve the fuel system pressure. For additional information, refer to [Section 310-00](#).
3. Disconnect the fuel pressure sensor electrical connector.

4. Remove the bolts.

5. Disconnect the fuel pressure sensor vacuum hose and remove the fuel pressure sensor.

6.  **WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and may be ignited, resulting in possible personal injury.**

NOTE: Lubricate the new seal and O-ring seals with clean Super Premium SAE 5W-30 Motor Oil XO-5W30-QSP or equivalent meeting Ford specification ESE-M2C153-G.

To install, reverse the removal procedure.

Fluid Maintenance

CAUTION: Use only MERCON® V transmission fluid. Use of any other fluids can result in transmission failure.

Intervals	
Normal maintenance	Not necessary. Filled for life.
Severe duty maintenance	Change the fluid at 48,000 km (30,000 miles) intervals. Use MERCON® V.

General Specifications

Vehicle	Engine	Approximate Liters	Refill Capacity ¹ U.S. Quarts	Fluid Type
Lincoln LS— 5R55N	3.0L, 3.9L	11.2	11.9	MERCON® V XT-5-QM

¹ Approximate dry capacity, includes cooler and tubes. Fluid level procedures in this section should be used to determine actual fluid requirements and fluid specification. DO NOT OVERFILL. If it is necessary to add or change fluid, use only fluid that has been certified by the supplier as meeting the Ford Motor Company specification shown.

Transmission Description

The 5R55N has the following features:

- five forward speeds
- electronic shift, pressure, and torque converter clutch controls
- three compound planetary gearsets
- three bands
- four multi-plate clutches
- three one-way clutches

All hydraulic functions are directed by electronic solenoids to control:

- static engagement feel.
- shift feel.
- shift scheduling.
- modulated torque converter clutch (TCC) applications.
- engine braking utilizing the coast clutch and band.
- manual first and second timing.
- reverse inhibit timing.

Transmission View

Identification Tags

I. D. Tag Located on Transmission Case

Item	Part Number	Description
1	—	Model number
2	—	Assemble level
3	—	Build code
4	—	Serial number
5	—	Build date (YMDD)

All vehicles are equipped with a Vehicle Certification Label, located on the driver side door lock post. Refer to the code in the space marked TR. For model, service ID level or build date information refer to the transmission service ID tag located on the transmission case.

Range Selection

Depending on the vehicle options selected the transmission range selector may have different range positions.

The standard range selector has eight positions: P, R, N, D5, D4, 3, 2, and 1.

Base Range Shifter

The optional Select Shift Transmission (SST) range selector has seven positions P, R, N, D5, or D4, + and -. This option will allow the driver to manually upshift and downshift into any gear range.

Optional Range Shifter

Park

In the PARK position:

- there is no power flow through the transmission.
- the parking pawl locks the output shaft to the case.
- the engine may be started.
- the ignition key may be removed.

Reverse

In the REVERSE position:

- the vehicle may be operated in a rearward direction, at a reduced gear ratio.
- backup lamps are illuminated.

Neutral

In the NEUTRAL position:

- there is no power flow through the transmission.
- the output shaft is not held and is free to turn.
- the engine may be started.

D5 (Overdrive)

D5 (overdrive) is the normal position for most forward driving.

The D5 (overdrive) position provides:

- automatic shift 1-5 and 5-1.
- apply and release of the torque converter clutch.
- maximum fuel economy during normal operation.
- engine braking in 5th gear.

D4 (Overdrive Canceled)

The D4 (overdrive) position provides:

- automatic shift 1-4 and 4-1.
- apply and release of the torque converter clutch.
- engine braking in 4th gear.

Third Position—3rd Gear (Base Shifter)

The 3rd position provides:

- third gear start and hold.
- the torque converter clutch may apply and release.
- improved traction on slippery roads.
- engine braking.

Second Position—2nd Gear (Base Shifter)

The 2nd position provides:

- second gear start and hold.
- the torque converter clutch may apply and release.
- improved traction on slippery roads.
- engine braking.

First Position—1st Gear (Base Shifter)

If this position is selected at normal road speeds, the transmission will downshift into the next lower gear and continue downshifting until the vehicle reaches first gear.

This position provides:

- first gear operation only.
- engine braking for descending steep grades.

+ and - Position Operation (Optional Shifter)

These positions allow the driver to manually select the appropriate upshift (+) or downshift (-) and gear range.

- Can only be entered from the D5 position.
- Gear ranges 1-5 provide the same function and ratio as found in the D5 or D4 automatic mode positions.
- Transmission will not upshift or downshift unless the selector lever is moved forward or rearward.
- One tap forward (+) will command the transmission to upshift one gear range.
- One tap rearward (-) will command the transmission to downshift one gear range.
- Upshifts are allowed at any vehicle speed.
- A second gear start up is normal. A third gear start up will be allowed only if selected. All other selections will revert to second gear.
- If the driver starts in second gear and does not pass 60% throttle, the transmission will remain in second gear. No automatic shift will occur.
- If the driver passes 60% throttle, then a 2-1 automatic kickdown will occur, scheduled by the PCM as used in D5. Once this has occurred, first gear will hold until second gear is selected by the driver moving the shift handle. No automatic upshift is possible under this condition.
- Once a kickdown has occurred, manual shifting in and out of first gear is allowed until the next time the vehicle stops.
- A shift to first gear with the vehicle at rest is never allowed.
- When downshifting at normal road speeds, the transmission will only allow a downshift into the next lower gear.
- If the shifter (-) is tapped more than once in rapid succession, the transmission will downshift only into the next lower gear. Then when the vehicle reaches a speed below a calibrated entry speed, the transmission will allow a downshift into the next lower gear, if again selected by the driver. This is to prevent engine and transmission damage and to keep the engine and transmission within allowable rpm ranges.
- An electronic indicator on the instrument cluster will display the selected gear.

Park Sense Switch

The park sense switch prevents the redundant PRNDL from displaying "P" until the shifter is in the park position.

Electronic Transmission Error Indicator

The vehicle is equipped with a redundant electronic gearshift indicator. This character appears with the key in the run position and displays the same gear selection as shown on the range selector floor console next to the range selector lever. If an "E" character flashes or remains on this indicates a

transmission malfunction.

Shift Patterns

Upshifts

Transmission upshifting is controlled by the powertrain control module. The PCM receives inputs from various engine or vehicle sensors and driver demands to control shift scheduling, shift feel and torque converter clutch (TCC) operation.

The PCM has an adaptive learn strategy to electronically control the transmission which will automatically adjust the shift feel. When the battery has been disconnected, or a new battery installed certain transmission operating parameters may be lost. The Powertrain Control Module (PCM) must re-learn these parameters. During this learning process you may experience slightly firm shifts, delayed, or early shifts. This operation is considered normal and will not affect the function of the transmission. Normal operation will return once these parameters are stored by the PCM.

Downshifts

Under certain conditions the transmission will downshift automatically to a lower gear range (without moving the gearshift lever). There are three categories of automatic downshifts: coastdown, torque demand and forced or kickdown shifts.

Coastdown

The coastdown downshift occurs when the vehicle is coasting down to a stop.

Torque Demand

The torque demand downshift occurs (automatically) during part throttle acceleration when the demand for torque is greater than the engine can provide at that gear ratio. If applied, the transmission will disengage the TCC to provide added acceleration.

Kickdown

For maximum acceleration, the driver can force a downshift by pressing the accelerator pedal to the floor. A forced downshift into a lower gear is possible below calibrated speeds. Specifications for downshift speeds are subject to variations due to tire size and engine and transmission calibration requirements.

Torque Converter

The torque converter transmits and multiplies torque. The torque converter is a four-element device:

- impeller assembly
- turbine and damper assembly
- reactor assembly
- clutch

The standard torque converter components operate as follows:

- Rotation of the converter housing and impeller set the fluid in motion.
- The turbine reacts to the fluid motion from the impeller, transferring rotation to the geartrain through the input shaft.
- The reactor redirects fluid going back into the impeller, allowing for torque multiplication.
- The clutch and damper assembly dampens powertrain torsional vibration and provides a direct mechanical connection for improved efficiency.
- Power is transmitted from the torque converter to the planetary gearsets and other components through the input shaft.

Item	Part Number	Description
1	—	Converter clutch and damper (part of 7902)
2	—	Reactor (part of 7902)
3	—	Turbine damper (part of 7902)

4	—	Impeller (part of 7902)
5	—	Fluid motion
6	—	Transmission input rotation
7	—	Input shaft
8	—	Engine rotation

Geartrain

Power is transmitted from the torque converter to the planetary gearsets through the input shaft. Bands and clutches are used to hold and drive certain combinations of gearsets. This results in five forward ratios and one reverse ratio, which are transmitted to the output shaft and differential.

Gear Ratio	
1st	3.25 to 1
2nd Early Production Vehicles	2.44 to 1
2nd Late Production Vehicles	2.29 to 1
3rd	1.55 to 1
4th	1.00 to 1
5th Early Production Vehicles	0.75 to 1
5th Late Production Vehicles	0.71 to 1
Reverse	3.07 to 1

Planetary Gearset — Overdrive

For component location, refer to [Disassembled Views](#) in this section.

The planetary gear overdrive carrier is driven by the input shaft.

- The overdrive planetary gearset carrier drives the center shaft via the overdrive one-way clutch in 1st, 3rd, 4th, and reverse gears.
- In 2nd, and 5th, the overdrive sun gear is held causing the pinion gears to rotate around the overdrive sun gear.
- The pinion gears in turn drive the overdrive ring gear resulting in the 5th (overdrive) gear ratio.
- The overdrive planetary gearset is internally splined to the coast clutch for engine braking.

Planetary Gearset — Forward

For component location, refer to [Disassembled Views](#) in this section.

The forward planetary gearset is splined to the output shaft.

- The forward planetary gearset is driven by the forward ring gear when the forward clutch is applied.
- The forward planetary gearset pinions drive the forward sun gear.
- The forward sun gear is splined to the input shell.
- The forward carrier is splined to the output shaft.

Planetary Gearset — Low/Reverse

For component location, refer to [Disassembled Views](#) in this section.

The low/reverse planetary gearset is connected to the reverse brake drum by lugs from the low/reverse brake drum to the lugs of the low/reverse planetary gearset.

- The low/reverse planetary gearset is driven by the forward sun gear which is splined to the input shell.
- The forward sun gear drives the pinions in the low/reverse planetary gearset.
- The pinions of the low/reverse planetary gearset drive the output shaft ring gear and output shaft hub which is splined to the output shaft.
- The low/reverse planetary gearset can be held by the low one-way clutch in the low/reverse brake drum, or by the low/reverse band.

Input Shaft

For component location, refer to [Disassembled Views](#) in this section.

- The radial positioning of the input shaft is controlled by two bushings in the stator support.
- Axial positioning of the input shaft is controlled by the splines in the converter turbine and the retaining ring in the overdrive planetary carrier.

Output Shaft

For component location, refer to [Disassembled Views](#) in this section.

The output shaft is supported by a bearing in the case and by a bearing in the extension housing. End positioning is controlled by the parking pawl gear and by the reverse ring gear hub and snap ring.

Apply Components

Band — Overdrive

For component location, refer to [Disassembled Views](#) in this section.

During 2nd and 5th gear operation, hydraulic pressure is applied to the overdrive servo.

- This pressure causes the piston to move and apply force to the band.
- This action causes the overdrive band to hold the overdrive drum.
- This causes the overdrive sun gear to be held stationary through the adapter plate and the overdrive drum.

Band — Low/Reverse

For component location, refer to [Disassembled Views](#) in this section.

During 2nd gear operation, 1st gear operation and reverse, hydraulic pressure is applied to the low/reverse servo.

- This pressure causes the servo to move and apply force to the low/reverse band.
- This action causes the low/reverse brake drum to be held.
- This action causes the low/reverse planetary assembly to be held stationary.

Band — Intermediate

For component location, refer to [Disassembled Views](#) in this section.

During 3rd gear operation, hydraulic pressure is applied to the intermediate servo.

- This pressure causes the servo to move and apply force to the intermediate band.
- This action causes the direct clutch drum to be held.
- The intermediate band holds the intermediate brake and direct clutch drum to the case in 3rd gear.
- This causes the input shell and forward sun gear to be held stationary.

Clutches — Direct

For component location, refer to [Disassembled Views](#) in this section.

The direct clutch is a multi-disc clutch made up of steel and friction plates.

- The direct clutch is applied with hydraulic pressure and disengaged by return springs and the exhaust of the hydraulic pressure.
- It is housed in the direct clutch drum.
- During 4th, 5th, and reverse gear application, the direct clutch is applied transferring torque from the forward clutch cylinder to the direct clutch drum.

- This action causes the forward sun gear to drive the pinions of the low/reverse planetary carrier.

Clutches — Forward

For component location, refer to [Disassembled Views](#) in this section.

The forward clutch is a multi-disc clutch made up of steel and friction plates.

- The forward clutch is applied with hydraulic pressure and disengaged by return springs and the exhaust of the hydraulic pressure.
- The forward clutch is applied in all forward gears.
- When applied, the forward clutch provides a direct mechanical coupling between the center shaft and the forward ring gear and hub.

Clutches — Coast

For component location, refer to [Disassembled Views](#) in this section.

The coast clutch is a multi-disc clutch made up of steel and friction plates.

- The coast clutch is applied with hydraulic pressure and disengaged by return springs and the exhaust of the hydraulic pressure.
- The coast clutch is housed in the overdrive drum.
- The coast clutch is applied when in 1st, 3rd, D4, and reverse positions.
- When applied, the coast clutch locks the overdrive sun gear to the overdrive planetary carrier, thus preventing the one-way clutch from overrunning when the vehicle is coasting.
 - This allows the use of engine compression to help slow the vehicle and provide engine braking.

Clutches — Intermediate

For component location, refer to [Disassembled Views](#) in this section.

The intermediate clutch is a multi-disc stationary clutch made up of steel and friction plates which are in a module assembly that includes the cylinder and frictions.

- Applied with hydraulic pressure.
- Disengaged by a return spring and releasing of hydraulic pressure.
- Hydraulic pressure is feed through a feed tube in the case worm trail.
- Uses a bonded piston in an aluminum housing.
- Applied in during a 2-3 shift event.
- Transfers torque from the sun gear to the planetary carrier.
- Torque transfer causes the one way clutch to engage and holds the sun gear from turning, delivering 3rd gear.

One-Way Clutch — Direct

For component location, refer to [Disassembled Views](#) in this section.

The direct one-way clutch is a sprag-type one-way clutch that is pressed into the center shaft.

- The direct one-way clutch is driven by the ring gear of the overdrive planetary carrier.
- The direct one-way clutch holds and drives the outer splines of the center shaft in 1st, 3rd, 4th and reverse gears.
- The direct one-way clutch overruns during all coast operations and at all times in 2nd and 5th gear.

One-Way Clutch — Intermediate

For component location, refer to [Disassembled Views](#) in this section.

The Intermediate One-Way Clutch is a sprag type one-way clutch.

- The Intermediate One-Way Clutch connects the intermediate assembly to the input shell and sun gear assembly in third gear.

One-Way Clutch — Low/Reverse

For component location, refer to [Disassembled Views](#) in this section.

The low/reverse one-way clutch is a sprag type one-way clutch.

- The low/reverse one-way clutch holds the low/reverse drum and low/reverse planetary assembly to the case in 1st and 2nd gear.
 - In all other gears the low/reverse one-way clutch overruns.
-

Hydraulic System

Fluid Pump

For component location, refer to [Disassembled Views](#) in this section.

- The fluid pump provides the fluid pressure necessary to charge the torque converter, main control assembly, transmission cooling system, lubrication system and apply devices.
- The fluid pump is a positive displacement, gear type pump.
 - The fluid pump is driven by the torque converter impeller hub.

Filter

For component location, refer to [Disassembled Views](#) in this section.

- All fluid drawn from the transmission fluid pan by the fluid pump passes through the fluid filter.
- The transmission fluid filter and its accompanying seals are part of the fluid path from the sump (pan) to the fluid pump.
 - The transmission fluid filter has a bypass section which allows fluid vented at the main regulator valve to be recirculated to the fluid pump, without passing through the transmission fluid filter.

Main Control

- The main control assembly and related components are part of the pressure side of the hydraulic system.
- The main control assembly consists of the solenoids, the valve body assembly and the separator plate.
- These components combine to convert electrical signals into hydraulic actions.
 - All valves in the main control assembly are anodized aluminum and cannot be sanded,

filed, or dressed in any other way. If there is any damage to the valves that prevents or restricts their movement, install a new main control assembly.

Transmission Electronic Control System

Electronic System Description

The powertrain control module and its input/output network control the following transmission operations:

- shift timing.
- line pressure (shift feel).
- torque converter clutch.

The transmission control strategy combined with the engine control provides optimum powertrain operation under all conditions. When determining the best operating strategy for transmission operation, the PCM uses input information from certain engine-related and driver-demand related sensors and switches.

In addition, the PCM receives input signals from certain transmission-related sensors and switches. The PCM also uses these signals when determining transmission operating strategy.

Using all of these input signals, the PCM can determine when the time and conditions are right for a shift, or when to apply or release the torque converter clutch. It will also determine the pressure needed to optimize shift feel. To accomplish this the PCM uses three pressure controls, one torque converter clutch and four shift solenoids to control transmission operation.

The following provides a brief description of each of the sensors and actuators used to control transmission operation.

Powertrain Control Module

The operation of the transmission is controlled by the powertrain control module. Many input sensors provide information to the powertrain control module. The powertrain control module then controls the actuators which determine transmission operation.

Air Conditioning (A/C) Clutch

An electromagnetic clutch is energized when the clutch cycling pressure switch closes. The switch is located on the suction accumulator/drier. The closing of the switch completes the circuit to the clutch and draws it into engagement with the compressor driveshaft. When the A/C is engaged, operating pressures are adjusted to compensate for additional load on the engine.

Brake Pedal Position (BPP) Switch

The brake pedal position (BPP) switch tells the powertrain control module (PCM) when the brakes are applied. The torque converter clutch disengages when the brakes are applied. The BPP switch closes when the brakes are applied and opens when they are released. The BPP is also used to disengage the brake shift interlock.

Engine Coolant Temperature (ECT) Sensor

The engine coolant temperature (ECT) sensor detects engine coolant temperature and supplies the information to the PCM. The ECT sensor is used to control torque converter clutch (TCC) operation.

Electronic Ignition (EI) System

The electronic ignition consists of a crankshaft position sensor, two four-tower ignition coils and the powertrain control module. The ignition control module operates by sending crankshaft position information from the crankshaft position sensor to the ignition control module. The ignition control module generates a profile ignition pickup (PIP) signal (engine rpm) and sends it to the PCM. The PCM uses PIP signal in the transmission strategy, wide-open throttle (WOT) shift control, torque converter clutch control and operating pressures.

Intake Air Temperature (IAT) Sensor

The intake air temperature (IAT) sensor provides the sequential fuel injection (SFI) system mixture temperature information. The IAT sensor is used both as a density corrector for air flow calculation and to proportion cold enrichment fuel flow. The IAT sensor is installed in the air cleaner outlet tube. The IAT sensor is also used in determining control pressures.

Mass Air Flow (MAF) Sensor

The mass air flow sensor measures the mass of air flowing into the engine. The MAF sensor output signal is used by the powertrain control module (PCM) to calculate injector pulse width. For transmission strategies, the MAF sensor is used to regulate electronic pressure control, shift and torque converter clutch scheduling.

Transmission Control Switch (TCS)

The transmission control switch (TCS) sends a signal to the powertrain control module (PCM) when the driver selects the D4 position, canceling operation of 5th (overdrive) gear.

The TCS is located within the range selector assembly (base shifter only).

The PCM uses this signal to control the shift solenoids to disengage/disable 5th gear operation and activates coast clutch. At the same time, the PCM changes the instrument panel indicator to display D4.

When the driver moves the range selector lever back to the D5 position, 5th gear operation is enabled, the coast clutch is released and the instrument panel indicator changes to display D5.

Throttle Position (TP) Sensor

The throttle position (TP) sensor is a potentiometer mounted on the throttle body. The TP sensor detects the position of the throttle plate and sends this information to the powertrain control module. The TP sensor is used for shift scheduling, electronic pressure control and torque converter clutch (TCC) control.

Digital Transmission Range (TR) Sensor

The digital transmission range (TR) sensor is located on the outside of the transmission at the manual lever. The digital TR sensor completes the start circuit in PARK, NEUTRAL, and the back-up lamp circuit in REVERSE. The digital TR sensor also opens and closes a set of four switches that are monitored by the powertrain control module to determine the position of the manual lever (P, R, N, D5, 3, 2, 1).

Turbine Shaft Speed (TSS) Sensor

The turbine shaft speed (TSS) sensor is a magnetic pickup that sends the powertrain control module torque converter turbine speed information.

The TSS sensor is mounted externally on the case.

The PCM uses TSS information to help determine appropriate operating pressures and torque converter clutch (TCC) operation.

Output Shaft Speed (OSS) Sensor

The output shaft speed (OSS) sensor is a magnetic pickup, located at the park gear, that sends a signal to the powertrain control module to indicate transmission output shaft speed. The OSS sensor is mounted externally on the case. The OSS is used for torque converter clutch control, speed scheduling and to determine electronic pressure control.

Intermediate Shaft Speed (ISS) Sensor

The intermediate shaft speed (ISS) sensor is a magnetic pickup that sends planetary sun gear speed information to the PCM. The ISS is mounted externally on the center of the case.

The PCM uses the ISS information to aid in determining pressure requirements.

Pressure Control Solenoids (PCA, PCB, PCC)

The pressure control (PC) solenoids are a variable-force style (VFS) solenoid. The VFS-type solenoid is an electrohydraulic actuator combining a solenoid and a regulating valve.

The line pressure tap is used to verify output pressure from PC A or PC B by turning either one off while verifying the output from the other solenoid. The second pressure tap is used to verify the output from the PC C solenoid.

There are three PC solenoids located in the solenoid body assembly used to control line pressure, band and clutch application pressure within the transmission.

The powertrain control module varies the current to the PC solenoid.

The PCM has an adaptive learn strategy to electronically control the transmission which will automatically adjust the shift feel. When the battery is disconnected or a new battery installed, certain transmission operating parameters can be lost. The Powertrain Control Module (PCM) must relearn these parameters. During this learning process, you may experience slightly firm shifts, delayed, or early shifts. This operation is considered normal and will not affect the function of the transmission. Normal operation will return once these parameters are stored by the PCM.

Torque Converter Clutch (TCC) Solenoid

The torque converter clutch (TCC) solenoid is a pulse-width-modulating type solenoid that is used to control the apply and release of the TCC.

Shift Solenoids — (SSA, SSB, SSC, SSD)

Four On/Off shift solenoids allow the powertrain control module to control shift scheduling.

- The solenoids are three-way, normally open style.
- The shift solenoids SSA, SSB, SSC and SSD provide gear selection of 1st through 5th and reverse gears by directing PC pressures to the appropriate elements.

Coast braking and manual gears are also controlled by the shift solenoids.

Transmission Fluid Temperature (TFT) Sensor

- The transmission fluid temperature (TFT) sensor is a thermistor-type sensor that varies a reference voltage signal. The resistance in the TFT varies with temperature. The powertrain control module (PCM) monitors the voltage signal across the TFT, and uses this information to determine the transmission fluid temperature.
- The TFT is located on the solenoid body.

- The PCM uses the TFT signal to help determine shift scheduling, torque converter clutch operation and pressure control requirements.

It sends a voltage signal to the powertrain control module. The voltage signal varies with transmission fluid temperature. The PCM uses this signal to determine whether a cold start shift schedule is necessary. The shift schedule is compensated when the transmission fluid temperature is cold. The PCM also inhibits torque converter clutch (TCC) operation at low transmission fluid temperatures and determines pressure control (PC) solenoid operations.

Reverse Pressure (RP) Switch

The reverse pressure (RP) switch is a simple open or closed switch that is used to detect the presence of pressure in the main control valve body. The switch is mounted on the main control valve body. When pressure is not present, the switch is opened and the voltage reading is high. When pressure is present, the switch is closed and the voltage reading will be near zero.

Instrument Panel Range Selector Indicator

This indicator is an electronic readout in the instrument cluster which will match the position of the range selector (P, R, N, D4, D5, 3, 2, 1). If an error in the range selector assembly occurs, an "E" (error) will be displayed on the instrument panel.

Select Shift Transmission (SST) Switches (+ and -)

The positions indicated by a (+) or a (-) allow the driver to manually select the appropriate upshift (+) or downshift (-) and gear range.

The SST switches are located within the transmission range selector assembly and are momentary contact switches that send a signal to the PCM each time the driver moves the selector lever into the upshift or downshift gear range.

The PCM uses the input signals from the SST+ and the SST- switches, along with other vehicle inputs to determine which gear should be commanded.

Diagnostic Strategy

Troubleshooting an electronically controlled automatic transmission is simplified by using the proven method of diagnosis. One of the most important things to remember is that there is a definite procedure to follow.

NOTE: Do not take any shortcuts or assume that critical checks or adjustments have already been made.

Follow the procedures as written to avoid missing critical components or steps.

To correctly diagnose a concern, have the following publications available:

- Powertrain Control/Emissions Diagnosis (PC/ED) manual
- TSBs and OASIS messages.
- Wiring Diagram.

These publications provide the necessary information when diagnosing transmission concerns.

Use the Diagnostic Flow Chart as a guide and follow the steps as indicated.

Preliminary Inspection

- Know and understand the customer's concern.
- Verify the concern by operating the vehicle.
- Check the fluid levels and condition.
- Check for non-factory add-on items.
- Check shift linkages for correct adjustment.
- Check TSBs and OASIS messages regarding the concern.

Diagnostics

- Carry out on-board diagnostic procedures key on engine off (KOEO) and key on engine running (KOER).
- Record all diagnostic trouble codes (DTCs).
- Repair all non-transmission codes first.
- Repair all transmission codes second.
- Erase all continuous codes and attempt to repeat them.
- Repair all continuous codes.
- If only pass codes are obtained, proceed to Diagnosis by Symptom Index for further information and diagnosis.

Follow the diagnostic sequence to diagnose and repair the concern the first time.

Diagnostic Flow Chart

Diagnostic Flow Chart		
<ul style="list-style-type: none"> ● Know and understand the customer concerns ● Check the fluid level and condition ● Verify the concern by operating the vehicle ● Check for non-factory-installed items and verify correct installation ● Check the shift linkage adjustments ● Check TSBs and OASIS messages for vehicle concerns ● Carry out quick test both KOER and KOEO ● Record all codes <p>1) Did you record any Diagnostic Trouble Codes?</p>	Yes	<ul style="list-style-type: none"> • REPAIR all hard Diagnostic Trouble Codes. 	No	<ul style="list-style-type: none"> • REFER to Diagnosis By Symptom in this section.
5) Are there any electrical concerns?	Yes	<ul style="list-style-type: none"> • INSTALL the NGS and CARRY OUT output state control test, then GO to Step 6.
	No	<ul style="list-style-type: none"> • REFER to the hydraulic and mechanical routine to diagnose and repair the concern, then GO to Step 7.
6) Was the transmission concern corrected when the NGS was installed?	Yes	<ul style="list-style-type: none"> • REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual, intermittent fault diagnosis section and use the NGS or WDS to diagnose cause of concern in the processor, vehicle harness or external inputs (sensors or

		switches).
	No	• REFER to the hydraulic and mechanical routine to diagnose the concern, then GO to Step 7.
7) Is the concern repaired?	Yes	• CARRY OUT the final quick test to verify that no diagnostic trouble codes are present. CLEAR memory codes.
	No	• GET assistance from Technical Hotline.

Preliminary Inspection

The following items must be checked prior to beginning the diagnostic procedures:

Know and Understand the Concern

In order to correctly diagnose a concern, first understand the customer complaint or condition. Customer contact may be necessary in order to begin to verify the concern. Understand the condition as to when the concern occurs, for example:

- hot or cold vehicle temperature.
- hot or cold ambient temperature.
- vehicle driving conditions.
- vehicle loaded/unloaded.

After understanding when and how the concern occurs, proceed to verify the concern.

Verification of Condition

This section provides information that must be used in both determining the actual cause of customer concerns and executing the appropriate procedures.

The following procedures must be used when verifying customer concerns for the engine.

Determine Customer Concern

NOTE: Some transmission conditions can cause engine concerns. An electronic pressure control short circuit can cause engine misfiring. The torque converter clutch not disengaging will stall the engine.

Determine customer concerns relative to vehicle use and dependent driving conditions, paying attention to the following items:

- hot or cold vehicle operating temperature
- hot or cold ambient temperatures
- type of terrain
- vehicle loaded/unloaded
- city/highway driving
- upshift
- downshift
- coasting
- engagement
- noise/vibration — check for dependencies, either rpm dependent, vehicle speed dependent, shift dependent, gear dependent, range dependent, or temperature dependent.

Check Fluid Level and Condition

CAUTION: The vehicle should not be driven if the fluid level is low or internal failure could result.

NOTE: If the vehicle has been operated for an extended period of time at highway speeds, in city traffic, in hot weather, or pulling a trailer, the fluid must cool down 30 minutes to obtain an accurate reading.

This vehicle is not equipped with a fluid level indicator. An incorrect level may affect the transmission operation and can result in transmission damage. To correctly check and add fluid to the transmission, refer to [Transmission Fluid Drain and Refill—Automated Equipment](#), [Transmission Fluid Drain and Refill—Vehicles With Torque Converter Drain Plug](#) or [Transmission Fluid Drain and Refill—Vehicles Without Torque Converter Drain Plug](#) in this section.

High Fluid Level

A fluid level that is too high can cause the fluid to become aerated due to the churning action of the rotating internal parts. This will cause erratic control pressure, foaming, loss of fluid from the vent tube and possible transmission damage. If an overfill reading is indicated, refer to [Transmission Fluid Drain and Refill—Automated Equipment](#), [Transmission Fluid Drain and Refill—Vehicles With Torque Converter Drain Plug](#) or [Transmission Fluid Drain and Refill—Vehicles Without Torque Converter Drain Plug](#) in this section.

Low Fluid Level

A low fluid level can result in poor transmission engagement, slipping or damage. It can also indicate a leak in one of the transmission seals or gaskets.

Adding Fluid

CAUTION: The use of any type of transmission fluid other than specified can result in transmission damage.

If fluid must be added, add fluid in 0.25L (0.5 pint) increments through the fill hole opening. Do not overfill the fluid. For fluid type, refer to the General Specification chart in this section.

Fluid Condition Check

1. Check the fluid level. For additional information, refer to [Transmission Fluid Drain and Refill—Automated Equipment](#), [Transmission Fluid Drain and Refill—Vehicles With Torque Converter Drain Plug](#) or [Transmission Fluid Drain and Refill—Vehicles Without Torque Converter Drain Plug](#) in this section.
2. Observe the color and the odor of the fluid. Under normal circumstances, the color should be dark reddish, not brown or black.
3. Allow the fluid to drip onto a facial tissue and examine the stain.
4. If evidence of solid material is found, the transmission fluid pan should be removed for further inspection.
5. If fluid contamination or transmission failure is confirmed by the sediment in the bottom of the transmission fluid pan, the transmission must be disassembled and completely cleaned.
6. Carry out diagnostic checks and adjustments. For additional information, refer to [Diagnosis By Symptom](#) in this section.

Road Testing Vehicle

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

NOTE: When the battery is disconnected or a new battery installed, certain transmission operating parameters may be lost. The powertrain control module (PCM) must relearn these parameters. During this learning process, you may experience slightly firm shifts, delayed, or early shifts. This operation is considered normal and will not affect the function of the transmission. Normal operation will return once these parameters are stored by the PCM.

The Shift Point Road Test and Torque Converter Clutch Operation Test provide diagnostic information on transmission shift controls and torque converter operation.

Shift Point Road Test

This test verifies that the shift control system is operating correctly.

1. Bring engine and transmission up to normal operating temperature.
2. Operate the vehicle with the selector lever in the D5 position.
3. Apply minimum throttle and observe the speeds at which upshift occurs and torque converter engages. Refer to the following Shift Speeds chart. (Also refer to the Automatic Transmission Specifications Issue.)
4. Stop the vehicle. Select the D4 position. Repeat Step 3. The transmission will make all upshifts except 4-5 and torque converter clutch should apply above 46 km/h (27 mph).
5. Press the accelerator pedal to the floor, wide open throttle (WOT). The transmission should shift from third to second, or third to first, depending on vehicle speed, and torque converter clutch should release.
6. With vehicle speed above 48 km/h (30 mph), move the transmission range selector lever from D4 position to first position and release the accelerator pedal. The transmission should immediately downshift to third gear. When vehicle speed drops below 32 km/h (20 mph), the transmission should downshift into first gear.
7. If transmission fails to upshift/downshift or torque converter clutch does not apply/release, refer to [Diagnosis By Symptom](#) for possible causes.

Shift Speeds

CAUTION: Always obey local traffic laws. Do not exceed posted limits.

			D5 Position	Speed km/h (mph)
Vehicle Information	Transmission Model	Throttle Position	Shift	Axle Ratio All
Lincoln LS 3.0L/3.9L	RJL-A	Closed	5-4	38-41 (24-26)

			2-1	38-41 (24-46)

Torque Converter Diagnosis

Prior to installing a new torque converter, all diagnostic procedures must be followed. This is to prevent the unnecessary replacement of good torque converters. Only after a complete diagnostic evaluation can the decision be made to install a new torque converter.

Begin with the normal diagnostic procedures as follows:

1. Preliminary Inspection.
2. Know and Understand the Customer Concern.
3. Verify the Concern — Carry out the Torque Converter Clutch Operation Test. Refer to Torque Converter Operation Test in this section.
4. Carry out Diagnostic Procedures.
 - Run on-board diagnostics; see On-Board Diagnostics With NGS, refer to [Diagnostics](#) in this section.
 - Repair all non-transmission related DTCs first.
 - Repair all transmission DTCs.
 - Rerun on-board diagnostic to verify repair.
 - Carry out the Line Pressure Test. Refer to [Special Testing Procedures](#) in this section.
 - Carry out the Stall Speed Test. Refer to [Special Testing Procedures](#) in this section.
 - Carry out the Diagnosis by Symptom Routine for torque converter diagnosis. Refer to [Diagnosis By Symptom](#) in this section.
 - Use the index to locate the appropriate routine that best describes the symptom(s). The routine will list all possible components that may cause or contribute to the symptom. Check each component listed; diagnose and service as necessary before servicing the torque converter.

Torque Converter Operation Test

This test verifies that the torque converter clutch control system and the torque converter are operating correctly.

5. Carry out the Quick Test; see On-Board Diagnostics With NGS, refer to [Diagnostics](#) in this section. Check for DTCs. Refer to the [Diagnostic Trouble Code Charts](#).
6. Connect a tachometer to the engine.
7. Bring the engine to normal operating temperature by driving the vehicle at highway speeds for approximately 15 minutes in D5 position.
8. After normal operating temperature is reached, maintain a constant vehicle speed of about 80 km/h (50 mph) and tap brake pedal with the left foot.
9. The engine rpm should increase when brake pedal is tapped, and decrease about five seconds after pedal is released. If this does not occur, see Torque Converter Operation Concerns, [Diagnosis By Symptom](#).

10. If the vehicle stalls in D5 or manual 2 at idle with vehicle at a stop, move the transmission range selector lever to manual 1 position. If the vehicle stalls, see Torque Converter Operation Concerns, [Diagnosis By Symptom](#) in this section. Repair as necessary. If the vehicle does not stall in D5, refer to [Diagnosis By Symptom](#) in this section.
-

Visual Inspection

This inspection will identify modifications or additions to the vehicle operating system that may affect diagnosis. Inspect the vehicle for non-Ford factory add-on devices such as:

- electronic add-on items:
 - air conditioning
 - generator (alternator)
 - engine turbo
 - cellular telephone
 - cruise control
 - CB radio
 - linear booster
 - backup alarm signal
 - computer
- Vehicle modification:

These items, if not installed correctly, will affect the powertrain control module, or transmission function. Pay particular attention to add-on wiring splices in the PCM harness or transmission wiring harness, abnormal tire size, or axle ratio changes.

- leaks. Refer to [Leakage Inspection](#) in this section.
- correct linkage adjustments. Refer to [Section 307-05](#).

Shift Linkage Check

Check for a misadjustment in shift linkage by matching the detents in the transmission range selector lever with those in the transmission. If they match, the misadjustment is in the indicator. Do not adjust the shift linkage.

Hydraulic leakage at the manual control valve can cause delay in engagements and/or slipping while operating if the linkage is not correctly adjusted. Refer to [Section 307-05](#) for shift linkage adjustment.

Check TSBs and OASIS

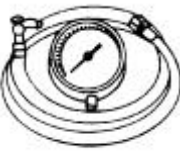

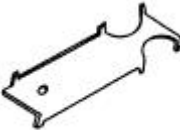

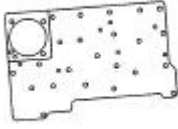

Refer to all Technical Service Bulletins and OASIS messages which pertain to the transmission concern and follow the procedure as outlined.

Carry Out On-Board Diagnostics (KOEO, KOER)

After a road test, with the vehicle warm and before disconnecting any connectors, carry out the Quick Test using New Generation Star (NGS) Tester. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the powertrain control system.

Diagnosing electronically controlled automatic transmissions is simplified using the following procedures. It is important to remember that there is a definite procedure to follow. **DO NOT TAKE SHORTCUTS OR ASSUME THAT CRITICAL CHECKS OR ADJUSTMENTS HAVE ALREADY BEEN MADE.** Follow the procedures as written to avoid missing critical components or steps. By following the diagnostic sequence, the technician will be able to diagnose and repair the concern the first time.

On-Board Diagnostics with NGS

NOTE: For detailed instruction and other diagnostic methods using the NGS, refer to the NGS tester and the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

These quick tests should be used to diagnose the powertrain control module and should be carried out in order.

- Quick Test 1.0 — Visual Inspection
- Quick Test 2.0 — Set Up
- Quick Test 3.0 — Key On, Engine Off
- Quick Test 4.0 — Continuous Memory
- Quick Test 5.0 — Key On, Engine Running
- Special Test Mode
 - Wiggle Test Mode
 - Output Test Mode
- PCM Reset Mode
- Clearing DTCs
- OBD II Drive Cycle
- Other NGS Features

For further information on other diagnostic testing features using the NGS or generic scan tool, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. Other diagnostic methods include the following:

- Parameter Identification (PID) Access Mode
- Freeze Frame Data Access Mode
- Oxygen Sensor Monitor Mode

Output State Control (OSC) Mode

Output state control (OSC) allows the technician to control certain transmission function parameters. For example, OSC allows the technician to shift the transmission only when commanding a gear change. If the technician commands 1st gear in OSC, the transmission will remain in 1st gear until the technician commands the next gear. For another example, the technician can command a shift solenoid to turn on or off when carrying out an electrical circuit check. The OSC has two modes of operation for transmission: the BENCH MODE and the DRIVE MODE. Each mode/parameter has a unique set of vehicle operating requirements that the technician must meet before being allowed to operate OSC.

NOTE: To operate OSC, the digital transmission range (TR) sensor and the vehicle speed sensor (VSS) must be operational. No diagnostic trouble codes (DTCs) related to the digital TR sensor or the VSS can be present.

- The vehicle requirements **MUST BE MET** when **SENDING** the OSC value. Refer to vehicle requirements for each individual test.
- If the vehicle requirements are **NOT MET** when **SENDING** the OSC value, an **ERROR MESSAGE** will appear. When the **ERROR MESSAGE** is received, OSC is aborted and must be restarted.
- If, after a sent value is substituted, the vehicle requirements are no longer met, the PCM will cancel the OSC value and resume normal operation. No error message will be sent.
- The OSC value [XXX] may be sent anytime to cancel OSC.

Output State Control (OSC) Procedures

- Carry out visual inspection and vehicle preparation as necessary.
- Select "Vehicle and Engine Selection" menu.
- Select appropriate vehicle and engine.
- Select "Diagnostic Data Link."
- Select "Powertrain Control Module."
- Select "Diagnostic Test Mode."
- Select "KOEO On-Demand Self Test and KOER On-Demand Self Tests."
- Carry out test and record DTCs.
- Repair all NON-Transmission DTCs.
- Repair all VSS and digital TR sensor DTCs.
- Make sure that VSS/digital TR sensors are functional.
- Select "Active Command Modes."
- Select "Output State Control."
- Select "Trans — Bench Mode" or "Trans — Drive Mode."

OSC — Transmission Bench Modes

The following Transmission Bench Modes may be used as necessary during diagnostics.

SSA, SSB, SSC, SSD and TCC in BENCH MODE

CAUTION: The parking brake must be set prior to carrying out this procedure.

The BENCH MODE allows the technician to carry out electrical circuit checks on the following components:

- SSA — Activates SS A OFF or ON.
- SSB — Activates SS B OFF or ON.
- SSC — Activates SS C OFF or ON.
- SSD — Activates SS D OFF or ON.
- TCC — Activates TCC OFF or ON.

OSC "SSA, SSB, SSC, SSD, TCC" BENCH MODE Operates ONLY when:

- VSS and digital TR sensor are operational.
- No VSS and digital TR sensor DTCs.
- Transmission range selector lever in P or N.
- Key ON.
- Engine OFF.

OSC Command Values

- [OFF] — turns solenoid OFF.
- [ON] — turns solenoid ON.
- [XXX] — cancels OSC value sent.
- [SEND] — sends the values to PCM.

BENCH MODE Procedure for SSA, SSB, SSC, SSD and TCC

Follow operating instructions from the NGS menu screen:

- Select "Output State Control."
- Select "Trans - Bench Mode."
- Select "PIDs" to be monitored.
- Monitor all selected PIDs during test.
- Select "Parameters - SSA, SSB, SSC, SSD or TCC."
- Select "ON" to turn solenoid ON.
- Press "SEND" to send command ON.
- Select "OFF" to turn solenoid OFF.
- Press "SEND" to send command OFF.
- Select "XXX" to cancel at any time.
- Press "SEND."

PC A, PC B, PC C in BENCH MODE

CAUTION: The parking brake must be set prior to carrying out this procedure.

The BENCH MODE is also used to test the functionality of the transmission electronic pressure control. During BENCH MODE, the PCx solenoids can be commanded in increments of 15 psi from zero to 90 psi and 90 to zero psi.

The line pressure tap is used to verify output pressure from PC A or PC B by turning either one off while verifying the output from the other solenoid. The second pressure tap is used to verify the output from the PC C solenoid.

The OSC functions for the parameter PCx allows the technician to choose the following options:

- PCx — Activates PCx to selected values.
- [00] — sets PCx pressure to 00 psi.
- [15] — sets PCx pressure to 15 psi.
- [30] — sets PCx pressure to 30 psi.
- [45] — sets PCx pressure to 45 psi.
- [60] — sets PCx pressure to 60 psi.
- [75] — sets PCx pressure to 75 psi.
- [90] — sets PCx pressure to 90 psi.

The OSC PCx Bench Mode should ONLY be operated to check PRESSURE FUNCTIONALITY using an installed pressure gauge (300 psi) when:

- VSS and digital TR sensor are operational.
- No VSS and digital TR sensor DTCs.
- Transmission range selector lever in P or N.
- Pressure gauge installed.
- Key ON.
- Engine ON.
- Engine rpm at least 1,500.

The OSC PCx Bench Mode should ONLY be operated to complete PCx SOLENOID CIRCUIT PINPOINT TESTS when:

- VSS and Digital TR Sensor are operational.
- No VSS and Digital TR Sensor DTCs are present.
- Transmission range selector lever is in "P" or "N".
- Key "ON".
- Engine "OFF".

OSC Command Values

- [00] — sets PCx pressure to 00 psi.
- [15] — sets PCx pressure to 15 psi.
- [30] — sets PCx pressure to 30 psi.

- [45] — sets PCx pressure to 45 psi.
- [60] — sets PCx pressure to 60 psi.
- [75] — sets PCx pressure to 75 psi.
- [90] — sets PCx pressure to 90 psi.
- [XXX] — cancels OSC value sent.
- [SEND] — sends the values to PCM.

BENCH MODE Procedure for PCx

Following operating instructions from the NGS menu screen:

- Select "Output State Control."
- Select "Trans — Bench Mode."
- Select "PIDs" to be monitored.
- Monitor all selected PIDs during test.
- Select "Parameters — PCx."
- Select Value "0 - 90 psi."
- Press "SEND" to send command.
- Select "XXX" to cancel at any time.
- Press "SEND."

OSC — Transmission DRIVE MODES

The DRIVE MODE allows control of three transmission parameters. Each mode/parameter has a unique set of vehicle operating requirements that the technician must meet before being allowed to operate OSC. When using the DRIVE MODE, the recommended procedure is to control one parameter at a time.

The DRIVE MODE allows the technician to carry out the following functions on the transmission:

- GEAR — allows upshifts or downshifts.
- TCC — engages or disengages the torque converter clutch.
- FIRM_SFT — commands a higher control pressure during upshift.

The pressure control (PCx) solenoids for this transmission are not directly controlled during DRIVE MODE testing. Pressures may be raised during an upshift via the harsh shift control channel (FIRM_SFT)

GEAR in DRIVE MODE

This OSC function is used to test the transmission shift functions.

The OSC functions for the GEAR parameter allow the technician to choose the following options:

- [1] — PCM selects 1st gear.
- [2] — PCM selects 2nd gear.
- [3] — PCM selects 3rd gear.
- [4] — PCM selects 4th gear.

- [5] — PCM selects 5th gear.

The OSC GEAR Mode operates ONLY when:

- VSS and digital TR sensor are operational.
- No VSS and digital TR sensor DTCs.
- Engine ON.
- TCC "OFF" (TCC cannot be engaged)
- Transmission range selector lever in D5.
- Vehicle speed is greater than 3 km/h (2 mph).

OSC Command Values

- [1] — PCM selects 1st gear.
- [2] — PCM selects 2nd gear.
- [3] — PCM selects 3rd gear.
- [4] — PCM selects 4th gear.
- [5] — PCM selects 5th gear.
- [XXX] — cancels OSC value sent.
- [SEND] — sends the values to PCM.

DRIVE MODE Procedure for GEAR

Follow operating instructions from the NGS menu screen.

- Select "Output State Control."
- Select "Trans — DRIVE MODE."
- Select "PIDs" to be monitored.
- Monitor all selected PIDs during test.
- Select "Parameters — GEAR."
- Select Value "1-5."
- Press "SEND" to send command.
- Re-Select Value "1-5."
- Press "SEND" to send command.
- Select "XXX" to cancel at any time.
- Press "SEND."

TCC in DRIVE MODE

This OSC function is used to test whether the torque converter clutch is engaging and disengaging correctly.

The OSC functions for the TCC parameter allows the technician to choose the following:

- TCC — activates TCC OFF and ON.

- [ON] — turns TCC solenoid ON.
- [OFF] — turns TCC solenoid OFF.

OSC "TCC OFF" DRIVE MODE operates ONLY when:

- VSS and digital TR sensors are operational.
- No VSS and digital TR sensor DTCs present.
- Engine ON.
- Transmission range selector lever in D5.
- Vehicle speed is greater than 3 km/h (2 mph).

OSC "TCC ON" DRIVE MODE operates ONLY when:

- VSS and digital TR sensors are operational.
- No VSS and digital TR sensor DTCs present.
- Engine ON.
- Transmission range selector lever in D5.
- Vehicle speed is greater than 3 km/h (2 mph).
- Transmission in 2nd gear or higher.
- TFT is between 33-153°C (60-275° F).
- Brake not applied "OFF" below 32 km/h (20 mph).
- Maintain steady speed.

OSC Command Values

- [OFF] — turns TCC OFF.
- [ON] — turns TCC ON.
- [XXX] — cancels OSC value sent.
- [SEND] — sends the values to PCM.

Drive Mode Procedures for TCC

Follow operating instructions from the NGS menu screen.

- Select "Output State Control."
- Select "Trans — Drive Mode."
- Select "PIDs" to be monitored.
- Monitor all selected PIDs during test.
- Select "Parameters — TCC."
- Select "ON" to turn solenoid ON.
- Press "SEND" to send command ON.
- Select "OFF" to turn solenoid OFF.
- Press "SEND" to send command OFF.

- Select "XXX" to cancel at any time.
- Press "SEND."

FIRM_SFT in DRIVE MODE

This OSC function is used to raise pressure during an upshift to determine whether the pressure control system is functioning correctly. Harsher shifts indicate that the pressure control system works at higher pressure. The best test for isolating pressure control system problems is to carry out the PC A, PC B, PC C in BENCH MODE, using a hydraulic pressure gauge.

The OSC functions for the parameter FIRM_SFT allows the technician to choose the following options:

- FIRM_SFT — activates the harsh shift channel.
 - [ON] — sets control pressure higher for all upshifts (determined by the PCM)
 - [OFF]— sets control pressure to normal for all upshifts (determined by the PCM)
 - [XXX] — cancel OSC for FIRM_SFT

OSC "FIRM_SFT" DRIVE MODE operates ONLY when:

- VSS and digital TR sensor are operational.
- No VSS and digital TR sensor DTCs.
- Transmission range selector lever in O/D.
- Pressure gauge installed (optional).
- Key ON.
- Engine ON.
- Vehicle speed greater than 3 km/h (2 mph).
- TCC is OFF (TCC is not engaged).

OSC Command Values

- [ON] — sets control pressure high for all upshifts (determined by the PCM)
- [OFF] — sets control pressure to normal for all upshifts (determined by the PCM)
- [XXX] — cancel OSC for FIRM_SFT
- [SEND] — sends the values to the PCM

DRIVE MODE Procedure for FIRM_SFT.

Follow operating instructions from the NGS menu screen.

- Select "Output State Control."
- Select "Trans — Drive Mode."
- Select "PIDs" to be monitored.
- Monitor all selected PIDs during test.
- Select "Parameters — FIRM_SFT."
- Press "SEND" to send command.
- Select "XXX" to cancel at any time.

- Press "SEND."

Using Output State Control (OSC) and Accessing PIDs

To confirm that the OSC value was sent by the NGS and the PCM has accepted the OSC substitution, a corresponding PID for each OSC parameter must be monitored. Additional PIDs should be monitored to help the technician adequately diagnose the transmission.

The following is a list of OSC parameters and their corresponding PIDs:

Corresponding PID	PID Description
BPP	Brake Pedal Position Switch On/Off
PCA	Pressure Control Solenoid A — Commanded Pressure
PCB	Pressure Control Solenoid B — Commanded Pressure
PCC	Pressure Control Solenoid C — Commanded Pressure
FIRMST	Firm Shift Control (FMC) status requested by OSC; 0 = FSC not commanded by OSC, NGS PID output = OFF; 1 = FSC commanded by OSC, NGS PID output = ON
GEAR	Commanded Transmission Gear (use in drive only)
RPS	Pinpoint test for reverse pressure switch; 0 = closed, 1 = open
FFG RPS	Instantaneous Failure Flag for reverse pressure switch; Failure = 1
RPM	Engine Revolutions Per Minute
SSA	Shift solenoid A Commanded ON
SSB	Shift solenoid B Commanded ON
SSC	Shift solenoid C Commanded ON
SSD	Shift solenoid D Commanded ON
TCC	Torque converter commanded duty cycles (%)
TCCRAT	Torque converter speed ratio (RPM and/or TSS)
TFT	Transmission Fluid Temperature (degrees F)
VSS	Vehicle Speed (mph)

To confirm that the OSC substitution occurred, SEND the OSC value and monitor the corresponding PID value. If no ERROR MESSAGE was received and the value of the corresponding PID is the same as the value sent from OSC, the OSC substitution was successful.

Transmission Drive Cycle Test

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

NOTE: The Transmission Drive Cycle Test must be followed exactly. Transmission failure must occur four times consecutively for shift error DTC code to be set, and five times consecutively for continuous torque converter clutch code to set.

NOTE: When carrying out the Transmission Drive Cycle Test, use the Solenoid Operation Chart for correct solenoid operation. Refer to [Pinpoint Tests — OSC Equipped Vehicles](#).

After carrying out the Quick Test, use the Transmission Drive Cycle Test for checking continuous codes.

1. Record and then erase Quick Test codes.
2. Warm engine to normal operating temperature.
3. Make sure transmission fluid level is correct.
4. With transmission in D5 position, moderately accelerate from stop to 80 km/h (50 mph). This allows the transmission to shift into fifth gear. Hold speed and throttle open steady for a minimum of 15 seconds.
5. With transmission in fifth gear and maintaining steady speed and throttle opening, lightly apply and release brake to operate stoplamps. Then hold speed and throttle steady for a minimum of five seconds.
6. Brake to a stop and remain stopped for a minimum of 20 seconds.
7. Repeat steps 4 through 6 at least five times.
8. Carry out Quick Test and record continuous DTCs.

After On-Board Diagnostics

NOTE: The vehicle wiring harness, powertrain control module and non-transmission sensors may affect transmission operations. Repair these concerns first.

After the on-board diagnostic procedures are completed, repair all DTCs.

Begin with non-transmission related DTCs, then repair any transmission related DTCs. Refer to the [Diagnostic Trouble Code Charts](#) for information on condition and symptoms. This chart will be helpful in referring to the correct manual(s) and aids in diagnosing internal transmission concerns and external non-transmission inputs. The pinpoint tests are used in diagnosing transmission electrical concerns. Make sure that the vehicle wiring harness and the PCM are diagnosed as well. The Powertrain Control/Emissions Diagnosis (PC/ED) manual will aid in diagnosing non-transmission electronic components.

Before Pinpoint Tests

NOTE: Prior to entering pinpoint tests, check the powertrain control module wiring harness for correct connections, bent or broken pins, corrosion, loose wires, correct routing, correct seals and their condition. Check the PCM, sensors and actuators for damage. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

NOTE: If a concern still exists after electrical diagnosis, refer to [Diagnosis By Symptom](#) in this section.

If DTCs appear while carrying out the on-board diagnostics, refer to the [Diagnostic Trouble Code Charts](#) for the appropriate repair procedure. Prior to entering pinpoint tests, refer to any TSBs and OASIS messages for transmission concerns.

Diagnostic Trouble Code Charts

Diagnostic Trouble Code Chart

**May also be generated by some other non-electric transmission hardware system.					
*Output circuit check, generated only by electrical symptoms.					
Five Digit DTC	Component	Description	Condition	Symptom	Action
P0102, P0103, P1100, P1101	MAF	MAF concerns	MAF system inoperative which may cause a transmission concern.	High/low EPC pressure, incorrect shift schedule. Incorrect torque converter clutch engagement scheduling. Symptoms similar to a TP failure.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0112	IAT	IAT indicates 125°C (254°F) (grounded)	Voltage drop across IAT exceeds scale set for temperature 125°C (254°F).	Incorrect EPC pressure. Either high or low which will result in harsh or soft shifts.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0113	IAT	IAT indicates -40°C (-40°F) (open circuit)	Voltage drop across IAT exceeds scale set for temperature -40°C (-40°F).	Incorrect EPC pressure. Either high or low which will result in harsh or soft shifts.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0114	IAT	IAT out of on-board diagnostic range	IAT temperature higher or lower than expected during KOEO and KOER.	Rerun on-board diagnostic at normal operating temperature.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1116	ECT	ECT out of on-board diagnostic range	ECT temperature higher or lower than expected during KOEO and KOER.	Rerun on-board diagnostic at normal operating temperature.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0117	ECT	ECT indicates 125°C (254°F)	Voltage drop across ECT exceeds scale set for temperature 125°C (254°F) (grounded).	Torque converter clutch will always be off, resulting in reduced fuel economy.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0118	ECT	ECT indicates -40°C (-40°F)	Voltage drop across ECT exceeds scale set for temperature -40°C (-40°F) (open circuit).	Torque converter clutch will always be off, resulting in reduced fuel economy.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

P0121, P0122, P0123, P1120, P1121, P1125, P1124	TP	TP concern	PCM has detected an error. This error may cause a transmission concern.	Harsh engagements, firm shift feel, abnormal shift schedule, torque converter clutch does not engage. Torque converter clutch cycling.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0300- P0308, P0320, P0340, P1351- P1364	EI	EI concerns	EI system is inoperative which may cause a transmission concern.	Harsh engagements and shifts, late WOT shifts, no torque converter clutch engagement.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0503, P0500,	ABS	Insufficient VSS input from ABS through SCP link.	PCM detected a loss of vehicle speed signal through SCP link from ABS.	No transmission symptom. I.P. speedometer may be affected.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0705	Digital TR sensor	Digital TR circuit failure	Digital TR circuits, indicating an invalid pattern in TR_D. Condition caused by a short to ground or an open in TR4, TR3A, TR2, and or TR1 circuits. This DTC cannot be set by an incorrectly adjusted digital TR sensor.	Increase in control pressure (harsh shifts). Defaults to D5 or invalid position.	Go To Pinpoint Test C.
P0708	Digital TR sensor	Digital TR sensor circuit TR3A open	Digital TR sensor circuit TR3A reading 2.6v - 5.0v (open circuit). This DTC cannot be set by an incorrectly adjusted digital TR sensor.	Increase in PC pressure. Defaults to D5 for all gear positions.	Go To Pinpoint Test C.
P0712	TFT	157°C (315°F) indicated TFT sensor circuit grounded	Voltage drop across TFT sensor exceeds scale set for temperature of 157°C (315°F).	Firm shift feel.	Go To Pinpoint Test B.
P0713	TFT	-40°C (-40°F) indicated TFT sensor circuit open	Voltage drop across TFT sensor exceeds scale set for temperature -40°C (-40°F).	Firm shift feel.	Go To Pinpoint Test B.
P0715	TSS	Insufficient input from	PCM detected a loss of TSS	Harsh shifts, harsh torque converter	Go To Pinpoint Test E.

		turbine shaft speed sensor	signal during operation.	clutch activation, and harsh engagement.	
P0717	TSS	Turbine shaft speed sensor signal intermittent.	PCM has detected an intermittent TSS signal.	Harsh shifts, harsh torque converter clutch activation, and harsh engagement.	Go To Pinpoint Test E.
P0718	TSS	Turbine shaft speed sensor signal noisy.	PCM has detected a noisy TSS signal.	Harsh shifts, harsh torque converter clutch activation, and harsh engagement.	Go To Pinpoint Test E.
P0720	OSS	Insufficient input from OSS sensor	PCM detected a loss of OSS signal during operation.	Possible abnormal shift schedule.	Go To Pinpoint Test E.
P0721	OSS	Output shaft speed sensor signal noisy	PCM has detected an erratic OSS signal.	Abnormal shift schedule.	Go To Pinpoint Test E.
P0722	OSS	Output shaft speed sensor signal intermittent	PCM has detected an intermittent OSS signal.	Abnormal shift schedule.	Go To Pinpoint Test E.
P0731**	SSA, SSB, SSC or internal parts	1st gear error	No 1st gear.	Incorrect gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material). Engine rpm could be higher or lower than expected.	REFER to the Solenoid On/Off Charts. Go To Pinpoint Test A.
P0732**	SSA, SSB, SSC or internal parts	2nd gear error	No 2nd gear.	Incorrect gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material). Engine rpm could be higher or lower than expected.	REFER to the Solenoid On/Off Charts. Go To Pinpoint Test A.
P0733**	SSA, SSB, SSC or internal parts	3rd gear error	No 3rd gear.	Incorrect gear selection depending on failure or mode and manual lever position. Shift errors may also be due to	REFER to the Solenoid On/Off Charts. Go To Pinpoint Test A.

				other internal transmission concerns (stuck valves, damaged friction material). Engine rpm could be higher or lower than expected.	
P0734**	SSA, SSB, SSC or internal parts	4th gear error	No 4th gear.	Incorrect gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material). Engine rpm could be higher or lower than expected.	REFER to the Solenoid On/Off Charts. Go To Pinpoint Test A.
P0735	SSA, SSB, SSC, SSD or internal parts	5th gear error	No 5th gear.	Incorrect gear selection depending on failure or mode and manual lever position. Shift errors may also be due to other internal transmission concerns (stuck valves, damaged friction material etc.). Engine rpm could be higher or lower than expected.	REFER to the Solenoid On/Off Chart. Go To Pinpoint Test A.
P0741**	TCC	TCC slippage detected	The PCM picked up an excessive amount of TCC slippage during normal vehicle operation.	TCC slippage/erratic or no torque converter clutch operation.	REFER to the Diagnosis by Symptom Index in Diagnosis By Symptom.
P0743*	TCC	TCC solenoid circuit failure during on-board diagnostic	TCC solenoid circuit fails to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostics.	Short circuit — converter clutch always engage. Open circuit — torque converter clutch never engages.	Go To Pinpoint Test A.
P0745, P1747**	PCA	PCA solenoid circuit failure, shorted circuit	Voltage through PCA solenoid is checked. An error will be noted if tolerance is exceeded.	Short circuit — causes minimum PCA pressure (minimum capacity) and limits engine torque (alternate firm). Slips in gear	Go To Pinpoint Test D.

				and third gear incorrect.	
P0750*	SSA	SSA solenoid circuit failure	SSA circuit failed to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	No fourth or fifth gear (short) or no first gear (open). Will flash MIL.	Go To Pinpoint Test A.
P0753*	SSA	SSA solenoid circuit failure	SSA circuit failed to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	No fourth or fifth gear (short) or no first gear (open). Will flash TCIL.	Go To Pinpoint Test A.
P0755*	SSB	SSB solenoid circuit failure	SSB circuit fails to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	No first gear (short) or no third gear (open). Will flash MIL.	Go To Pinpoint Test A.
P0758*	SSB	SSB solenoid circuit failure	SSB circuit fails to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	No first gear (short) or no third gear (open). Will flash TCIL.	Go To Pinpoint Test A.
P0760*	SSC	SSC solenoid circuit failure	SSC circuit failed to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	Incorrect gear selection depending on condition mode and manual lever position. See Solenoid On/Off chart. Will flash MIL.	Go To Pinpoint Test A.
P0763*	SSC	SSC solenoid circuit failure	SSC circuit failed to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	Incorrect gear selection depending on condition mode and manual lever position. See Solenoid On/Off chart. Will flash TCIL.	Go To Pinpoint Test A.
P0765	SSD	SSD solenoid circuit failure	SSD circuit failed to provide voltage drop	No engine braking in manual gears. Will flash MIL.	Go To Pinpoint Test A.

			across solenoid. Circuit open, shorted or PCM driver circuit failure during on-board diagnostics.		
P0768	SSD	SSD solenoid circuit failure	SSD circuit failed to provide voltage drop across solenoid. Circuit open, shorted or PCM driver circuit failure during on-board diagnostics.	No engine braking in manual gears. Will flash TCIL.	Go To Pinpoint Test A.
P0775, P1789**	PCB	PCB solenoid circuit failure, shorted circuit	Voltage through PCB solenoid is checked. An error will be noted if tolerance is exceeded.	Short circuit — causes minimum PCB pressure (minimum capacity) and limits engine torque (alternate firm). Zero PCB — no second and fifth gear.	Go To Pinpoint Test D.
P0779	PCB	PCB solenoid Intermittent short to ground	Voltage through PCB solenoid is checked. An error will be noted if tolerance is exceeded.	Short circuit — causes minimum PCB pressure (minimum capacity) and limits engine torque (alternate firm). Zero PCB — no second and fifth gear.	Go To Pinpoint Test D.
P0791	ISS	Intermediate shaft speed sensor signal failure.	PCM has detected a loss of the ISS signal.	Harsh shifts (2-3).	Go To Pinpoint Test E.
P0794	ISS	Intermediate shaft speed sensor signal intermittent	PCM has detected an intermittent ISS signal.	Harsh shifts (2-3).	Go To Pinpoint Test E.
P0795, P0797**	PCC	PCC solenoid circuit failure, shorted circuit	Voltage through PCC solenoid is checked. An error will be noted if tolerance is exceeded.	Incorrect gear ratio in fourth and fifth gear.	Go To Pinpoint Test D.
P0796**	PCC	PCC solenoid circuit open	Voltage through PCC solenoid is checked. Error is noted if tolerance is exceeded.	Open circuit — causes maximum PCC pressure, harsh engagements and shifts.	Go To Pinpoint Test D.
P0799	PCC	PCC solenoid intermittent short to ground	Voltage through PCC solenoid is checked. An error will be noted if tolerance	Short circuit — causes minimum PCC pressure (minimum capacity) and limits engine	Go To Pinpoint Test D.

			is exceeded.	torque (alternate firm). Incorrect gear ratio in fourth and fifth gear.	
P0814	J-GATE	J-GATE circuit input signal failed.	PCM has detected incorrect J gate voltage.	No or improper illumination of the J-gate position.	REFER to Section 307-05 .
P0815	SST +/-	SST +/- circuit input signal failed.	PCM has detected an incorrect voltage SST input.	May not be able to shift in manual mode.	REFER to Section 307-05 .
P0840	REV	Reverse pressure switch circuit input signal failed.	PCM has detected incorrect voltage at the reverse pressure switch input.	No engine braking in manual third or fourth gear.	Go To Pinpoint Test G .
P1124	TP	TP voltage high/low for on-board diagnostic.	TP was not in the correct position for on-board diagnostic.	Rerun at appropriate throttle position per application.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1460	A/C	A/C clutch cycling pressure switch error	A/C or defrost ON condition may result from A/C clutch being ON during on-board diagnostic.	DTC set during on-board diagnostic — rerun with A/C OFF. Failed ON — EPC pressure slightly low with A/C OFF.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1636	SSx	SSx ISIG communication error	PCM has detected an error with the ISIG chip.	—	INSTALL a new PCM.
P1700	TRANS	Transmission indeterminate failure	Internal component failure. Direct one-way clutch failure.	Failed a neutral condition. FMEM becomes active — engine rpm limited to 4000 rpms. No 1st, 3rd, or 4th gear in automatic mode. Other DTCs that may set P1700: P0745, P1747, P1760, P1714, P1715, P0750, P0755.	If other solenoid DTCs are present, diagnose and repair them first. CLEAR DTCs and drive vehicle. If P1700 returns, disassemble transmission and inspect the direct one-way clutch. Repair as required. CLEAR DTC. Drive vehicle and verify repair.
P1702	Digital TR	Digital TR signal intermittent, code P0705, P0708 are set.	See P0705, P0708 conditions.	See P0705, P0708 symptoms.	Go To Pinpoint Test C .
P1703	BPP	Brake not actuated during on-board diagnostic KOER	Brake not cycled during KOER.	Failed ON or not connected — torque converter clutch will not engage at less than 1/3 throttle. Failed OFF or not	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

				connected — torque converter clutch will not disengage when brake is applied.	
P1703	BPP	BPP switch circuit failed	Brake ON circuit failure during KOEO.	Failed ON or not connected — torque converter clutch will not engage at less than 1/3 throttle. Failed OFF or not connected — torque converter clutch will not disengage when brake is applied.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1704	Digital TR	Digital TR not in P or N positions during KOEO/KOER.	Digital TR sensor or shift cable incorrectly adjusted or digital TR circuit failure.	Wrong commanded PC pressure. Digital TR reading the wrong gear position. (i.e., in overdrive position, transmission stuck in manual three for base shifter and four for SST shifter).	Go To Pinpoint Test C.
P1705	Digital TR	Digital TR not in PARK or NEUTRAL during KOEO/KOER.	KOEO/KOER not run in PARK or NEUTRAL, or digital TR circuit failure.	DTC is set.	RERUN KOEO/KOER in PARK or NEUTRAL or Go To Pinpoint Test C.
P1711	TFT	TFT out of on-board diagnostic range	Transmission not at operating temperature during on-board diagnostic.	DTC set — vehicle cold or overheated.	Warm or cool vehicle to normal operating temperature. Go To Pinpoint Test B.
P1713	TFT	No change in TFT - low range	PCM has detected no TFT change at low range during operation.	Increase EPC, incorrect TCC engagement schedule, harsh engagement, harsh shifts.	Go To Pinpoint Test B.
P1714	SSA	SSA inoperative	Mechanical failure of the solenoid detected.	No fourth or fifth gear (short) or no first gear (open).	Go To Pinpoint Test F.
P1715	SSB	SSB inoperative	Mechanical failure of the solenoid detected.	No first gear (short) or no third gear (open)	Go To Pinpoint Test F.
P1716	SSC	SSC inoperative	Mechanical failure of the solenoid detected.	Incorrect gear selection depending on condition mode and manual lever position. See Solenoid On/Off Chart.	Go To Pinpoint Test F.

P1717	SSD	SSD inoperative	Mechanical failure of the solenoid detected.	Incorrect gear selection depending on condition, mode and manual lever position. See the Solenoid On/Off Chart.	Go To Pinpoint Test F.
P1718	TFT	No change in TFT - high range	PCM has detected no TFT change at high range during operation.	Increase EPC, incorrect TCC engagement schedule, harsh engagement, harsh shifts.	Go To Pinpoint Test B.
P1740	TCC	TCC inoperative	Mechanical failure of the solenoid detected.	Failed ON — Converter clutch always on. Failed OFF — torque converter never applies.	Go To Pinpoint Test F.
P1746**	PCA	PCA solenoid circuit open	Voltage through PCA solenoid is checked. Error is noted if tolerance is exceeded.	Open circuit — causes maximum PCA pressure, harsh engagements and shifts.	Go To Pinpoint Test D.
P1760	PCA	PCA solenoid Intermittent short to ground	Voltage through PCA solenoid is checked. An error will be noted if tolerance is exceeded.	Short circuit — causes minimum PCA pressure (minimum capacity) and limits engine torque (alternate firm). Slips in gear, third incorrect.	Go To Pinpoint Test D.
P1780	TCS	TCS input incorrect per selected position	TCS voltage incorrect.	No overdrive cancel when range selector is moved	RERUN on-board diagnostic and cycle switch. REFER to Section 307-05.
P1783	TFT	Transmission overtemp condition indicated	Transmission fluid temperature exceeded 127°C (270°F).	Increase in control pressure.	Go To Pinpoint Test B.
P1788**	PCB	PCB solenoid circuit open	Voltage through PCB solenoid is checked. Error is noted if tolerance is exceeded.	Open circuit — causes maximum PCB pressure, harsh engagements and shifts.	Go To Pinpoint Test D.

Rotunda Transmission Tester

The Rotunda Transmission Tester is used to diagnose electronically controlled transmissions and is used in conjunction with the pinpoint tests. The tests should be carried out in order. Installing the Rotunda Transmission Tester allows separation of the vehicle electronics from transmission electronics. Refer to the Rotunda Transmission Tester manual for these tests.

- Digital Transmission Range (TR) Sensor Testing
- Resistance/Continuity Test

- Switch Test - Park/Neutral, Backup Lamp, and Optional Circuits
-

OVERDRIVE	D5/D4	D5	1	1	1	1	1.3 - 1.8 Volts
In Between	D5/D4	D5	1	1	1	0	1.3 - 1.8 Volts

Manual 3	3	D4	1	0	1	0	0.0 Volts
In-Between	2	—	1	0	1	1	0.0 Volts
Manual 2	2	—	1	0	0	1	0.0 Volts
In Between	2	—	1	0	1	1	0.0 Volts
Manual 1	Man 1	—	0	0	1	1	0.0 Volts

- A. TR_V is the voltage at the PCM pin 64 (TR3A Circuit) to signal return.
- B. "In Between" reading could be caused by a shift cable or digital TR sensor misaligned or a digital TR sensor circuit failure of TR1, TR2, TR3A, or TR4.
- C. TR_D: 1= Open digital TR switch, 0= Closed digital TR switch.
- D. EEC-V Control System Breakout Box Readings: Taken from PCM signal pins for TR1, TR2, TR3A, TR4 to signal return.

- **Voltages for TR1, TR2, TR4:**

- 0 = 0.0 volts.
- 1 = 9.0 - 14.0 volts.

- **Voltage for TR3A:**

- 0 = 0.0 volts.
- 1 = 1.3 - 1.8 volts.

Wiggle Test Information for Open/Shorts

- A. TR4, TR3A, TR2, and TR1 are all closed in PARK, PARK is a good position to check for intermittent open circuits (with scan tool monitoring TR_D).
- B. TR4, TR3A, TR2, and TR1 are all open in D5, so D5 is a good position to check for shorts to ground. To determine the shorted components while observing TR_D, unplug the TR and see if the short goes away. If the short is still present unplug the transmission harness and see if the short goes away. If the short is still present, then the short is in the PCM or vehicle harness. Remove the suspect circuit(s) wire terminal from the PCM connector. If the short is still present, then the PCM has an internal failure, otherwise the failure is in the vehicle harness.

Reverse Pressure (RP) Switch Diagnosis Chart

Selector Lever Position	Actual Gear	PID RPS
P,R,N	—	1
D5	1	0/1 ^a
	2	0/1 ^a
	3	1
	4	1
	5	1
D4	1	0/1 ^a
	2	0/1 ^a
	3	1
	4	1
3	3	1
2	2	0/1 ^a

1	1	0/1 ^a
---	---	------------------

^a RPS will read "0" when pressure is above 23 psi and "1" when PC A pressure is below 8 psi. This reading should show "0" for a calibrated time then go to "1".

RP Switch Symptoms

Conditions	Actions	Results
FFG_RPS = 1 FFG = Failure Flag	RPS does not match RPS diagnosis chart	No manual third gear and fourth gear
P0840 set	RPS reads zero (0) in first, third, fourth, and fifth or one (1) in first, third, fourth, and fifth (PCM sees this condition three times in first)	"E" symbol will appear on the instrument panel. If equipped with the message center, a message to "Check Transmission" will be transmitted. No manual third and fourth gears.

Shift Solenoid Pre-Diagnosis

Any time an electrical connector or solenoid body is disconnected, inspect the connector for terminal condition, corrosion and contamination. Also inspect the connector seal for damage. Clean, repair or install new as necessary.

Use the following shift solenoid operation information when carrying out Pinpoint Test A.

Solenoid Operation Chart

Pinpoint Tests

PINPOINT TEST A: SHIFT AND TORQUE CONVERTER CLUTCH SOLENOIDS

CONDITIONS	DETAILS/RESULTS/ACTIONS
<p>NOTE: Refer to the Transmission Vehicle Harness Connector illustration preceding these pinpoint tests.</p> <p>NOTE: Refer to the Internal Harness Diagram illustration preceding these pinpoint tests.</p> <p>NOTE: Read and record all DTCs. All Digital TR Sensor and VSS DTCs must be repaired before entering Output State Control (OSC).</p>	
<p>A1 ELECTRONIC DIAGNOSTICS</p>	
<p>1</p>	

2

4

NGS Tester

5

6

Diagnostic Data Link

7

PCM

8

Active Command Modes

9

Output State Control (OSC)

10

Trans-Bench Mode

3 Check to make sure the transmission harness connector is fully seated, terminals are fully engaged in connector and in good condition before proceeding.

● Does vehicle enter Trans-Bench Mode?

- **Yes**
REMAIN in Trans-Bench Mode. GO to [A2](#).
- **No**
REPEAT procedure to enter Trans-Bench Mode. If vehicle did not enter Trans-Bench Mode, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis of PCM or NGS.

A2 WIGGLE TEST

- 1 Remain in Trans-Bench Mode.
 - 2 Select PIDs to be monitored.
- | PID Command | PID Actual |
|-------------|------------|
| SSA | SSA |
| SSB | SSB |
| SSC | SSC |
| SSD | SSD |
| TCC | TCC |
- 3 Select "ON" to turn suspect solenoid on.
 - 4 Press "SEND".
 - 5 Wiggle all wiring and connectors to the transmission. Monitor the solenoid state for changes.
 - 6 Select "OFF" to turn solenoid off.
 - 7 Press "SEND".
- **Does the suspect solenoid(s) fault state change?**
- **Yes**
REPAIR the circuit. TEST the system for normal operation.
 - **No**
GO to [A3](#).

A3 SOLENOID FUNCTIONAL CHECK

- 1 Monitor each solenoid state.
 - 2 Turn each solenoid ON and OFF.
- **Does the solenoid turn ON and OFF when commanded and can solenoid activation be heard?**
- **Yes**
GO to [A4](#).

→ **No**
GO to [A5](#).

A4 OSC TRANS-DRIVE MODE (GEAR OR TCC)

- 1 Carry out OSC Trans-Drive Mode.
- 2 Select GEAR for shift solenoids or follow procedures for GEAR as listed in this section.
- 3 Select TCC for Torque Converter Clutch Solenoid. Follow procedures of TCC in Drive Mode as listed in this section.

- **Does the transmission upshift and downshift or torque converter engage/disengage when commanded?**

→ **Yes**
CLEAR all DTCs. ROAD TEST to verify if concern is still present. If concern is still present, REFER to [Diagnosis By Symptom](#) to diagnose shift or torque converter concern.

→ **No**
GO to [A5](#).

A5 CHECK FOR BATTERY VOLTAGE

1

Transmission Vehicle Harness Connector

3

4

A0005135

- 2 Visually inspect all wires and connectors for damage.

- 4 Measure the voltage on pin 3 harness side and ground.

- **Is the voltage greater than 10 volts?**

- **Yes**
GO to [A6](#).
- **No**
REPAIR the circuit. TEST for normal operation.

A6 ELECTRICAL SIGNAL CHECK

1

2

Trans-Bench Mode

1 Leave positive lead connected to pin 3 and connect negative lead to pin 5, 6, 14, 15 and 16.

- 3 Select Parameter SSA, SSB, SSC, SSD or TCC.
- 4 Select "ON".
- 5 Press "SEND".
- 6 Measure the voltage while cycling the solenoids ON and OFF.
- 7 Select "OFF", press "SEND".

● **Does the voltage change?**

- **Yes**
GO to [A7](#).
- **No**
REPAIR the circuit. TEST the system for normal operation.

A7 CHECK SOLENOID RESISTANCE AT SOLENOID

1

1 Measure the resistance between pin 3 and pin 5, 6, 14, 15, and 16 solenoid side.

Solenoid	Resistance (ohms)
SSA	16-45
SSB	16-45
SSC	16-45
SSD	16-45

A0039133

● Is the resistance within specification?

→ **Yes**
GO to [A8](#).

→ **No**
INSTALL a new solenoid body assembly.
TEST the system for normal operation.

A8 CHECK SOLENOID FOR SHORT TO GROUND

1

A0005137

1

Measure the resistance between pin 3 and pin 5, 6, 14, 15, and 16 solenoid side and ground.

● Is the resistance less than 5 ohms?

→ **Yes**
INSTALL a new solenoid body assembly.

→ **No**
REFER to [Diagnosis By Symptom](#) in this section for diagnosis of shift or torque converter concerns.

PINPOINT TEST B: TRANSMISSION FLUID TEMPERATURE (TFT) SENSOR

CONDITIONS	DETAILS/RESULTS/ACTIONS
NOTE: Refer to the Transmission Vehicle Harness Connector illustration preceding these pinpoint tests.	
B1 ELECTRONIC DIAGNOSTICS	
1	

2

4

NGS Tester

5

9

PIDs; TFT, TFTV

3 Check to make sure the transmission harness connector is fully seated, terminals are fully engaged in connector and in good condition before proceeding.

6 Select Diagnostic Data Link.

7 Select PCM.

8 Select PID/Data Monitor and Record.

• Does the vehicle enter PID/Data Monitor and Record?

→ Yes
REMAIN in PID/Data Control.GO to [B2](#).

→ No
REPEAT procedure to enter PID. If vehicle did not enter PID, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis of PCM and NGS.

B2 WARM-UP/COOL-DOWN CYCLE

1 While monitoring the TFT PIDs, carry out the following test: If transmission is cold, run transmission to warm it up. If transmission is warm, allow transmission to cool down.

• Do the TFT PIDs increase as the transmission is warmed up or

decrease as the transmission is cooled or does the TFT or TFTV drop in and out of range?

→ **Yes**

If the TFT PIDs increase as the transmission is warmed or decrease as the transmission is cooled, CLEAR all DTCs. ROAD TEST to verify if concern is still present. If concern is still present, REFER to [Diagnosis By Symptom](#) in this section to diagnose transmission overheating.

If the TFT or TFTV drop in and out of range, INSPECT for intermittent concern in the internal/external harness, sensor or connector.

→ **No**

GO to [B3](#).

B3 ELECTRICAL SIGNAL CHECK

1

Transmission Harness Connector

3

A0005138

2

Visually inspect all wires and connectors for damage.

3

Measure the voltage between pin 2 harness side and ground.

● Is the voltage between 4.5 and 5.0 volts?

→ **Yes**

GO to [B4](#).

→ **No**

REPAIR the circuit. TEST the system for normal operation.

B4 CHECK RESISTANCE OF TFT SENSOR

1

A0038288

- 2 Measure the resistance between pin 2 and 12 at the solenoid body connector.
- 3 Record the resistance.
- 4 Resistance should be approximately in the following ranges:

Transmission Fluid Temperature

°C	°F	Resistance (Ohms)
-40 to -20	-40 to 4	967K - 284K
-19 to -1	-3 - 31	284K - 100K
0 - 20	32 - 68	100K - 37K
21 - 40	69 - 104	37K - 16K
41 - 70	105 - 158	16K - 5K
71 - 90	159 - 194	5K - 2.7K
91 - 110	195 - 230	2.7K - 1.5K
111 - 130	231 - 266	1.5K - 0.8K
131 - 150	267 - 302	0.8K - 0.54K

● **Is the resistance in the range?**

→ **Yes**
REFER to [Diagnosis By Symptom](#) in this section to diagnose an overheating concern.

→ **No**
INSTALL a new solenoid body assembly.

PINPOINT TEST C: DIGITAL TRANSMISSION RANGE (TR) SENSOR

CONDITIONS	DETAILS/RESULTS/ACTIONS
<p>NOTE: Refer to the Digital Transmission Range (TR) Sensor Connector illustration and Digital Transmission Range (TR) Sensor Diagnosis Chart preceding these pinpoint tests.</p>	
<p>C1 VERIFY DIAGNOSTIC TROUBLE CODES</p>	
<p>1 </p> <p>2 </p>	<p>3 Carry out on-board diagnostic test.</p> <ul style="list-style-type: none"> ● Are only DTC codes P0705, P0708 present? <p>→ Yes GO to C4.</p> <p>→ No GO to C2.</p>
<p>C2 VERIFY DIGITAL TRANSMISSION RANGE SENSOR ALIGNMENT</p>	
<p>1 </p> <p>2 </p> <p>5 </p>	<p>3 Check to make sure the digital TR sensor harness connector is fully seated, terminals are fully engaged in connector and in good condition before proceeding.</p> <p>4 Apply the parking brake.</p> <p>6 Disconnect the shift cable/linkage from the manual lever.</p> <p>7 Verify that the TR Sensor Alignment Gauge fits in the appropriate slots.</p> <ul style="list-style-type: none"> ● Is the digital TR sensor correctly adjusted?

- **Yes**
GO to [C3](#).
- **No**
ADJUST the digital TR sensor; REFER to [Digital Transmission Range \(TR\) Sensor](#) in this section. PLACE transmission range selector lever into PARK and CLEAR DTCs. RERUN OBD Tests.GO to [C3](#).

C3 VERIFY SHIFT CABLE/LINKAGE ADJUSTMENT

1

D5

- 2 Connect the shift cable/linkage.
- 3 Verify that the shift cable/linkage is correctly adjusted. Refer to [Section 307-05](#).

- **Is the shift cable/linkage is correctly adjusted?**

- **Yes**
GO to [C4](#).
- **No**
ADJUST the shift cable/linkage. REFER to [Section 307-05](#).GO to [C4](#).

C4 CHECK ELECTRICAL SIGNAL OPERATION

1

2

Digital TR Sensor

- 2  **CAUTION: Do not pry on connector. This will damage the connector and result in a transmission concern.**

Press button and pull out on the digital TR harness connector.

- 3 Inspect both ends of the connector for damage or pushed out pins, corrosion, loose wires and missing or damaged seals.

- **Is there damage to the connector, pins or harness?**

- **Yes**
REPAIR as necessary. CLEAR DTCs and RERUN OBD Tests.

→ **No**
If diagnosing a DTC, GO to [C5](#).

If diagnosing a starting concern or a backup lamp concern, GO to [C10](#).

C5 CHECK ELECTRICAL SYSTEM OPERATION (DTR AND PCM)

1

2

NGS Tester

3

Digital TR Sensor

4

5

TR PIDS TR_D, TR_V

6 Move transmission range selector lever into each gear and stop.

7 Observe the PIDs, TR_D, and TR_V (vehicle-dependent) while wiggling harness, tapping on sensor, or driving the vehicle. Use PIDs TR_D for DTCs P0705, P1704, and P1705. Use PIDs TR_V for DTC P0708.

8 Compare the PIDs to the Digital Transmission Range (TR) Sensor Diagnosis Chart.

- **Do the PIDs TR_D and TR_V match the Digital Transmission Range (TR) Sensor Diagnosis chart, and does the TR_D PID remain steady when the harness is wiggled, the sensor is tapped on, or the vehicle driven?**

→ **Yes**
The problem is not in the digital TR

sensor system. REFER to [Diagnosis By Symptom](#) in this section for further diagnosis.

→ **No**
If TR_D changes when wiggling harness, tapping on the sensor or driving the vehicle, the problem may be intermittent.

GO to [C6](#).

C6 CHECK DIGITAL TRANSMISSION RANGE SENSOR OPERATION

1

Digital TR Sensor

2

TR-E Cable to Transmission Tester

3

TR-E Cable to Digital TR Sensor

4 Place the DIGITAL TR Overlay onto Transmission Tester.

5 Carry out SENSOR Test as instructed on the digital TR Overlay.

- Does the status lamp on the tester TRS-E cable match the selected gear positions?

→ **Yes**
Concern is not in the digital TR sensor. GO to [C7](#).

→ **No**
INSTALL a new digital TR sensor and ADJUST. REFER to [Digital Transmission Range \(TR\) Sensor](#) in this section. CLEAR DTCs and RERUN OBD Tests.

C7 CHECK PCM HARNESS CIRCUITS FOR OPENS

1

2

2 Inspect for damaged or pushed out pins, corrosion or loose wires.

150 Pin PTEC Module Connector "B"

3

Digital TR Sensor

4

A0005028

5

A0003752

6

A0005029

7

3

CAUTION: Do not pry the connector. This will damage the connector and result in a transmission concern.

Disconnect the digital TR sensor connector.

4

Measure the resistance between pin 2 harness side and signal return pin 17 harness side.

5

Measure the resistance between pin 22 and pin 4 harness side.

6

Measure the resistance between pin 18 and pin 5 harness side.

7

Measure the resistance between pin 10 and pin 6 harness side.

A0005030

8

A0005031

8 Measure the resistance between pin 9 and pin 3 harness side.

• Are the resistances less than 5 ohms?

→ **Yes**
GO to [C8](#).

→ **No**
REPAIR the circuits. TEST the system for normal operation.

C8 CHECK PCM HARNESS CIRCUITS FOR SHORT TO GROUND OR POWER

1

A0005213

2

1 Measure the resistance between pin 17 and pin 10 harness side and ground; and pin 12 harness side.

2 Measure the resistance between pin 22 harness side and ground; and pin 17 harness side and ground.

A0036187

3

A0005215

4

A0005217

5

A0005216

3 Measure the resistance between pin 18 harness side and ground; and pin 17 harness side and ground.

4 Measure the resistance between pin 10 harness side and ground; and pin 17 harness side and ground.

5 Measure the resistance between pin 9 harness side and ground; and pin 17 harness side and ground.

• Are the resistances greater than 10,000 ohms?

→ **Yes**
GO to [C9](#).

→ **No**
REPAIR the circuits. TEST the system for normal operation. CLEAR DTCs. RERUN OBD Tests.

C9 CHECK FOR SHORT BETWEEN TR/PCM INPUT SIGNAL CIRCUITS

1

A0036188

1

Measure the resistance between pin 9 harness side and pin 22; pin 18; pin 10 harness side.

2

A0005032

2

Measure the resistance between pin 22 harness side and pin 9; pin 18; pin 10 harness side.

3

A0005033

3

Measure the resistance between pin 18 harness side and pin 22; pin 9; pin 10 harness side.

4

A0005034

4

Measure the resistance between pin 10 harness side and pin 22; pin 18; pin 9 harness side.

- Are the resistances greater than 10,000 ohms?

→ Yes

INSTALL a new PCM. TEST the system for normal operation.

	→ No REPAIR the circuit. TEST the system for normal operation.
C10 CHECK THE NON-PCM INTERNAL CIRCUITS OF SENSOR	
<p>1 </p> <p>TRS-E Cable to Transmission</p> <p>2 </p> <p>TRS-E Cable to Digital TR Sensor</p>	<p>3 Place the Digital TR Overlay onto Transmission Tester.</p> <p>4 Carry out Switch Test as instructed on the digital TR Overlay.</p> <ul style="list-style-type: none"> ● Does the status lamp on the tester indicate RED for the correct gear position? <p>→ Yes Concern is not in the digital TR sensor. For start system concerns, REFER to Section 303-06 . For backup lamp concerns, REFER to Section 417-01 .</p> <p>→ No INSTALL a new digital TR sensor and ADJUST; REFER to Digital Transmission Range (TR) Sensor in this section. CLEAR DTCs and RERUN OBD Tests.</p>

PINPOINT TEST D: PRESSURE CONTROL (PC) SOLENOIDS (PCA, PCB, PCC)

CONDITIONS	DETAILS/RESULTS/ACTIONS
<p>NOTE: Refer to the Transmission Vehicle Harness Connector illustration preceding these pinpoint tests.</p> <p>NOTE: Read and record all DTCs. All digital TR Sensor and VSS DTCs must be repaired before entering Output State Control (OSC).</p>	
D1 ELECTRONIC DIAGNOSTICS

PCM

9

Active Command Modes

10

Output State Control (OSC)

11

Trans-Bench Mode

3 Check to make sure the transmission harness connector is fully seated, terminals are fully engaged in the connector and in good condition before proceeding.

4 Install 300 psi pressure gauges into Line and PC C tap.

● Does the vehicle enter the Trans-Bench Mode?

→ Yes

REMAIN in Trans-Bench Mode. GO to [D2](#).

→ **No**
REPEAT procedure to enter Trans-Bench Mode. If vehicle did not enter OSC, REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis of PCM or NGS.

D2 SOLENOID FUNCTIONAL TEST

2

Parameter; PCx

8

XXX

1 Monitor pressure gauges.

3 **NOTE:** Make sure that the solenoids not being tested are off or at zero.

Select PC A, PC B, or PC C.

4 Select value - 15, 30, 45, 60, 70 or 90 psi.

5 Press "SEND".

6 Select another value "0-90 psi".

7 Press "SEND".

9 Press "SEND".

- For PC A and PC B: Does the pressure reading for A or B follow the commanded pressure, (actual A and B pressure will be higher than the commanded pressure)?

For PC C: Does the pressure reading match the commanded pressure?

→ **Yes**
CLEAR DTCs.

→ **No**
GO to [D3](#).

D3 CHECK FOR BATTERY VOLTAGE

1

Transmission Harness Connector

3

4

A0005135

2 Visually inspect all wires and connectors for damage.

4 Measure the voltage between pin 3 harness side and ground.

• Is the voltage greater than 10 volts?

→ Yes
GO to [D4](#).

→ No
REPAIR the circuit. TEST the system for normal operation.

D4 ELECTRICAL SIGNAL CHECK

1

A0035164

1 Leave positive lead connected pin 3 and connect negative lead to pins 1, 4 and 11 harness side.

3

Trans-Bench Mode

4

2 Activate solenoids (ON and OFF) while monitoring the voltage reading.

Parameter; PCx

9

XXX

- 5 Select a value "0-90 psi".
- 6 Press "SEND".
- 7 Select another value "0-90 psi".
- 8 Press "SEND".

- 10 Press "SEND".

- Does the voltage and solenoid state change?

→ **Yes**
GO to [D5](#).

→ **No**
CHECK for open or short circuit in harness or PCM.

D5 CHECK SOLENOID RESISTANCE AT SOLENOID

1

- 1 Measure and record the resistance between PC solenoid pin 3 and pins 1, 4, and 11. Resistance should be between 3.3 and 7.5 ohms.

- Is the resistance within specifications?

→ **Yes**
GO to [D6](#).

→ **No**
INSTALL a new solenoid body assembly.

D6 CHECK SOLENOID FOR SHORT TO GROUND

1

A0037992

2 Measure and record the resistance between the PC solenoid pins 1, 4, 11, and ground solenoid side.

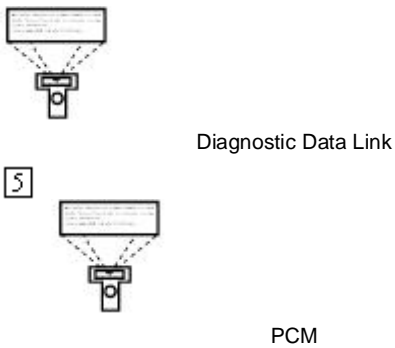

• Is the resistance less than 10,000 ohms?

→ **Yes**
INSTALL a new solenoid body assembly.
TEST the system for normal operation.

→ **No**
REFER to [Diagnosis By Symptom](#) in this section for diagnosis of pressure concerns. TEST the system for normal operation.

PINPOINT TEST E: TURBINE SHAFT SPEED (TSS), INTERMEDIATE SHAFT SPEED (ISS), AND OUTPUT SHAFT SPEED (OSS) SENSORS

CONDITIONS	DETAILS/RESULTS/ACTIONS
<p>NOTE: Refer to the turbine shaft speed (TSS), intermediate shaft speed (ISS), and output shaft speed (OSS) sensor connector illustrations preceding these pinpoint tests.</p>	
<p>E1 ELECTRONIC DIAGNOSTICS</p>	
<p>2 </p> <p>NGS Tester</p> <p>3 </p> <p>4</p>	<p>1 Check to make sure the transmission harness connectors are fully seated, terminals are fully engaged in connector and in good condition before proceeding.</p>

- 6 Select PID/Data Monitor and Record.
- 7 Select the following PIDs: TSS, ISS, or OSS.

● **Does vehicle enter PID/Data Monitor and Record?**

- **Yes**
REMAIN in PID/Data.GO to [E2](#).
- **No**
REPEAT procedure to ENTER PID. If vehicle did not enter PID, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis of PCM or NGS.

E2 DRIVE CYCLE TEST

- 1 While monitoring the appropriate sensor PID, drive the vehicle so that the transmission upshifts and downshifts through all gears.

● **Does the TSS, ISS, or OSS Speed PID increase and decrease with engine and vehicle speed?**

- **Yes**
GO to [E3](#).
- **No**
If the TSS, ISS, or OSS Speed PID does not increase and decrease with engine and vehicle speed, INSPECT for open or short in vehicle harness, sensor, a PCM concern, or internal hardware concern.GO to [E4](#).

E3 DRIVE CYCLE TEST ERRATIC

- 1 While monitoring the appropriate sensor PID, drive the vehicle so that the transmission upshifts and downshifts through all gears.

● **Is the TSS, ISS, or OSS Speed PID signal erratic (drop to zero or near**

zero and return to normal operation)?

→ **Yes**

If the sensor signal is erratic, INSPECT for intermittent concern in the harness, sensor, or connector. GO to [E4](#).

→ **No**

CLEAR all DTCs. Rerun OBD.

E4 CHECK PCM HARNESS CIRCUITS FOR OPENS

1

2

150 Pin PTEC Module Connector "B"

3

A0005069

4

A0009270

5

2

Inspect for damaged or pushed out pins, corrosion or loose wires.

3

For OSS, measure the resistance between pin 17 and the appropriate sensor connector pin 2 harness side.

4

For ISS, measure the resistance between pin 17 and the appropriate sensor connector pin 2 harness side.

5

For TSS, measure the resistance between pin 17 and the appropriate sensor connector pin 2 harness side.

A0005069

6

A0009271

7

A0005141

8

A0005035

6 For ISS, measure the resistance between pin 21 and the appropriate sensor connector pin 1 harness side.

7 For TSS, measure the resistance between pin 27 and the appropriate sensor connector pin 1 harness side.

8 For OSS, measure the resistance between pin 26 and the appropriate sensor connector pin 1 harness side.

• Are all resistances less than 5 ohms?

→ **Yes**
GO to [E5](#).

→ **No**
REPAIR the circuit. TEST the system for normal operation.

E5 CHECK PCM HARNESS CIRCUITS FOR SHORT TO GROUND

1

1

For OSS, measure the resistance between pin 26 and sensor connector pin 1 harness side and ground.

2

2

For ISS, measure the resistance between PCM pin 21 and sensor connector pin 1 harness side and ground.

3

3

For TSS, measure the resistance between PCM pin 27 and sensor connector pin 1 harness side and ground.

- Are the resistances greater than 10,000 ohms?

→ **Yes**
GO to [E6](#).

→ **No**
REPAIR the circuits. TEST the system for normal operation. CLEAR DTCs. RERUN OBD Tests.

E6 CHECK RESISTANCE OF TSS, ISS or OSS SENSOR

2

1

Disconnect the appropriate vehicle harness connector from the TSS, ISS or OSS sensor.

2

Connect ohmmeter negative lead to one pin of the sensor and the positive lead to the other pin on the sensor.

A0005211

- 3 Record the resistance. Resistance should be as follows:

Resistance (ohms)	Temperature C° (F°)
266-390	-20° (4°)
325-485	21° (70°)
492-738	150° (302°)

- Is the resistance within specification for the appropriate sensor?

→ **Yes**
GO to [E7](#).

→ **No**
INSTALL a new sensor.

E7 CHECK SENSORS FOR SHORT TO GROUND

1

A0005501

- 1 Measure the resistance between pin 1 and 2 of each sensor and ground.

- Is the resistance less than 10,000 ohms?

→ **Yes**
INSTALL a new sensor.

→ **No**
REFER to [Diagnosis By Symptom](#) for diagnosis of shift or torque converter concerns in this section.

PINPOINT TEST F: SOLENOID MECHANICAL FAILURE

PINPOINT TEST G: REVERSE PRESSURE SWITCH

CONDITIONS	DETAILS/RESULTS/ACTIONS
<p>NOTE: Refer to the Reverse Pressure (RP) Switch Diagnosis Chart preceding these pinpoint tests.</p>	
<p>G1 ELECTRONIC DIAGNOSIS</p>	
<p>1</p> 	
<p>2</p> 	
<p>4</p> 	
<p>5</p> 	
	<p>3 Check to make sure that the transmission harnesses is fully seated, the terminals are fully engaged in the connector, and the terminals are in good condition.</p>
	<p>6 Select Diagnostic Data Link.</p>

9

PIDs: RPS, FFG RPS

7 Select PCM.

8 Select PID DATA Monitor and record.

● Does the vehicle enter PID/DATA Monitor and record?

→ Yes
REMAIN in PID/DATA control. GO to [G2](#).

→ No
REPEAT the procedure. If vehicle did not enter PID, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for PCM and NGS.

G2 ELECTRICAL SIGNAL CHECK

1 Carry out Transmission Drive Cycle Test and monitor line pressure and PIDs: RPS, FFG RPS.

● Do the PIDs: RPS, FFG RPS match the chart for a given gear?

→ Yes
RP switch is OK. REFER to [Diagnosis By Symptom](#) in this section.

→ No
GO to [G3](#).

G3 CHECK HARNESS FOR OPENS

1

2

150 Pin PTEC Module Connector "B"

3

Transmission Connector

4

4 Measure the resistance between PCM pin 30 and pin 13 harness side.

A0037855

5

A0037854

5 Measure the resistance between PCM pin 17 and pin 12 harness side.

• Are the resistances less than 5 ohms?

→ **Yes**
GO to [G4](#).

→ **No**
REPAIR the circuit. CLEAR DTCs.
RERUN OBD tests.

G4 CHECK CIRCUIT FOR SHORT TO GROUND OR POWER

1

A0005220

1 Measure the resistance between PCM pin 30 and pin 17 harness side and ground.

• Is the resistance less than 10,000 ohms?

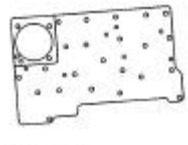

→ **Yes**
INSTALL a new reverse pressure switch.
TEST the system for normal operation.

→ **No**
REPAIR the circuit. CLEAR the DTCs.
RERUN OBD test. TEST the system for

normal operation.

Special Testing Procedures

Special Tool(s)

 ST2408-A	Air Test Plate, Transmission 307-405
 ST1565-A	Transmission Fluid Pressure Gauge 307-004 (T57L-77820-A)

The special tests are designed to aid the technician in diagnosing the hydraulic and mechanical portion of the transmission.

Engine Idle Speed Check

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the engine idle speed.

Line Pressure Test

CAUTION: Carry out Line Pressure Test prior to carrying out Stall Speed Test. If line pressure is low at stall, do not carry out the Stall Speed Test or further transmission damage will occur. Do not maintain wide open throttle in any gear range for more than five seconds.

NOTE: Certain sensor failures may cause high PC, FMEM (Failure Mode Effect Management) actions. Be sure that self test and electrical repairs have been carried out, or test results may be incorrect.

NOTE: The line pressure tap is used to verify output pressure from PC A or PC B by turning either one off while verifying the output from the other solenoid. The second pressure tap is used to verify the output from the PC C solenoid.

This test verifies that the line pressure is within specifications.

1. Connect pressure gauge to the line pressure tap.

Item	Part Number	Description
1	—	Line Pressure Tap

2. Start engine and check line pressures. Refer to the following Line Pressure Chart to determine if line pressure is within specifications.

Line Pressure Chart

Range	Idle	WOT Stall	Idle	WOT Stall
	PC C	PC C	Line	Line
P/N	0-103 kPa (0-15 psi)	0-103 kPa (0-15 psi)	862-1,137 kPa (125-165 psi)	2,000-2,482 kPa (290-360 psi)
R	793 kPa (115 psi)	793 kPa (115 psi)	758-1,034 kPa (110-150 psi)	1,448-1,793 kPa (210-260 psi)
D5/D4	0-103 kPa (0-15 psi)	0-103 kPa (0-15 psi)	758-1,034 kPa (110-150 psi)	1,448-1,793 kPa (210-260 psi)
M5/M4	0-103 kPa (0-15 psi)	0-103 kPa (0-15 psi)	425-800 kPa (76-116 psi)	1,448-1,793 kPa (210-260 psi)
M3	0-103 kPa (0-15 psi)	0-103 kPa (0-15 psi)	758-1,034 kPa (110-150 psi)	1,448-1,793 kPa (210-260 psi)
M2/M1	0-103 kPa (0-15 psi)	0-103 kPa (0-15 psi)	634-910 kPa (92-132 psi)	1,448-1,793 kPa (210-260 psi)
P/N	0-103 kPa (0-15 psi)	0-103 kPa (0-15 psi)	862-1,137 kPa (125-165 psi)	—
R	793 kPa (115 psi)	793 kPa (115 psi)	634-910 kPa (92-132 psi)	2,000-2,482 kPa (290-360 psi)
D5/D4	0-103 kPa (0-15 psi)	0-103 kPa (0-15 psi)	758-1,034 kPa (110-150 psi)	1,448-1,793 kPa (210-260 psi)
M5/M4	0-103 kPa (0-15 psi)	0-103 kPa (0-15 psi)	758-1,034 kPa (110-150 psi)	1,448-1,793 kPa (210-260 psi)
M3/M2/M1	0-103 kPa (0-15 psi)	0-103 kPa (0-15 psi)	758-1,034 kPa (110-150 psi)	1,448-1,793 kPa (210-260 psi)

3. If line pressure is not within specifications, check PC C pressure.
4. Connect Pressure Gauge to PC C pressure tap.

Item	Part Number	Description
1	—	Pressure Control (PC C) Tap

5. Start engine and check PC C pressure. Refer to Line Pressure Diagnosis Chart in this section for specification.
6. If PC C pressure is not within specification, [Go To Pinpoint Test D](#) to diagnose PC C operation. If PC C operation is OK, refer to Line Pressure Diagnosis Chart in this section for line pressure concern causes.

Line Pressure Diagnosis Chart

Test Results	Possible Source
High at Idle — All Ranges	<ul style="list-style-type: none"> ● Wiring Harnesses ● EPC Boost Valve ● EPC Solenoid ● Main Regulator Valve
Low at Idle — All Ranges	<ul style="list-style-type: none"> ● Low Fluid Level ● Fluid Inlet Filter/Seal ● Main Control Body ● Cross Leaks ● Gaskets ● Pump ● Separator Plate
Low — All Forward Ranges	<ul style="list-style-type: none"> ● Forward Clutch ● Main Control ● Overdrive Servo ● Intermediate Servo
Low in Park Only	<ul style="list-style-type: none"> ● Valve Body
Low in Reverse Only	<ul style="list-style-type: none"> ● Separator Plate ● Rear Servo Piston, Cover Seal ● Reverse Clutch ● Overdrive Servo ● Intermediate Servo ● Valve Body ● Forward Clutch

Low in Overdrive Only	<ul style="list-style-type: none"> ● Forward Clutch ● Overdrive Servo ● Intermediate Servo ● Valve Body
Low in Drive Only (O/D Cancelled)	<ul style="list-style-type: none"> ● Forward Clutch ● Overdrive Servo ● Intermediate Servo

	<ul style="list-style-type: none"> ● Valve Body
Low in 1st Position	<ul style="list-style-type: none"> ● Forward Clutch ● Valve Body
Low in 2nd Position	<ul style="list-style-type: none"> ● Intermediate Servo ● Overdrive Servo ● Intermediate Servo ● Forward Clutch

Stall Speed Test

This test checks operation of the following items:

- torque converter clutch
- forward clutch
- low-one way clutch (OWC) assembly
- engine performance
- overdrive one-way clutch assembly

WARNING: Apply the parking brake firmly while carrying out each stall test.

CAUTION: Always carry out the Line Pressure Test procedures prior to carrying out the Stall Speed Test. If line pressure is low at stall, do not carry out the Stall Speed Test or further transmission damage will occur.

NOTE: The Stall Speed Test should be carried out with the engine and transmission at normal operating temperatures.

1. Connect tachometer to the engine.
2.  **CAUTION:** After testing each of the following ranges D5, D4, 3, 2, 1, and R, move the transmission range selector lever to N (NEUTRAL) and run the engine at 1,000 rpm for about 15 seconds to allow the torque converter to cool before testing the next range.

CAUTION: Do not maintain wide open throttle in any range for more than five (5) seconds.

CAUTION: If the engine rpm recorded by the tachometer exceeds maximum specified rpm, release the accelerator pedal immediately. Clutch or band slippage is indicated.

NOTE: Prolonged use of this procedure may set Diagnostic Trouble Code P0712, P1783. After Carrying out Stall Speed Test run OBD Test and clear DTCs from memory.

Press accelerator pedal to floor (WOT) in each range. Record rpm reached in each range. Stall speeds should be as follows:

Stall Speed Chart

Vehicle	Engine	RPM
Lincoln LS	3.0	2,565-3,060
Lincoln LS	3.9	2,491-2,900

If stall speeds were too high, refer to the following Stall Speed Diagnosis Chart. If stall speeds were too low, first check the engine idle speed. If engine idle is OK, remove torque converter and check the torque converter one-way clutch for slippage.

Stall Speed Diagnosis Chart

Transmission Range Selector Lever Position	Stall Speeds High	Stall Speeds Low
D5, D4, and 1	Overdrive One-Way Clutch, Rear One-Way Clutch	—
D4, 2 and 1	Forward Clutch, Overdrive One-Way Clutch	—
D5	Forward Clutch, Overdrive One-Way Clutch	—
D5, D4, 2, 1 and R	General Pressure Concerns, Forward Clutch, Overdrive One-Way Clutch	Converter One-Way Clutch or Engine Driveability Concerns
R Only	High/Reverse, High Clutch, Low and Reverse Band/Servo	—
2 Only	Intermediate Band/Servo	—
1 Only	Low/Reverse Band/Servo	—

Air Pressure Tests

Item	Part Number	Description
1	—	Reverse servo
2	—	Intermediate clutch apply
3	—	Intermediate servo apply
4	—	Direct clutch
5	—	Overdrive servo apply
6	—	Forward clutch
7	—	Coast clutch

A no-drive condition can exist even with correct transmission fluid pressure because of inoperative clutches or bands. An erratic shift can be located through a series of checks by substituting air pressure for fluid pressure to determine the location of the failure.

Follow the procedure to determine the location of the inoperative clutch or band by introducing air pressure into the various test plate passages.

NOTE: Use only dry, regulated (276 kPa [40 psi] maximum) air pressure.

Apply air to the appropriate passage(s). A dull thud should be felt or heard or movement could be observed when the component applies. There should be no hissing sound when the component is fully applied.

NOTE: Cover the vent hole in the test plate with a clean, lint-free shop towel to prevent spray when the air is applied. Plugging the vent hole during testing will result in inaccurate results.

1. Drain transmission fluid and remove the transmission fluid pan.
2. Remove the main control valve body.
3. Install the Transmission Test Plate and gasket. Tighten bolts to 10 Nm (89 lb-in).
4. **NOTE:** Do not apply air to the test plate vent hole.

Apply air to the appropriate clutch port (refer to diagram). A dull thud may be heard or movement felt when the component is applied or released. If clutch seals or check balls are leaking a hissing sound may be heard.

If test results find that the servos do not operate, disassemble, clean and inspect them to locate the source of the concern.

If air pressure applied to the clutch passages fails to operate a clutch, or operates another clutch simultaneously, disassemble and use air pressure to check the fluid passages in the center support and clutches to detect obstructions.

Leakage Inspection

CAUTION: Do not try to stop the fluid leak by increasing the torque beyond specifications. This may cause damage to the case threads.

Leakage at the transmission fluid pan to case gasket often can be stopped by tightening the attaching bolts to 14 Nm (10 lb-ft). If necessary, install a new oil pan case gasket.

Check the fluid filler plug at the transmission case. If leakage is found here, install a new plug.

Check fluid tubes and fittings between the transmission and the cooler for looseness, wear, or damage. If leakage cannot be stopped by tightening a fluid tube nut, install new parts. When fluid is found leaking between the case and cooler line fitting, check for missing or damaged O-ring seal, then tighten the fitting to maximum specification.

If the leak continues, install a new cooler line fitting and tighten to specification. The same procedure should be followed for fluid leaks between the cooler and the cooler line fittings in this section. For additional information, refer to [Section 307-02](#).

The cooler can be further checked for leaks. For additional information, refer to [Section 307-02](#).

If leakage is found at the transmission range selector lever, install a new seal.

If leakage is found at the transmission harness connector, install a new O-ring seal.

External Sealing

The transmission has the following parts to prevent external fluid leakage:

- gaskets
- lip-type seals
- O-ring seals
- seal rings
- seal grommets
- thread sealant

External Sealing

A0005499

Item	Part Number	Description
1	7902	Torque converter assembly
2	6730	Torque converter drain plug
3	7A248	Front pump fluid seal assembly
4	7A248	Seal— front fluid pump
5	W704892-S1300	Screw and washer assembly
6	7G187	Cover assembly fluid pump
7	7A136	Gasket front fluid pump
8	7D273	Fluid tube connector assembly
9	7D027	Overdrive servo cover
10	W703119-S300	Overdrive servo cover seal
11	W702969-S300	Intermediate servo cover seal
12	7D027	Intermediate servo cover
13	390318-S2	Pipe plug
14	W702981-S300	O-ring seal — speed sensor
15	7H103	Turbine shaft speed and output shaft speed sensors
16	7M183	Intermediate shaft speed sensor
17	7034	Vent assembly
18	7060	Output shaft
19	7086	Gasket — extension housing
20	7A039	Housing assembly — extension
22	W500312-S1309	Screw — extension housing to case (2 req'd)
22	W701516-S304	Fluid fill access plug

23	7052	Seal assembly — extension housing
24	W500311-S1427	Screw — extension housing to case (5 Req'd)
25	7005	Case
26	3930318-S2	Pipe plug
27	7B498	Seal assembly — main control lever
28	7A256	Manual control lever
29	W705582-S430	Overdrive intermediate lock nut
30	7C492	Screw — intermediate band adjuster/lock
31	W705928	Solenoid body connector O-ring seal
32	7A191	Gasket — fluid pan
33	7A194	Pan — fluid
34	W500213-S1309	Screw — fluid pan to case
35	7A010	Fluid fill drain tube
36	W704999-S309	Short hex plug
37	7N171	Converter housing access plug

Fluid Leakage in Torque Converter Area

In diagnosing and correcting fluid leaks in the front pump support and gear and torque converter area, use the following procedures to locate the exact cause of the leakage. Leakage at the front of transmission, as evidenced by fluid around the torque converter housing, may have several sources. By careful observation it is possible, in many instances, to pinpoint the source of leak before removing the transmission from the vehicle. The paths which the fluid takes to reach the bottom of the torque converter housing are shown in the illustration. The five steps following correspond with the numbers in the illustration.

1. Fluid leaking by the pump seal lip will tend to move along the impeller hub and onto the back of the impeller housing. Except in the case of a total seal failure, fluid leakage by the lip of the seal will be deposited on the inside of the torque converter housing only, near the outside diameter of the housing. Fluid from the vent assembly may move along the impeller hub and onto the back of the impeller housing. Fluid from a converter hub weld leak will move along a path on the inside of the converter housing.
2. Fluid leakage by the outside diameter of the pump seal and pump body will follow the same path that leaks by the inside diameter of the pump seal follow. Fluid from a converter hub weld leak will move along a path on the inside of the converter housing.
3. Fluid that leaks by a pump to case screw or pump gasket will be deposited on the inside of the torque converter housing only. Fluid will not be deposited on the back of the torque converter.
4. Fluid leakage from the converter drain plug, (vehicle-dependent) converter seal weld or converter to flexplate stud weld will appear at the outside diameter of the torque converter on the back face of the flexplate, and in the converter housing only near the flexplate. Fluid leaks from the torque converter will leave a ring of fluid around the inside of the torque converter housing.
5. **NOTE:** White facial tissue paper may aid in determining the color (red is transmission fluid) and source of the leaking fluid.

Engine oil leaks are sometimes incorrectly diagnosed as transmission pump gasket leaks. The following areas of possible leakage should also be checked to determine if engine oil leakage is causing the concern.

- a. Leakage at the valve cover gasket may allow oil to flow over the torque converter housing or seep down between the torque converter housing and cylinder block causing oil to be present in or at the bottom of the torque converter housing.
- b. Oil galley plug leaks will allow oil to flow down the rear face of the cylinder block to the bottom of the torque converter housing.
- c. Leakage at the crankshaft rear oil seal will work back to the flexplate, and then into the torque converter housing.
- d. Leakage at the oil pressure sensor.

Leak Check Test

1. Remove the fluid drain tube and note the color of the fluid. Original factory fill fluid is dyed red to aid in determining if leakage is from the engine or transmission. The red color should assist in pinpointing the leak.
2. Clean off any fluid from the top and bottom of the torque converter housing, of the case, and the rear face of the engine and oil pan. Clean the torque converter area by washing with a suitable nonflammable solvent and blow dry with compressed air.
3. Wash out the torque converter housing, and the front of the flexplate. The torque converter housing may be washed out using cleaning solvent and a squirt-type oil can. Blow all washed areas dry with compressed air.
4. Start and run the engine until the transmission reaches its normal operating temperature. Observe the back of the cylinder block and the top of the torque converter housing for evidence of fluid leakage. Raise the vehicle on a hoist. Refer to [Section 100-02](#) and run the engine at fast idle, then at engine idle, occasionally shifting to the D5 and REVERSE positions to increase pressure within the transmission. Observe the front of the flexplate, back of the cylinder block (in as far as possible), and inside the torque converter housing and front of the case. Run the engine until fluid leakage is evident and the probable source of leakage can be determined.

Leak Check Test With Black Light

Fluid soluble aniline or fluorescent dyes premixed at the rate of 2.5ml (1/2 teaspoon) of dye powder to 0.24L (1/2 pint) of automatic transmission fluid have proven helpful in locating the source of fluid leakage. Such dyes may be used to determine whether an engine fluid or transmission fluid leak is present. An ultraviolet light must be used to detect the fluorescent dye solution.

Transmission Fluid Cooler

CAUTION: Whenever a transmission has been disassembled to install new parts, the transmission fluid cooler must be replaced and the transmission fluid cooler tubes must be cleaned and backflushed.

NOTE: Cleaning and backflushing the transmission fluid cooling system along with normal cleaning and inspection procedures as outlined in this section during disassembly and reassembly will keep contamination from reentering the transmission and causing a repeat repair.

When internal wear or damage has occurred in the transmission, metal particles, clutch plate material, or band material may have been carried into the torque converter and transmission fluid cooler. These contaminants are a major cause of recurring transmission troubles and must be removed from the system before the transmission is put back in use.

If the vehicle was not equipped with a fluid filter, install a fluid filter kit follow the instructions supplied in the kit. If the vehicle was equipped with a filter install a new filter.

Transmission Fluid Cooler Flow Test

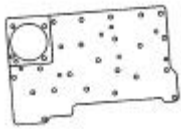

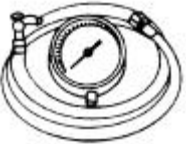

Prior to carrying out the Transmission Fluid Cooler Flow Test check to see if the vehicle is equipped with a fluid filter. If the vehicle was not equipped with a in-line fluid filter, install a fluid filter kit follow the instructions supplied in the kit. If the vehicle was equipped with a filter install a new filter. For additional information, refer to [Section 307-02](#).

Transmission Fluid Cooler Tube Replacement

Prior to carrying out the Transmission Fluid Cooler Tube Replacement check to see if the vehicle is equipped with a in-line fluid filter. If the vehicle was not equipped with a fluid filter, install a fluid filter kit follow the instructions supplied in the kit. If the vehicle was equipped with a filter install a new filter. For additional information, refer to [Section 307-02](#).

Diagnosis By Symptom

Special Tool(s)

 ST2408-A	Air Test Plate, Transmission 307-405
 ST1137-A	73 III Automotive Meter 105-R0057 or equivalent
 ST1137-A	Trans Tester TR/MLP Overlay and Manual 007-00131 or equivalent

 ST1632-A	MLP-TR Cable 418-F107 (007-00111) or equivalent
 ST1389-A	Transmission Tester 307-F016 (007-00130) or equivalent
 ST1565-A	Pressure Gauge, Transmission Fluid 307-004 (T57L-77820-A)
	UV Leak Detector Kit 164-R0756 or equivalent

The Diagnosis by Symptom Index gives the technician diagnostic information and direction, and suggests possible components, using a symptom as a starting point.

The Diagnosis by Symptom Index is divided into two categories: Electrical Routines (indicated by 200 series numbers) and Hydraulic/Mechanical Routines (indicated by 300 series numbers). The Electrical Routines list the possible electrical components that can cause or contribute to the symptom described. The Hydraulic/Mechanical Routines list the possible hydraulic or mechanical components that can cause or contribute to the symptom described.

Diagnosis by Symptom Index — Directions

1. Using the Symptom Index, select the Concern/Symptom that best describes the condition.
2. Refer to the routine indicated in the Diagnosis by Symptom Index.
3. Always begin diagnosis of a symptom with:
 - a. Preliminary inspections.
 - b. Verifications of condition.
 - c. Checking the fluid levels.
 - d. Carrying out other test procedures as directed.
4. **NOTE:** Not all concerns and conditions with electrical components will set a diagnostic trouble code (DTC). Be aware that the components listed may still be the cause. Verify correct function of these components prior to proceeding to the Hydraulic/Mechanical Routine listed.

NOTE: When the battery is disconnected or a new battery installed, certain transmission operating parameters can be lost. The powertrain control module (PCM) must relearn these parameters. During this learning process, you may experience slightly firm shifts, delayed, or early shifts. This operation is considered normal and will not affect the function of the transmission. Normal operation will return once these parameters are stored by the PCM.

Begin with the Electrical Routine, if indicated. Follow the reference or action statements. Always carry out the on-board diagnostic tests as necessary. Never skip steps. Repair as necessary. If the concern is still present after electrical diagnosis, then proceed to the Hydraulic/Mechanical Routine listed.

5. The Hydraulic/Mechanical Routines list possible hydraulic or mechanical components that can cause the concern. These components are listed in the removal sequence and by most probable cause. All components listed must be inspected to ensure correct repair.

Diagnosis by Symptom Index

Diagnosis by Symptom Index

5R55N	Routines	
	Electrical ¹	Mechanical/ Hydraulic
Engagement Concerns:		
● No Forward in D5 or D4 Only	201A	301A
● No Forward Only (All Positions)	201B	301B

● No Reverse Only	202	302
● Harsh Reverse Only	203	303
● Harsh Forward Only	204A	304A
● Harsh Manual 1st Gear Only	204B	304B
● Delayed/Soft Reverse Only	205	305
● Delayed/Soft Forward Only	206	306
● No Forward and No Reverse	207	307
● Harsh Forward and Harsh Reverse	208	308
● Delayed Forward and Delayed Reverse	209	309
Shift Concerns:		
● Some/All Shifts Missing (Automatic Mode Only)	210	310
● Timing Concern		
Early/Late (Some/All)	211	311
Erratic/Hunting (Some/All)	212	312
● Feel Concerns		
Soft/Slipping (Some/All)	213	313
Harsh (Some/All)	214	314
● No First Gear in Drive, Engages in a Higher Gear	215	315
● No First Gear in Manual 1st	216	316
● No Manual 2nd Gear	217	317
Torque Converter Clutch Operation Concerns:		
● Does Not Apply	240	340
● Always Applied/Stalls Vehicle	241	341
● Cycling/Shudder/Chatter	242	342
Other Concerns:		
● Shift Lever Efforts High	251	351
● External Leaks	252	352
● Poor Vehicle Performance	253	353
● Noise/Vibration — Forward or Reverse	254	354
● Engine Will Not Crank	255	355
● No Park Range	256	356
● Transmission Overheating	257	357
● No Engine Braking in Manual 2nd Position	258	358
● No Engine Braking in Manual 1st Position	259	359
● Fluid Venting or Foaming	261	361
● Vehicle Movement with Gear Selector in "N"	262	362
● Slips/Chatters in Manual 1st Gear	263	363
● Slips/Chatters in Manual 2nd Gear	264	364
● No Engine Braking in Manual 3rd Position	280	380
● No Engine Braking in Manual 4th (D4) Position	281	381
● Slips/Chatters in Manual 3rd Gear	282	382
● Engine Braking in ALL Gears	283	383
● No 2nd and 5th Gears	284	384
● No 3rd, 4th and 5th gears

207 — ELECTRICAL ROUTINE	
Powertrain Control System	
• PCM, vehicle wiring harnesses, Pressure Control Solenoid B (PC B)	• Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	• Go To Pinpoint Test D .
	• Repair as required. Clear DTCs, road test and carry out on-board diagnostic test again.
307 — HYDRAULIC/MECHANICAL ROUTINE	
Fluid	
• Incorrect level	• Adjust to the correct level. Refer to Transmission Fluid Level Check in this section.
• Condition	• Carry out Fluid Condition Check. Refer to Preliminary Inspection in this section.
Shift Cable/Digital TR Sensor	
• Cable system or digital TR sensor damaged, misaligned	• Inspect and repair as necessary. Refer to Digital Transmission Range (TR) Sensor or Section 307-05 .
Main Control	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Separator plate damaged	• Inspect for damage. If damaged, install a new separator plate.
• Contamination	• Disassemble and clean.
• Valves and springs damaged, misassembled, missing, stuck, or bore damaged	• If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This removes the anodized finish and can result in further main control or transmission damage.
Input Shaft	
• Damaged	• Inspect for damage. Repair as necessary.
Fluid Pump Assembly	
• Bolts not tightened to specification	• Tighten bolts to specification.
• Gasket damaged	• Inspect for damage. If damaged, install a new gasket.
• Porosity, cross leaks, ball missing, plugged hole	• Inspect for damage. If damaged, repair as necessary.
• Pump gears cracked and/or siezed	• Inspect for damage. Install a new pump.
• Flow control valves, springs, or seal damaged,	• Inspect for damage. Install a new seal or flow control valve.

stuck or not assembled correctly	
OD Planetary Assembly	
· Planetary damaged	· Inspect for damage. Repair as necessary.
Center Shaft Assembly	
· Damaged. One-way clutch damaged	· Inspect for damage. Repair as necessary.
Forward Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.
Forward Planetary Assembly	
· Planetary damaged	· Inspect for damage. Repair as necessary.
Intermediate Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.
Reverse Planetary Assembly	
· Planetary damaged	· Inspect for damage. Repair as necessary.
Output Shaft	
· Damage	· Inspect for damage. Repair as necessary.
Torque Converter	
· Damaged flexplate or adapter plate	· Inspect for damage. Carry out the Torque Converter checks, refer to the procedure in this section. Repair as necessary.
· Damaged impeller hub	
· Damaged turbine hub	
Direct One-way Clutch	
· Worn, damaged or assembled incorrectly	· Inspect for damage. Repair as necessary.

Engagement Concern: Harsh Forward and Harsh Reverse

Possible Component	Reference/Action
213 — ELECTRICAL ROUTINE	
Powertrain Control System	
<ul style="list-style-type: none"> • PCM, vehicle wiring harnesses, Shift Solenoids A, B, C, Pressure Control Solenoids A, B, C, D, Intermediate Shaft Speed (ISS) sensor, Transmission Fluid Temperature (TFT) sensor, IAT Sensor, VSS input 	<ul style="list-style-type: none"> • Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM, IAT, and VSS.
	<ul style="list-style-type: none"> • Go To Pinpoint Test A, Go To Pinpoint Test B, Go To Pinpoint Test D and Go To Pinpoint Test E.
	<ul style="list-style-type: none"> • Repair as necessary. Clear DTCs, road test and carry out on-board diagnostic test again.
313 — HYDRAULIC/MECHANICAL ROUTINE	
Only some Shifts Soft/Slipping	
	<ul style="list-style-type: none"> • If only some of the shifts are soft/slipping, determine which shift(s) is missing.
	<ul style="list-style-type: none"> • Refer to the following routine(s) for further

	<p>Soft/Slipping concerns:</p> <ul style="list-style-type: none"> ■ Soft/Slipping 1-2 Shift, Routine 226/326 ■ Soft/Slipping 2-3 Shift, Routine 227/327 ■ Soft/Slipping 3-4 Shift, Routine 228/328 ■ Soft/Slipping 4-5 Shift, Routine 272/372 ■ Soft/Slipping 5-4 Shift, Routine 273/373 ■ Soft/Slipping 4-3 Shift, Routine 229/329 ■ Soft/Slipping 3-2 Shift, Routine 230/330 ■ Soft/Slipping 2-1 Shift, Routine 231/331
Fluid	
· Incorrect level	· Adjust to the correct level. Refer to Transmission Fluid Level Check in this section.
· Condition	· Carry out Fluid Condition Check. Refer to the procedure in this section.
Incorrect Pressures	
· High/Low pressures	· Check pressure at line and PC C taps.
